Wood's empirical theory of exploitation suggests a different conclusion regarding these two cases. Recall that in Wood's account, exploitation occurs when A exploits a weakness or a vulnerability in B to derive a benefit from B. In this account, workers in both factories are exploited. This is because they take advantage of the workers' powerlessness to benefit from their cheap labor. In this sense, Wood concurs with Marx that owners nearly always exploit wage laborers.

It remains a separate question whether or not such exploitation is morally objectionable. Much can be said in defense of the right of individuals to engage in transactions involving their own property and labor, and efforts to interfere with capitalist exploitation may unduly restrict liberty or economic efficiency. At this point, one might conclude that no determinations regarding the moral status of capitalist exploitation can be made independently of an adequate theory of economic justice. However, there is another means for evaluating the moral legitimacy of the practices of employers. According to Wood, exploitation is morally objectionable when it is disrespectful of others.

Kant and his interpreters have provided the most sophisticated philosophical defense of the idea of respect for persons. In a Kantian analysis, persons are entitled to respect because they have dignity; they have dignity because they are free and rational beings capable of autonomous action and are subject to moral law. Kant famously argues that to respect someone, one must treat that person as an end and not merely as a means. To treat someone as a means only is to treat that person as a tool, as an object with mere instrumental value. Popular criticism of the labor and wage practices of MNCs is frequently grounded in the belief that the contract employees of these and other MNCs are treated merely as tools of production. So in the empirical account of exploitation discussed here, the exploitation of sweatshop workers is morally objectionable when it is disrespectful and unobjectionable when it is not.

Conclusion

Exploitation is a contested social concept about which there is little consensus among philosophers and social theorists. Nonetheless, an empirical view of the concept that allows for morally unobjectionable exploitation and that does not render phrases such as "wrongful exploitation" nonsensical has more plausibility than alternative concepts. Such a concept may be of considerable use in assessing market transactions that occur between parties with significantly different power.

Export-Import Bank

The Export-Import Bank (Ex-Im Bank) was established on February 12, 1934, as the official export credit agency of the United States. The mission of the agency is to assist in financing the export of U.S. goods and services to international markets. The agency was originally incorporated as the Export-Import Bank of Washington until 1968, when the name was shortened to Ex-Im Bank. Services and products provided by the Ex-Im Bank include basically two categories of assistance: (1) financial products and support for U.S. companies exporting abroad and (2) financial products and support to foreign entities to establish and maintain markets for U.S. products.

The bank's programs come in the form of direct loans, export credit insurance, working capital guarantees, and financing for special projects such as environmental programs or small business initiatives. The Ex-Im Bank has supported the following specific programs in the recent past. In the environmental category, the bank has provided financing for the export of environmentally beneficial U.S. goods to foreign markets, including renewable energy exports such as wind turbines, photovoltaic panels, solar energy outdoor lighting, and geothermal plant services. The bank provides financial support for infrastructure that facilitates trade in foreign markets in the form of new airports, telecommunications projects, and transportation security programs.

Another initiative includes transportation products (aircraft, locomotives) and transportation security. Other areas of recent emphasis include electronics, telecommunications, mass transit, medical equipment, and the promotion and support of U.S. services in foreign markets, such as engineering, design, construction, oil drilling, training, and consulting. The Ex-Im Bank also provides support for markets of agricultural products from the United States including commodities, livestock, foodstuffs, equipment, chemicals, supplies, and services. In addition, the bank partners with the U.S. Small Business Administration (SBA) to assist small businesses seeking to sell their products or services in foreign markets. The Ex-Im Bank and the SBA can coguarantee loans up to $2 million. This partnership enables small businesses to obtain more capital than they could acquire under the SBA program alone. More than 80% of the bank's transactions benefit U.S. small businesses.

The Ex-Im Bank provides pre-export financing, financing for foreign buyers of U.S. products and services, and insurance to protect against buyer nonpayment. The bank can provide long-term credits to public or private entities, credits to foreign lending institutions for the purpose of lending funds to local businesses, and credits to countries with dollar shortages to maintain a consistent flow of trade of U.S. goods and services. Rather than compete with the private sector, the Ex-Im Bank offers financial products and services the private sector would normally not engage in.

The bank deals only with the export of U.S. goods and services; it does not finance imports. Governance of the bank includes a congressionally mandated advisory committee, 23 bank officers, and a board of five to seven directors appointed by the president of the United States. While the bank is headquartered in Washington, D.C., it operates out of six regional areas of the United States. In the past 5 years, the Ex-Im Bank has completed at least 11,000 total transactions involving $65.5.

Ethical issues concerning this institution lie mostly in the choices made about which ventures to support. Much like other industrial policy decisions, financing through the Ex-Im Bank has the potential to be influenced by politics.

Export Trading Company Act of 1982

The Export Trading Company Act of 1982 was enacted to encourage U.S. exports of goods and services. The act was intended to facilitate the formation of export trading companies and export trade associations and to expand the provision of export trade services. Export trading companies are persons or organizations, whether operated for profit or as a nonprofit organization, principally involved in exporting, or facilitating the exports of, goods or services produced in the United States. The export trade services mentioned in the act are wide-ranging: They include consulting, international market research, advertising, marketing, insurance, product research and design, legal assistance, transportation (including trade documentation and freight forwarding), communication and processing, warehousing, foreign exchange, and finance services provided to facilitate the export of goods or services produced in the United States. A newly established office within the Department of Commerce would promote the creation of export trade associations and export trading companies.

The act sought to reduce restrictions on trade finance offered by financial institutions. To give exporting firms protection for joint activities, a provision of the act authorized the U.S. Department of Commerce to issue a certificate that entitles a holder to a limited antitrust exemption. Once issued, the certificate exempts the specified conduct from criminal and civil suits under both federal and state antitrust laws.

The act made it easier for exporters to secure loans, especially in cases where the private credit market failed to provide adequate financing for export transactions. The official export credit agency of the United States, the Export-Import Bank, was authorized and directed to establish a program to provide guarantees for loans extended by financial institutions or other public or private creditors to exporters. These loans had to be secured by export accounts receivable or inventories of exportable goods. The guarantees would facilitate expansion of exports that would not occur otherwise. The intended recipients of the loan guarantees were among the tens of thousands of small, medium-size, and minority businesses that produce exportable goods and services but do not engage in exporting.

The expansion of exports sought under the act was intended to boost manufacturing activity—at the time, U.S. exports accounted for one out of every nine manufacturing jobs in the United States—and counter the putative adverse effects of a growing trade deficit on the value of the dollar and the inflationary impact of a depreciating currency. In 1982, when the act came into effect, U.S. exports of goods and services amounted to $302 billion; in 2005, more than two decades later, they had quadrupled in inflation-adjusted terms to $1,195 billion. But the trade deficit has continued to rise inexorably, from $13 billion in 1982 to $633 billion in 2005 in real terms. During this period, the dollar has risen sharply against the yen, from 220 yen per dollar in January 1982 to 102 in January 2005. Manufacturing employment has declined steadily since reaching a peak of 19.5 million in 1979, falling to 14.2 million by the fourth quarter of 2005.

In a market-oriented economy, the government should play a minimal role in promoting exports. Trade policies designed to favor certain industries militate against the expansion of free trade sought by successive agreements of the World Trade Organization and in fact impose economic and political costs on the parties involved. Export promotion policies by the United States, for instance, will impose costs on the U.S. taxpayer and create tensions with trading partners. By encouraging production in certain sectors, these policies may also lead to a decline in world prices. In the case of agriculture, the increased production by farmers in developed countries will come at the expense of farmers in developing countries.

Externalities

An externality is a side effect generated as a result of consumption or production choices by one individual or entity and involuntarily received by another individual or entity. The decision maker's analysis or calculation deliberately or inadvertently ignores the consequence. The decision maker avoids "internalizing" a particular consequence and thus externalizes any cost or benefit. The recipient bears the burden of a negative (i.e., costly) externality and gains the value of a positive (i.e., beneficial) externality.

A negative externality imposes a burden elsewhere while benefiting the source through avoidance (i.e., externalization) of a cost. A classic example is air or water pollution. The polluter damages someone else and thereby avoids the cost of pollution control. Negative externalities particularly raise important issues for business ethics and law. Not generating, or at least compensating for, a negative externality comports with the ethical principle of avoiding unjustifiable harm to others when feasible to do so. A good citizen does not dump refuse on the road to avoid the inconvenience of finding a garbage can. Someone else pays the cost of that dumping.

A positive externality generates a benefit elsewhere at no direct cost or benefit to the source. A classic example is a beekeeper whose freely wandering bees pollinate the apple trees of a neighboring farmer. The farmer gains in the production of apples, while the beekeeper bears no immediate cost and cannot collect any part of the farmer's benefit. The beekeeper may gain of course in honey production, and if so, a second positive externality is at work in the reverse direction from farmer to beekeeper. Positive externalities can be interpreted as a form of violation of the opportunity cost principle of economics: The beneficiary does enjoy a "free lunch" in this instance. Beneficiaries may under some circumstances oppose acts to internalize the value of a positive externality. Positive externalities raise important issues for public policy formulation, particularly in the extreme forms of public goods and merit goods. A public good either occurs freely in nature (e.g., air) or cannot readily be produced for profit by a business (e.g., national defense). A merit good might be produced privately for profit (e.g., medical care) but ought in someone's judgment to be more broadly available (e.g., public education). The notion of a positive externality is akin to the ethical principle of discretionary altruism, where the producer cannot recapture the value of the beneficial side effect. A good citizen picks up at personal cost the refuse left by children at a public park.

An externality can be an example of Adam Smith's notion of unintended consequences. Discretionary corporate social responsibility might be predicted to create unintentionally more harm than good (i.e., negative consequences), while Smith's "invisible hand" market mechanism might unintentionally generate more good than harm (i.e., positive consequences).

Economic Theory of Externalities

Because side effects are commonplace phenomena resulting from consumption and production decisions, externalities are an important matter in welfare (i.e., normative) economics and public policy. Welfare economics concerns the conditions under which Adam Smith's invisible hand of free markets leads to the most efficient allocation of scarce resources so as to maximize national wealth. A resource allocation is Pareto optimal if no other resource allocation can make one person better off without making some other person worse off. So when resources are allocated in a Pareto-optimal manner, all possibilities for mutually beneficial voluntary exchange have been exhausted. In static conditions, workable competition reasonably achieves Pareto optimality. However, even a competitive market economy confronted with significant amounts of externalities and public goods will generally not achieve a Pareto-optimal allocation. Consumers will focus on private goods so that they can capture the full benefit of their expenditures. As a result of this focus on private goods, market economies typically underproduce positive externalities and public goods as measured by the condition of Pareto optimality. Market economies typically overproduce negative externalities as measured by that condition, raising the question of government regulation.

Positive and negative externalities are also termed external benefits and costs, external economies and diseconomies, or social benefits and costs, respectively. The language means simply, for example, that benefits and costs occur externally of the producer. Similarly, an economy is a side effect that increases someone else's benefits and a diseconomy is a side effect that increases someone else's costs. Externalities often create broad social rather than individualized side effects.

There are several ways of classifying externalities. They can be harmful (i.e., negative) or beneficial (i.e., positive), as illustrated earlier for pollution or a beekeeper and a farmer, respectively. They can be real (i.e., technological) or pecuniary (i.e., financial or monetary). A real or technological effect changes the total stock of assets. For example, water pollution adds something to the physical composition of water. Water as an asset has changed. A pecuniary or financial effect changes the prices of existing assets. A pecuniary externality is simply a working through of the market price mechanism. For example, air pollution may reduce the market value of affected housing. As a general rule, real externalities must be considered in a cost-benefit analysis, but pecuniary externalities should be ignored. In a voluntary exchange between a consumer and a firm, a product or service goes to the consumer, and money goes to the firm. An externality may occur in consumption (generated by the consumer) or in production (generated by the supplier). For example, a consumer mowing the lawn pollutes the environment. A producer dumping waste into a river pollutes the environment. Negative (i.e., costly) externalities can become depletion of a common pool or property resource in the tragedy of the commons. There is a continuing controversy over whether the broadcast spectrum (for radio and TV transmission) is properly a commons or a set of private property rights.

Where externalities exist, private benefits and/or costs diverge from social benefits and/or costs. Externalities result in a difference between a private decision maker's calculation of benefits or costs and society's valuation of benefits or costs. This difference can result in market failure or suboptimality. Suppose, for example, that the sale price of a good is \$10 per unit, reflecting consumer willingness to pay (i.e., demand). The producer bears a cost of \$8 and makes a profit of \$2. There is a production-generated negative externality of \$3 per unit and a production-generated positive externality of \$1 per unit—both ignored by the firm. The consumer generates an additional negative externality of \$1, ignored in throwing the unit away when economic lifetime is exhausted. The social valuation of this good is consumption benefit of \$10 plus the \$1 positive externality; from the sum of \$11 overall social benefit, one must now subtract the \$4 of negative externalities. The social valuation reduces to \$7 compared with the market price of \$10. Too much of this good is being produced and consumed. The firm cannot collect the value of the positive externality. If society compels the firm to internalize the negative externality of \$3 per unit, then the firm would lose money on each unit sold unless it can figure out a way to reduce its production cost.

The conventional diagrammatic illustration of externalities is to depict two demand or supply curves—depending on whether a consumption (demand) or production (supply) externality is involved. In the case of production externality, on the production side there is a social cost (i.e., supply) function positioned vertically above the private cost (i.e., supply) function (because supply embeds cost). At each point along these two cost functions, marginal private cost is less than marginal social cost by the amount of the external cost. A single demand curve (demand embeds consumer willingness to pay), in this instance, would mean that there are no external benefits offsetting the external costs: Social benefit and individual benefit are equal. In the case of consumption externality, on the demand side there is a social benefit function positioned vertically above the private benefit function. At each point along these two demand functions, marginal private benefit is less than marginal social benefit by the amount of the external benefit. A single supply curve, in this instance, means that there are no external costs offsetting the external benefits: Social cost and individual cost are equal.

Solutions for Externalities

Significant external impacts may have to be internalized in the decision maker's analysis or calculation in some way. How to do so is the vital policy issue, because the market mechanism no longer achieves optimal outcomes. Potential solutions include governmental regulation (e.g., ordering a ban on or reduction of an activity) or a Pigouvian tax (named after Arthur C. Pigou, 1877–1959) for negative externalities, or governmental subsidy for or even direct provision of beneficial externalities. Negative externalities—especially pollution, which can produce irreversible costly results in time—can be interpreted as a form of nuisance or of trespass on someone else's property fit for tort litigation. Ronald H. Coase presented the case for private self-regulation through a complete and enforceable system of property rights. Continuing deforestation of the Amazon basin occurs because no one owns the land or possesses sufficient resources and incentives to defend against loggers—in the absence of effective governmental action. The Brazilian government may argue that it requires substantial international financial transfers to address the problem.

Pigou, an English economist, pioneered welfare economics. Pigou drew the important distinction between private costs (or benefits) and social costs (or benefits). Pigou took the view that only governments—through taxes and subsidies—can feasibly "internalize" externalities in economic exchange or production. A Pigouvian tax is one intended to correct a negative externality. Pigou's position invokes the circumstance in which firms in competitive markets likely cannot address internalization of social costs. Any firm that moves first to internalize external costs would have higher costs than its competitors and be forced to exit the industry. As a result, a monopoly theoretically might be better able to address externalities. Given economic rent (profits above cost including a competitive return), a monopoly (where regulated by government) might be able to pay for the cost of the externality or restrict the quantity supplied so as to reduce the externality.

Coase—winner of the 1991 Nobel Prize in Economic Sciences—brought together the economic theory of externalities and the common-law tradition addressing nuisance and torts claims. The subsequently labeled "Coase theorem" expands solutions for externalities beyond government actions: Private losers and winners might in principle negotiate the internalization of externalities. Nongovernmental solutions also may evolve over time through community agreements and other approaches. It does not matter which party possesses rights of ownership over the cause of the externality: The initial assignment of property rights does not affect the efficiency of resource allocation where there is completely free trade of property rights. What can prevent negotiation are high transaction costs of bargaining. Coase had developed a theory that the firm (or any other economic organization or institution) exists as an entity in place of pure market exchange only when actors find a particular governance mechanism useful for minimizing transaction costs. The firm is a nexus of contracts intended to minimize transaction costs. Coase's insights have occasioned wide application in law and the social sciences—launching the field called the "new institutional economics."

The Coase theorem argues that government should facilitate private bargaining and enforce what amounts to private contracts concerning property rights. This theorem requires simultaneously (1) well-defined property rights, (2) a relatively small number of bargainers, and (3) relatively small bargaining (or transaction) costs. As the numbers increase, free riding may vitiate the bargaining efforts—as one encounters the difficulties attending attempted collective action. A class action lawsuit is a partial substitute for the numbers problem. Pigou's view can be interpreted as the necessity for governmental action when at least one of these conditions does not obtain in the real world. Litigation concerning asbestos or tobacco harms cannot meet Coase's conditions. Multiple-stakeholder forums for addressing business problems are a variant of the bargaining solution.

Environmental Economics

Environmental economics focuses on the negative externalities or side effects of consumption and production. The Kyoto Protocol for global climate protection is an example of the problem. Everyone generates negative externalities that in various ways likely contribute to global warming. These externalities damage the natural environment (a common resource pool) and are treated by the individual polluter as costless. These damages accumulate into conditions that warm the planet. The Kyoto Protocol—a negotiated arrangement—seeks to reduce pollution levels on a country-by-country basis. A difficulty in the arrangement is that the advanced economies agree to reduce pollution (in effect internalizing the cost of negative externalities), while the developing countries (including Brazil, China, and India, which are rapidly industrializing) are not parties to the commitment. As developing countries industrialize, their pollution levels—still driving global warming—will likely increase.

An illustrative pollution cost situation, adapted from John H. Dales, is as follows. Suppose that an isolated community living on the edge of a lake dumps all its water pollution into the lake, which is also the source of its drinking water and other water-related activities. Each person is contributing to the destruction of a common pool or common property resource. The cost of treating polluted lake water to obtain potable water is $1,000 per person annually. The only alternatives are to transport in bottled water at $1,200 per person annually or to divert waste water to a treatment plant rather than permitting runoff into the lake at $1,500 per person annually. Suppose further that diversion or cleaning is just sufficient to produce potable water but not to permit fishing or swimming in the lake. Each person would be willing to pay $50 a year for fishing and $50 a year for swimming. If the community decides on potable water only, fishing and swimming effects remain as noninternalized negative externalities. The decision output depends on citizen preferences in relationship to cost structure.

Spillover and Network Effects

Spillovers or neighborhood effects are externalities that affect the interests of a relatively broad number of people or of nature. This broad effect is in contrast to the simple beekeeper and farmer example used at the beginning of this entry. Spillover effects can be either real (i.e., technological) or pecuniary (i.e., financial). Complementary goods (e.g., purchase of cars increases purchase of gasoline) are a real spillover effect. The spillover notion permits the inclusion of pecuniary (or financial) externalities, which would be excluded from a cost-benefit analysis. A public park may raise the property values of all the houses in a neighborhood. This spillover effect is pecuniary. A spillover effect can occur across governmental jurisdictions, in the sense that provision of a public good in one jurisdiction could have impacts on another (generally neighboring) jurisdiction.

Public education of all the children in the neighborhood may create real spillovers. Education arguably is a merit good. The market economy can produce some limited quantity of education for profit. Someone's judgment is that education should be more broadly available through governments or nonprofit organizations, because having an educated citizenry generates broad positive externalities for everyone in the community or society.

The *Washington Post* reported research suggesting that an additional year of education is worth on average an estimated 8% to 10% more in pay to the individual educated. It was reported that, controlling for other factors affecting wages, a college education benefits the less educated through spillover effect: The proportion of college graduates in a city raises all wages. The largest gain is by those with the least education—high school dropouts. The specific estimate links a 1 percentage point increase in the proportion of college graduates living in a metropolitan area to a 1 percentage point increase in everyone else's pay. A cited reason is that as the relative supply of lower-wage labor declines (in proportion to college graduates), the wages of that labor rise; there may also be informal transfers of marketable skills among population groups.

Network externalities involve the progressive expansion of usage as more and more consumers purchase something. A network effect means that a good or service has value to a potential customer dependent on the number of customers already owning that good or using that service. The purchase of a good by one consumer indirectly benefits others who own the good: By purchasing a fax machine or using an e-mail service, a person makes fax machines and e-mail accounts more useful. A network effect is a network externality if either the participants in the market or the owner of a network do not internalize these side effects. A network effect is also an example of a positive feedback loop in which, initially, additional customers attract more customers sufficiently to pass some critical mass point; the feedback growth continues until congestion through overuse occurs (as on a crowded toll bridge). It may be the case that network effects are important in high-tech industries and are related to the dot-com phenomenon of the late 1990s. Firms may have thought that market share and volume growth were the most important strategic target in a new market. The largest firm arguably could set technical and marketing standards and dominate competition. Network effects occur on the demand side, scale and scope economies on the supply side.

Net-Harm Industries and Activities

Industries are socially net-gain or net-harm activities. A net-gain industry is one whose output causes greater benefits than harms. In consequence, hypothetical compensation of harms is feasible. In theory, beneficiaries could compensate losers and still have net benefits left over to enjoy. The net-gain condition characterizes most industries. There are net-harm industries, whose output causes greater harms than benefits; hypothetical compensation is not feasible. Net-harm industries produce socially undesirable goods (i.e., social or merit bads). A classic instance is tobacco production and consumption. Although there is consumer demand for tobacco products (which demand may reflect addiction), consumption is unavoidably harmful, and there are significant externalities including health harms from secondhand smoke. The net-harm notion can be extended to alcohol, child pornography, drug abuse, firearms, and gambling.

As reported in 2004 by the Associated Press, an estimate of lifetime costs of more than 60 years for a 24-year-old smoker suggests that smokers pay at least $33 a pack of cigarettes, while their families bear $5.44 and others in society about $1.44 net (not including higher cleaning bills and lower resale values). Part of the social cost is offset by earlier deaths, so that smokers do not draw as much on funds paid into retirement accounts. Smokers pay $0.76 a pack in taxes, as an offset to social costs of $2.20, thus reducing net to the $1.44 figure. External costs on families and society run (net) about one fifth (20.8%). Consumption is at least too much by that proportion—before addressing any judgment that tobacco is bad for the individual consumer.

EXTORTION

Extortion (or solicitation) and bribery are among the main forms of corruption. Both may be defined as the act or effect of giving or receiving a thing of value, so that a person acts or does not act in violation of a formal or implicit rule about what that person ought or ought not to do, to the benefit of the person who gives the thing of value or a third party. In bribery, it is the beneficiary that takes the initiative—for example, when a company that wants to obtain a contract from a public authority makes a payment to the politician who has the power to decide who gets the contract. In extortion, it is the agent that takes the initiative.

Both extortion and bribery have the following features in common:

- A power or influence that someone (the agent: a public official, politician, manager, or employee) has in the exercise of a function, task, or responsibility in the service of a public office or company
- An element of discretion deriving from that power or influence
- Certain duties (established by law, contract, or code of conduct) associated with the agent's function in a public office or company
- An incorrect exercise of that power or influence, contrary to the duties associated with the agent's position or function
- A private benefit for a person or organization (the beneficiary): The benefit may be monetary or not (a cost reduction, or a job, license, or permit, or the mere expectation of it), and it may be positive or negative (e.g., avoiding reprisals)
- The delivery, or the promise of delivery, of something of value to the agent or another person (a relative, a political party, etc.) in exchange for the agent's exercising a power or influence in the beneficiary's favor

Extortion and bribery may take a wide variety of forms: The beneficiary may be entitled to the benefit obtained from the agent (e.g., a legitimate permit) or not entitled to it (an unjust sentence); the agent may be public or private (e.g., the manager of a company with which the beneficiary has contractual relations); the payment may be direct or indirect (e.g., a scholarship for the agent's son or daughter); and the payment may be made directly or through an intermediary. Facilitating payments are small payments made to help resolve a matter, expedite an administrative process, secure the issuance of a license, and so on, but not to obtain a major business advantage.

Ethical Problems of Extortion

In extortion and bribery, many ethical principles are violated: justice, impartiality, legality, professionalism, loyalty, good faith, solidarity, avoidance of harm, and so on. The moral core of extortion and bribery lies in the unfairness and disloyalty of those who execute these acts in the exercise of their duties to the company or public agency in which they work, when they use their position to obtain a benefit to which they are not entitled. There may also be injustice to the beneficiary, to the company or government department (because the agent's duty is not fulfilled or because the agent encourages others to act in a similar manner), to third parties (e.g., competitors), and to society (when an atmosphere of corruption is created). The moral responsibility of the beneficiaries derives mainly from their cooperation, as abettors or accomplices, in the agent's disloyal action.

The ethical rules for responding to extortion and bribery will depend on one's conception of ethics. The following views are shared, to a greater or lesser extent, by a broad range of theories:

- It is unethical to accept or offer a bribe or to demand a bribe (extortion).
- It is unethical to give in to extortion in order to obtain something to which one is not entitled.
- In certain cases, it is legitimate to give in to extortion in order to obtain something to which one is entitled. In such cases, the following rules should be observed: (a) Carefully consider all the options, to see whether it is possible to solve the problem without getting involved in extortion; (b) the extortion must be open—it is unethical to present what in fact is bribery as if it were a response to extortion; (c) act with the intention of obtaining a right; (d) try to avoid harm to third parties; (e) make sure that there are sufficient objective reasons for giving in to the extortion, in proportion to the damage caused; (f) take steps to minimize the bad example that may be set; and (g) take steps to prevent any recurrence of such collusion with corruption.

Other Consequences of Extortion

Extortion and bribery have many other harmful effects on the economy, society, and political life. For example, the following are the consequences with respect to the economy:

- Inefficient use of resources: higher costs and prices, lower output and quality, wasted time, slower growth, insufficient capital formation, reduced foreign investment, less efficient public spending, reduced tax revenues, and so on
- Unjust redistribution of income: illicit enrichment of certain groups, greater inequalities, growth of the underground economy, and so on
- Less competition, less transparency, laxity in the implementation of rules, obstacles to free trade, loss of legitimacy of institutions, distrust of the market system, and so on

In the sociopolitical arena, extortion distorts decision-making processes, restricts the scope of citizen rights, facilitates concealment, weakens controls, and, in the long run, undermines the government's legitimacy.

What ethics adds to the economic and sociopolitical arguments is recognition of the harm done to people: loss of virtues and weakening of the ability to act in a noncorrupt manner, on both a personal and a social level (corrupt people's behavior is imitated by others). Also, extortion tends to become endogenous: It becomes organized and institutionalized.

Exxon Valdez

At 12:04 a.m. on March 23, 1988, the *Exxon Valdez* ran aground on Bligh Reef, near Valdez, Alaska. This was the 28th trip that the *Exxon Valdez* had made to this particular area. It was, and still remains, the largest oil spill in American history. More than 1,900 km of Alaskan coastline was affected. The actual size of the spill is still debated. Exxon initially reported the spill as 10.8 million gal, but others have challenged that figure and have estimated the spill at approximately 35 million gal. Other large oil spills include the *Ixtoc-1* blowout off the Mexican coast (1978: about 400 million gal); the tanker *Amoco Cadiz* off Brittany, France (1978: 69 million gal); and the tanker *Torrey Canyon* off the English coast (1967: 38 million gal); as spills go, the *Exxon Valdez* does not rank in the top oil spills worldwide. Yet the environmental impact of this spill was enormous. It is clear that thousands of animals died in a very short period of time after the spill, and the most reasonable estimates suggest 250,000 sea birds, 2,800 otters, 300 harbor seals, 250 bald eagles, up to 22 orcas, and billions of salmon and herring eggs.

The cleanup of the oil spill took more than 3 years and cost in excess of $2.1 billion. Several years later, the U.S. Congress passed the Oil Pollution Act of 1990, which authorized the Coast Guard to strengthen regulations on oil vessels, oil tanks, and owners and operators.

Despite extensive hearings, trials, and investigations, it is still not clear how or why this accident occurred. It has been alleged, but never proven, that the ship's captain, Captain Joseph Hazelwood, was operating under the influence of alcohol. A jury in Alaska found him not guilty of operating a vessel under the influence of alcohol, but he was seen in a bar prior to the ship leaving port. All parties agree that there was a well-qualified pilot on the ship, who left after the vessel cleared the Valdez narrows. The ship maneuvered to avoid icebergs in the channel (not an unusual occurrence). Captain Hazelwood left the bridge at this time, and it is not clear why the ship did not turn back into the shipping channel after avoiding the icebergs. The ship was taken to San Diego for repairs (estimated to have cost $30 million) and renamed the *SeaRiver Mediterranean* (still in service). It was barred from ever entering Alaskan waters again.

In 1991, Exxon settled several lawsuits (criminal and civil) and paid over $1 billion in fines and penalties as a result of the events in Valdez. An Anchorage, Alaska, jury awarded punitive damages to the tune of $5 billion in 1994. Exxon has fought this award, and as of July 2006, it is currently on appeal at the 9th U.S. Circuit Court of Appeals. Exxon Corporation's handling of the spill—both the cleanup and the communications as the event unfolded—has been subjected to deep criticism and scrutiny. The *Exxon Valdez* has entered into our vocabulary as an example of enormous environmental damage and poor corporate response to that damage.

F

Factory Farming

Factory farming generally refers to confined animal-feeding operations (CAFOs), in which very large numbers of animals—especially cattle, pigs, and chickens—are crowded in a narrow space to gain weight, and therefore value, as rapidly as possible. In pursuit of optimum weight, motion is discouraged, and since animals tend to become sick in crowded and unhygienic conditions where exercise is impossible, their food is laced with antibiotics to keep them healthy as well as hormones and other nutritional supplements to speed their growth. Forty percent of the world's meat supply is raised in CAFOs.

At one point, CAFOs, and the agricultural practices associated with them, were restricted to Europe and North America, as the largest consumers of meat. With the new prosperity in China, Brazil, India, and other recent entrants to the global economy, the farms have spread worldwide, especially near the urban concentrations of Asia, Africa, and Latin America.

On the one hand, these practices have made fresh meat much more available to consumers in all parts of the world. Furthermore, the meat is not very expensive, largely because of the world overproduction of grain, which will fatten the animals much more quickly than will grass. Consumers have voted with their dollars to maintain these practices.

On the other hand, many objections to CAFOs have been raised, which may be summarized as follows:

First, there is widespread hunger in the world; the grain surpluses are artificial, fueled by developed world subsidies, and cry out for more equitable distribution. While people starve, critics have argued, it is wrong to feed the cereal grains that could save their lives to animals. (It takes about 10 pounds of plant protein to make 1 pound of animal protein.) Growing meat is not a good allocation of the food resources of the world.

Second, it is not clear that the addition of substantial amounts of animal protein is a good thing for the health of the developing world, or indeed for anyone. Most of the degenerative, chronic, and most dangerous conditions of the developed world are associated with animal protein and fat—heart disease, stroke, obesity, and several forms of cancer come to mind. Critics insist that there is no health imperative to maintain these facilities.

Third, the pollution that they generate is arguably an assault on the eyes, the nose, the neighborhood, and the natural environment. Where cattle, chickens, and pigs roam freely in small numbers over pastures, their widely distributed manure fertilizes the ground and enriches their food supply. But the CAFOs provide no room to spread and reabsorb the manure; it is stored in lined pits or lagoons in concentrations that would be toxic to any natural ecosystem. Discharge of the manure into the local waterways would kill all life for miles; spillage on the land makes the land unusable. Ironically, critics point out, this most organic of products, the manure of domestic farm animals, has become as threatening to its environment as any store of nuclear waste. And the amount continues to increase, exponentially.

Fourth, the concentration of work for the sake of maximizing profit changes the traditional work of the farmer and herdsman into an industrial job with traditionally unsafe conditions. When Upton Sinclair wrote *The Jungle* in 1906, the meatpacking industry was characterized by brutal and unsafe conditions in long hours of work. Since the 1970s, observers of the industry report, those conditions have largely returned, especially in those parts of the world without well-enforced worker safety provisions. In long rooms called disassembly plants, where the animals are butchered as rapidly as possible, not all the blood on the floor comes from the animals.

Fifth, critics argue that the nature of the industry leads to the choice of just the most profitable, that is the fastest growing, breeds to raise. Genetic engineering has made possible breeds of chickens, for instance, that have huge breasts and unworkable wings—in any disruption, not one would survive. Traditional breeds of cattle, pigs, and chickens, adapted to the climates in which they evolved, are in danger of disappearing altogether, taking with them the possibilities of reverting to them should climatic conditions become more extreme.

Sixth, the crowded conditions of the animals spread disease with terrible rapidity, the source of severe loss of profit unless countered with regimes of antibiotics that cure disease, prevent disease, and, independent of any disease, increase the rate of growth of the animals. Regular use of antibiotics, the critics point out, reliably produces antibiotic-resistant germs, and the result of that last is the spread, through the human population, of microbes that are resistant to all known antibiotics, and that is a very dangerous condition indeed.

Seventh, the suffering of the animals themselves in these crowded and toxic quarters is obvious, and heart wrenching to those who care for them.

For all those reasons, factory farms have become the target of activist nongovernmental organizations (NGOs) and restrictive legislation in many parts of the world, especially in the developed nations. While they are economically profitable, however, the practices adopted by them will continue.

Fact-Value Distinction

The fact-value distinction is generally summarized as the distinction between what is, or descriptive claims (the realm of facts), and what ought to be, or normative/prescriptive claims (the realm of values). Even though the issue of the fact-value distinction is closely intertwined with the is-ought distinction—and often the two are conflated in discussions, arguments, or positions—they are not identical. It can be held, for example, that values are natural facts or that normative propositions are factual or that normative claims assert nothing about real values.

The issue of the fact-value distinction came to the forefront, during the Enlightenment, with David Hume's argument that normative claims about values or what ought to be cannot be derived from descriptive claims about facts or what is. Hume argued that there is a gap between facts and values or between what is and what ought to be. For example, the fact that you promised to repay me the money you borrowed does not imply the conclusion that you ought to do so unless there is added the nonfactual, moral premise that one ought to keep one's promises or that one ought to repay one's debts. Hume argues that ethical philosophers make an imperceptible switch from the realm of facts to the realm of values, with no explanation offered. The switch to the value realm of obligation introduces a new relation or affirmation that needs to be clarified and justified. However, since he can find no justification, Hume suggests such a derivation cannot be made.

This problem was reinforced in the 20th century with G. E. Moore's attack on the view that moral terms are completely definable in nonmoral terms. The view he attacked, held by many philosophers who were ethical naturalists, claimed that moral judgments are a subspecies of empirical judgments and that moral terms stand for purely natural characteristics. They held, for example, that moral goodness can be defined in terms of one or more natural properties that we already understand. An instance of this would be the hedonist standpoint that good means pleasure. But, Moore points out, we can always ask if pleasure is always good; for it is not a contradiction to say that some pleasures are not good. Moreover, this lack of contradiction holds for any empirical property or set of properties that can be offered. These are significant questions regardless of what properties are substituted. But, if the naturalists are right, asking these questions should mean only that the questioner does not understand the terms being used. It would be like asking if all sons are male.

Moore argued that a naturalistic fallacy is committed when one identifies value properties with natural or empirical properties. He held that the property of moral goodness is simple, indefinable, nonnatural, or nonempirical and must be immediately grasped by a nonnatural moral intuition. This is analogous to an empirical quality such as yellow. The meaning of yellow cannot be understood by any definition, such as wavelengths, or by knowing that ripe lemons are yellow. Rather, yellow must be immediately experienced by a sensible or natural apprehension, a natural intuition. He calls the fallacy involved the naturalistic fallacy in ethics because it involves confusing a natural property, such as pleasure, with the nonnatural property of goodness.

The fact-value distinction has influenced the directions taken by the social sciences and business ethics. Scholars interested in business ethics seem, for the most part, to have split into two camps in delineating two kinds of business ethics, the normative and the empirical. The former is considered to be a prescriptive or value-laden approach and the latter an explanatory, descriptive, and/or predictive approach concerned with empirical facts.

The normative approach is rooted in philosophy and the liberal arts and focuses its attention on questions of what ought to be, how an individual or business ought to behave to be ethical. The empirical approach is rooted in management and the social sciences. This approach generally focuses on questions of what is, assuming that the organizational world is basically objective, awaiting impartial exploration and discovery. Empiricists answer questions of what is by attempting to describe, explain, and/or predict phenomena in the natural world, using the agreed-on methodologies of their social scientific training. Scholars who represent these different domains are said to be guided by different theories, assumptions, and norms that often result in misunderstanding or lack of appreciation for each other's endeavors.

The social scientist may devalue the philosopher's moral judgments because these judgments cannot be understood in empirical terms and cannot be verified by empirical testing or be used to predict or explain behavior. The social scientist's statements about morality, on the other hand, may be seen to be of little value to the philosopher because they do not address the essential questions of right and wrong. Normative ethical theories develop standards by which the propriety of certain practices in the business world can be evaluated. In contrast, the empirical approach focuses on identifying definable and measurable factors within the individual psyches and social contexts that influence individual and organizational ethical behavior.

In a broad sense, the fact-value split leads to the view that facts are not action guiding, for they do not indicate that something ought to be done. They are descriptions and causal explanations of human or natural phenomena. Value judgments, on the other hand, do have an action-guiding function and commend or condemn particular courses of action, whether this commendation or condemnation is held merely to evince subjective feeling or state an objective standard. Whether subjective or objective, such statements are usually understood as immune from scientific testing and hence are radically different from scientific claims and beyond factual refutation or verification.

While the two domains may be held to rely on each other in a practical relationship, they are two differently oriented conceptual sets with distinct methodologies. There are attempts to bring normative and empirical inquiry together under one big conceptual tent, but these are still usually understood in terms of the endeavor of trying to bring into a symbiotic relationship two distinct realms, facts, and values.

This split between the two approaches to business ethics is another manifestation of a problem that has existed between philosophy and science for several centuries. The fact-value gap as it developed and became entrenched in the way we think was grounded in what many think was a narrow empiricism rooted in the implicit acceptance of a scientific description of nature as exhaustive of what kinds of qualities can really exist in nature. It resulted in the view that empirical experience cannot include the experience of value, just as value cannot be a real irreducible quality unless it is nonnatural, to be experienced in a nonempirical way. What science finds is what and only what is truly real and truly knowable, and what we experience is reducible to the procedures and contents of math and science. Moore's attack on empiricism in ethics (because empiricism is unable to reduce normative claims to empirical claims) is based on the insight that value is not reducible to something other than itself. Along with this, however, he held deeply embedded assumptions, rampant in his time, regarding what can be experienced empirically and what kinds of qualities can exist in nature; if value is irreducible to the kinds of properties that can exist in nature and be experienced empirically, then value must be nonempirical.

A different approach may be taken that undercuts the fact-value distinction. This does not collapse the two fields of normative inquiry and empirical research. Rather, such an approach understands empirical and normative business ethics not as inquiries that focus on two different realms, facts and values, but as inquiries that focus on different dimensions of a concrete unified situation based on the two fields' differing contextual interests. In this way each area of business ethics can recognize that its particular perspective and approach not only cannot substitute for those of the other but also that in fact each approach gains its full significance only within the context of the other.

This way of viewing the two fields is found in a position known as holism. Holism understands the whole as having a significance that is on a level different from that of its parts. The meaning of the whole is greater than the aggregate meaning of its elementary parts, and things can have properties as a whole that are not explainable from the properties of their parts.

A dominant form of this position is called emergentism, the view that the properties of the more complex level are unique emergents that are lost when reduced back to parts whose interactions give rise to them. For example, for the reductionist, water is nothing but hydrogen and oxygen, while the emergentist holds that the unique qualities of wetness, thirst-quenching ability, buoyancy, and so forth, are emergent properties of the whole that are as real as, but on a level different from, those of the hydrogen and oxygen whose interaction gives rise to them, and these real emergent properties are lost when water is reduced to nothing more than the sum of its parts.

This position claims that nature is rich with contextually emergent qualities, including value as an emergent in the interactive context of natural organisms, just as wetness is an emergent property in the interactive context of hydrogen and oxygen. Value need not be, nor can it be, reduced to some experienced quality other than itself, for it is among the qualities that pervade our sensory experience. The occurrence of the immediate experience characterized by value is a qualitative dimension of a situation within nature, on an equal footing with the experiencing of other qualitative aspects of nature. Furthermore, any experienced fact within the world can have a value dimension, for the value dimension emerges as an aspect of the context within which the fact functions as value relevant. Indeed, the experience of value is itself a discriminable fact within our world.

According to this view, claims about the valuable, what ought to be, are about the enrichment of value, about creative ways of organizing the real but conflicting value qualities of experience to direct activity toward what works in enhancing value-relevant qualitative experiences in the long run for all those involved. This understanding of value-relevant qualities as contextually emergent natural properties, and the normative as about the enrichment and expansion of the value dimension of concrete human existence, undercuts the problematics of the fact-value issue as originally put forth.

In responding to the issue of the fact-value distinction, nonreductive naturalists in general agree that value concepts are special and sui generis but argue that value properties are natural properties. Emphasizing broad empiricism and holism, they claim that both facts and values are wedded dimensions of complex contexts that cannot be dissected into atomic bits. The entire fact-value problem as it has developed out of the past tradition of moral philosophy is wrongheaded from the start. The problem of how values can exist in a world composed of facts, or how one can get normative claims about what ought to be from descriptive statements of what is, is based on philosophical starting points that are alien to their way of thinking. For the nonreductive naturalist, the problem is not to figure out how to unite two ontological discretes, facts and values, but rather to figure out how to distinguish the two dimensions, for purposes of intellectual clarity and advancement of understanding, without viewing the resultant "products" in ways that distort both the qualitatively rich, unified concrete reality they are intended to clarify and the thought processes by which these products are obtained. Of course, there is a difference between normative and descriptive claims, but according to this view the distinction is not ontological but functional. Whether a statement is descriptive or normative depends on its situational function.

The rejection of the split between facts and values often leads to the view that normative judgments involve facts and causal relations relevant to the potential production of valuing experiences. Moreover, the rejection of this distinction is a strong impetus for the view that the empirical approach does not necessarily describe what actually occurs (objectively given facts) but rather describes what the researchers' conceptual nets are structured to catch and the values inherent in the very way the researchers structure their nets. Even the most scientific of disciplines are affected by the values of the people who direct the research and practices in that discipline and are thus value laden throughout. Some are led to oppose the fact-value distinction precisely because they accept the position that modes of factual inquiry presuppose values.

The separation of facts from values has led some to embrace either moral skepticism of some sort or various forms of noncognitivism or relativism. Noncognitivism holds that expressions such as "Lying is wrong" do not express factual claims or beliefs and therefore are neither true nor false, or that there are no objective facts to make them true or false. It may hold that such statements are either expressions of emotional approval or disapproval, prescriptions or commands, or nonfactual or nondeclarative speech acts that can work as if they were cognitive. Ethical relativism takes the position that that there are no universally valid moral principles. Morality is purely conventional, and moral claims are valid if they conform to the conventions of the particular culture (cultural relativism) or individual choice (individual relativism).

The issue of the fact-value relationship has a long history and, regardless of the stance one takes toward it, it continues as a driving force in our ways of thinking, shaping the developing course of the various disciplines, and structuring ongoing debates.

Fair Labor Association (FLA)

The Fair Labor Association (FLA) is a nonprofit organization that represents the combined efforts of the apparel industry, various nongovernmental organizations (NGOs), and colleges and universities to improve the conditions of workers around the world. In 1996, at the initiation of the U.S. Department of Labor, 300 apparel company representatives participated in the Fashion Industry Forum. This workshop was intended to raise awareness of labor and human rights abuses against persons employed in manufacturing clothing. As a result of the success of that forum, under the auspices of the White House, the Apparel Industry Partnership (AIP) was formed. The partnership consisted of representatives of labor unions and consumer advocacy, human rights, and religious groups. The purpose of the AIP was to improve conditions and eliminate abuse of adults and children in the garment industry, regardless of location. Participation by companies is voluntary.

Formation of the FLA

The principal mechanism to achieve an improvement in the working conditions is a code of conduct supported by independent monitoring. The code applies to both company-owned operations and, importantly, contractors who manufacture garments for the companies. Key elements of the code cover working conditions, minimum wages, limits on forced overtime, and banning child labor. Principles for monitoring compliance with the code of conduct were also developed. To recruit additional companies for membership, monitor compliance, and publicize the compliance with the code of conduct, the FLA was formed by the AIP. Publicizing compliance by member companies includes labels on clothing and statements or logos in advertising and in stores that advise consumers that the factories where the garments were produced met the

FLA standards. Another branch of effort by the FLA is to monitor the activities of licensees for college-branded merchandise. Based in Washington, D.C., FLA has a board of directors that includes six company representatives, six representatives from NGOs, three university representatives, and its chairperson.

FLA Membership

Apparel manufacturers belong to FLA to seek accreditation of their compliance programs. FLA does not certify companies but the compliance programs themselves. Companies seeking accreditation must commit to conduct internal audits of their factories, permit the FLA to review internal audit records, communicate the workplace standards to its management, submit their suppliers' factories list to the FLA, and allow the audit results to be publicized by the FLA. Unannounced audits are part of the compliance procedure, and FLA represents that approximately 5% of covered factories are audited each year.

College licensees join by applying in one of four categories, A through D, generally based on the size of the company and location. The compliance standards are similar to the apparel manufacturer requirements above.

NGOs and trade unions also belong to FLA and participate through the FLA's NGO Network. These groups are encouraged to participate in the standards-setting process and to assist in the monitoring efforts of FLA factories.

Numerous brand-name companies belong to the FLA, including Adidas-Salomon, Eddie Bauer, Liz Claiborne, Nordstrom, and Nike. These companies have committed to compliance with the FLA Code of Conduct and the related monitoring efforts. Colleges and universities join the FLA to insure that goods bearing their logos are produced under humane conditions. More than 180 schools require their licensees to participate in the FLA college licensee program.

Code of Conduct

The FLA Code of Conduct covers a number of aspects of employment. Forced labor in any form is banned. Child labor is also banned. The FLA considers child labor as involving persons younger than age 15, subject to adjustment for the age at which compulsory education ends in the country where the factory is located. Harassment or abuse of any kind is also prohibited. Employees are not to be subjected to discrimination in any facet of employment based on gender, race, religion, age, disability, sexual orientation, nationality, politics, or ethnicity. Healthy and safe working conditions are required. Employees must be allowed to associate and bargain collectively.

The Code of Conduct also requires employers to provide the higher of the minimum wage required by law in the location of the factory and the prevailing industry wage. Benefits mandated by law must also be provided. Employers shall not require employees to work more than 48 hours in a week, or more than 12 hours overtime, except in extraordinary business circumstances. Employees must be provided at least one day off in every seven days. Overtime compensation must meet the legal requirements of the jurisdiction where the factory is located or be at least the normal hourly wage, where it is not legally defined. Application of the Code of Conduct also applies to licensees, contractors, and suppliers of the member organizations.

Monitoring

Monitoring compliance with the Code of Conduct is a key aspect of FLA membership. In addition to compliance with all applicable laws of the location of its factories and the FLA Code of Conduct, companies must submit to monitoring. The monitoring for compliance takes two forms, internal and external. Internal monitoring requires member companies to establish an internal system of monitoring their production facilities. This includes communicating to employees their rights under the Code of Conduct, establishing relationships with labor unions and human rights organizations, training company monitors, providing employees with a grievance procedure, conducting internal inspections of its facilities, and committing to correct situations that are not in compliance.

External monitoring involves inspection of member company facilities by independent monitors who are accredited by FLA. The results of these unannounced audits are reported to FLA and the company. Any deficiencies must be corrected by the company to maintain its accredited status with FLA.

Reporting

Member companies submit annual reports to FLA that report on compliance activities and any corrective actions that have been taken as the result of the monitoring activities. These member reports are reviewed by FLA and combined with the results of external monitoring activities to generate an annual report on each member company. These reports are publicly available on the FLA Web site.

Perspectives on FLA

Some human rights groups and union representatives have challenged the good faith of the participants in the FLA, characterizing their participation as motivated more by public relations than concern for their workers. One issue raised by critics is the FLA's establishment of a minimum wage in compliance with the laws of the country of manufacture or the prevailing industry wage. Critics have argued for what has been called a living wage. As various companies choose to join the FLA, this issue has become more contentious, with other monitoring organizations being touted by various public interest groups. The Worker Rights Consortium (WRC) was established by college students to monitor factories producing goods sold with college emblems. This group has lobbied for a living wage and mandatory disclosure of the factories where the goods are produced. Some manufacturers claim that identification of the factories is proprietary information. Duke University has joined both the FLA and WRC in an effort to meet student demands.

Regardless of the organization doing the monitoring, accurate information from the factories themselves is a key component. Recently, serious issues have been raised about the veracity of the reporting of work hours and overtime pay for factories in China. There have been reports that managers of Chinese factories have been coached on how to falsify work records to disguise unpaid overtime. Monitoring efforts may not result in improved working conditions in such cases.

Advocates of a free market approach have suggested that monitoring efforts may reduce employment opportunities in some countries to the detriment of the workers who most need the wages. In some cases, factories have lost large contracts when monitoring agencies reported unacceptable conditions. The resulting layoffs led to even more difficult economic conditions for the employees, who have little alternative employment. An issue of national sovereignty has been raised by some observers. When a monitoring agency from a developed nation enters a country and criticizes the way its citizens are being treated, there is an implicit criticism of the government of that country. Historians note that many countries used child labor as they developed, including the United States.

The voluntary nature of membership in the various monitoring organizations, including the FLA, introduces the issue of cost and production margins. In most cases, manufacturers that have joined FLA produce widely known major brands that sell for relatively high market prices and produce significant wholesale and retail margins. This is also true of college-branded merchandise. Notably missing from membership in FLA are major retailers such as Wal-Mart and Target, which produce large amounts of private-branded merchandise. This means that large amounts of goods produced throughout the world are made in factories where there is no independent monitoring that takes place, although the companies may undertake their own efforts.

Conclusion

As long as there are significant disparities in world economies, there will be controversy regarding appropriate working conditions, wages, overtime, and child labor. FLA functions as one of a handful of agencies that attempt to provide an independent view of working conditions in manufacturing facilities, primarily in less developed countries.

FAIRNESS

Fairness is a term that is commonly employed. In respect of its everyday usage, it is commonly interpreted as meaning justice, the absence of bias, and being equitable or impartial in accordance with certain rules. As such, whenever claims of unfairness are considered, seemingly familiar and accepted principles are employed in determining the merits of the claim.

On reflection, whenever the notion of fairness is employed, many questions remain unanswered, not least the question of whether the notion of fairness can be an objective assessment. Its nature is also problematic. Whether justice, a lack of bias, and an equitable or impartial process or outcome are determinants that can be substituted for fairness or whether fairness is something more or less than any one of them is uncertain. The term justice is especially problematic: Some authors interchange the terms fairness and justice haphazardly, whereas others postulate fairness as being fundamental to justice, thereby suggesting that it is some form of subset.

The underlying basis for claiming fairness is also uncertain. The term carries moral overtones; it conveys something that is generally regarded as moral and ethical, and yet the foundations for whatever fairness is and what it conveys are unclear.

A decision or action may also be considered to be fair if it is in accordance with the relevant rules or standards or in accordance with a person's rights. But when viewed from another moral perspective, a decision or action may be fair only if it maximizes the well-being of individuals in society.

The complexity of fairness is revealed in the literature pertaining to moral philosophy; it is here that we appreciate fairness as a notion that lacks clarity or consistency in terms not only of its being identified as a moral concept but also its relevancy.

Fairness as a Moral Concept

The notion of fairness as a moral concept is often justified by reference to social norms that guide ordinary individuals in their everyday lives; it is also argued that notions of fairness are self-evident, in accord with instinct and intuition, and that there is no need for an explicit justification of what is fair. These arguments are appealing because notions of fairness such as keeping promises, holding wrongdoers accountable for their actions, and promoting well-being correspond to internalized, meaning-inculcated, and inborn social norms. But these arguments do not provide a satisfactory answer, and, given the extent to which fairness is employed, there is surely a need to further elaborate its moral basis.

That the notion of fairness is employed extensively can be evidenced by our understanding of a "fair game." Whether in the context of recreational games, house rules, professional codes, or laws, fairness is invariably intended in creating the so-called rules of the game. Thus, laws governing discrimination are intended to ensure fairness in the way people are treated, irrespective of, for example, their sex, race, age, or family status. That we create such rules suggests that we perceive a need to reinforce fairness as an internalized social norm or that we need to establish what is fair in a particular circumstance because otherwise there may be conflicting claims as to what is a fair game.

Arguably, we increasingly perceive a need to reinforce fairness as an internalized social norm not only to ensure fair game but also to overcome greed, and other unsociable behavior, and to bring about ordered societies. The notion of fairness is thus evident in theories relating to a social contract.

Fairness as a moral concept is, at best, vague. But if fairness is grounded in intentions, it may be that we can identify what we understand to be fair. A fair intent underlying a particular process or outcome will ensure that rules, codes, and laws endure. But intent is problematic in the event that a fair intention is thwarted by unfair processes or leads to an unjust outcome.

The Relevancy of Fairness

Here there are essentially two major concerns, the fairness of procedures and the fairness of outcomes.

The fairness of procedures is concerned with the absence of bias. If a decision or action is unbiased it means that it is made or done impartially, free from self–interest, and without preference or favoritism. Thus, in the event of several companies submitting tenders for a contract, if every company has an equal chance of success, the tender process can be described as being fair. But if the person determining the successful tender has an interest in one of the companies concerned, a conflict of interest arises and the procedures will appear to be unfair.

The fairness of procedures is also concerned with rights. The rights that are commonly claimed in relation to the fairness of procedures include the following: the right to be heard, the right to remain silent for fear of self-incrimination, and the right of presumed innocence until proven guilty. Such rights are regarded in Western societies as pertaining to Natural Justice. Others talk of rights more generally as human rights: the rights of free speech, freedom of the press, and privacy. These rights may also have an effect on procedures.

The process of negotiating business transactions raises complex issues concerning the fairness of procedures; while a fair game and a level playing field are accepted as the basis for certain laws governing the formation of contracts, such as misrepresentation and unconscionable bargains, the processes employed to agree on the terms of a contract, and the contract terms, are essentially for the parties themselves to determine. Negotiation is arguably morally justifiable if all persons importantly affected by a transaction are in agreement.

Aristotle took the view that trading, generally, and making a gain out of money, by usury in particular, are unnatural ways of gaining wealth. His notion of virtue requires habit of action in an intermediate state between the opposed vices of excess and deficiency. Thus, justice is the mean between doing injustice and suffering injustice. If the process of negotiation ensures that neither party gains more than the other from the transaction, it would be just. Thus, a price must be negotiated that equals the true value of the goods.

In practice, and given the nature of business today, this notion of fairness is arguably untenable. But Immanuel Kant would also condemn negotiations that do not abide by the golden rule of treating others the way you would like to be treated or, more precisely, acting in a way that would be accepted as a universal law. Fairness of procedures is also evidenced by the rules governing all forms of inquiry; in the event of an assessment for entitlement to social benefits or an investigation into an accident, there needs to be a fair process as a means of ensuring a fair outcome. The fairness of outcomes is a subject that has received a good deal of attention and that continues to provoke debate employing notions as diverse as equality, retribution, compensation, and need.

Equality as a principle of fairness has long been regarded as a social ideal. Egalitarians hold that there are no relevant differences among people that can justify unequal treatment, that all benefits and burdens should be distributed equally, that all human beings are equal, and that each person has an equal claim to society's goods. This argument is however heavily criticized on the grounds that (inter alia) human beings differ in their abilities in terms of their intelligence, virtues, needs, desires, and all other physical and mental attributes. The needs, abilities, and efforts of human beings will thereby be ignored.

The notions of retribution and compensation tend to be relevant to the outcome of criminal as well as negligent behavior. Retributive justice refers to the just imposition of fitting punishment and penalties on those who do wrong. Thus, it is fair that a person who has committed a serious crime is imprisoned for a certain period of time, whereas a person who has committed a minor offence is fined or required to perform some form of community service. Compensatory justice refers to the opportunity for obtaining compensation in the event of being wronged by others. Thus, it is fair that the victim of an accident has the opportunity to sue a negligent injurer (and that the negligent injurer pays). If such outcomes are just, it implies that conscience, ethics, and reason are employed as a means of ensuring fairness and that justice is being served.

Determining the fairness of outcomes is undoubtedly the most controversial and problematic aspect of fairness. In the event of competing claims of what would be a fair outcome, utilitarian theories offer a balance of social benefit over social cost. Thus, we need to identify the various courses of action that are available, and we need to ask who is affected by each action and what benefits or harms will be derived from each. We then choose the action that will provide the greatest benefits and the least harms. Utilitarianism thereby poses a number of difficulties relating to measurement and balancing one set of factors against anther. But, of greater difficulty is the fact that this outcome ignores not only the means but also other consequences, both of which may be grossly unfair.

While utilitarianism has been refined to accommodate some of its critics, Jeremy Bentham's notion of the greatest good for the greatest number (maximizing social utility) in his search for an objective basis for determining social policy and social legislation, which is regarded as traditional utilitarianism, is still respected. His concern was for making value judgments that would provide a common and publicly acceptable norm. But an evaluation that depends only on consequential benefit and ignores justice and fairness is arguably absurd.

The connection between justice and utility is a subject explored by John Stuart Mill. He discusses impartiality and inequality for the purpose of discerning the common attributes of justice by reviewing various actions that he argues are commonly regarded as unjust.

Mill concludes from his review that justice, as distinct from generosity or beneficence, constitutes a moral obligation or duty with a correlative moral right relying on the notions of punishing those who have done harm and knowing or believing that there is some definite person(s) to whom harm has been done. He concludes that nearly all cases of justice are also cases of expediency but that sentiments of justice have more definite commands and sterner sanctions. He illustrates this by reference to maxims of justice that are commonly appealed to: that it is unjust to condemn any person unheard and that the punishment ought to be proportionate to the offence. But Mill also acknowledged that in particular cases some other social duty may be so important that it overrules any one of the general maxims of justice. Thus, in some circumstances, stealing food may be justified to save a person's life.

In the course of this discussion Mill touches on the notion of distributive justice and benefits for all, as opposed to the majority. In his view, having an equal claim to happiness and to all the means of happiness, except insofar as the inevitable conditions of human life set limits, requires bending to every person's ideas of social expediency and ultimately leads to injustice and tyranny. He then reverts to utility and to utilitarianism.

John Rawls was deeply concerned with this apparent flaw, offering an egalitarian theory of justice that seeks to protect the least advantaged from the tyranny of the majority. Rawls advocates that ethical decisions or acts are those that lead to social justice in the form of an equitable distribution of goods and services. His approach is Kantian in that he attempts to arrive at a set of principles that are acceptable to all rational persons. These principles must be universal, must respect all persons, and must be rationally acceptable to all. To find such principles he suggests imagining that all people are behind a "veil of ignorance," meaning that behind the veil they would not know whether they were rich or poor, upper or lower class, talented or untalented, and so on. They would make rational choices and so determine principles that are just or fair and thus achieve a more objective and equitable method of distributing goods and services.

Rawls proposes two basic principles that, he argues, we should select if we were to use a fair method of choosing principles to resolve our social conflicts: first, the principle of equal liberty and, second, the principle of fair equality of opportunity. Together they ensure the greatest benefit to the least advantaged. But he does also permit economic inequalities if they do in fact benefit the least advantaged.

Karl Marx's criticisms of capitalism as being unfairly advantageous for the wealthy at the expense of the workers are extensive. He argues that capitalism necessarily produces inequality, promotes injustice, and undermines communal relationships. But ensuring fairness by reference to ability and need also produces difficulties.

Libertarian theories also appeal for fairness. They reject the conclusion that egalitarian patterns of distribution represent a normative ideal arguing that it would be a basic violation of justice to regard people as deserving of equal economic returns—that people have a fundamental right to own and dispense with the products of their labor as they choose, even if this leads to large inequalities of wealth in society.

Robert Nozick, a personal libertarian, argues that morality springs from the maximization of personal freedom and that individuals should be free from the interference of others. Justice and fairness, right and wrong should not be measured by equality of results (e.g., wealth) for all but from ensuring equal opportunity for all to engage in informed choices about their own welfare. Such negative natural rights justify the acquisition of wealth—wealth acquired without harming anyone else is fairly gained. Despite these enduring theoretical differences, common ground as to the relevancy of fairness can be found, especially in the relatively limited spectrum of business ethics.

Fairness Employed in Business Practices

The notion of fairness can be seen in a vast array of business practices but predominately in procedures and relationships between companies and their employees.

The procedures employed for selection, payment, and promotion of employees need to assure fairness. The short-listing of candidates, the interviewing, and the ultimate selection all need to be conducted fairly as a means of ensuring that the outcome is fair. The information in personnel files is critical in making decisions about wage increases and promotion and likewise needs to be fairly collated and accurate; otherwise the decision making will be unfair. The pay scales also need to be fair.

Determining what is fair, and setting up systems to ensure fairness, may meet with resistance simply because of a reluctance to change but especially if the new system requires greater disclosure of what is perceived to be a private matter. The notions of fairness explored in the foregoing may be employed to justify the proposed changes. The disclosure of the pay scales for executives, for example, can be justified by reference to both Marx and Nozick. They might agree that such information should be publicly available, but Marx would see it as a means of paying equity for the workers and Nozick would see it as accountability and transparency for investors.

Similar issues arise in relation to the directors of companies that look to the general public to raise funds. Fairness is employed to argue for greater transparency in matters such as nominating and appointing a director to the company's board of directors and disclosure of directors' remuneration packages.

Fairness is also employed extensively in matters relating to finance. In presenting and disclosing financial information, it is used as an evaluative principle, for example, auditors being required to report on whether a company's financial statements provide a "true and fair view" of its state of affairs.

In regulating markets, fairness serves as a means to the end of efficiency. While the main aim of financial markets regulation is to ensure efficiency, it is acknowledged that markets can be efficient only when people have confidence in their fairness and corresponding stability. Regulations concerning insider dealing and other forms of manipulation in the sale of securities are designed for this purpose. Trading off efficiency in recognition of the need to ensure fairness, the so-called equity/efficiency trade-off is commonly employed to justify further regulation of securities markets.

In relation to finance, that fairness may also be employed as an end in itself is clearly demonstrated by the notion of pro rata: that a company's dividends are paid in proportion to the amount paid up on the relevant share and that in insolvency, distributions to unsecured creditors are paid to all such creditors in the same proportion.

Societies are now demanding ethical business practices that go beyond the demands of their legal systems, and companies have responded by developing their own codes of practice. The development of in-house policies and rules dealing with ethical practices commonly relies on the notion of fairness. It may be that many of the broader theoretical disputes discussed in the foregoing are at least partially resolved when the notion of fairness is employed in a particular setting.

Family-Friendly Corporation

A *family-friendly corporation* is a workplace that recognizes the family responsibilities of its employees and implements policies that allow them to sustain a work and family life balance. It can also be called a family-friendly company or family-friendly employer.

There are several reasons why organizations decide to become family friendly. Some of them adopt family-friendly programs in an effort to create a committed workforce. Other reasons are improving retention and productivity and providing an environment that allows employees to simultaneously accomplish work and family responsibilities.

Family-friendly corporations were initiated partly by the demographic changes in Western countries: Women entered the labor market in a massive way during the Industrial Revolution, the divorce rate increased, the number of single-parent families rose, and the birth rate decreased. The trend continues as Europe, for example, is currently experiencing a "demographic winter" (diminished birth rate in industrialized countries).

However, not all organizations consider these changes when they manage and organize their staff. The traditional work structure is still basically designed for male employees with timetables that are not compatible with other needs such as caring for dependents (children, the elderly, or persons with special needs) and being at home.

As a consequence of these sociodemographic changes, many people experience a big conflict among different life scenarios, especially between work and family. This is a reality not only for working mothers who are taking care of the family but also for working fathers, who are now more involved in family tasks.

Different Views About Family-Friendly Corporations

Reasons to become a family-friendly corporation may vary from one organization to another. Some companies implement family-friendly programs as a response for meeting the minimum requirements of the legislation and also as a response to the pressure and demands coming from their workforce. These organizations care about their image and use their family-friendly initiatives as a marketing strategy to attract more candidates and customers. Companies named "best employers" receive many more job applications per position compared with other firms.

Other organizations are on an alert status and do not want to risk losing valuable and efficient employees. They implement family-friendly programs to attract and retain people by creating favorable working conditions. Research suggests that giving employees flexibility, information, and financial assistance can improve the whole organization's performance and raise employees' satisfaction.

It is important to clarify to employees that not all family-friendly initiatives can apply to all of them at all times. One of the reasons is that not all employees have to take care of dependent persons. As a consequence, some employees may feel left out when compared with others and may have a negative attitude toward the organization. Therefore, it is advisable when implementing family-friendly programs to determine objective criteria and be consistent in the application process. Some organizations prefer to adopt a "work-life" program instead of a "work-family" one to include all employees, with or without family obligations.

All organizations should plan and evaluate the cultural change for implementation of family-friendly programs. There is no unique solution to achieving a family-friendly environment in a corporation. Nevertheless, changes are possible, and the specific design of a program would depend on the company's business model, size, geographic location, industry type, and the workforce needs. Experts recommend employers to calculate the inputs and projected outcomes of work-family arrangements in the short and long terms. In terms of inputs, the organization may have to spend money to set up home offices, part-time contracts, train supervisors in management by objectives, etc. These inputs should be weighed against the reduced cost of absenteeism and turnovers, workforce improvement, etc.

Some Family-Friendly Policies/Arrangements

Corporations may select from the different types of family-friendly policies that would most benefit the organization and the employees. There is not one widely accepted classification of family-friendly policies. Family-friendly arrangements can be grouped into five categories: (1) flexible work arrangements, (2) care provisions, (3) leave arrangements, (4) social benefits/salary perks, and (5) supportive arrangements.

The first group, flexible work arrangements, gives employees flexibility to adapt their work according to their needs. There is a general distinction between arrangements that create flexibility in time and flexibility in space.

The flexible working hours policy is the most popular measure and also the one that involves the least cost. Employees have a flexible work schedule where they can start and end work within a certain margin and are required to work a standard number of hours per day depending on each country's legislation. Another type of flexible arrangement is the part-time work where employees work fewer hours than the standard number of working hours. The job sharing policy allows two workers to share the same job and responsibilities of one full-time job.

On the other hand, flexibility in space refers to the workplace—it is also known as telework. It provides employees the choice of working at home or at the office. Employees have greater control over their timetable and workspace. To consider an employee with a flexible work arrangement in space, he or she must work at least some part of the week at home and not just occasionally or during business trips. It is also important to mention that some people adapt better than others to this type of arrangement. For certain individuals, a lack of physical barriers between work and family creates a higher level of stress and conflict.

The second policy group is the care provisions. Companies provide child and/or elder care referral to employees. Some organizations also offer on- or near-site child care centers. They can be owned by the firm or a third party. A less expensive option is to reimburse employees for child care expenses or negotiate discounts at care centers close to the organization. Other arrangements in this group include after-school care, summer programs or activities, and sick/emergency child care.

A third group of family-friendly policies is leave arrangements. In most countries, leave arrangements are regulated by legislation. They include maternity, paternity, and parental leaves that allow employees to take time off from work to care for an infant or a sick child or elderly member of the family.

The next group of arrangements is the social benefits and salary perks. They include health insurance for the employees and family members, life insurance, and retirement plans. Other forms are bonuses for childbirth, as well as gifts from the company and family trips as incentives for achieving objectives.

The last group, supportive arrangements, consists of the organization's support toward family-friendly policies and can include a work-family coordination unit, a work-family handbook, and an intranet Web page with the firm's family-friendly initiatives. Supportive arrangements also include training seminars on time and stress management as well as family seminars with a range of topics related to parenting, child development, and elderly care.

Some organizations may also include professional support: advice to expatriates seeking relocation services, legal and financial advice, psychological and career support. In all cases, the family situation is taken into account.

Several researchers have shown that formal work-family policies alone are not enough; to have a family-friendly workplace, employers need to create a supportive culture. This support is often needed in a more informal than formal way. Managers here are key players. Their attitude, example, and support are essential because they decide and implement policies on a daily basis. If managers, for example, do not follow the new culture and do not use any support policies, employees will not feel comfortable asking for a flexible timetable or leaving work on time.

One of the barriers to family-friendly programs is based on the assumption that there is a direct connection between presence and contribution at work. Consequently, employees might feel that if they use some family-friendly arrangements their careers can be put in danger as a result.

The success of a family-friendly program depends on a joint effort: Together with the corporate initiatives and the managers' support, the explicit will and commitment of the employees play an important role, but the achievement of a work and family life balance depends on each person.

Federal Communications Commission (FCC)

The Federal Communications Commission (FCC) is an agency of the U.S. government. Independent of the Executive Branch, it reports directly to the U.S. Congress. It was established by Congress in the Communications Act of 1934. Its purpose is to ensure that the nation's various communications systems work together and services and prices are in the best interest of the consumer, and it has the specific authority to regulate the broadcast of obscene, indecent, or profane language. Recent controversies include the "wardrobe malfunction," which enabled viewers of Super Bowl XXXVII to view pop singer Janet Jackson's breast for 19/32 of a second, about which the FCC received more than half a million complaints, causing it to move to a zero-tolerance response; and the $2.5 million in fines levied against radio shock-jock Howard Stern, prompting his move to satellite radio, which in 2005 remained unregulated.

The FCC is directed by five commissioners who are appointed by the president, with the advice and consent of the Senate. The President selects one of the commissioners to serve as chairperson. Commissioners serve five-year terms, except if they were appointed to fill an unexpired term. Only three commissioners can be of the same political party at any given time, and no commissioner can have a financial interest in any commission-related business.

The FCC's major charge is to regulate interstate and international communications by radio, television, wire, satellite, and cable. Present concerns include the deployment of broadband services, spectrum allocation through a fair and open competitive bidding process, media ownership, and strengthening the national communications infrastructure. The FCC has the authority to enforce provisions in the Communications Act. The FCC oversees compliance with international agreements about satellites and international telecommunications facilities and services.

In the technical arena, FCC policies influence the future directions of technology, such as high-definition television. All televisions sold in the United States since January 1, 2000, are equipped with a V-chip. The V-chip reads information encoded in programs, and it blocks programs from the set based on the rating selected by the parent. Since 1997, all television programming is labeled with a content rating. The original ratings system was voluntarily proposed by the industry. News and sports programming are exempt from these guidelines.

In the social arena, FCC regulations prohibit licensees from broadcasting obscene material at all times and from broadcasting indecent material during the safe harbor period between 6:00 a.m. and 10:00 p.m. Cable and satellite broadcasters are not subject to the indecency regulations because they are subscription services and because they allow subscribers to filter out channels showing indecent content.

An interesting ethical dilemma involves striking a balance between the government's concern for public interest and freedom of speech. Critics say the FCC's indecency standard for censoring expression on radio and broadcast television is vague and subjective. The recent imposition of fines threatens the free flow of ideas and hinders free speech. Other issues include the digital divide and the question of the coverage bias that might arise due to media consolidation and conglomeration.

Federal Deposit Insurance Corporation (FDIC)

The Federal Deposit Insurance Corporation (FDIC) is an independent agency of the federal government. It was created by the Banking Act of 1933 to restore the public's confidence in banks after the numerous bank failures of the 1920s and early 1930s. The FDIC's mission is to maintain stability and the public's confidence in the nation's financial system. The FDIC has three main responsibilities: (1) to insure deposits, (2) to examine and supervise financial institutions, and (3) to manage receiverships for failed banks.

Virtually all the deposits in every bank and thrift in the United States are insured by the FDIC. If an insured banking institution fails, it is the FDIC's responsibility to ensure that customers have access to their insured deposits. Savings, checking, certificate of deposit, money market, IRA, and Keogh accounts are insured up to $100,000 per depositor. Since January 1, 1934, when the FDIC started insuring banks, no depositors have lost insured funds due to a bank failure.

The FDIC is funded through premiums that banks and thrift institutions pay for deposit insurance coverage and from earnings on investments in U.S. Treasury securities. The FDIC only insures the type of accounts listed in the foregoing and does not insure other types of financial investments such as securities, mutual funds, or other investments that banks and thrift institutions may offer.

There are approximately 9,200 banks in the United States today. Banks can be either state or nationally chartered. The FDIC has primary responsibility for examining and supervising all the FDIC-insured, state-chartered banks. It also serves as the backup supervisor of the banks that are members of the Federal Reserve System. As primary regulator, the FDIC conducts periodic examinations of the state-chartered banks to assess their overall financial condition, management policies and practices, and compliance with laws. The FDIC has authority to approve or deny applications by prospective banks for participation in federal deposit insurance. The receivership management program of the FDIC works proactively to identify troubled insured depository institutions before they fail and works with the institutions after failure to ensure that depositors and creditors are paid.

The FDIC is headquartered in Washington, D.C., and conducts business through six regional offices (Atlanta, Chicago, Dallas, Kansas City, New York, and San Francisco) and field offices around the country. It employs approximately 5,200 people. The FDIC is managed by a five-person board of directors who are appointed by the President and confirmed by the Senate.

While the FDIC has grown and modified operations in response to changing environmental and economic conditions (in particular the consolidation in the banking industry, in which the concentration of industry assets, deposits, and revenues with the top 10 organizations is more than 40% from 18% in the 1980s), the mission of the FDIC has remained unchanged.

FEDERAL ENERGY REGULATION

The U.S. federal government plays a pervasive role in the supply, delivery, and use of energy resources. Defining regulation as a set of governmental programs or activities intended to yield results that otherwise would not have occurred, as of 2002, other than military and national security operations, federal government energy regulation extended through 150 energy-related programs and 11 energy-related tax preferences. These programs and activities address a variety of energy concerns, including supply, environment and health effects, low-income assistance, basic research, delivery infrastructure, conservation, system reliability and physical security, market competition, and education. There are at least 18 major federal departments and agencies that have substantial energy-related responsibilities, including the Department of Energy (DOE), the Interior Department, the Department of Health and Human Services, the Nuclear Regulatory Commission, and the Federal Energy Regulatory Commission. In 2003, the federal government spent, directly or by tax preferences, $14.2 billion on energy programs and collected $44.7 billion in energy-related fees, taxes, royalties, and other program revenue.

Federal government energy regulation mechanisms include a variety of constraints, inducements, and development and support efforts. Examples of constraints are limits placed on energy prices, environmental pollution, and energy use efficiency. Examples of inducements include tax incentives and favorable access to federal lands for energy production. Development efforts range from supporting basic energy research to funding demonstration projects. Support activities include low-income energy use assistance and energy production subsidies. Energy policy has been used to pursue a variety of objectives including geopolitical standing, income distribution, and the promotion of ideologies.

Federal control of energy prices is most evident in the electricity and natural gas industries. The Federal Energy Regulatory Commission (FERC), the successor in name of the Federal Power Commission (FPC), has regulatory authority over electric and natural gas wholesale and transmission prices. The FPC was established in 1920 to license hydroelectric generation facilities on navigable streams and waterways. The FPC's authority was extended by the Federal Power Act (1935) and the Natural Gas Act (1938) to include the regulation of various electricity and natural gas prices. The FERC has regulatory authority over the construction of natural gas and petroleum pipelines though, at least historically, not over the construction of electric power transmission lines. In recent years the FERC has shifted its regulatory focus from cost-based regulation to the promotion of competition.

The FPC originally interpreted its price regulation authority under the Natural Gas Act to be limited to the control of interstate pipeline company wholesale prices. In 1954, the United States Supreme Court ruled in *Phillips v. Wisconsin,* 347 U.S. 672 (1954), that the FPC was required to regulate the prices that pipelines pay producers for the purchase of natural gas, effectively regulating natural gas wellhead prices. The FERC's regulation of production prices was phased out by the Natural Gas Policy Act (1978) and the Natural Gas Wellhead Decontrol Act (1989).

Prior to the 1990s, natural gas pipeline companies were merchant intermediaries. Pipeline companies purchased natural gas from producers and sold it to local distribution companies and various industrial customers. Local distribution companies and end-use consumers were effectively precluded from purchasing natural gas supplies directly from producers because they could not obtain transmission service from pipeline companies. Starting with FERC Order 436 (1985) and extending through FERC Order 636 (1992), FERC opened consumer access to the producer supply market by requiring natural gas pipelines to provide transmission service for natural gas purchased by local distribution companies and end use consumers from producers or brokers. Subsequently, interstate pipeline companies have transformed from wholesale supply merchants into the equivalent of transportation common carriers. In the past few years, most of the FERC's natural gas utility regulatory efforts have focused on pipeline transportation rates and service.

Historically, the FERC's electric power regulation focused on setting wholesale and transmission rates on a case-by-case, cost-of-service basis. Following the Public Utility Regulatory Policy Act (PURPA, 1978), however, non–public utility wholesale power supplies have accounted for a growing and substantial portion of bulk power sales. Prior to PURPA, virtually all electricity bulk power sales were made by regulated electric utilities subject to FERC price control. Following PURPA, a substantial portion of the wholesale market supply shifted to electricity suppliers whose prices are not regulated by the FERC. The nonregulated suppliers include independent producers and corporate affiliates of regulated electric utility companies. In the past few years, electric companies have increasingly transferred the ownership of their generation facilities from regulated utility companies to nonregulated corporate affiliates.

Though the FPC generally opposed competition, in the 1990s FERC moved toward supporting the development and expansion of competitive wholesale power markets. With Order 888 (1997), FERC opened access to the electric power transmission grid; open access is essential for the development of a competitive electric bulk power supply market. Over the past few years, FERC has sought to further wholesale competition by promoting regional transmission organizations and specifying market conditions under which negotiated prices could be held as just and reasonable. The purpose of the regional transmission organizations is to operate regional transmission grids and to establish and oversee market mechanisms for wholesale power sales. Though the FERC continues to have price control authority, it is moving in the direction of granting blanket approval for wholesale market prices when it appears that individual power producers lack appreciable market power.

Following the Arab oil embargo and subsequent substantial world market price increases in the early 1970s, the U.S. Congress imposed price controls on domestic oil. Concerned with the massive income redistribution that would occur if domestic oil supply prices rose to world market levels, Congress passed the Emergency Petroleum Allocation Act (1973), which established a two-price system for domestic oil. The price for pre-1972 production sources was limited to 1972 price levels, but the price for post-1972 supply sources was not regulated. Congress repealed oil price controls in 1981. Following the repeal of price controls, however, many oil companies were found to have perpetrated massive price control violations by selling pre-1972 oil resources at world market prices. The companies were fined several hundreds of millions of dollars, much of which went to support state-level energy programs.

Federal energy regulation has played a substantial role in the development of the nuclear power industry. The Atomic Energy Commission (AEC) was established in 1946 to both foster and control the development of peacetime uses of the atom. In 1975 Congress split the AEC into two separate organizations. The AEC's development activities were transferred to the newly created Energy Research Development Administration (ERDA), which was subsequently subsumed into the DOE. The AEC's control activities were transferred to the newly created Nuclear Regulatory Commission (NRC). The NRC is responsible for assuring the protection of public health, safety, and the quality of the environment from the adverse consequences of radiation associated with the commercial use and disposal of nuclear materials. The NRC controls the construction, operation, and decommissioning of commercial reactors, including those used for electric power production. Separate licenses are required for the construction and operation of nuclear power plants. The NRC oversees power plant operation operations on an ongoing basis. Should operation or facility integrity problems arise, the NRC can close a plant until all deficiencies have been rectified.

Federal energy regulation promoting nuclear power has taken many forms. Nuclear power research is substantially supported by the federal government, in particular by the DOE. The federal government has taken the lead in the development of uranium mining, milling, and fuel-rod fabrication. The federal government also bears substantial responsibility for nuclear waste disposal, including the development of a facility that can hold and protect high-level radioactive waste for thousands of years.

The development of the nuclear power industry was hampered by the limited availability of liability insurance. Nuclear power producers found it very difficult to obtain private insurance coverage. To address the problem, Congress passed the Price-Anderson Act (1975) to indemnify power producers against substantial liability for nuclear accidents. The Price-Anderson Act as amended and extended currently limits the industry's private insurance requirements to $200 million per nuclear generator. All nuclear power plant accident damages beyond $200 million are to be paid from a public fund that is limited to $9.5 billion for the entire industry.

The Department of Energy has substantial energy program and oversight responsibilities. The DOE was created in 1977 as a cabinet-level department that brought together oversight responsibilities for energy programs, nuclear weapons and waste cleanup, and various science and technology programs. The DOE's energy program areas include those associated with energy efficiency, fossil fuels, nuclear energy, renewable energy, nonmilitary radioactive waste management, and the collection and dissemination energy information. The DOE establishes minimum energy efficiency standards for numerous residential and commercial appliances and types of equipment such as air conditioners, clothes dryers, clothes washers, cooking equipment, dehumidifiers, dishwashers, furnaces and boilers, pool heaters, refrigerators, freezers, water heaters, and motors. The DOE requires energy efficiency and likely operating cost labeling for many appliances to facilitate appliance purchase decisions. The DOE has provided energy subsidy, and research and development support for various energy supply technologies. However, a variety of efforts have been far from successful; for example, the DOE provided several hundreds of millions of dollars of subsidies for the development of oil production from shale with little result.

The federal government has regulated motor vehicle fuel efficiency since the mid-1970s. In response to the 1973 Arab oil embargo, Congress mandated minimum fuel efficiency standards for automobiles and light trucks. The Corporate Average Fuel Economy (CAFE) standards establish minimum miles per gallon requirements for automobiles and trucks. Compliance is assessed on the basis of the weighted average fuel economy of a manufacturer's fleet of passenger cars or light trucks sales. The standards are established, amended, and administered by the National Highway Traffic Safety Administration of the Department of Transportation. The Environmental Protection Agency (EPA) tests and verifies vehicle fuel efficiency levels.

Early in the development of the domestic petroleum industry, production practices led to substantial wastes of natural gas and oil supplies. To conserve resources and avoid loss of reservoir production capability, the government limited natural gas flaring, unitized fields, required coordinated production, established reservoir-specific maximum efficient rates of production (MERs) and maximum allowable of production rates (MPRs). MERs are established so as to maintain reservoir integrity; MPRs are generally set at or below MERs. Originally administered by producer states, MPRs were used to maintain oil prices by limiting domestic oil production. Currently the responsibility for overseeing constraints on flaring, MERs, and MPRs is vested in the Department of the Interior.

A substantial portion of the oil and natural gas domestic production comes from onshore and offshore government lands. The Department of the Interior establishes royalty rates and leases federal lands for oil and natural gas production. In recent years the federal government expedited the rate of leasing and reduced royalty payments to promote increased domestic oil and natural gas production. A continuing debate centers on whether the United States Arctic National Wildlife Refuge lands should be opened for oil and natural gas exploration and production.

The EPA has a major impact on energy production and use. The National Environmental Policy Act (NEPA, 1969) was passed to promote harmony between humans and the environment, reduce harm to the biosphere, and enrich understandings of ecological systems. Much of the NEPA responsibility was passed to the subsequently established EPA. The EPA was established as an independent agency pursuant to a governmental reorganization plan submitted by President Richard Nixon to Congress in 1970. A variety of responsibilities were transferred to the EPA from other departments and agencies such as the Department of the Interior; the Department of Agriculture; the Department of Health, Education, and Welfare; the Council on Environmental Quality; the Atomic Energy Commission; and the Federal Radiation Council. Major regulatory responsibilities for the EPA are set forth in the Clean Air Act and its amendments (1970, 1977, 1990); the Federal Water Pollution Control Act Amendments (1972); and the Clean Water Act (1977) together with its various amendments. The EPA regulates vehicle emissions and gasoline additives; these regulations substantially affect vehicle production and oil refinery operations. EPA regulation of sulfur and nitrogen oxides, particulate matter, carbon monoxide, mercury, and other emissions has significantly affected generation technologies and the choice energy sources for electric power production.

The EPA traditionally used "command and control" methods to regulate pollution levels, specifying site-specific emission levels and requiring the use of the best available control technologies. More recently, EPA has adopted cap-and-trade methods to control overall pollution levels and improve economic efficiency in pollution reduction. With cap and trade, producers can trade "pollution permits" limited in amount to assure attainment of overall pollution constraints.

A variety of provisions in the federal tax code affect energy production and use. From the early 1900s, the federal tax code permitted the deduction of intangible drilling and dry hole costs and percentage depletion allowances for the stated purpose of increasing domestic oil and natural gas reserves and production. In the 1970s, oil and natural gas industry tax preferences were substantially reduced, new excise taxes were imposed on oil to capture windfall profits, and numerous tax preferences were established to encourage energy conservation and alternative fuels development and commercialization. During President Ronald Reagan's administration, oil windfall profit taxes were repealed and most energy tax preferences were phased out. During the presidential administrations of George H.W. Bush and William Jefferson Clinton, many tax preferences were again established to promote energy conservation and efficiency and the production of alternative fuels. Production incentives for fossil fuels were again adopted during the presidential administration of George W. Bush.

Though federal energy regulations extend back for more than a century, the federal government did not develop comprehensive energy policies until after the 1973 Arab oil embargo, when President Richard Nixon established Project Independence to end reliance on foreign oil by the 1980s. Every president since then has developed an energy plan that often led to comprehensive energy legislation. Energy independence has been a recurrent theme of federal energy policy. However, federal energy policies have not been effective in achieving the desired results. From 1975 to 2004, U.S. oil consumption increased from 16 million barrels per day to 20 million barrels per day. In 1975, oil imports accounted for one third of daily oil supply. By 2004, oil imports accounted for two thirds of daily oil supply.

Federal Reserve System

The purpose of the Federal Reserve System (The Fed) is to ensure stability in the banking system and to keep short-run political pressures out of monetary policy. The Federal Reserve System was created by the U.S. Congress and signed into law by President Woodrow Wilson on December 23, 1913, following a series of bank panics years earlier. In subsequent statutes, Congress refined The Fed's purpose to include enabling economic growth consistent with the U.S. economy's potential, a high level of national employment, stability in the purchasing power of the U.S. dollar, and moderate long-term interest rates.

The Federal Reserve System is composed of a seven-member board of governors and 12 regional Federal Reserve Banks with their 25 branches, which share the responsibilities mandated of the system. The Federal Reserve System is an independent entity within the government that is self-funded through its various operations. It is structured to have both public purposes and private aspects. The Federal Reserve System and its components are subject to several levels of review and audit, and its ultimate accountability is to the U.S. Congress, which can alter the responsibilities of the System by statute.

The seven presidential appointees to the board of governors are required to be representative of "the financial, agricultural, industrial and commercial interests and geographical divisions of the country." The members of the board of governors are appointed for 14-year terms with staggered appointments. A staff of about 1,700 in Washington, D.C., supports the board of governors.

Each of the 12 regional Federal Reserve Banks is designated a distinct letter and a number as an identifier. The regional Federal Reserve Banks supervise and regulate certain financial institutions and activities, they provide banking services to depository institutions and the federal government, and they ensure consumers receive adequate information and fair treatment in their transactions with the banking system.

A major component of the Federal Reserve System is the Federal Open Market Committee (FOMC). The FOMC oversees open market operations to influence money market conditions and the growth of the money supply and credit. The FOMC is a voting committee composed of the board of governors of the Federal Reserve, the president of the Federal Reserve Bank of New York, and presidents of four other Federal Reserve Banks who serve on the committee on a rotating basis. The rotating seats are filled from four groupings of the regional Federal Reserve banks. All the Federal Reserve Bank presidents attend the FOMC meetings and participate in the discussions. The FOMC normally meets for one day (the January-February and June-July meetings are two-day meetings) eight times each year in Washington, D.C., to discuss policy options related to the financial markets, the foreign exchange markets, and the trading desk activities of the New York Federal Reserve Bank. The FOMC deliberates monetary policy options at its meetings and then issues directives to the New York Fed's domestic trading desk on whether to tighten, maintain, or ease existing policy through the buying or selling of U.S. government securities. In addition to the open market operations, the Federal Reserve System conducts monetary policy through reserve requirements for depository institutions and through the discount rate paid by depository institutions when they borrow reserves from a regional Federal Reserve Bank.

Actions by the Federal Reserve have significant political and practical implications. The Fed has the ability to stimulate or restrain financial markets and broad economic activity by tightening or loosening the financial system with funds, by lowering or raising margin requirements, and by administratively changing other regulatory requirements. The Fed, through its FOMC actions on interest rates, has the ability to influence political activity regarding budget deficits, cumulative national debt, and tax policy. Changes in interest rates affect the rate of inflation, unemployment, and the flows of foreign investment. Changes in interest rates affect individual borrowing for homes, automobiles, durable goods, and credit card purchases. Changes in interest rates affect business expenditures and capital spending for plants, property, and equipment.

Federal Sentencing Guidelines

In what was to have a profound effect on corporate America, unique legal standards were enacted in the United States in November 1991. The standards, referred to as the U.S. Federal Sentencing Guidelines for Organizations ("Guidelines"), used a carrot and stick approach to create incentives for thousands of corporations to report wrongdoing, to cooperate with authorities while accepting responsibility for misconduct, and to establish or enhance their compliance or ethics programs. As opposed to discussing the Federal Sentencing Guidelines for individuals convicted of federal crimes, this entry focuses on the Federal

Sentencing Guidelines for Organizations, their impact, their use by the courts, and their effectiveness with respect to improving legal and ethical behavior.

The Guidelines were developed by the United States Sentencing Commission, a governmental body that came into existence in 1984. The Commission was charged with the responsibility of creating uniformity in the sentencing of offenders of federal laws. Following the promulgation of the Guidelines in 1987 for sentencing *individuals* convicted of federal offenses (including crimes such as murder, assault, robbery, and drug trafficking as well as business crimes such as fraud, embezzlement, forgery, bribery, tax evasion, money laundering, racketeering, or extortion), the Commission proceeded to create the Guidelines specifically for *organizations* that went into effect in 1991. The Guidelines consist essentially of a manual for judges to apply when determining the appropriate sentence for organizations convicted of a federal crime. Judges were being required for the first time to consider whether the convicted firm had established an effective compliance and ethics program before the violation taking place—in other words, whether the firm had taken appropriate steps to prevent and detect violations of the law.

According to Win Swensen, the former Deputy General Counsel of the Sentencing Commission, one of the primary reasons for the enactment of the Guidelines was that the U.S. government lacked a clear corporate crime sentencing and enforcement policy. As a result, judges were having great difficulty in finding meaningful ways in which to sentence corporations. Empirical research conducted by the U.S. Sentencing Commission on corporate sentencing practices demonstrated that " . . . corporate sentencing was in disarray . . . nearly identical cases were treated differently." In addition, average fines were found by the Commission to be " . . . less than the cost corporations had to pay to obey the law."

To address these concerns, the Commission eventually came to accept the carrot and stick approach to corporate sentencing. This approach was based on three principal and related objectives: (1) to define a model for good corporate citizenship; (2) to use the model to make corporate sentencing fair by providing objective, defined criteria; and (3) to use the model to create incentives for companies to take crime-controlling actions. The final objective was designed to shift from the previous "speed trap" enforcement policy of the past (i.e., merely lie and wait for corporate offenders and then fine them) to a more interactive approach. By providing financial incentives, the government was inviting companies to undertake effective, crime-controlling actions that in turn would put less pressure on already limited government enforcement resources.

Numerous corporations have been prosecuted under the Guidelines since their enactment, some suffering fines and penalties in the tens and even hundreds of millions of dollars. Empirical evidence (discussed in the following sections) is now suggesting that the implementation of these programs is raising the level of legal and ethical behavior in corporations.

What Are the Guidelines?

According to the Guidelines, any organization is liable to payments of restitution, fines, and periods of probation if convicted for a federal offense connected with offenses such as price-fixing, bid rigging, copyright and trademark infringement, bribery, fraud, money laundering, extortion, embezzlement, conspiracy, and other types of misconduct. The preamble to the Guidelines states that the organization operates only through its agents, usually its managers, and is, therefore, liable for the offenses committed by them. Naturally, the managers are personally responsible and liable for their own behavior. The innovation of the Guidelines lies in the fact that the sentences imposed on the organization and its agents are designed to achieve the following objectives: (1) just punishment; (2) sufficient deterrence; and (3) encouragement of the development of internal mechanisms to prevent, identify, and report on criminal behavior in organizations (i.e., through a carrot and stick approach).

The Guidelines require judges to follow a specific formula in determining fines. The range of potential fines is based on two factors: (1) the seriousness of the federal offense (i.e., the "base fine"); and (2) the culpability of the organization (i.e., the "multiplier"). The base fine is the greater of the company's monetary gain, the victim's monetary loss, or a specified amount depending on the type of offense (ranging anywhere from $5,000 to $72,500,000). Once the base fine is determined, federal judges are required to multiply this amount by a "culpability score." The culpability score can lead to either a substantial increase or decrease of the base fine, depending on which of several factors are in existence. The culpability score will increase when (1) a larger sized organization is involved; (2) high-level employees are involved in the offense or have tolerated the offense; (3) the organization has a prior history of engaging in similar misconduct; (4) the organization has violated a court order; or (5) the organization has obstructed justice relative to the offense. As a result of these factors, a company could find itself facing up to hundreds of millions of dollars in fines (the "stick").

At the same time, the Guidelines provide organizations with an opportunity to take steps that can substantially mitigate the severity of the base fine (up to 95%). The Guidelines provide that the culpability score can be reduced (i.e., the "carrot") if the organization engages in (1) self reporting; (2) cooperation and acceptance of responsibility; and/or (3) establishing, prior to the offense occurring, an "effective compliance and ethics program" to prevent and detect violations of the law. In addition to potential fines, judges are required to place organizations with 50 or more employees on probation when they are deemed not to have an effective compliance program in place.

To assist corporations in knowing exactly what constitutes an appropriate internal detection and prevention mechanism (i.e., an "effective compliance and ethics program"), the Guidelines (which were recently bolstered through the 2004 amendments) list several minimum "due diligence" requirements: (1) standards and procedures to prevent and detect criminal conduct (e.g., a code of conduct or ethics); (2) responsibility at all levels supported by adequate resources and authority for the program (e.g., a compliance or ethics officer); (3) personnel screening related to program goals; (4) effective training at all levels; (5) auditing, monitoring, and evaluating program effectiveness as well as establishing and publicizing a nonretaliatory internal reporting system that allows anonymity or confidentiality (e.g., an employee helpline or hotline); (6) incentives and discipline to promote compliance; and (7) reasonable steps to respond to and prevent further similar offenses on detection of a violation. The Guidelines also indicate that the implementation and successful maintenance of an effective compliance and ethics program requires that organizations periodically assess the risk of criminal conduct. Guidance is also provided by the Guidelines on how small organizations may adapt the requirements to the particular constraints they may face (e.g., fewer resources). In addition, as a significant modification resulting from the 2004 amendments, the Guidelines now require organizations and their high-level personnel (i.e., directors and senior managers) to demonstrate that they have promoted "an organizational culture that encourages ethical conduct and a commitment to compliance with the law."

Impact of the Guidelines on Corporate Compliance and Ethics Programs

Although the Guidelines have been in existence for only over a decade, they have received significant attention from academia and the media. For example, one study found that, by 2001, nearly 500 law review articles and more than 300 newspaper articles had already addressed the Guidelines.

Part of the reason for the significant interest in the Guidelines may be due to the impact they have had on corporate America. For example, many companies have indicated that the Guidelines were one of the factors that influenced the enhancement of already existing compliance or ethics programs. According to a 1995 national study of compliance practices, 44% of the respondents stated that the Guidelines caused them to add vigor to their compliance programs, while 20% added compliance programs because of their awareness of the Guidelines. According to Andrew Apel, the author of the study, ". . . certainly, the guidelines are having a significant impact on what organizations are doing to prevent and detect violations of law." A 1997 survey by the Ethics Officer Association found that 47% of those firms responding indicated that the guidelines had ". . . a lot of influence on the organization's decision to adopt a compliance program."

Unfortunately, the studies do not break down the impact of the Guidelines on individual components of ethics programs. Despite this gap, one can assume that the Guidelines have had the greatest impact on four components: (1) ethics training; (2) ethics officers; (3) ethics offices; and (4) ethics hotlines. Each of these components can be related to one of the elements of an effective compliance program as stipulated by the Guidelines (corporate codes of conduct were already prevalent in most large companies by 1991). For example, the Ethics Officer Association was formed in 1992 shortly after the sentencing guidelines came into effect, with only 12 members. The membership has grown to more than 1,000 members, representing more than half of the Fortune 100 companies, doing business in more than 160 countries. Another organization, the Health Care Compliance Association (HCCA), was also established essentially as a result of the Guidelines. Its membership has grown to more than 3,000 members.

Use of the Guidelines

The Guidelines appear to have clearly had an impact on the establishment or enhancement of corporate compliance or ethics programs. One of the reasons for this achievement is that in the case of an offense, the size of the fine is conditional on the existence of a compliance or ethics program. But have U.S. courts actually used the Guidelines in sentencing corporations?

More than 2,000 organizations have been sentenced based on the Guidelines since they came into effect in 1991. According to the 2003 U.S. Sentencing Commission's Annual Report, 200 organizations were sentenced according to the Guidelines during 2003, with 134 organizations subject to the Guideline's fine provisions. Although this represented a decline in sentencing from 2002 (252 organizations were sentenced) and 2001 (238 organizations), the number of organizations sentenced steadily increased in almost every other year (2000 [304 organizations]; 1999 [255 organizations]; 1998 [218 organizations]; 1997 [220 organizations]; 1996 [157 organizations]; 1995 [111 organizations]; 1994 [86 organizations]). The major types of offenses in 2003 included the following: fraud (32%); environmental pollution (20%); food, drugs, agricultural, and consumer (7%); antitrust (7%); and money laundering (7%).

The Guidelines have had an even more significant impact on probation. Approximately 65% of companies sentenced from 1994 to 2003 were placed on probation, with approximately 12% to 20% of these being ordered to implement compliance programs. The Guidelines were to have less of an impact, however, on the courts' consideration of corporate compliance programs when assessing fines. Since 1994, only a handful of the prosecutions involved a direct consideration of the defendant's compliance program by the court. In 2003, none of the organizations received a reduced fine for having in place an "effective compliance program" to prevent and detect violations of the law, although one firm was recognized in 1999 for having such a program in place. Only two organizations in 2001 were found to have made an effort in the way of *compliance* or *ethics.* In 2003, 24 out of the 200 organizations that were sentenced (12%) were ordered to make some sort of *ethics*-related or *compliance*-related improvement.

Since the adoption of the Guidelines in 1991, we have already seen a number of examples of significant fines faced by firms that failed to implement effective compliance programs. For instance, in 1996, a Manhattan federal court sentenced Daiwa Bank to pay a fine of $340 million under the Guidelines. The case involved a bank employee who lost $1.1 billion in unauthorized trades. Two reasons for the fine were the bank's "lack of a meaningful compliance program" and its "consequent failure to report the employee's wrongdoing." In May 1998, in what was the largest criminal fine in U.S. history, Hoffman-LaRoche, a large Swiss pharmaceutical company, was fined $500 million under the Guidelines after being convicted of an antitrust conspiracy. The company, along with two other firms, attempted to control the prices and sales volume of a series of vitamins. In October 2001, TAP Pharmaceuticals was subject to a $290 million criminal fine for violating the Prescriptions Drug Marketing Act—the largest fine in any health care case under the Guidelines. The company engaged in a kickback scheme with doctors in marketing its cancer drug. All these cases appear to suggest that effective compliance programs are still not in place in many corporations.

Another development that has been noted due to the Guidelines is being referred to as the shadow effect. Essentially, the Guidelines are also being considered by courts and government agencies in criminal cases other than those brought under the Guidelines. For example, in the 1996 Delaware Chancery Court case *In Re Caremark International Inc.,* the judge essentially relied on the Guidelines in warning that directors themselves can be held personally liable if they have failed to institute an adequate compliance program to prevent illegal acts by employees. Other cases, such as *Dellastatious v. Williams* of 2001 and *McCall v. Scott* of 2001 have followed *Caremark* in requiring corporate directors to ensure that their companies have an effective compliance program in place, which has now been essentially legislated for public companies under the U.S. Sarbanes-Oxley Act of 2002.

In terms of government agencies, the Environmental Protection Agency (EPA) and the U.S. Department of Health and Human Services (HHS) have both issued standards for companies based on the Guidelines' compliance criteria. The EPA issued a policy providing in some circumstances for reduced civil penalties and no criminal sanctions for corporations with effective environmental compliance programs. The Department of HHS has set forth specific criteria for compliance programs as well as incentives for developing such programs.

The Guidelines also appear to be influencing the initial decision by government regulators on whether to prosecute companies. A 1999 memorandum from the U.S. Department of Justice includes a list of factors to consider in terms of prosecution, including the existence and adequacy of the corporation's compliance program and whether the corporation's remedial actions included any efforts to implement an effective corporate compliance program or to improve an existing one.

Effectiveness of the Guidelines

It can be seen from the above discussion that the Guidelines have had an impact on the creation and implementation of compliance or ethics programs and have actually been used by the courts (and by some U.S. government agencies as well) in assessing fines, in placing companies on probation, and even in deciding whether to prosecute. Despite this impact, one could ask a more fundamental question: Have the Guidelines helped to achieve their ultimate purpose, the reduction of corporate crime and an improvement in ethical behavior?

Unfortunately, there are no empirical data that measure organizational crime rates over time. As a result, as indicated by John Steer, the vice-chair of the U.S. Sentencing Commission, it is not possible to assess directly the success, or lack thereof, of the organizational guidelines in altering the rates at which organizations commit crimes. Thus, it may be some time before we can know the answer to this question with any degree of certainty. There is, however, a certain amount of indirect empirical information. Several studies released by the U.S.-based Ethics Resource Center (i.e., "Ethics in American Business: Policies, Programs and Perceptions" of 1994 and the "National Business Ethics Survey" of 2000 and 2003) found that comprehensive compliance or ethics programs (including codes, training, ethics offices, and reporting systems) appear to lead to several positive outcomes including a greater likelihood of misconduct being reported, higher perceptions that employees are held accountable for ethics violations, and lower pressure to compromise ethical standards. A 2003 study by the World Bank on the effectiveness of compliance programs in reducing corruption found that the 22 companies interviewed say they have no doubt that their ethics programs are succeeding in reducing the incidence of corruption.

In any event, the bulk of the evidence to date indicates that the Guidelines have had an influence on the development of compliance and ethics programs that appear to lead to improved ethical behavior in organizations. According to John Steer, "The past decade's experience with the organizational sentencing guidelines has provided positive evidence supporting the efficacy of this bold, novel means of influencing desirable organizational behavior." According to Judge Diana Murphy, former chair of the U.S. Sentencing Commission, "[The Guidelines] are a real success story for the United States Sentencing Commission in its work to deter crime and encourage compliance with the law." The Sentencing Commission, in reflecting on its first 10 years, states that " . . . the guidelines have had a tremendous impact on the implementation of compliance and business ethics programs over the past 10 years."

Future for the Guidelines?

More recently, the long-term future of the Guidelines may have been put into jeopardy. In a pair of 5-4 decisions issued in January 2005, the U.S. Supreme Court held that the Guidelines violate a defendant's Sixth Amendment right to be tried by a jury to the extent that they allow judges to engage in fact finding that can lead to a harsher sentence. As a result, the Court ruled that judges cannot increase sentences beyond the maximum that the jury's findings alone would support. The Court also held that the Guidelines should serve only as "advisory" rules as opposed to "mandatory" rules for judges. While some question whether this decision will lead to the downfall of the Guidelines, other commentators suggest that the Court's decisions should not affect organizations that are being sentenced (as opposed to individuals) as organizations do not appear to possess a constitutional right to be tried by a jury.

Federal Trade Commission (FTC)

The Federal Trade Commission (FTC) is an independent agency of the U.S. government that regulates markets and competition. Founded in 1915, the FTC is a successor to the Bureau of Corporations of the Department of Commerce, which was founded in 1903, making it one of the oldest regulatory agencies in the United States. The agency is known to consumers and businesspeople for its many functions, including consumer protection, product safety, enforcement of warranties, prohibition of price-fixing, and maintenance of competitive markets through review of mergers and restrictions on anticompetitive activities.

History

As the United States transitioned from an agricultural nation to an industrial power during the 19th century, many citizens and legislators became concerned about the concentration of economic power in the hands of only a few large corporations. The Sherman Antitrust Act was passed in 1890 in an effort to stem the tide of corporate consolidations. The objective was to protect competition and thereby benefit consumers by providing better products and services at competitive prices. However, United States Supreme Court rulings during this laissez-faire economic period, based on the belief that unrestricted competition would produce the best results for society, exempted mergers from the Sherman Act's coverage.

Following an unprecedented wave of merger activity from 1898 to 1902, the Bureau of Corporations was formed by President Theodore Roosevelt. The self-described trust-buster established the Bureau due to his concern about business combinations that reduced competition and in an effort to revitalize the Sherman Antitrust Act. The Bureau conducted investigations and published reports on interstate corporations. Such investigations were also in response to a growing consumerism movement early in the 20th century. This movement was aided by the publication in 1906 of *The Jungle* by Upton Sinclair. The resulting public outrage at the unsafe and unsanitary conditions in the Chicago meatpacking industry helped to give added momentum to the movement. Sinclair partially blamed the conditions he observed on the consolidation of businesses in the meatpacking industry, also known as the beef trust.

The 1912 presidential election featured a national debate on the necessity for controlling big business and business concentration. Democrat Woodrow Wilson was elected president by defeating William Howard Taft, the Republican challenger, and Theodore Roosevelt, then a third-party challenger. In 1914, Wilson signed into law the Federal Trade Commission Act, which created the FTC. Section 5 of the act prohibited unfair methods of competition. A short time later, the Clayton Act was signed into law, which strengthened and defined the limitations on business combinations.

The FTC assumed the role of the Bureau of Corporations, and its first chairperson was the former commissioner of the Bureau. Like the Bureau, the FTC could investigate and publish reports. However, unlike the Bureau, it could also bring enforcement actions, including enforcement of the Sherman and Clayton Acts. The FTC also had the informal duty to assist businesses in complying with the law.

The new FTC expanded its role by providing support to the federal government during World War I by establishing prices for goods sold to the government. Throughout the 20th century, the President and Congress expanded the role of the FTC as the leading source of protection for consumers and of protection of competition among businesses.

Due to amendments in 1938 and 1950, the FTC moved past, simply enforcing antitrust and price-discrimination laws on matters involving deception of consumers and unfair competition. It was also armed with the ability to assess civil penalties for violations of its orders. The Hart-Scott-Rodino Antitrust

Improvements Act of 1976 required that certain proposed mergers be filed with the FTC for approval before the mergers could proceed.

In more recent times, observers have commented on the various positions taken by the FTC depending on the political party in power and the general mood of the country regarding business conditions. The debate features arguments by advocates of minimal regulation of business, which would include allowing cooperation among businesses and most mergers, and advocates of a strong governmental regulatory approach that would as a matter of course restrict most mergers and business cooperation. The advocates for loose regulation argue that businesses in the United States are competing in a world market and that viewing businesses solely in the context of local or national competition is a myopic view of market realities. Advocates of strict regulation argue that with the power of major corporations, many with more revenue and assets than some countries in the world, controls are necessary to preserve some balance between the consumers and small businesses and the large, multinational corporations.

Major Functions

The FTC is governed by five commissioners appointed by the President and serving staggered seven-year terms. No more than three commissioners can be of the same political party. Headquartered in Washington, D.C., the FTC is composed of administrative, legislative, investigative, and legal functions. Its activities are supported by seven regional offices. It enforces laws passed by the U.S. Congress and also rules enacted by the FTC through its rule-making authority. The 21st-century FTC divides its focus across three bureaus: the Bureau of Consumer Protection, the Bureau of Competition, and the Bureau of Economics. Each bureau is described in more detail in the following sections.

Bureau of Consumer Protection

The Bureau of Consumer Protection (BCP) is charged with protecting consumers from deceptive or unfair trade practices. The BCP is composed of seven divisions, each with specific responsibilities. The Division of Advertising Practices has responsibility for protecting consumers from false advertising. Included in its broad authority are claims regarding tobacco, alcohol, food, over-the-counter drugs, energy-saving products, and products asserting environmental claims. The Division of Financial Practices enforces many of the laws related to consumer credit matters, including the Fair Debt Collection Practices Act and the Truth in Lending Act. The Division of Marketing Practices protects consumers from marketing schemes and possible scams by regulating franchise sales, telemarketing, and Internet sales.

The Division of Planning and Information develops reports to guide law enforcement and the FTC education efforts. The International Division of Consumer Protection works to increase international cooperation in combating consumer fraud. There is also a Division of Enforcement and an Office of Consumer and Business Education.

Bureau of Competition

The Bureau of Competition (BC) shares responsibility with the U.S. Department of Justice for enforcing antitrust laws. The Bureau works to insure that mergers and other business combinations and practices do not reduce competition in the marketplace. The Bureau concentrates its efforts on industries with the most potential impact on consumers, including energy, prescription drugs and health care, food, and technical products such as computers, cable services, and Internet access.

The BC enforces the following laws: Sections 1 and 2 of the Sherman Antitrust Act, Section 5 of the Federal Trade Commission Act, and Sections 7 and 7A of the Clayton Act. It is Section 7A of the Clayton Act, aided by the Hart-Scott-Rodino Act noted previously, that requires the submission of proposed mergers to the BC for evaluation before a merger can proceed. The main focus is on mergers between direct competitors, horizontal mergers. The BC also reviews mergers between companies in a supplier-buyer relationship, a vertical merger, and between companies where one of the parties might enter the market rather than purchase a potential competitor. The BC review is to determine the possible impact on consumers due to a reduction in competition if the merger is completed. Only a small percentage of mergers are actually disallowed by the BC.

The BC's authority is not limited to disallowing a merger. In some cases, divestiture of assets by one or both parties to a merger can correct the potential anticompetitive effects of the proposed merger. In the case of some oil company mergers, the divestiture of refineries and certain retail facilities allowed the mergers to go forward. In addition, the BC has the responsibility to investigate anticompetitive acts that do not involve merger activities. Other prohibited activity investigated by the BC includes price-fixing, tying product purchases to other products, and dividing markets or customers among competitors.

A more difficult area is the establishment of standards in certain industries. While standards, such as ones for DVDs and other technology-based products, can make life a great deal easier for consumers, they can also provide a windfall and perhaps control of the market for one or more competitors. This is especially true if patents are incorporated in the standards that are adopted.

Bureau of Economics

The Bureau of Economics (BE) provides economic reports on the impact of the FTC's activities and government regulation in general. Armed with the BE's detailed economic studies in cooperation with the BC, the enforcement arm of the FTC can proceed to make prosecution decisions in antitrust and other matters within the purview of the FTC. These studies are also used to direct the enforcement efforts of the BCP. The BE also assists the FTC in advocacy issues related to legal cases and legislation that affects businesses and consumers.

Agency Visibility in Daily Life

The FTC is one of the most visible agencies in the daily life of Americans, although few may realize it. FTC requirements include labels on clothing indicating fabric care and country of origin, energy labels on new appliances, product warranties, Truth in Lending notices, and the National Do Not Call List.

Businesses must be cautious when placing advertisements and marketing products and services to comply with the consumer protection regulations as well as the rules and laws governing antitrust and unfair competition. However, businesses benefit from a more level playing field and from protection from unfair competition by other businesses. Playing by the rules may be more confusing and difficult for small businesses due to the complexity of FTC regulations and the cost of compliance. The Fair Debt Collection Practices Act limits the measures businesses may take to collect debts. In addition, the Fair Credit Reporting Act may interfere with the investigation of the backgrounds of employees at the same time when business liability for hiring employees who cause thefts or injuries is increasing.

Conclusion

While the FTC has had an impact on the lives of most Americans and businesses, the benefits of the agency are still debated. Some consumers believe that when the local gasoline retailers raise their prices almost simultaneously, there must have been illegal collusion. The FTC has rarely found that to be the case as the retailers are allowed to meet competition. Businesses in many situations benefit from the protection of competition implicit in the enforcement of antitrust laws, but FTC enforcement of these laws could also prevent a business from being acquired by a competitor and, in turn, prevent the business from selling for its peak value.

Feminist Ethics

Feminist ethics is a diverse set of gender-focused approaches to ethical theory and practice. The primary aims of feminist ethics are (1) to examine the traits, virtues, and values that have been culturally tied to women worldwide, but particularly in the Western world; and (2) to determine whether they have been wrongly assessed and underused by much of traditional (Western) ethical thought. According to philosopher Alison M. Jaggar, many schools of traditional (Western) ethics fail women in five interrelated ways. First, they focus far more on men's issues, interests, and rights than on women's. Second, they approach problems that arise in the private or domestic realm as morally uninteresting or trivial. Third, they imply that for a variety of biological as well as social reasons, women are not as morally developed as men. Fourth, they privilege traits linked to masculinity (autonomy, separation, mind, culture, and transcendence) over traits linked to femininity (interdependence, community, connection, body, emotion, nature, and immanence) as if the latter traits were not just as essential for human beings to cultivate as the former. Fifth, they present masculine modes of moral reasoning that emphasize rules, universality, and impartiality as somehow better than feminine modes of moral reasoning that emphasize relationships, particularity, and partiality when, in point of fact, both these modes of moral reasoning are equally capable of yielding wise moral judgments.

Historical Background

Feminist ethics has its roots in 18th- and 19th-century debates about the nature and function of women's morality. Thinkers such as Mary Wollstonecraft, John Stuart Mill, Harriet Taylor Mill, Catherine Beecher, Charlotte Perkins Gilman, and Elizabeth Cady Stanton posed questions such as the following: Are women's feminine traits produced biologically and/or socially? Is there a nonbiased standard available to distinguish "good" feminine traits from "bad" ones? Is women's morality different from men's, and, if it is, why? Is ethics gender neutral or gender specific? Should women and men be held accountable to the same set of moral rules or to different ones?

Because 18th- and 19th-century feminist thinkers had different answers to the questions posed in the foregoing, it is not surprising that 20th-century feminist ethicists should have developed a variety of approaches to ethics. Despite their diversity, however, all feminist approaches to ethics use gender as their primary category of analysis and women's experiences as their primary source of empirical data. They can be divided into two basic types: care-focused feminist ethics and power-focused feminist ethics. Because these two fundamental approaches to feminist ethics stress different concepts, concerns, and controversies, they are able to check and balance as well as complement each other.

Care-Focused Feminist Ethics

Care-focused feminist ethics include a cluster of so-called feminine and maternal approaches to ethics that put a premium on those moral virtues that tend to strengthen people's felt commitments to each other. Whereas feminine approaches to ethics stress the value of human relationships in general, maternal approaches to ethics focus on the value of one type of human relationship in particular, namely the mother-child relationship. The strengths of feminine and maternal approaches to ethics are many, but they are offset by some significant weaknesses as discussed in the following.

Proponents of feminine approaches to ethics characteristically maintain that biological and/or social differences between men and women are the foundation of men's and women's, respectively, different moral identities, behaviors, and styles of moral reasoning. They also emphasize that, at least in the West, traditional moral theories generally ignore, trivialize, or demean virtues of character and traits of personality that are culturally associated with women.

Among the best-known ethicists who have developed a feminine approach to ethics is moral psychologist Carol Gilligan. In her classic, *In a Different Voice,* Gilligan claims that because women have traditionally focused on others' needs, they have developed an ethics of care that stresses the importance of creating and sustaining a strong network of human relationships. In contrast, because men have traditionally focused on competing in the public world, where people are sometimes tempted to advance their careers and causes by unfair means, they have developed a language of justice that emphasizes adherence to agreed-on rules or contracts. Moreover, there is a tendency to regard the language of justice as somehow ethically superior to the language of care because the former is associated with being objective and impartial, while the latter is associated with being subjective and partial. Supposedly, reason rules the ethics of justice, while emotion rules the ethics of care.

Gilligan criticized her university mentor, educational psychologist and moralist Lawrence Kohlberg, for devising a scale of moral development that presented men's morality in more favorable terms than women's. In his work, Kohlberg claimed that moral development is a six-stage process. Stage 1is the punishment and obedience orientation. To avoid the stick of punishment and/or to receive the carrot of a reward, children follow simple commands. Stage 2 is the instrumental relativist orientation. Based on a limited principle of reciprocity—"You scratch my back and I'll scratch yours"—young children meet the needs of someone only if that individual is meeting their needs. Stage 3 is the good boy–nice girl orientation. Adolescents conform to prevailing norms to secure others' approval and love. Stage 4 is the law and order orientation. As they move out of adolescence, young adults begin to do their duty, show respect for authority, and adhere to social standards to secure others' admiration and respect for them as honorable, law-abiding citizens. Stage 5 is the social contract legalistic orientation. Mature adults adopt an essentially utilitarian moral point of view, according to which individuals are permitted to do as they please, provided they refrain from harming other people in the process. Stage 6 is the universal ethical principle orientation. Exceptional adults adopt an essentially Kantian moral perspective that seeks to transcend and judge all conventional moralities. These fully morally developed individuals are ruled not by self-interest, the opinion of others, or the fear of legal punishment but by self-legislated and self-imposed universal principles such as justice, reciprocity, and respect for the dignity of human beings.

The more Gilligan reflected on Kohlberg's scale, the more she realized why speakers of the language of care (typically women) did not do nearly as well on it as speakers of the language of justice (typically men). Kohlberg's scale, alleged Gilligan, was constructed to recognize and validate the voice of justice but not the voice of care. There was little opportunity for people who justified their moral decisions in terms of their concrete personal relationships rather than in terms of adherence to a utilitarian calculus or an abstract set of universal principles to fare well on it. Gilligan's solution to this male-biased outcome was to conduct several empirical studies on women's (later also men's) styles of moral reasoning and propose a gender-neutral moral development scale. As a result of these early studies and subsequent later studies, Gilligan concluded that although many men and women can speak both the languages of justice and care, women tend to favor the vocabulary of care and men the vocabulary of justice. She also concluded that men are far less comfortable speaking the language of care than are women speaking the language of justice. Society views women who speak the language of justice as clear successes but men who speak the language of care as somehow failing.

Nel Noddings, another care-focused feminist ethicist, went further than Gilligan did in her defense of women's morality. Ethics, insists Noddings, is about particular relations. There are two parties in any relation: The first member is the one-caring and the second, the cared-for. The one-caring is motivationally engrossed or otherwise psychologically situated in the cared-for. She or he makes it a point to attend to the cared-for in deeds as well as in thoughts. When all goes well, the cared-for actively receives the caring deeds of the one-caring, spontaneously expressing his or her appreciation for the time, energy, and/or resources the one-caring is expending on him or her. Caring is not simply a matter of feeling favorably disposed toward humankind in general, of being concerned about people with whom we have no concrete connections. Rather, it is about two or more people being engaged in a face-to-face relationship. There is, after all, a fundamental difference between the kind of care a mother has for her child and the kind of care a woman has for an anonymous child to whom her charity of choice will give a measure of material support. Real care, insists Noddings, requires actual encounters with specific individuals; it cannot be accomplished through good intentions alone, let alone anonymously.

Noddings's ethics of care borrows from the moral sentiment theory that frames David Hume's ethics. Like Hume, Noddings believes both that the sentiments of sympathy are *innate* and that these sentiments must be *cultivated* lest they fail to guide one's everyday moral decisions and actions. In explaining the complex relationship between what she terms natural caring on the one hand and ethical caring on the other, Noddings notes that most people's initial experiences of care come easily, even unconsciously. Among the examples of *natural* caring that Noddings provides is that of a little boy who helps his mother fold the laundry because she does so many things for him. He wants to be connected to her and have her recognize him as her helper. Later, when he is a young man and would rather be around his friends than around his mother, he remembers all his mother has done for him throughout the years. Feelings of obligation flood over him. These feelings prompt the young man to forsake fun time with his friends so that he can assist her in what may be her days of greatest need. Through this kind of decision and action rooted in feelings, says Noddings, *ethical* caring comes into existence, a form of caring that is more deliberate and less spontaneous than *natural* caring.

Significantly, Noddings does not describe moral development as the process of replacing natural caring with ethical caring. As she sees it, our oughts build on our wants. Moreover, morality is not about serving others' interests through the process of disserving one's own interests. Rather, morality is about serving one's own and others' interests simultaneously. Supposedly, when we engage in ethical caring, we are not denying, negating, or renouncing ourselves to affirm, posit, or accept others. Rather, we are acting to fulfill our need to be related to other people.

As intuitively appealing as an ethics of care may be, it is in many ways an underdeveloped ethics subject to a variety of misunderstandings. In fact, the concept of care is susceptible to misinterpretation and may become a disempowering trap for women. More often than not, society has viewed women as bearing primary responsibility for the care of the young, the old, and the infirm. It has expected women to be the ones to sacrifice their careers and interests to serve family members' and friends' needs. Continuing to associate women with caring, as Gilligan and Noddings do, might have the effect of reinforcing the idea that because women can care and have cared so well for others, they should always care—regardless of the cost to themselves.

Closely related to feminine approaches to ethics are so-called maternal approaches to ethics. Maternal thinkers such as Sara Ruddick, Virginia Held, and Caroline Whitbeck affirm the feminine psychological traits and moral virtues that society associates with women. As they see it, a truly gender-equal ethics would not favor paradigms that speak much more to men's experience in the public world than to women's experience in the private world. Most of our relationships, say Ruddick, Held, and Whitbeck, are not between equals but between unequals. Women's relationships with their helpless infants, aging parents, ailing siblings, and distraught friends are not the same as the relationships that exist between equally informed and powerful adults. The way in which two businessmen negotiate a deal is not to be compared with the way in which a mother and her child agree to a bedtime. If any model fits relationships between unequals, says Held, it is the relationship between children and mothers—or more precisely—between children and *mothering persons.*

However appealing maternal ethics may be, nonfeminist critics of it doubt that any one human relationship either can, or should, serve as the paradigm for all human relationships. As they see it, no one type of human relationship is robust enough to serve as a general model for how all people should treat each other. In particular, relationships between unequals should not serve as the model for relationships between equals or vice versa. The same words that mothers use to comfort their children may strike an adult friend as condescending or demeaning.

Feminist critics of maternal ethics express similar reservations about it, adding the point that the mother/child relationship is a problematic choice for a feminist moral paradigm because it is burdened with enough patriarchal baggage to weigh down even the strongest of women. Although feminist critics concede that the mother-child relationship is a better model for fully human relationships than is the traditional two autonomous adults model, they believe that even better models are available. The mother-child relationship is not, they note, the only human relationship that is based more on need, love, and trust than on desire, duty, and fear. Nor is it the only kind of relationship that recognizes human beings' emotional connections as well as rational links. On the contrary, friendship relationships, especially ones based on shared goals and aspirations, can bind human beings in particularly strong ways. Held together by tears, laughter, and sweat rather than waivers, subpoenas, and depositions, goal-orientated and/or value-shared friendship relations hold out more possibilities for moral development than do contractual relations. They are also less imbalanced than mother/child relationships in that the parties to them are equals who can give as much as they take from each other, albeit in different sorts of ways.

Power-Focused Feminist Ethics

Unlike care-focused feminist approaches to ethics, power-focused feminist approaches to ethics ask questions about male domination and female subordination *before* they ask questions about good and evil, care and justice, or mothers and children. In an attempt to specify the kind of questions that feminist as opposed to nonfeminist ethicists typically ask, philosopher Alison M. Jaggar has claimed that to qualify as feminist, an approach to ethics, whether care-focused or power-focused, must assume that it is morally wrong to treat women as men's subordinates, as if women are somehow less deserving of respect and consideration than men. In her view, it is especially important that power-focused feminist ethics correct for the mistakes in some wrongly formulated care-focused feminist ethics. Among these mistakes is a tendency to overestimate the value of care and to underestimate the value of justice, thereby failing to see that equality is the proper aim of feminist ethics. Although power-focused feminist ethicists should attend first and foremost to patterns of *male* domination and *female* subordination, Jaggar believes that they should go on to address the immoralities caused by other patterns of human domination and subordination. Not only sexism but also classism, ethnocentrism, heterosexism, ableism, and so on are the enemies of feminist ethicists. Jaggar also stresses that any feminist ethics that merits allegiance must go beyond theory into practice. Feminist ethics is about making the present world a better world in which men and women equally thrive. It is not simply about imagining such a world.

Among the theorists who have followed Jaggar's admonitions is Susan Sherwin, a feminist bioethicist. Sherwin has written extensively on topics related to women's role in reproduction and women's overall health status in both developed and developing nations. Like Jaggar, she believes that a feminist approach to ethics differs from feminine and maternal approaches to ethics because it is more political than either of these two alternative approaches is. Although a *feminist* approach to ethics may affirm the same values and virtues a *feminine* or *maternal* approach does, it will not do so uncritically. Women must be wary of women's values and virtues to the degree that they are unliberating by-products of life in a sexist culture. Whatever positive features the virtue of care has, for example, it may still be a virtue that subordinates women to men, as it sometimes does in the field of health care. Vulnerable people such as patients and nursing home residents know they cannot afford to alienate the affections of those who have power over them such as physicians and nursing home administrators. The powerless are especially motivated to accommodate the powerful. Similarly, whatever the moral advantages of maternal thinking may be, it is still a mode of thought produced in a certain kind of family structure—namely, a Western, middle-class, heterosexual family. Insofar as this *structure* oppresses women, the maternal mode of thought produced within it is likely to oppress women. By choosing to specialize, as it were, in motherhood and caring, women tend to legitimate patriarchal attempts to make mothering women's prime duty. Women must win the right *not* to mother—the right for equality in public and private life—before they can safely develop a maternal or feminine ethics.

As mentioned previously, a feminist approach to ethics does not focus only on *women's* oppression. As Sherwin and many other feminists see it, because feminists are sensitive to patterns of male domination and female subordination, they are also attuned to patterns of domination and subordination that are classist and/or racist. Although a feminist approach to ethics usually begins with a question such as, "How does this policy, this state of affairs, oppress *women* in particular?" it often ends with a question such as, "How does this policy, this state of affairs, oppress vulnerable *people* in general?" Having posed the question, "How do current health care insurance schemes oppress women?" for example, many feminist ethicists tend to move on to the question, "How do current health care insurance schemes oppress the chronically ill, the elderly, people with serious disabilities, and the poor?" Often, it takes an oppressed group—in this instance, women—to recognize the oppression of other oppressed groups and to seek remedies for them. Clearly, the aim of feminist ethicists is not to prove that women's oppression is the worst form of oppression imaginable; rather, it is to identify and eliminate the *kind* of oppression that women have traditionally experienced.

Another feature of Sherwin's feminist approach to ethics, which is common to most other feminist approaches to ethics, is her refusal to envision it as a theory to end all theories. To the degree that feminist epistemology rejects universal truth as a desirable goal for human knowledge and that feminist ontology rejects the totally self-sufficient individual as a desirable model for selfhood, a feminist approach to ethics rejects absolute goodness as a desirable goal for human action. It does not aim to articulate an absolute and unchanging morality for all human beings, be they female or male, the oppressed or the oppressors. On the contrary, a feminist approach to ethics aims to provide oppressed women—and also other oppressed groups—with moral action guides and interpretive tools suited to their particular historical situation. These flexible norms aim to help people liberate themselves from those who would dominate them, for unless a person is free, she cannot dare to be fully moral.

Because liberation is not an overnight process, most feminist approaches to ethics tend to be incremental. To the degree that a woman, usually with the help of other women, frees herself from the constraints that limit her ability to help structure a world in which relationships of domination and subordination do not exist, to that same degree, she becomes a moral agent. Morality's imperatives are as different as the individual women to whom they speak in the sense that each woman must interpret morality's demands in terms of her social and historical context. Each woman is a Joan of Arc of sorts. She must decide whether the "voices" speaking to her are true or false, a source of liberation or further oppression.

As Sherwin sees it, however, it is not enough for a feminist approach to ethics to encourage women to assess the moral validity of the different voices that speak to them. On the contrary, a feminist approach to ethics must provide women with a rationale for determining whether a voice they hear is singing gibberish or articulating a meaningful message. Most feminists reject not only the kind of "moral absolutism" that cannot see beyond its own vested interests but also the kind of "moral relativism" that permits anything and everything, including the oppression of women or other oppressed groups. Only if feminists can say that some things are clearly wrong can they justifiably coalesce to try to make them right. If one person's decisions are as good as anyone else's, then there is no reason for either person to change their minds and/or course of action. Socially and politically speaking, moral relativism denies the possibility of moral progress.

Because feminist approaches to ethics focus on how power is used to oppress *women* in particular, critics have complained that these approaches are female biased. Ethics, insist the critics, cannot proceed from a specific standpoint—in this case, from the standpoint of women—and still be regarded as ethics. To this objection, feminist ethicists respond that traditional ethics proceed from a standpoint also. This standpoint is the standpoint of men presented as the standpoint of all human beings. Rather than hiding the fact that feminist ethics begins, though it does not end, with a discussion of women's moral experiences, feminist ethicists publicly celebrate their ethics' point of origin.

The fact that feminist approaches to ethics focus first, or even exclusively, on *women's* concerns makes them controversial, but it also makes them particularly empowering for women. Although it is difficult to make generalizations about specifically lesbian approaches to ethics, most of them seem to entail a thorough transvaluation of traditional moral values. Mary Daly, for example, insists that she whom the patriarch calls "evil" is in fact good, whereas she whom the patriarch calls "good" is in fact bad. If a woman is to escape the traps men have laid for her—if she is to assert her power, to be all that she can be—then she must realize that it is not good for her to sacrifice herself for the sake of the men and children in her life. What *is* actually good for women is precisely what patriarchy identifies as evil for women—that is, becoming their own persons.

Lesbian approaches to ethics also typically urge women to replace the question "Am I good?" with the question "Does this contribute to my self-creation, freedom, and liberation?" Just because lesbian ethicists emphasize the role of choice as opposed to duty in ethics, it does not mean that they are asking the wrong questions about human morality. As Marilyn Frye sees it, the need to ask the "right" questions tends to arise among people who have a vested interest in maintaining the socioeconomic and political status quo. For example, a white/Christian/middle-class/American male probably bases his conception of himself as an upright citizen on his conviction that he is in the right—that he knows what is best for himself and others. So long as women as well as men continue to accept this "male" conception of moral agency, reasons Frye, women will have but two choices: (1) to become men so that they can exert men's moral authority over others; or (2) to become female moral authorities who then make it their business to exert *women's* moral authority over others. Frye regards both these options as unacceptable for women. The first forces women to negate themselves; and the second sends women down the same moral blind alley men have gone. If ethics is about some people not only proclaiming to other people what is "good" for them but imposing that good on them, then Frye welcomes the criticism that lesbian approaches to ethics are not really about *ethics.* Only those who have a vested interest in the status quo—in the powerful remaining powerful—require certitude about their righteousness—about their warrant to direct and administer everything. But because lesbians supposedly do not want this kind of power—because their personal experiences have enabled them to appreciate the major immoralities it generates—they require neither proof of their "goodness" nor the "right" to impose it on anyone but themselves. Thus, it is doubtful that lesbians want or need ethics in the traditional sense of ethics.

Conclusion

Whether they are care-focused or power-focused, feminist approaches to ethics differ from nonfeminist approaches to ethics in that they are sensitive to women's moral concerns and to the ways in which being a member of a culturally disfavored gender—in this instance, the "feminine" or "female" gender—leads to women's disempowerment personally, politically, economically, and socially. In addition, they all agree with Alison Jaggar that their most important tasks are (1) to provide moral critiques of actions, practices, systems, structures, and ideologies that perpetuate women's subordination; (2) to devise morally justifiable ways (e.g., public policy initiatives, peaceful protests, boycotts) to resist the economic, social, and cultural causes of women's subordination; and (3) to envision morally desirable alternatives to the world as we know it: sexist, racist, ableist, heterosexist, ethnocentric, and colonialist.

Because feminist ethicists focus on women—or, more abstractly, on gender—some nonfeminist ethicists have dismissed their work as being just as "sexist" as traditional Western ethics supposedly is. These critics claim that if it is wrong to disguise men's preferences as human values, it is wrong to disguise women's preferences as human values. Either gender-free moral values exist or they do not. If they do exist, they belong equally to men and women. Finally, if it is wrong, for example, to keep women on the moral defensive by underscoring their low scores on Kohlberg's scale, it is just as wrong to keep men on the moral defensive by highlighting men's violence against women.

To the extent that feminist approaches to ethics are women-centered—that is, focused on female subordination and male domination—critics claim that they are not so much *ethical* approaches as *political* power plays. To say that feminist approaches to ethics are political in the modern sense of the term is to say something decidedly negative. It gives the impression that women are fighting against men to gain control over them—to have their own say, no matter what. But to say that feminist approaches to ethics are political in the classical sense of the term is to say something quite different. It is to say that feminists pay attention to issues of power because they want to liberate not only themselves but also others from oppressive structures, systems, and relationships. Politics is indispensable to ethics in the sense that only an empowered person has the capacity to *self-reflectively* make this a better world. Only free persons can be moral persons, and feminists want women (and men) to be free persons.

FEMINIST THEORY

Feminist theory is a diverse body of thought based for the most part on one or more traditional or contemporary political, social, and cultural theories such as liberalism, socialism, and postmodernism. The difference between feminist theory and nonfeminist theory is that the former self-consciously reflects on the experience of women and deliberately uses the lens of gender as its preferred critical perspective. Sometimes nonfeminist theorists fault feminist theorists for not viewing reality through the single lens of the quintessential impartial and objective human being but instead through the multiple lenses of partial and subjective existing women. But feminist theorists are not flummoxed by this harsh critique. They respond that no one can simply be human. Among other feminist theorists, Susan Bordo emphasizes that reality is gendered. We cannot entirely escape the categories male/female, man/woman, and masculine/feminine, not even if we are transgendered, transsexual, multiply gendered, multiply sexed, or trying to be nongendered/nonsexed.

Throughout the 1960s and 1970s, liberal, radical, and Marxist-socialist feminisms were predominant, but they were complemented by several other modalities of feminist thought including psychoanalytic and gender feminism. By the 1980s and 1990s, these types of feminist thinking had been joined by multicultural, global, and postmodern feminism, all of which have been further supplemented by new millennial third-wave feminist thinking. Whatever their disagreements with each other may be, most feminist thinkers agree that to be classified as feminist, a theory must proceed on the assumption that traditional, largely patriarchal, modes of thinking, which support women's subordination to men, have to be replaced by modes of thinking that equally value both women's and men's intellectual, moral, and social contributions to the private, professional, and public domains.

Liberal, Radical, and Marxist-Socialist Feminist Theories

Liberal feminism is probably the most recognized and accepted form of feminist thought today. It is predicated on the view that women's subordination to men is rooted in a set of gender identities and roles that are used as justifications, first, for relegating women to the private realm, where they are expected to bear the brunt of most domestic work and care-giving activity, and, second, for limiting women's access to the public realm and the major professions (business, medicine, and law). As liberal feminists see it, the way to release women (and men) from this confining state of affairs is to open the public world to women and, as a correlative, the private world to men.

Liberal feminists are revisionists, not revolutionaries. Their goal is not to destroy existing systems and structures but to integrate women into them. Using legal and political remedies, liberal feminists have accomplished this goal to some degree over the past 35 years. Yet, the complete liberal feminist agenda, articulated in the 1967 National Organization for Women's (NOW's) Bill of Rights, remains far from being fully implemented. Circa 2000, the Equal Rights Amendment has yet to pass into U.S. law; the average American female worker earns only 56.0% as much as the average male worker; only 14 out of 100 members of the U.S. Senate are women; and just nine Fortune 500 chief executive officers are women. Moreover, U.S. women, like women throughout the world, remain heavily invested in the private realm, where they continue to do most of the family housework and a major proportion of dependency work (taking care of infants and children, the elderly, the infirm, and people with disabilities in home and institutional settings).

In contrast to liberal feminists, radical feminists focus not so much on social and economic issues as on women's sexual and reproductive concerns, seeing women's liberation in women's ability to control how their bodies are used. There are two major types of radical-feminist thinkers: radical-libertarian feminists and radical-cultural feminists. Their disagreements are several and somewhat profound.

Radical-libertarian feminists urge women to explore the pleasures of consensual sex, be it heterosexual or homosexual, autoerotic, sadomasochistic, or intergenerational. They seek to free women from the belief that good sex can be experienced only in a committed, long-term love relationship and that sex for sex's sake is somehow bad, promiscuous, or dirty. In addition, radical-libertarian feminists advise women to use reproduction-controlling and reproduction-assisting technologies as little or as much as they wish. For example, they encourage women to prevent or terminate unwanted pregnancies or, alternatively, to have children when they want them (premenopausally or postmenopausally), how they want them (naturally or artificially), and with whom they want them. The overall conviction of radical-libertarian feminists is that no matter how much educational, political, and economic equality women achieve, nothing fundamental will change for women so long as women's reproductive role remains the same. It does not matter whether a woman is a CEO or a file clerk. So long as her primary identity is that of a wife and/or mother, she will remain burdened with responsibilities from which men are free. For this reason, some radical-libertarian feminists look forward to the day when ectogenesis (extracorporeal gestation in an artificial placenta) entirely replaces the natural process of pregnancy, labor, delivery, birth, breast-feeding, and subsequent weaning.

Although radical-cultural feminists are just as focused on sexual and reproductive matters as radical-libertarian feminists are, they have serious reservations about women substituting reproductive technologies for their own birthing powers. Increasingly referred to as "essentialists" on account of their view that all women are fundamentally the same, radical-cultural feminists caution that sex, understood primarily as heterosexual sex, is usually more dangerous and compulsory than pleasurable and consensual for women. In their estimation, women are forced to serve men's sexual desires and reproductive needs to a greater or lesser degree. More often than not, men reject and/or ridicule women who are not attractive. Worse, some men physically abuse women for not satisfying them sexually or failing to produce children for them on demand. Radical-cultural feminists believe, therefore, that heterosexuality is not about men and women pleasing each other equally; rather, it is about men seeking to control and objectify women representatively through pornography and actually through the use of sex workers and the systematic sexual harassment, rape, and physical abuse of women. Therefore, radical-cultural feminists urge women to abandon heterosexual relations and to seek lesbian relations instead. Separate from men's gaze, control, and power, women can discover a woman-centered sexuality and gain strength to accomplish goals they value.

In addition to stressing the dangers of heterosexual relations and the advantages of lesbian alliances, radical-cultural feminists claim that artificial reproduction is more likely to disempower than empower women. They advise women to view physician-mediated donor insemination, in vitro fertilization, genetic testing, reproductive cloning, and plans for an artificial womb not as procreative options for women but as means for a male-dominated society to exercise greater control over women's procreative powers. In an unreflective rush toward the local assisted-reproduction center, women may unwittingly forsake their fundamental power—namely, their ability to bring new life into the world through their own bodies. Marxist-socialist feminists depart from both liberal and radical feminists in that they come close to replacing the category of gender with the category of class. They note that although it is true that women occupy a subordinate position relative to men for gender-related reasons, this fact does not mean all women are equally oppressed. For example, rich women are able to control poor men in ways that poor women cannot control poor men. In the United States, at least, money purchases women a measure of power that can offset their body-based vulnerabilities vis-à-vis men.

Marxist-socialist feminists insist women's oppression originated in the introduction of private property, an institution that they believe obliterated whatever equality of community humans had previously enjoyed. Private ownership of the means of production by relatively few persons, originally all male, inaugurated a class system whose contemporary manifestations are corporate capitalism and state imperialism. Reflection on this state of affairs suggests that capitalism per se, as well as the larger social rules that privilege men over women, is the cause of women's oppression. If all women—rather than just the "exceptional" ones—are ever to be liberated, the two-headed beast of capitalist patriarchy or partriarchal capitalism must be destroyed.

Marxist-socialist feminists are conflicted in ways that liberal and radical feminist are not precisely because they are not certain whether to use gender or class as their primary lens of analysis. According to Chris Beasley, Marxist-socialist feminists have developed three approaches to enable them to do what may be impossible, namely, blend class and gender into a seamless analytic tool. These three approaches are labeled the two-tier or dual-systems approach, the unified-system or capitalist-patriarchy approach, and the dynamic-duo approach.

The early work of Juliet Mitchell epitomized the two-tier or dual systems approach to class and gender. In her well-known work, *Women's Estate,* Mitchell abandoned the traditional Marxist feminist position according to which women's relatively low social status is fundamentally a function of their relation to capital, of whether or not they are part of the productive workforce. In place of this monocausal explanation for women's oppression, she suggested that women's condition is multiply determined by women's role not only in production but also in reproduction, the socialization of children, and sexual relationships. Yet Mitchell did not go so far as to say that women's role in production is no more important than her reproductive, maternal, and sexual role. Ultimately, her explanation for women's oppression is more class focused than gender focused.

In an effort not to privilege the category of class over that of gender, some of Mitchell's successors strove harder to develop a unified-system version of Marxist-socialist feminism. For example, Iris Young claimed that because class per se is a sex-blind category, it can never be an adequate basis for an analysis of women's specific oppression as women. She insisted that only a gender-aware category such as the sexual division of labor could explain why women in the productive workforce are more likely than men to take the orders, do the mundane jobs, get paid less, and work a "double day" (for example, 8 hours as a secretary in the "public" realm and then 8 hours or more as a housekeeper and child rearer in the "private" realm). Moreover, no matter how high up the professional ladder women climb, their work will be marked with the stamp of gender. For example, female physicians are more likely to specialize in pediatrics than in neurosurgery and women in business are more likely to head the human resources than the finance department.

Although a unified-system version of Marxist-socialist feminism blended class and gender analysis better than a dual-system version did, it turned out to be problematic precisely because it insisted there was no way to separate gender oppression from class oppression. Reasoning that capitalism could exist without patriarchy and vice versa, exponents of yet another version of Marxist-socialist feminism, the dynamic-duo version, stressed that despite capitalism's and patriarchy's common desire to control women, patriarchs sometimes want to use women in ways that do not serve capitalists' interests and vice versa. In the 19th century, for example, male workers wanted their wives and daughters to stay at home, where they could personally service them, whereas male employers wanted women (excluding their own wives and daughters) to work for low wages in the productive workforce so they could make higher profits for them. Only if male workers and male employers could find some mutually agreeable way to use women to meet their separate needs could both patriarchy and capitalism thrive. As it turned out, in this particular instance, a satisfactory deal was cut. Male employers offered male workers a "family wage" large enough to permit male workers to keep their wives and daughters at home but still small enough to keep male employers rich. But just because capitalists and patriarchs managed to answer the "woman question" successfully in this situation, it does not mean that they will always be able to answer it successfully. It is, in other words, possible for patriarchy to outlive capitalism or vice versa in the estimation of exponents of the dynamic duo version of Marxist-socialist feminism. One is not necessary for the other's survival.

Psychoanalytic and Gender Feminism

To the degree that liberal, radical, and Marxist-socialist feminists focus on the macrocosm (patriarchy or capitalism) in their respective explanations of women's oppression, psychoanalytic and gender feminists retreat to the microcosm of the individual, claiming that the roots of women's oppression are psychological—a matter of self-esteem, self-respect, and general self-understanding.

For psychoanalytic feminists, a focus on sexuality's role in the oppression of women stems from Freudian theory. In the so-called pre-oedipal stage, all infants are initially symbiotically attached to their mothers, whom they perceive as an omnipotent, unpredictable force in their lives. The mother, who can give so much, can also give too little. She can fail to nurse the infant on demand or to cradle him or her in the dead of night.

The primal pre-oedipal stage, which tethers the infant to the mother, ends for boys with the so-called Oedipus complex, the process by which boys give up their first love object, the mother, to escape castration at the hands of their fathers. As a result of submitting his id (desires) to the superego (collective social conscience), a boy is fully integrated into culture. Together with his father, he will rule over nature and women, seeking to control their irrational powers. In contrast to boys, girls, who have no penises to lose, separate slowly from their first love object, the mother. As a result of this slow individuation, a girl's integration into culture is incomplete. She exists at the periphery of culture as the one who does not rule but is ruled by men, to some degree because she fears her own power.

Because the Oedipus complex is the root of male rule, or patriarchy, some psychoanalytic feminists speculate it may be nothing more than a fiction created by men's imagination—a psychic trap that women in particular need to escape. Others object that human beings must accept some version of the Oedipus complex as the experience that integrates the individual into civilized society. In accepting some version of the Oedipus complex, however, human beings need not accept the Freudian version, according to which authority, autonomy, and universalism are labeled *male,* whereas love, dependence, and particularism are labeled *female.* These labels, meant to privilege men over women, are not essential to the Oedipus complex. Rather, they are simply the consequences of a child's actual experience with men and women. Over time, practices such as dual parenting and dual participation in the workforce might change the gender valences of the Oedipus complex substantially, so that authority, autonomy, universalism, love, dependence, and particularism become the equal property of both men and women.

Although gender feminism is related to psychoanalytic feminism, there are important differences between psychoanalytic feminists who focus on pre-oedipal and oedipal themes on the one hand and gender feminists who focus on the virtues and values associated with femininity or femaleness on the hand. Although care-focused feminists as well as psychoanalytic feminists probe women's psyches, care-focused feminists such as Carol Gilligan and Nel Noddings also pursue the relationship between women's psychology and morality, particularly their style of moral reasoning. In her groundbreaking work, *In a Different Voice,* Carol Gilligan claimed that on the average, and for a variety of cultural reasons, women in societies such as the United States tend to espouse an ethics of justice that stresses rules and rights. As Gilligan saw it, U.S. society seems to subscribe to a male model of moral development according to which a truly moral person is the kind of individual who is willing to forsake even family members and friends to uphold the law or to serve a cause he deems "noble." The kind of situation Gilligan has in mind is, for example, a father who rejects his homosexual son on the grounds that homosexuality is against God's law. Measured against this male model of moral development, many women fare poorly largely because abstractions such as the Law, Truth, and Faith are not nearly as important to them as the flesh-and-blood people in their lives. Gilligan insisted, however, that this fact about women does not mean that women are less morally developed than are men. Rather, it simply means that women are differently morally developed compared with men. For men, ethics is typically about being autonomous, taking a stand, self-identity, and achievement in work. For women, ethics is typically about being related to others, not hurting other people, intimacy, and success in love. But even though both men and women typically pursue their own kind of ethics, each gender is also capable of embracing the ethics of the other gender. In fact, in her later work Gilligan repeatedly stressed that the fully moral person is someone who is able to blend within his or her psyche the values of both women's and men's morality, expertly translating between the moral language of rights on the one hand and the moral language of responsibilities on the other.

Nel Noddings also drew a distinction between an ethics of justice and an ethics of care, identifying the former with men and the latter with women. She diverged from Gilligan, however, in her insistence that care is more fundamental than is justice. She also implied that, in U.S. society at least, men need to catch up with women morally.

Noddings contrasted the Greek myth of Ceres with the Old Testament account of Abraham and Isaac to underscore the limits of a morality she labels *male.* Recalling that Ceres was the Greek goddess responsible for the Earth's well-being, Noddings stressed that despite her sacred duties to nurture Earth, Ceres abandoned her post to search for her daughter Proserpine after she was abducted by Pluto, god of the underworld. Ceres refused to put her job, so to speak, above her daughter. In contrast to Ceres, observed Noddings, the Old Testament patriarch Abraham put abstract duty above concrete love. For him, doing one's duty—specified in his case as obeying God's will—was the ultimate moral imperative. When God commanded Abraham to sacrifice his son Isaac to him, Abraham prepared to kill his son even though he could not understand why God would command such an atrocious act. Distinctly unimpressed by Abraham's blind faith in God, Noddings claimed that Sarah, Abraham's wife, would have flatly refused to sacrifice her son Isaac to God. She would have reasoned that the command to kill Isaac was not really coming from God, or if it was coming from God, she wanted nothing to do with such a cruel deity.

In addition to Noddings, so-called maternal thinkers have used the mother-child relationship as a springboard for discussing the necessary and sufficient conditions for any and all moral human relationships. Maternal thinker Sara Ruddick argued that from the work mothers do for their children emerges a distinct mode of moral reasoning best termed maternal thinking. To meet the three fundamental goals of maternal practice—namely, the preservation, growth, and social acceptability of children—mothers must, said Ruddick, cultivate a multitude of very specific virtues, the most important of which is the metavirtue of attentive love. This metavirtue, which is at once cognitive and affective, enables mothers to really know their children in all their uniqueness. Recognizing that their children are capable of doing evil as well as doing good, good mothers try to help their children eliminate the vices and weaknesses peculiar to them, slowly replacing them with virtues and strengths.

Concerned that well-intentioned, goodwilled men might feel that, by virtue of their XY chromosome, they cannot think maternally, Ruddick noted that *all* human beings are capable of thinking in terms of preserving each other, helping each other grow, and making each other socially acceptable. To survive as a human species and to thrive as individual human beings, both genders need to think maternally in the public world as well as the private world. Ruddick opined that because nonmaternal thinking has dominated the public realm, U.S. society has been pushed in the direction of ecological disorder, social injustice, violence, and war. People who do not think like mothers, observed Ruddick, do not seem to see like mothers. For a nonmaternal thinker, war is about winning, defending one's way of life, and establishing one's position of power. In contrast, for a maternal thinker, war is about destroying the child whom one has spent years preserving, nurturing, and training—a unique human person who cannot be replaced. In other words, for a maternal thinker, war is about death—about canceling out the "product(s)" of maternal practice—and it is this realization that turns maternal thinkers in the direction of peace activities.

Multicultural and Global Feminism

Common to all the feminisms discussed in the foregoing is a desire to view women as somehow the same. There is a problem with stressing women's sisterhood and solidarity, however. Not only are women different from men, they are also different from each other. Women's class, race, ethnicity, nationality, sexual orientation, and so forth are not uniform. This point about women's differences, and not confusing one kind of woman (white, Western, middle-class) with all women or women in general, is the core conviction of both multicultural and global feminism.

In the late 1980s and early 1990s, the concept of "cultural diversity" captured the attention of major institutions in the United States, and multicultural feminism emerged as part of this celebration of diversity. Gender is neither the only nor necessarily the main cause of many women's oppression, according to multicultural feminists. As they see it, depending on her race, ethnicity, class, religion, sexual orientation, age, health status, and level of education, one woman's oppression may be another woman's liberation. Just because college-educated housewives in suburbia seek release from their domestic duties so they can get jobs in corporate America, it does not mean that female assembly-line workers do not yearn to be stay-at-home wives and mothers. More generally, just because many women find that matters related to their sexuality and reproductive capacities and responsibilities play the greatest role in their oppression, it does not mean that all women find this to be the case. For some women, not sexism, but racism, ethnocentrism, classism, heterosexism, ableism, and/or ageism are the major contributors to their low status.

Multicultural feminists replace discussions of sexism and androcentrism with discussions of interlocking systems of oppression (gender, race, and class) and women of color's and other marginalized women's multiple jeopardizes. Although a privileged white woman may hit her head against a glass ceiling or two in her lifetime, she will not have to face the kind of obstacles a Native American woman with limited education opportunities, severe diabetes, intermittent depression, and an alcoholic husband has to face. Nor will she have to contend with the kind of hardships that an undocumented Mexican woman in the United States accepts as her lot—as the price of admission to a better life for her children. As multicultural feminists see it, sexism, racism, classism, ableism, elitism—indeed all the "isms" that divide people—interlock and choke whomever they catch in their grip. Oppression is a many-headed beast capable of rearing any one of its heads depending on the situation. The whole body of the beast is the appropriate target for multicultural feminists who wish to end its reign of terror, and, depending on her situation, each woman must pick and choose her battles.

Global feminism differs from multicultural feminism because it focuses not on women in any one nation-state but on how the condition of women anywhere in the world affects the condition of women everywhere else in the world. Agreeing with multicultural feminists that feminism cannot ignore women's cultural differences, global feminists nonetheless strive to create alliances among women worldwide. They have two goals in common. The first is to convince all nations to honor women's right to make free choices about matters related to their reproductive and sexual capacities and responsibilities. Without the ability to control their own bodies, women cannot feel like full human persons. The second, coequal goal of global feminists is to bring women (and men) together to create a more just social and economic order at the international level as well as the national level. Global feminists are activists as well as theorists; they are bent on creating a world in which all people, no matter where they live, have enough food, shelter, clothing, health care, and education to live full human lives.

Global feminists claim that women must forge strong international networks to eliminate the disparities that exist between the world's wealthy people and the world's poor people. For them, universal sisterhood is not a natural state of affairs but an ideal to achieve. Because of their nations' condition, women in developing nations are often much more focused on economic, social, political issues than on the sexual and reproductive issues that have tended to preoccupy the interest of women in developed nations. As a result of women's different national priorities, however, women's conversations at international conferences have sometimes degenerated into shouting matches. In fact, at each of the three international women's conferences the United Nations (UN) sponsored during the International Decade for Women (1975–1985)—in Mexico City (1975), Copenhagen (1980), and Nairobi (1985)—problems emerged among women who were variously identified as First World, Western, Northern, or from developed nations on the one hand and women who were variously identified as Third World, Eastern, Southern, or from developing nations on the other. By the 1995 women's conference held in Beijing, however, global feminists had helped women resolve some of their cross-cultural differences and to appreciate some of their commonalities. This conference was pronounced a success by its participants, who forged a strong women's human rights document at it.

Global feminists are proud of women's international agreements, but they realize that women need to do more than talk about women's human rights to create a just and equitable social order. Privileged feminists must, they say, be prepared to forsake some of their material luxuries so that disadvantaged women can secure the food, clothing, and shelter they and their families need to survive. Emphasizing that material goods are not in infinite supply and that scarcity of goods and services is increasingly the order of the day, global feminists claim that feminists must take the lead in living more simply and frugally so that life on earth can continue through this millennium and beyond. Unless privileged feminists stop being part of the world's maldistribution system, they cannot in good conscience represent themselves as true opponents of the forces that coconspire to create and maintain systems of human domination and subordination.

Postmodern and Third-Wave Feminisms

Like multicultural and global feminists, so-called postmodern feminists emphasize women's differences, but in ways that shake some of feminism's basic assumptions. Inspired by a variety of antifoundationalists, especially the deconstructionist Jacques Derrida and the psychoanalyst Jacques Lacan, postmodern feminists faulted feminist thinking prior to their emergence on the scene to the degree that it sought to articulate *one, true feminist* story of reality. Postmodern feminists viewed this kind of feminist project as a variation on patriarchal phallocentric thought, which uses divisive language to maintain patterns of human subordination and domination. Wanting to overcome so-called oppositional thinking—that is, a mode of thinking that contributes to conceptual polarities and political divisions such as developed nation/developing nation, white/nonwhite, rich/poor, nature/culture, and male/female—postmodern feminists attempted to think nonoppositionally.

Among the early second-wave postmodern feminists who maintained that oppositional or binary thinking impeded the development of feminist thought was Hélène Cixous. She claimed that thinking in terms of oppositions not only limits thought but also generates real world power struggles by privileging one term in an oppositional dyad over the other. She also claimed that all conceptual dichotomies are grounded in the fundamental dichotomy—man/woman—in which man is associated with all that is active, cultural, light, high, or generally positive and woman with all that is passive, natural, dark, low, or generally negative. Cixous stressed that in the man/woman dichotomy, as in all dichotomies, the first term of the dichotomy is the term from which the second is said to depart or deviate. Man is the self, woman is the other; man leads, woman follows, and so on. Thus, said Cixous, woman exists in man's world on his terms. She is either the other for man, or she is nothing—the unthinkable, the unthought.

Cixous challenged women to liberate themselves by putting themselves into words and thinking the unthinkable. The type of writing that Cixous identified as woman's own—marking, scratching, scribbling, jotting down—evoked the image of Heraclitus's ever-changing river. In contrast, the type of writing that Cixous associated with man brought to mind Parmenides' changeless world in which what is has always been and will always be. As soon as a thought gains the official seal of patriarchal approval, said Cixous, it is no longer permitted to move or change. Thus, for Cixous, the way women write is not merely a new style of writing; it is the only way in which women can escape the power of men.

Third-Wave Feminism

Like postmodern feminists, so-called third-wave feminists are more than willing to accommodate diversity and change. They are particularly eager to understand the ways in which gender oppression and other kinds of human oppression reinforce each other. For third-wave feminists, difference is the way things are. Their world is the Heraclitean world, not the Parmedian world. Moreover, contradiction, including self-contradiction, is expected and even welcomed by third-wave feminists. So too is conflict. Leading third-wave feminists stress that they do not require women to subscribe to any one feminist dogma or party line. Their only goal is to help women, individually and collectively, lead happier, healthier, and fuller lives.

As part of their attempt to help women better understand each others' situations, third-wave feminists engage in research and writing that attends to the lives and problems of specific groups of women and, even more typically, individual women. Their work is based on the real lives and problems women face, and, even more than multicultural, global, and postmodern feminists, third-wave feminists stress that women come in many different colors, ethnicities, nationalities, religions, and cultural backgrounds. Thus, a typical third-wave feminist text will include articles about women who represent a wide variety of multicultural perspectives: Hispanic-American, African-American, Asian-American, Native American, and so on. Indeed, it is difficult to find an article authored by a third-wave feminist that is not heavily hyphenated and that does not emphasize that each woman is different from every other woman.

Third-wave feminists are not so much interested in getting women to want what all women should want, as in responding to what individual women say they want and not second guessing or judging whether their wants are authentic or inauthentic. They describe the context in which they do feminism as messy or partial and provisional in nature. According to third-wave feminists Leslie Heywood and Jennifer Drake, part of this messiness includes embracing women who refuse to identify themselves either as women or as men and who try on different ethnic identities as one might try on different styles of clothes. To put it mildly, third-wave feminists are very nonjudgmental.

Conclusion

By not only insisting that one feminist identity does not exist, but also celebrating its absence, third-wave feminists and postmodern feminists respond to the spirit of the 2000s. The strength of these forms of feminism is that they refuse to force women to think and act in the same way. But third-wave feminism and postmodern feminism also have faults of their own. Not only is the essentialist notion "Woman" gone, the category of gender has been seriously weakened. Whereas the challenge for past feminist thinkers was to overcome the idea that all women are necessarily victims or victims in the same sort of way, the challenge for feminists today is to recognize that to have feminism, one has to believe that women constitute some sort of class or social group and that just because some women feel empowered it does not mean all women feel this way. Women in the United States and other developed nations may be more equal and free than they were 50 or even 25 years ago. But women in many developing nations often live in conditions more oppressive to women than even the conditions that challenged U.S. feminists at the turn of the 19th century. Thus, women may have something to lose as well as to gain in their embrace of each other's many differences. They may, as Christine di Stephano cautions, lose themselves.

Gender still makes a difference, and men still remain more "equal" than women. Feminists are in no position to develop gender-blind theories as of yet. The only theories they dare create must remain focused on women and distinct from humanism.

Ferguson, Adam (1723–1816)

Ferguson was a noted figure of the Scottish Enlightenment. His major work, *An Essay on the History of Civil Society,* offers a natural history of the development of society and examines the role of the citizen in the modern commercial state. Born near the Highlands of Scotland and educated at the University of St. Andrews and at Edinburgh, Ferguson was an ordained minister in the Church of Scotland (Presbyterian). He was later appointed to the chair of natural philosophy at the University of Edinburgh and subsequently was appointed to the chair of moral philosophy. His works include *Institutes of Moral Philosophy, The History of the Progress and Termination of the Roman Republic,* and *Principles of Moral and Political Science.*

Preeminently a moralist, and influenced by Aristotle and the Stoics, Ferguson maintains that the moral good lies in happiness, the perfection of character. Not reducible to pleasure, happiness requires activity and achievement, including benevolent action. There is no conflict between genuine self-interest and the well-being of society. Because this theoretical knowledge of moral goodness requires an awareness of human nature and social circumstances, these provide the subject matter of much of the *Essay on Civil Society.*

Ferguson opens this work declaring that human beings are forever found in groups. There is no state of nature out of which isolated individuals contract to form society. Nor can human motivation be reduced to egoism, as Thomas Hobbes or Bernard Mandeville seemed to believe. Blessed with multiple propensities, including a natural affection for society, humans also have an impulse to competition and opposition, seemingly negative tendencies that may, Ferguson maintains, contribute to social cohesion and the preservation of liberty. The human being also possesses an instinct to excel and seek improvement, and this operates at both the individual and the species level. Society progresses from savage and barbaric stages (with no or little property) to a refined state with landed property, government, and liberty under law. Notable in Ferguson's account is how institutions, including constitutional and social arrangements, develop and emerge in a slow and unintended fashion. What is attributed to rational foresight or conscious agreement is often the result of the myriad actions and adjustments of individuals responding to circumstances over time.

Although Ferguson prefers the prosperity and liberty of the modern commercial society, he worries that modern individualism puts at risk communal bonds and public spirit. The division of labor, an unintended development, is essential for prosperity, but overspecialization may leave the citizen distinct from the soldier and the soldier distinct from the statesman; it may also create inequalities between those in liberal and mechanical vocations. Ferguson warns that a fixation on material fortune, including luxury goods, may distract citizens from the public weal and sunder all social connections except those of trade and exchange. Such a corruption of the self, with its indifference, cowardice, and loss of vigor, leads to despotism.

Ferguson's thought manifests a sympathetic awareness of the risks that accrue to modern and commercial societies. He also discerns how social order emerges slowly and spontaneously, often from the interplay of agents in conflict. That unintended outcomes may also be beneficial is an important idea that also has a home in the work of Bernard Mandeville, Adam Smith, and, more recently, F. A. Hayek.

FIDELITY

Fidelity is a word that means being faithful to obligations, duties, or observances. It means being true to one's word and having the disposition to fulfill promises. It equates to trustworthiness and implies discretion, judgment, and conscientiousness. It can also mean having unswerving allegiance to a person, spouse, or cause.

Fidelity came into English usage in the 15th century. Initially it referred only to the quality of being faithful or loyal to a person. It has its origins in the ancient Greek word *peithesthai,* meaning to believe or trust in a thing. Homer (eighth century BCE), the Greek epic poet who wrote the *Iliad* and the *Odyssey,* used a form of the word that indicates that the notion of fidelity has been a key concept in Western thinking from earliest times.

Fidelity covers a wide range of meanings. It reflects words such as accuracy, veracity, loyalty, honesty, observance, and probity. In respect to accuracy, we talk about exactness and exactitude or precision and preciseness in reproduction. In the electronic world, we speak of high fidelity and low fidelity when referring to the reproduction of sound and the amount of distortion that is associated with it. In respect to veracity, we talk about truthfulness, and in respect to loyalty, we talk about constancy and faithfulness. Observance relates to reliability, good faith, and probity.

Probity is probably the most relevant of all these terms. It relates to qualities such as rectitude, uprightness, goodness, honesty, and integrity.

In today's business world, not all senior managers and executives have these qualities. Some of them appear in the media from time to time accused of breaching ethical guidelines or taking part in illegal activities such as fraud and embezzlement. If we interpret fidelity in a business sense to mean faithfulness to one's professional obligations, duties, or observances, then it seems there are some issues to address.

Fidelity in Business

Fidelity in a business sense, as opposed to fidelity in a general sense as described in the foregoing, is the quality that facilitates transactions that take place on the stock market or in real estate. Fidelity is the special quality that facilitates closure in a business situation where a handshake or verbal agreement is often all that is necessary to clinch a deal.

Fidelity in business refers specifically to three criteria, that is, keeping contracts; fiduciary duties and responsibilities; and maintaining confidences or giving assurances.

A contract is a mutual agreement between two or more parties that something shall be done or forborne by one or both. A contract can be agreed on within the context of an ethical approach to business and being responsible socially, but it can also be an agreement enforceable by law.

Fiduciary duties and responsibilities are more complicated. A fiduciary is someone who makes decisions on behalf of someone else: For example, a person who acts as a trustee in respect to an organization's retirement scheme is a fiduciary because she or he makes decisions on behalf of the plan participants. A fiduciary duty is a legal relationship between two or more parties where someone has agreed to act as a caretaker of someone else's assets or well-being.

Fiduciary duties require moral behavior and probity of a high standard, over and above that expected in a business environment. Fiduciary responsibility means that a financial adviser will always act in the client's best interests. In real estate or stock market dealings, agents have fiduciary duties and responsibilities in respect to their clients, which means that their basic duty is to act solely in the interest of their clients. People who want to buy or sell a house or who want to invest for their retirement would like to think that their assets are safe because the agent to whom they have entrusted their business can be trusted. Unfortunately, we see reports in the press where well-known corporations have fraudulently misled their staff and the investors who put their trust in them.

Fiduciary duties and relationships require a range of actions such as (1) acting with the utmost care, ensuring that maximum protection and information are provided to the client; (2) acting with integrity (integrity defined as soundness of moral principle and character); (3) acting honestly and fulfilling the duty of full disclosure of all material facts; (4) acting loyally, that is, refraining from acquiring any interest that could be adverse to that of the client; and (5) fulfilling the duty of good faith, which includes total truthfulness, absolute integrity, and total fidelity to the client's interest. There would be no conflicts of interest such as an adviser being compensated by a company for promoting their product(s).

In choosing an investment manager, trustees are charged with the responsibility of finding the best person in terms of qualifications and experience to carry out their duties. Investment managers must always act prudently, meaning they must act cautiously and wisely. Maintaining confidences or giving assurances also involve qualities such as trust, reliance, or faith.

The following may help explain the meaning of the term fiduciary. An acquaintance acquired $0.75 million from an associate who was also a mortgage broker. No one, it seemed, knew the exact terms of the deal. Was it a loan? A payoff? Something for services rendered? Or what? The money, we learned, was used to purchase an old warehouse that was in need of repair and renovation. Some years later, the associate who had provided the $0.75 million was surprised, perhaps shocked and angry would be more accurate, to see the warehouse being advertised. It was being transformed into inner-city, luxury apartments. The selling price started at $1.5 million and ranged upward. The acquaintance, that is, the beneficiary who had use of the money, took legal advice and became concerned when the word fiduciary was used by his lawyer to describe his dealings with the associate who had lent him the original $0.75 million. The acquaintance, we learned, was prepared to repay that sum but was having difficulty in coming to terms with the fact that he would probably have to repay considerably more if it was proved in court that the deal had been made on the basis of it being a fiduciary business arrangement.

The aggrieved associate who had provided the money felt he was entitled to a cut on his capital outlay if the apartments were sold at a substantial profit. He insisted that the two of them had entered into a fiduciary relationship. He wanted his $0.75 million back plus a substantial add-on for the increased value of the old warehouse that was being renovated with his original loan. The case reached the civil courts after a long-drawn-out process. The legal proceedings, which seemed to drag on for years, had a detrimental effect on the beneficiary's family, who were living with the possibility of bankruptcy and being made homeless if the case went against them. It transpired that the original transaction was a fiduciary business arrangement based on trust, a trust that had since broken down. The case was eventually settled out of court and at great cost.

Fiduciary Duty

A *fiduciary* is a person who has been entrusted with the care of another's property or other valuables and who has a responsibility to exercise discretionary judgment in this capacity solely in the interest of this other person's interest. Common examples of fiduciaries are trustees, guardians, executors, agents, and, in business, directors, officers, and executives of corporations. Fiduciaries provide a valuable service for individuals who are unable for some reason to exercise control over their own property or assets. Thus, a parent facing death might provide for a dependent child by creating a trust to be managed by a trustee.

A fiduciary is part of a *fiduciary relationship,* in which another person is the *beneficiary* of the fiduciary's service. Typically, the beneficiary is in a vulnerable or dependent status and must rely on the fiduciary to act on behalf of the beneficiary. A fiduciary, on the other hand, usually occupies a superior position of power and authority, which creates opportunities to advance the fiduciary's personal interests. For example, a trustee might (improperly) invest the assets of a trust in a personal business venture.

Anglo-American law has developed the principles of a legal duty to ensure that a fiduciary in a fiduciary relationship acts solely in the interest of a beneficiary and does not take improper advantage of the position of trust. A *fiduciary duty* may be defined, then, as the duty of a person in a position of trust (a fiduciary in a fiduciary relationship) to act solely in the interests of another (the beneficiary) without gaining any material benefit except with the knowledge and consent of that other person.

Who Is a Fiduciary?

The concept of a fiduciary originated in Anglo-American common law for cases in which one person entrusts property or other valuables to the care of another, and it remains a central concept in the law of trusts. The concept has evolved over time to cover other trustlike situations where one person has superior power and influence over another and that other person places confidence in or relies on that person. A fiduciary relationship, then, involves two elements: trust and confidence. Something is entrusted to the care of a person, and another has confidence that proper care will be taken.

That which is entrusted is most often property (land, for example) or assets (such as money or securities), but it can be anything of value, including information and power. Thus, a client may entrust valuable information to an attorney or an investment banker; or a person may entrust the power to make a certain decision to another, as when someone gives another person power of attorney. Indeed, guardians and agents are fiduciaries only in virtue of being delegated the authority to make decisions on behalf of another.

The concept of a fiduciary is of ancient origin. Certain positions of trust, such as trustee and guardian, were recognized in Roman law, and the word *fiduciary,* which derives from the Latin word for trust, dates from the 16th century. The position of agent, though, developed only in the 18th century, and a great expansion in the scope of fiduciaries occurred in the 19th and 20th centuries. This expansion occurred primarily in connection with the rise of a market economy and the modern corporation since they create a great need to rely on other individuals and on large institutions.

Anglo-American law holds that directors, officers, and executives of corporations have a fiduciary duty to serve the shareholders' interest. In addition, members of partnerships and joint enterprises are fiduciaries with respect to each other's interest, and majority shareholders are fiduciaries with responsibilities toward minority shareholder in some circumstances. Mutual and pension funds are fiduciaries for their investors, and investment advisers are fiduciaries for their clients. In recent years, fiduciary law has been extended to parties such as physicians and attorneys that have not been traditionally recognized as fiduciaries. Thus, the scope of fiduciary law is constantly expanding.

Although fiduciary duties can be created by contract between two parties and have a basis in legislation, they have been imposed largely by courts. Historically, fiduciary duty belongs to the law of equity, in which courts decide cases on the basis of justice or fairness instead of strictly formulated rules. The reason for this is that the duties of fiduciaries cannot easily be specified in rules, either in written contracts or in detailed legislation. These duties are concerned more with the proper exercise of broad discretion than with the observance of the terms of a contract or a legislative act. For this reason, courts rely on certain general principles to determine whether a fiduciary has acted appropriately.

The Duty of Fiduciaries

Broadly, the duty of a fiduciary is to act in the interest of the beneficiary. This duty, which requires the subordination of self-interest, contrasts with the market conduct, in which everyone is assumed to act out of self-interest. The main principles of fiduciary duty are candor, care, and loyalty. In general, these principles involve obligations that also apply to market actors but to a higher degree for those in fiduciary relationships.

Candor

In a market, everyone has an obligation of honesty or truth-telling. It is wrong to say something false or to make a material misrepresentation. However, market actors are not required to disclose all information that others might want to know. A fiduciary, on the other hand, has a duty of candor, that is, a more extensive obligation to disclose information that the beneficiary would consider relevant to the relationship. Thus, it would be violation of a fiduciary duty for an attorney or an investment banker to conceal important information from a client (unless doing so would violate a duty to another party). Similarly, the director of a company would fail in a fiduciary duty by remaining silent about matters that are critical to a decision under discussion.

Care

When property or assets are entrusted to a fiduciary—the trustee of a trust, for example—that person should manage what is entrusted with due care, which is the care that a reasonable, prudent person would exercise. Although an extraordinary level of care is not legally required, a fiduciary is expected not to act negligently. Although market actors also have a duty of due care with respect to certain matters, this obligation governs only how the party conducts a chosen activity and not the activities that are chosen. For example, a manufacturer should exercise due care in the design and assembly of its products, but it has no responsibility of due care in the products it chooses to manufacture. A fiduciary, in contrast, has a duty to act in all matters with a high level of care. Generally, a fiduciary has a great amount of discretion in choosing how to care for that which has been entrusted, and the principle of due care for a fiduciary includes how that discretion is exercised.

Loyalty

A duty of loyalty has two aspects: It requires a fiduciary to act in the interest of the beneficiary and to avoid taking any personal advantage of the relationship. In a market transaction, there is generally no obligation to serve the interests of another except to make good faith efforts to abide by the contracts made; and gaining some personal advantage is the whole point of entering into a market transaction. In general, acting in the interest of a beneficiary is acting as the beneficiary would if that person had the knowledge and skills of the fiduciary. Taking personal advantage, in contrast, is deriving any benefit from the relationship without the knowledge and consent of the beneficiary.

An example of personal advantage-taking in a fiduciary relationship is self-dealing, as when a director or executive buys some asset from the company or sells something to it, unless it can be shown that the transaction is fair and would have occurred at arm's length. Insider trading or other personal use of confidential information gained in a fiduciary relationship is also a violation of a duty. It is wrong for a fiduciary to gain some personal benefit, even if the beneficiary is not harmed, because the fiduciary would no longer have an undivided loyalty. To have such a divided loyalty is also a conflict of interest, and so the principle of loyalty entails that a fiduciary should avoid any conflict of interest.

Conflict of interest is difficult to avoid, however, and a requirement that conflict be avoided entirely might not be desirable. For example, directors are usually officers or executives of another company, and they often serve on other boards as well. To insist that directors avoid all conflict of interest would deprive companies of knowledgeable and experienced guidance. The principle of loyalty can still be honored, though, if directors act conscientiously to exercise unbiased judgment, disclose all conflicts, and refrain from participating in some decisions.

Remedies for Violations of Fiduciary Duty

For violations or breaches of fiduciary duty, the courts have generally imposed remedies that are more far-reaching than those for mere failures to fulfill contracts. The standard remedy for breach of contract is an award in the amount of a victim's loss. However, the remedy for violation of fiduciary duty takes account not only of the victim's loss but also the wrong done by the breach; that is, the breach of a fiduciary duty is a moral and legal wrong that ought to be punished regardless of the loss to a victim. The standard remedy for violation of a fiduciary duty, therefore, is the amount of the wrongful gain by the fiduciary. Thus, even if the beneficiary is not harmed or perhaps even benefited, any amount realized by the beneficiary in a violation of fiduciary duty is wrongfully gotten gain that ought to be forfeited. That a director's action benefited a company is no defense to a charge of self-dealing, for example.

The Justification of Fiduciary Duty

To the question of why a fiduciary has a particular duty—that is, why a fiduciary should act with candor, care, and loyalty—there is a simple answer: This is what a fiduciary has agreed to do. Fulfilling a fiduciary duty is merely abiding by the terms of a contract that one has made in becoming a fiduciary and entering into a fiduciary relationship. Fiduciary duty is thus founded on a contract, and the specific obligations of a fiduciary are whatever terms are contained in this contract. This simple answer requires some further explanation, however.

Although a fiduciary relationship is founded on a contract, the contract is incomplete in important ways. The obligations of a fiduciary, or what a fiduciary has agreed to do, cannot be fully specified in advance. For example, the creator of a trust (a grantor) could not write a contract with a trustee that details every act the trustee should perform. The situations that a trustee might encounter are too varied and unpredictable to allow the grantor to give precise instructions for each one. Indeed, the grantor may not know what instructions to give and may be relying on the knowledge and skill of the trustee to determine how to act in certain situations.

The main value of the fiduciary relationship is its use in situations where complete instructions are not possible, where it is impossible, in other words, to write contracts that specify every act to be undertaken. Indeed, if such contracts were possible, then there would be no need for fiduciaries. Fiduciary relationships exist primarily to enable individuals to give control of property, information, or power to other people without complete instructions, relying instead on trust.

Some of the obligations of fiduciaries may also be imposed by legislatures. The law of trusts prescribes some rules for trustees, for example, just as the law of wills similarly prescribes some rules for executors. However, the role of legislatures in connection with fiduciary duties is mainly to anticipate some of the situations a fiduciary might encounter and to enact legislation that approximates what the contracting parties might agree to. Such legislation provides, in effect, standard-form, "off-the-shelf" contracts that save contracting parties the trouble of addressing every matter. Thus, it would be burdensome for people creating trusts or wills to include all the necessary instructions for trustees or executors, and so legislatures provide rules that, in some instances, the parties involved can alter if they choose. Much of the law on fiduciary duty is default legislation that applies unless the parties contract differently.

However, in fiduciary relationships, neither contracts nor legislation can provide complete instructions and rules for all situations. In such cases, there is a role for courts to step in to "fill in the gaps" of incomplete contracts. Fiduciary duty can be understood, then, as gap-filling judicial interpretation. To some extent, the courts fill this role with all contracts, but in most cases, the need for such gap-filling is minor. In fiduciary relationships, in contrast, much of the contract is left open with only the general objective of serving the beneficiary's interest specified. Since a fiduciary has a great deal of discretion in the choice of means, the main task for the court is to determine whether the means are appropriate for the objective and whether any abuse has occurred. These matters can best be judged by applying the general standards of candor, care, and loyalty.

The Fiduciary Duty to Shareholders

The importance of fiduciary duty in business lies principally in the question, "For whom are corporate managers fiduciaries?" To whom do directors, officers, and executives of corporations owe a fiduciary duty? The standard answer is that managers have an exclusive fiduciary duty to shareholders, which is to say that they ought to serve shareholder interests alone and should seek to maximize shareholder wealth. This fiduciary duty to shareholders has been questioned on two related grounds. One ground is that management's fiduciary duty appears to place shareholders in a privileged position in comparison with employees, customers, suppliers, and other corporate constituencies. The second ground is that a fiduciary duty of exclusive loyalty to shareholders appears to bar corporations from being socially responsible inasmuch as this involves serving other interests as well. Both concerns may be largely explained away, however.

Why a Fiduciary Duty Is Owed to Shareholders

Although many rationales have been offered for making shareholders the beneficiary of management's fiduciary duty, the standard argument begins with the assumption that each corporate constituency—employees, customers, suppliers, and investors—contracts with a firm, providing inputs needed for production in return for some gain. The firm thus becomes a nexus of all the contracts with its various input providers. Most of these contracts are relatively unproblematic, but the situation of shareholders presents difficult contractual problems. Their return on the capital they have provided consists of a claim on the residual revenues or profits of a firm, which are the revenues that remain after all debt obligations are paid. This claim on residual revenues can be secured only if management operates the firm so as to maximize residual revenues or profits, and the best way of assuring this is for shareholders to have corporate control.

The right to residual revenue and the right of control constitute the contract that shareholders have with a corporation. If shareholders also manage a firm or are able to give complete instructions to the managers, then there is no need for fiduciary duty. However, when there is a separation of ownership and control, shareholders, like grantors with respect to trustees, are unable to write complete contracts; that is, the situations likely to be encountered by managers, who have effective de facto control of corporations, are so varied and unpredictable, that shareholders, who have de jure control, cannot provide detailed, comprehensive instructions. To compensate for this inability to write complete contracts, they rely instead on the protection offered by management's fiduciary duty.

Other constituencies, in contrast, are able to form relatively complete contracts with a firm and thus have little need to be the beneficiary of management's fiduciary duty. Employees, for example, would prefer that their wages be secured by fixed claims rather than residual claims, so that the payment of wages becomes a debt obligation rather than a part of the residual revenues. Similarly, the interests of customers, suppliers, and other kinds of investors, such as bondholders, are adequately protected by relatively complete contracts, and so they also prefer fixed claims that constitute debt obligations.

Fiduciary duties thus have value primarily for residual claimants, whose return on their investment in a firm cannot be easily secured by complete contracts. Far from privileging shareholders, management's fiduciary duty to them reflects their unique vulnerability inasmuch as fixed claims or debt obligations are much more secure than are the shareholders' claim on residual revenues or profits. Put another way, fiduciary duty is a corporate governance device that is uniquely suited to filling in the massive gap that exists in the open-ended contract between shareholders and corporate directors, officers, and executives. In some situations, other constituencies may benefit from the use of fiduciary duties; for example, in U.S. law, managers are fiduciaries with respect to employee pension plans. However, such exceptions are limited.

Fiduciary Duty and Corporate Social Responsibility

Management's fiduciary duty to exercise candor, care, and loyalty in pursuing the shareholders' interest serves in practice mainly to forbid self-dealing and gross negligence. However, short of such egregious violations or breaches of fiduciary duty, managers still have broad discretion. In particular, management has broad discretion in contracting with the corporation's main constituencies or stakeholder groups, and the business judgment rule protects managers from charges of violating their fiduciary duty as long as their actions are reasonably intended to promote the shareholders' interest. Since most acts of corporate social responsibility fall well within the appropriate exercise of management's discretionary authority, fiduciary duty is not a significant legal barrier to such conduct.

FIDUCIARY NORM

The fiduciary norm is a social norm that instructs the agent acting in his or her role of agency to act solely in the interest of his or her principal, without regard for any other interests, including the self-interest of the agent. The more highly dependent the principal on the agent's tasks of agency, the more likely is the norm to be triggered and to be more strongly prescribed.

As described in the following sections, the fiduciary norm requires the agent to make full use of the agent's skills; to expend all necessary effort to serve the principal; to exclude competing interests that could adversely affect the agent's actions for the principal, hence abiding scrupulously by the promise to serve the principal with perfect fidelity; to keep confidential information relevant to the relationship confidential; to make full disclosure to the principal regarding the agency, including the existence of any potentially competing interests;

and to ensure that the agent's actions feature good conduct, that is, are not disreputable in a way that will adversely reflect on the principal.

The notion that special expectations are placed on a social actor on whom others are dependent has a long history in the common law. Indeed, the counterpart of the fiduciary norm in the law is the *fiduciary principle,* which plays a prominent role in the laws of agency, contract, and trusts. As a social norm, however, the fiduciary norm is prescribed in certain quite general social contexts of dependency, described below, whether or not the relationship of agent and principal is formal. The fiduciary principle, on the other hand, is mandated in legal relationships of agency in which the agent is at least nominally under the orders of the principal (or has contracted with a third party to serve a beneficiary's interests and must act as if the agent's activity is mandated by the contract to serve). The modern law of agency, which incorporates the expectations of the fiduciary principle, is summarized in the *Restatement of the Law Third, Agency,* published by the American Law Institute in 2006.

The fiduciary principle presumes that the agent is acting under direction and must follow that direction. Thus, corporate directors are expected to serve shareholders under the fiduciary principle because they are actors who are in a legal agency relationship with the owners, that is, they must, at least technically, follow the orders of their principals, the stockholders. As a huge case law documents, this relationship, including the failure to follow the fiduciary principle, can be enforced—sanctioned—by the courts.

The fiduciary norm is also enforced, if with less certainty and formality. The fiduciary norm does not, of course, have a legal status, such that there exist governmental enforcement agents to ensure performance consistent with its provisions. But some definitions of *social norm* require that a social instruction does not even have the status of a norm unless behavior deviant from the norm's prescriptions is sanctioned by the community. In general, such sanctions are negative, though positive ones given on correct performance of the norm are also consistent with normative status.

As a social norm, however, the fiduciary norm is prescribed via socialization from the community in which the actor is embedded, and is actively maintained by that community. Hence, its essential character assumes that, whether or not the agent is in a formal relationship of agency, for example, within an employment relationship, the agent is acting with some discretion. Thus, the agent's discretionary choice of action is shaped by the community-supported norm; the agent *constructs* both the instruction of agency and the acts necessary to realize that agency. This is qualitatively different from the situation in which the question is whether or not to perform at a high level in response to a direction from the principal under a formal agreement with that principal, even though the level of response is discretionary, that is, the classic situation of the fiduciary principle.

In Stanley Milgram's famous experiments on obedience to authority, subjects follow experimenter directions to administer what they think are painful shocks to others. The issue is obedience, given knowledge of the consequences. This is not the same situation as the fiduciary norm, in which the question becomes how the agent will choose to fill in the discretion that she or he possesses to act for the principal. As noted and discussed at more length below, the agent's behavior under the fiduciary norm can be even more extreme because it can exceed the principal's initial request. In the Stanford Prison Experiment conducted by Philip Zimbardo, role-playing "guards"—agents—who had received only general instructions developed abusive behaviors toward the "prisoners." Their creative cruelty seems more consistent with the fiduciary norm than with what would have been generated by simple obedience to authority. Thus, ironically, both ethically best and worst behaviors under agency can follow from the operation of the norm.

The relationship between agent and principal under the fiduciary norm is at least abstractly one of contract, as it is in the case of the fiduciary principle and legal agency, but the contract may be informal in character so that there is mutual consent by principal and agent that the agent is to act for the principal. The situation may be distinguished from cases in which the consent by the principal is sequential, for example, that of the altruist or good Samaritan who rushes to the aid of a highly dependent principal who is unable to contract for the critical services voluntarily performed by the agent. Related social norms, including those of giving and helping, apply to such circumstances.

Some Examples

Examples of the fiduciary norm in operation are pervasive across many societal roles. They include situations as diverse as the following:

- A father agrees to bring back chocolate ice cream for his children for dessert. Finding the corner store out of chocolate, he drives five miles to buy it at a market certain to have chocolate, rather than trying another local store that may or may not have it. No one needs to ask him to drive the extra miles. If he were to come home with vanilla, his wife and children would tell him how much they were "depending" on him to bring chocolate and how disappointed they were in him because he did not put out the extra effort to try to get it elsewhere.

- A professor agrees to supervise an independent study course for a student who needs the credits to graduate. The professor creates a syllabus, discusses its content regularly with the student, and grades the student's paper. Teaching credit for independent studies is not given in the professor's department, but the department chair and the professor's colleagues make it known that they are aware and applaud the fact that the professor "went the extra mile" with the student.

- A doctor known for expertise in a particular developmental disability receives a phone call from parents of a newborn with the disability, born in another city. The phone call went to her office, but she takes the call, transferred from an assistant who answered the phone. The parents have specific questions about problems the child is having. After checking on some research, the physician calls the parents back in the evening of the same day. She does not get paid for this. Interns and residents in the doctor's specialty area are made aware that such behavior will be expected of them once their training is complete.

- Even while not under the direct supervision of their commanders, prison camp guards are observed to act with surprising cruelty when making discretionary choices about punishments or privileges to be given prisoners.

In each case, the agent chooses to go "above and beyond" in serving his or her dependent or vulnerable principal because it is uncertain whether ordinary levels of service will achieve the principal's goal, and, because of the norm and its sanctioning, it is unacceptable to the agent to fall below the principal's desired level of agent performance—*fiduciaries try to be "perfect" agents.* This assumes, of course, that provision of higher levels of service is indeed always preferred by the principal.

Such behavior illustrates a typical result of action by agents under the fiduciary norm: The use of the agent's skills with appropriate effort and without distracting, conflicting interests is not the only outcome from the norm. In addition, we get a tendency toward maximizing (or, at least, increasing) the level of service, given uncertainty, to ensure that the actual performance at least meets the principal's wishes. In an uncertain world, fiduciaries get us not only closer but sometimes beyond what was initially defined as *perfection.*

Note that because social norms are socially reinforced, the self-interest of the agent is not completely discarded, though it is not allowed to limit the agent's action for the principal. It enters as agents seek to avoid sanctioning for failing to serve the principal as a fiduciary. Thus, it acts as a spur to exceptional service for the principal.

Prescriptions of the Fiduciary Norm

The fiduciary norm was first identified as such—as a social norm, rather than only as a prescription in the common law—by Barry Mitnick in 1973. In 1975 (revised and published in a 1986 book), Arthur Stinchcombe independently discussed such a norm, placing it in the context of other norms of exchange, including norms of status and authority as well as the fiduciary norm. Other work on the fiduciary, both in its legal contexts and as a general social norm, has followed in the legal literature and elsewhere in social science. The discussion follows Mitnick's analysis of the norm.

The fiduciary norm is prescribed under the following conditions: (1) The norm applies to an actor, the agent, who *consents* to act for another actor, the principal. Thus, the norm occurs in mutually consensual, that is, contractual, relationships between agent and principal, though the contract may, but need not, be formal as in common business contracting. (2) The principal depends on the agent's actions. In other words, the principal is vulnerable to the agent's actions. (3) The agent is able to make *choices* of actions that affect the level of benefit received by the principal, that is, the agent has a degree of *discretion* over the return that the principal gets from the relationship. Thus, it is not just that what the agent does can affect the principal in different ways, depending on what the agent does; it is that the agent can *choose* acts that affect the principal differently. This is important because it permits aspects of the agent's preferences to shape his or her action for the principal.

The fiduciary norm instructs the following behaviors:

- The agent following the fiduciary norm (hereafter, *the fiduciary*) must act diligently for the principal's interests. This includes both the use of the agent's skills and the application of adequate levels of effort to the agency. Because the agent has discretion, she or he has by definition a range of actions that may be selected in the agency. Thus, lacking complete direction from the principal, the agent acting under the norm must diligently evaluate available actions and choose those actions that will result in better outcomes for the principal. The more that the principal depends on the agent, that is, the greater the discretion of the agent, the greater the prescription of the norm. Thus, agents for highly dependent principals, such as elderly or disabled principals, or principals unable to take any actions to oversee or correct the agent's work, must take extra care in acting for their principals.

- The fiduciary must allow only the principal's interests, as he or she sees them, to guide his or her actions. No other interests must be allowed to influence his or her decisions, including the self-interests of the fiduciary. Note that the agent had consented to act for the principal and that that consent may have been influenced by the provision of advance compensation to the agent. But once consent has been given, no self-interest must figure in the agent's actions. If the agent erred in calculating the benefits that the agent would receive in becoming agent, then the agent must live with his or her choice and choose the best actions for the principal. This component of the fiduciary norm is reinforced by another social norm, *valid agreements should be kept,* a norm described by Stewart Macaulay in his widely cited article on noncontractual relations in business. Thus, once the agreement is made to act for the principal, it constitutes a promise that must be kept.

The sensitivity of the charge given to a fiduciary, whether in the context of the legal principle or of the norm, is illustrated by the oft-cited remarks of Chief Judge Benjamin Cardozo in *Meinhard v. Salmon,* 249 N.Y. 458 (1928): "Many forms of conduct permissible in a workaday world for those acting at arm's length, are forbidden to those bound by fiduciary ties. A trustee is held to something stricter than the morals of the market place. Not honesty alone, but the punctilio of an honor the most sensitive, is then the standard of behavior. As to this there has developed a tradition that is unbending and inveterate."

The fiduciary norm incorporates such an instruction, but because it is a social norm there is an additional, sometimes subtle effect. The adoption and implementation of social norms are positively and/or negatively sanctioned by the community. Such sanction obviously bears on the agent's self-interest. No pure fiduciary should allow the possibility of community sanctions for performance (or for less-than-adequate performance) to influence the agency. But, as described below, real-world agents may logically perceive no conflict if they resolve the question of social sanctions by overperforming on behalf of the principal, while assuming that the principal will then be even better off.

- Several subnorms accompany the fiduciary norm. They tend to protect the principal and are prescribed at the same time as the fiduciary norm:
  - Confidentiality: The fiduciary must not reveal information that is confidential in his or her relationship with the principal.
  - Full disclosure: The fiduciary must reveal to the principal all information not received confidentially from other sources that bear on the agency actions. This includes revealing all interests of the agent that may conflict with the principal's interest.
  - Good conduct: The fiduciary's behavior must not draw criticisms or be disreputable, so that the principal's relationships with third parties are not compromised, and so that good relations between the agent and the principal may be maintained.

Consequences of the Fiduciary Norm

Several consequences follow from implementation of the fiduciary norm:

- Because the fiduciary norm is a true social norm, its implementation is monitored and sanctioned by the community. This monitoring can lead to requests for justification—to give accounts that support that the agency actions did in fact serve the principal with primacy, diligence, and lack of bias from conflicting interests. In addition, the norm carries with it the obligation to make full disclosure to the principal, so that a means of justification must be created to provide both to the principal and to external monitors. Thus, operation of the fiduciary norm typically generates a trail of account-giving and of defensive reporting.

- The fiduciary norm allows principals to economize on the costs of specifying actions to their agents and of policing them afterward to ensure adequate performance. This makes it possible for social systems to shift the burdens of action to agents, removing the need for principals to invest in training themselves in the expertise that would otherwise be necessary to either directly implement or evaluate the performance of agents. It is thus a way of dealing with problems of adverse selection, the condition that occurs when principals can observe their agents but cannot judge whether the agents' performance is optimal in reaching the principal's goals. In adverse selection, self-interested, perhaps lazy, agents conceal the fact that they are shirking in their agency task, knowing that the principal is unable to detect the difference. Thus, with the fiduciary norm instructing the behavior of their agents, social organizations can function more efficiently and effectively.

- When agency tasks are repetitive, the fiduciary may adopt prepared programs of action that improve his or her performance as agent. In addition, such programs may economize on the fiduciary's costs in service if the fiduciary is imperfect in adherence to the norm's prescriptions and wishes to keep the costs of agency low. Of course, the agent may have agreed to perform the agency with the programs in mind, so adoption of fiduciary programs may be completely consistent with the contracted agency and not be an imperfect action reflecting economizing during service for the principal. Such programs also isolate the fiduciary from pressure to make adaptations if the service to the principal is objectionable to third parties: The fiduciary can offer the excuse that, in following the prepared program, the fiduciary is "only following orders." The fiduciary can also disengage his or her own involvement in the agency; the actions of the program may be seen as not the result of active choice by the agent—it is the principal's program, not the agent's. Hence, we see agents acting with diligence in implementing prepared programs of action for the principal, with seeming disregard for the effects of such programs on others.

- In an imperfect world, with imperfect information, the fiduciary will often tend to maximize the return to the principal (at least to increase the return over the nominally set level). The maximization can go beyond that point at which the principal would stop, were he or she acting for himself or herself, fully informed, and could intervene, and beyond the point at which the fiduciary would stop if the principal's interest were his or her own. These behaviors may occur for the following reasons, taken together, though some may work by themselves to increase the return sought by the agent for the principal:
  - Because the norm prescribes action most strongly where discretion is greatest, yet that situation is one in which the principal is least able to convey his or her detailed preferences to the agent, the agent will err on the side of increasing returns to the principal.
  - The valid agreements norm reinforces the agent's contractual promise to act. With discretion and imperfect information about the principal's preferred stopping point, fiduciaries will err on the side of increasing returns to the principal.
  - The fiduciary has a task simpler than that of agent alone—he or she must serve only the principal; other agents may take account of more complex and/or competing interests. Hence, the agent will be less likely to be diverted from devoted service to the principal's interest.
  - Lacking complete information about the principal's preferences, the fiduciary will assume the most common forms for that preference, for example, making the assumption that, for the principal, "more is always better." With a simple goal, the fiduciary may construct a fiduciary program that generates returns to that goal, with no means of restraining its production of outcomes for the principal.
  - If the action for the principal is episodic or idiosyncratic, rather than repeated or continuous, there is less opportunity for the principal to intervene and instruct the fiduciary to keep returns to a lower level. Thus, the effect toward overreturn to the principal can occur both in the case of repeated actions (preparation of prepared programs) and with idiosyncratic cases (principal is unfamiliar with the actions taken by the agent and so cannot intervene).
  - Because it is a social norm, the fiduciary norm's implementation is sanctioned, positively or negatively, by the community. Thus, although the agent may not allow competing interests, such as the effects of community sanctions on the agent, to interfere with his or her agency for the principal, the sanctions may under uncertainty lead the agent to overproduce return to the principal. The agent reasons that by "going above and beyond" the principal will receive increased benefit at the same time that the agent escapes social condemnation or receives social approbation. In essence, both win. The agent's logic fails if his or her judgment of the structure of the principal's preferences is incorrect (i.e., more is not better to the principal) or if the agent's excesses are obnoxious to third parties (though still perhaps successful as agency).
  - The costs of supervision and policing by the principal may make it irrational for the principal to intervene and request a lower return from the agent's actions; that is, it does not pay the

principal to intervene—the costs of doing so can exceed the benefits that would follow. Hence, supranormal levels of service can be rationally tolerated.

It is evident that the use of fiduciaries can bias systems to overproduce returns to the principal. And thus a social mechanism implemented to provide quality of service can produce a service that goes beyond what is socially desirable. The ethical consequences of such extreme service are well described in accounts of discretionary responses to authority in social settings as diverse as those involving concentration camp guards, soldiers in wartime, and organizational/bureaucratic functionaries producing unsafe products.

Finance, Ethics of

Finance is concerned broadly with the generation, allocation, and management of monetary resources for any purpose. It includes *personal finance,* whereby individuals save, invest, and borrow money to conduct their lives; *corporate finance,* whereby business organizations raise capital, mainly through the issue of stocks and bonds, and manage it to engage in economic production; and *public finance,* whereby governments raise revenue by means of taxation and borrowing and spend it to provide services for their citizens. This financial activity is facilitated by *financial markets,* in which money and financial instruments are traded, and by *financial intermediaries,* such as banks and other financial service providers, which facilitate financial transactions.

Ethics in finance consists of the moral norms that apply to financial activity broadly conceived. That finance be conducted according to moral norms is of great importance, not only because of the crucial role that financial activity plays in the personal, economic, political, and social realms but also because of the opportunities for large financial gains that may tempt people to act unethically. Many of the ethical norms in finance are embodied in laws and government regulation and enforced by the courts and regulatory bodies. Ethics plays a vital role, however, first, by guiding the formation of laws and regulations and, second, by guiding conduct in areas not governed by laws and regulations. In general, moral norms reflect the conduct in financial activity that follows from fundamental ethical principles.

A Framework for Finance Ethics

Most financial activity takes the form of *financial contracting,* in which two parties come to some mutual agreement. For example, bank loans and stock trades are each kinds of contracts. Because so much financial activity consists of contracting, the ethical norms that apply in finance can be groups under two main heads: *fairness in making contracts* and the *observance of contractual obligations.* Virtually the whole of ethics in finance can be reduced to two simple rules: "Be fair (in making contracts)!" and "Keep your promises (made in contracts)!"

Although the ethical issues that arise in finance are numerous, they, too, can be grouped under a few main heads. These heads are as follows: financial markets, financial services, and financial management. The main ethical concern in financial markets, such as stock markets, is that they be *fair,* especially in cases of *asymmetry,* which occur when parties have unequal information or power. Ethical issues in the financial services industry and in the financial management of corporations mainly involve *agents,* who have an obligation to act in the interests of other parties, called *principals,* and *fiduciaries,* who have a *fiduciary duty* to act in the interest of *beneficiaries.* When agents and fiduciaries have a personal interest that interferes with their ability to serve others, they are said to have a *conflict of interest.*

Financial Markets

In financial markets, money and financial instruments, such as stocks, bonds, futures, options, and derivatives, are issued or traded. Generally, this activity is conducted in organized markets or exchanges, such as stock or bond markets or foreign exchange markets. However, many financial transactions, including the purchase of financial products, such as mutual funds or insurance policies, and private exchanges between two parties can be viewed as taking place in a market.

Market activity of any kind may be criticized as unfair. Unfairness in financial markets is commonly ascribed to unfair *trading practices* (most notably, fraud and manipulation), the *conditions* under which a trade is made (which are often described as an *unlevel playing field*), and difficulties in the *contracting process* (that is, in forming, interpreting, and enforcing contracts). Fairness or unfairness in financial markets may be further classified as *substantive* or *procedural*. A stock trade, for example, is fair in substance when the price reflects the actual value of the shares. It is fair in procedure when the trading parties have sufficient opportunity to accurately determine the value of the shares. Thus, "blue-sky laws," which require expert evaluation of securities offered for sale, aim at substantive fairness, whereas regulations that merely require disclosure of relevant information aims at procedural fairness.

Trading Practices

Fraud in a financial trade or transaction is committed when one party makes a material misstatement or omission that the other party reasonably relies on to his or her detriment. Fraud thus has three elements: a false statement about or the concealment of a significant fact; reliance by the victim of the fraud on the information provided; and some harm to the victim. Fraud is an unfair trading practice because the perpetrator uses dishonest means to induce the victim to make a trade that he or she would not otherwise make. Whereas fraud creates a false impression by means of a false statement (or an omission), manipulation deceives others by creating a false impression. In a so-called pump and dump scheme, for example, a trader buys a thinly traded stock to drive up the price (pumps) and then sells at the artificially created high price (dumps). Some large institutional investors have been accused of manipulating markets by creating volatility that they can exploit with sophisticated trading strategies.

Fair Conditions

A fair market, like a fair sports contest, requires a level playing field in which no one has an unfair advantage. A financial market may be unfair or unlevel because of inequalities in information, bargaining power, resources, and processing ability or because of special vulnerabilities. Unequal information, or *information asymmetry,* results when two parties either do not *possess* the same information or do not have the same *access* to information. Neither kind of information asymmetry is necessarily unfair; market participants inevitably differ in their possession of and access to information. However, it is wrong under some conditions to take advantage of another's ignorance or weakness. Thus, the law requires that issuers of securities (stocks and bonds) or financial products (a mutual fund, for example) provide a prospectus that offers sufficient information for buyers to make informed decisions. Insider trading—which is trading by a person inside a publicly held corporation on the basis of material, nonpublic information—is illegal, in part, because the parties on the other side of the transaction, being outsiders, cannot obtain the same information. The insider is thus taking unfair advantage of a privileged position.

In general, it is unfair to take advantage of different conditions when doing so violates some right or obligation. Thus, a prospectus is required for the issuance of securities because the buyers have a right to make an informed decision. In cases of insider trading, the insider is usually violating a fiduciary duty to the corporation not to use confidential information for personal gain. Laws that impose a "cooling off" period during which a buyer can cancel a large purchase or loan may be justified on the ground that it is wrong to take advantage of people's impulsiveness or inexperience. In other words, people have a right not to be taken advantage of in certain ways.

Financial Contracting

Contracts are often vague, ambiguous, and incomplete, with the result that disagreements arise about what is ethically and legally required. *Implied* contracts, which are unlike *express* contracts in that not every detail is put into writing, can usually be violated without any legal consequences. Most contracts are *imperfect* or incomplete either because it is not worthwhile to specify every detail or because it is impossible to do so given uncertainty about the situations that might arise. These "gaps" in imperfect contracts are commonly "filled" by relying on good faith efforts or fiduciary duties, both of which may be unreliable. Finally, contracts often fail to specify what constitutes a breach or how a breach should be remedied. In all such cases, ethical issues arise over the obligations of the parties to the contracts they have made. Because contracting by means of perfect, express contracts may be difficult, some parties rely instead on *relational contracting,* which involves building good working relationships.

Financial Services

Financial service firms—which include banks, brokerage firms, mutual and pension funds, and financial planners—act primarily as financial *intermediaries* by enabling their clients to consummate transactions rather than by engaging in transactions themselves. In acting as intermediaries, these firms become *agents* or *fiduciaries* with certain obligations or duties. In addition to the ethical issues that arise for agents and fiduciaries, financial service firms are engaged in selling various services and products to their customers or clients and thus encounter ethical issues in their sales practices and other operations.

Agents and Fiduciaries

In an agency relationship, one party (the agent) is engaged to act on behalf of another (the principal) and to serve that other party's interest. For example, a homeowner may hire a real estate agent to handle the sale of a house because the real estate has knowledge and skills that the homeowner lacks. In selling the house, the real estate agent is duty bound to act as the homeowner-principal would if that person possessed the agent's knowledge and skills. In this relationship, the agent has agreed—for a fee, of course—to forgo any personal interest and to act solely in the interest of the homeowner in all matters connected with the sale of the house. Thus, an agent owes a duty of *loyalty* to a principal in all matters within the scope of the engagement.

A fiduciary is a person who has been entrusted with the care of another's property or other valuables and who has a responsibility to exercise discretionary judgment in this capacity solely in the interest of the intended beneficiaries. Common examples of fiduciaries are trustees, guardians, executors, and, in business, directors and executives of corporations. Fiduciaries provide a valuable service for individuals who are unable for some reason to exercise control over their own property or assets. Thus, the pension funds of retirees are commonly controlled by trustees, who, like agents, have a duty of loyalty. Fiduciary duty is especially valuable in situations like those of directors and executives of corporations in which it would be difficult, if not impossible, for the intended beneficiaries—the stockholder, in this case—to specify precisely what should be done. As a result, considerable discretion must be allowed a fiduciary.

Although fiduciary relationships are similar to agency relationships, they are also characterized by a stronger duty to act in the interests of others as well as more latitude or discretion in serving the beneficiaries' interests. Whereas agents are generally engaged by a contract to perform specific tasks, fiduciaries assume positions of trust to exercise judgment about a broader range of matters. The duty of loyalty of a fiduciary is thus more open-ended and comprehensive than that of an agent. In addition, fiduciaries are specifically barred from gaining any material benefit from the relationship without the knowledge and consent of those the fiduciary serves.

Financial service professionals are almost always agents and frequently fiduciaries in their relations with customers and clients. For example, a stockbroker is an agent, but not a fiduciary, when he or she agrees to execute a stock trade for a client. Such a broker is acting merely as an intermediary in a particular transaction. However, a broker who manages a client's portfolio by offering financial advice and especially a broker who has the authority to trade on the client's behalf become a fiduciary as well. In contrast, a broker who merely recommends a stock to a client is acting as a salesperson and not as an agent or fiduciary, although the broker still has the moral obligations of any salesperson to avoid deception and offer only suitable products.

Opportunism

Agency and fiduciary relationships are subject to two well-known problems: *opportunism* and *conflict of interest.* Opportunism or shirking refers to the tendency of agents or fiduciaries to slack off and not expend the full amount of expected effort. This phenomenon, which is central to agency theory, occurs when principals are not able or willing to monitor the behavior of their agents. A client cannot easily monitor a stockbroker, for example, and the cost of doing so, even if it could be done, might exceed the benefit. As a result, the stockbroker might take advantage of the opportunity to increase his or her compensation by engaging in excessive trading of a client's portfolio, a practice known as *churning.* Similarly, a CEO might seek to acquire other companies, not because doing so benefits shareholders but because it expands the CEO's compensation and power, a practice called *empire building.*

Opportunism can be reduced by a number of measures besides closer monitoring. One of these involves changes in the incentives of the agent or fiduciary. For example, the self-interested incentives of brokers to churn client accounts can be countered by basing compensation on the performance of clients' portfolios rather than the volume of trades. Similarly, compensating CEOs with stock options aligns their interests more closely with those of shareholders and thus reduces the incentives to engage in empire building. Other means are to increase the sense of professionalism of agents and fiduciaries, which may involve the adoption of codes of ethics, and to use moral suasion to emphasize their ethical and legal responsibilities.

Conflict of Interest

A conflict of interest is a situation in which a person has an interest that interferes with that person's ability to act in the interest of another when that person has an obligation to act in that other person's interest. Agents and fiduciaries are called on to exercise judgment on behalf of others, and their judgment can be compromised if they stand to gain personally from a decision. Unlike opportunism, which involves merely the natural human tendency to act self-interestedly, conflict of interest arises when a person acquires an interest that competes with the interests an agent or fiduciary is pledged to serve.

A conflict of interest is created, for example, when brokers are offered a higher commission for selling a firm's own in-house mutual funds than for selling the funds of other firms. A conflict of interest is present in such cases because the broker, who has a duty to serve the clients' interests, has a countervailing incentive to sell a fund that may not represent the best value for clients. Mutual fund managers who also trade for their own account face a conflict of interest since they can direct especially attractive trades to their own account instead of the funds they manage. Analysts for an investment bank may also have a conflict of interest if they are involved in the bank's deals because the analysts' recommendations, which should be objective, might be influenced by a desire to attract and retain clients for the bank.

Conflict of interest can be managed by many means, including avoidance, that is, not acquiring any conflicting interests. Thus, a brokerage firm can avoid conflict of interest by not offering higher commissions for in-house mutual funds; a mutual fund can also avoid conflicts by not allowing fund managers to trade for their own account; and an investment bank can prohibit analysts from participating in its deal-making business. When avoidance is not practical, conflict of interest can also be managed by requiring disclosure on the assumption that when a conflicting interest is disclosed, other parties can take steps to protect themselves. A conflict of interest may also be managed by requiring a person with a conflict to recuse and not take part in a decision. Conflicts of interest can also be managed by fostering a greater sense of professionalism so that agents and fiduciaries appreciate the importance of exercising objective and independent judgment.

The Financial Services Industry

Financial services firms operate as businesses, and like any business, they have an obligation to observe the accepted standards of ethical business conduct. Thus, in their sales practices, firms should avoid deception and provide adequate information about products and services. Some advertising for mutual funds, for example, has been criticized for exaggerating a fund's past performance, omitting sales charges, and downplaying the level of risk. The generally accepted standard for disclosure is *materiality,* which refers to information that a reasonable or prudent investor would consider important in making a decision. Financial service professionals also have an obligation to recommend securities and products that are *suitable* for the client. This suitability requirement is violated by abusive practices such as *twisting* and *flipping.* Twisting occurs when an insurance agent persuades a client to replace an existing policy with a new one merely to generate a commission, and flipping is the practice in banking of inducing a customer to replace one loan with another to generate additional fees.

In the financial services industry, it is common for firms to require both customers and employees to sign a predispute arbitration agreement (PDAA) that commits them to submit all disputes to binding arbitration. Although arbitration has many benefits over litigation (that is, bringing suit in court), some critics consider mandatory arbitration to be unfair because it may deny customers and employees adequate protection. This is especially true if arbitration panels, as is sometimes alleged, have an industry bias. In addition, customers such as credit card and insurance policy holders generally have no choice when signing a PDAA as a condition for making an application. Mandatory arbitration for employees denies them the right that other employees have to sue in court over matters such as harassment or discrimination.

Bank lending practices have many impacts that raise ethical concerns. If banks refuse to issue mortgage loans for homes in distressed areas of a city, a practice known as *redlining,* then they contribute to further urban decay. Redlining has been addressed in the United States by the Community Reinvestment Act of 1977 and subsequent legislation that require banks to meet the credit needs of people in their service area. Large banks that finance massive infrastructure projects such as dams and pipelines in less developed countries have been criticized for failing to evaluate the impact of these projects on the local people. Cases in which banks have financed the fraudulent transactions of companies such as Enron raise questions about their responsibilities. Do banks have an obligation to act as "gatekeepers" when they have the ability to detect and prevent fraud by their clients?

Mutual and pension funds have an opportunity to enable investors to satisfy their desires to do good with their investments or at least to avoid profiting from businesses of which they disapprove. So-called ethical or socially responsible investment (SRI) funds use negative screens to avoid the stocks of companies with certain products, most commonly tobacco, alcohol, gambling, nuclear energy, and military weapons, or that have an objectionable record of social responsibility. In some cases, SRI funds also use positive screens to seek out companies that exhibit notable social responsibility. Some SRI investors hope, through their investments, to influence the behavior of corporations; others seek merely to avoid being complicit in certain kinds of activities. However, it is questionable whether SRI, in fact, has any impact on corporate behavior or whether profits from the makers of certain products really are morally tainted. In any event, it is morally permissible for investors to seek out SRI funds and for firms to offer such funds as long as there is full disclosure. Some critics contend, though, that the screening done by SRI funds is arbitrary, inconsistent, and largely ineffectual, with the result that SRI investors may be misled.

Financial Management

Financial managers, especially the chief financial officer (CFO) of a firm, have the task of raising capital for a corporation and determining how that capital is to be deployed. In a sense, a CFO is making investment decisions and developing a portfolio, but these decisions are not about which securities to hold but about what business opportunities to pursue. A corporation can be understood, then, as a portfolio of lines of business that can be bought and sold. Capital budgeting is making decisions about which businesses to invest in and how much to invest. Every firm must also have a financial structure in which its capital is divided between equity, debt, and other types of obligations. All these decisions are guided by a single corporate objective: to maximize shareholder wealth.

Ethical issues in financial management fall into two broad categories: the ethical obligations or duties of a financial manager of a corporation, and the ethics of organizing a corporation with shareholder control and the objective of shareholder wealth maximization. The former category bears on decisions made by financial managers, whereas the latter is a matter largely for government in establishing the laws of corporate governance.

Duties of Financial Managers

Financial managers are agents and fiduciaries who have a duty to manage the assets of a corporation prudently, avoiding the use of these assets for personal benefit and acting in all matters in the interest of the corporation and its shareholders. Specifically, this duty prohibits unauthorized self-dealing and conflict of interest, as well as fraud and manipulation in connection with a company's financial reporting and securities transactions.

It may be noted in this regard that the CFO of Enron allegedly committed all these offenses by personally benefiting from partnerships that he created to do business with Enron, serving as a principal of these partnerships while acting as CFO (although this conflict was approved by Enron's directors), hiding debts in these partnerships, which properly belonged on Enron's balance sheets, and preparing false reports that misrepresented Enron's financial condition. Although Enron is an exceptional case, the use of financial engineering through the use of off-balance-sheet partnerships and complex derivative transactions, not only to manipulate earnings but also to avoid government regulations, is a common practice that raises significant ethical and legal questions for financial managers. Even when accounting rules are satisfied, financial engineering may facilitate a lack of transparency that prevents investors from being fully aware of a firm's true financial condition.

To meet these possible failings in financial management, Section 406 of the Sarbanes-Oxley Act, passed in 2002 in response to the scandals at Enron and other companies, requires publicly held companies to adopt a code of ethics for senior financial officers that includes, among other elements, standards for honest and ethical conduct, including the ethical handling of conflicts of interest, full, fair, accurate, timely, and understandable disclosure, and compliance with applicable governmental rules and regulations.

In addition to a financial manager's duties as an agent and a fiduciary, there are other areas in which ethical judgment is called on, most notably in determining a level of risk, declaring bankruptcy, and responding to takeover offers. Although these matters involve financial management, the responsibility for decision making generally rests with the CEO and the board of directors.

Risk

Any business firm must determine an appropriate level of risk, and generally greater rewards require greater risk. Usually, shareholders, whose wealth is not tied closely to any one firm, prefer that corporations in their portfolio assume a higher level of risk than is favored by managers and employees, whose wealth is heavily dependent on one firm. Finance theory also suggests that for properly diversified shareholders, the level of risk for any given firm, called *unique risk,* is irrelevant and that only *market* or *systemic risk* is important. Shareholders might even support a strategy that courts bankruptcy if the returns are high enough. For these reasons, financial managers serving only shareholder interests might be led to pursue a very high-risk strategy. However, such a strategy poses dangers for employees and suppliers, as well as bondholders and managers themselves, who place a high value on the continued operation of the corporation as an ongoing entity. At issue, then, is the question, "Is it ethical for financial managers to increase risk in a firm so as to benefit shareholders at the expense of other parties?"

Bankruptcy

If a firm is truly insolvent, then bankruptcy may be forced on it, but entering bankruptcy can also be a means for achieving strategic ends. The bankruptcy code in the United States has been used by companies to avoid or reduce the payment of heavy legal judgments and to void or renegotiate collective bargaining agreements and other onerous contracts. Some solvent but unprofitable corporations enter bankruptcy to gain additional leverage with employees, creditors, and other groups as part of a reorganization. In such situations, bankruptcy is a strategic choice rather than an unavoidable condition. Although such strategic bankruptcy may save companies (think of some American airlines), critics have charged that such strategic bankruptcies are an abuse of the Bankruptcy Code.

Takeovers

Corporate takeovers often affect many groups, including employees who may lose jobs and local communities, their economic base. Bondholders often suffer when the debt incurred in the takeover, especially a highly leveraged buyout, lowers bond ratings. Some critics argue that directors, who generally have a fiduciary duty to act solely in the shareholders' interest, ought to be able to consider the interests of all affected parties. Some states have antitakeover laws and so-called other constituency statutes that permit consideration of a wider range of interests. Moreover, incumbent management has many defenses, including poison pills, golden parachutes, and greenmail, which may also be criticized on ethical grounds. Insofar as takeovers are conducted in a market through the buying and selling of shares, there is a market for corporate control. Broadly speaking, the rules for this market should be fair to all parties and provide a level playing field, but some critics of hostile takeovers question whether such important decisions as corporate control should be made in the marketplace.

The Corporate Objective

That a corporation should have the objective of maximizing shareholder wealth has been questioned by some critics, who hold that an exclusive pursuit of shareholder interests unjustly neglects the interests of other corporate constituencies. The argument for this objective of shareholder wealth maximization, as well as for the fiduciary duty of management to serve shareholder interests, is, in brief, that shareholders, who provide equity capital to a firm in return for the residual income or profits, ought to have control because this is the best means for securing their return. Other constituencies—employees who are compensated with wages, suppliers whose bills are paid, and bondholders, who receive principal and interest payments, to mention three of these constituencies—have little need for control. Shareholder control also benefits other constituencies automatically because only residual risk bearers have an incentive to operate the firm for maximum profitability and because their assumption of residual risk insures the return of all other stakeholder groups.

This argument is open to criticism, first, by those who reject the economic view of the firm that underlies it and adopt a communitarian view of the firm. Whereas the economic view considers the firm to be like a market, the communitarian position is that the firm is more like a community. Stakeholder theory, which maintains that a corporation ought to serve the interests of all those with a stake in the firm, also rejects the economic view. Second, the pursuit of shareholder wealth maximization may lead to social costs, such as pollution and urban blight, and also to an unequal distribution of wealth. Advocates of shareholder wealth maximization do not deny these consequences but hold that these problems are better addressed by means other than changes in the corporate objective.

Financial Accounting Standards Board (FASB)

The Financial Accounting Standards Board (FASB) is a subsidiary of the Financial Accounting Foundation (FAF), an independent exempt organization. The FASB sets standards for financial accounting and reporting in the United States, a set of guidelines that constitutes an important component of generally accepted accounting principles (GAAPs). Although the Public Company Accounting Oversight Board (PCAOB) has superseded the FASB in formal standard-setting authority over the profession since the enactment of the Sarbanes-Oxley Act in 2002, the FASB continues to wield significant influence as a private-sector advisory body.

Historical Background

The Securities Act of 1933 provided for federal regulation of financial accounting and reporting for public companies and, by extension, for the practice of public accounting in the United States, and it invested this authority in the Federal Trade Commission. In the Securities Exchange Act of 1934, Congress created the Securities and Exchange Commission (SEC) and assigned it responsibility for this regulatory oversight. Between 1936 and 1938, the SEC moved to delegate this responsibility back to the private sector, on the premise that the accounting profession's decades of leadership in the development of the practice and theory of accounting enabled it to discharge this responsibility efficiently, effectively, and in the public interest.

A succession of private entities took up this regulatory task. The first was an agency of the American Institute of Certified Public Accountants (AICPA), the Committee on Accounting Procedure (CAP), which operated from 1936 through 1959. It issued more than 50 accounting research bulletins, but its modular, ad hoc approach to issues did not lend itself to developing a conceptual framework for financial reporting standards. The AICPA organized its successor, the Accounting Principles Board (APB), in 1959 to develop such a framework. Although the APB issued 31 opinions, it garnered little prestige, due, in part, to perceptions that it was not sufficiently proactive and productive, and it eventually ceased operating in 1973.

After review by the Study Group on the Establishment of Accounting Principles (the "Wheat Committee"), the accounting profession in 1973 established a new institutional apparatus to develop a conceptual framework and to promulgate standards for financial accounting and reporting, including a third private organization to assume this role, the FASB. Independence from other business organizations and professional associations was a distinctive feature of this apparatus from the beginning, and this helped the FASB gain early official recognition from the SEC and the AICPA as a standard setter. At the same time, to avoid disruptions for preparers, auditors, and users of financial reports, the FASB provided a bridge of continuity with the CAP and the APB by continuing to recognize the pronouncements of these entities, except where it amended or superseded them, for example, with its own statements of financial accounting standards.

Two parallel advisory and oversight bodies have helped to promote the FASB's independence, by informing its work with guidance from experienced leaders in the profession, while minimizing direct interference from the constituencies it regulates: (1) the Financial Accounting Standards Advisory Council (FASAC) and (2) the FAF, of which the FASB is a subsidiary.

The FASAC provides technical consulting services for the FASB, assists it in setting priorities, recommends issues for FASB consideration and action, and helps it to establish task forces to research questions for it and to attain its objectives. Its more than 30 members reflect a broad cross section of constituencies that prepare, audit, and use financial statements and collateral financial information, and this group forms an important source of experience and wisdom to inform the work of the FASB and to help it be accountable to those who depend on the profession.

The FAF is a tax-exempt organization, and it selects the members of the FASB and the FASAC. It also finances the operations of these organizations and supervises their activities, apart from the FASB's main technical work. The FAF performs these services for the Governmental Accounting Standards Board (GASB) as well, which it formed in 1984 to set parallel standards for financial accounting and reporting for state and local governmental entities.

Just as for the FASAC, the board of trustees for the FAF draws its membership from a cross section of constituencies with a concern for the efficiency and effectiveness of financial reporting in the public interest. In the case of the FAF, this representation comes mostly in the form of nominees whom prominent professional accounting organizations put forth for approval by existing trustees. These organizations consist of the American Accounting Association; the AICPA; the Chartered Financial Analyst (CFA) Institute; Financial Executives International (FEI); the Government Finance Officers Association; the Institute of Management Accountants (IMA); the National Association of State Auditors, Comptrollers, and Treasurers; and the Securities Industry Association. The existing trustees also choose a number of at-large members for the board.

In addition to the structural supports for the autonomous voice of the FASB, the members of the organization itself have worked diligently since 1973 to preserve its independence, through qualification and service rules to limit the effects of potential conflicts of interest on board members and by taking principled stands over accounting and financial reporting standards in the public interest, even when key constituencies from public accounting, industry, regulatory authorities, and other quarters have pressed for alternative treatments, for example, over accounting for stock options. Such conflicts have led to overt criticisms of the decisions of the FASB by members of these constituencies, and the resulting pressure on the FASB members and their staff occasionally has affected the willingness of some accounting professionals to accept service in these leadership roles.

Breakdowns in the Framework and the Reclamation of Federal Oversight

This framework for regulating standards and practices for financial accounting and reporting worked fairly well for many years, although problems occasionally arose over issues such as the thoroughness and diligence of audits in the face of financial fraud in the savings and loan crisis and ownership interests of accountants in their audit clients. When scandals arose, a common refrain among regulators, investors, and the public was "Where were the auditors?" The subsequent scrutiny of the profession by these constituencies led to widespread perceptions that, in many instances, accountants had failed to preserve their professional independence, in fact or in appearance.

The growing complexity of the practice of accounting and the ascent of nonaudit practices within accounting firms, especially advisory services, were prominent factors in accountants getting themselves into trouble, for example, as they became financially dependent on revenue from these alternative services and found themselves in the untenable position of issuing audit opinions on their firms' own work.

The seeds of many of these problems were apparent by the end of the 1980s. However, the combination of the robust growth in the U.S. economy and the dramatic expansion of the high-technology, telecommunications, and information services sectors in the 1990s diverted the attention of many inside and outside the accounting profession from the creeping structural dysfunctions in the framework, including government regulators, corporate leaders, stock exchange managers, and individual and institutional investors. One of the few voices to raise concerns during this period was SEC Chair Arthur Levitt, who supported tighter regulation of corporate governance and financial reporting. However, few in Congress believed his dire warnings, against the backdrop of record gains in financial markets and a booming economy. Instead, in response to pressure from the accounting profession, and over President Clinton's veto, Congress passed the Private Securities Litigation Reform Act of 1995, which raised barriers to litigation against auditing firms and others in cases of financial fraud, and diminished further the profession's incentives to mitigate risk (aggravating a condition that organizational theorists call *moral hazard*).

When the massive financial accounting frauds involving Enron, WorldCom, the accounting firm Andersen, and other organizations became public in 2001 and 2002, it was apparent that the integrity of the framework for financial accounting and reporting, and more generally for the accounting profession, was seriously deficient. Whatever progress the profession had made in regulating itself through institutions such as the FASB, it had become clear that the opportunistic behavior of multiple constituencies had led capital markets around the world to a state of crisis. There was a dramatic drop in confidence in the integrity of American accountants, corporate leaders, capital markets, and the economy, and the public's concern for the future mirrored the dramatic stories of the downfall of narcissistic and greedy corporate leaders and of millions of ordinary people who lost jobs and retirement savings as a result of these defalcations.

The early response from the accounting profession was to minimize the scope of the problems and to impute them to a small number of bad actors. The Bush administration also was slow to acknowledge the scope of the disaster. Comments by SEC Chair Harvey Pitt, a former general counsel for the SEC and external counsel for major accounting firms during his intervening years in the private sector, did little to allay people's fears and instead heightened anxiety among investors. The administration resisted calls to respond with substantive additional legislation or regulation through early 2002, when the number of scandals increased, including the problems at WorldCom.

By the spring of 2002, with the federal indictment of Andersen for obstruction of justice, and the rapid dissolution of that venerable firm as its audit clients departed in droves, it became clear that a federal response was necessary to begin the process of restoring confidence in corporate governance practices, the accounting profession, and capital markets. The profession was not eager to see tinkering with the regulatory framework in such an atmosphere, but the major accounting firms resigned themselves to legislative action in early 2002 and moved to influence the result, which became the Sarbanes-Oxley Act of 2002.

The passage of this act signaled the reversion to the federal government of substantive oversight of the accounting profession with regard to setting standards for financial accounting and reporting. This legislation created the Public Company Accounting Oversight Board (PCAOB), a tax-exempt organization with rule-making authority over corporations that issue and list securities in public capital markets ("issuers") and the accounting firms ("firms") that audit them. Although the PCAOB is not a government agency, its members are not federal officers under the Constitution, and it draws its funding principally from registration fees rather than from federal appropriations, it works under the oversight of the SEC (which also appoints its members). This reclamation of authority from the accounting profession marked the most dramatic change in the regulatory framework for the profession since the 1930s.

At the same time, the amendments to this framework evinced a subtle approach, especially in reserving a zone of authority for the private sector. In addition, the statutory requirement that three of the five members of the PCAOB *not* ever have been certified public accountants reflected the importance of sustaining a voice distinct from the perspective of the accounting profession, and in favor of the public interest. Despite the dramatic corporate scandals in the early 2000s that led to the disintegration of the accounting firm Andersen, turbulence in global capital markets, and passage of the Sarbanes-Oxley Act, Congress fashioned the legislative response with restraint, and it did not assign full regulatory authority to the federal government. This allowed a measure of continuity with those aspects of the regulatory framework that had been constructive, including the FASB. In fact, the Sarbanes-Oxley Act expressly permitted the SEC to designate reputable *private-sector standard setters* to provide authoritative guidance for the profession, and it moved quickly to affirm its confidence in the FASB for this role, on April 25, 2003.

The Structure of the FASB

The FASB consists of seven members who serve full time for five-year terms that are renewable once, and who, during their service, must discontinue their relationships with the accounting firms and other organizations and institutions that they have served. The FASB requires that board members possess "knowledge of accounting, finance and business, and a concern for the public interest in matters of financial accounting and reporting."

In addition, the FASB retains a staff of about 70 professionals from public accounting, industry, academe, and the public sector, plus their support staff. The professional staff directly assist the FASB and task force groups, perform research, contribute to roundtable meetings, analyze comments from the public, and draft recommendations and response documents for the FASB to evaluate. Among these professional researchers and technical specialists are the FASB Fellows, whom the FASB recruits for rotation assignments during leaves of absence from their firms, companies, and universities. This allows the FASB to benefit from their current experience, and it educates the fellows about the FASB's processes for setting accounting and financial reporting standards.

The Mission of the FASB

The FASB articulates its mission as a commitment "to establish and improve standards of financial accounting and reporting for the guidance and education of the public, including issuers, auditors and users of financial information." Foremost in the minds of the members of the board is a concern for the efficient and effective operations of capital markets, and the broader social effects of reliance on those markets by all types of investors whose financial, legal, and ethical interests the quality of financial reporting implicates. The availability of reliable and timely information is essential to the functioning of capital markets, but these institutions, the individual and institutional participants that animate them, the regulatory frameworks that oversee them, and the sources and uses of capital that they reflect and enable, all exist within a broader social context, and this enlarged sphere of moral concern for the work of the FASB is a legacy of the vocation of the accounting profession as a trustee for the public good that extends at least as far back as 18th-century Great Britain.

The FASB enumerates the following means for effecting its mission:

- Improve the usefulness of financial reporting by focusing on the primary characteristics of relevance and reliability and on the qualities of comparability and consistency.
- Keep standards current to reflect changes in methods of doing business and changes in the economic environment.
- Consider promptly significant areas of deficiency in financial reporting that could benefit from improvement through the standard-setting process.
- Promote the international convergence of accounting standards concurrent with improving the quality of financial reporting.
- Improve the common understanding of the nature and purposes of the information in financial reports.

To carry out this work, the FASB publishes five principal types of guideline pronouncements: (1) statements of financial accounting standards, (2) statements of financial accounting concepts, (3) interpretations, (4) technical bulletins, and (5) staff positions. The following sections summarize these processes.

The Process for Promulgating Statements of Financial Accounting Standards

The FASB continuously monitors professional and industry practices, significant litigation, and regulatory developments to note items for consideration for its standard-setting agenda. In addition, many recommendations and requests to develop and revise technical standards and advice come from public and private sources, including the SEC, industry, academe, professional associations, and other domestic and international regulatory bodies. Foremost among the FASB's advisory network are

- the AICPA's Accounting Standards Executive Committee (AcSEC) and the Auditing Standards Board;
- the PCAOB;
- the International Accounting Standards Board (IASB);
- the FASAC;
- the FASB User Advisory Council (representing investors, investment professionals, financial analysts, and rating agencies);
- the FASB Small Business Advisory Committee (SBAC); and
- relevant committees of the CFA Institute, FEI, and IMA.

The FASB often publicizes items that it proposes to include in its standard-setting agenda as a means for discerning public interest and soliciting public comment. It then uses the following criteria to decide which of these items to include in the agenda:

- The scope, frequency, likely duration, and diversity of treatment for an issue for preparers, auditors, and users of financial reports
- The likelihood that there will be alternative solutions to enhance the relevance, reliability, and comparability of financial reporting
- The practicability of developing a technically robust solution under current conditions
- The likelihood of acceptance and adoption, and the probable range of responses of other public and private regulatory entities
- The likelihood of developing a solution that will promote salutary convergence between domestic and international accounting standards, with improvements in the quality of the former
- The likelihood of cooperation or joint project management with one or more international standard-setting organizations
- The sufficiency of financial and professional resources from the FASB and other standard-setting organizations to manage and complete the project proficiently

To promulgate standards, the FASB has adopted "due process" rules that closely mirror the guidelines of the United States Administrative Procedure Act, including requirements that its processes remain open to the public, both in person and via Internet broadcasts, and that the public have the opportunity for comment on proposed standards. The FASB follows a majority written vote to determine whether to issue exposure drafts of these standards, and these drafts reflect and explain alternative positions among board members to foster open and honest dialogue. When the FASB receives comments on an exposure draft, the board members and their staff review and analyze them carefully for the substantiveness of their arguments and not merely for the number of responses in support of respective positions. Afterward, the board redeliberates over the proposed standard, also in public. It then issues a revised draft exposure for additional comments, or it votes to decide by simple majority whether to adopt the draft.

The document that the FASB issues as a result of this process is a "statement of financial accounting standards," and it bears a cardinal number for identification purposes, for example, Statement of Financial Accounting Standards No. 123, or FASB 123 for short. Each statement recites the content of the standard, the date it takes effect, the means for making the transition to the new method for reporting, supporting information regarding the factual and systematic issues the statement implicates, a summary of the FASB's research, the justification for the FASB's conclusions over alternative treatments, a roster of the vote by the FASB members, and explanations for dissenting votes.

The Process for Promulgating Statements of Financial Accounting Concepts

In addition to issuing statements of financial accounting standards, the FASB formulates "broad accounting concepts," and publishes guidance for accounting professionals to implement its standards. This conceptual framework helps the FASB and others analyze questions that arise regarding financial accounting and reporting, and it provides support for solutions that the FASB recommends. In this process, the FASB seeks to abide by guidelines and objectives that help protect the integrity of its work product, including

- objectivity in its decision making, and standards that promote "neutral" financial information and consistent treatment;
- reflective deliberation of the views of stakeholder constituencies, consistent with the FASB members' independent professional judgment;
- proportionality and commensurability between the articulable benefits and costs of accounting standards;
- a commitment to effect changes in financial standards and reporting through timing, treatment, and other means that create as little disruption as possible from existing practices; and
- a discipline to engage in an ongoing process of assessment, interpretation, and amendment of standards in a timely fashion.

The FASB's research draws on the resources of its own staff, as well as external contributions, including other national and international standard-setting organizations. The FASB has adopted "due process" rules for its thought leadership and conceptual development activities, which closely mirror the aforementioned procedures for formulating and promulgating statements of financial accounting standards, including openness to public observation.

The FASB's commitment to analytical transparency, reasoned justification for its positions, and participatory deliberation helps it to educate accounting professionals and users of financial information, to increase public confidence in the integrity and rational foundation of the financial reporting system, and to mitigate uncertainty and other risks that can raise the cost of capital. The FASB has continued these practices since the promulgation of the Sarbanes-Oxley Act, but the new reality of oversight by the PCAOB has made this a more challenging process. Even though the SEC has ratified the role of the FASB as a standard setter, the FASB has diminished in stature slightly, and its voice, though still venerable in the profession, now must compete for attention in a more crowded environment.

Additional Pronouncements From the FASB

In addition to statements of financial accounting standards and statements of financial accounting concepts, the FASB publishes "interpretations," "technical bulletins," and "staff positions," to aid practitioners in implementing its standards. The FASB also forms implementation issues resource groups to assist its staff in (1) gathering current information regarding its standards, (2) determining whether the relevant parties grasp the significance of new standards, and (3) assessing the effects of alternative interpretations of standards.

The FASB's technical bulletins include work from the Emerging Issues Task Force (EITF), an entity that it formed in 1984 to help improve the timeliness of financial reporting and to identity and preliminarily assess incipient issues facing preparers, auditors, and users of financial reports. The EITF has 14 voting members and principally consists of representatives from accounting firms, professional associations of financial statement preparers, and the chief accountant of the SEC. It meets at least quarterly in sessions that are open to the public, and it acts as an *early-warning system* for the FASB, analyzing issues and practices before they become widespread and providing an opportunity for an early assessment of the need for action by the FASB itself. When the EITF reaches "consensus" over an issue or practice (i.e., at least near unanimity), then the FASB typically ratifies the EITF's position, and it becomes part of GAAP. When consensus is not possible, then the FASB may undertake a direct and more formal review as a prelude to action with long-term effects.

This role in anticipating trends signals a distinctive ongoing contribution for the FASB in that it helps that body, and other constituencies, including the PCAOB, the SEC, and the investing public, think critically and imaginatively about the scope and likelihood of prospective risks. The lesson of the 1990s is that the appearance that the regulatory framework and capital markets remain healthy can be not only inaccurate but also dangerous because of the false sense of security that it can engender.

The fact that significant incidents of financial statement fraud occurred under the watch of the SEC, the FASB, the AICPA, the stock exchanges, and the state boards of accountancy in the early 2000s bespeaks a precautionary tale that one should retain a decorous skepticism about the efficacy of such institutions. They are necessary for the efficient and effective functioning of markets for governance, professional services, and capital, but they are not sufficient, particularly when human judgments remain essential for deciding whether to act on the risks they portend. A case in point is the 2006 scandal regarding the backdating of corporate stock options, which unfolded under the "improved" framework of the Sarbanes-Oxley Act and the PCAOB. The challenge in the future for the FASB, the EITF, the PCAOB, the SEC, the stock exchanges, and those who rely on them will be to avoid recurrences of such overconfidence and to anticipate the forms of fraud and misconduct that are not obvious to observers.

Financial Derivatives

A *financial derivative* is a financial instrument whose value and profits depend on the value of some more basic underlying financial instrument. For example, a stock option is a financial derivative because the value and payoffs of a stock option depend on the value and price movements of the underlying stock. Similarly, an interest rate futures contract is a financial derivative because the value and payoffs of the futures contract depend on the value of an underlying debt instrument, such as a bank deposit or a bond. As a final example, a foreign currency forward contract is a financial derivative because its value and payoffs depend on the value of the underlying currency.

Strictly speaking, a financial derivative is a derivative that is built on an underlying financial instrument.

Different types of financial derivatives include primarily financial futures, options, forward contracts, and swap agreements. Financial derivatives are closely related to other types of derivatives, including agricultural, oil, and precious metal derivatives. The similarity extends to the structure of the instruments, the common economic understanding that links all the instruments, and the very similar pricing principles that unite all derivatives. Social and ethical issues surrounding financial derivatives arise because they are extremely powerful financial instruments that can generate very dramatic profits and losses, they are complex and difficult to understand, they are susceptible to misuse as gambling vehicles, and they at least seem to be far removed from economic realities.

Financial derivatives commonly embody very high leverage; that is, the price of a financial derivative is often very sensitive to the price of the underlying financial instrument, or equivalently, a small movement in the price of an underlying financial instrument can cause a very large percentage price movement in a financial derivative built on that instrument. For example, a 1% movement in the price of a stock could easily cause a 10% movement in the price of an option on that stock. This means that an apparently benign position in a financial derivative can suddenly generate very substantial profits or losses. This happens particularly when some sudden event causes a dramatic swing in financial markets. For example, a sudden interest rate rise can cause debt instruments themselves to have a sudden price drop, and debt derivatives will typically respond to the same interest rate shock with a much larger percentage price movement.

Because financial derivatives tend to be complex and difficult to understand, senior management in firms often lacks a full grasp of the financial implications of the derivatives positions the firm holds. Because of the complexity of financial derivatives, top management sometimes leaves oversight of these instruments to specialists. This lack of control has led to some spectacular business disasters involving financial derivatives that even include the ruin of entire firms, and they have often been used as vehicles for irresponsible speculation and gambling. In some spectacular instances, junior derivatives traders have used the firm's resources to place huge bets via financial derivatives, and the resulting losses have resulted in bankruptcy.

To many observers, the world of finance seems divorced from real economic concerns. For example, a share of stock is nothing other than a financial instrument that evidences an ownership interest in a firm. But a share of stock already stands at a considerable conceptual remove from the land, trucks, and equipment to which the share gives partial title. A financial derivative built on that share may seem completely divorced from economic reality. This perception has led some observers to see financial derivatives as being merely instruments of financial speculation and gambling. Perceived in these terms, it is not surprising that some have seen them as socially and ethically undesirable. Thus, some critics have even called for trading bans and for the dissolution of financial derivatives markets.

Since financial derivatives trading began to be a force in the United States in the early 1970s, the market for financial derivatives has grown to be a worldwide market trading many trillions of dollars of derivative instruments every year. This growth has been fueled primarily by the great usefulness of financial derivatives for legitimate business purposes. The three main uses of financial derivatives are as vehicles for investment, price discovery, and risk reduction and risk management.

Investment

Financial derivatives can be used as vehicles for investment and speculation. The difference between investment and speculation is obscure, but the distinction between the two turns principally on the level of perceived risk and legitimacy of purpose. Here investment may be taken to mean trading financial derivatives in a way that increases the investor's risk in pursuit of profit. As such it embraces the kinds of investment that many would choose to label as speculation. As a model to promote understanding, we may think of the investor as a person who trades stock index futures merely to profit if the stock market moves as the investor predicts. Such trading provides no new investable funds to the economy, and it produces no benefits for others, with the exception of its role in price discovery to be discussed below. Because of the lack of benefits for others, some observers see such trading as lacking social value. However, the millions of people who trade financial derivatives for investment or speculative purposes each day reveal that they find the markets useful for their own purposes. In this sense, even the most speculative use of the markets may be said to confer some benefits to those who choose to use the markets. However, if this minor and perhaps dubious benefit were the only social benefit of financial derivatives, they would be difficult to defend.

Price Discovery

Financial derivatives and derivatives trading confer significant benefits to society through their role in the process of price discovery. Price discovery might better be termed *price uncovering* or *price predicting.* The term *price discovery* refers to the process by which information about the future prices of goods is revealed and communicated to the public at large. Most financial derivatives have expiration dates at specific times in the future. As such, the prices of financial derivatives today embody information about the likely prices of underlying goods that will prevail at those future expiration dates. For example, today's futures price for corn for delivery in one year turns out to be one of the best available predictors of the price for corn that will actually prevail one year from now.

It is important to note that the price information is entirely a by-product of derivatives trading. This information about future prices is quite valuable to economic agents of all sorts. For example, information about future interest rates that financial derivatives markets reveal helps businesses to plan investment and financing. As an example, consider a home builder who contemplates a large project that will require considerable financing. Financial derivatives markets provide the home builder with some insight into the future direction of interest rates and the future financing costs the home builder is likely to face.

Traders in financial derivatives markets do not trade to generate price information for the benefit of the public, of course. They trade for their own purposes, either to seek profit or to manage risk as explained below. So the information about future prices that derivatives markets provide for the public is purely an unintended social benefit. Furthermore, it is also a benefit provided free of charge by derivatives markets to the public at large, who can simply observe prices that are reported from derivatives markets to gain insight into the future direction of prices.

Risk Reduction and Risk Management

In addition to pursuing profit, many participants in financial derivatives trade to reduce or manage preexisting risk that arises in the ordinary conduct of business. The classic example explains how both the farmer and a corresponding grain processor use the futures markets to reduce preexisting risk that they face in the conduct of their businesses. Consider a farmer who plants wheat today for harvest in six months. The farmer knows the cost of seed and can estimate production costs very accurately. But the price that will be received for wheat in six months is quite uncertain. The farmer, however, sells the anticipated crop in the futures market today for delivery in six months. This establishes the price per bushel that the farmer will receive when the crop comes to harvest. At the same time, a miller anticipates a need for wheat to mill into flour six months from now. Like the farmer, the miller can estimate operating costs but faces an uncertain future cost for wheat, a key raw input to the milling business. The miller buys wheat in the futures market for delivery in six months and thereby establishes the price that will be paid for that key input. Both parties use derivatives to eliminate the price risk that is inherent in their respective businesses.

While the mechanics of this transaction have been greatly simplified in this example, it reveals the key point about derivatives markets and risk reduction: Traders can use derivatives markets to reduce risks that they face in the ordinary conduct of business. Because the derivatives markets provide this possibility, they provide a very real benefit for society.

The example of the farmer and the miller does not use a financial derivative in the strict sense, but the basic risk reduction transactions of the farmer and miller find exact analogs in financial derivatives. For example, some businesses know they will need to borrow or lend at a future date, such as home builders or savings institutions, respectively. Both parties can use interest rate futures markets to reduce the uncertainty about interest rates that they face in the ordinary conduct of business. Businesses find similar uses for all existing financial derivatives.

In addition to purely reducing existing business risk, more sophisticated users of financial derivatives use these markets to manage risk rather than attempting to avoid it all together. For example, pension funds are charged with managing a pool of assets for beneficiaries who will need pension payments at distant future dates. As such, pension funds are in the business of managing the risk-return trade-off of their investments. For such an investor, the goal is not to avoid all risk but to limit the risk to certain acceptable levels and to manage that risk in the best possible way. Financial derivatives markets provide tools of great power and flexibility for achieving that desirable social outcome.

As this discussion of risk reduction and risk management shows, financial derivatives provide considerable social benefits that are difficult for the uninitiated to discern. A great deal of the bad press that financial derivatives receive is due to the fact that their misuse and their admitted susceptibility to misuse is much more visible and dramatic than the obscure and vital services that they provide to businesses that use these powerful tools in a prudent business manner.

Financial Services Industry

Ethics in the financial services industry refers to ethics in banking, securities, and insurance. This is a broad field in that it covers an array of somewhat dissimilar products and services, connected by their link to the financial interests of customers. In spite of heavy regulation of the industry, ethical challenges persist. The reliance of customers on the responsibility of members of this industry to care for their financial well-being leaves customers feeling particularly vulnerable. Furthermore, the complexity of many available products and/or services places the industry under additional scrutiny.

Financial Services as a Profession

Providing financial services is often considered a profession. This is clearly linked to the increasing complexity of financial planning and the vital role that planners, agents, and so on play in assisting individuals and companies identify and meet their complex financial needs. Unlike other professions, there is no specific code. There are, however, norms that reflect understood principles and responsibilities that guide behavior within the industry.

Professionalism enjoys a long history in the financial services industry, which dates back at least a century when, in 1915, Solomon S. Huebner articulated his dream of turning the life insurance salesperson into a professional. In 1927, Huebner founded The American College to educate insurance salespeople. Since that day, The American College has established a strong presence in the financial services industry through distance education and the award of respected industrywide designations.

As professionals, members of the financial services industry are both involved in the industry (not merely in the periphery) and knowledgeable as new financial instruments are introduced and older products evolve. Furthermore, they remain committed to serving customers, particularly where customers need guidance in differentiating among products and services and understanding their implications. As is characteristic of professionals, members of the financial services industry take ownership of and responsibility for their industry through self-regulation.

Industry Background

Before the past decade or so, as a result of legislation passed during the Great Depression of the 1930s, financial services were divided among separate industries. Banks were not permitted to sell insurance, and insurance companies were limited to the distribution of insurance products and services. This began to change with the introduction of new financial instruments, such as mutual funds and retirement funds. This, coupled with increasing longevity, which has enhanced the importance of long-term care and access to retirement funds, led to the passage of the Financial Services Modernization Act (known as the Gramm-Leach-Bliley Act) on November 12, 1999, which created the financial services industry, which now encompasses banking, securities, and insurance.

The Gramm-Leach-Bliley Act was significant in that it paved the way for common entities to offer one-stop shopping for financial products and services. On the one hand, many argue that this step, of bringing these sorts of operations together, was natural, particularly since most other countries either never recognized the distinctions removed by the Gramm-Leach-Bliley Act or removed them before the 1990s. At the same time, however, there is still concern that the industry needs to be mindful of problems that could arise, such as those linked to conflicts of interest and/or monopolization.

Marketplace Changes

The changing legal landscape has been accompanied by significant marketplace influences that influence the roles and responsibilities of financial services professionals. For example, the passage of the Gramm-Leach-Bliley Act has not only changed the nature of the industry but also augmented the requisite knowledge and responsibilities of members of the industry. Financial planners, insurance agents, and so on can no longer limit their knowledge to the select group of products and services with which they are familiar; they have to understand the industry to give customers the appropriate guidance and advice.

Technological advancements have also complicated the role of the financial services professional. The Internet increases the knowledge that the consumer has available to him. This leads to more educated consumers but also, often, more confused consumers (whether they realize it or not). Many products and services are complex so that publicly available information, such as that accessible via the Internet, is not always sufficient to guide responsible decision making. It thus becomes incumbent on planners and other professionals to anticipate these sorts of difficulties and to account for them.

The trend is toward self-service, and the Internet makes this possible without discriminating among customers. The lack of discrimination also translates into the failure to recognize particularized needs of vulnerable groups of customers, such as the elderly. While the Internet makes self-service possible, it is the responsibility of professionals nevertheless to provide oversight where he or she recognizes the expertise that he or she inherently brings to bear on the situation.

Products, Services, and Customers

Responsible behavior in the financial services industry is an increasing concern, not only because of the amount of money at stake but also because of the complexity of products. There are many products, particularly related to insurance, that even producers do not understand fully. Equity-indexed annuities, for example, are currently creating considerable controversy such that some firms are choosing to stay out of that market entirely. A number of common themes characterize ethical concerns in the financial services industry.

Conflicts of Interest

Of significant concern is the elimination of conflicts of interest and the removal of any sort of presence of these sorts of conflicts. Conflicts exist where there is a presence of perceived or actual competing interests. Conflicts of interest are said to arise where the professional's separate relationships with clients intersect such that the advice to one client can affect the financial situation of another client.

This sort of conflict can exist, for example, where a planner advises a husband and a wife who subsequently enter into a divorce. On the other hand, a conflict could also exist between two seeming strangers who, as it turns out, are engaged in a business partnership or some other relationship. It is not necessarily the case that these sorts of conflicts cannot be overcome, but most professionals recognize that they have to be recognized and handled in a responsible fashion.

Conflicts also exist where a professional is connected to other stakeholders (i.e., suppliers). For example, it is considered a conflict for a professional to advise a client to invest in a company in which the professional is a major stockholder. It is generally expected that professionals will avoid these sorts of conflicts or even the perception thereof.

A potential perceived conflict exists in that the adviser is paid by commission—that is, according to what he or she sells. While this does not create an absolute conflict, perceptions often exist that advisers are influenced by the lure of compensation.

Disclosure

One way in which professionals handle conflicts of interest, or the appearance thereof, is through disclosure.

Disclosure refers to open acknowledgment of these sorts of potential biases. It entails informing the customer so that he or she is aware and can make a meaningful choice. This choice can involve how to evaluate the professional's advice, or even whether or not to continue the relationship with this professional.

Disclosure also comes up as an important issue with regard to compensation practices. Insurance agents are often paid by commission, and some of the commissions paid are distributed in lump sums. Oftentimes agents choose not to discuss their payment arrangements with consumers because it creates a perception that financial services professionals consider distorted. To many, it appears that agents receive a windfall, and this can jeopardize sales. An increasing number of customers are moving toward Internet-based options that seem to involve lower commissions.

In fact, the perceived windfall is not entirely accurate, in that it reflects the timing of the recognition of payment, not necessarily the extent of the professional's efforts on the client's behalf. The trend, nevertheless, appears to be toward increased disclosure. The emphasis lies on educating consumers so that compensation practices become less controversial.

Suitability

Suitability also remains a significant concern. Suitability refers to the consideration of various strategies to meet the client's needs. It is considered important for financial services professionals to evaluate opportunity within the context of investment risk and the risk tolerance of the consumer.

Particularly in recent years, suitability is becoming an increasing issue. A number of professionals and companies have been faulted for selling products too aggressively, without adequate consideration of clients' needs. In fact, this sort of situation can happen through intentional neglect, but it can also occur, through no conscious fault of the professional, as a result of his or her inability to navigate through all the information appropriately. The industry continues to wrestle with suitability as a priority for enhancing responsible decision making in the financials services industry.

Conclusion

One of the leading tensions in the financial services industry remains the perceived conflict between ethics and compliance. In fact, many people argue that the increasing emphasis on compliance is detracting from sufficient attention being paid to ethics. Compliance refers to adhering to rules; ethics, on the other hand, guides decision making in the absence of clear rules. It is therefore deeply troubling that ethics could possibly be lost in the morass of regulations.

At the intersection of ethics and compliance, however, lies attention to and concern for the customer. This is a pervasive theme that has existed as long as the financial services industry has been operating. While lapses in judgment do occur, the professionals within the industry continue to take responsibility for their industry and the customers for whom they care.

Firestone Tires

Firestone has faced significant scrutiny for the production of tires that matched poorly with Ford Explorer and Mercury Mountaineer sport utility vehicles. This mismatch, or ultimately poor tire performance, resulted in many highway accidents wherein consumers were injured and in extreme cases killed when Firestone tires experienced tread separation. Firestone has suffered significant brand, reputation, and financial repercussions as a result of the faulty performance and ensuing recalls.

Bridgestone/Firestone, Inc., based in Nashville, Tennessee, has been in the business of making tires since 1900, when Harvey Firestone founded the Firestone Tire & Rubber Company in Akron, Ohio. Firestone was acquired by Bridgestone USA, Inc., a subsidiary of Tokyo-based Bridgestone Corporation, in 1990 for $2.6 billion. Today, the company markets 8,000 different types and sizes of tires and a host of other products. The company has also enjoyed a long and prosperous relationship with Ford Motor Company that began in 1906 when Henry Ford purchased 2,000 sets of tires from Harvey Firestone.

In July 1998, a State Farm Insurance researcher advised the National Highway Traffic Safety Administration (NHTSA) that he had found 20 cases of tread failure associated with Firestone tires dating back to 1992. He was politely thanked, but no action resulted. In January 2000, Houston television station KHOU aired a 9-minute story on tread-separation accidents in Texas. After the story aired, many people called the station to relate their own stories of Firestone tire failures, most on them on Ford Explorer sport-utility vehicles. These were relayed to Joan Claybrook, former chief of the NHTSA. Finally, Sean Kane, a former employee of the Center for Auto Safety and the founder of Strategic Safety, a research organization, also tried to alert the NHTSA about problems with tread separations on Firestone tires. After learning about similar problems in Venezuela, Strategic Safety, together with Public Citizen, another consumer watchdog group, issued a press release on August 1 asking Ford for a vehicle recall.

Despite the evidence compiled by these sources, the NHTSA was slow to respond. In March 2000, investigators Steve Beretzky and Rob Wahl found 22 tread-separation complaints that they marked for "initial evaluation." The number of complaints skyrocketed between March and May, and by May 2, the NHTSA had elevated their status to "preliminary investigation." Days later, the NHTSA requested that Bridgestone/Firestone supply production data and complaint files, which it produced on July 27.

On obtaining a copy of the report, Ford immediately began analyzing the data. Of the 2,498 complaints logged by that time, 81% involved P235/75R15 Firestone tires. Of the 1,699 complaints involving tread separation, 84% involved Ford's Explorer and Bronco SUVs and Ranger and F-150 trucks. On August 5, agents of Ford and Bridgestone/Firestone met in Dearborn, Michigan, to discuss the issue. By this time, the NHTSA was investigating 21 possible deaths related to tread separation of Firestone tires. Within days, the investigation had grown to include 46 possible deaths, and Ford and Bridgestone/Firestone met with NHTSA officials to discuss a plan of action. On August 9, the companies issued a recall of 6.5 million tires.

After continued investigations, the NHTSA encouraged Bridgestone/Firestone to expand the recall to include other sizes and models of tires, but the company refused. On September 1, the NHTSA issued a consumer advisory warning of potential problems with other sizes of Firestone tires.

Since the recall announcement, both companies' stock prices have declined, and Bridgestone/Firestone suffered a $750 million loss in 2000. Opinion polls suggested that the public had lost faith in both Bridgestone/Firestone and Ford and that consumers were quite worried about the safety of Ford Explorers with Firestone tires. Moreover, both companies face hundreds of lawsuits stemming from deaths and injuries resulting from tire-separation incidents—these still continue five years later. The first of these, which went to trial in Texas in August 2001, was settled out of court for $7.85 million. Ford, which also was named in the suit, settled for $6 million before the trial began. Ford Motor Co. filed a lawsuit against Bridgestone/Firestone relating to the 2000 recall of defective tires. Bridgestone/Firestone recalled 6.5 million tires and in 2001 Ford had to cover the costs of the tire-replacement program. More than 270 people were reportedly killed and more than 700 more were injured in accidents involving Firestone ATX and AT tires, mostly on Ford Explorer vehicles. In late 2005, Bridgestone agreed to pay Ford a $240 million settlement.

In July of 2006, Bridgestone-Firestone announced a recovery rate of recalled tires that exceeded 95%. The company declared it was not satisfied with this recall rate and attempted to reach out to consumers who were still in possession of the potentially faulty tires. The renewed effort to communicate with consumers included sending letters to current registered owners of Ford Explorers, Mercury Mountaineers, and Mazda Navajos. In addition, the company sent letters to every Firestone company-owned store and participating, authorized Firestone dealer reminding them to look for the recalled tires and to check the spare. Firestone reiterated their offer to replace, mount, and balance new, replacement tires, at no cost to consumers.

The ultimate question is not where this crisis will leave Ford and Bridgestone/Firestone but how it will affect the ethical and legal responsibilities of the government, regulatory agencies, and businesses. Consumers can now research all aspects of vehicle quality except for tires, so one suggestion has been to create consumer reports on tire durability, traction, strength, and other important traits. It is up to consumers to determine whether Ford, Bridgestone/Firestone, and the NHTSA acted ethically and responsibly based on the information available. Did they try to hide information? Did they act quickly enough? Will the public forgive and forget? Only time will tell.

Public Citizen, along with Bridgestone, three other tire companies, and a trade group representing the tire industry, took regulators at the NHTSA to court asking for a tougher tire-pressure monitoring rule. The resulting rule is mandated under the Transportation Recall Enhancement, Accountability, and Documentation Act (TREAD), which was passed by Congress following the Firestone incident. This act calls for stricter reporting of vehicle and tire problems with NHTSA and requires vehicle manufacturers to install a system on vehicles' tires to warn when they become 25% or more below the recommended tire pressure. This new technology must be present in all new vehicles manufactured after August 31, 2007.

FLAT TAX

The flat tax is a proposal to replace the current federal income tax code with a simple one-rate tax on all earned income. Instead of a system of progressive rates in which the percentage of tax taken increases as income rises, all income would be taxed at the same rate, 17% in some proposals, and the only deduction allowed would be a personal deduction.

Proponents of the flat tax cite several advantages over the present system. Complexity would be reduced, making it possible for all individuals to fill out their own tax forms. The present tax code fills more than 60,000 pages, and most income tax returns are prepared by professionals. Complying with the tax code costs as much as $194 billion a year according to some estimates. The flat tax would eliminate virtually all compliance costs.

A second advantage claimed by proponents of the flat tax is more ethical government. Under the present system with its thousands of exemptions, deductions, credits, and special treatments, there is an incentive for special interest groups to lobby legislators for favorable treatment. A flat tax, it is claimed, would eliminate the rewards for manipulating the tax code and thereby reduce the temptations of government officials to be influenced by favors.

A third advantage cited by flat tax supporters is economic stimulus. Removal of the highest income tax rates would motivate people to work more, earn more, save more, and invest more, resulting in economic growth that benefits everyone. Some flat tax proposals include elimination of any taxes on dividends, interest, and other unearned income for further economic stimulus, although this is not necessary for a flat tax system.

A flat tax has been enacted in nine nations of Central and Eastern Europe, the major one being Russia, which has a flat rate of 13% on personal income. Supporters point to the growing economies of this region as evidence of the beneficial effects of the flat tax.

Criticisms of the Flat Tax

The main criticism levied by those who oppose the flat tax is that it is unfair. This system, they say, would result in a windfall for the rich and a higher burden for the poor and middle class. The flat tax would abandon the progressive tax system, which places a greater burden on those more able to pay, and increase taxes on those less able to afford them. Defenders of the flat tax say a progressive tax system would be maintained through a generous personal exemption, which is as high as $30,000 for a family of four under some proposals.

A second criticism is that the flat tax would increase the federal government deficit by lowering the taxes paid by the wealthy. Flat tax supporters counter with the argument that the economic growth stimulated by the flat tax would more than make up for the revenue lost from lower tax rates. While the 17% flat tax depends on economic growth to make up for lost revenue, the flat tax rate could be set at any level to produce desired government revenue.

Among the most vocal opponents of the flat tax are home buyers and builders since the interest on a home mortgage is the main income tax deduction for most people. The mortgage interest deduction, they say, has encouraged home ownership and brought the social benefits that come with a larger number of homeowners. Other groups generally opposed to a flat tax are nonprofit organizations. Since the flat tax would eliminate deductions for charitable contributions, there would be less incentive for people to donate to these organizations. Defenders of the flat tax answer concerns of both these groups counter these arguments by citing the economic growth they say their plan will generate. People who have more income, they say, will contribute more to charity even without tax deductions. Economic growth will enable more people to buy homes also, even without the mortgage interest deduction. Furthermore, they say, the increased savings will drive down interest rates, making home mortgages more affordable than they are under the present system.

As for the economic growth in Russia and other European nations that instituted flat tax systems, critics say that economic growth in these nations had begun well before the flat tax was instituted. The growth, they say, was due to other structural changes in the economies.

Ethical Issues

Debates over the flat tax involve both utilitarian arguments and issues of justice. Proponents of the flat tax rely mainly on utilitarian arguments to defend their proposals. Although they admit a flat tax would further enrich the wealthiest citizens, they argue that the resulting economic growth would bring greater prosperity for everyone. Furthermore, the simplification of the tax system and elimination of the necessity for professional tax preparers would lessen the burden on all tax payers and free the tax professionals for more socially useful work. Economic justice is often a secondary argument for the flat tax. The same rate for everyone is said to be a fairer system than one that discriminates against the wealthy.

Opponents of the flat tax tend to be skeptical of the economic growth predicted by flat tax proponents. They often appeal to ideas of justice and fairness in opposition to a plan that could result in a greater disparity between the wealthiest and the poorest segments of the population. Those opposed to the flat tax are often political liberals who believe in the ability of the government to accomplish desirable social objectives through the incentives available with the present system of tax deductions. For example, a flat tax would eliminate the tax incentives that encourage the use of alternative energy sources such as wind and solar power as well as hybrid automobiles and other products desired by environmentalists. These types of tax deductions are often cited by flat tax supporters as examples of the wasteful allocation of resources that their plan would eliminate.

Food and Drug Safety Legislation

Major Federal Food and Drug Laws

In the United States, food and drug safety is regulated through a variety of federal, state, and local laws and government organizations. This complex web of enforcement agencies and regulations works to cover all aspects of food and drug safety, from drug approvals to food labeling to restaurant sanitation. With regard to food safety, continual monitoring is provided by food inspectors, microbiologists, epidemiologists, and other food scientists working for city and county health departments, state public health agencies, and various federal departments and agencies. Some monitor only one kind of food, such as milk or seafood. Others work within a specified geographic area. Others are responsible for only one type of food establishment, such as restaurants or meatpacking plants. The Clinton administration's Food Safety Initiative of 1997 was created to strengthen the efforts of all the members of the food safety team.

The primary federal law covering food and drug safety is the Food, Drug, and Cosmetic Act of 1938. This law, which has been amended multiple times over the years, requires safety and effectiveness testing of new drugs for humans and animals, prohibits adulteration of food products, requires labeling of food products, and monitors devices that emit radiation such as microwave ovens and medical equipment. The U.S. Food and Drug Administration (FDA) is responsible for enforcement of this law. The FDA is charged with protecting the public health by assuring the safety, efficacy, and security of human and veterinary drugs, biological products, medical devices, our nation's food supply, cosmetics, and products that emit radiation. The U.S. Department of Agriculture is responsible specifically for the safety of meat, poultry, and egg products and serves to uphold the Federal Meat Inspection Act, Poultry Products Inspection Act, and Egg Products Inspection Act.

All states have laws that regulate some aspects of food and/or drug safety. Most state laws model the Federal Food, Drug, and Cosmetic Act and adopt the food safety standards found in the Code of Federal Regulations. The states serve as important first responders to inspect, monitor, and detect problems in food safety. A Government Accounting Office (GAO) report in 2001 indicated that state programs provided more than $300 million in resources to food safety programs in 1999. These resources accounted for almost 2 million food safety inspections, of which 44% were at the processor level. The FDA's budget for field activities provided $145 million in resources that same year. These numbers show the valuable contributions made by both the federal and state governments, just in the area of food inspections and field activities.

Some of the agencies involved in food safety include the FDA, Centers for Disease Control and Prevention, U.S. Department of Agriculture, Cooperative State Research, Education and Extension Services, U.S. Environmental Protection Agency (EPA), National Oceanic and Atmospheric Administration, Bureau of Alcohol, Tobacco, and Firearms, U.S. Customs Service, U.S. Department of Justice, Federal Trade Commission, and state and local governments.

History of Food and Drug Legislation in the United States

The United States was slow to recognize the need for a national food and drug law. Great Britain's first national food law was passed in 1860, while the first food and drug law was passed in the United States in 1906.

The conditions in the U.S. food and drug industries during the 1800s and early 1900s can hardly be imagined today. Changes from an agricultural to an industrial economy had made it necessary to feed the increasing city population with food from distant areas. But sanitation was primitive and ice was the principal means of refrigeration. Milk was still unpasteurized, and cows were not tested for tuberculosis. The use of chemical preservatives and toxic colors was virtually uncontrolled.

In the same era, thousands of so-called patent medicines, produced by patent medicine companies, reflected the limited medical capability of the period.

Medicines containing such drugs as opium, morphine, heroin, and cocaine were sold without restriction. Labels did not list ingredients, and there were no warnings against misuse.

Yet there were many firms producing reliable and wholesome products. Ethical companies were concerned with competitors who used fake ingredients and adulterated foods to save money. At the same time, scientific developments led to the ability to detect impurities and fake ingredients.

The Pure Food Movement, a grassroots phenomenon that began in the 1870s, was the original and principal source of political support for the Food and Drugs Act of 1906. Members of the food industry began to advocate for a federal law against adulteration as a result of trade interests. They were concerned about competition from a new breed of food products (glucose as a replacement for sugar and oleomargarine as a threat to butter were just two examples). Another issue was that variations in the laws between the states made it difficult for food manufacturers to comply with the requirements for their products according to differing state laws. In 1879, Peter Collier, the fifth head of the Division of Chemistry, urged federal legislation to make food adulteration a crime.

President Abraham Lincoln appointed Charles M. Wetherill as the first chemist of the New Department of Agriculture. Wetherill set up a laboratory and began to analyze samples of food, soils, fertilizers, and other agricultural substances. Wetherill was a chemist and physician. He organized a wide array of groups into a coalition that would be powerful enough to get Congress to act. Members included agricultural chemists, state food and drug officials, women's club members, the medical profession, sympathetic journalists, the reform wing of business, and favorably disposed members of Congress.

In 1883, Dr. Harvey W. Wiley became chief chemist and came to be leader of the pure food crusade. Dr. Wiley conducted research with human volunteers to study the effects of food preservatives on digestion and health beginning in 1902. The voluntary "poison squad," as they came to be known, ingested such chemicals as borax, formaldehyde, and salicylic, sulfurous, and benzoic acids. These experiments went on for five years.

Opposition to Wiley's campaign for a federal law came from whiskey distillers and the patent medicine firms, who were then the largest advertisers in the country. Many of these men thought they would be put out of business by federal regulation. Pressure for a law ultimately came from President Theodore Roosevelt in December 1905 after he had read about filthy conditions in Chicago's packing plants from the news media and the Upton Sinclair novel *The Jungle*. The news of the conditions cut meat sales in half and angered President Roosevelt. When it appeared that the House leadership seemed determined to give the food bill the silent treatment, Roosevelt called the Speaker in and insisted that the bill be brought to the floor. The Meat Inspection Act was passed the same day as the Food and Drugs Act.

The 1906 Food and Drugs Act

The 1906 law forbade interstate and foreign commerce in adulterated and misbranded food and drugs. The assumption of the law was that the average consumer was prudent enough to plot his or her own course and would avoid risks if labeling made him or her aware of them. The law required that drugs abide by standards of purity and quality, set forth in the United States Pharmacopeia and the National Formulary, or meet individual standards chosen by their manufacturers and stated on their labels.

The law prohibited the adulteration of food by the removal of valuable constituents, the substitution of ingredients so as to reduce quality, the addition of harmful or toxic ingredients, and the use of spoiled animal and vegetable products. Making false or misleading label statements constituted misbranding.

The Bureau of Chemistry enforced the 1906 law until 1927, when it was reorganized. The Food, Drug and Insecticide Administration was formed and renamed in 1931 as the Food and Drug Administration.

In 1937, a public health disaster drove home the need for a stronger federal drug safety law. One hundred and seven people (mostly children) died from the liquid formulation of a drug. This highlighted a weakness with the 1906 law that did not require the drug manufacturers to test the formulation for safety before it was sold.

The Federal Food, Drug, and Cosmetic Act of 1938

Congress corrected the prior law's weakness with the passage of the Federal Food, Drug, and Cosmetic Act in 1938. Now companies were required to prove the safety of new drugs before putting them on the market, including different formulations of previously approved drugs. The new law also covered the regulation of cosmetics and therapeutic devices and updated the old law to improve consumer protection. Drugs and medical devices must be proven effective as well as safe before they can be sold. The Food, Drug, and Cosmetic Act of 1938 has been amended multiple times since it was passed. The following are some examples of the types of amendments that have been made.

The Kefauver-Harris Drug Amendments of 1962 were passed to improve drug safety and ensure greater drug efficacy. For the first time, drug manufacturers were required to prove to the FDA the effectiveness of their products before marketing them.

After several deaths from cyanide placed in Tylenol capsules, the FDA issued Tamper-Resistant Packaging Regulations in 1982 to prevent further poisonings. The Federal Anti-Tampering Act of 1983 made it a crime to tamper with packaged consumer products. In 1990, the Nutritional Labeling and Education Act required all packaged foods to have nutrition labeling. The act further required that all health claims for foods be consistent with terms defined by the Secretary of Health and Human Services. Some health claims were allowed for foods and the food ingredient panel and serving sizes, and terms such as *low fat* and *light* were standardized.

Regulatory changes arising from the implementation of a 2004 Food Allergen Labeling Law and food companies' own desire to court health-conscious consumers drove new requirements in food labeling by the FDA in 2004. As a result of the food allergen law, food makers were required to label in plain language the presence of the eight allergen groups: tree nuts, milk, eggs, fish, crustacean shellfish, peanuts, soybeans, and wheat. The FDA required that food makers list the amount of trans fat on the label. Trans fat is found naturally in animal-based foods and in processed foods like vegetable shortening. In response, some food makers changed the formulations of their products to remove trans fat and/or updated their product labels.

California's Proposition 65 passed in 1986 created a controversy in food labeling. Proposition 65 requires that businesses disclose the presence of chemicals that the state believes cause cancer, birth defects, or other reproductive harm. For example, fish counters in California display state-mandated warnings about mercury and related compounds. Like the drug labeling policy above, recently introduced legislation in Congress would prohibit many state and local laws, such as California's Proposition 65, unless the states obtain FDA approval to keep them. The food industry argues that it is difficult to comply with requirements that vary state by state because it adds uncertainty, confusion, and extra costs to interstate commerce. The state attorneys general and food-safety officials are concerned with protecting the rights of the citizens and their governments in passing laws.

There are a few key federal laws pertaining to food and drug safety, and there are numerous state and local laws regulating the same areas. Many federal, state, and local government agencies work together every day to ensure the safety of the U.S. food supply and the safety and efficacy of drugs.

Social and Ethical Issues in Food and Drug Safety

The social and ethical issues surrounding the food and drug industries are significant, and questions of corporate obligations beyond specific legal requirements abound. One very pertinent issue, not specific to the food and drug industry but certainly looming large within that realm, is the problem all corporations face of balancing profit with public welfare. The public expects that corporations will, at a minimum, comply with the law. It is the government's responsibility at all levels to work to provide the legal and regulatory environment for insuring that the food we consume and drugs we use are safe. Prior to the first food and drug laws in the United States, some unethical companies violated the public's trust by producing products with fake or adulterated ingredients or sold dangerous "patent medicines" containing ingredients such as cocaine or heroin. Governmental regulation was required to ensure punishment for such unethical behavior and to reassure consumers about the food and drugs they use. Most corporations, to protect their reputation and their market share, abide by the food and drug laws and may even go beyond what is required by law, being aware that it is in their best interest to maintain the public's trust beyond the scope of simple legal compliance. Examples of corporations taking actions above and beyond legal compliance are common. Johnson & Johnson is cited as an exemplary case of corporate responsibility in the face of a product tampering in which several people died. Johnson & Johnson pulled all their Tylenol products from retailers and took the time to reformulate the product and create tamper-resistant packaging. When the company reintroduced the product, it was met with much support and enthusiasm by consumers. In some cases pressure from nonstatutory entities, such as environmental groups encourage companies to go above and beyond what is required by law. Dolphin-safe tuna is an example of pressure put on companies that started at the grassroots level and resulted in some companies changing their fishing methods to minimize or eliminate the number of dolphin accidentally caught in tuna nets.

Some ethical issues in the drug industry have raised the question of what society condones or supports based on what is accepted as right and wrong. An example of this is the work that has been done by pharmaceutical companies and researchers regarding stem cell research and products. The issues in the case of stem cell research center not so much on the safety of the public as they do around the values that society as a whole professes to hold. Another ethical question relevant to the drug industry is whether or not some laws are overly restrictive. A case in point would be FDA laws that keep certain drugs off the market that could be beneficial to many people but that have proven to have very adverse, in some cases fatal, effects for a small percentage of the population. Merck Pharmaceutical's Vioxx is one such example. While some individuals were harmed by taking Vioxx, others lobbied the FDA to keep the product on the market because the improved quality of life they experienced while taking the drug more than made up for any risks of the drug. Pharmaceutical products are often a trade-off. While the drug may cure or control a medical condition, there are side effects experienced by some individuals. The ethical issue is whether drugs that harm some individuals, even though they help others, should be completely pulled from the market. Some people feel that consumers should be able to make an informed choice, as long as the risks and benefits are clearly outlined.

Keeping up-to-date with food and drug safety requires continual monitoring of situations and events that can affect these areas. As new food safety risks arise, or we gain better knowledge about nutrition, new medical conditions, epidemics, or new technologies, updates to the food and drug laws and policies are necessary. As a result, Congress or the states may amend the existing food and drug laws or create new laws. Food and drug agencies such as the FDA may create new policies to deal with amended or new laws.

Technological developments and medical research has resulted in the ability to create new types of drugs and will continue to result in new drugs and products. The FDA can grant "fast track" clearance to a company to expedite development of a drug under certain circumstances. Over the years, more and more medicines and related products have been and are being created with biotechnology techniques. Medical research over the past several decades has made significant discoveries pertaining to the human genome that, in turn, have resulted in the creation of numerous biological drugs, many of them reengineered human proteins. Biotechnology has resulted in significant advances against cancer and age-related blindness, among other diseases. New medical research and discoveries have and will lead to innovative and novel products and cures for diseases. How these are handled by the FDA and the companies involved will be an important issue in maintaining drug safety.

The question of who bears the primary responsibility for public safety, the government or the corporations, is a question that goes well beyond the food and drug industry. It is a question that is as old as free market society itself and one that we will be struggling with more and more as populations and technologies increase and resources decrease.

Ford Pinto

One of the best-known and infamous cases in corporate ethics and social responsibility involves the Ford

Pinto. The case involved the decision by the Ford Motor Company during the 1970s not to recall its Pinto model, despite knowledge of a dangerous fuel tank design flaw and the potential loss of life that would result. It also involved, for the first time, charges that were brought against a corporation not just for negligence but for murder.

In 1976, Ford was the second largest manufacturer of automobiles, with revenues of $30 billion a year and net income of almost $1 billion. Due to concern over competition over subcompact vehicles from Germany and Japan, Ford President Lee Iacocca was determined to manufacture a car at or below £2,000 and for less than $2,000. Whereas normal development and production of an automobile takes more than three and a half years from start to finish, the Pinto was a rush project, beginning in 1968 and taking just over two years to reach the showrooms. As a result, engineering design decisions came after style decisions to a greater degree than normal. The Pinto's style required that the fuel tank be located behind the rear axle, leaving only 9 or 10 inches of "crush space" between the rear bumper and rear axle. In addition, bolt heads were exposed that were capable of puncturing a fuel tank on rear impact.

Crash tests revealed that when the Pinto was struck from behind at even slow speeds the fuel tank could be punctured, causing fuel leakage. Any stray sparks could then ignite the spilling gasoline, causing the car to become engulfed in flames. If the fuel tank design was to be modified however, or a rubber bladder installed, the vehicle could pass the rear impact test. The crash test information was forwarded to the highest levels of Ford management.

Despite being fully aware of this information, the company continued with the production of the Pinto and was able to justify the decision on the basis of several reasons. First, the company met all applicable federal safety standards. Second, the car was comparable in safety with other cars then being produced. Third, in the early 1970s consumers were more concerned with price than safety, leaving little incentive for firms to spend money promoting the safety of their vehicles. Fourth, changing the design would lead to little trunk space, an important selling feature for cars.

The fifth and most controversial reason for sticking with the design was based on a cost-benefit analysis conducted by Ford. An internal study suggested that it would be more cost effective to continue with the same fuel tank design rather than change it. The study indicated the cost to improve the design of all Ford vehicles using the flawed fuel tank to be $137 million ($11 per vehicle × 12.5 million vehicles), which was much greater than the cost to society of just over $49 million. Ford's estimate of the cost to society was based on a 1972 study by the U.S. National Highway Traffic Safety Administration, which estimated the cost of a human life to be approximately $200,000, with the cost of a serious burn injury being approximately $67,000. These amounts included categories such as future productivity losses, medical costs, property damage, legal costs, and employer losses. The amount of $49 million was based on the estimated cost to society of the expected 180 burn deaths (180 × $200,000), 180 serious burn injuries (180 × $67,000), and 2,100 burned vehicles (2,100 × $700).

Despite reported incidents of burning vehicles, Ford still decided not to recall the Pinto. In addition, the company managed to successfully lobby the U.S. government for 8 years not to implement a key government safety standard that would have required Ford to modify its fire-prone gas tank or even warn the public of the danger. Several high-profile deaths were reported in the media, and a civil suit was settled in 1978 when a jury awarded $125 million, later reduced to $6 million, for what the judge called Ford's callous indifference to human life. Following the death of three teenage girls in 1978, Ford went on trial in 1980 with the charge of criminal conduct, the first time a company experienced such a charge. It was only after the law became effective in 1977 that the Pinto was made with a rupture-proof fuel tank design. In 1978, Ford finally recalled all Pintos made between 1970 and 1976 and replaced the Pinto with the Ford Escort after 1980. Some estimate that more than 500 people died in burn deaths related to the Ford Pinto.

It's not clear whether Ford learned anything from the Pinto experience, based on its actions (or inaction) during the Ford Explorer versus Bridgestone/Firestone scandal in 2000 when many drivers and passengers died or were seriously injured due to rollovers and/or tire blowouts. Ford appears to have known of rollover problems for some time before taking any action and continued to blame Bridgestone/Firestone. On May 25, 2001, Ford placed advertisements in several newspapers such as *USA Today* signed by its CEO Jacques Nasser and Chairman Bill Ford stating that customer safety has always been and always will be their first priority. Based on the Ford Pinto case, however, many might suggest that Ford provided an example of a company that disregarded the safety of its customers out of concern for their bottom line.

Foreign Corrupt Practices Act of 1977 (FCPA)

The Foreign Corrupt Practices Act (FCPA) is a U.S. law that prohibits companies from gaining business or any improper competitive advantage through bribes paid to foreign officials. Passed by Congress in 1977, the FCPA's enactment made the United States the first industrial nation to criminalize transnational bribery. Congress further amended the law in 1988 and 1998.

The FCPA applies to companies organized under U.S. law, as well as foreign companies that issue securities within the United States. These organizations and their agents may be held liable under the FCPA for acts performed either within or outside U.S. borders. A 1998 amendment also extends the law's reach to include citizens of other countries who support or engage in foreign bribery while physically present within the United States.

The FCPA addresses bribery through two avenues. First, it proscribes companies from making payments to foreign officials that are intended to induce the recipient to misuse his or her official position to help the firm obtain, retain, or direct business or secure any improper advantage—for example, by encouraging the recipient to take or omit some action or to use his or her influence to affect a foreign government's decision. The law's definition of *foreign official* includes officials of foreign governments, officials of foreign political parties, candidates for foreign political office, and officials of public international organizations, such as the International Monetary Fund or the World Bank. The FCPA prohibits both direct payments to these individuals and payments made through intermediaries. The law is violated once a payment is offered, even if it is subsequently refused. Companies convicted under the FCPA's antibribery provision are subject to a criminal fine of up to $2 million. Willful violation of the law by individual officers, directors, employees, and other company agents can result in a maximum fine of $100,000 and up to five years' imprisonment.

The FCPA's antibribery provision is notable not just for what it prohibits but also for the kinds of payments it allows. It does not outlaw bribes aimed at private companies or individuals, so long as these payments are not channeled to the government. Furthermore, it permits so-called facilitating or grease payments. This is a sum paid to induce a government official to provide a service he or she is obliged to perform and to which the payer is entitled. Facilitating payments typically are differentiated from bribes on the basis of two features: (1) they usually involve small amounts of money, and (2) they are not intended to secure a competitive advantage. In many poorer nations, such payments function as "tips" that supplement inadequate wages. The original 1977 legislation exempted payments of this type directed at foreign government employees whose positions were "essentially ministerial or clerical." The 1988 amendments modified this definition, permitting payments to public employees for "routine government action." Examples of such activities provided within the statute include visa processing, mail delivery, the scheduling of inspections, and utility hookups (phone, power, water, etc.). The list is not exhaustive: a subsequent qualification makes clear that other government services may qualify under this exemption.

The second avenue through which the FCPA addresses bribery is a set of accounting and control requirements. The law obliges companies to maintain records and file financial statements that accurately reflect the firm's transactions. It also requires the implementation of internal controls adequate to reasonably assure that a company's assets are used only for purposes that are legal and appropriately authorized. The FCPA's accounting provisions are designed to enhance corporate transparency, prevent the creation of slush funds, and forestall the disguising of bribes as legitimate commercial transactions.

The FCPA is a product of the heightened sensitivity to political corruption that prevailed during the years immediately following Watergate. Investigations during the mid-1970s revealed that numerous U.S. corporations had offered or given bribes to political figures in foreign countries. Perhaps most notoriously, Lockheed Corporation paid senior officials in Japan and the Netherlands for preferential consideration of its aircraft. The resulting scandals led to the fall of the Japanese government and implicated a member of the Dutch royal family. A voluntary disclosure program conducted by the Securities & Exchange Commission demonstrated that Lockheed's activities were by no means unique: More than 400 corporations, including 117 of the Fortune 500, admitted to paying more than $300 million to foreign officials.

Through the years, commentators from government, business, and the academy have raised numerous questions and concerns about the FCPA. These critiques center on three issues. First, the FCPA is alleged to place U.S. companies at a competitive disadvantage relative to firms unhindered by similar legal constraints. Some assessments of the FCPA's financial impact estimate the value of the business opportunities lost by U.S. companies at tens of billions of dollars annually, not counting related economic consequences (lost wages, diminished tax revenues, decreased shareholder returns, etc.). Other studies conclude that the law has a smaller economic effect on U.S. exports, but one that is statistically significant. Still, some U.S. business leaders underscore the benefits their organizations enjoy under the FCPA. For example, the law provides a public standard to which U.S. firms can appeal when confronted by bribe solicitations; thus, it helps shield them from the direct and indirect costs that surround such demands. The refusal to pay bribes also can provide companies with a reputational advantage.

A second line of criticism questions the law's moral soundness. The FCPA has been cited as an example of a law that imposes Western values on other cultures. Respondents to this charge of ethical imperialism emphasize two indicators that suggest bribery is broadly acknowledged as morally improper: the ubiquity of legislation outlawing domestic bribery, and the clandestine and secretive conduct that universally attends these payments. Others argue that the FCPA categorically imposes a moral standard that is only conditionally binding, and there may be occasions when a corporation's responsibilities to its stakeholders—for example, providing a fair return to shareholders—should take precedence over its obligation to avoid bribes. One reply to this argument is that it does not actually oppose two moral duties. Rather, it places stakeholder *interests* in opposition to the moral obligation to abstain from bribery, and it is uncertain whether these interests ever could carry sufficient weight to override that duty.

A third criticism of the FCPA is that it is an ineffective deterrent to bribery. Advocates of this view highlight trends and data that suggest the law's impact has been limited at best. The evidence cited includes the following: the relatively small number of cases prosecuted under the FCPA; economic analyses showing that during the 1980s U.S. exports grew faster in product markets traditionally susceptible to corruption—for example, defense equipment and oil and gas field machinery—than in sectors customarily less plagued by bribery; and the relatively poor showing of the United States on Transparency International's Bribe Payer's Index, a ranking of bribe sources first instituted in 1999. Defenders of the law point to the positive developments that have followed in its wake. The FCPA has served as the basis for several highly publicized prosecutions, resulting in substantial fines for guilty companies. It has also spurred companies within its purview to implement internal policies and practices aimed at preventing bribery.

The FCPA has played a critical role in catalyzing multilateral responses to the problem of transnational bribery. Concerns about the law's impact on the competitiveness of U.S. companies created political pressure to extend antibribery legislation through international agreements. In 1988, the FCPA was amended with a proviso that directed the President of the United States to work with the country's trading partners to staunch cross-border bribery. Aided by a growing global awareness of corruption's deleterious effects on both countries and companies, these and similar diplomatic efforts began to bear fruit during the late 1990s, when numerous multilateral conventions addressing international bribery began to appear.

The multilateral initiative most closely linked with the FCPA is the Convention on Combating Bribery of Foreign Public Officials in International Business Transactions, adopted in 1997 by the Organisation for Economic Co-operation and Development (OECD), a worldwide association of advanced economy nations. Modeled largely on the FCPA, the OECD Convention is directed toward the supply side of the bribery equation. Signatories to the Convention must establish laws criminalizing the bribery of foreign government officials by businesses. Furthermore, they are called to cooperate with other signatory countries in identifying and fighting bribery. Importantly, the OECD Convention contains a provision for compliance monitoring and reporting, to promote its full and effective implementation. A related initiative also calls on those OECD member countries whose tax codes permit the deductibility of foreign bribes to eliminate this practice.

As of 2004, all 36 countries party to the Convention had passed implementing legislation. For example, the 1998 amendments to the FCPA were introduced specifically to align U.S. law fully with the Convention's stipulations. Some of the national legislation spawned in response to the OECD Convention is noteworthy for its innovation. In particular, the bribery and corruption section of the United Kingdom's Anti-terrorism, Crime, and Security Act of 2001 does not distinguish between facilitating payments and larger bribes, making both types of payments illegal. The UK law thereby moves beyond the Convention's requirements and arguably sets a new benchmark for corporate conduct in this arena.

The OECD Convention is reinforced by other important antibribery initiatives, including the European Union's Convention on Corruption, the Council of Europe's Criminal Law Convention, and efforts sponsored by the United Nations, the World Bank, and the International Monetary Fund. Its goals also are broadly supported by the civil society organizations now working to combat corruption, most important the country-specific and transnational projects of Transparency International. Assiduously and consistently implemented, the OECD Convention could help both to deter bribery and level the playing field for multinational enterprises headquartered in the world's leading economic nations.

In summary, then, the significance of the FCPA is threefold. As the first national law to criminalize foreign bribery by domestic enterprises, the FCPA stands as a milestone in the history of efforts to eradicate transnational bribery. The statute also serves as a continuing test case for laws that seek to raise standards of corporate conduct in global markets: The concerns raised about the FCPA's economic consequences, moral soundness, and effectiveness illustrate the challenges faced by such legal initiatives. Finally, although the FCPA has been widely criticized, it has become, through the OECD Convention, a model for international legislation. Thus, it has helped to stimulate some important first steps toward the development of a comprehensive, global antibribery regime.

Foreign Direct Investment (FDI)

Foreign direct investment (FDI) is the investment in an entity in one economy by an investor in another economy. Unlike foreign portfolio investment (FPI), in which the investment is in foreign financial instruments, FDI provides the investor with control over the acquired asset. Control of an asset has been defined (OECD Benchmark) as owning 10% or more of the ordinary shares or voting stock in an incorporated enterprise or the equivalent in an unincorporated enterprise. FDI can occur in various forms: greenfield investments in which there is an investment in a new facility; mergers in which the assets and operations of firms from two different countries are combined to form a new entity; and acquisitions in which there is a transfer of existing assets from a local entity to a foreign investor. There are also nonequity forms of FDI, which include types such as subcontracting, management contracts, turnkey arrangements, franchising, licensing, and product sharing. The amount of FDI is generally defined by two measures: the flow of FDI and the stock of FDI. The flow of FDI refers to the amount of investment over a given time period (typically one year), and it is made up of three components: equity capital (purchase of shares of the enterprise), reinvestment of retained earnings of the entity, and intracompany loans or transactions between the parent enterprises and its foreign affiliates. It is commonly tracked both inwardly (FDI recipient or host country) and outwardly (FDI source or home country). The stock of FDI refers to the total accumulated value of foreign-owned assets at a given time. Individuals or business entities may undertake FDI. Firms that source FDI are known as multinational or transnational corporations (MNCs or TNCs) or enterprises (MNEs or TNEs). These firms are generally large and have budgets that exceed those of many countries.

An investor's motivation for acquiring or establishing foreign assets fall into three primary categories: FDI may be an effective way of gaining access to a foreign market or to valuable foreign resources, or it may be an effective way of reducing the cost of operations. But these incentives may be mitigated by potential risks due to uncertainty in the political and economic environment of the host country or the openness of the country to FDI.

Worldwide FDI has grown tremendously since the late 1980s as the institutional structures have encouraged economic liberalization and globalization. FDI inflows peaked in 2000 at $1.4 trillion but have since fallen to $560 billion in 2003 as a result of a worldwide economic downturn and the events of September 11, 2001, in the United States.

Historically, the developed countries have accounted for the majority of FDI. In 2003, they were responsible for 90% of the FDI outflow and were the recipients of 66% of the inflow. That being said, FDI is a major source of external capital for developing countries and is thought to be a major contributor to economic growth and development. In 2003, FDI inflows accounted for 72% of all resource flows to developing countries.

With economic globalization, the demand for FDI dollars far exceeds the supply, allowing foreign investors to be choosier when deciding where to invest and, in turn, creating an environment of fierce competition among developing countries for the scarce FDI dollars. Developing countries have responded by instituting liberal FDI policies, providing tax breaks, and relaxing environmental and worker health and safety standards to attract foreign investors. This has created a situation where the developing countries are increasingly more vulnerable to foreign investors' actions, which in turn has raised the level of awareness and the debate concerning the social responsibility of foreign investors in developing countries.

History of FDI

During the two decades following World War II, FDI rapidly increased in Western Europe and some developing countries. The United States undertook new international expansion efforts, first in the reconstruction of war-torn Europe and then during the period of rapid economic growth in many countries during the 1960s. To a great extent this was a honeymoon period for FDI and MNEs. There was not much concern about regulating MNEs. Host countries welcomed private foreign capital in the form of inward FDI, and home countries were not too worried about the effects of outward FDI on trade, employment, or technology. FDI regulation was primarily defined through bilateral investment treaties, which prevailed over multilateralism after the unsuccessful attempt to create an international trade organization at Bretton Woods. The UN Conference on Trade and Development (UNCTAD), which was established in 1964, initially focused on increasing the flow of foreign capital, and thus it recommended that governments of capital-exporting developed countries should take steps to encourage the flow of private investment to developing countries and those of private-capital-importing countries should provide favorable conditions for FDI. By the end of the 1960s, the total FDI stock value was approximately $160 billion, four fifths of which was sourced from only five countries (United

States, United Kingdom, Germany, France, and Switzerland), and 50% of that was sourced by the United States.

By the late 1960s and early 1970s, the honeymoon period was over for MNEs. The focus shifted from the flow of FDI to the activities of MNEs. There were allegations of U.S. MNEs interferring in policital matters in developing countries. In a speech to the UN General Assembly in 1972, Chile's President Allende made a virulent attack on MNEs, as a result of the International Telephone and Telegraph Company (ITT) devising a plan to overthrow the Chilean government and another company, Kennecott Copper Corporation, attempting to control its natural resources. And thus, while only a third of the MNE activity was located in developing countries, it attracted the most attention because of MNEs' power and bold actions.

The developing countries used the UN system to try to protect their national sovereignty and control their natural resources. In 1974, two General Assembly resolutions were sponsored by developing countries that affirmed the principle of permanent national sovereignty over natural resources and called for the industrialzed world to assist in financing third world economic development. While the resolutions had no force in international law, they did highlight the developing countries' position.

Also in 1974, the UN Economic and Social Council (ECOSOC) established the Commission and the Center on Transnational Corporations, in which the developing countries held a majority of the 48 member seats. The objective of the Commission was to enhance the understanding and nature of MNE activities, to obtain arrangements for MNE operations that promoted national goals, and to strengthen the negotiating capacity of host governments in dealing with MNEs.

In 1976 and 1977, the Organisation for Economic Co-operation and Development (OECD) created guidelines that were promoted by the United States but counteracted the moves of the developing countries. These guidelines protected U.S. investments overseas, promoted a liberal investment climate, and accepted that all OECD governments had a responsibility to treat foreign enterprises no less favorably than their own national enterprises.

The economic situation in the late 1970s and early 1980s was one of high oil prices and worldwide recession conditions, which quickly reduced the bargaining power of developing countries as the international direct capital flow slowed down. Developing countries were in a state of debt crisis, and sources of external financing other than FDI were drying up. The debt-ridden developing countries that did seek help from international financial institutions, such as the IMF and the World Bank, were required or encouraged to institute austere fiscal policies. Structural adjustment programs became the prescription and the Washington consensus idealogy was an important basis for this prescription. The recommendation to developing countries was to give a larger role to the market forces and to reduce the role of the state, which in turn gave FDI a bigger role in the economy. This shifted the focus from how to control FDI to that of how to attract FDI. Hence, this period saw a proliferation of national liberalization programs, bilateral investment treaties, regional trade agreements that included significant investment policy liberalization measures, and General Agreement on Tariffs and Trade/World Trade Organization (GATT/WTO) agenda items that focused on investment issues.

As a result of economic liberalization, FDI increased rapidly in the 1980s, with the United States and the European Community together making up nearly 80% of the total world's outward FDI stock. By the end of this decade, Japan became a major source as the outward flow of the United States declined, and the triad (United States, European Union, and Japan) sourced 80% of the world's FDI stock. The triad also dominated the inward FDI flow and stock, accounting for 65% and 50% of the world total FDI flow and stock, respectively. Only 17% of FDI inflows went to developing countries, and 0.1% of it went to the least developed countries. Overall, FDI outflows tripled between 1984 and 1987, and they increased another 20% in both 1988 and 1989.

The focus in the 1990s continued along the path of economic liberalization. During the period from 1990 to 2002, of the 1,641 changes that were introduced by 165 countries in their FDI laws, 95% were in the direction of greater liberalization. Many countries had established investment promotion agencies to attract inflows of FDI, and the World Association of Investment Promotion Agencies (WAIPA) was established in 1995. In 1991, UNCTAD started to publish an annual World Investment Report that provides data and trends relating to FDI.

As FDI increased, MNEs' voluntary behavior came under more scrutiny since there was no international regulation to constrain them. In 1999, UN Secretary General Kofi Annan offered a challenge to MNEs to form a "Global Compact" with society, adhering to a set of principles that would protect especially the environment, and human and labor rights. Increasingly, more studies were conducted to understand the impact of FDI on economic development. It became increasingly clear that the benefits of FDI were not automatic and were dependent on the proper behavior of MNEs.

Impact of FDI in Developing Countries

While intratriad investment dominates international capital movement, FDI continues to be an important source of external capital for developing countries. FDI has the potential to affect nearly every aspect of the host country's environment, including the following: the market structure and performance; technological development; human capital development, employment and wage structure; quality of the physical environment; and economic growth. While FDI provides immediate direct benefits to the host country in that it is a source of capital, tax revenue, and employment, it is difficult to determine the exact impact FDI has on other aspects of the host country's environment.

The impact of FDI on the host country's market structure and performance is not easily understood. Some argue that the competitive pressures of FDI will force the local enterprises to be more efficient if they are to survive, resulting in higher productivity and lower prices. Conversely, a foreign enterprise may be significantly superior to domestic enterprises and may either buy or drive out local firms, leading to a concentration of power in the industry.

FDI will also affect the diffusion of technology in the host country. This will occur, some argue, through vertical linkages (local suppliers and distributors) because the foreign investor's success depends on a domestic firm's ability to perform. But this can transpire only to the degree that foreign investors use local suppliers and distributors. Diffusion occurs in the horizontal direction (competing or complimentary enterprises) because the presence of FDI forces local firms to use more efficient techniques to survive. But this requires that local enterprises have the capability to imitate, which means that the level of technology is within their grasp.

FDI can also have an impact on human capital enhancement. Some argue that the skills and knowledge from the foreign enterprise will transfer to its employees, suppliers, and distributors by way of interaction and training. Foreign investors can also affect human capital through workplace standards and labor practices. Some argue that foreign investors will manage the workplace as they do at home and create an atmosphere where employees are empowered and treated with a high level of self-respect and dignity. In addition, there is a long-term impact whereby foreign investors' demand for more skilled workers directs educational policy in the country. This reasoning supports a "race to the top" hypothesis; that is, foreign investors are interested in locations where workers are trained and protected. On the other hand, some argue that a "race to the bottom" hypothesis is more likely; that is, foreign investors will go where labor is cheapest and costly standards are lax, to reduce their overall transaction costs. This in turn imposes downward pressures on wages and working conditions in the more developed investing countries. As the race to the bottom hypothesis has gained support, pressure has been applied on MNEs from developed countries to improve the working conditions in developing countries where they invest or subcontract, as exemplified by criticisms of Nike, Disney, and Wal-Mart. In addition, nonprofit organizations such as the Fair Labor Association and the Worker Rights Consortium keep a watchful eye on the activities of MNEs by assisting in the monitoring and the verification of workplace standards worldwide.

FDI can also affect the physical environment. Even when the latest technology is used, industrialization negatively affects the environment, and hence, as FDI increases the industrialization and urbanization of a developing country, it can have a detrimental effect on the environment. But not all the environmental consequences associated with FDI are necessarily negative. Foreign investors may bring technological solutions that are environmentally superior to those currently in use in the developing country. On the other hand, they may use the developing country as a dumping ground for inferior or obsolete technology. And host countries may be tempted to relax environmental standards to attract FDI.

FDI will also have an impact on economic growth. While there is little argument about the idea that FDI is a source of capital and tax revenues and thus provides benefits in the short term, what is of even greater concern for long-term development is domestic investment. Some argue that FDI will crowd out local enterprises and actually be detrimental to economic development in the long run. While there is some evidence of crowding out, especially in countries where mergers and acquisitions figure prominently in FDI inflow, another view is that FDI "crowds in" domestic investment by creating complimentary activities, and thus spurring local investment.

There has been an abundance of empirical studies to evaluate the true impact of FDI on developing countries. The overall prognosis is that the indirect benefits of FDI are not automatic. Developing countries are extremely heterogeneous, and the exact nature of the impact varies between industries and between countries. The country's characteristics and policies are important determinants of the net benefits.

Fraud

Fraud is a generic term that encompasses the multifarious and often ingenious means by which one individual can gain an advantage over another through deliberate false suggestion, concealment, or misrepresentation of the truth. Fraudulent acts include the forging of documents, tampering with scales and measures, false bookkeeping, and intentionally lying in contractual negotiations. In ethical terms, fraud combines deliberate falsehoods with a conscious willingness to prey on the trusting nature and reliance needs of others; hence, fraudulent acts carry strong moral disapprobation. In the law, fraud constitutes a defense to a breach of contract action, an affirmative cause of action in tort, and a crime.

Although the scope and scale of fraudulent practices in America are difficult to assess and measure, a significant amount of fraud seemingly touches every industry and commercial endeavor. The U.S. Attorney General's Office estimates that fraud in the health care industry alone, including Medicare fraud, illegal kickbacks, and the prescription of unneeded medical procedures, costs society in excess of $100 billion each year. Tax evasion costs the government $250 billion a year. The costs associated with Internet fraud, including fraud through online auctions, identity theft, and electronic embezzlements of various sorts similarly have been estimated at over $100 billion annually. The recent wave of managerial misconduct epitomized in the Enron and WorldCom scandals has brought accounting and securities fraud in its various forms to the center stage of the public consciousness. These scandals eroded investor confidence and contributed to a $1.5 trillion decline in the New York Stock Exchange in the year following the public disclosures. Of course, there also is good old-fashioned common-law fraud, including the schemes and scams of the unscrupulous huckster and confidence man.

This entry begins with a general discussion of the legal elements of fraud. It then examines economic and sociological explanations for various types of fraud in American society.

Legal Elements

Depending on the context, the law of fraud can be criminal or civil, state or federal, common law or statutory. Hence, there is not one law of fraud but many. Historically, the law of fraud, criminal and civil, developed in the state courts through common-law interpretation. Today, most states have enacted criminal codes that replace the various common-law crimes, including criminal fraud, with specific statutory provisions. Congress also has enacted several antifraud statutes, many of which provide for both criminal penalties and civil remedies. The common law of fraud retains its relevance, however, supplementing the various federal and state statutes by providing a civil action for fraud when no statute applies.

The elements of criminal fraud are specified by statute. Some criminal statutes address the *means* through which fraud is perpetrated; others are limited by the *substantive context* in which the fraud occurs. For example, the federal Wire Fraud Act addresses means, making it a crime to engage in fraud over the radio or television. The Sarbanes-Oxley Act and Lanham Act differ by substantive context, with the former pertaining to managerial fraud and the latter defining fraudulent advertising. State statutes also differ by substantive context, with one statute addressing nursing home fraud, a second statute covering bank forgery, and yet another statute addressing insurance frauds. Criminal fraud at both the state and federal levels typically constitutes a felony, and sanctions generally include significant fines and imprisonment. As in any criminal case, the prosecutor must prove each element of criminal fraud beyond a reasonable doubt.

The common law specifies the elements of civil fraud. The *Restatement (Second) of Contract* defines civil fraud as (1) an intentional (2) misrepresentation (3) of material fact (4) that is reasonably relied on, causing an injury. Pursuant to the common law, whenever one party fraudulently induces another party to enter a contract, the defrauded party can rescind that contract and get a full refund. The defrauded party can also sue for civil damages in tort law, receiving both compensatory damages and often a punitive damage as well. A punitive damage goes beyond compensation, seeking to punish the wrongdoer rather than simply compensate the victim.

The *Restatement* provides a good working definition of fraud. Although the *Restatement* addresses civil law, not criminal, the statutory elements of most criminal frauds mirror those of common law. Hence, the elements of criminal and civil fraud are essentially similar. On first look, the four elements enumerated in the *Restatement* may seem deceptively simple; yet, each is open to interpretation and has its own vagaries and dynamics. To get a fuller understanding of the social, ethical, and legal issues associated with fraud, it is useful to look at each of these four elements in more depth.

Intent to Deceive

The common law distinguishes between fraudulent misrepresentations and innocent misrepresentations. The former arises when an assertion of fact is consciously false and the falsity is intended to mislead the other party. An innocent misrepresentation, in contrast, arises when the asserting party does not know and has no reason to know that the assertion he or she is making is false; that is, there is no intent to deceive. If a party enters a contract induced by an innocent misrepresentation, then contract law will often allow that party to rescind the contract and get a refund. An innocent misrepresentation, however, does not constitute a tort or crime.

Fraud involves *scienter,* or intentional deception. Sometimes the deception is premeditated, with steps taken to conceal the fraud. For example, suppose a used car salesperson rolls back an odometer with the intent to mislead the buyer into thinking the car is worth more than it is. Knowing that this act is both unethical and illegal, the salesperson forges mileage documents to conceal the deception. The salesperson's purposeful and premeditated state of mind constitutes the highest form of culpability and blameworthiness and accounts for fraud being treated as a crime and may justify the implication of a punitive damage as well.

Reckless misrepresentations may also be fraudulent. The common law defines recklessness as the "unreasonable taking of a known risk." To illustrate a reckless intent, suppose a businessperson is selling a business and has provided the latest cash flow information pertinent to the sale. Before the deal is finalized, new data come in. If the businessperson purposely avoids seeing the new data so as to avoid any duty to provide bad news, he or she is behaving recklessly and could potentially be liable for fraud.

The purposeful avoidance of negative information may have been at work in the Enron case. Ken Lay, former CEO at Enron, has claimed that he did not know of the fraudulent schemes undertaken by other members of his organization. He has argued that this lack of knowledge negates any criminal intent. Most courts, however, hold that reckless disregard for the truth or, alternatively, willful ignorance, is sufficient to establish criminal intent. In this light, simply saying that one did not know that financial records were false would not disprove scienter so long as the former CEO had reason to know that there was a significant risk that the records were false and intentionally disregarded that risk.

Misrepresentations

To establish fraud, one party must prove that the other party made a misrepresentation. Most commonly, the misrepresentation is expressed in spoken or written words. For example, when the confidence man claims that the forged painting is an original Rembrandt, or the tax fraud submits a false tax claim, each has made a misrepresentation in words. Misrepresentations can also be made through actions: For instance, when a real estate vendor constructs a false wall that conceals structural damage to the home, the act of concealment constitutes a misrepresentation that the structure is sound. The acts of forging a signature or tampering with scales similarly constitute misrepresentations even though no words are used.

Sometimes failing to either act or speak can be interpreted as a misrepresentation. This occurs whenever a person has a legal duty to take action or to speak but does or says nothing. For example, a person who sells a product with a latent and dangerous defect has a legal duty to warn the buyer of the danger, and failure to warn may be interpreted by the buyer as an assertion that the product is safe and sound. In such a setting, intentionally omitting to mention that danger can be both unethical and illegal.

Exactly when a party has a legal duty to speak up in contract negotiations and other business settings varies from state to state, and the law is constantly evolving. Nonetheless, some aspects of the law seem fairly clear. As a general rule, sellers must warn buyers of product defects that pose potential dangers to human health and safety. Sellers also have a duty to fully respond to reasonable questions posed by buyers and to clear up half statements that may be misleading. For example, suppose a buyer in a real estate transaction asks the seller about the annual taxes on the property. The seller provides truthful information about taxes in previous years but intentionally fails to mention that higher tax rates now apply and that the county assessor has recently raised the appraisal on the home. resulting in a significant net increase in the property's tax burden. Responding with misleading half statements in response to reasonable questions posed by the buyer is not only unethical, but it is potentially criminal fraud as well.

The common law also recognizes a heightened duty to speak in fiduciary relationships. A fiduciary is a trusted person. Classic fiduciary relationships include trustee/beneficiary, doctor/patient, corporate executive/shareholder, and attorney/client. In each case the trusted party has undertaken a duty to act primarily for the benefit of another. In such settings, if the stronger party seeks advantage over the weaker party, an act of fraud may occur. Consider, for example, the fraud of insider trading. An executive who uses inside information to trade on the executive's own account takes unfair advantage of shareholders who are unaware of the information the executive is trading on. Such trades are deemed fraudulent even if the executive makes no direct misrepresentations. Similarly, physicians who prescribe questionable procedures without explaining other options to the patient may be violating a fiduciary pledge to avoid the excesses of self-serving behavior.

Material Fact

To be fraudulent, the misrepresentation must concern a material fact. The common law distinguishes facts from opinions. Facts typically can be proven or disproved; opinions cannot. For example, if a salesperson states that a toothpaste tastes great, this is an opinion; claiming that in an experiment 7 out of 10 people rate the taste as great is a statement of fact. Facts also concern things of the past or of the present rather than predictions of the future. For instance, projecting that a business is likely to earn increased cash flows in the future is most likely an opinion. Stating that over the past decade the business has witnessed a steady increase in cash flows constitutes a statement of fact.

The distinction between fact and opinion may become blurred when an expert expresses the opinion. For example, stockbrokers and investment bankers routinely offer expert opinions on which stocks to buy. Presumptively these opinions are based on hard facts, independent judgment, and applied expertise. Suppose, however, that the expert has a conflict of interest so that the expert has a financial incentive to encourage the buying of particular stocks. This was a common scenario in the recent wave of financial scandals that struck Wall Street. It appeared that certain opinion letters were skewed to favor the hidden agendas of the advising companies. In such contexts, expert opinions can be sufficiently factual to support a legal claim for fraud, including criminal fraud.

A fact is material when it is of significance and importance to the defrauded party. Immaterial matters are of relatively little or no importance. For example, suppose a seller of a used car states that the car used to be owned by a famous country-Western singer. To most buyers, such a statement would be immaterial; they would base the decision to buy or to not buy the car on other criteria. On the other hand, if the transaction depends on the veracity of such information, then the assertion is material, and if it is knowingly false, then the seller may have committed fraud.

Reasonable Reliance Causing an Injury

The final elements of fraud are reasonable reliance and injury. Ultimately, fraud involves predatory behavior. The defrauding party makes a misrepresentation fully intending that the other party will trust that the misrepresentation is true. When the assertion proves false, the trusting party gets hurt. If the lie was intentional and the innocent party's reliance was reasonable, then fraud, both civil and criminal, has been committed.

The question arises as to when it is reasonable to rely on the representations of one's trading partner. Traditionally, the law has required business actors to be fairly self-sufficient and to take reasonable steps to inform themselves with regard to the material aspects of any business transaction. In other words, parties cannot always reasonably believe the representations made by their trading partners. Such a rule may reflect an economic logic by encouraging people to take cost-effective precautions and by rewarding self-industry. If one can easily check the veracity of the assertions made by one's trading partner, then it may be unreasonable not to do so.

The common-law rule of caution and self-sufficiency may also reflect traditional marketplace ethics. In the absence of a fiduciary relationship, a reasonable person should generally assume that his or her trading partner is primarily self-interested. Given an assumption of self-interest, words of inducement during a business negotiation must be taken with a grain of salt. For example, it is customary for salespeople to emphasize the positive aspects of a transaction and potentially to engage in a little puffery, framing their wares in the best possible light. Both marketplace ethics and the law distinguish between legitimate and acceptable sales puffery and material misrepresentations, with only the latter potentially constituting fraud. Buyers are expected to exercise both caution and common sense.

Sometimes, however, salesmanship can go too far, and increasingly courts are using the law of fraud to discourage overly aggressive sales tactics. This is particularly true whenever there is a high degree of expertise involved in the transaction and unequal access to information. In an increasingly specialized society, asymmetric information has become the norm rather than the exception. Specialization is the key to a bountiful society, but it also creates dependency and places a premium on trust. In highly specialized settings, relying on one's trading partner seems reasonable, and abuses of confidence appear unconscionable.

Causes of Fraud

Fraudulent behavior may be at an all time high. On any given day, the business pages of the *Wall Street Journal, New York Times,* and *Washington Post* are likely to report some sort of high-profile fraud. Consider for example recent scandals in defense contracting. Headlines announce that a major defense contractor has admitted to overbilling the U.S. Navy by tens of millions of dollars, another contractor has agreed to pay $37 million in a cost-inflation scam, and a third contractor may have been overcharging for fuel in Iraq. Of course, fraud is not limited to defense contracting or even to traditional business contexts. For example, commentators estimate that half of major league baseball players use performance-enhancing steroids. Studies report that 80% of "A" students admit to having cheated on an exam and suggest that nearly half of all résumés contain lies. Overall, employee theft totals $600 billion annually, or 6% of GDP.

What then accounts for fraud? Perhaps one explanation derives from simple economics. According to economic theory, people respond to pecuniary incentives. Apparently too many people in too many settings conclude that fraud pays. Given the difficulty in detecting and proving fraud, it is far from clear that they are wrong. Certain forms of white collar crime such as insider trading or tax fraud are notoriously difficult to detect and prove, and even if the crime is detected and proven, prison sentences may be light. Economic theory predicts that the rational businessperson will calculate the potential gains from the illegal behavior and compare those gains with the potential costs associated with criminal and civil sanctions and loss of business reputation. The perception, and likely reality, that fraud pays may explain the widespread instances of consumer fraud, tax fraud, Medicare fraud, and the like.

Of course people do not always commit fraud just because it is in their financial interest to do so. First, people value things other than money, and a person may feel a sense of shame from blatant criminal activity such as tax fraud, securities fraud, or insider trading even if their guilt goes completely undetected. This suggests that for many people, it is in their non-pecuniary self-interests to obey the law, even when fraud pays. Second, people often act out of a sense of public duty. If a person has sufficient respect for the rule of law in general or respect for the law in question, then they may restrain themselves even if they calculate that crime pays. Third, people are not always so calculating. Most commonly, people obey the law simply from habit without calculating anything.

Ultimately, there seems to be a trade-off at the core of fraud. Fraud occurs in part because society commits too few resources to detecting fraud and provides penalties that are too light. But fraud also occurs because people fail to restrain themselves. To be willing to obey a law of fraud that is not effectively enforced, people must recognize that fraud in its various forms is inherently wrongful and embrace a duty to act accordingly.

Freedom and Liberty

The idea of liberty is closely associated with the concept of freedom, although *freedom* may be slightly broader in its meaning. Compared with *freedom, liberty* carries clearer associations with the social and political world, and this entry addresses that social and political meaning of freedom and liberty.

Thus, we are not concerned with the issue of free will versus determinism. If we lack free will in the sense that we have no choices and that all human behavior is causally determined by the laws of physics since the beginning of time, then our discussion of liberty and freedom lacks significance. Nor does this entry consider restrictions on behavior and choices that result from the laws of nature in the ordinary sense of the term. No human is free to fly under his or her own power, but that is not a restriction on his or her liberty in the current sense of the term.

Positive and Negative Liberty

Contemporary discussions of liberty typically take their starting point from a famous article by Isaiah Berlin, "Two Concepts of Liberty," which was published in the middle of the 20th century. Berlin distinguishes between "negative" and "positive" liberty. Negative liberty is concerned with freedom from certain external restraints, while positive liberty is concerned with the agent's internal freedom to act in certain ways. Negative liberty addresses restrictions on the scope of control that a person faces, while positive liberty focuses on the source of control. Negative liberty emphasizes external constraints, while positive liberty gives weight to internal factors, such as psychological ability or inability to act in certain ways. Doctrines of negative liberty emphasize the importance of freedom from interference by others, while theories of positive liberty are concerned with one's ability to control and shape one's own life. As most commentators would agree, it is extremely difficult to draw a sharp line between negative and positive liberty, yet the two ideas represent different general outlooks about the factors that are important in assessing human freedom and liberty.

Negative Liberty

In the most minimal sense of liberty, one is free if one is not physically restrained. Thomas Hobbes emphasized this conception in his *Leviathan,* while recently Hillel Steiner has argued that one is free unless some other individual makes an action impossible. An armed robber may threaten death, but in this very limited sense, one is still free to refuse to surrender her wallet. The robber's gun makes the surrender of the wallet less desirable, but one is free, in some sense, to refuse. But virtually all theorists of freedom would agree that physical restraint limits freedom. We may take absolute physical restraint as one end point in what it means to be free. In a way, this minimalist conception of freedom lacks interest—we all hope for a richer freedom for ourselves.

A slightly more robust sense of liberty asserts that one is free unless one is "subject to the arbitrary will of another." For many authors in the libertarian tradition, the direct coercion of one person by another is the paradigmatic violation of one's freedom. The master, for example, can dispose of the slave, so the slave is subject to the arbitrary will of his master. This slightly broader conception of freedom would regard the victim of a robbery as lacking freedom. In this view, the key criterion of freedom is absence of coercion, the paradigmatic case of which arises when one person directly forces another to perform a certain action or prevents a person from acting in a certain way. The coercion can also be by a group of people against another person.

But what is to count as coercion is often somewhat unclear. Expanding our robbery example somewhat, would a gang of teenage toughs in a dark street verbally demanding a wallet, be coercive? In contrast with the armed robber or gang, an aggressive panhandler may make it desirable to surrender a donation, but is this an example of coercion? More broadly, some even speak of "coercive wage offers"—an offer that one feels compelled to accept merely due to an absence of better choices. In contrast, if we take an offer as an overture that may be rejected without changing the position one had before the offer, some deny that any offer can be coercive. When we compare the view of freedom as the absence of absolute physical restraint with the slightly broader idea of coercion, we begin to see that there is a continuum of actions by others that can be seen to limit our freedom differentially. This idea of a range of possible restrictions on liberty reveals the motivation for maintaining that only absolute physical restraint restricts freedom. Otherwise one may be embarked on a "slippery slope" toward an ever more expansive idea of freedom.

So far, we have considered obstacles to freedom that are placed on one person by another person or group of persons. These views we have been considering would not count laws and regulations as limits on freedom. However, when we turn to liberty in a social or political context, many thinkers maintain that laws and regulations limit individual freedom. Legal speed limits deploy the coercive power of the state with the intention of restricting behavior, for example. If such laws do not intend to restrict our freedom to drive as rapidly as we wish, what point could they possibly have?

As we consider the relationship between individual liberty and the power of the state, we reach the core concern for the theory of negative liberty. Thus, when we consider the issue of political freedom, we reach a very practical level of concern. If we value individual freedom as consisting of the absence of constraints, what laws should we have that limit some freedoms, and what effect do these limitations on freedom have for the freedom of others?

Advocates of political freedom typically maintain that there must be a region of activity and concern that lies within the province of the individual alone and that the state must not infringe on this personal space. This way of thinking about political liberty developed most intensely from the Enlightenment to the present day and takes political liberty as its touchstone. Thus, we find theorists such as John Locke maintaining that the state should not infringe on one's "life, liberty, and property," just as the United States Declaration of Independence insists that one must be free to enjoy "life, liberty, and the pursuit of happiness." In the same spirit, John Stuart Mill asserts that *liberty* simply means "protection against the tyranny of the political rulers."

The tradition of thought that insists on protecting an individual's private sphere of action against state intrusion is known as *classical liberalism.* Liberalism in this sense is the ancestor of, but quite different from, the doctrines of current-day liberals in U.S. politics, which generally countenance considerable state intrusion in some areas of human life but not in others. Classical liberalism is much closer to the political philosophy of libertarianism. Classical liberalism maintained that the state's regulation of individual conduct should be held within very strict bounds to ensure a wide-ranging individual freedom. To a considerable extent, this tradition views a key function of the state as placing minimal restrictions on the freedom of some only to maximize the extent of freedom that can be enjoyed by all.

Among many thinkers of the early modern period, the goal was to promote freedom across all citizens. In their conception, this required placing the minimal constraints on the liberty of some that would expand the freedom of others. Thus, laws against theft aim to restrict the freedom of would-be thieves to expand overall societal freedom.

Classical Republicanism

In these different versions of negative freedom, the emphasis has been on actual palpable restrictions of the freedom of one person or group of persons by another person, persons, or the law. But what if the restrictions are not actual but only potential? For example, consider a state ruled by an absolute dictator, who happens to be benevolent toward her citizens. People in that state might have a great deal of freedom that they can exercise from day to day, but they live under the shadow of a government that is not of their own devising. Similarly, consider a state that exists under the hegemony of a much more powerful neighbor. The weaker state's existence and the freedom of its people are not secure.

Some theorists of freedom maintain that the residents of the autocratic state or the dominated state would lack freedom. In recent years, thinkers such as Pettit and Skinner have striven to revive what they identify as the classical republican theory of freedom. Under this view, people are free only if they live in a state in which the actions of the body politic are determined by the community as a whole. This would not be the case, they maintain, in our examples of either an autocratic state or the dominated state. More specifically, the theory of classical republicanism maintains that freedom requires the unconstrained enjoyment of a wide range of civil rights, including the right to participate in the making of laws. In short, if a person or people are within the power of others, even potentially, that person or people lack freedom.

If the classical republican view is correct, it implies that restrictions on negative freedom need not always be intentional. The benevolent autocratic, for example, does not aim to restrict the freedom of her citizens. This situation differs significantly from the narrow view that we considered at the outset, in which one person physically constrains another or in which one person intentionally coerces another.

Must Restraints on Negative Freedom Be Intentional?

Theorists of negative freedom are divided on the question of whether negative freedom is diminished only by intentional restrictions. Consider for example a situation in which a clerk locks a store's stockroom at the end of the day. Unknown to the clerk and contrary to all custom, a colleague was sleeping there. Later, the sleeper awakes to find that he cannot exit. Clearly, a person in this situation would feel a lack of freedom quite acutely. Whether we should think of this kind of example as illustrating an unintentional reduction in negative freedom or as an instance in which one's free movement is constrained by physical circumstances instead of the actions of a person is not clear, and there is much debate on this topic.

But we can shed more light on this issue by thinking again of the autocratic state ruled by a benevolent despot who really wants what is best for the people of that state. In such a case, it is easy to see that many people in the state might readily feel they have less freedom than they would in a democratic state, and they may even act in a way consistent with an absence of freedom. In this case, the lived experiences of citizens in the autocratic state can be ones in which freedom is reduced and actions that might be undertaken under circumstances of more robust freedom are foregone.

This survey of curtailments of negative freedom began by considering the brute force of physical restraint and then went on to consider milder forms of a loss of liberty, such as direct coercion of various sorts and the coercive effect of the law. But we ended by analyzing a state in which there is no specific restraint on liberty but where the feeling of freedom is curtailed and actions of a free person are sacrificed under the specter of power outside oneself. This brings us to the positive theory of freedom, which emphasizes one's ability to experience life as free and to be able to implement a life plan that one chooses.

Positive Liberty

While negative liberty focuses on the obstacles that limit one's actions, the concept of positive liberty concerns a person's freedom to carry out a plan of action. Negative liberty addresses the external obstacles to one's free action, while positive freedom focuses on the internal psychic obstacles to a plan of action. But not just any plan of action is at stake but the very ability to carry out a plan of life. Thus, positive freedom is concerned with issues of self-realization, self-determination, and self-mastery.

Imagine you observe someone moving freely around his or her house, looking in this cupboard, opening that drawer. No external impediments block the person's path. Eventually, this person finds a pack of cigarettes, nervously lights up, and takes a long draw. Those actions now seem to take on a different meaning. It becomes plausible to say that the person was not acting in a manner that was fully free but rather was driven by a strong habit or even an addiction. Such impediments are internal and lead to considerations of limits on positive freedom. Without meaningful control over oneself, it is impossible to implement a life plan, and those who emphasize the concept of positive freedom want to focus on these issues of self-control and self-direction.

But factors other than a drug addiction can limit our positive freedom. For instance, a lack of self-respect and self-confidence can impair a person's ability to undertake a course of action that they would have good prospects of being able to complete if they would merely try. A lack of these internal psychic resources may limit one's freedom to act and achieve. To addiction, we might add irrational desires, illusions, compulsions, and phobias as other types of freedom-limiting psychological states.

Against this line of argument, one might say that our concern here is with freedom in the social and political sphere, not limitations on freedoms that arise from our neuroses or psychological limitations. Yet theorists of positive freedom—Rousseau and Marx for example—emphasize the social and political factors that can be internalized and come to limit positive freedom just as a lack of self-confidence might. Thinkers in this tradition tend to maintain that social and political factors do affect the consciousness of individuals and can incapacitate them for developing life plans they otherwise might be able to undertake. They would maintain that social and political circumstances can lead to just the lack of psychic resources that limit positive freedom.

Think, for example, of a slave who through long captivity becomes inured to his state. While this person might once have had ambitious plans, a long history of servitude has slowly compressed the scope of his desires such that he now feels quite content with his station in life. This sequence of events has led to psychological changes that limit the slave's capacity for action and thwart his positive freedom. He no longer considers or even desires to undertake certain actions that are inconsistent with his slavery.

A society structured in a way that frustrates the realization of life plans of its citizens may be subject to serious criticism for limiting positive freedom—especially if these factors become internalized. For example, a society that engages in ideological manipulation of its subjects may lead to the internalization of freedom-limiting attitudes. Furthermore, a society may be structured in such a way that a large segment of its citizens come to see its opportunities as considerably diminished. This is, in briefest terms, one of the criticisms that Marx levels against capitalist society. The bourgeois world, according to Marx, has abused the workers to such an extent that they no longer understand their capacity and have come to accept their diminished place in a corrupt society. In short, for such people positive freedom is limited by internalized factors, but social and political arrangements might be responsible for engendering those limitations. Finally, it is important to note that those who emphasize positive freedom also acknowledge that people suffer from various restrictions on their negative freedom. Thus, positive freedom theorists expand the concept of freedom beyond merely negative freedom.

Resource Constraints and Disincentives as Impediments to Freedom

While negative and positive concepts of freedom focus on external blocks and internal disabilities, respectively, some find yet another class of freedom-limiting structures in the social and political sphere. Implementing virtually any plan of life requires some resources. At the most elemental level, if one lacks food, one lacks freedom to implement many life plans that would be within the ordinary scope of human endeavor. For example, in his "capability approach," Amartya Sen argues that one must have resources to be free to act in a fully human way. Focusing largely on emerging nations, he addresses the necessity for economic development in creating the conditions of freedom.

Similarly, a society may be structured in a way that makes human achievements difficult. A structure of cumbersome disincentives might arguably limit the scope of one's freedom. For example, a society could be organized with a system of economic regulations, religious prohibitions, and social expectations that would limit the life choices of its people. Resource constraints and a social structure that reduce one's choices do not seem to be instances of constraints on negative or positive freedom. Yet there can be no doubt that such factors can limit life prospects and that circumstances in such a society can be felt as freedom limiting.

Freedom, Rights, and Distributive Justice

While this entry concentrates on freedom and liberty, it is important to realize that freedom and liberty are generally regarded as a special case of a broader class of rights. In the modern world, we tend to regard freedom as a right. We may think of freedom as a human right that obtains independent of all social organization, or we may think of liberty as a right guaranteed by the political structure of a nation. For example, this second way of thinking of liberty as a right has been an intellectual cornerstone of the United States since the American Revolution.

But freedom, like almost all rights, is seldom absolute. This certainly proves true in practice, and rights are generally not regarded as absolute and inviolable in theory either. This is necessarily the case because one right can often conflict with another, and one right can also conflict with other important values.

Not only can freedom conflict with other rights, but one person's freedom often conflicts with another's also. My negative freedom to park my car in a particular spot may conflict with your negative freedom to park in the same location, at least on some interpretations of negative freedom that we considered above. Also, one form of freedom can conflict with another. For example, some assert that we possess a negative right to engage in commerce as we wish without governmental interference. Critics of unrestricted commerce maintain that the rapacity of the economically successful will impoverish some members of society and leave them in dire circumstances. As discussed earlier, the positive freedom to implement a plan of life requires a resource base. If these critics of unfettered commerce are correct, the result of this process would be the diminishment of the positive rights of economic losers. Thus, one version of freedom can conflict with another.

Freedom, like many other rights, can conflict with other values that are not considered rights. For example, many believe that freedom can conflict with the values of equality and a just distribution of society's resources. If the critics of unfettered commerce are correct, and the pursuit of profit by the able leads to the impoverishment of others, equality of resources in a society will be grossly affected, and the resulting distribution of resources may be unjust.

Freedom and the World of Commerce

Freedom is a key concept of all dimensions of human life, including business, and the different ways in which freedom and liberty can be exercised and denied in commerce are numerous. This section uses the concepts of freedom outlined above to explore a sample of business issues that illustrate issues of freedom and liberty.

Economic Liberty

The idea of economic liberty emerged with the advent of market society and developed into a key principle of economic thought from the 17th through 19th centuries. The idea that one should be able to enter contracts freely, to dispose of one's property as one wishes, and to engage in commerce without government interference was a core belief of classical liberalism during this era. As such, the idea of economic liberty is essentially a species of negative liberty because economic liberty enshrines *freedom from* interference with business operations.

Of course, government regulation does restrict economic liberty. In part, these restrictions limit the economic freedom of some persons to expand the economic freedom of others and perhaps to enhance freedom across society. It also seems that some restrictions on economic liberty attempt to foster values other than negative liberty. For example, rent control policies directly interfere with the economic liberty of the landlord in the interest of benefiting the tenant in a way that has no necessary association with the economic liberty of the tenant.

Minimum wage laws, working condition regulation, and restriction on working hours are all examples of ways in which government restricts economic liberty in the pursuit of other values. Similarly, legal prohibitions on deceptive advertising and consumer fraud also intentionally limit economic freedom and have the aim of promoting the public good. Under the doctrine of "employment at will," both the employer and the employee are free to terminate the employment contract at any time without notice and without cause. In a way, such an arrangement seems to epitomize economic freedom for both parties. While employment at will continues to be a widespread doctrine of employment law, governments constrain the employer side of this relationship to a considerable, and perhaps growing, degree.

Contemporary, highly developed, industrial countries generally support economic freedom, at least in concept, but they all place limits on economic freedom as well. The argument for such policies is that, while economic freedom is to be valued, it must be restricted to some extent to prevent rapacious behavior. While most observers of economic life would support the idea that there must be some restrictions on economic freedom, the nature and extent of those limitations continue to be hotly debated.

Sweatshops

Other business practices bring issues of both negative and positive freedom to the fore. Consider, for example, the controversy over sweatshops and a living wage. *Sweatshop* is a pejorative term that usually refers to a manufacturing facility located in a developing country with market-determined wages that are very low and working conditions that are extremely harsh. Usually the term refers to a facility that makes some good for the industrialized West.

The economic arrangement of sweatshops seems to emerge from the exercise of economic liberty on the part of the employer, but some observers contest that the workers who have accepted these wages and conditions have the opportunity to exercise their full freedom. For example, some activists insist that it is morally required that working conditions be improved and that workers in these facilities receive a "living wage"—a wage that will sustain a reasonable standard of living in the local economy. Here, a living wage contrasts with the market wage, with the presumption that the living wage is higher than the market wage.

Critics of sweatshops often maintain that employment at such low wages and in such bad working conditions results from a lack of negative freedom on the part of the workers. They regard the terms of employment as being the result of a "coercive wage offer"—an offer of employment on such unfavorable terms that only a person with no meaningful freedom of choice would accept. On this account, the workers lack negative freedom and are being coerced by the employer. (Traditional defenders of classical liberalism would deny that any offer that one can refuse without altering circumstances that prevailed before the offer can be coercive.)

Living wage proponents also typically maintain that the terms of employment in sweatshops interfere with the positive freedom that all people should enjoy. As we have seen, many thinkers believe that a person enjoys positive freedom only when she can implement a meaningful life plan. On this account, the employment bargain characteristic of sweatshops frustrates the positive freedom of workers because the wage contract restricts the resources necessary for anyone to implement such a life plan.

Globalization

In a similar spirit, many critics reject the movement toward globalization on the grounds that this economic movement interferes with the positive freedom of people in poorer economies. More specifically, they charge that the invasion of developing countries by multinationals reorganizes economic life in those countries, dominates and perverts the local culture, and frustrates the positive freedom of the local inhabitants to choose their own life plans.

Right to Work

As another example of positive freedom in the context of business, Article 23 of the Universal Declaration of Human Rights promulgated by the United Nations includes the following provision: "Everyone has the right to work, to free choice of employment, to just and favorable conditions of work, and to protection against unemployment." Exercise of this right to work is essentially an instance of a positive freedom. It is a *freedom* to have employment, the income from which is regarded as essential to the implementation of a meaningful plan of life.

Personnel Issues

Finally, personnel issues for individual employees can interfere with one's negative and positive freedoms. For example, sexual harassment on the job is a violation of a worker's negative freedom. Similarly, surveillance makes one behave differently than one otherwise would. So, inappropriate surveillance of employees violates their negative freedom by violating their zone of privacy. Various forms of discrimination in employment can violate both negative and positive freedom. Racial and sexual discrimination violate one's negative freedom from unjust interference, but both forms of discrimination also interfere with the positive freedom to pursue a meaningful life plan. Similarly, illegitimate hiring and advancement policies interfere with one's positive freedom to pursue a meaningful career as part of a plan of life.

Freedom of Contract

There are three basic institutions that provide the framework for all economic transactions in contemporary society, namely, market, governmental regulation, and contract. The economic analysis of their performance and function reveals that contracting is an especially effective legal institution in coordinating private economic transactions if the following requirements are satisfied in the process of contract formation and contract performance: freedom of contract, fairness and social utility, bargaining power parities, symmetric information and transparency of intentions, third-party exemption, possibility of adjustment, and legal forum for settlement and enforceability.

Freedom of contract is sometimes explained as deriving from the prepolitical notions of freedom and autonomy, which assign rights to the individuals to plan, consider, and pursue their welfare. Other contract theorists originate freedom of contract within democratic self-government and the division of responsibility between the citizens and the state for promoting just society, and individual and social welfare. One of the basic duties of the liberal state is to recognize its citizens' rights to freedom of contract and to protect their voluntary, rational, and lawful consent from coercion or interference in their private transactions. Therefore, governmental and judicial intervention in private contractual relationships by means of legislation and court rulings must be limited to equal protection of citizens' rights, their rightful expectations, and the legal enforcement of their obligations. Briefly, freedom of contract is constitutionally protected in a liberal society. Besides moral and political claims for freedom, autonomy, and responsibility, freedom of contract is also justified by the fact that it provides the most efficient welfare-enhancing institution for coordinating the transfer and exchange of property, rights, and entitlements among the members of society. Therefore, considerations as to whether private contractual arrangements enhance individual and social welfare do not fall outside the purview of legislation and jurisdiction. Jurisprudence and the law based on these philosophical, economic, and political theories have attributed central importance to freedom of contract—and ownership rights—since the last decades of the 19th century.

Nevertheless, the proponents of legal realism and critical legal studies, to mention a few influential legal schools, discuss critically the notion of freedom of contract and regard it as an ideological doctrine of jurisprudence, which is rooted in 19th-century laissez-faire capitalism. One of the most persuasive arguments against classical contract theory comes from the plain fact that standard form contracts created and used by business enterprises in transactions with their clients and customers are predominant in the economy today. In the case of standard form contracts, bargaining—whereby the contracting parties attempt to draft a contract, determine its contents, and agree on contract terms and conditions of performance—virtually never takes place. Price frequently comes under the nonnegotiable terms of contract as well. These types of contracts do not depend on *aggregatio mentium* or *consensus ad idem,* namely, the meeting of the minds of the parties. Standard form contracts are deliberately drafted on a take it or leave it basis. *Freedom of contract* rarely means freedom of contract from the point of view of the nondrafting party. We have to conclude standard form contracts on a daily basis without following the steps of contract formation prescribed in contract law textbooks. Bargaining inefficiencies, high transaction costs of contract formation, asymmetric information, and other market imperfections give business enterprises opportunity to create their own private ordering and to impose less favorable or even unfair terms and conditions on their nondrafting parties. While it is necessary to choose the law of the jurisdiction to avoid choice-of-law conflicts in private contractual arrangements, business enterprises can also capitalize on the global commercial environment, especially in the case of online transactions. Mutual acceptance of governing law, forum, arbitration, and judgments on the part of the contracting parties are also absent in standard form contracts. Business enterprises choose the exclusive jurisdiction and venue of the courts on whose territory they are incorporated, even if the place of performance is in another hemisphere. They also endeavor to opt out of the legal jurisdiction that prescribes high and strict standards for contractual liability and contains detailed regulations on the protection of consumer rights. As a result, a legal forum for settlement is practically inaccessible to the nondrafting parties—most often, clients and customers—when contract disputes arise. The geographical distance of courts located far away from the place of performance, high transaction costs, and the imperfect knowledge of contract terms and governing law provide disincentives for the other party to seek remedies for unconscionability, undue influence, harm, or contract breach. Nondrafting parties typically take the option of rational ignorance and do not educate themselves about terms and conditions of contract to become informed and rational decision makers. In doing so, they seek to avoid incurring the high transaction costs of obtaining information, negotiation, and contract formation. Therefore, the well-established concepts of classical contract theory—such as offer, acceptance, and consent between equally situated and rational economic actors—lose their original meaning in the context of standard form contracts. To sum up, commercial and consumer sales contracts—boilerplate contracts, preprinted contracts, one-sided contracts, mass-market uniform adhesion contracts, take it or leave it contracts, rolling contracts, shrink-wrap and click-wrap contracts, and so on—usually do not satisfy the above-mentioned requirements for contract formation.

It does not follow from these objections that the nonnegotiated terms and conditions of contracts are inevitably unfair or surely inefficient for the nondrafting parties. However, the ritual recitation of freedom of contract in the legal literature cannot conceal the core of the problems of contract theory: There are fundamental discrepancies between the notion of freedom of contract and actual contracting practices in the economy and society. While freedom of contract is justified on the ground of the priority of individual rights and autonomy over any other considerations in contract theories, it is frequently traded off against economic efficiency. The classical model of contract theory, which focuses on atomistic individuals' discrete (one-time, clearly specified) contractual relationships, can be hardly applied to the real-world situation, where contracts are usually relational (open-ended and evolving) agreements between individuals, large economic organizations, and legal entities. Isolated, discrete, and person-to-person contracts are quite marginal in the economy today. Critical legal scholars point out that bargaining power disparities, asymmetric information, bounded rationality, opportunism, and monopolistic or oligopolistic markets can seriously undermine the ethos of freedom, self-reliance, and autonomy in private contractual relationships. These problems of private contractual arrangements lead us to constitutional dilemmas, which necessitate equitable regulatory solutions in contract law, especially when the choices of business enterprises encroach on freedom and welfare of individuals. Therefore, the state should not be a neutral and reserved observer of the economic and social consequences of unequal distribution of rights and obligations in its citizens' private contractual arrangements. Indeed, the state should play a proactive role in placing freedom, self-reliance, and autonomy in the focal point of public policy. As a matter of fact, contract law in most countries explicitly prohibits contractual terms and conditions that are contrary to the requirements of reasonableness and good faith and that cause significant imbalance in the rights and obligations of the parties. According to critical legal scholars, contract law rules are aimed not only at providing the parties with value-neutral and technical nonmandatory default rules to facilitate communication in the process of contract formation but also at implementing fairness and distributive and corrective justice in their contractual relationships. Only a binding and effective contract law regime can deter the parties from using contract terms opportunistically and can contribute to creating fair contractual relationships between individuals, economic organizations, and legal entities. They also tend to hold the view that contract adjudication should enforce individual rights and implement public policy, respectively.

The claim for more active legislative and judicial interventions and more mandatory rules in private domains is not devoid of paradox. Insisting on a clear demarcation between public and private domains, libertarian theorists think that the state must take the position of distributive neutrality in enacting contract law and private law rules in general. Paternalistic legislation in contract law and judicial activism in private contractual arrangements result in less freedom of contract and finally in less freedom in society. Despite these well-known libertarian arguments against state and judicial interference in the private domain, contemporary states prescribe substantive and procedural rules to be observed when entering into contract in almost all fields of economic and social activities. They also administer sophisticated systems of institutional and legal constraints on private contractual arrangements.

Law and economics scholars are quite skeptical about promoting fairness and justice through the coercive and distributive mechanism of the law and legal institutions in private contractual relationships. Moreover, they call into question the assumption that an omnipotent state and a coercive regime of private law could master the contractual problems by means of codifying equitable regulatory solutions, more compulsory and binding rules in contract law, and interventionist and policy-oriented adjudication. Economic analysis of contracting practices provides the best policy guideline for legislatures that seek enacting of contract law rules, completing contracts between parties, interpreting contract provisions, and applying default rules in the absence of precise or explicit wording at court. At any rate, the prevalence of standard form contracts in the economy demonstrates that they are cost effective and a rather fair alternative to active governmental and legal regulations for both parties. There is no reason to believe that mandatory and binding legal rules and more judicial interventions to prevent bargaining power disparities, information asymmetries, and cognitive biases between parties could yield more efficient and more equitable contractual outcomes. Because competitive markets punish opportunistic behavior of business enterprises in the short term, this circumstance creates incentives for them to offer fairly advantageous terms and conditions for the nondrafting parties. If they offer suboptimal contracts, the nondrafting party can quite easily choose optimal contracts in competitive markets without incurring high transaction costs of information and negotiation. Competitive markets are believed to steer all parties' decisions into a welfare-enhancing direction and to solve their contractual conflicts with or without emphasizing the importance of freedom of contract. On the face of it, this argument is convincing from an economic perspective. However, it does not rely on the rights of individuals, freedom of contract, or the proper system of contract law but rather on the priority of pricing and the market mechanism. If this assumption about market mechanism were correct, contractual disputes over performance, entitlements, and the rights and obligations of parties would never occur.

Law and economics scholars usually refer to the Coase theorem, which is thought to buttress their strong arguments against imposing legal and judicial restrictions on freedom of contract. According to the Coase theorem, in a bilateral contractual situation when the parties are free, rational, and symmetrically informed, their rights are initially well-defined, and transaction costs are zero, the allocation of resources will be efficient and invariant regardless of the underlying rule of law or alternative assignments of rights. Nevertheless, there is no general consensus of what the Coase theorem precisely proves in the context of practical contractual problems originating from bargaining power disparities, information asymmetries, undue influence, cognitive biases, and other market imperfections. The Coaseans tend to draw a conclusion from the theorem that the operation of a paternalistic legal regime and the imposition of legal and judicial constraints on private contractual transactions use up all the expected benefits of balancing bargaining power disparities and information asymmetries or setting cognitive biases and "irrational" choices of parties right. In case of proactive legal and judicial interventions in freedom of contract, the parties will privately bargain over contracting out the rules, which they assume to be inefficient. In a world of market imperfections and positive transaction costs, the strict regime of governmental and judicial regulations on freedom of contract could not provide a better resolution for contractual conflicts.

Fair and efficient outcomes of private contractual agreements will rarely emerge spontaneously from economic transactions if the initial rights of the parties are not well-defined. Government and legal institutions play the central roles in the assignment, protection, and enforcement of these rights, which give the opportunity and set a limitation for private contractual transactions. The extent of freedom and restriction allowed by law in private contractual arrangements varies from time to time since the issue is subject to endless debate.

Freedom of Information Act of 1966 (FOIA)

The Freedom of Information Act (FOIA) is a law intended to give citizens and organizations access to government information with minimal restrictions and hindrance. The original act was signed into law by President Lyndon Johnson on July 4, 1967. It was subsequently amended to specifically include in its scope all electronically stored and transmitted information, which resulted in the Electronic Freedom of Information Act (EFOIA), signed by President Bill Clinton on October 2, 1996. The law provides a process for requesting government information, a timeline for government response, and judicial channels for forcing government compliance.

The FOIA and EFOIA laws are meant to ensure a citizen's "right to know." While usually framed in the context of national security, the FOIA has been valuable in accessing information as diverse as consumer product safety data, workplace condition reports, government-business contracting practices, environmental data, and public policy implementation and effectiveness.

In theory, democracy works best with an informed citizenry; governments are believed to best respond to the interests of their citizens when their actions are open to public scrutiny. However, in the wake of World War II and through the beginnings of the Red Scare and the Cold War, the U.S. government showed a greater reluctance to share information with the public, either directly or through news and educational organizations. Eventually, the Department of Defense adopted a policy of only releasing information that would directly contribute to its national security efforts, institutionalizing a governmental "right to withhold" and creating de facto censorship of the news media. Pressure from news organizations and growing concerns in Congress resulted in a series of congressional hearings through the 1950s and early 1960s and eventually led to the passage of the FOIA in 1966.

The cornerstone of the FOIA is its bias toward public access to government information and away from a governmental right to withhold. The law requires that the government release information unless it can prove that it should not make the requested information public rather than force the public to prove that the information is needed. Just as critically, the law also attempts to specify what constitutes "secret" information, putting in place some boundaries to the government's ability to withhold information on the basis of national security concerns.

Although the FOIA most often is applied to government information, this can also include information about individual businesses or entire industries provided to the government by lobbyists, industry associations, and the businesses themselves. Through both routine interactions (e.g., regulatory reporting, permit applications, responses to RFPs) and other more specialized activities (e.g., lobbying efforts, task force participation, informal discussion with government officials, congressional fact-finding efforts), information that businesses provide to the government in many cases becomes subject to discovery through FOIA requests. Information that businesses would prefer remain closely held may eventually become public in this way.

The law has proven to be effective in improving the flow of information between the government and the public, but it has not eliminated all problems. While the law sets a time period in which the government must respond to requests, agencies often fail to meet those requirements, either due to the volume of requests received or through intentional delays. Forcing government agencies into court over delays is costly and time-consuming, so many requests either expire due to government or public neglect or are litigated indefinitely. Especially in requests involving the FBI and CIA, requests from as far back as the 1980s and 1990s are yet to be handled, and as backlogs on all agencies grow, delay has become an effective tool for the government to withhold information.

The FOIA is not perfect, but it has become a model for similar laws around the world. In the United States, requests have increased to more than 3,000,000 per year, and the FOIA is considered by many to be an indispensable tool for the public's monitoring of government activities.

Free Market

The free market represents an unregulated system of economic exchange. *Unregulated* in this context means that taxes, governmental quality controls, quotas, tariffs, and other forms of centralized economic interventions by government either do not exist or are at least minimal. From this definition, it is clear that the free market represents an ideal type that does not actually exist. In reality, modern societies can only approach or approximate this ideal of efficient resource allocation. In other words, real markets can be described along a spectrum ranging from low to high amounts of regulation. Many economists (such as

Adam Smith, the father of economics) consider resource allocation in a free market to be efficient. According to Vilfredo Pareto, who elaborated on this concept of market efficiency, a free market is efficient if no one can be made better off without making anyone else worse off. Moreover, according to this theory, through the invisible-hand mechanism, society benefits by having self-interested actors make free (but also virtuous) economic decisions that benefit them. Some ethicists have argued that the efficiency of free markets depends on several moral parameters as scope conditions, such as fair play, prudence (or self-restraint), competition among equal parties, and cooperation.

Critics of the free market system tend to argue that certain market failures require government intervention. First, prices may not fully reflect the costs or benefits of certain goods or services. Because of these externalities, public goods are underinvested or exploited to the detriment of others or future generations, unless such exploitation is prohibited through government regulation. Second, a free market may tempt competitors to collude, which makes antitrust legislation necessary. Antitrust and similar regulations are especially necessary in cases where certain market actors (for example, companies) have acquired enormous market power. Third, transaction costs may mean that some exchanges are best performed in a hierarchy rather than spot markets. Most important, Pareto-optimal resource allocation in a free market may violate principles of distributive justice and fairness, which again may necessitate some government action, according to the critics of the free market concept.

In reply to, or preempting, several of these critiques, Ronald Coase, Milton Friedman, Tibor Machan, Ludwig von Mises, Friedrich Hayek, and many others have argued for the robustness of markets because they can adjust to or internalize supposed market failures in many situations. For instance, many goods that have traditionally been conceptualized as public goods and, thus, have been presumed to require government provision have been shown to be open to free market contracting as well, ranging from lighthouses to beekeeping. Today, libertarians are strong defenders of the idea that a system of free markets provides the best economic system.

Free Riders

A free rider can be defined as a person who, being a member of a group, decides to take advantage of the consumption of a good, or use of a service, that is generated as a result of the common efforts by the group members, without bearing a proportionate (or, in *pure* free riding, any) share of its cost of production or without contributing to its direct realization. One simple way of representing free riding is to think of a member of a rowing team who fails to do his or her share by faking the rowing effort—consequently getting a "free ride" on the boat.

The possibility of free riding is not an exceptional case: On the contrary, according to economic and rational choice theory (as we will discuss in the next paragraphs), it is a rather natural condition of human interaction within groups. This is because rational, self-interested individuals will naturally tend to minimize their costs of participation in a group if they can still benefit from the outcomes of cooperation.

In the business world there are many examples of situations where individuals have a positive incentive to free ride. For instance, consider being a member of a sales team. You know that your company will reward each member of the team with an annual bonus if a predetermined goal—say, an increase of 5% in total sales—is reached by the end of the year. You also know by the beginning of December that your team is very likely to meet the target due to the good work done by everyone so far, you included. At this point, you will have an incentive not to contribute to the collective effort anymore and still will enjoy the benefits of the collective good. Similar manifestations of the free rider problem can be found within many other team working situations, such as in R&D (e.g., an individual can free ride the intellectual property generated by others), in production (e.g., lack of or less effort from some team members, as in the example of the rower), or in services, in a tax or legal consulting team (e.g., weak or no contribution in performing a team brainstorming task).

The free riding tendency can be extended from the provision of collective goods and services to, more generally, a wide range of situations concerning participation in collective action—for example, teamwork within organizations, local community activities, pressure groups, social activism, etc. A well-known example of its manifestation concerns the tendency to not participate in political elections—when an individual enjoys the benefits resulting from collective action (elections produce a government, which ensures the provision of public goods such as roads and infrastructure, a legal system, and national protection) without bearing the cost of participating in the activity itself. Another manifestation of the free rider problem that creates social concerns refers to the preservation of natural resources and to issues such as pollution and environmental degradation: Everybody in society benefits from actions that preserve air and water quality, but since the relative impact of any individual's behavior on overall pollution is hardly noticeable, no one has an adequate incentive to contribute with her or his effort to preserve natural resources.

The key problematic aspect of free riding is that if every individual followed the same logic, there would be scarce or no public good produced or service delivered at all, and the entire society (including the free rider) would ultimately end up being worse off—a situation described as the tragedy of the commons. This is, in a nutshell, what constitutes the free rider problem, also known in economic theory as "the problem of collective action."

The Sources of Free Riding

What makes free riding possible and influences the probability of its occurrence is the combination of three main elements characterizing collective action: (1) the *indivisibility* of the collective good produced by the group cooperation; (2) the *noticeability* of individual efforts; and (3) the *perceptibility* of individual contributions. The first element refers to the fact that the benefits produced by cooperation are equally distributed among the group members—in other words, it is not possible to exclude anyone from enjoying them. For instance, if a football team wins its league, all the team members enjoy the same benefit of being the league champions, and no one can be excluded. Therefore, free riders will seek to avoid—or, at least, minimize—their share of effort.

The remaining two elements—noticeability and perceptibility—are directly influenced by the size of the group. In large groups, it is easier for the free riding behavior of an individual member to pass unnoticed as the relative contribution of any individual member is very modest. On the contrary, in small groups it is more likely that group members are able to detect a free ride as the lack of any single individual contribution has more significant impacts on the production of the common good. With regard to perceptibility, as the size of the group increases, members' perception of their individual contribution will decrease, therefore making it less attractive to pay their share, while in small groups individuals perceive a higher importance of their own contribution, and therefore the benefits of membership are more likely to exceed the cost of participation.

The Analysis of Free Riding Across Different Disciplines

The early formulation of the concept of free riding can be traced back to the origin of economic theory, particularly in the work of Adam Smith. In describing the benign mechanism of the "invisible hand," Smith recognized the importance of individual *self-interest* in guiding individual behaviors toward socially desirable outcomes. However, at the same time Smith also clearly emphasized—what, unfortunately, has been neglected by generations of economists—the crucial role of *moral sentiments* for the existence and well functioning of the market itself as they provide the underpinning rules of conduct without which no transaction could take place (in the absence of trust among the parties) and no contract signed (by fear of poor or unfair enforcement). These moral rules, Smith wrote, can in many situations correct the "misleading" tendencies originated by narrow self-interest—that is, as economists would say today, help limit the negative effects that opportunism and free riding produce on society.

More recently, since the 1950s the free riding problem has been formally analyzed and empirically studied by economists, rational choice theorists, political scientists, social psychologists, and moral philosophers, who have pointed out the puzzling questions it raises in many different situations of human interaction in economic, social, and political contexts. "Why should I pay my share, if I can enjoy the benefits of public goods without doing so?" is the question that has embarrassed economists over the decades. Similarly, "Why should I cooperate, if by defecting I can gain a larger outcome?" is the problem that rational choice theorists have to face—that is, the solution of the "prisoner's dilemma." Another free riding manifestation can be formulated in the question, "Why should I care to vote, if my participation in elections is almost certainly irrelevant to decide the outcome?" also known as the *voting paradox,* which kept busy generations of political theorists. Finally, the implications of free riding also matter from the perspective of ethical theory, which looks in normative terms at the rightness or wrongness of people's choices. Within ethics, the relevant question we should ask is therefore, "Is free riding a morally wrong behavior?" The following sections explore in greater depth some of these questions.

Free Riding and Economic Theory

In economics, the free rider problem has initially been addressed as the problem of inefficient production (i.e., too scarce) or the lack of production of public goods—a situation configuring a market failure and generating nondesirable, Pareto-inefficient social outcomes. Public goods are defined as goods whose consumption has the characteristics of being *nonexclusive* (or *nonrivalrous*), meaning that any individual consumption of that good does not affect the ability of any other member of the community to consume the same good. Traditional examples of public goods include national defense, public radio, or a lighthouse. Assuming that everyone enjoys the consumption of public goods, and that individuals maximize their utility function, economic analysis of public goods concludes that rational people will not be willing to pay a price for the consumption of public goods and therefore public goods will not be supplied, or will be undersupplied, if the contribution to them is left voluntary. To counterbalance free riding effects on the provision of public goods, economic analysis concludes, it is necessary to supplement the market system with some form of political decision, such as taxation.

Free Riding and Rational Choice Theory

The focus of rational choice theory is the study of rational decision making in situations of strategic interaction and in the presence of uncertainty. The problem of free riding emerges within this field of study as the problem of how to promote human *cooperation* when the tendency to take advantage of each other's cooperation leads to mutually disadvantageous effects—as represented in the prisoner's dilemma situation. This represents a paradox for rational choice as the noncooperative strategy *is* the best choice (it is a *dominant strategy* in the terminology of game theory) for each individual rational actor—yet, it generates socially inefficient results. Cooperation, according to standard rational choice theory, is therefore an *anomaly,* as rational behavior predicts—and as a normative decision theory, prescribes—free riding is sometimes the best choice to pursue the actor's interests (i.e., maximizing the actor's utility function).

However, the empirical evidence contradicts this prediction: There are many examples of human cooperation, where free riding is possible. Many passengers do pay the ticket on the bus; people clean up after a picnic in a public park; and public radios are able to broadcast thanks to voluntary contributions. The interesting question therefore becomes "What factors influence the degree of cooperation versus free riding?" Recent developments within rational choice theory have suggested that factors such as *ideology* (i.e., a sense of membership within a group), *expressive choice* (i.e., the benefits people receive from the act of participation itself, rather than from the outcomes of cooperation), and *self-commitment* (i.e., the idea that in the prisoner's dilemma one player will respect a self-commitment to cooperate in response to the other player's cooperation) can significantly change an individual's tendency to free ride and promote the emergence of cooperative behaviors. These studies demonstrate that the traditional assumption of selfish rationality of the economic man—what Amartya Sen incisively described as "rational fools"—is inadequate to understand the complexity of human motivation. Their conclusions suggest a revision toward a richer concept of rationality, able to encompass "sensible cooperators"—people who have good reasons to cooperate (and not to free ride).

Free Riding and Ethical Theory

From the point of view of ethics, free riding behavior raises a number of issues. The fundamental issue concerns its moral legitimacy: What are the *fair* rules that members of any group should be bound to respect? Is free riding simply "unfair playing" and therefore morally condemnable behavior, or can it be, at least in some instances, morally acceptable? Other ethical issues are generated by the fact that in any group *individual interests* coexist—and sometimes conflict—with the *common interest* of the group. One implication of this duality of interests is, for instance, that even if individual members of the group may agree that their cooperation produces desirable benefits, their self-interest may make them prefer not to cooperate (i.e., free ride) to save costs/effort. The relationship between individual freedom of choice and group/society's goals becomes critical: To what extent can the achievement of a (socially desirable) collective outcome interfere with individual freedom? Where is the line between voluntary cooperation and coercion? What is the role of persuasion, and the risk of manipulation, by the group leaders?

Within ethical theory, the libertarian approach of the theory of rights emphasizes the importance of individual rights and interests versus the common interest of the group. Robert Nozick, one of its most famous representatives, illustrated the issues at stake with a simple, brilliant example: If each day a different person on your street sweeps the entire street, must you do so when your time comes? Even if you don't care that much about a clean street? Must you imagine dirt as you traverse the street, so as not to benefit as a free rider? In the libertarian approach, allocating to the group (e.g., the State) a right to enforce an individual obligation to cooperate would be in many instances objectionable and unacceptable: It would violate most fundamental natural rights of every human being—for example, the right to have your own system of values and preferences. After all, in some cases, people might not desire to be free riders; they may just not care about the ride (the clean street) at all.

An opposite answer to this dispute can be found in the social contract approach to ethics, which is based on the idea that rational and autonomous individuals can agree on impartial principles of justice on which their life in society can be regulated. In particular, the problem of free riding is addressed by the "principle of fairness" formulated by John Rawls, one of the most prominent philosophers of this approach. According to the principle of fairness, any person who has voluntarily accepted to be a member of a cooperative scheme, in light of sharing the benefits produced by cooperation, is bound by a duty of fair play to do his or her part and not to take advantage of the free benefit by not cooperating. In other words, according to the principle of fairness free riding is a morally unacceptable behavior.

Free Speech in the Workplace

Free speech refers to the First Amendment rights of individuals to express themselves, such as through religion, association, and the press. An individual's free speech rights exist solely to prevent action by the government to silence speech. In fact, there is no constitutional right to free speech in the private workplace; any right to free speech of an employee at a private place of employment exists, if it all, solely as the result of state and federal legislation passed specifically to protect rights associated with free speech.

Freedom of speech, or freedom of expression, is often recognized in the context of free press. One of the hallmarks of American society is the guarantee of freedom of the press. This is considered vital to a free society, in that it enables people to speak out against the government without fear of recriminations. One of the conditions on which the founding fathers based their eventual decision to accept a federal government was that fundamental rights, such as free speech, be protected.

Freedom of Association

Closely tied to the freedom of expression is the freedom of association. A citizen of the United States has a constitutional right to associate freely—or to choose not to associate with—anyone else. This right has not always been protected as vigorously as it is today, with anti-Communist laws and oath of office requirements in the 1950s as perhaps the most recent example. The right to associate is closely tied to the right to free expression, as often like-minded individuals are drawn to organize on behalf of whatever position or platform they might wish to advance.

The analysis of free association rights for employees is largely the same as that for free speech. In the absence of other state or federal prescriptions to the contrary, a private employer may not base employment decisions on many outside affiliations—in other words, employers are prohibited from choosing to hire (or retain) or terminate employees who associate with most other groups. While this is constitutional, there are a number of other restrictions that constrain an employer in this regard. First, an employer who terminates or takes any other negative employment action against an employee on the basis of speech or association protected by the Civil Rights Act can face stiff penalties in the form of damages from lawsuits brought by aggrieved employees (often with the assistance of the Equal Employment Opportunity Commission). Second, some states or localities have laws that protect employees from termination without cause. Finally, association with organized labor is further controlled and protected under federal law.

Global Perspective

The First Amendment is not unique when compared with other declarations of free speech rights, though the breadth of free speech rights afforded to American citizens is broader than that in most other countries. Article 19 of the Universal Declaration of Human Rights, promulgated by the United Nations, recognizes the importance of free speech and guarantees to everyone the freedom of expression, which specifically encompasses freedom of the press. While some countries have adopted similar language, many others have not. Even in those countries that have adopted similar rights, the enforcement and interpretation of the right of free speech is often less vigorous than it is in the United States.

Free Speech in the Private Workplace

The right to free speech is guaranteed by the First Amendment to the Constitution of the United States. The First Amendment bars Congress from making any laws that interfere with religion, speech, association, or the press. The critical, and often overlooked or misunderstood, word is *Congress*. A private employer is not constitutionally required to permit free speech by its employees. To reiterate, although other state and federal legislation does exist that imposes civil liability on employers for permitting, or failing to control, certain forms of speech within the workplace, employees in private workplaces do not have protected First Amendment rights in those workplaces. The protection of any speech in private workplaces is the result of other state or federal legislation.

As technology has advanced, so too has the opportunity for employers to monitor its employees' expressions in the workplace. Before the advent of computers, an employee who held certain opinions could avoid scrutiny by simply refraining from mentioning them in the presence of the employer. With the rapid increase in electronic communications, the temptation for employees to express their personal opinions in "private" electronic transmissions to personal friends, either within or outside the workplace, has increased. The employer is often watching, however. A substantial number of employers save, and have the capability to review, an employee's e-mail and/or instant messages. A large percentage of employers monitor the Web surfing of employees, and some employers employ software capable of capturing screen shots of an employee's computer or recording every keystroke. Put simply, an employee's speech, if performed at the workplace, is often capable of being reviewed by the employer, a fact that is often disclosed in company policy manuals or sign-on screens.

Whether or not an employer should be capable of such oversight is a matter of political debate. Many argue that the long hours required of employees underpin arguments that they should be afforded some privacy for clearly private communications, even if the communication is made using an employer's time and equipment. Employers defend the oversight on several fronts, arguing that it permits them to identify employees spending inordinate amounts of time on personal matters while being paid and further permits employers to identify improper communications that might otherwise lead to civil liability against the employer (e.g., harassing content transmitted to fellow employees). While the matter is one of debate, what is clear is that private employees often do not have reasonable expectations of free speech or privacy in their workplace communications.

Free Speech and the Government Employee

Far more complicated a subject is the right of a government employee to free speech within the workplace. Where the government is the employer, the First Amendment prohibits actions undertaken by the employer to restrict an employee's speech. The result has been a substantial body of litigation, still ongoing and seemingly never ending, in which government employees continue to challenge restrictions on their workplace speech.

Court decisions interpreting the speech of government employees have made it clear that a government employee does not lose his or her constitutional protections by entering the government workplace. A government employee can, for example, choose a political party, support a political or social issue, or speak out in favor or against legislation, without fear of retribution. Far more problematic is when, where, and in what manner, the government employee can do so. Put another way, courts have attempted to address, on an ad hoc basis, what a government employer can do to restrict speech within the workplace. The decisions are fact specific and often tied to the specific duties of the government employee. In general, however, a government employer can restrict an employee's speech under certain circumstances.

For example, a government employer may not forbid an employee from holding certain religions or political beliefs or from expressing them in letters to the editor or in speeches made on personal time. The same government employer often can, however, generally control the content of an employee's speech if the speech can be fairly construed as that of the government. After all, the government does get to decide what speech it wishes to make on its own behalf and thus can exercise some control over employees when they are speaking for the government itself.

Conclusion

Mindful of the roles played by those political leaders who risked their wealth, employment, and even lives to rally the colonists against the government of England, the founders of the United States treated the right to free speech, and the closely related right to free association, as fundamental, and thereby gave free speech a place of honor as the First Amendment to the U.S. Constitution. The right is not as broad, however, as many people might think. The right is generally a prohibition of government repression of speech, and private employers are often at liberty to control employee speech within the private workplace. Even government employers can, under certain circumstances, exercise some control over a government employee's speech, especially if it is made within the workplace.

It is worth noting that the right to free expression is also a right not to be forced to give an audience to the expression of others—a right that is often forgotten in the shuffle. While the government may not generally prohibit a person from speaking in support of an issue, there is no requirement that any private citizen or corporate entity must listen and provide the speaker with a forum or audience. Speakers may thus speak on nearly any topic in the town square free from interference by the government but may find local media unwilling to cover the event and passersby uninterested in listening.

Free Trade, Free Trade Agreements, Free Trade Zones

Free Trade

Free trade is the trade of goods, services, or intellectual property across national borders, substantially unencumbered by governmental policies. Free trade is driven by market forces: domestic buyers desiring to purchase foreign products or services and foreign sellers willing to sell to those domestic customers. Free trade emphasizes the limited role of government through restrictions on international trade such as tariffs and nontariff barriers.

Comparative Advantage

Free trade is related to international trade. International trade is based on what the economist David Ricardo originally called the "law of comparative advantage." At its simplest, the law states that a country's wealth will be maximized if it produces only what it is best at producing and trades that output for all other goods and services. Economists derive what is best in a backward kind of way: You are best at what costs you the least to give up. This is called *opportunity costs.* Sometimes opportunity costs seem obvious: It would be quite costly to grow bananas in the northern reaches of Canada—one would need a hothouse and considerable energy for example—while it might be difficult for a fisherman in a warm-water country such as Honduras to raise cold-water fish such as cod. In this case, trading Honduran bananas for Canadian cod seems to be a no-brainer. This is a case in which each country has an absolute advantage over the other in terms of producing one of the goods and free trade can ensue.

But comparative advantage states that trade can be beneficial even when one partner is superior to the other in producing both (or all) the products. In a world of free trade, a country will specialize in the production of what it is relatively best at doing and trade for other products. In doing so, free trade forces manufacturers to specialize only in what they can do best in that particular location, forcing economic efficiency and, in turn, driving down the costs of production.

Ideologies of Free Trade

There are three distinct ideologies of political economy for analyzing free trade: (1) the liberal view;

(2) the nationalist view; and (3) the Marxist-Leninist view.

Liberal View of Free Trade

This view of comparative advantage finds itself embedded within the liberal position on trade. The liberal position on trade places the individual consumer as the most important stakeholder in international economic relations. The liberal view emphasizes the economic advantages of efficient production driven by free trade that ultimately benefits consumers in terms of more variety, higher quality, and lower prices. Efficiencies come from the technological, labor, or geographic advantages that one country's producers have over others. Free trade becomes a positive sum game where both parties are better off specializing and trading across borders than producing and selling all their output domestically.

The liberal position on trade does not require a heavy-handed government. Government exists mainly to define and defend the property rights of merchants and consumers, to provide or facilitate some of the public goods for commerce such as public ports and power and telecommunications systems, to open the economy to foreign goods and services, and to eliminate trade protection. The liberal view also emphasizes the positive international relations aspect of free trade; that is, liberals believe that free trade promotes cooperation and peace between nations because they rely on each other for goods and services that benefit their respective consumer-citizens. Therefore, countries that trade with each other are less likely to have wars and other conflicts than those without such economic relationships.

Nationalist View of Free Trade

Other perspectives, however, do not give such a rosy review of free trade. Political economist Robert Gilpin of Princeton University says that the nationalist perspective and the Marxist-Leninist perspective stand alongside the aforementioned liberal perspective on international trade and investment. The nationalist view focuses on how economic activities serve the "primacy of the state." The goal of nationalists is to promote the power and wealth of the state. The question is, How well does free trade serve this goal? As the liberal perspective shows, free trade forces efficiency and thus economizes on the use of resources—this can bring wealth. But in doing so, one might rely on the goods and services from other countries. For example, in information technology outsourcing, a U.S. company might rely on an Indian company for that function. What happens, for example, if the government of India decided to prohibit Indian companies from having U.S.-based clients unless the government of the United States changes its diplomatic position toward Pakistan? Since U.S. companies rely on Indian companies for these services, they will want the U.S. government to acquiesce to this political request. But the request may contravene the best national interests of the United States. This demonstrates that free trade can place a country in a vulnerable political position. So according to the nationalists, free trade should only be pursued when it creates relative advantages in wealth and power for the country: Otherwise it should be prohibited. Because of this fear, nationalists often support economic self-sufficiency, often through subsidies, particularly in the industrial and military-technology sectors, and advocate erecting trade barriers against foreign products and services in these areas.

The Marxist-Leninist View of Free Trade

The Marxist-Leninist view of political economy also does not fully support free trade. The Marxist-Leninist position looks at the inequality of economic relations. For trade, Lenin focuses on the relations between countries with capital and those without. The basic argument is that countries with capital have leverage over those without so that the terms of trade and international investment are always skewed toward those capital-rich countries. Furthermore, with each transaction, the terms become less desirable for the poor country. Lenin saw a world where the capital-rich countries would divide the rest of the world, the capital-poor countries, into economic spheres for their own gain. But he foresaw that eventually even the rich countries would be in dire straits as they fought over each other's possessions. Thus, the Marxist-Leninist view of free trade is one of inequality between capital-rich and capital-deficient states and one where conflict is likely to occur between rich and poor nations and eventually between rich states. In sum, international capitalism is conflict ridden and unstable over the long run.

Free Trade Agreements

Free trade agreements (FTAs) are agreements between two (bilateral), three (trilateral), or more (multilateral) nations that specify the terms of trade. Generally, FTAs seek to lower the barriers to the flow of goods and services between the countries and to facilitate greater investment by companies in each other's territory. FTAs have become a popular trade policy for many countries to pursue parallel to their participation in the multilateral World Trade Organization (WTO). Many countries have found it considerably easier and faster to achieve satisfactory trade arrangements with a few other countries via FTAs than working with the nearly 150 countries in the multilateral WTO.

Free Trade Zones

Free trade zones, also known as preferential trade areas, are the formalized arrangements between nations for free trade and investment. The WTO permits free trade zones when they cover substantially all the trade between nations and do not worsen the conditions of trade for third parties. The WTO's General Agreement on Tariffs and Trade (GATT) Article XXIV gives member countries permission to pursue free trade zones under certain conditions. The two types of free trade zones are (1) customs unions and (2) free trade areas.

Customs Union

A customs union is a free trade zone between nations that sets a common tariff for members of the customs union (sometimes called the "internal tariff") to zero or very low levels and a common tariff (the "external tariff") for countries outside the customs union at a higher rate. These tariffs cover substantially all the goods and services traded between the nations. The European Union and Mercosur in South America are examples of customs unions. Oftentimes, customs unions involve deeper political commitments than for free trade areas.

Free Trade Area

A free trade area (FTA) is a free trade zone between nations that sets a common internal tariff, typically zero or very low, but unlike the customs union does not set a common external tariff—that is, for a country that is a member of a FTA, it can maintain whatever tariff schedule it chooses for countries that lie outside the FTA. Like a customs union, the countries in an FTA set tariffs for substantially all goods and services that are traded as well as other trade rules such as over investments. Modern examples of FTAs are the North American Free Trade Agreement (NAFTA) between Canada, Mexico, and the United States; the Central European Free Trade Agreement (CEFTA) between Poland, the Czech Republic, Slovakia, Hungary, Slovenia, Romania, Bulgaria, and Croatia; and the Andean Community between Bolivia, Colombia, Ecuador, Peru, and Venezuela. There are hundreds of bilateral FTAs.

The creation of free trade zones is not without controversy. Advocates support their creation for several reasons. First, they worry that countries may engage in stalling tactics, sometimes called *foot dragging,* during the multilateral WTO negotiations. Foot dragging slows the speed and limits the scope of negotiations within the WTO. For example, agricultural subsidies have been discussed for many years with few substantive changes in the rules. In a smaller forum such as in a preferential trade arrangement, the parties may move swiftly on such topics. In addition, in a smaller setting, parties may address some new trade topics neglected by the WTO. For example, the NAFTA placed investment rules centrally and was ahead of the WTO in handling this area of international commerce. In this way, the free trade zones often experiment with particular trade issues before the WTO subsumes them.

Discrimination and Trade Diversion

Critics, however, have several complaints about free trade zones. First, since these free trade zones give advantage to members relative to nonmembers, they seem to be contrary to the most favoured nation clause of the WTO's rules. Expressed otherwise, free trade zones discriminate against nonmembers. Second, one of the effects is that free trade zones may result in trade diversion. Trade diversion is when a trading partner switches its source of supply from a supplier located outside the free trade zone to a member of the free trade zone that would have been a higher cost supplier than the outside supplier if not for the tariff advantage conferred by the free trade zone. For example, the World Bank conducted a study in the mid-1990s that showed that after the formation of Mercosur many Argentine companies switched their source of supply from cheaper suppliers outside Mercosur to more expensive Brazilian suppliers, only because of the tariff advantages bestowed to Brazilian producers through the free trade zone. If this is so, free trade zones distort production and do not result in maximum benefits for consumers.

Rules of Origin

A third problem is specific to FTAs and concerns something called the *rules of origin.* Since FTAs do not set a common external tariff, a country outside the FTA that wishes to ship something to a customer inside the FTA should choose the lowest tariff country to make this transaction and then transship within the FTA to the customer. For example, if a supplier of computer printers from Singapore wishes to reach customers in the United States, but the United States had set a tariff of 20% on such printers, the Singapore firm might first ship to Canada, where there is only a 5% tariff, and then ship from Canada to the United States duty-free. Since more often than not political pressure from domestic printer manufacturers is what led the U.S. government to set the tariff at 20% to protect the domestic industry, transshipment defeats such a policy goal. Therefore, in FTAs, procedures called rules of origin must be written to identify the origin of goods subject to tariff treatment. Rules of origin are often very complex and are often crafted to protect various domestic producers. Rules of origin are particularly elaborate for products that contain many components from different countries. For example, a typical desktop computer has parts that were made in China, Singapore, Malaysia, South Korea, Japan, and the United States and was assembled in China, Taiwan, or Malaysia. So if Malaysia has an FTA with Australia that lowers Australia's tariffs on laptop computers that were "made in Malaysia," would this computer qualify for this favorable treatment? The answer is derived through the rules of origin that specify what value of the product needs to originate within the FTA zone. The difficulty is that to some extent the rules of origin are arbitrary. For example, should the value be based on the costs of production such as the materials and labor used and an allocation of overheads or the price that the product is sold? Which currency should be used, and what should be the conversion exchange rate? Should a value-added system be used?

An example of the rules of origin comes from NAFTA, between Canada, Mexico, and the United States. Article 401 defines *originating* in four ways: (1) goods wholly obtained or produced in the NAFTA region, such as silver mined in Mexico and exported to the United States; (2) goods produced in the NAFTA region wholly from originating material, such as silver rings made in the United States from Mexican silver and exported to Mexico and Canada; (3) goods meeting the Annex 401 originating rule; and (4) unassembled goods that do not meet the Annex 401 rule or origin but contain 60% regional value content using the transaction method or 50% using the net cost method. The Annex 401 originating rule refers to a change in tariff classification, a regional value-content requirement, or both. From the NAFTA Guide to Customs Procedures, a change in tariff classification would be frozen pork meat imported into the United States from Hungary and combined with spices from the Dominican Republic and grains from the United States to make pork sausage. This finished product, the sausage, represents a changed tariff classification from its meat and spice inputs and is considered by the rules to be a NAFTA-originating product. The other criterion used is the regional value content, meaning the percentage of the value of the goods must be from one of the NAFTA countries. There are two methods used to calculate this: the transaction value method, which uses prices with certain adjustments, and the net cost method, which takes into account the costs of the goods used to produce the items. Finally, there are rules to confer origin on certain unassembled goods.

The WTO stipulates that the rules of origin in FTAs be transparent, that they do not restrict or inhibit international trade, that they are consistently administered, and that they specify what confers origin rather than what does not. The WTO has a Committee on Rules of Origin to promulgate guidance for these trade rules.

In spite of the problems, it is likely that FTAs will multiply in the coming years. FTAs are quite attractive to governments as they attempt to position themselves favorably toward important trading partners. For example, South Korea is moving ahead toward an FTA with the United States, even with much domestic opposition, because it sees the FTA as a way of securing an economic advantage for Korean producers in the United States against Chinese and Japanese rivals. Second, FTAs seem to breed more FTAs. For example, in the wake of NAFTA, many countries in Central America and the Caribbean saw that their producers were at a disadvantage against Mexican producers for access to the lucrative U.S. and Canadian markets. The recently consummated Central American Free Trade Agreement (CAFTA), a regional FTA that includes the United States, is aimed at reducing this gap with Mexico. For companies, the implications are that while FTAs generally reduce barriers toward conducting business, they also create these pockets of policy-created cost advantages that must be constantly monitored. For example, many apparel manufacturers relocated from Central America to Mexico because of NAFTA; a company that did not do so was at a cost disadvantage. So FTAs make international business increasingly complicated for companies.

Free Will

Free will is the capacity to make choices and to act on those choices. Most of us are convinced that we have this capacity because we know, or think we know, that when faced with a choice between one action and another, it is up to us to decide. We decide what to do, and we act on that decision. Had we decided otherwise, we would have done otherwise. Thus, we have free will. Or so it certainly seems.

The problem is that our conviction that we have free will does not fit together with other things we think we know. For instance, either everything that happens—every event—is a necessary consequence of previous events and the laws of nature, or not everything that happens is a necessary consequence of previous events and the laws of nature. Call the first possibility "determinism" and the second "indeterminism." We know that one of these two must be true; there are no other alternatives. If the first is true, then everything we do, including every decision we make, is a necessary consequence of previous events and the laws of nature. If so, we do not have free will after all because we cannot do anything other than what we actually do. On the other hand, if not everything is a necessary consequence of previous events, then some of the things we do might have no antecedents—they just happen for no reason at all. Yet if a decision we make or an act we perform just happens for no reason, then there is no reason to say that it is our decision or our action. It is not up to us in the sense required for free will. Again, we do not have free will. Since one of these alternatives must be true, and since we do not have free will on either alternative, the only conclusion we can draw is that we are not free. We may fervently believe that we are, but if we do, we are sadly mistaken.

A response might be that as long as we believe that we have free will, then it does not really matter that at some "deeper" level we suspect that we are not free. Our commonsense belief in free will works well enough for everyday purposes, so why not leave it at that?

This sounds like a good way to sidestep the problem, but it immediately collides with another commonsense idea, that is, that moral responsibility implies free choice. We all believe that we are morally responsible for what we do only if we could have done otherwise had we chosen to do so. But if we cannot do otherwise, if we are not, in a deep sense, free to choose and free to act on our decisions, then in what sense are we morally responsible? And if we are not morally responsible, how can we be properly blamed or praised for what we do? Without freedom, the notion of moral responsibility and all that goes with it seems pointless. So it looks like we are in a tight spot. On one hand, we believe that we have free will, we believe that we are morally responsible, and we believe that either determinism or indeterminism is true. On the other hand, it seems impossible that all three of these beliefs are correct. We have to give up something. What should it be?

Compatibilism

Maybe we do not have to give up anything. This is the position of compatibilists, who argue that we can both be free in a sense required for moral responsibility and accept determinism. All we need to do to show that free will and determinism are compatible, the argument goes, is be clear about what is ordinarily meant when we say an action is free. In the ordinary sense an action is free when we have the ability to do it and nothing prevents us from doing it. For example, you are free to walk to the store provided you have the ability to walk and nothing is stopping you from doing it. You are not free to walk to the store only if you lack the ability to walk or you have the ability but are, for example, tied to your chair. In short, a free act is one you can physically perform and to prevent doing which there are no impediments.

Someone might object that this sort of freedom is no better than that of a thermostat. A thermostat has the ability to control temperature if not prevented and so would be free in the compatibilist understanding of freedom given so far. What the thermostat lacks is the ability to choose to do otherwise, to choose not to control the temperature if the mood strikes. People, however, do have the ability to choose otherwise. A person can take a walk or choose not to. What people do is up to them in a way that it is not up to the thermostat. All this is missing from the compatibilist account of freedom.

A compatibilist would reply that to say that you could have chosen otherwise is just to say that you would have chosen otherwise had you wanted to choose otherwise. You decide to take a walk, but you could have stayed home to shoot a little pool. Had you chosen to shoot pool, you would have, but you thought some exercise would do you good. Thus, compatibilists claim, once we understand what it means to say that someone could choose otherwise, we see that there is no real problem here. If you had wanted to choose otherwise, you would have, and if nothing prevented it, you would have acted on that choice.

Still, the objection might continue, something crucial is missing in compatibilism. If determinism is true, then your deciding to take a walk instead of shooting pool is a necessary consequence of previous events and the laws of nature. You could not have done otherwise; deciding to take a walk is the only thing you could do given past events and the laws of nature. The only way you could have chosen and done otherwise is if the past had been different, if you could reach back and alter something that has already happened. But this is impossible. The past cannot be changed. Thus, when compatibilists say that *you could have done otherwise* means *you would have done otherwise had you chosen to do so,* what they are really saying is that had the past been different, you would have chosen and acted differently. That may well be true, but it does not capture the sense of "could have done otherwise" necessary for moral responsibility. To be morally responsible it must be true that at the moment of choice you could decide differently given the past that you actually have, not merely that you would choose differently had the past been different. Thus, compatibilist freedom is only a flimsy facade, not the robust structure needed for moral responsibility.

Compatibilists have responded to this argument in two main ways. The first is to deny that moral responsibility implies that at the moment of choice we have the ability to choose otherwise. The second is to develop new and finer-grained understandings of freedom and moral responsibility that are consistent with determinism. Whether these arguments are successful is a matter of ongoing controversy.

Incompatibilism

Suppose that free will and determinism are incompatible, that is, that they cannot both be true. Then there are three possibilities. One is that we have free will and determinism is not true. This is called *libertarianism.* The second is that determinism is true and we do not have free will. This is *hard determinism.* The third is that neither is true; we do not have free will, and determinism is not true. This is sometimes called *hard incompatibilism.*

Libertarianism

Libertarians argue that when you make a free choice you could have chosen otherwise given the same past events and laws of nature. For example, on Tuesday at one o'clock you decide to take a walk instead of shooting pool. Libertarians assert that because determinism is not true, you could have decided otherwise even if the laws of nature and everything in your past remained exactly the same. At the moment of choice on Tuesday it was literally up to you and was based entirely on your deliberations. You make the choice, and you bear the responsibility for it.

An objection to libertarianism is that if some of our decisions and actions are undetermined, that is, if they could have been otherwise given the same past and laws of nature, then they are arbitrary and inexplicable. They are not under our control in the way needed for moral responsibility. For instance, if libertarians are correct, then given precisely the same circumstances and precisely the same deliberations, you might have decided to shoot pool instead of taking a walk. Thus, your actual choice "just happened" because your deliberations made no difference. You might have made a different choice given exactly the same deliberations. If so, then there is no clear sense in which you are responsible for the choice because nothing you did had any effect on the action you eventually performed. This is not free choice; it is mere chance.

In response, libertarians have proposed what might be called "hidden aspect" accounts of free will. The idea is that if free acts cannot be entirely explained by past events and the laws of nature, and if such acts are not to be arbitrary or inexplicable, then there must be some other aspect of action, some "agent" or "act of will" or "purpose" that is the source or cause of free action. Whatever this is, it is not itself determined by previous events and the laws of nature. Moreover, since these things in a sense stand outside the normal chain of cause and effect, they are hidden from ordinary view and can only be discerned by introspection or by analysis and argument. For example, philosophers such as Roderick Chisholm argue that free acts are caused by agents, which are not events or laws of nature, but enduring substances that cause free acts and are not themselves causally determined. Hence, according to Chisholm, when you decide to take a walk instead of shoot pool, it is true that your action is not determined by previous events and the laws of nature, but it is not true that what you do is totally uncaused. It is caused by an agent—you—and you are the sort of thing that causes things to happen, but nothing causes you to cause those things. You are a *causa sui,* an unmoved mover.

Many writers reject Chisholm's argument on the grounds that it posits mysterious entities that really explain nothing. Even assuming there are agents, either what they decide to do is based on past events and the laws of nature or not. If the former, then agents are no different from ordinary things. They are no more free at the moment of choice than anything else. If the latter, that is, if what they decide to do is not determined by past events and the laws of nature, then what they do just happens for no reason at all. It is inexplicable and not under the agent's control or will. Hence, positing agents does not solve the problem. Moreover, positing agents is ad hoc; there is no reason to suppose there are agents except to solve a problem about free will. If we cannot explain freedom without agents, we cannot explain freedom with them either.

One response to this argument appeals to modern science, especially quantum physics and chaos theory. Writers such as Robert Kane note that quantum theory postulates undetermined quantum events and that these events might occur in the brain. Furthermore, according to chaos theory, small alterations in initial circumstances can eventually cause large and unpredictable changes. Kane then argues that moments of stress and uncertainty in our lives could make our brain sensitive to quantum changes and that these changes could lead to actions on our part that are not strictly determined but are up to us because we willed them to happen "then and there," at the moment of choice.

The complete version of Kane's attempt to reconcile modern science, indeterminism, and free will is far beyond the scope of this entry. His argument has generated a number of objections and considerable discussion. In this respect, at least, it is no different from any other argument in the debate over free will.

Hard Determinism

Hard determinists argue that free will and determinism are incompatible. The argument is simple. If determinism is true, we do not have free will. Determinism is true; hence we do not have free will. Consider the second premise. As mentioned earlier, quantum theory seems to show that determinism is not true. Some events at the quantum level are undetermined. Thus it appears that the second premise of the argument is false, and so hard determinists cannot use it to show that we do not have free will.

Hard determinists have replied in two ways. The first is that quantum indeterminism is irrelevant to free will. Subatomic particles may behave in strange ways, but human behavior is not influenced by random quantum events because in larger physical systems like the human body quantum indeterminism is negligible. However, whether it is negligible is, of course, just what Kane and others like him dispute.

Hard Incompatibilism

The second reply, hard incompatibilism, is closely related to hard determinism. However, hard incompatibilists abandon the commitment to determinism and argue that nevertheless we have no free will. The argument is roughly this. Compatibilism fails as an account of free will because it implies determinism, and modern science has shown that determinism is not true. Libertarianism fails as an account of free will because there are and could be no agents, no "unmoved movers," of the sort required by libertarianism. One reason, as Galen Strawson argues, is that for us to be responsible for what we do now, we must be responsible for our nature or character, from which our actions flow. But for us to be responsible for who we are now, at this moment, we must have done something in the past to make us as we are now. Furthermore, to be responsible for who we are now, we must have been responsible for who we were then, at that moment in the past. And to be responsible for who we were then, at that moment in the past, we must have done something even further back in the past, and so on. This regress continues all the way back to our birth, when we clearly are not responsible for anything. Thus, Strawson argues, there can be no free will, and this is true regardless of whether determinism is true or not.

If Strawson is right, or if some version of hard determinism is correct, then free will is no more than a persistent illusion. We all believe that we have free will, but we are all wrong. This has disturbing implications. For example, we admire and praise acts of generosity, kindness, and courage in no small part because we believe that they are undertaken freely by people who could have chosen otherwise. Yet if we have no free will, these acts and others like them are not free, and the people who do them could not have done otherwise. If so, our admiration and praise feels empty, valueless. On the other side of the coin, we condemn and punish those who transgress the laws, but if they are not free to choose what they do, condemnation and punishment are inappropriate. A prison might be used to deter crime or to rehabilitate offenders but not because we think it just to imprison the guilty. Finally, if we do not have free will, then we are not in control of our lives in the way we think we are. We cannot be credited with our achievements or reproached for our failures. Our lives may go on as before, but if we know we are not free, surely the spice of living must lose some of its flavor.

Ethics, Free Will, and Business

Free will is one of the most difficult problems in philosophy. All the alternatives discussed above, and others not discussed, face weighty objections. It is also one of the most important problems, since how it is answered has deep implications for how we see ourselves in the world. However, outside philosophy it goes largely unnoticed. In everyday life, almost everyone believes in free will. So, leaving philosophical worries aside, consider for a moment exactly how free we really are. In business, for example, managers and workers are buffeted by a myriad forces beyond their control. On a small scale, markets, customers, suppliers, fellow workers, bosses and subordinates, and government and corporate rules and regulations all have their say over what businesspeople do and become. On a larger scale, globalization, terrorism, and even global warming play a big part in controlling the possibilities open to them. Freedom in business, if we have it at all, is for most businesspeople not the freedom to do what they want, when they want, for the reasons they find compelling. It is only the freedom to respond imaginatively to what the forces in business require or to what other people want or expect. It is a limited freedom, constrained in almost every respect.

For example, suppose Jones is a skilled software engineer with many years' experience. He has a family, house, and deep roots in the community. One morning he is notified that within a month all software engineering in the corporation he works for will be outsourced to another country. When the move is made, his employment contract will be terminated. He will receive three months' severance pay, three months' medical insurance, and nothing else. What does he do?

The obvious answer is to look for another job. But think of the constraints he faces. He is limited by the global trend toward outsourcing, about which he can do nothing. He is limited by his commitments to his family and by their commitments to their friends, school, and community. Not least, he is limited by his own specific expertise and experience. Thus, he is not free to accept just any job or to move to just any location. He is not a candidate for retraining for an entry-level job in another field. His best option is to find something suitable in the local area. But, again because of outsourcing and his own experience and expertise, suitable jobs may be hard to find or even nonexistent. Maybe he will be lucky enough to find another decent job or will be able to cobble together enough consulting work to keep going. But Jones is not really free to do whatever he wants. He is tied down in a hundred different ways.

Not, however, in every way. There is one way, a very important way, in which we are still free in business in spite of everything. It is how we treat the people we work with and work for. We are free to treat them with the respect and dignity they deserve, and we are free not to so treat them. This is the heart of ethics, and it is up to us to decide.

—Robert Frederick

Friedman, Milton (1912–2006)

Milton Friedman, born in New York City in 1912, was one of the 20th century's most famous and influential economists, renowned for his depth of analysis, his innovative capacity, his practical outlook, and his simple, persuasive style. However, he is probably best known for the political repercussion of his ideas. The son of an immigrant, he studied at Rutgers (B.A. 1932), Chicago University (M.A. 1933), and Columbia (Ph.D. 1946). Married to Rose Director, he spent most of his professional life at Chicago University and was awarded the Nobel Prize for Economics in 1976.

Friedman conceived economics as a positive science. Value judgments are consigned to private life and must not interfere with scientific proposals: There is no place for moral criteria in economics. The economists' task is to provide theoretical arguments that enable predictions to be made about reality but not to give opinions about the results of their predictions.

Friedman's methodology is drawn from John Dewey's pragmatism. The role of theory is to provide a framework for the formulation of explanations and predictions. Theory is not validated by the realism of its assumptions but by its ability to generate predictions that are not refuted by facts.

Liberalism (or classical liberalism) is perhaps the trait that best defines his economic policy proposals. Friedman upheld freedom (conceived as an indivisible whole) as a basic moral principle in the shaping of society and maintained that the market is the system of economic organization demanded by that freedom. His liberalism was individualistic: There are no reference values outside of the individual; ethics is strictly private. The role of the State is to create the framework in which the individuals perform their free activities. This led to some of his best-known proposals, including those against price controls, in favor of the education voucher and negative income tax, etc.

Friedman's content and method helped define the Chicago School, characterized by a solid grounding in the principles of neoclassic economics, strict logic in the development of these principles, and emphasis on empirical verification. For example, his statement that the firm's sole purpose is to maximize profits was a logical consequence of neoclassical economics in the pursuit of maximum economic efficiency.

In macroeconomics, Friedman is known as a key figure in monetarism: Money influences output and employment in the short term (money matters), but this effect is not lasting; in the long term, money only influences prices. Monetary policy is powerful. However, it should not be practiced discretionally but in accordance with simple rules (a constant growth rate of the money supply). The capitalist economy is basically stable, and therefore it is not desirable to implement active stabilizing policies, which may be dangerous (monetary policy) or ineffective (fiscal policy).

Gaia Hypothesis

The Gaia hypothesis holds that the earth itself is a living organism. Associated most closely with the work of atmospheric chemist James Lovelock and microbiologist Lynn Margulis, the Gaia hypothesis is interpreted by some as a metaphor for how we should think about the earth and by others as a literally true description of the earth.

The Gaia hypothesis can be best understood in contrast to the alternative, which views the earth's biological and abiotic processes as independent of one another. From that perspective, the planet's geophysical processes, from plate tectonics and climate to atmospheric and oceanographic conditions, simply provide the physical context in which life evolves and exists. In contrast, the Gaia hypothesis emphasizes the effects that biological processes have in creating and maintaining geophysical conditions.

In one version, often referred to as the weak Gaia hypothesis, the hypothesis suggests only that living organisms alter the abiotic conditions in which they live in ways that result in a more hospitable environment. A more radical version, often called the strong Gaia hypothesis, postulates the earth as a living superorganism, which, by design or conscious intent, maintains the balance of abiotic conditions necessary to support its own life.

Lovelock's initial hypothesis was stimulated in the 1960s by his study of the striking contrast between the atmospheres of Venus, Mars, and Earth. The atmospheres of both Venus and Mars are in equilibrium that is chemically inert, consisting of more than 95% CO_2. In contrast, Earth's atmosphere is also in equilibrium but is composed of a gaseous mixture (77% nitrogen, 21% oxygen) that should be chemically reactive and unstable. Lovelock sought a hypothesis to explain this anomaly and was struck by the parallel with biological homeostasis. In simple terms, the atmospheric equilibrium was maintained through a complex and dynamic interrelationship between the biotic and abiotic processes on earth.

Biological homeostasis is the property of living systems to maintain the internal equilibrium necessary for life. For example, the human body must maintain such features as temperature, salinity, nutrients, blood pressure, wastes, water, and oxygen within certain levels in order to remain alive. Biological systems maintain homeostasis through a variety of processes, including respiration, metabolism, sweating, shivering, excretion, and food ingestion. A series of physical, chemical, and biological processes work together in a complex system of feedback loops to produce and maintain the conditions necessary for life. Some might even say that this very interaction of physical and chemical processes of working together to maintain equilibrium is life itself.

Lovelock's initial hypothesis was that the earth is itself a living system. The earth can be understood as existing in a state of homeostasis in which physical, chemical, and biological processes work together to maintain a systemic equilibrium necessary for life. Photosynthesis is a paradigmatic example of such interaction. Life (in this case plants) creates, through a physical (solar energy) and chemical (water and carbon dioxide) process, the conditions (oxygen and carbohydrates) by which life can be maintained. Lovelock named this self-regulating living system after the Greek earth goddess Gaia.

The Gaia hypothesis was immediately challenged by a wide range of critics. The fact that it had been adopted by a diverse collection of New Age religions, mystics, and many environmentalists only added to its scientific disparagement. Scientific critics tended to focus on the stronger versions of the hypothesis in which purposive, intentional, and teleological categories were attributed to the Earth. Scientific criticisms especially rejected the teleological aspects of the hypothesis and denied that it was testable.

Revised and less teleological versions of the Gaia hypothesis have entered the scientific mainstream. Least controversial are versions of the hypothesis that simply acknowledge that living beings influence, and are influenced by, their physical environment. This conclusion enjoys universal scientific assent.

A somewhat more controversial version is defended by Lynn Margulis, whose initial work with Lovelock in the mid-1970s did seem to attribute purposive designs to the living earth. More recently, she defends a version that diverts from the homeostatic hypothesis. Instead, Margulis suggests that the earth should be understood as a "homeorhetic" system, a system in which a variety of dynamic processes interact but which do not tend toward any single state of equilibrium. Rather than operating in concert to maintain a single equilibrium, the earth's biotic and abiotic elements operate to remain in a relative, yet evolving, equilibrium. As a result, the biotic and abiotic elements of the earth are understood to be on a trajectory of coevolution. By implication, there is no guarantee that any particular biophysical equilibrium, including the one necessary to support human life, will continue into the future.

The Gaia hypothesis has given rise to a wide variety of ecological, social, and ethical conclusions. Even the more modest and metaphorical interpretations can reinforce ecological conclusions about the interdependency of life and its natural environment. Normative implications suggest caution when taking physical or chemical resources from, or putting waste into, the natural environment. Given the interdependencies of biological life and its abiotic environment, discretion and caution would be the prudent social and business policy. Strong versions of the Gaia hypothesis in which the earth itself is a living being suggest the possibility of recognizing moral standing for the earth.

The Gaia hypothesis can also provide a broader perspective on the concept of sustainability that is in much use within business and economic contexts. Sustainability is often characterized in terms of economic and business activity that provides for present needs without jeopardizing the opportunity for future generations to meet their own needs. The Gaian concept of homeostasis can be understood as the biological conditions necessary for economic sustainability. The Gaia hypothesis, therefore, can also provide a link between economic sustainability and the ecological sciences.

Gambling

Gambling, also often referred to as gaming or betting, has been defined as any behavior involving the risk of money or valuables on the outcome of a game, contest, or other event in which the outcome of that activity is partially or totally dependent on chance or on one's ability to do something. Gambling occurs in many forms and is now widespread throughout the world, whether as a legalized or illegal activity. For example, lotteries are publicly operated on almost every continent, in at least 100 countries. Lottery tickets are sold at more than 240,000 locations in North America, most of which are retail outlets such as convenience stores, gas stations, and supermarkets. Worldwide lottery sales were almost $160 billion in 2003. Legalized casinos (e.g., slot machines and table games) operate throughout North America, as well as in Europe, Asia, and Australia. Worldwide, revenue from legalized casino gambling alone is expected to exceed $100 billion in 2009, up from $68 billion in 2004. In the United States, casino gambling revenue will top $64 billion in 2009, compared with $47 billion in 2004. The Asia/Pacific region (and in particular the Chinese gaming enclave of Macau) is expected to be the world's second largest casino market, with revenues reaching $18 billion by 2009, up from $9 billion in 2004. Worldwide pari-mutuel wagering (e.g., horse racing, dog racing, Jai Alai) is estimated at $116 billion. Online gambling via the Internet has enhanced one's opportunity to gamble from the comfort of one's home. Revenues from online gambling (e.g., lotteries, sports betting, slots, blackjack, roulette, bingo, poker) reached almost $6 billion in 2003 and is expected to reach $17 billion by 2009.

Over time, a continuing debate over the morality of gambling has taken place. Society is now potentially at a pivotal point in time in the history of gambling, as many are wondering in particular whether the proliferation of gambling opportunities will continue to be a "financial pearl" or ultimately result in "social peril." To better address the nature of the debate, the following will outline the principal arguments for and against gambling. Other related ethical issues, such as whether or not governments should be involved in owning or operating various gambling ventures (i.e., whether governments are "addicted" to the tax revenues), whether advertising of gambling should take place or be limited, or the possible ethical or social responsibilities of gambling operators, while important, are outside the scope of this discussion.

Arguments in Favor of Gambling

Society's Acceptance of Gambling

One of the primary arguments in support of gambling is simply due to the fact that society now seems to accept it as a legitimate activity. In determining society's acceptance of gambling, one can look to various indicators such as polls regarding its moral acceptability, current legislation and its historical development, legal decisions, increased licensing of gambling activities, direct government involvement and promotion of such activities, and the large number of individuals who participate in games of chance.

All the evidence indicates that society's views have shifted dramatically with respect to gambling around the world, particularly over the last few decades. For example, although casinos were legalized in Nevada in 1931, until 1969 most forms of gambling remained illegal in the United States as well as elsewhere around the world. Eventually, however, amendments in criminal legislation began to legalize a wider range of gambling activities, such as lotteries and charitable gaming. Eventually, legislation was again amended providing various governments with exclusive jurisdiction over lotteries, slot machines, and video devices.

Several have documented the history of casino gambling in the United States and its transformation from an immoral practice into an acceptable activity. Even by 1993, casino visits made by U.S. households were 92 million, ranking ahead of other forms of popular entertainment such as major league baseball games and arena concerts. By 2004, the number of casino visits had increased to 319 million. Research from the American Gaming Association in 2005 indicates that approximately 54% of U.S. adults believe that casino entertainment is "perfectly acceptable," while an additional 27% believe that casino entertainment is "acceptable for others, but not for me." Only 15% feel that the activity is not acceptable. While certain governments in the world still prohibit various types of gambling activities (e.g., casinos), the vast majority now permit it.

From the above, it becomes extremely difficult to argue that gambling is unethical on the basis of society's conventions. Current legislation, the current level of gambling activity, and national surveys all indicate that a majority find gambling acceptable.

Gambling as a Source of Revenue and Employment

Gambling, from a consequentialist perspective, has certainly provided a tremendous source of revenue for governments (i.e., taxes) and gambling operators. Almost $5 billion in gaming tax revenues paid in 2004 by the industry to government bodies where casinos operated provided funding for needed services and programs for various communities. In addition, gambling activities have provided enormous opportunities for employment. The American Gaming Association found that in 2004 there were more than 350,000 individuals employed by the U.S. casino industry alone earning more than $12 billion in wages (including benefits and tips). Spending by the industry and its employees created approximately 500,000 more jobs nationwide.

Gambling as Entertainment

In addition to direct and indirect revenues, gambling arguably provides an additional form of entertainment that would have some degree of value for society. Many consider gambling a social activity and derive personal enjoyment from the "risk" involved. For some, the attraction of gambling is not the money, thrills, or addictive compulsion but the social rewards of regular participation.

Gamblers Possess the Moral Right to Gamble

According to moral rights theory, individuals should have the right to engage in gambling if they freely choose to do so, and governments should be prevented from limiting this right by deciding which activities their citizens can engage in. For example, a rights principle would suggest that a person is entitled to dispose of his or her own property in any manner they wish. The loss of money from gambling could be compared with other misguided voluntary actions such as making a bad investment in the stock market, whereby no claims of injury would arise.

Religious Arguments in Favor of Gambling

Each world religion takes a slightly different position on the moral acceptability of gambling. For example, Judeo-Christian doctrine does not directly forbid gambling. There is no mention of it in the Ten Commandments or in the Sermon on the Mount. On the contrary, one can find several biblical references to gambling. In the Book of Numbers, lots were taken to decide how to distribute the Promised Land. God placed the first wager in recorded biblical history to see whether Job's belief in God would falter if he were tested severely enough. In fact, many churches throughout the years have used bingo as a means of fund raising suggesting a level of moral acceptability.

Arguments Opposed to Gambling

Social Costs of Gambling

The benefits of gambling have to be contrasted with the costs. For example, in addition to the cost felt by gamblers (and their families) in losing their bets, arguably the most serious social costs of gambling are the contributions to gambling addiction that ensue. The central argument is that a certain number of individuals are prone to gambling addiction, that gambling addiction is a disease with severe societal costs, and that the existence of gambling opportunities only exacerbates the potential for individuals to become addicted.

As early as 1980, pathological gambling (as opposed to casual social gambling) was recognized by the American Psychiatric Association as an official disorder or illness in the *Diagnostic and Statistical Manual of Mental Disorders* (*DSM-IV*). Although the studies on the number of problem gamblers differ, most studies appear to place the prevalence rate at between 1% and 6% of the adult population. For those individuals who are problem gamblers, there are reports of serious social consequences such as throwing away savings and careers, abuse of families, lies and deception, illegal acts, divorce, depression, and even suicide. One study suggests that each problem gambler affects between 10 and 17 individuals, including one's spouse, children, extended family, employer, employees, clients, consumers, creditors, and insurance agencies. It has been estimated that the total social cost of a problem gambler is approximately U.S.$30,000 per year in lost productivity, social services, theft, and jails.

Gambling Exploits Gamblers

Others argue that gambling is wrong because as a potentially addictive activity it infringes on the mental health rights of problem gamblers. Gambling has also been viewed as exploiting the weaker elements of society (e.g., the poor) by creating unrealistic hopes of "winning it big."

Religious Arguments Against Gambling

Others use religious arguments in opposition to gambling in terms of stewardship; gamblers ignore their duty of ownership of property or their responsibility to properly use the property of God. While Judaism does not explicitly forbid gambling, the Talmud makes it clear that a professional gambler (i.e., one who makes money only from gambling) is not to be trusted as a witness during court proceedings. As opposed to Judeo-Christianity, Mohammed (the founder of Islam) considered gambling a forbidden pleasure in the Koran, and Confucius believed that gambling represents a significant human weakness.

Gambling as an Unfair Form of Taxation

The moral standard of distributive justice would ask the question, "Does gambling improve the lot of the least advantaged?" One view is that gambling is unjust as it takes disproportionately from the poor and almost none from the wealthy. This argument may be more related to lotteries whereby there is evidence that low-income families pay a higher proportion of their income on lottery tickets than high-income families.

No Net Benefit to Society

Other arguments suggest that there is not net economic gain in gambling (i.e., it is a nonproductive activity) if the benefits and costs for the entire world are taken into account, as opposed to a specific jurisdiction. For example, some research studies suggest that a particular state jurisdiction will not derive a net benefit unless gamblers are coming in from other jurisdictions, with the corresponding social costs left for other state governments to deal with. In a similar vein, one might argue that there is no net benefit to society from gambling, but rather, it simply leads to a reshuffling of assets from the "losers" (e.g., the gamblers and their families) to the "winners" (e.g., governments, casino operators, and their employees).

Response to Above Arguments

Due to the inability to translate many of the benefits and costs of gambling into monetary figures, a clear assessment of the overall impact of gambling on society is extremely difficult. Overall, gambling might be argued to benefit society, but only when the social costs due to problem gamblers are minimized.

While a rights approach does not provide a clear determination of the morality of casino gambling, most of the moral criticism based on a moral rights approach might be countered if gambling can take place in a manner that leads to a fair, informed transaction without deception or exploitation of gamblers, and with measures to protect problem gamblers. In terms of gambling representing an unfair form of taxation, as long as there is evidence that the disadvantaged are much happier for the opportunity to gamble and that the hope of winning is worth something and is not irrational, then it may not represent an unfair form of taxation.

—Mark S. Schwartz

Game Theory

Game theory uses mathematics to model the interaction between two or more parties when they make decisions that will affect their outcomes. It sets up rules that determine each player's possible moves, the available information, and the various payoffs. Their actions are strategic in the sense that the actions of all parties are not fixed. The players have to make their best assessment of what to do in the face of actions of the other party and other variables to achieve an optimal outcome. Game theory has been used extensively in various fields, including economics, business, politics, social sciences, psychology, military planning, and more recently, biology.

Game theory originated shortly after World War II from work done by the mathematicians John von Neumann and Oskar Morgenstern for the RAND Corporation. It was further developed by John Nash and John Harsanyi in the 1950s.

The standard terminology calls the strategic interaction a *game*, and the participants are *players.* The best strategy is known as the *solution*, and the outcome is the *value* of the game. Games in this sense need not be trivial; for example, they have been used to work out nuclear strategy, where quite literally the payoffs involve life and death.

The game will specify who the players are, what moves are allowed, and the payoffs for each. A very simple example of a game used by von Neumann had two players who simultaneously present a coin face up or face down. If they are the same, then Player 1 wins by taking both coins; if they are different the coins go to Player 2. Games may be represented either by decision trees known as the *extensive* form that plot all the available information or more typically as a simple matrix (see Table 1).

Table 1 A Zero-Sum Game

	Heads	*Tails*
Heads	+1, −1	−1, +1
Tails	−1, +1	+1, −1

Source: Adapted from Neumann, J. v., & Morgenstern, O. (1953). *The theory of games and economic behavior* (3rd ed.). Princeton, NJ: Princeton University Press.

The rows typically correspond to the strategic possibilities for the first player, and the payoffs are typically rendered with the row player's result, followed by those for the column player. Thus in this case, if both play heads, the top left cell, then the row player will win the coin at Player 2's expense. This is a *zero-sum* game since a win for one side represents a loss for the other: +1, −1 = 0. We assume the players to be self-interested, and so they will seek to maximize their gains and minimize their losses.

Either before they begin or after a few rounds, players will develop a *strategy.* If a strategy were written down it would provide a set of directions that specify how to act and react to various payoff options. Here, the first player recognizes that if she is consistent in showing heads, then the other player will work out what is going on and play to his advantage by always selecting tails. Both sides impute similar rational thinking to the other and develop a strategy that denies any advantage to the opponent. In this case, the first player is best off choosing randomly and the best response by the second will be to play randomly as well. Thus in this game, and in fact for any similar game, the sides will come to a point where they have achieved the best possible response given the constraints and payoffs involved.

Maximin

In a one-time, two-party, zero-sum game no cooperation is possible. We can imagine that two hungry children have to divide a pizza, where one cuts once and the other chooses whichever half she wants (see Table 2).

Table 2 A Maximin Game

	Choose Bigger	*Choose Smaller*
Cut evenly	Little difference +	Little difference −
Cut unevenly	Disproportionately large	Disproportionately small

Source: Adapted from Poundstone, W. (1992). *Prisoner's dilemma* (p. 43). New York: Bantam Doubleday.

If we put ourselves in the place of the cutter, the clear strategy is to cut as evenly as possible, because we believe the chooser will take the largest slice offered. It is plausible that she will irrationally take the smaller, but we impute our own motives onto her and, therefore, expect that if we cut unevenly we will lose out by doing so. The cutter is attempting to maximize the possibility of an outcome that provides the chooser the minimum possible. Here, that will be the top left cell, and the strategy is known as the *maximin.* In a similar vein, John Rawls says in his book *A Theory of Justice* that behind the veil of ignorance, and not knowing exactly our place in society, a rational, risk-averse person would choose the maximin strategy by spreading almost equal opportunities as widely as possible so that they are available to everyone.

Equilibrium

Equilibrium represents an optimal strategy for a player. In the following game, we can imagine that a business, Widget Inc., is trying to decide whether to spend money on a new advertising campaign (see Table 3). The advertisements promise to be cost effective by bringing in more revenue. If its rival also launches a campaign at the same time, however, the effects will be considerably dampened.

Table 3 A Strategy for Equilibrium

	Launch	*Do Not Launch*
Launch	+1, +1	+5, 0
Do not launch	0, +5	0, 0

Source: Adapted from Davis, M. (1997). *Game theory: A non-technical introduction* (p. 34). New York: Dover.

Looking at the various options, the row player will be better off by launching the campaign whatever the other company does. The game is not zero-sum, since a gain for one side is not made at a cost to the other. Widget might hit the jackpot if the rival does nothing, but nevertheless advertising will always bring a gain. However, if both sides are aware of what the other is doing and each other's payoffs, then they are likely to act the same way, with the result that both will end up advertising. In technical terms, Widget will be better off choosing to advertise in every case, that is, its *dominant* strategy. Thus, in this game the sides will come to the equilibrium point where they select the best possible response available in the circumstances.

Table 4 represents a game called "battle of the sexes" (sometimes, battle of wills). In this case, a couple, Martha and George, want to go out together, but it is a one-time date, and hence they cannot alternate preferences. Martha, the row player, prefers the opera (which she rates as worth 2) to boxing (rated 1), whereas George would rather watch boxing (2) than the opera (1). They both want to go out together instead of going alone (0). There is no dominant strategy, and hence no obvious solution. The outcomes depend on the parties communicating and accommodating the desires of the other, lest they be left alone. Hence, this kind of choice set is called a *coordination game.*

In games without a dominant strategy, each side will opt for strategies that have the result that any alteration will make them worse off. This is the case with the battle of the sexes: They can both go to the opera or both to the boxing match, and any other choice has a less attractive outcome. These optimal points are known as the *Nash equilibrium.* Some games will have multiple equilibriums, but nevertheless the set will be limited and can be portrayed mathematically.

Mixed Strategies

In cases where there are multiple equilibriums, game theory has worked to establish decision processes for choosing the right strategy. The game of tennis gives us a nice example of how mixed strategies operate. Imagine that there are two players who have a weekly game. Although fairly evenly matched, one is better at serving the ball to land near the net rather than at the back of the court. However, if she plays to her strength all the time, then the opponent will realize what is going on and adapt his play accordingly. Thus, in a repeated game it may be worth altering strategies from time to time. We assume that both sides think the same way and are aware of what the other side is doing but find an advantage in keeping them guessing. Furthermore, game theory asserts that expected payoffs are treated the same as certain payoffs; in other words, a player will be risk neutral between receiving $15 and a 15% chance of earning $100 (and the associated 85% chance of getting nothing). Once we incorporate this assumption, we can then use probabilities in working out the optimal strategy for any game.

So, for example, one of the tennis players may have a 90% chance of winning a point by positioning herself at the back of the court because the other player routinely places himself near the net (see Table 5). Rationally, she ought to do that for every serve. However, as the other player learns what she is doing, he

Table 5 A Mixed Strategy

	Front	*Back*
Front	50, 50	80, 20
Back	90, 10	20, 80

Source: Adapted from Duffy, J. (2003, December). *Introduction to game theory.* Retrieved from www.pitt.edu/~jduffy/econ1200/Lectures.htm may well change his position and the likelihood of her success would diminish. Next, we integrate the second player's response (for ease, limited to two options in this case). The players can play front or back. However, rather than getting direct payoff, we put in the percentage of success; recall that a 90% success rate over 10 serves will be equivalent to a payoff of 9.

If the column player alternated front and back randomly over a series of games, then the row player is better off constantly playing back; the winnings will offset the losses over time. The situation is more fluid, though, because the column player is making exactly the same sort of calculation. Mathematically, we can plot the point where the payoff for the opponent is the same whatever strategy they employ. That will tell us their ideal mix of strategies in the face of our behavior and is termed a *best response function.* (Here, it turns out if the row player plays front 60% of the time, her opponent will be indifferent to front or back.) Combining the probability of the other side making a particular choice and the payoffs they will receive from it with our own allows us to derive what we can expect over repeated encounters. In business as well as tennis, plotting out the equilibrium point with mixed strategies enables us to minimize any exploitation that could arise from constant predictable behavior. As an interesting correlate, some chess grand masters playing challengers they have met several times before have benefited from making deliberately poor opening moves to throw their opponents off guard.

Nash acknowledged that his formulation relied on the assumption of complete information about the choices and payoffs facing the other side and fully realized that if it is relaxed, then the outcomes are far less predictable. In typical bargaining, for example, the parties often deliberately try to mislead the other side about their goals and alternatives. This will confound the predictions somewhat, and a lot of research has gone into marrying the cleanliness of laboratory testing with the messiness of the real world.

Variables

Game theory deals with a number of variables. Games may be zero-sum, or may have outcomes that depend on cooperation. The payoffs may not be symmetrical, and the players may have mixed motives. For example, in cases such as the famous prisoner's dilemma it is mutually beneficial to cooperate, but rational to go it alone if there is reason to suspect that the other side may defect from the enterprise. In the coin game above, the sides had to take action simultaneously, whereas in dividing the pizza the parties took turns and could clearly see what the other side had done. Some games are single play, whereas others have many rounds where players are faced with similar choices. Consider, for instance, that the tactics a buyer uses at a yard sale may be significantly different from those at a weekly market.

Another key factor is the number of players involved. In the so-called *n*-player games, players have the opportunity to form coalitions. Thus, there may be three companies bidding on a contract; the client says that the payments will be the same whether two companies or three share the work. This leaves each manager with the decision of whether it is better to join an alliance of three and get less reward or try for a two-party coalition's higher amount with the consequent risk of being frozen out of the deal altogether by the other two. There are sophisticated mathematical means of working out the best course of action for coalitions working under uncertainty as long as there are rational players and sufficient information, again based on calculating the probability of achieving the optimal payoff from all the various possible permutations.

Confounds

Humans tend not to be perfectly rational in their decision making. A series of recent experiments have set up games where participants have to guess a number, and then divide it by a fraction they decide on, and the one closest to the mean of the group wins. Thus, if ten participants decide on the numbers 10, 20, and so on to 100, and the fraction they choose is one half, the total will be 550, the mean 55, and the answer half of that, 27.5: The winner would be the one who chose 30. Once participants realize that the number has to be low, they would modify their choice if they could for the next round; for example, the person choosing 100 would make a far more conservative guess nearer 30. But, of course, the people who chose 90 and 80 would also act the same way and so the final number would keep going down. The Nash equilibrium for this game is to choose 0, but it takes forethought to work this out. The number someone chooses reflects their ability to think in the abstract about future choices and make judgments about their fellow players' ability to do the same. Research shows that the majority of people only think one or two steps ahead. This goes against Nash's assumption about perfect rationality over iterated plays. If we apply game theory to real-life applications such as negotiation, then we would do well to assume that most people are only thinking one or two steps in advance, either because they are incapable or unaware of repeated strategic play.

Utility

Utility is a measure of personal welfare. Individuals place different values on resources and events. There are signs, for example, on casinos in Las Vegas that declare they return 98 cents on the dollar. The clear message is that the house will win, and thus it is economically irrational. On the other hand, we realize that players are paying for the thrill of betting, and hence they find it a worthwhile expense.

A game that is totally zero sum, where the options are essentially "take it or leave it," often demonstrates how our decisions are not purely economic. One form has a pair of negotiators given the chance to have $100 if they can decide on a division against a deadline. Typically, participants will come up with an even split, but one strategy is to hold out for a $99 to $1 division; rationally, it makes sense that someone should take a dollar rather than nothing, but it is very common for people to walk away from the deal because of the perceived inequity. The effects of the deadline and perceptions of the future relationship come into play, too. Individuals have psychological needs to be respected and treated fairly, and game theory does not incorporate these values very well.

Utility also varies with wealth in the sense that a rich person can afford to forsake a gain much more readily than a poor one. In addition, experience shows that people are conservative when faced with risk; contrary to economic supposition, most people would prefer a certain million dollars than a 50% chance on 2 million if faced with the real choice.

A lot of recent work has been done in the area of trust. For example, one game gives the first player (P), say, $10. P then divides the money and sends some amount to a receiver (R). The amount that R gets is doubled or tripled, and then R is asked to do another allocation back to P. Under Nash's assumptions, no money would be sent either way because of the conjecture that the players are selfish and untrusting. Instead it turns out that the average amount allocated to each is about half the total. This implies that people are inclined to put themselves in the other party's shoes and treat them accordingly. Furthermore, the perception of intentions appears to have a significant effect on play. In prisoner's dilemma games where cooperation had been established, and one side defects to its own benefit, expressions of regret were tremendously effective in reestablishing cooperation, although they are regarded in economic terms as *cheap talk*. Although all these effects can be modeled with proxy valuations in games, they are highly subjective and vary widely in different situations.

The fact that we favor some people more than others is known as *social preference*, and the effect is that we develop networks and alliances to facilitate our dealings. Here again, this mirrors common experience that has only been recently incorporated into game theory and shows us that individuals do not always act as selfish atomistic entities. Despite some of these limitations, game theory has been profoundly effective and influential over the past 50 years in bringing intellectual rigor into discussions about decision making.

Gay Rights

Historically, the term *gay rights* has encompassed areas as diverse as free speech, employment, religion, and cultural expression. Proponents of gay rights argue that the ability to inherit property from their partners without paying inheritance taxes, to have legal standing in matters involving a partner's health and legal guardianship, the right to marry, and the right to adopt children are basic civil rights that belong to all individuals, including gays, lesbians, and transgender individuals. Critics of gay rights argue that homosexuality is contrary to human nature, generally from a moral or religious perspective.

Because there are so many interest groups with widely diverging perspectives, there can be no single definition for the term *gay rights*, but in a broad sense it refers to a movement that supports nondiscrimination against lesbians, gay men, transgender individuals, and other sexual minorities identified by sexual orientation. From a business perspective, such support would include access to equal employment opportunities, provision of domestic partnership benefits, gay-inclusive diversity training, the protection of employees against violence and other forms of harassment in the workplace, and nonbiased representations of gays and lesbians in television, newspapers, and all other forms of media. Critics of such corporate policies contend that promotion of a gay or lesbian lifestyle undermines family values. Groups such as Focus on the Family and The Christian Coalition argue that gay rights advocates are seeking special treatment. In response, these groups conduct protests, create picket lines, and boycott products and services to make their opposition known.

Taking a position either for or against gay rights must first assume that all individuals are entitled to *rights*. From a philosophical point of view, a presupposition to rights can be disputed. Rights theorists have examined this question from a variety of perspectives, taking into consideration the fact that an individual's actions may be governed by self-interest or preservation of a culture or community, or that one might shift the discussion from a matter of rights to one that focuses on *responsibilities*. If an employee, for example, claims a right to spousal health insurance, does that employee have a corresponding obligation to claim that right for others in the same firm? In addition, one might argue that such benefits are not natural but acquired rights, and as such do not extend to all members of the community. Such arguments have broad implications. Nevertheless, organizations, whether countries or corporations, have created constitutions, laws, policies, and regulations based on the assumption that certain fundamental rights do exist. Whether or not these rights can be extended to specific interests groups such as gays and lesbians is a matter of historical debate.

The Global Perspective

From an international point of view, the response to equal rights for gays and lesbians varies widely; however, the legal problems faced by same-sex partners are similar around the world. One of the earliest movements to petition for gay rights formed in Germany in the 1890s. Magnus Hirschfeld, Max Spohr, and Erick Oberg founded the Wissenschaftlich-Humanitäres Komitee (the Scientific-Humanitarian Committee) in Berlin in 1897. The committee provided assistance for defendants in criminal cases and labored to achieve social recognition of homosexuals. Their major goal was to lead a program to repeal Paragraph 175 in the Imperial Penal Code of the German Constitution that contained a provision against homosexual behavior. Such behavior was considered immoral and many medical professionals concluded that it was a form of mental illness. Although the provision was repealed in 1929, the rise of the Nazi party led to additional anti-homosexual measures and the Wissenschaftlich-Humanitäres Komitee eventually disbanded.

Today, the position of gays and lesbians in many societies is largely governed by religious and traditional cultural beliefs. In many Asian countries, where family relationships are highly prized and individual rights are sometimes subservient to the rights of groups, social acceptance of gays and lesbians would undermine such values and is, therefore, strongly discouraged. Religion has a persevering influence on politics in Middle Eastern countries and in traditionally Catholic countries such as Italy and Spain; however, in July 2005, Spain officially published a law legalizing same-sex marriage. Other western European countries and Australia are considered more liberal with regard to gay and lesbian issues, and in Britain and Europe many gays and lesbians have formed political alliances with the left, whose members often promote social policy reforms that benefit minority communities.

In North America, Canada's federal government indicated that it would extend spousal benefits to the gay and lesbian partners of federal employees in 1999. The plan covers more than 300,000 federal employees and pays the same survivor pension benefits to spouses of gay and lesbian employees as are currently paid to spouses of heterosexual couples. In Latin America, there have been several proposed initiatives. In 1996, the Statutory Convention of Buenos Aires, Argentina, approved a measure forbidding workplace discrimination on the basis of gender, age, race, religion, political ideology, or sexual orientation. According to a study by the International Gay and Lesbian Association (ILGA), this measure made Buenos Aires the first Spanish-speaking city in Latin America to address all these issues. In March 2003, Brazil presented a resolution on sexual orientation at the UN Commission on Human Rights in Geneva. The text states that sexual diversity is an integral part of Universal Human Rights. Under the pressure of the Organization of Islamic Conferences and the Vatican, a solid block of countries opposed the voting of the text in 2003. In 2004, Brazil, realizing that the resolution still did not have sufficient support to ensure passage, decided to postpone discussion to 2005, but the commission again delayed the vote during that session.

Scandanavian countries and the Netherlands have been more liberal in supporting gay and lesbian rights. On June 21, 1979, the Netherlands passed Article 1623h of the Civil Code, a law granting a succession right to a same-sex cohabitant of a deceased tenant. In June 1989, Denmark passed the Law on Registered Partnership, which allowed same-sex partners to register, and in December 2000, Article 30(1), Book 1 of the Civil Code of the Netherlands was amended by the *Act on the Opening up of Marriage*, which allows marriage by two persons of the same sex.

Currently, there are 48 countries that have publicly supported sexual orientation as an issue at the UN Commission on Human Rights between 2003 and 2005. In addition to recent laws passed in the United States, legislation recognizing some form of same-sex partnership has been passed in at least 18 of the 189 countries that are members of the United Nations, including Australia, Austria, Belgium, Canada, Denmark, France, Germany, Hungary, Iceland, the Netherlands, New Zealand, Norway, Portugal, Scotland, South Africa, Spain, Sweden, and Switzerland. Some of these laws allow registration for partners and offer an official legal recognition. Many include antidiscrimination laws that prohibit discrimination in employment, housing, and other areas.

Today, gay rights activists are working to create a global agenda, and groups such as the ILGA attempt to bring these issues up for consideration by larger bodies such as the United Nations. In 1994, one year after ILGA had been granted consultative status at the United Nations, the Economic and Social Council suspended it, based on concerns that the association promoted pedophilia. Subsequently, ILGA requested reinstatement of its status, but a number of delegations repeated their concerns and the Economic and Social Council voted again in 2002 to deny the association consultative status.

Gay Rights in the United States

Although many scholars mark the beginning of the modern American gay rights movement with the Stonewall Rebellion of 1969, the struggle for gay rights in the United States has a long history. One early activist group, the Society for Human Rights, was founded in Chicago in 1924. The organization published two issues of a newsletter called *Friendship and Freedom*, but the members disbanded after only a few months. For many years, division between private and public life was an accepted part of homosexual society. Police frequently raided gay bars and cruising areas such as parks and public restrooms, publishing the names of those arrested in newspapers. Such publicity often meant losing a job.

It was generally regarded that homosexuals were vulnerable to blackmail and easily convinced to divulge sensitive information to political adversaries. After World War II and the Cold War, gays and lesbians were linked to Communist organizations and were denied employment as civil servants because they were considered security risks. Such restrictions on civil rights led to the rise of several "homophile" movements, including the Mattachine Society, a men's group established by Harry Hay in Los Angeles in 1950, and the Daughters of Bilitis, a women's group formed in San Francisco in 1955 by Del Martin and Phyllis Lyon. These organizations sought to create change through existing institutions without challenging the values of mainstream society. They sought legal and legislative ways to secure basic rights for gays and lesbians.

To some extent, these early groups protested antigay employment practices, particularly in government employment, but for the most part they served as social outlets, educational forums, and support groups. But by 1964, gay men and lesbians were picketing government offices, demanding civil rights and calling for an end to discriminatory employment practices. Even then, the federal government prohibited lesbians and gay men from civil service employment until 1975. Opposition to the war in Vietnam, and persistent discriminatory practices in employment, housing, and education, sparked resistance efforts for many groups seeking freedom from oppression. This period, inspired by the black civil rights movement and Women's Liberation, was marked by public protests. Between 1968 and 1973, the years of "gay liberation" sparked by the anti-Vietnam war activism, such rebellion was characterized by a much more vocal style of protests and an emphasis on "coming out."

The Stonewall Riots began on the evening of Friday, June 27, 1969, when New York City police raided the Stonewall, a popular gay bar in Greenwich Village. Many of the patrons fought back, locking the police in the bar and setting it on fire. The street riots continued between the police and angry residents for another day and night, and *Stonewall* became a symbol for the modern gay rights movement. In many ways, this protest divided the generations—unlike their earlier counterparts, the activists involved in the Stonewall riots sought to work against the system rather than inside it. But all those who supported gay and lesbian causes benefited from the publicity generated by their outcry, and by the mid-1970s most major U.S. cities hosted gay pride marches attended by individuals from all generations who marched enthusiastically side by side.

Much of this activism was in response to specific state and federal legislation. Until 1961, when Illinois decriminalized sodomy, all 50 states in the United States had laws against it. Other states followed Illinois in repealing these laws, but in 1976 the Supreme Court upheld Virginia's sodomy law, which made it a felony for individuals of any orientation, punishable up to 20 years in prison. Another Supreme Court decision in 1986, *Bowers v. Hardwick*, upheld Georgia's right to make and enforce sodomy laws. A series of state decisions overturned sodomy laws, in Louisiana in 1994, Michigan in 1990, and Georgia in 1998.

As these laws were repealed, gay activists began to push for inclusion of new laws recognizing same-sex partnerships. By 1997, more than two dozen cities had domestic partner registries. State courts witnessed a wide variety of cases, and today many cities and states allow same-sex couples to register for domestic partnership. In 2003, the Vermont Supreme Court found that same-sex couples had the same rights to benefits as married couples, and the state legislature created a category of partnership called "civil union." In May 2004, Massachusetts became the first state to legalize marriage for same-sex couples; however, the state's governor Mitt Romney, a staunch supporter of exclusively heterosexual families, has backed a campaign to reverse the court's decision. On a national level, the Defense of Marriage Act, enacted by the U.S. Congress in 1996, prohibits federal recognition of same-sex marriages.

From a business perspective, equal employment is a focal point for discussion about gay and lesbian rights. In 1980, the Office of Personnel Management prohibited employment discrimination based on sexual orientation in all federal civil service jobs. In 1994, the Employment Non-Discrimination Act was introduced in Congress, offering gay men and lesbians protection against antigay discrimination in the federal workplace. The act prohibited discrimination based on sexual orientation, but it was voted down in 1996 by the Senate by a 50 to 49 vote and never made it to the House.

Defenders of gay rights also argued for benefits from corporations and some complied, in part because of growing protests from consumers. One of the first gay and lesbian protests against a major corporation began in the spring of 1970, when gay liberationists in San Francisco, New York, and Los Angeles picketed ABC after one of its affiliate stations fired an employee because he participated in a militant gay movement. When Anita Bryant led an effort to repeal a Dade County Florida gay rights ordinance and the measure was repealed in 1977, gays and lesbians led a nationwide orange juice boycott. In the 1980s, activists challenged the price of pharmaceutical companies for AIDS treatment drugs, with protests by such groups as ACT UP that convinced Burroughs Wellcome to reduce the price of AZT. Other early protests included action against AT&T, which then added "sexual orientation" to its nondiscrimination policy in 1974.

Groups such as the Human Rights Campaign and the Investor Responsibility Research Center periodically survey corporations to gather data regarding equal employment policies, and such surveys indicate that there is a growing trend to incorporate "sexual orientation" into nondiscrimination policies. A report on equal employment opportunity issued by the Investor Responsibility Research Center in 2003 examined gay and lesbian rights as part of the larger issue of equal opportunity for women and minorities. The report found that although there has been significant demand for public disclosure of workforce data by race and sex, only a small percentage of U.S. companies comply with such requests. The report also noted that there is no federal legislation to protect gays and lesbians in private employment from discrimination based on sexual orientation and that only 13 states have made it illegal to fire someone based on sexual orientation.

Those 13 states have amended their civil rights statutes to include sexual orientation in the private sector and 9 have executive orders barring such discrimination. At least 130 cities and counties have employment nondiscrimination laws that include sexual orientation. Many of these municipalities have adopted ordinances requiring extension of same-sex employee benefits as a prerequisite to eligibility to contract for goods or services. On the opposing side, equivalent measures were enacted to facilitate continued employment discrimination against gays and lesbians. In January 2000, the governor of Ohio, Bob Taft, deleted the words "sexual orientation" from a state government policy banning employment bias. In November of that year, Maine voters rejected a ballot initiative banning discrimination based on sexual orientation, and in December of that same year, a judge overturned an executive order in Iowa that prohibited the state from employment discrimination based on sexual orientation or gender identity.

Corporate Policy

More than 60% of the Fortune 500 corporations have nondiscrimination policies that bar discrimination based on sexual orientation. In 1984, IBM became the first corporation to adopt a written nondiscrimination policy that included sexual orientation. By 1997, more than half the Fortune 1000 companies offered domestic partner health and other benefits. In June 2000, the Big Three automakers announced that they would offer domestic partner benefits to same-sex partners of more than half a million gay and lesbian employees. These benefits included coverage of medical, dental, and prescription-drug costs to same-sex domestic partners of all eligible U.S. employees. Workers are required to attest that their domestic-partner relationship meets eligibility guidelines, including being of the same sex and having shared a committed relationship with each other for no less than 6 months. Although there are no studies to indicate that such policies have had a negative effect in the workplace, critics might argue that such benefits undermine the meaning of marriage or divert funds that might instead benefit the entire workforce.

To date the only studies that evaluate corporate behavior have been conducted by defenders of gay rights. The Human Rights Campaign Foundation (HRC) launched the Corporate Equality Index in 2002 as a way to evaluate how major U.S. corporations treat their gay, lesbian, bisexual, and transgender employees, consumers, and investors. The Foundation surveys the Fortune 500 companies, companies on *Forbes*'s list of the 200 largest privately held firms, and any other company with 500 or more employees that requested a rating or for which HRC had sufficient data to derive a score.

The criteria used in creating the Corporate Equality Index requires a written nondiscrimination policy that includes the words "sexual orientation" or "gender identity" or "gender identity and/or expression" in a corporation's primary written nondiscrimination policy. The index also measures health insurance coverage to employees' same-sex domestic partners firmwide or cash compensation offered to employees to purchase health insurance for a domestic partner on their own. Other criteria include recognition and support of a gay, lesbian, bisexual, and transgender employee resource group; diversity training that includes sexual orientation and/or gender identity and expression in the workplace; respectful and appropriate marketing to the gay, lesbian, bisexual, and transgender (GLBT) community; and financial support for GLBT health, educational, political, or community organizations or events. In 2004, a total of 56 companies met all the criteria, resulting in a score of 100%. This was more than four times the number of perfect scores awarded in 2002, the first year the index was released. No company that received 100% in 2002 or 2003 has seen its score decrease.

Corporations must also take into account the values of customers who oppose such nondiscrimination policies. Campaigns against "gay-friendly" corporations include boycotts and letter-writing campaigns.

Conservative organizations such as the American Family Association, the Family Research Council, the Moral Majority, Anita Bryant's Save Our Children, and the Southern Baptist Convention have opposed corporations offering benefits to same-sex domestic partners on moral and religious grounds. In 1996, the Southern Baptist Convention issued a statement opposing Walt Disney Company for offering benefits to same-sex partners. The Convention encouraged its members to boycott Disney's theme parks and store. Similar groups have also contacted Cracker Barrel to protest adding "sexual orientation" to its nondiscrimination policy.

Conclusion

On a global scale the response to defenders of gay and lesbian rights varies widely. Although there have been many changes, particularly in the area of employment, not all gays and lesbians feel they have job security. Employment discrimination continues, particularly at the federal level. The armed forces, one of the largest employers in the United States, refuse to accept avowed gays and lesbians among its ranks. A September 2002 survey released by Witech-Combs communications and Harris Interactive(R) found that almost 1 in 10 gay and lesbian adults had been fired, dismissed, or pressured to quit a job because of their sexual orientation.

Corporations provide support for gays and lesbians in a variety of ways. Many major companies advertise in gay and lesbian publications and provide financial support through foundations and community giving programs. Proponents for gay rights contend that these corporations benefit by recruiting talented employees and by addressing the needs of gay and lesbian consumers and investors. At the same time, these corporations risk alienating conservative groups that seek to prevent such policies. Those who defend gay rights base their arguments on the fact that gays and lesbians are members of a larger community and that corporations that provide benefits to that community should also address their needs. This is a basic tenet of rights theory. Those with opposing viewpoints generally do not make an argument based on equality, or entitlement, or human need, but instead base their opposition on convictions that stem from scripture or morality.

As more corporate executives make the decision to recognize or dismiss sexual orientation as part of a larger human resources agenda, they must weigh the effects of such changes on the entire organization. These effects will vary from one organization to the next. From a practical perspective, it may not be a question of morality or human rights, but a question of how such policy changes will influence the bottom line. However, as is evident by the history of boycotts on both sides of this issue, consumers' moral values and principles can dramatically affect corporate profits. On an international scale, as more multinational corporations adopt workforce diversity, these policies will have a significant impact on global perception of sexual minorities. Conservative and religious opposition will continue to resist broader acceptance of gay rights, and the array of issues relevant to gay rights will remain in flux for the foreseeable future.

Gender Inequality and Discrimination

Gender inequality can be defined as allowing people different opportunities due to perceived differences based solely on issues of gender. Gender discrimination is the prejudicial treatment of an individual or group due to gender. Gender inequality and discrimination are generally discussed as pertaining to women, but anyone can experience gender-based inequality or discrimination.

In order for these definitions to have meaning, we must first define "gender." The terms *gender* and *sex* are sometimes used interchangeably, but social scientists and medical personnel are beginning to recognize them as different. Sex refers to one's biological identity as defined by physical and/or chromosomal makeup. Generally, people are categorized as either male or female depending on their chromosomes and/or genitalia. Gender is commonly defined as the social identity of the sexes. It is determined by socialization and social values, not biology, and includes social markers such as behavior and appearance. Usually, people who identify as transgender believe they are different in sex and/or gender than what society has labeled them. For example, a person may believe himself to be a man despite genitalia that is defined as female by society. Transgender issues have helped bring to light the spectrum of sex and gender possibilities that is denied by the male or female binary and the use of sex and gender interchangeably.

This entry will begin by exploring the broader issue of gender inequality and will then discuss gender discrimination as it relates to business.

Gender Inequality

Gender inequality is rampant in most societies. In some countries, women continue to be denied access to financial resources such as bank loans to start a business, scholarships for education, and legal recourse against wrongful termination. American popular culture illustrates more subtle examples of gender inequality. In general, women are portrayed in the media as weaker and less intelligent than men. Magazines marketed to women tend to define women in terms of their being sexually attractive and available to men. On television and in movies, women tend to be younger than their male counterparts and cast in roles that are supportive to a male and less serious. Women are held to a more rigid standard of beauty and are depicted as more sociable, nurturing, and caring. In popular culture, men are generally portrayed as more aggressive, assertive, and violent as well as less expressive and emotional than their female counterparts. While male characters are more likely to initiate violence, female characters are more likely to be the victim of male violence. These stereotypes of gender hold each sex to an impossible standard. Gender inequality is perpetuated not only by a person's views of others based on gender, but also her or his view of her or his own abilities and opportunities based on her or his gender. Gender inequality can manifest itself in obviously discriminatory ways—such as not hiring a male candidate for a child care position because of the stereotype that women are naturally better at child care—and in more subtle ways—such as a male not ever considering a career in child care because he has internalized the stereotype that desiring such a position proves he is feminine.

Gender inequality is a major concern of feminist theorists. While some have fought for the equitable treatment of women in society, others have celebrated the difference between the sexes. Feminist theories on gender can be split into three major categories: essentialist, constructivist, and performative. Essentialists believe that something innate within people determines their gender. Essentialist feminists tend to celebrate what they define as the "feminine" and believe that embracing the "feminine" will allow women to better understand their difference from men. Carol Gilligan, Nancy Chodorow, and Luce Irigaray are examples of essentialist thinkers. Constructivists believe that gender is not innate or natural but constructed through interactions with society. Constructivists believe that one's sense of his or her gender does not come from something essential but rather is created. Constructivist thinkers include Gloria Anzaldua, Donna Haraway, and Juliet Mitchell. Performative theories describe gender and all gendered behaviors as performative, meaning that one behaves in a particular way to perform the gender roles he or she believes society requires. Judith Butler wrote the most well-known performative theory, which can be categorized as a constructivist theory. Eve Kosofsky Sedgwick also proposed a performative theory of gender, one that focuses on sexual orientation. Sedgwick theorizes that while there are performative aspects of gender, there must also be something innate. Her theory attempts to combine essentialism and constructivism. Debates regarding gender inequality continue within feminism, and inequality remains a central issue for most feminist theorists.

Differences between the sexes—either real or perceived—have caused differences in the ways individuals are perceived and valued in society. These differences in treatment have caused inequalities between the sexes. Gender inequality differs between nations and within nations. While generalizations about gender inequality can be made based on recent research, individual experiences may differ greatly depending on the time and place, as well as the perceptions of those involved.

Causes of Gender Inequality

There are many, often competing, ideas about the causes of gender inequality. Theories regarding the causes of gender inequality can be grouped into five main categories: biological, psychological, sociological, materialist, and religious.

The biological argument for gender inequality states that women are physically weaker than men and made more physically vulnerable by their ability to have children. Therefore, women need to be protected by men. This argument had more support when the majority of work needing to be done was physical in nature. Now that the majority of jobs do not involve physical labor, this argument has lost much of its appeal. Women's menstruation has also been used to argue that they are less emotionally stable than men and, therefore, should not be allowed positions of power, such as political office. By unfairly denying women access to the workplace, a society is not using all its resources.

Sigmund Freud and other psychological thinkers have proposed various psychological theories to explain gender differences and, therefore, gender inequality. To compliment the "Oedipus Complex," Freud developed the "Electra Complex" through which a young girl supposedly realizes that she and all women do not have penises, which causes her to feel inferior to men and, therefore, develop "penis envy." Freud defines a woman's gender identity through the lack of male genitalia. This use of the male as the norm persisted in psychology through much of the 20th century until Carol Gilligan began to explore female identity and developed her theory regarding the ethics of care. Defining women as the other (i.e., not men) may explain why "women's work" (generally thought of as the nurturing and caring of others) has been devalued by most cultures.

The socialization of children is believed by many anthropologists and sociologists to be the main cause of gender inequality. From the moment a child is born, his or her gender is the deciding factor in how the child will be treated by both the family and the society at large. Children learn appropriate behaviors for their gender. In most cases, this means that boys are socialized to be "masculine" (typically defined as more independent and aggressive), while girls are taught to be "feminine" (more dependent on others and nurturing). Gender socialization is a cycle that perpetuates itself through generation after generation.

Materialist theories point to the lack of access to valued resources as the cause of gender inequality. Due to their position either in the home or in lower-valued jobs, women do not have personal access to the most valued resources in their society. While a mother's work in the home is vital to a society, it is devalued, goes unpaid, and is not acknowledged as work. Women also have less access to financial resources due to lower paid or unpaid work. Historically, women have received a lower level of education than their male counterparts. This lack of educational resources limits women's ability to improve their material status. Recently, this educational trend has begun to reverse in some nations.

Finally, religious beliefs have also affected gender equality. Most of the major religious texts imply that men are superior to women, causing those that follow these teachings to maintain the conditions that cause gender inequality in their culture. For Christianity and

Judaism, the Old Testament of the Bible is that text. In the Old Testament, women are often absent and, when present, have a subservient role to men. One portion of text that is often cited as the source of gender inequality is in Genesis: Eve is created out of one of Adam's ribs. Many read this as an illustration of female inferiority. The role of women in Muslim culture is currently being debated. Many Muslims believe that the Quran mandates women's subservience to men. They argue that their religious laws are based on the understanding of gender by the divine. The role of women has evolved in religions over time and will continue to do so.

Reinforcement of Gender Inequality

Gender inequality is reinforced through various social structures, most prominently social, familial, religious, and materialist structures. Language also perpetuates gender inequality by reinforcing the idea that men are the dominant gender and women are subordinate. Until recently, "he" was universally accepted as the generic pronoun in English for a person of an unspecified gender. Many languages continue to be more "gendered" than English. For example, in many Romance languages plural groups of people with just one male use the male version of the plural noun for "they" or "them." Women also tend to be referred to in sexually derogatory or trivializing ways more frequently than men.

Gender Discrimination

Gender inequality is also reinforced within the workplace. One major way this occurs is through gender discrimination. Gender discrimination is treating individuals differently specifically because of an individual's gender. In many developed countries, discrimination is illegal regardless of whether it is based on sex or gender or both sex and gender. The ways in which gender discrimination occurs tend to be subtle and complex. Gender discrimination is often difficult to prove. Gender discrimination in the workplace is the most widely discussed form of gender discrimination and will be the focus of the remainder of this entry. While gender discrimination is generally thought of in terms of female workers being discriminated against, men are also vulnerable to gender discrimination. For example, a male who wishes to become a nurse may be discriminated against because men are generally not considered nurturing and caring.

Types of Gender Discrimination

There are four major ways in which people are discriminated against in the workplace based on gender: hiring, pay and benefits, promotion, and firing.

Hiring

During the hiring process, gender discrimination can occur because of the employer's preconceived notions regarding the work ethic and style of a gender. For example, a woman may not be hired because the employer is concerned she will have or already has children and will need to take time off from work to care for them. Proving discrimination during the hiring process is extremely difficult because the sexist reasons given for or against a hire are generally not revealed in an obvious manner.

Pay and Benefits

In the United States, on average, women make 76 cents to every dollar made by men. While the exact statistic is debated and has improved in recent years, it still reflects the basic pay inequity experienced by female workers. Also, this gender gap increases substantially for women of color. Differences in pay are also difficult to prove because of the differences in skill sets and employment histories between individuals. Women may also face a "glass ceiling" in their pay level. This occurs when a women finds she is no longer able to advance in her company while her male counterparts continue to advance. Many people debate the existence of glass ceilings. Benefits are another aspect of compensation in which gender discrimination is possible. Concerns about job security due to taking maternity leave, needing to take breaks to collect breast milk while at work, and needing health insurance coverage for medically prescribed birth control are common examples.

Promotions

Women can also feel the effect of the glass ceiling in terms of promotions within the company. Women with families may be looked over for promotions because the employer believes that she will not be as committed to the position as someone without a family. As with other forms of discrimination, proving that one was overlooked for a promotion based on her gender can be very difficult.

Firing

Most gender discrimination cases tend to be regarding wrongful termination. If a person believes that she or he has been discriminated against while employed at a company, being fired from her or his position causes her or him to no longer be fearful of losing her or his job; therefore, she or he feels free to seek legal recourse.

Legal Aspects of Sex Discrimination

Discrimination based on sex is illegal in most developed nations. In the United States, the federal law Title VII of the Civil Rights Act of 1964 protects individuals from discrimination based on sex. This law makes it illegal for an employer to discriminate against individuals because of their sex in hiring, firing, and other terms and conditions of employment, such as promotions and other job opportunities. Title VII covers all private employers, state and local governments, and educational institutions that employ 15 or more individuals. Most states also have their own sex discrimination laws in place.

Concerns regarding sex discrimination have resulted in other federal laws, including the Equal Pay Act (EPA) and the Pregnancy Discrimination Act (PDA). Under the EPA, employers are prohibited from paying unequal wages to men and women who perform jobs that require substantially equal skill, effort, and responsibility, and that are performed under similar working conditions within the same establishment. The PDA amended Title VII to clarify that discrimination based on pregnancy is a form of sex discrimination. Under the law, pregnancy is considered a temporary disability. Title VII prohibits employers from treating pregnant women different from other temporarily sick, injured, or disabled employees. The Equal Employment Opportunity Commission (EEOC) enforces the federal laws regarding equal opportunity. Federal law does not currently prohibit parental status discrimination, meaning that a parent can be denied employment opportunities based solely on her or his status as a parent. However, several states have laws making it illegal to discriminate on the basis of parental status and many companies have rules against such discrimination.

In many developing nations, employees have little or no legal recourse for sex or gender discrimination.

Gender Identity Discrimination

As discussed earlier, there are some people for whom their biological sex and their chosen gender identity do not match in a socially accepted manner. The term *transgender* is generally used to describe such a person. A person whose outward appearance and self-identified gender do not match is an example of a potentially transgender person, meaning that one may have the physical markers of a female but identify oneself as a male. Currently, gender identity is not an issue protected against discrimination in federal laws. Six states—California, Minnesota, Illinois, Maine, New Mexico, and Rhode Island—have established antidiscrimination laws that make it illegal to discriminate on the basis of gender. Many cities and counties across the United States have local ordinances that make gender identity discrimination illegal. Numerous large corporations have also instituted rules against gender identity discrimination, including American Airlines, Apple Computers, JP Morgan, and Xerox. The laws in this area are under constant change.

Genetic Engineering

Genetic engineering is a catchall term for the development of substantially novel living organisms and marks a breakthrough from selective breeding or conventional hybridization that has gone on without controversy for centuries. In its most common form, genetic engineering describes the direct transfer of genetic material across or within an organism's genome, which is then described as a "transgenic organism," "genetically engineered" (GE) organism, or a "genetically modified organism" (GMO). GMOs breed true, while hybrids do not; the entire germ line of the modified organisms are permanently reconfigured. Scientists and private industry embrace transgenic modification because this allows the more precise insertion of genes carrying desired traits into target organisms. Genetic engineering is used in a variety of contexts. It has been relatively uncontroversial in medical applications such as human insulin and far more controversial as an agricultural technology.

To date, commercially grown genetically engineered organisms in agriculture have been limited to a few major grain and legume crops that function as industrial inputs for the modern food system and less effort into the manipulation of animals. The first wave of crop biotechnology emphasized traits to increase the economic efficiencies of large-scale farming. The two most common traits engineered into seeds are naturally occurring insecticides and tolerance to herbicides. The second wave is poised to deliver traits desirable for consumers, such as nutritional or health benefits. The third wave will bring factories to the fields in the form of crops that produce pharmaceuticals or industrial chemicals. From one perspective, it is merely the technological improvement on conventional plant breeding. But from another vantage, it poses the threat of serious ecological and social disruption. Genetic engineering is a highly controversial practice among some producers and consumers in industrialized nations, more so in Europe and Japan than in the United States. Its proponents regard it as a panacea for the world's food and environmental problems. But its critics charge that it will maintain worrying trends in industrial agriculture.

Its Endless Promise

Before any controversy started, growers of our most basic crops—corn, soybeans, cotton, canola—adopted GMOs, and for good reasons. Monsanto's Roundup Ready soybeans, corn, and canola (rapeseed), for instance, are engineered to be tolerant to Roundup, the most popular broad-spectrum herbicide on the market. These crops are planted extensively, in blocks of thousands of acres, allowing growers to spray herbicides directly over the crop—without affecting it—to kill weeds. Roundup Ready seeds simplify weed control. However, the technology user fees that accompany the patented seeds incur additional expenses that must be weighed against purported benefits. The potential for increased herbicide usage or the evolution of herbicide resistance in weeds also figure into the logic of adoption.

Corn (maize) and cotton genetically engineered with *Bacillus thuringiensis* (Bt), a naturally occurring soil bacterium that is lethal to the larvae of lepidopteran insects (butterfly and moth family, some of the most common agricultural pests), have other advantages. Bt is not toxic to humans or other animals, with the exception of this specific order of insects. Private industry has engineered Bt into crops to reduce reliance on insecticides, and GE crop has this naturally occurring pesticide in every cell. In small, targeted amounts, Bt has proven relatively environmentally safe; it has been used by organic gardeners and farmers for years, as a natural alternative to petroleum-based, chlorine-laced pesticides. However, Bt breaks down in the sun's ultraviolet rays, and GE crops with the Bt trait have been shown to accumulate Bt in the soil beyond the sun's rays.

Across the globe, genetic engineering has been suggested as a plant breeding strategy to end one of the most severe forms of childhood malnutrition in Southeast Asia. A Swedish scientist, Ingo Potrykus, has developed a strain of rice that can produce provitamin A (from daffodils!) in the endosperm. The vitamin in the rice grain turns it yellow, so Potrykus dubbed it golden rice. It promises to end the eyesight failures and other effects of vitamin A deficiency among people who subsist mainly on rice.

In the developing world, genetic engineering may be able to help small farmers cultivate marginal lands, where water and nutrients are in short supply or conventional plant breeding techniques have proven ineffective. Perhaps scientists could engineer sweet potatoes for Africa that would resist the plague of witchweed that ruins harvest after harvest. In an era of global warming and climatic variability, conventional breeding may proceed too slowly to give us crops better adapted to heat and drought. Could we genetically engineer crops to grow in hotter and drier weather?

Meanwhile, a genetically engineered hormone, bovine somatotropin (BST), is able to increase milk production in cows; further experiments seem likely to develop a genetic modification to goats that will allow them to produce tough fibers in their milk; the research continues and is not limited to food. The future is exciting but filled with ethical dilemmas. Is it humane to genetically engineer animals with traits that affect their welfare?

Its Intractable Problems

Genetic engineering has its critics, and the points they make have to be taken seriously. In some cases, for instance, engineering only postpones problems, and biological rules will trip up this strategy. As soon as insect pests become resistant to Bt, just as they did to DDT, we will be back where we started, except that now the organic gardeners will not have any natural pesticide to fall back on. The chemical treadmill will give way to the genetic treadmill. Researchers point to preliminary evidence of the development of "superweeds" resistant to herbicides. After all, we have not trumped the laws of natural selection.

There are persistent questions about threats to human health in the consumption of GMOs, although no evidence of harm has been demonstrated. It is particularly difficult to apply the "precautionary principle," which suggests strict regulation of GMOs if there are doubts about their safety. Almost all GMOs end up as animal feed, textiles, or oils; and does the modification survive the conversion of grain into meat? The rest of it turns up unlabeled in processed food; after so much processing, is the "transgene" still present?

Beyond the possible danger to human health, there is the possibility that transgenic material may spread to native plants in the field margins. We occasionally forget that wild relatives and landraces, the origin plants of the crops we grow for food and trade, are essential reservoirs of genetic material to tap whenever new plagues or pests bedevil our crops.

Last, the possibility has been raised that GMOs may be harmful to nontarget species; it was plausibly argued, for instance, that Bt corn pollen are toxic to the larvae of monarch butterflies. A study at Cornell in 1999, currently discounted for absence of controls, demonstrated that corn with high levels of Bt expressed in the pollen was toxic to monarch larvae.

The environmental and health risks of GMOs, while widely circulated, are largely speculative. More clear and immediate are the problems of economic justice. At the global scale, agricultural germplasm had been viewed as the common heritage of humankind until just a few decades ago, but the biotechnology revolution and economic globalization are accelerating a trend away from traditional common property regimes. The development of GMOs has revolutionized the seed industry, transforming it from a series of regional commercial enterprises into highly concentrated transnational corporations, eager to sell seeds as the foundation for an integrated agrotechnological package of herbicides and seeds.

Most companies manufacturing GMOs claim to regulators that their product has "substantial equivalence" with natural seeds, but claim to patent courts that they are novel inventions among competitors. Critics insist that society's best interest cannot be pursued when private corporations control the research trajectory. The economic concentration of something so fundamental to life as seeds raises profound ethical questions of access and justice.

Widespread cultivation of GMOs bears heavily on the small farmer and especially on the poor farmer, especially in the less developed world. Many of them are the poorest people on the planet. The problem is economic scale; given the large expense of the seed, all of which is covered by the Europe- and U.S.-oriented patent regime under our current conventions on Intellectual Property Rights, only very large, and very well-capitalized, farms can use GMOs and make a profit.

In Europe, where small farms have more state support, GMOs are not widely accepted. A February 2006 ruling from the WTO found that their precautionary moratorium on the cultivation of GMOs was not based on "sound science." It remains to be seen whether this will change the amount of GMOs brought to Europe; the EU has strict labeling requirements and major European food retailers refuse to purchase GMOs.

Small farmers generally want nothing to do with GMOs because they will be put out of business by the large farms required to grow them profitably. In their resistance, they are supported by Greenpeace, the environmental nongovernmental organization (NGO), because of worries about the potential environmental effects of GMOs; European governments back up Greenpeace because they need the votes of the farmers and are tangling with a powerful environmental political presence; moral authorities weigh in on the side of maintaining the integrity of creation; and only on this point do the agendas of those diverse parties converge. Experience suggests that a more diplomatic approach on the part of the industry will be required to obtain widespread acceptance of this new technology.

Some farmers in the developing world perceive corporations from the advanced industrial organizations to be exploiting their genetic resources. In India, for example, farmers have stormed and burned facilities owned by the Monsanto Corporation. Disagreements about GMOs among member countries of the World Trade Organization, especially between the United States and small, developing countries, have contributed to blocking progress in trading regimes. Widespread use of GMOs across the world could have dire consequences for small farmers. To the extent that the cultures of many countries are built on the small farm, GMOs might cause irreparable cultural damage. To the transnational corporations that manufacture GMOs, however, these seeds merely represent scientific and economic progress.

The State of the Conflict

The future status of GMOs is uncertain and ambiguous. Investors have grown uneasy about the amount of time their capital is tied up in the development of these technologies, and they are queasy about public resistance. Despite their volatility, nonagricultural biotechnology investments have outperformed GMO-oriented companies. Original patent laws were expanded by the U.S. Supreme court to include life forms in 1980, which was a key development making the GMO economically practical. But the application of patent law to these cases must leave some people feeling somewhat odd, posing questions such as the following: Does God have some right to be concerned about these new life forms, born of the laboratory, possibly creating havoc? Few people realize that it is now legal to patent living organisms. Why was there no genuine debate about this? Religious leaders, including John Paul II, have speculated that genetic engineering may be "playing God," claiming the right, with God, to create life, insufferably arrogant and inherently wrong. Even if they were to make definitive pronouncements that this were so, civil authorities would not be likely to ban the technology itself. Because they raise genuine political, economic, environmental, ethical, and scientific questions, GMOs are likely to remain controversial, at least in some sectors of the globe.

Genetic Information in the Workplace

Although genomic information is not yet widely applied in the business world, rapidly growing knowledge about the workings of our genes has the potential to give businesses fuller information about the future, as well as the current, health of the individuals with whom they deal. People's genetic condition—acquired either through inheritance or mutation—affects whether they are disposed to manifest symptoms of various kinds of illnesses. Genomics already has shown that humans are less able to control what illnesses they will suffer from than advocates of healthy lifestyles and preventative care may hope.

Genetic testing could help make what is not controllable at least more predictable for businesses. For example, information from genetic testing could enable businesses to reduce risks arising from people susceptible to certain adverse health conditions being included in their employee or customer pools. Genetic testing, therefore, could offer useful information to businesses that are affected by the health of individuals with which they deal, and genetic testing may become more common as more, and more economical, tests become available.

Ethical Issues

That such information could be used to advance organizational interests at the expense of individuals raises several crucial ethical issues, however. For example, businesses could use people's genetic information to separate individuals who carry risks of ill health from employment or to defend against victims' claims for compensation by claiming that the harm is traceable to their genes. Conversely, individuals could use knowledge of their own genetic inheritance to gain advantage over an organization, for instance, by not revealing having inherited an allele associated with the early onset of a degenerative disease to an organization that relies on the individual's remaining well. These and similar possible uses raise concrete ethical questions are about who owns such genetic information and in what circumstances it may or must be revealed, or instead must be considered confidential. Prior to these, however, there are theoretical ethical questions centering on the degree to which individuals should bear social accountability for biological outcomes they cannot control, such as health risks resulting from their having certain configurations of genes.

We cannot be fully free to take advantage of one another's bad luck. For if we were, fear of falling prey to other people when luck deserts us could deter us from productive engagement with one another. So protective constraints that regulate our interactions with one another are basic to cultivating the cooperative climate on which commerce depends. Whether such protections should extend to protecting people against the medical and social consequences of inherited bad health is a matter of conscience as well as of moral, legal, and political debate. The proposition that risk should be distributed beyond the individuals whose health is made problematic by their genetic inheritance raises related questions. Should government, employers, health care providers, or others share the risks and accept the costs?

Reducing Health-Related Business Risks

In principle, relating to individuals—whether as customers or employees—carries risks as well as benefits for businesses. Ideally, risks can be revealed, assessed, and thereby reduced. But it has been hard to know in practice what the future holds in store for particular individuals. In practice, businesses with an interest in the future good health of employees or customers have adopted two approaches to reduce their risks.

Sometimes businesses preclude involvement with individuals whose health is already compromised or who have a biological condition that increases the likelihood of their being so in future. To illustrate, employers sometimes make preemployment medical examinations a condition for being hired. The Americans with Disabilities Act (ADA) permits job-related preemployment medical examinations after an offer of employment has been made. In *Chevron USA, Inc, v. Echazabal*, the U.S. Supreme Court held that a business could withdraw an employment offer if a risk of serious illness was found, even if the individual might never become symptomatic, as long as the business would encounter hardship should the person become ill. In a similarly risk-aversive practice, health care insurers often will not cover individuals who manifest or disclose conditions that might dispose them to or are associated with illnesses.

Businesses also sometimes promote protective practice to preserve the health of individuals with whom they are involved. To illustrate, employers can require abstention from smoking as a condition of employees being retained, and health care insurers can require their service providers to encourage patients' participation in preventative care. In sum, businesses have relied most heavily on retrospective and preventative measures to reduce risks occasioned by employees or customers with poor health.

Risk Management Through Genetic Testing

Genetic testing promises to improve on both these risk-reducing strategies. The application of genetic testing in business could shift the emphasis in risk reduction to a prediction-based mode. Tests that examine genes for mutations, analyze gene products, or identify the structure of chromosomes are commonly viewed as genetic tests. There are now approximately 1,000 genetic tests. These detect many but by no means all the genetic variances that dispose people to single gene, multigene, and mutifactorial illnesses. Undoubtedly, more genetic tests will be available in the future. Subjects are usually tested directly, but tests of a subject's family members that are positive for variations or markers associated with genetic anomalies may also indicate the subject's disposition to manifest an inherited disease. Of course, the predictive value of information gained from genetic testing is affected by variances in gene expression, false positives and negatives, and by genetic recombination causing the genetic marker or markers to separate from the disease genes.

Applications of genetic testing might effect enormous risk reductions for businesses that are disadvantaged by involvement with individuals of compromised health. Conversely, some businesses, among which insurers come prominently to mind, could experience increased risk if prospective customers could weigh information about their own genetic makeup in making decisions, when that same information that is denied to the businesses with which they deal. Insurers fear the prospect of "adverse selection," where people who know their inherited risk characteristics to be great purchase insurance but where the premium charged is based on underwriting that is denied information about these characteristics, while people who know their risk characteristics to be low do not contribute premiums to the insurance pool at all. Of course, this scenario is plausible only if predictive genetic testing is sufficiently comprehensive and clear to reliably determine those who will be unusually unhealthy from those for whom insurance is unnecessary.

Presymptomatic genetic testing discovers genetic conditions that are associated with a higher than usual disposition to future illness. As is the case in families with Huntington's disease, a negative result may provide reassurance. Where prophylactic measures to delay or prevent the onset of dysfunction are available, a positive test result can lead to precautions or to treatment that staves off the symptoms of disease. Individuals identified as genetically susceptible to berylliosis can be kept from work sites where beryllium is machined, individuals identified as susceptible to early onset breast cancer can be approved for more frequent monitoring, and individuals disposed to Wilson's disease can be treated to address copper buildup.

Carrier testing identifies individuals who do not have genetic impairments but whose offspring are at risk of inheriting such genetically associated diseases as cystic fibrosis, Tay-Sachs, and sickle cell from them. Carrier testing is usually used to enable informed family planning and to help prospective parents avoid, or at least prepare for, having children whose medical conditions could affect their parents' employment status or increase costs for their parents' health care provider.

Diagnostic genetic testing confirms a suspected diagnosis or else eliminates the possibility of a genetic condition as the cause of symptoms, thereby facilitating appropriate medical intervention and deterring incorrect or unnecessary treatment. Once identified as possessing one of the mutations associated with cystic fibrosis, for instance, patients receive the specialized antibiotic and pulmonary treatments that can preserve their functionality and prolong their lives.

Risk Management Through Personal Information

Even without genetic testing, some businesses have used predictive information to reduce risks. For example, some businesses have required applicants to divulge any family history of Huntington's disease. Huntington's disease is a degenerative neurological disease with symptoms that usually onset in early or late middle age. It is associated with the presence of a single allele and has the rare property of 100% penetrance. Penetrance is the proportion of individuals of a particular genotype that express its phenotypical effect. Individuals with the genetic configuration associated with Huntington's disease invariably develop the symptoms.

A person whose parent has manifested Huntington's symptoms has a 50% chance of developing the disease, and a person whose grandparent did so has a 25% chance. Such a family history has been enough to disqualify applicants in the United Kingdom from obtaining mortgages needed to purchase homes and to disqualify applicants in the United States from obtaining disability insurance (although in the latter case insurers sometimes simply have excluded work disability arising from Huntington's disease from coverage or else raised the price of insurance to reflect the applicant's odds of developing the disease). Now, however, a genetic test can reveal whether an individual has inherited the Huntington's allele and, therefore, can free those who have not from being penalized by suspicion. Nevertheless, very few disease-related alleles share the highly deterministic 100% penetrance of Huntington's disease.

Genetic Discrimination

Most disease-related alleles constitute a much less reliable basis for supposing that individuals who test positive for them will become symptomatic. The history of the association of the alleles BRCA1 and BRCA2 with the onset of breast cancer is illustrative. When the link between these mutations and the disease was first made, the rate of disease manifestation in women who tested positive was thought to be about 90%. In addition to the fear of developing cancer, women in this group also experienced threats of loss of employment and of health insurance.

The data available at that time were drawn from initial studies that had discovered that women with certain histories of cancer very often also had one or the other of these variants of the gene. Concerned about having to bear the costs of this illness, employers and insurers considered testing young women of the highest risk European heritages. In response, legislatures in states where ethnic groups with such medical history had political influence imposed bans on basing negative employment or insurance decisions on medical information about BRCA1 and BRCA2. Subsequently, studies of asymptomatic subjects with these genetic variations have shown the incidence of breast cancer to be less than 50%, although the risk is still higher for this group than for species typical cohorts.

Public Concerns

The story of legislation developed to protect individuals with certain kinds of genetic configurations is not unique to breast cancer. The earliest state prohibition against disadvantaging individuals because of an inheritable trait was Georgia's ban on the use of information about sickle trait for such purposes. Sickle trait is not deterministically predictive of severe symptoms. Some individuals who inherit the trait from both parents develop anemia, impaired immune systems, organ damage, stroke, vision problems, reproductive difficulties, episodic profound pain, and delayed growth, while others never experience more than mild symptoms or are virtually symptom free. Both physical and social environments appear to influence the severity of symptoms but the mechanisms that differentiate cases are not fully known.

In this case, as in the case of genetically heightened risk of breast cancer, concerns about the ethical and political propriety of disadvantaging individuals with a greater than species-typical disposition to illness are particularly acute. Breast cancer patients are usually women (although males with breast cancer are not unknown). Approximately 1 in every 500 African American babies is diagnosed with sickle cell anemia. Impelled by these groups' histories of unfairly truncated opportunity, current U.S. law requires at least heightened scrutiny of practices that subject these groups to special disadvantage. In a culture that has stigmatized these groups as being defective competitors and contributors, is it fair to penalize a subcategory of the group for biological anomalies even though most individuals in the category will never become symptomatic?

Business Applications of Genetic Testing

In general, businesses might apply genetic testing to screen out prospective or current employees whose genetic dispositions invite illnesses in themselves or in family members that could reduce the worker's productivity and/or increase the employer's health care insurance costs. Individuals believed likely to take sick leave, resign, or retire early for health reasons, file workers' compensation claims, or be eligible for expensive health care benefits could encounter special difficulty in finding or remaining at work. Such screening could have a disproportionate impact on members of historically stigmatized or disadvantaged groups.

Businesses might also screen out prospective employees with a higher than typical risk of being made ill by worksite conditions or deny compensation for work-related illnesses and injuries by proposing that the harm would not have occurred but for the worker's own anomalous genetic state. Insurance providers might screen out, curtail coverage, or charge higher rates to higher risk customers. And businesses might defend against charges of harmful negligence by arguing that damaged individuals were genetically more likely to be injured than the ordinary population reasonably is expected to be.

Informed Consent and Autonomy

To adopt such practices, businesses must have access to medical information about the individuals with whom they are involved. Two basic and closely related ethical values are relevant here. People own their own bodies, and they should be free to make autonomous decisions about what medical tests and treatment they receive. Businesses must obtain informed free consent if they want to do genetic testing.

To illustrate, in 2002 the Burlington Northern and Santa Fe Railway Company settled a complaint about genetic testing filed with the U.S. Equal Employment Opportunity Commission (EEOC) for more than $2 million with 36 employees who were required to provide blood samples after reporting work-related carpal tunnel injuries. Associating a genetic anomaly with carpal tunnel syndrome, the company proposed to defend against worker compensation claims by describing the injured workers as genetically disposed to injury from tasks harmless to other people. The EEOC intervened, citing the company's coercion of employees in obtaining the samples and its failure to disclose the intention to submit the samples to genetic testing without specific consent from the sample donors.

Legal Protection

The Americans with Disabilities Act

The Burlington Northern workers pursued their complaint under the Americans with Disabilities Act of 1990, claiming their employer mistakenly regarded them as having disabilities and on that basis subjected them to medical testing not imposed on other employees. In the context of this case, the EEOC made a general determination that entities that discriminate on the basis of genetic predisposition are regarding the individuals as having impairments, and such individuals are covered by the ADA. But unaffected carriers of recessive and X-linked disorders, and individuals with late-onset genetic disorders who may be identified through genetic testing or family history as being at high risk of developing the disease, would not be protected under this standard unless they are treated as already having disabilities. Furthermore, whether the EEOC determination in the Burlington Northern case extrapolates to other cases, or whether courts ultimately will find that the ADA protects against genetic discrimination in any sense at all, remains unclear.

Other Federal Protection

An executive order issued during the Clinton administration protects federal workers against coerced genetic testing, imposes strict privacy, and bans depriving federal employees of assignment or advancement opportunities because of a genetic predisposition for certain illnesses. The third main federal protection against genetic discrimination is found in the privacy and antidiscrimination provisions of the Health Insurance Portability and Accountability Act of 1996 (HIPPA), which limits exclusions for preexisting conditions and prohibits discrimination in covered plans against individuals based on health status, including their genetic information. While HIPPA extends coverage to people who have genes that predispose them to a disability or disease, or who have genes for a late onset disorder, it may not protect carriers of genetic disorders who do not yet manifest symptoms. More than 30 U.S. states have statutes pertaining to genetic discrimination, almost all states limit employer access to genetic information about employees, and most states have enacted higher standards of privacy for genetic than for other health-related information.

Acceptable and Problematic Uses of Genetic Information

Almost all statutes that regulate business uses of genetic information enable employers to access genetic information in the service of workplace safety. Indeed, employers may have a positive ethical obligation to do regular genetic testing for the purpose of monitoring the genetic normality of employees exposed to mutagens. Furthermore, employers have at least a moral duty to warn employees about environments that can injure genetically susceptible individuals, and their duty might extend to paying for employees' testing. Under the ADA, employers may deny work to at-risk individuals, because this law does not prohibit adverse employment action if a person's biological anomaly makes a work environment dangerous for that person.

Nor does the ADA prohibit banning anomalous persons if their presence in the workplace is dangerous to other people. The question becomes more difficult when the choice is between denying genetically anomalous individuals equal employment opportunity or eliminating the possibility of future harm that anomalous individuals might visit on others in case they become unable to execute a job's essential tasks. To illustrate, existing genetic tests can identify some individuals who are at risk of the early onset of Alzheimer's disease, but their predictive reliability is not established. Workers such as air traffic controllers, whose assignments demand accurate perceptual judgment, might endanger the public if they continued working after Alzheimer's symptoms set in. There is an ethical problem about what degree of threat would justify overriding autonomy and privacy to mandate nondispositive genetic testing for such workers.

Even if regulations sequestering genetic information are strengthened, complete privacy may prove impossible to guarantee. Clues to a person's genetic inheritance are to be found in family members' records as well as the person's own. And unless genetic testing becomes routine, the very fact of having been tested could stigmatize the patient.

If businesses subscribe to genetic discrimination, genetic test results could make some individuals uninsurable or unemployable, regardless of whether they ever manifest symptoms of inherited disease. Fear that genetic information might be used against them could induce people to forego the health benefits that better understanding of their genetic dispositions can bring and consequently could reduce the pharmaceutical industry's potential for bringing about a healthier population. Widespread discrimination based on genetic information could lead to the formation of a genetic underclass in a society where hard work and talent are less deserving of opportunity than the random luck of inherited genes. Such eventualities are unlikely to serve either civic or commercial interests and so are problematic for a fair and productive society.

Genetics and Ethics

Genetics is the study of heredity. The basic unit of heredity is the *gene*, which passes traits from one generation to another. Genes are sequences of DNA (deoxyribonucleic acid) located in *chromosomes* (of which humans have 23 pairs). The total DNA in an organism is called the *genome.* The genes that are part of the genome make up the *genotype.* The expression of the genotype in the physical characteristics and functions of an organism is known as the *phenotype.*

A number of technologies have been developed in the course of genetics research. *Recombinant DNA technology* involves splicing a gene from one source into another. Using a genetically modified virus as a vector, which introduces a gene into a cell, often does this. This technology is used in agricultural technology involving genetic alternations in plants and animals, and in *gene therapy*, in which normal DNA replaces defective DNA to treat genetic diseases. Both nonhuman and human genetic technology have raised a host of ethical issues, including issues surrounding genetic modification of plants and animals, human genetic engineering and gene therapy, genetic testing, and cloning.

Genetically Modified Crops

There has been considerable controversy over the use in agriculture of crops whose genetic code has been modified. *Transgenic crops* are those developed when a gene from another species has been inserted into a plant such as corn or tobacco. The gene could come from another plant, an animal, or a bacterium. Plants resistant to drought and disease (such as plant viruses), plants with an ability to produce their own pesticides, and plants with a higher crop yield have been developed. Companies that make these products argue that they both increase crop yields and decrease crop loss from drought, disease, and insects. In a difficult agricultural market, genetically modified crops can help make farming more economically viable. But more important, higher crop yields can increase the world's food supply, especially in developing countries. Agribusiness companies also argue that genetic modification of crops is only an extension of what farmers have been doing with selective breeding for centuries and that such crops are as safe as their non-genetically engineered counterparts.

Opponents of genetically modified crops (which many label as *frankenfoods*) argue that agribusiness companies have put profit first, ignoring potential safety concerns. They argue against inserting of genes from different species into crops, claiming that this practice is not safe. If someone is allergic to particular plant products such as peanuts and peanut genes are inserted into another crop such as corn, then eating that corn might cause an allergic reaction. Another potential problem is that pest-resistant crops may lead to "super pests," which are pesticide resistant. In the case of disease-resistant crops, new varieties of viruses could develop, which are even more destructive of crops. A 1999 study of Bt corn (corn with a gene from a bacterium that causes the corn to produce an insecticide) involved monarch butterfly caterpillars eating milkweed leaves dusted with pollen from Bt corn. Half the caterpillars died. This fueled opponents of transgenic crops, who also pointed out that it may be difficult to localize such crops within a particular area—Bt corn pollen, for example, might spread to other corn. Proponents replied that most transgenic corn did not use the gene correlated with caterpillar deaths. Opponents said that more testing should be done before transgenic crops are placed on the market, since we do not know all the effects genetic modification may have on the plant—there may be health hazards (such as carcinogens) created, which may not be detected for a long time. Pressure was also put on the Food and Drug Administration to require labeling of genetically modified foods.

Another concern is the potential loss of biodiversity due to the increasing cultivation of monoculture crops (in which only one variety of a crop, for example, corn or wheat, is grown on a farm). There is concern that growing only one variety of crop will deplete the soil of key nutrients as well as reduce the diversity of plants needed for a healthy environment. These critics argue that traditional methods of farming in developing nations, in which several varieties of crop are grown, preserve such biodiversity. In addition, if only one genetically engineered variety of a particular crop, such as corn, is grown, it will not have the necessary genetic diversity to respond to any new environmental challenges. Opponents also claim that biotechnology firms have pressured governments and farmers to become dependent on genetically modified crops, which have not only harmed the environment, but have hurt farmers economically because of their dependence on one cash crop. Biotechnology firms reply that their crops help reduce starvation in developing nations due to high yields and fewer problems with pests.

Genetically Modified Animals

Animals used in agriculture may have their genetic code modified to make them more disease resistant or to make the meat more tender or favorable. Similar issues arise as those stemming from the discussion of genetically modified crops. Transgenic animals have also been used in medical research, particularly in transplantation research. Human genes have been inserted into pigs; the hope is that this will allow pig organs, which are similar in size to human organs, to be transplanted into human beings without being destroyed by hyperrejection. The hope is that the extent of the organ recipient's rejection reaction will not go beyond the reaction of patients receiving human organs. The advantage is that pigs are plentiful, and if pig organs could be transplanted into humans, the shortage of human organs could be wiped out.

Most opponents of pig to human transplantation are not as concerned with human genes being injected into pigs as the danger of potentially dangerous pig viruses being transferred to recipients of pig organs. The concern is that viruses that have little effect on pigs could cause sickness or death in human beings. Although defenders of research on pig organ transplantation say the risk is minimal, concerns about viral transmission have slowed research in the field. Another concern of opponents is that of proponents of animal rights, who believe that killing pigs for organs is unwarranted exploitation and unjustified killing of a sentient creature.

Human Genetic Engineering

The same techniques used to modify the genetic code of organisms from bacteria to dogs can also be used on human beings. Recombinant DNA technology can be used to transfer DNA into human genes. The DNA could come from another human being or from a member of another species. In gene therapy, a normal gene is injected into a cell, and if all goes well and it expresses itself by making a protein, a genetic disease could be permanently corrected. If gene therapy is focused on the individual person's organs and tissues to correct a genetic disease for that individual alone, this is *somatic gene therapy.* If the target is one of the germ cells (egg or sperm) so that the results of gene therapy are passed on to the offspring of the affected person, this is *germ line gene therapy.* Both forms of gene therapy raise moral issues.

Ethical Problems in Somatic Gene Therapy

Somatic gene therapy, if successful, could cure an individual of a genetic disease such as cystic fibrosis. Although this is a worthy goal, there are problems with somatic gene therapy. There are technical problems with accurately inserting a gene into the right location. With today's technology, the final location to which the gene attaches cannot be precisely pinpointed. Not only is there a risk that such inaccuracy will not eliminate the disease, with interaction between genes important to the expression of phenotype, there could be unintended negative effects on the body. This raises the issue of whether human subjects research with gene therapy is safe enough to move forward at this time. The 1999 death of an 18-year-old patient in a gene therapy trial has exacerbated such concerns. Critics of research in gene therapy believe that it should be banned until technical and safety problems have been resolved. Such a ban has been in place since January 2003 in the United States due to Food and Drug Administration concerns about patient complication in a French gene therapy project. When such research is approved, subjects should be informed of the risks in order to give adequate informed consent.

Another concern is the safety of the vector (usually a virus) used to introduce the gene into the cell. Has the virus been sufficiently deactivated so that there is virtually no risk of disease? The subject could also have an allergic reaction to the vector.

There are also business ethics issues, one of which is related to the fact that most gene therapy research focuses on treating malignant diseases (cancers) rather than single-gene disorders. This is due to the larger market of cancer patients, and a larger market means a larger profit. But, some argue, gene therapy would be most effective in treating monogenetic disorders such as Huntington's disease, which results in its victims suffering irreversible progressive brain damage, usually beginning in their 30s or 40s. The issue is one of whether it is fair that the large market diseases are the focus of almost all gene therapy.

Germ Line Gene Therapy: Additional Ethical Issues

In addition to the previous concerns, germ line therapy muddies the moral waters with concerns about genetic changes that are passed on to an individual's offspring. The advantage is that it may be possible to totally eliminate a genetic disease (cystic fibrosis, Huntington's disease) from the human germ line. Some writers have also argued that human capacities might be improved and these improvements passed on through the germ line.

On the other side of the issue, given present technological limitations on the accuracy of gene targets, there is considerable risk that negative traits could result that will be passed on to offspring. Since phenotypic traits are due more to the interaction of genes than one specific gene, concerns have been expressed about how the inserted gene will interact with other genes and which phenotypic traits would result. Critics of germ line therapy also note that the same gene that causes sickle-cell anemia also causes the body to protect itself against malaria. If that gene is wiped out of the human genome, and a major malaria outbreak occurs, will people regret that a protective trait has disappeared for good?

Genetic Testing

Sophisticated tests are being developed that reveal with high accuracy whether a person has a genetic disease or whether a person has a greater risk for cancer or heart disease. With the success of the Human Genome Project in mapping the genes in the human body, more tests for more conditions will be developed. Some tests may be given to embryos used in in vitro fertilization before they are implanted; others may test the fetus in the womb. If a test for, say, cystic fibrosis were positive, a prospective parent might decide to abort the fetus. If a preimplantation embryo were to test positive, it might be discarded. At this point, the debate over abortion intersects genetic testing. Those who believe that the embryo or fetus is a human person oppose abortion and the destruction of the embryo, even if it has a genetic disease. Those who deny such personhood may believe that the embryo and fetus deserve some respect but not to the point that these entities have the moral right not to be killed. They also argue on utilitarian grounds that a parent should not be required to bring a child into the world that will suffer greatly and create a significant burden for the parents. Defenders of the rights of people with disabilities, who may not oppose abortion, in general, have argued that abortion of those with genetic diseases contributes to negative attitudes toward the sick and individuals with disabilities in society.

Issues also arise concerning genetic profiling. If an employer knows an individual's genetic profile showing either that the person has a genetic disease (such as Huntington's disease) or a high probability of heart disease, then the employer may either refuse to hire the individual or, if the individual is already an employee, lay the person off. Insurance companies may also deny an individual coverage based on the person's genetic profile. Opponents of such profiling by employers and insurance companies consider it to be discrimination. Laws have been passed in several states protecting the privacy of genetic information, though critics say that an employer or insurance company can find loopholes in the laws. On the other side, insurance companies, in particular, have argued that the increased risk of disease of those with high-risk profiles justifies their denying or charging more for insuring them.

Cloning

A *clone* is a cell or an organism genetically identical to another organism; examples include two bacteria that result from the division of one bacterium and human identical twins. Artificial cloning involves a variety of methods, many of which involve cloning embryos or cells derived from embryos. But the most famous clone, "Dolly the sheep," was created in 1996 using a mammary gland cell from an adult sheep. The genetic material was removed from an egg cell, the material from the mammary gland cell inserted. This material was then reprogrammed to divide and form an embryo, which was inserted into the mother. Dolly was the first mammal cloned from an adult somatic (bodily) cell.

Artificial cloning could be used in agriculture, for example, to clone high-yield milk-producing dairy cows. Proponents of such cloning argue that cloning superior animals can increase agricultural production; opponents argue that reducing the diversity of the gene pool may result in animals more vulnerable to disease. Cats have also been cloned, and pet cloning may become an industry in itself.

It is human cloning that fuels the most intense debate. Although there is little opposition to cloning individual human cells, tissues, or organs, cloning the human being as a whole is much more controversial. Human embryos have been cloned to harvest embryonic stem cells (cells that can divide to form any type of bodily cell), and in theory a cloned embryo could be implanted in a mother who gives birth to a clone. Cloning to harvest embryonic stem cells is controversial because the embryo is destroyed in the process, and those who believe the embryo is a person believe that such destruction is unjustified killing. Proponents deny that the embryo is a person.

Advocates of cloning to produce a complete human being have claimed a variety of reasons a person would want someone cloned. These include parents cloning a dead child or infertile couples cloning a child genetically related to one of the parents. Defenders of cloning for such reasons often appeal to personal autonomy and reproductive rights. They argue that these rights should be respected, even in a case in which a parent wishes to clone a dead child, not realizing that the child born would be a younger identical twin of the dead child, with its own individual personality. Opponents argue against cloning for a number of reasons. First, they argue that human cloning amounts to unauthorized experimentation on human subjects who cannot give permission for research. In addition, they point out safety concerns; more than 90% of cloning attempts fail, and cloned animals often have severe deformities such as organs too large for their bodies. Human clones may suffer similar deformities. Other criticisms include a concern about cloning involving humans becoming manufactured objects, leading to the devaluation of human reproduction and human life. Controversy over cloning has led to attempts to ban human cloning in the United States and elsewhere. But proponents of cloning argue that opponents do not distinguish mainstream cloning research, involving cloning human tissues, organs, and embryos for uses such as harvesting stem cells, and extreme research involving the implantation of a human embryo into a woman so that she could give birth to a clone.

George, Henry (1839–1897)

At one time, the third most famous American (after Thomas Edison and Mark Twain), George was an influential practical philosopher, social critic, and reform proponent of the "single tax" during the progressive error. Despite George's limited education, he was praised for his logic and originality by many prominent intellectuals ranging from Leo Tolstoy to John Dewey.

In his book *Progress and Poverty* (first published in 1879), George asserted that the ownership of property created poverty by only enriching the owner at the expense of the community. In essence, George believed that land and its wealth belong to all. In this he was akin to the 18th-century physiocrats and their *impôt unique*, as well as philosophers such as James Mill, John Stuart Mill, and David Ricardo.

As a political economist, George argued that "economic rent" on land going to its owners served to create resource inequity (through commerce on urban properties, through agriculture on farm lands, and the value of natural materials extracted from mineral leases, minus the cost of property improvements that increase land's value).

To rectify misdistribution, George said that governments at every level should abolish all taxes except those on beneficiaries of economic rent. Because land is a fixed resource, the income it yields is a product of the economy's growth and not individual effort. The remedy was to impose a "single tax" on the unimproved value of that land if it remained in its natural state without buildings or other improvements. George believed that the government's annual income from this single tax would be fair and prove so significant that resulting surpluses could underwrite necessary beneficial public works. On the other hand, opponents have argued that there is no correlation between land ownership and total income or wealth. Furthermore, they protest that the lack of graduation under a single tax system fails to take into account an individual's ability to pay.

George's first book sold in the millions and appeared overseas in numerous translations. In 1880, he moved to New York to continue writing and lecturing. His popularity grew and this encouraged George to try to put his ideas into practice. He challenged the "politics as usual" system in a reform platform campaign for mayor of New York in 1886. Although George outpolled Theodore Roosevelt in a three-person race, he narrowly lost to the Tammany Hall–endorsed Democrat. Later, he again campaigned for the office, but died before the election.

Ethics form a central focus of *Progress and Poverty* and George's subsequent books, especially on the dominant question of right and wrong. For George, each person's labor belongs to himself or herself and should be free of arbitrary government taking. George, thus, sees a natural right or justification for private property in products created by one's own hands. On the other hand, land is not produced by man and is to be held in common. The value of land exists only as the community exists. It grows as the community expands and decreases as the population declines. Thus, unfettered private property in land, according to George, is unjust because it allows landowners to erect a toll for its use (a form of robbery) or even refuse all access to property (thereby injuring one's livelihood and threatening life itself).

The single tax plan actually gained considerable support in subsequent decades but was never fully implemented. Nevertheless, a number of single tax mayors and legislators have been elected to office, and the continuing interest in his ideas has influenced tax legislation in some U.S. states, as well as across the globe in western Canada, Australia, Britain, and Western Europe. Interestingly, the origin of the popular board game "Monopoly" has been traced to Henry George's followers by the Public Television program *History Detectives.*

Even today, for George's adherents the single tax is not merely a proposed fiscal reform. Rather, they argue that it remains a basic necessity if human progress is to occur, because without fundamental realignment in wealth and ownership no other meaningful social restructuring will prove lasting.

Glass Ceiling

The term *glass ceiling* was first used by Carol Hymowitz and Timothy Schellhardt in their 1986 *Wall Street Journal* article to describe the invisible barriers that keep women from upper management positions in American corporations. It has also been used to refer to the exclusion of racial and ethnic minorities from upper management, both women and men. The glass ceiling phenomenon was studied extensively during the 1990s and, although Carly Fiorina denied its existence when she was appointed CEO of Hewlett Packard in 1999, there is evidence that it still exists. There are currently many more women in upper management and executive positions, but parity has certainly not been reached, particularly in the highest positions.

Exclusion of women and racial and ethnic minorities from the possibility of promotion to senior management positions in business has a long history. In the United States, the problem of entry-level positions was aided by the passage of the Civil Rights Act of 1964, Title VIII, and later, the Equal Opportunity Act of 1972. In 1968, women were not even accepted in management training programs, thus preventing them from beginning their climb up the corporate ladder. During the 1980s, women began to obtain college degrees in business administration and continue on for their MBAs. By 1990, however, there were still only three women CEOs in Fortune 1000 companies: Katherine Graham, Linda Wachner, and Marion Sandler. That year, 97% of all senior managers were male, although progressively more women and minorities filled entry level and middle management positions.

In 1991, President George H. W. Bush appointed the Glass Ceiling Commission to study and prepare recommendations for eliminating the glass ceiling. The 21-member commission was chaired by Robert Reich, the secretary of labor, and consisted of 16 women, 3 of whom were senators, and 5 men. Many members were minorities. The commission defined the glass ceiling as the unseen, yet unbreachable, barrier that keeps minorities from rising to the upper rungs of the corporate ladder, regardless of their qualifications or achievement. They issued two reports in 1995: *Good for Business: Making Full Use of the Nation's Capital: The Environmental Scan: A Fact-Finding Report of the Federal Class Ceiling Commission* and *A Solid Investment: Making Full Use of the Nation's Capital: Recommendations of the Federal Glass Ceiling Commission.* After soliciting research from a number of organizations, their findings showed that the glass ceiling did indeed exist and that it excluded women and minorities from leadership positions. The commission was also convinced that this exclusion was not good for business and that there was a need to address the issues.

The findings reported three sets of barriers to true parity. Societal barriers were caused by stereotypes and prejudice, while structural barriers were perceived as the corporations' failure to recruit women and minorities and a hostile corporate culture. Governmental barriers included inadequate monitoring of cases as well as inadequate law enforcement. Various explanations have been forwarded for the existence of the glass ceiling. Corporations have traditionally blamed a woman's lack of experience, low motivation to succeed, having not enough or the wrong kind of education, and a lack of training. They also suggest that a woman has less interest in promotion due to a focus on family and household responsibilities. Other explanations focus on built-in organizational structure: bias in selection and promotion decisions, gender-typed jobs leading to lower expectations of the employee, a lack of developmental opportunities, few available mentors, problems with work-life balance, and lower compensation for the same job a male is performing.

The second report, *A Solid Investment*, detailed recommendations for alleviating the problem, one set aimed at corporations and another set for the government. Corporations were urged to demonstrate visible commitment to diversity from the board of directors and the CEO down through all management levels. It was also suggested that diversity be included in the strategic plan, that line managers be held accountable for diversity initiatives, and that affirmative action be used as a tool to ensure equal access and opportunity to compete. Imagination was suggested in the recruitment process through seeking out candidates from unusual backgrounds and experiences. And, once hired, minorities and women needed to have access to developmental experiences, mentoring, and career guidance in preparation for senior positions. Changing the corporate culture was addressed through sensitivity training and workplace practices emphasizing participation and partnership. The commission also suggested work/life and family friendly benefits and practices. The federal government was urged to lead by example and increase all efforts to erase the glass ceiling. Other recommendations focused on strengthening enforcement of and updating antidiscrimination laws, improving the complaint process, and deepening data collection.

By 2005, 10 years after the publication of the Glass Ceiling Commission reports, progress remains very slow. Catalyst, a consulting organization that takes a biennial census of women CEOs, suggested that it would take 40 years at the present rate to achieve parity with men in senior leadership positions in large corporations in the United States. In their 2005 census, findings showed that, while both men and women aspire to top positions and use the same strategies for business success, the numbers did not reflect equality of position. Only 16.4% of the corporate officers in Fortune 500 companies were women and 1.7% were women of color. Only 6.4% of the top earner positions were held by women, and more than half of the Fortune companies had fewer than three female corporate officers. In 2006, with the appointment of Indra Nooyi as the CEO of Pepsico, there were 11 women leading Fortune companies.

The glass ceiling is not unique to the United States. While there are a few women leading corporations in other countries, they stand out because there are so few. Despite all the research and recommendations, and all the women and minorities in middle management, progress has been very slow and it will take many years to attain true equality in promotional decisions between men and women in management, particularly at the senior management levels.

Global Business Citizenship

Global business citizenship (GBC) is an emerging theoretical framework that extends the concept of corporate social responsibility into a globalized environment. It is an alternative to prevailing frameworks in finance and economics in that it accepts the validity of stakeholder claims on firms. The GBC framework offers a process that multinational managers can use to consistently implement social responsibility and ethics within and across nations and cultures.

Concept History

The GBC framework was developed to address several problems with predecessor concepts and to offer an alternative to views of the firm as merely a nexus of contracts or a tool of capital owners' interests. GBC's principal conceptual ancestor is corporate social responsibility (CSR), the obligation of corporations to use their power wisely and to respond to societal needs. Developed in the United States from the 1960s onward, CSR was built on an assumed moral base that was never adequately articulated. The dimensions and processes of CSR were never well-defined, so businesses had little guidance in identifying or exercising social responsibilities. Furthermore, CSR was typically defined in terms of a business's responsiveness to social demands, or responsibility to particular societies, with little attention paid to a company's own core values or to real cultural differences in ethics.

GBC is also a conceptual replacement for corporate citizenship (CC). Although some scholars have attempted to define corporate citizenship as a broad-based enactment of a business organization's social and ethical obligations, the term is much more commonly used to narrowly indicate firms' voluntary participation in philanthropy and community affairs.

GBC does not view the firm as consisting solely of contracts or as a single-purpose tool for shareholder value. The GBC concept is counterposed to these perspectives in several ways: (1) GBC accepts the view from traditional organization theory that firms are entities, not fictions; (2) GBC recognizes a broad range of relationships, rights, and duties between a firm and its stakeholders; and (3) GBC requires an explicit, principled, comprehensive moral foundation for firm policies and practices.

Businesses as Citizens

Citizenship ordinarily defines the relationship of persons and political units. Citizenship typically involves certain protections based on rights guaranteed by the polity's legal infrastructure, often including rights to liberty and rights to protection and welfare. Citizens may also have duties; Aristotle's observation that citizens participate in taxation, governance, and defense is still largely true in modern democracies.

On three counts, nation-state citizenship for persons does not provide an adequate metaphor for companies: Can businesses be citizens in the same way that persons are? If so, what is the polity of which businesses are "global" citizens? Finally, what kinds of citizens can businesses be? GBC, thus, requires attention to and expansion of the citizenship metaphor.

First, there is considerable debate over the question of whether organizations can be citizens as humans are. The issues concern who should have what rights and duties, how organizations should participate in government, and whether businesses should be thought of as citizens in any manner, given the presumed special moral standing of human beings and the overwhelming power and influence of large organizations. The GBC framework does not assume that businesses are equal to humans in moral status or that businesses should be accorded equivalent rights. Instead, businesses are thought of as secondary citizens—a convenient status for accomplishing certain human goals.

Second, in the absence of world government, to what polity do firms owe allegiance as citizens? Globalization has made nation-states increasingly irrelevant to economic activity, so older notions of firm allegiance to the "home" country no longer offer a basis for a business citizenship metaphor. To answer the question, the GBC framework relies on the idea of universal citizenship, as in the works of Rousseau and other "natural law" thinkers. To be a "citizen of the world" means to hold allegiance to the human race rather than to any particular subgroup. "Global citizen" reflects a perspective, not a legal status.

With respect to the third question, political theory—a branch of philosophy that attempts in part to answer the question, "How can we live well together?"—can be used to categorize the ways in which businesses can be citizens.

Minimalist theories, such as libertarianism, public choice theory, and agency theory, view the firm as a nexus of contracts with no independent substance and no loyalties other than those specified in its contracts. In this view, the firm can be a citizen only in the minimal sense of being law-abiding; it has no justification for considering the common good or the interests of noncontract holders, and its executives are not likely to see it as a citizen. Minimalist firms may indeed behave ethically within and beyond the demands of law, but their guiding perspective does not require that they do so.

Communitarian theories, with a focus on boundary maintenance and group identity, view the firm as an important player in the local environment, and so the firm can be a "corporate citizen" in the usual sense of a business that voluntarily "gives back" to local communities. Communitarian firms are likely to abide by the ethical principles governing their communities of allegiance, and they may or may not apply those principles when dealing with "outsiders."

Universalist theories, whether deontological or teleological, emphasize the rational consideration of others' interests as well as the interests of the whole, in addition to self-interest. In these views, firms accept responsibilities to a broader range of stakeholders as well as a general responsibility to act in ways that are consistent with universal ethical principles and that advance, or at least do not harm, human well-being.

Only from the lens of universalist political theories can firms be viewed as global business citizens. This does not imply that other lenses produce unethical, irresponsible firms. A minimalist firm may be law-abiding and ethical, but its focus is on generating wealth for capital owners and it will not hold an image of itself as a citizen. A communitarian firm is likely to be law-abiding and ethical at home, but may not extend these behaviors elsewhere. A universalist firm will attempt to consistently and responsibly exercise its rights and implement its duties to individuals, stakeholders, and societies within and across national and cultural borders.

The Global Business Citizenship Framework

The GBC framework is developed by considering relationships between a company's choices of global *strategy* and the degree of *ethical certainty* with respect to particular issues and environments. The framework is shown in Table 1 and explained below.

Table 1 The Process of Implementing Global Business Citizenship: Ethical Certainty and Strategic Approaches

Degree of Ethical Certainty	*Multidomestic Strategy*	*Globally Integrated Strategy*
High certainty: Principles—a limited number of basic, universal ethical rules	(Ethical relativism)	Step 1: Code of conduct
Moderate certainty: Consistent norms—variations in practice consistent with principles	Step 2: Local implementation	(Ethical imperialism)
Low certainty: Incompatible norms—variations in practice inconsistent or in conflict with principles	Step 3: Problem analysis and experimentation	Step 4: Organizational and systemic learning

The Strategy Dimension

In international business, companies use a multidomestic strategy that tailors its operations to local conditions, or a globally integrated strategy that strives to achieve a unified approach across all units, or a hybrid model combining elements of the two.

The Ethical Certainty Dimension

The GBC framework acknowledges varying degrees of ethical certainty about what is right. A GBC firm has high certainty about its principles, such as, "It is wrong to harm innocent persons." However, there are situations where local custom demands variations in implementing principles without violating them. And there are situations where local norms are in conflict with principles, application of the principles will cause unintended negative consequences, or where local managers cannot tell whether local customs conform to or conflict with company norms. In such cases, the degree of ethical certainty is much lower.

GBC'S Hybrid Approach

Table 1 shows the nature of the hybrid approach that best allows companies to consistently and responsibly exercise rights and implement duties within and across national and cultural borders. Two cells are eliminated from the model and the remaining four cells form a process for implementing GBC.

The two eliminated cells are ethical relativism and ethical imperialism. First, a multidomestic strategic approach cannot be applied by GBC companies in situations of high ethical certainty, because once one accepts universal ethical principles, they must by definition be operative everywhere. Ethical relativism allows companies to violate those few big principles by which they aspire to operate. Second, ethical imperialism is also eliminated, because a globally integrated approach requires that identical practices occur everywhere a company does business. This can be dysfunctional because it fails to recognize and respect legitimate differences in practice that do not violate principles, and it, therefore, creates stresses and hostilities where none are necessary. The four remaining cells constitute rational steps in the hybrid process of implementing GBC.

Steps in the GBC Process

Step 1: Development of a Code of Conduct

To implement GBC, companies first accept a small, reasonably comprehensive set of ethical principles that are near-universal and easily justifiable. Principles of liberty and welfare contained in the Universal Declaration of Human Rights, or the 10 principles of the United Nations Global Compact, are examples. Principles serve as the basis for the company's code of conduct, developed from a comprehensive inventory of the company's exposures, liabilities, and stakeholder challenges.

Step 2: Local Implementation

Sometimes a company's code and policies can be implemented straightforwardly. Sometimes, however, modifications will be demanded to conform to local law or custom. An acceptance of *cultural* relativism does not necessarily imply acceptance of *ethical* relativism. Companies can often implement policies in culturally sensitive ways without violating basic principles. Doing so may involve a measure of stakeholder engagement and concentrated effort to listen and learn, but it need not involve conflict or compromises in basic values.

For example, child labor prohibition is a near-universal principle. But there are legitimately different ideas about what the age limits and constraints should be. UN guidelines say that children less than 14 years should not be employed full time. This can be construed as a minimum, with some nations having 16 years or older as the age of compulsory education. And, in some less developed cultures, a child of 12 years might legitimately be employed in a family enterprise as long as schooling continues and the child is not exploited.

Step 3: Problem Analysis and Experimentation

When the company is faced with high ethical uncertainty, managers at Step 3 of the GBC process respond with analysis and experimentation to situations in which their company's principles cannot readily be implemented, or are violated by, seem to conflict with, or do not cover observed local practices. Experimentation involves testing various ways of satisfying the demands of universal principles and the constraints of local cultures. Outcomes may range from discovering that there is no conflict after all to deciding that the company must exit the region because its principles cannot be applied.

Step 4: Organizational and Systemic Learning

In the final step in GBC implementation, the company engages in a continuous process of *systematic* learning from its experiences and making the results accessible to all company decision makers. In addition, the company engages in *systemic* learning. GBC is aimed at sustainable capitalism, not merely competitive advantage for particular firms; so GBC companies will share what they learn with other companies so that overall harms are lessened and benefits are enhanced for people, social institutions, and the earth itself. Systemic learning can happen through trade and industry associations, conferences, scholarly research and publications, and increasingly through the posting of data on the World Wide Web.

Examples

Companies that have adopted universal principles as their guiding values (Step 1) include export contractor W. E. Connor & Associates, in their role in supplier certification of child labor–free production, and computer giant Hewlett-Packard, which spearheaded industrywide supplier codes of conduct. Local implementation examples (Step 2) are plentiful on the UN Global Compact Web site (www.unglobalcompact.org). Experimentation (Step 3) can be seen in Bouygues Telecom's employee experiments to find the most satisfactory way to recycle office paper and in the partnering of gold mining company AngloGold Ashanti with several global nongovernmental organizations to address the HIV/AIDS crisis among its African workforce by delivering both basic health care and HIV/AIDS drugs to employees and their families. Organizational learning (Step 4) is illustrated by clothing retailer The Gap's response to stakeholder criticisms with an extensive regional reporting of sweatshop conditions in its supply chain and a process for follow-up and improvement. Systemic learning (also Step 4) is seen in Interface Inc.'s transparency about and advocacy of its ongoing efforts to create and market environmentally friendly carpets and to reduce the company's overall "environmental footprint" or impact.

Global Business Environments

Global business environments encompass internal and external stakeholders that affect the operations of multinational companies (hereafter referred to as "multinationals"). Multinationals are firms that make investments to produce and/or market products and services in foreign countries.

Several theorists such as Jagdish Bhagwati and Steven Hymer have identified the reasons for the rise of multinationals and the benefits and costs that they bring to global environments. Generally, the theories of multinationals have identified multinationals as possessing intangible assets, including brand names, investments in research and development, ability to engage in financial arbitrage, managerial expertise, and control over logistics and distribution channels; these intangible assets, theorists have argued, give multinationals advantages over local companies' knowledge of local markets and conditions. Theories of multinationals can focus on either internal or external stakeholders in the global environment. For example, theories dealing with market imperfections, internalization, and strategic management delineate the interests of internal stakeholders, specifically multinationals' owners and managers. A second set of theories dealing with manufacturing processes, oligopolistic markets, political economy, international relations, dependent development, and global networks specify multinationals' abilities to affect labor, governments, states, societies, and the world. As argued in *Multinational Corporations in Political Environments: Ethics, Values and Strategies*, the second set of theories has portrayed multinationals as catalysts or change agents: Theorists have assumed that because of their control over intangible assets, powerful multinationals bring about major changes, beneficial to some stakeholders but detrimental to others in global environments. In this entry, we do not deal with the net benefits or losses of globalization and global production, but rather review the effects that global production through multinationals have on various stakeholders in global environments.

Theoretical Rationales for Relations With Stakeholders

Owners and Managers

Economists beginning with Stephen Hymer have portrayed multinationals as arising from market imperfections that allow them to exploit their intangible assets and give them advantages, over local companies' knowledge of local markets. They have also argued that multinationals internalize markets—that is, they bring external markets for goods and services under internal control. These theorists have portrayed multinationals as entrepreneurial firms that strive to maximize profits and efficiencies and have granted owners' (stockholders' and investors') interests paramount importance. Many of the theories also deal with how managers recoup transaction benefits by common governance of separate but interrelated global activities—that is, the theories explain why managers control and coordinate operations. Many of the theorists have assumed that subsidiaries are miniature versions of headquarters. Consequently, subsidiaries' and headquarters' managers are portrayed as having similar interests and views.

Strategic-management theories have also focused on how headquarters' managers may control subsidiaries to maximize profits. When the theories have explained labor's or governments' behaviors, they have concentrated on the circumstances under which these stakeholders hinder or help managerial control. Many theories have focused on multinationals' needs to integrate subsidiaries' managers into global operations and the most efficient types of management controls. For example, Yves Doz and C. K. Prahalad concluded that various organizational mechanisms enhance the abilities of headquarters' managers to elicit valid, reliable information from subsidiaries' managers. These include data management mechanisms such as information systems, managerial mechanisms such as reward-and-punishment systems, and conflict-resolution mechanisms such as task forces and business teams.

Labor

Theories that analyze manufacturing processes have related multinationals' growth and expansion to technological developments in their home countries. The theorists have generally assumed that technological developments occur in developed countries with high labor costs, which encourage the multinationals to use laborsaving, capital-intensive technologies. When multinationals eventually move production to less developed states, the theorists have posited that they continue to use the same factor proportions in production—to the detriment of labor-rich, host states. For the most part, theorists have ignored the possibilities that by initiating labor-intensive innovations of their own, host states could make multinationals less competitive.

Raymond Vernon and other theorists extrapolated on how multinationals' manufacturing processes hurt domestic labor. As multinationals' technologies evolve, their operations may use foreign rather than domestic labor. Efficiency and profit considerations may prompt multinationals to export labor-intensive jobs from home to less developed states. In effect, multinationals may snatch jobs from home states' labor. Thus, theorists explained social phenomena, such as the antagonistic behaviors of home states' labor toward multinationals.

Governments

Multinationals often operate in oligipolistic markets, where a few companies control the bulk of the markets. Theorists concentrating on multinationals' strategies in oligopolistic markets have argued that they may prevent the growth of domestic firms. Their observations have implications for governmental roles in industries and the regulation of multinationals' activities.

In many of these models, multinationals adopt defensive strategies in response to their major competitors' price cuts and maneuvers. Edward Graham referred to the relations between these oligopolistic multinationals as exchange-of-threat motivations. Oligopoly theorists have often concluded that as multinationals increase their potential responses, they concurrently reduce domestic and global competition and stabilize markets. Oligopoly theories imply that multinationals' comparative advantages and global strategies often preclude domestic firms from competing successfully in the same markets. Their implied conclusion is that governments should intervene to maintain competitive markets, and to promote social welfare, by correcting the imbalances perpetuated by multinationals.

Early political economists used bilateral-monopoly models to analyze the relations between multinationals and governments: Multinationals control capital, technology, management, and marketing skills to launch economic projects; governments control access to states before multinationals invest, and control conditions for operation afterward. Multinationals and governments were generally represented as struggling over the distributions of benefits from economic projects. For example, Edith Penrose argued that at first, multinationals receive just enough benefits to induce them to commit investments; later, they receive just enough to prevent them from withdrawing.

Raymond Vernon introduced the dynamic concept of the obsolescing bargain to the static, bilateral-monopoly models. Risks and uncertainty formed central tenets of this concept. Before multinationals invest in foreign states, production costs and markets determine their perceptions of risks and uncertainties. To induce foreign investments, governments structure contracts to reward multinationals handsomely for successful projects, and initial contracts tilt heavily in favor of multinationals. However, if projects prove successful, risks and uncertainties dissipate. Hostage effects also take place, because multinationals cannot credibly threaten to exit once they have invested heavily in states. Besides host states may move up learning curves of bargaining and managerial skills, drive harder bargains with multinationals, and threaten to replace them if they fail to renegotiate contracts. Whatever the causes, the obsolescing bargain predicts that initial agreements favoring multinationals are likely to be renegotiated in favor of host governments.

Political-economy theories have generally depicted subsidiaries' behaviors as strategies to exploit intangible assets and to extend parent firms' abilities to extract oligopoly rents. For the most part, the theories have concentrated on just a few ways in which governments influence multinationals: by creating or heightening market imperfections through tariffs and trade barriers, restricting financial and factor markets, restricting know-how, containing sellers' markets, and widening international tax differentials.

Generally, the theories have focused on how multinationals influence governments. Theorists have argued that multinationals cause efficiency and equity effects in states. Efficiency effects deal with multinationals' abilities to increase states' outputs: As multinationals move resources such as capital from places where returns are low to places where returns are high, they bid up the prices of abundant resources, such as labor, in host countries. By their more efficient uses of global resources, multinationals may increase global outputs. By increasing market competition, multinationals may also boost domestic firms' efficiencies. Equity effects deal with the distribution of the incremental outputs between governments and multinationals. Equity effects generally take place through host states' taxes, lower prices for consumers, and increased profits for multinationals. Political-economy theorists often viewed governments and multinationals as antagonists, arguing over allocations of incremental outputs through taxes or repatriated profits. Generally, labor forces lose in these theories: Multinationals' strivings for increased efficiency, together with their flexibility, cause labor forces to lose their bargaining powers.

States

Many international relations theorists have assumed that from the early 1900s until World War II, the United States constituted the world's dominant military and economic power, contributing greatly to creating and to maintaining the international economy through institutions such as multinationals. After World War II, the United States, Western Europe, and Japan formed the dominant powers. Today, this triad, and the economic order it maintained, is in disarray. The theorists have offered at least two contradictory explanations for multinationals' roles in the aftermath of this hegemonic collapse.

Raymond Vernon initially proposed one explanation in his influential book *Sovereignty at Bay.* He argued that economic interdependence and technological advances in communication have undermined the traditional, economic rationales for states. World efficiencies and domestic, economic welfares will continue to decrease states' powers vis-à-vis multinationals and other international institutions. Sovereignty-at-bay differentiates between the United States' creation of a world economy and the subsequent dynamics of its maintenance. Theorists subscribing to this view have argued that rather than hegemonic powers, interdependent, international, economic interests, and the benefits from the interdependencies, now bind international orders together. States have joined in economic relations with multinationals and other states from which they cannot easily escape and from which they derive great benefits. States' citizens would not tolerate the sacrifices in economic well-being that would follow if states hamper multinationals' operations. Governments, therefore, dare not forego employment and regional-development opportunities by sanctioning multinationals.

Sovereignty-at-bay deduces that the flexibility and vast resources of multinationals grant them advantages in confrontations with states. If multinationals move production facilities elsewhere, states lose employment, corporate resources, and access to world markets. Thus, the theorists have argued that multinationals often escape states' controls and emerge as powers to change international, political relations. Conversely, states often face the possibility of losing control over economic affairs to multinationals. States may not be able to retain traditional sovereignty and to meet their citizens' rising economic demands. Therefore, the sovereignty-at-bay model views states' efforts to enhance security and power as incompatible with an interdependent world economy that generates absolute gains. The theorists have contended that economic forces will eventually contribute to the end of nationality as we know it. The sovereignty-at-bay world consists of interdependent economies with voluntary cooperative relations that accelerate everyone's economic growth and welfare. In this world, multinationals, freed from nation states, form critical transmission belts of capital, ideas, and growth.

Another explanation revolves around the mercantilist theories that have painted the interplay of states' interests as the primary determinants of the international economic order's future. These theories relegate multinationals to peripheral places or regard them as states' instruments. According to these theorists, the interdependent world economy that provided an extremely favorable environment for multinationals has come to an end. In the wake of the relative decline of the United States' power, and of the growing conflict among capitalist economies, a new international order, less favorable to multinationals, is coming into existence. This emergent world order is characterized by intense, international, economic competition for markets, for investment outlets, and for sources of raw materials. In the new order, states manipulate economic arrangements to maximize their own interests, even at the expense of their stakeholders. States' interests concern domestic matters (such as employment and price stabilities), as well as foreign-policy matters (such as security and independence). Thus, mercantilist theories have granted priority to states' economic and political objectives over global economic efficiencies. In pursuit of economic objectives and national interests, states attempt to control actors within their realms, including multinationals.

Mercantilist theorists have argued that international competition has intensified because the United States has lost its technological lead in products and manufacturing processes. U.S. multinationals must now increasingly compete on the basis of prices and a devalued dollar. Thus, the United States can no longer draw on the technological rents associated with its industrial supremacy, and the supremacy of U.S. multinationals in the economic order has come to an end. Consequently, U.S. multinationals play greatly diminished roles in maintaining the United States' hegemonic rule. States will now increasingly form regional, trade, and monetary alliances to advance their own interests. This regionalization will replace the United States' emphases on multilateral free trade, the dollar's international role, and the U.S. multinationals' supremacy.

Societies

Multinationals' effects on societies are largely depicted in sociological studies dominated by the Marxist, dependency school. A variety of contentions, some contradictory, have emerged from the dependency theorists. The theorists have argued that multinationals distort economic development in less developed states by forcing them into associated or "dependent development" relationships. They have charged multinationals with creating branch-plant economies of small, inefficient firms that are incapable of propelling overall development. They have argued that foreign subsidiaries exist as appendages of their home firms, and as enclaves in states' economies, rather than as engines of self-reliant growth. They have accused multinationals of introducing inappropriate, technological developments and of employing capital-intensive, production techniques that cause unemployment and prevent the emergence of domestic technologies. They have asserted that multinationals skew income distributions among classes in less developed states. And, because of their repatriation of profits and their superior access to local capital, they have contended that multinationals prevent the rise of indigenous companies.

Dependency theorists have also concluded that multinationals wreak negative, political consequences in less developed states. For example, theorists have asserted that multinationals require stable, host governments that are sympathetic to capitalism; therefore, dependent development encourages authoritarian regimes in host states and creates alliances between multinationals and domestic, reactionary elites. They have contended that multinationals' home governments sustain these exploitative alliances by intervening in the internal affairs of less developed states. In this fashion, multinationals tend to make host states politically dependent on home, industrialized states.

Some dependency studies have concentrated on trying to show that social and economic equalities are caused by multinationals distorting employment opportunities and labor-force structures. The studies generally have drawn on Marxists' beliefs that capitalist systems increase inequalities. Other studies have concentrated on multinationals' negative effects on societies and cultures. Dependency theorists have concluded that states may lose control over their culture and social development. Therefore, multinationals may contribute to cultural imperialism or CocaColaization of less developed societies. Dependency theorists have proposed that multinationals undermine societies' traditional values by introducing new values and tastes through advertising and business practices. These new values often create demands for goods that do not meet the masses' true needs.

The World

Anthropological theories have analyzed multinationals' attempts to control and to coordinate their operations by managing global environments. Changes in political and economic systems threaten multinationals' abilities to predict, to plan, to manage, and to economize. To help control their destinies, multinationals generate large-scale regularities and interdependencies through means other than centralization. Anthropological theories show how political and economic networks develop as multinationals, create branch offices, merge, and cooperate with other firms, political groups, and governmental agencies. Thus, multinationals develop political-control networks that serve as socially integrating mechanisms for them. The networks bind multinationals, states, and families into supranational structures with ambiguous boundaries. But as multinationals extend their spheres of influence through participating in the networks, and as they increasingly adopt policies that slow growth, they also de-emphasize their market-exchange functions, and increasingly emphasize redistributive functions with respect to states and societies.

George Haley documented how the overseas Chinese companies form global networks to enhance the distribution of information while not necessarily maximizing profits or efficiencies. Alvin Wolfe also described how multinationals bind together in global networks that channel reciprocities. He isolated two types of decision rules that multinationals use: maximization rules in which behaviors are contingent on anticipated returns and reciprocity rules in which behaviors are contingent on assessing others' needs and wants. He argued that often multinationals follow reciprocity rules just to keep some stakeholders in the system. For example, a multinational may sell another a raw material that is in such short supply as to be unavailable to firms unaffiliated with the system. In this fashion, multinationals may control and coordinate their operations at global levels, while not necessarily maximizing profits or efficiencies.

Ethical Implications in the New Economy

In recent decades, substantial changes have occurred in multinationals' competitive environments. Traditionally, the industrialized democracies of Western Europe, North America, and Japan (the Triad) had spawned multinationals. This prevalence of culturally and economically related home countries created an environment of similar ethical standards for multinationals' managers: Japan served as the only significant, non-Western source of ethical conflict for multinationals. Today, emerging markets such as India and China, culturally and economically different from the Triad, are also giving birth to multinationals. The ethical standards of multinationals from these emerging markets can differ substantially from their Western counterparts. Ethical differences often emerge starkly in China and Southeast Asia, where ethics have Confucian roots independent of the West's Judeo-Christian roots. Differing perceptions of intellectual property (IP) provide an example of the difficulties that can arise. In Confucian societies, IP did not exist—entrepreneurs were supposed to copy their employers' and/or competitors' technologies. Thus, people raised in traditional Confucian societies tend to view the Western multinationals that seek compensation for IP theft as the transgressors.

Consumerism and relations with customers also pose ethical dilemmas in the new global environment. Whereas the industrialized societies generally have active consumer movements, most of the newly emerging economies do not. Consumer movements are rapidly developing in many of the more advanced emerging economies, but in the poorer economies and in some of the transitional, formerly communist, economies, multinationals' managers must be cautious: In the former, because failure in consumer issues can elicit charges of ethical callousness in the Triad markets; in the latter, because the emerging markets' governments, frequently still totalitarian, can use consumerist charges to attack foreign multinationals.

Ethical and policy implications arise in business practices, such as relations with clients in global environments. For example, advertising ethics in the United States vary widely from those in Asia. In the United States, an advertising agency that represents two competing companies would commit a breach of ethics; in Japan, advertising agencies tend to specialize so that the same agency represents several companies in the same industry; in Europe, the standards are subject to interpretation.

The relative role of the media also differs between countries. In most Triad economies, the media enjoys relative freedom. In some Triad countries, such as the United Kingdom, the state owns substantial portions of the media, but the media retains its independence. In contrast, in many emerging markets the governments own and control the media. Even when media ownership rests in private hands, substantial ties often exist between the media and the local governments. In these instances, multinationals must deal with situations where the media serves governmental rather than public or private interests.

Global Codes of Conduct

A global code of conduct may be defined as a set of guidelines or principles for business practice that establish ethical standards for business and employee conduct, especially for those firms operating in the international business environment. Global codes of conduct have grown in importance as we have witnessed the rise of global business as a critical element in the world economy. This rise is one of the most significant developments in business during the past 50 years. This period has been characterized by the rapid growth of direct investment in foreign lands by the United States, Western Europe, Japan, and increasingly other Asian countries. Global business has grown by leaps and bounds as technology, communications, and competitive forces have pressured firms to seek new markets.

In recent years, there has been evidence of a backlash against global capitalism. One reason for this is the complexity of the transnational economy and the opportunity for ethical issues to arise as companies increasingly do business across cultures. It is inevitable that as the clash of cultures and ethics increases, the need for business to take more affirmative action to head off these problems also occurs.

Protests in recent years have been led by environmentalists, who are concerned about the degradation of natural resources, and by human rights activists, who are concerned about treatment of human rights and fair treatment of the world's workers. Many protestors are today being referred to as antiglobalists because they believe global capitalism has gone too far and has been creating more disadvantages than advantages. These antiglobalists argue that multinational corporations have created ethical problems with respect to consumers, employees, human rights, developing nations, and the natural environment.

It is against this backdrop that the issue of global codes of conduct have arisen and become more important in recent years. It should also be observed that global codes of conduct are just an extension of traditional codes of conduct that have been used by companies for decades before international business and global competition became a widespread and integral part of the business world.

As global ethical issues have become more of a serious concern, there has been a growing need for effective responses on the part of business to these issues. Companies have taken many different steps to help restore confidence and trust in business. Consequently, global extensions of corporate social responsibility, corporate citizenship, and business ethics initiatives have become commonplace in the past two decades. Thus, global codes of conduct have typically been embedded in broader programs aimed at improving corporate conduct around the world, especially in developing countries. In this context, global codes of conduct may be seen as just one element in business's overall global corporate social responsibility initiatives.

Global Codes of Conduct Defined

A global code of conduct may be defined as a set of guidelines or principles for business practice that establish ethical standards for business and employee conduct. These global codes are established at a variety of different levels. Corporations may create a global code applicable to just the firm in question. Industry-wide codes of conduct may also be established. For example, industries such as shoes, apparel, forest products, mining, and paper have established industry-level codes of conduct. In addition, global codes of conduct have been established by international organizations. Some of these international organizations may be government based, nongovernmental organizations (NGOs), or other nonprofit, special-interest organizations interested in improving business ethics internationally.

Code Formats

Most global corporate codes of conduct are voluntary in nature. That is, there is no legal enforcement mechanism governing their implementation. Such codes may be expressed in a variety of different formats. In a major study of corporate codes, The Conference Board, a nonprofit, business advocacy association, has found that these codes may be formulated and distributed in several different formats. Codes may be stated as *compliance codes.* These are usually a set of directives that give guidance to managers as to what to do or not to do with respect to various business practices. Another form used is that of the *corporate credo.* These are composed of broad, general statements of business commitment to various constituencies, or stakeholders, and may embrace value statements and strategic objectives. Finally, *management philosophy statements* may be the format used. These are similar to corporate credos but may just explicitly summarize the company's or the CEO's approach to doing business.

In its own study, the U.S. Labor Department has differentiated among the following different kinds of code formats. *Special documents* include written codes of conduct that summarize company standards, principles, or guidelines in a number of different arenas. These special documents communicate standards to the public and to affected stakeholder groups such as suppliers, customers, competitors, and shareholders. *Circulated letters* are another format. Such letters expressly state company policies on a specific issue to affected stakeholders. *Compliance certificates*, another format, are documents that require suppliers, agents, or other contractors to agree in writing that they will comply with the company's stated standards. Finally, *purchase orders or letters of credit* are written documents that make compliance with a company's policy part of a contractual obligation on the part of suppliers or other contractors.

Three Types of Global Corporate Codes of Conduct

Previously, it was stated that global corporate codes may be established by individual companies, industry groups, and international organizations. A more careful exploration of these three types of codes reflects details clarifying how each type is developed and used.

Corporate Global Codes of Conduct

Corporate codes of conduct are typically just one element in a company's overall ethics program. Today, many companies have ethics programs that are often managed by ethics officers. These ethics programs typically include codes of conduct, ethics training, whistle-blowing mechanisms (e.g., ethics "hotlines"), ethics audits, and responsibility for a variety of different ethics-related aspects of the business such as ethical decision-making processes, discipline of violators, board of director's oversight, corporate transparency efforts, and effective communication of company standards.

Since the creation in 1991 of the Federal Sentencing Guidelines, which reduce penalties for companies with ethics programs, most large corporations today have embraced the idea of ethics programs and codes of conduct. According to these U.S. Sentencing Guidelines, a key feature in an ethics program needs to be a statement of *compliance standards*, and this is what is typically reflected in a company's global code of conduct.

Regarding these compliance standards, companies are expected to have established a set of standards that then serve as the basis for detecting and preventing legal violations. The code of conduct states these standards. Beyond this, a set of ethical principles or guidelines are also helpful to extend beyond what is required by law or to address topics that may not be covered by the law. Other U.S. Sentencing Guidelines requirements state aspects of the code of conduct's implementation that make a difference in its effectiveness. For example, it is expected that the code of conduct's implementation will entail high-level personnel in the company (such as ethics officers); will prevent the undue delegation of inappropriate discretionary authority; will be effectively communicated; will contain systems for monitoring, auditing, and reporting; and will embrace effective enforcement. Furthermore, companies are expected to take action when offenses have been detected, thus preventing future offenses, and to keep up with industry standards. This means that companies are expected to carefully monitor industry standards and practices and make sure that it is at least keeping up with industry standards.

Beyond the fact that companies may suffer less severe penalties if they have ethics programs and codes of conduct in place, what other benefits do companies receive from global codes of conduct? Various studies have shown that companies believe that they get some of the following benefits from codes of conduct:

- Legal protection for the company
- Increased company pride and loyalty
- Increased consumer and public goodwill
- Improved loss prevention
- Reduced bribery and kickbacks

The literature on corporate codes identifies that companies create such codes for both normative and instrumental reasons. From a *normative* point of view, the corporate codes serve as principles intended to guide corporate behavior in the most ethical directions. These have been referred to as "aspirational strategies," the purpose of which has been to describe how employees and agents of the firm *ought* to behave. From an *instrumental* point of view, corporate codes have been motivated by a variety of justifications. According to Krista Bondy, Dirk Matten, and Jeremy Moon in 2004, some of these motivations are their being a part of an internal control system, their being a part of a strategy of differentiation in the marketplace, their being a signal to stakeholders concerning a company's quality and reputation, reduced insurance premiums, peer pressure within an industry, improvement of customer relations, maintenance of standards within a supply chain, and preemption of boycotts and formal accusations.

As to what subjects or topics global codes of conduct address, the following represent some of the most frequently addressed topics found in these corporate codes:

- Conflicts of interest
- Receipt of gifts, gratuities, and entertainment
- Protection of company's proprietary information
- Giving gifts, gratuities, and entertainment
- Employee discrimination
- Sexual harassment
- Kickbacks
- Bribes
- Employee conduct
- Employee theft
- Proper use of company assets
- General conduct

To make sure that corporate codes are more than platitudinous statements of aspiration, S. Prakash Sethi, an expert on this topic, believes that companies need to create codes of conduct for their multinational operations, but that it should not stop there. Sethi recommends that companies should permit their activities and practices to be monitored by external and independent sources. An example of this model would be the Mattel toy company, which Sethi has worked with, in setting up a code, standards, and monitoring procedures. In the case of Mattel, the independent reviews of the company's practices are posted on a Web site, where they may be viewed by others. The company would have the opportunity to correct any factual errors, but beyond this they may not alter the monitor's report. They may write their own report disputing the findings or reporting on how the company would be responding to the findings. Sethi argues that the best global codes are those voluntarily written by companies because such a code may be carefully scrutinized and evaluated by outside parties and only the company itself can be held responsible for its actions. Some corporations have taken their global codes a step further by stipulating that their business partners and suppliers also adhere to their codes. For example, on the subject of global outsourcing, some companies such as Nike, adidas-Salomon (formerly adidas), Levi Strauss & Co. (LS&Co.), and the Gap have striven to monitor not only their own companies but also those with which they do business.

Specific Corporate Examples

As reported by Tara Radin in 2003 and 2004, two different companies in different industries serve as modern exemplars of the use of global codes of conduct: Chiquita Brands International and LS&Co. Chiquita, operating primarily in Latin America, employs a values-based approach to management and monitors its global conduct through the umbrella of a corporate responsibility officer. Chiquita monitors its performance through both internal and external means. Chiquita issues annual corporate responsibility reports in which it presents and evaluates both the strengths and weaknesses of its social and ethical performance.

In contrast, LS&Co. operates almost exclusively through sourcing partners scattered throughout the world, including Latin America. LS&Co.'s initiatives have served as a model for others in developing outsourcing standards and guidelines as many companies operate throughout the world in a similar manner. LS&Co.'s *Global Sourcing Guidelines* include both regular country assessments as well as analyses of the extent to which its sourcing partners are adhering to the company's "Terms of Engagement," which were established in 1991. These Terms of Engagement represent the actual standards by which the company expects its global partners to comply. LS&Co. implements its initiatives through a corporate level director and regional compliance officers. The company conducts widespread monitoring of its suppliers, and is increasingly seeking to employ external monitors. In many respects, LS&Co.'s program is more difficult to implement because it operates through private contractors, while Chiquita, in contrast, operates as a direct employer. Both these companies have served as exemplars for other firms seeking to employ global codes of conduct. The experience of both these companies points to the critical importance of internal and external monitoring to give their codes of conduct integrity.

As it will become apparent with both industry-based corporate codes and international groups' codes, the issue of monitoring is crucial to the effectiveness of global codes, whatever the level of their implementation. Internal monitoring may occur by special teams or consultants and represent a necessary first step in developing effective code implementation. External monitoring, often made possible through a strategy and practice of corporate transparency, allows external groups to conduct their own analyses of the codes' effectiveness. External monitoring sets the stage for higher levels of accountability as NGOs and other stakeholder groups are able to independently evaluate the firms' progress and achievements.

Industry-Based Corporate Codes

Beyond the individual company level, some industries have begun initiatives to create global codes of conduct for the companies competing in that industry. This makes a lot of sense because often the firms in a given industry are identified as a group and the actions of one affect the reputations of others. Furthermore, if firms operating in an industry can agree on ethical standards, this places the member firms on a level playing field in terms of treatment of stakeholders and issues affecting the industry.

As suggested earlier, one of the first industries to recognize the common interests of those in the industry was the defense industry in the United States. Due to corporate scandals surfacing in the 1980s, companies in the defense industry saw that one way to promote common interests was through some form of self-regulation that might deter further government regulatory strictures. The various initiatives in the industry included codes of conduct and the creation of ethics programs, ethics officers, and ethics training. These efforts eventually led to the Defense Industry Initiative on Business Ethics and Conduct, which would be classified as an industry-based set of guidelines or corporate code.

Over the years, other industries have developed global corporate codes as their commercial activities became more internationalized. Industries that have moved in this direction by creating various forms of corporate codes include apparel/garments, lumber, paper, mining, banking, and manufacturing, in general. Thomas Hemphill has termed such initiatives as attempts at industry self-regulation.

In recent years, the controversy surrounding "sweatshops" and some of the questionable practices associated with them have spurred the creation of a number of different industry groups determined to set standards for the firms participating in the apparel industry. In many instances, these different associations have come into competition with each other, as each is striving to become the standard-setter for the industry. Two industry-level groups trying to regulate industry behavior with respect to sweatshops include the Fair Labor Association (FLA) and Social Accountability International (SAI).

According to its Web page, the FLA is a nonprofit organization that coordinates the work of industry, NGOs, and colleges and universities to promote adherence to international labor standards and improve working conditions worldwide. The FLA conducts independent monitoring and verification to ensure that the FLA's workplace standards are upheld where FLA company products are produced. Through public reporting, the FLA provides consumers and shareholders with trustworthy information to make responsible buying decisions. The FLA "workplace code of conduct" includes ethics standards for such categories as forced labor, child labor, harassment or abuse, nondiscrimination, health and safety, freedom of association and collective bargaining, wages/benefits, work hours, and compensation for overtime work. The FLA takes these standards one step further by expecting that signees to these standards also require its licensees and contractors, or suppliers, to abide by local laws in the country in which they are operating and with the standards set forth in the FLA code.

According to its Web page, SAI has the mission of promoting human rights for workers around the world as a standards organization, ethical supply chain resource, and programs developer. SAI promotes workers' rights primarily through its voluntary SA8000 system, which is based on the International Labour Organization (ILO) standards and UN Human Rights Conventions. SAI argues that SA8000 is widely accepted as the most viable and comprehensive international ethical workplace management system available. What is interesting about SAI and to some extent the FLA is that they both originate in specific industries that compete globally but have drawn other organizations, including governments and other nonprofits, into their networks. Thus, although they began as industry-based initiatives, they evolved to be more comprehensive in scope, membership, and affiliation.

Another example of industry-level global corporate codes is the banking industry that has developed its Equator Principles, which are a set of guidelines developed by the banking sector for dealing with social and environmental issues with respect to the financing of economic development projects. The Equator Principles truly represent a global industry set of standards for financial institutions as member banks currently come from most of the major countries of the world.

International Organizations' Global Codes

Over the years, a number of different international organizations have sought to develop global codes of conduct that would serve as overarching guidelines for multinational companies doing business across country lines. These international organizations have included faith-based groups, NGOs, and even some political entities that have sought to set standards for companies operating globally or in particular countries. Their standards have been dubbed "group based." Examples of these group-based global codes of conduct that have been developed by various international groups include, but are not limited to, the Sullivan Principles for South Africa, later renamed the Global Sullivan Principles, the Caux Principles for Business, Principles for Global Corporate Responsibility, the Global Reporting Initiative, and the UN Global Compact. A brief statement of several of these is illustrative of the types of groups putting them together.

Caux Principles

The Caux Principles were issued in 1994 by a group known as the Caux Round Table. The Round Table was composed of senior business leaders from Japan, Europe, and North America. The Caux Principles are an aspirational set of recommendations and guidelines for corporate behavior that seeks to communicate a worldwide set of standards for ethical and responsible business conduct. The Principles address the social impact of company operations on the local communities.

Principles for Global Corporate Responsibility: Benchmarks

These principles were developed by the Interfaith Center for Corporate Responsibility (United States), Taskforce on the Churches and Corporate Responsibility (Canada), and the Ecumenical Council for Corporate Responsibility (United Kingdom) in 1998. These principles are intended to provide a model framework through which stakeholders can assess corporate codes of conduct, policies, and practices related to Corporate Social Responsibility expectations. The standards include 60 principles and benchmarks that can be used to assess corporate social and ethical performance.

UN Global Compact

The Global Compact was issued by the United Nations in 1999. It includes a set of 9, later expanded to 10 principles, that endorsing companies would agree to abide by. According to its Web page, the UN Global Compact asks companies to embrace, support, and enact, within their sphere of influence, a set of core values in the areas of human rights, labor standards, the environment, and anticorruption.

Global Reporting Initiative (GRI)

A revision of the GRI was issued in 2000 by the Coalition of Environmentally Responsible Economies.

GRI is an international reporting standard for voluntary use by organizations reporting on the social, environmental, and economic aspects of their products, services, and activities.

Global codes of conduct at this level have typically been created by a variety of different groups, often working in conjunction with governments and NGOs, to create standards that serve as guidelines for companies doing business in the international sphere. Many different companies have become signatories to these codes and some companies have agreed to comply with multiple codes.

Conclusion

Global codes of conduct are an important way by which companies and industries may strive to conduct their activities on a legal and ethical plane in the international sphere. Most codes began as domestic focused, only later to become globally focused in keeping with the increasing globalization of commerce worldwide. Such codes have been created primarily on three different levels—the level of the firm itself, the level of industry associations, and the global level at which international organizations have created principles and standards for all firms doing business in the world or a particular part of the world.

To some extent, the idea of global codes of conduct has been controversial and not supported by everyone. It is difficult enough to implement conduct codes at the domestic level but extremely difficult at the global level. Some commentators have thus been critical of the idea, thinking they represent more of an ideal than a realistic possibility. In spite of this, the trajectory of global codes continues to grow.

Global corporate codes seem to have a bright future. It is axiomatic that increased ethical conduct and practice can only follow from standards that have been expressly established, communicated, adopted, and monitored. As the trend toward corporate transparency continues, the monitoring activities that have begun will continue. It is expected that all three levels of corporate codes will continue to flourish in the future as companies, industries, and the business community strive to build and retain trust and credibility with customers, employees, countries, and other stakeholders. To date, the use of global codes of conduct has had a positive impact on international labor practices, and thus, they are expected to continue.

GLOBAL CROSSING

Global Crossing was founded in 1997 and became the fourth-largest bankruptcy in U.S. history just 5 years later in 2002. Specifically, Global Crossing was swapping network capacity with other carriers to artificially inflate earnings and make the company look more profitable than it was. The road to that bankruptcy is a story of revenues inflated by what appears to be fraudulent accounting, in which senior executives enriched themselves while Arthur Andersen served as auditor. Global Crossing employees and shareholders seem to have been left holding the bag, much as in the Enron bankruptcy filed just 2 months earlier.

Global Crossing was the brainchild of Gary Winnick. Winnick was a former junk bond financier who worked with Michael Milken at Drexel Burnham Lambert but escaped untarnished from a 1990s scandal at that firm. Together with a group of financial gurus and chief executive officers, he envisioned a global broadband network that would link continents with undersea fiber-optic cables. This was a risky proposition in 1997 because no such network existed, and no one knew exactly how profitable, or unprofitable, such a network would be. It has always been extremely difficult to forecast the profitability of new services or new technologies, and the Global Crossing proposal was no exception.

Global Crossing faced one, not so small obstacle to executing its business plan: It effectively had no assets, and building such a high-tech, undersea network would be tremendously expensive, of the order of $2.7 billion. Fortunately, *Wall Street* investors valued the Global Crossing concept highly and offered Winnick and his management team about $40 billion in equity financing and $10 billion in debt financing. Investment analysts gave the stock a "strong buy" rating.

The Global Crossing situation was complicated due to the fact that stock analysts were consistently bullish after the company went public in August, 1998. For example, during the time that Jack Grubman, employed by Salomon Smith Barney, was pushing the stock, Global Crossing executives were selling company stock. The result was millions of dollars of personal income for executives at a time when the business model was falling apart. Chairman Gary Winnick is reported to have sold stock valued at $123 million on May 23, 2001, despite a witness telling a congressional committee investigating Global Crossing that Winnick had seen an April 2001 forecast projecting a drop in revenue of $300 million.

Global Crossing founder and chairman Gary Winnick resigned from the board on December 31, 2002, under pressure from investor groups. Altogether, it appears that Winnick profited by about $734 million from his sales of Global Crossing stock before the company filed bankruptcy. However, he and more than 20 Global Crossing executives and directors face a lawsuit filed in the Federal District Court in Manhattan that consolidates several class-action complaints on behalf of investors who lost billions of dollars on Global Crossing stocks and bonds. Arthur Andersen settled with Global Crossing investors for $25 million for its role in the company's financial failure.

Global Crossing had a market valuation of more than $50 billion, larger than General Motors on paper, and its fiber-optic telecommunications network connected 200 cities in 27 countries. However, it amassed about $12.4 billion in debt establishing its global fiber-optic telecommunications network. Global Crossing's revenues dropped to $2.4 billion in the first three quarters of 2001, down from about $3.8 billion for the same period in 2000. Global Crossing was forced to declare bankruptcy on January 28, 2002.

The Securities and Exchange Commission (SEC) claimed that Gary Winnick didn't have enough involvement with day-to-day operations to warrant civil securities charges. Winnick agreed to pay $1 million to settle charges that he failed to fully disclose the terms of several deals to swap fiber-optic network capacity. Global Crossing has emerged from bankruptcy as a global Internet protocol (IP)-based telecommunication carrier whose customers include more than 40% of the Fortune 500.

Today, Global Crossing has reemerged through a strategy of "invest and grow." The company now provides sophisticated IP products to multinational corporations. Just less than 80% of the company's traffic is now VoIP (Voice over Internet Protocol) and the company operates between 130 and 140 softswitches worldwide. In addition, Global Crossing has been able to improve their gross margin from 7% to nearly 13% over the past 2 years (2004–2006). Customers include more than 35% of the Fortune 500, as well as 700 carriers, mobile operators, and Internet service providers.

Globalization

Globalization refers to the increasing interconnectedness of the world. In stark contrast with prior times, when countries frequently found themselves in competition with one another (and often at war), globalization reflects their coming together to pursue common goals. This phenomenon is manifest most prominently, though not exclusively, through business. At the same time, however, the development of a world economy and global workplace has been accompanied by a general shift in thinking about social, economic, cultural, and political issues as well.

While globalization has arguably been taking place for centuries, the term was not coined until 1983, in a *Harvard Business Review* article by marketing scholar Theodore Levitt. In "The Globalization of Markets," he argued that the world was moving toward a single "global" market and that success would be dictated by the ability of companies to integrate global thinking into their strategic thinking and planning. According to Levitt, "Companies that do not adapt to the new global realities will become victims of those that do."

Globalization allows for the international transfer of goods, services, and ideas through a global marketplace. Although the 1980s and 1990s witnessed a large degree of globalization, its pace has quickened in recent years, particularly as a result of changing technology and the rise of the Internet. Enhanced communication has enabled people to overcome geographic obstacles through real-time interaction. Exchanges take place through local vendors, distributors, and via the Internet. People around the world now have access to many of the same products, no matter where they are. People are also connected through shared media—including, but not limited to, the Internet. CNN, for example, is available on most cable networks across the globe.

A critical factor is that these technological changes have substantially brought down the cost of the spread of information. Even some of the poorest people around the world have cell phones and can get access to the Internet. This has opened the door to innumerable business opportunities that have, in effect, changed the face of the globe.

Historical Context

Scholars and historians tend to differ with regard to how they categorize the various eras of globalization. Some distinguish merely between the pre– and post–World War I periods, while others draw additional distinctions.

Globalization begins with curiosity—the desire to know, understand, and interact with others. It actually dates back at least to the discovery that navigation and travel could connect various peoples around the world. This curiosity led Marco Polo to head east in 1295 and prompted Christopher Columbus to set sail for the West in 1492. At this point in time, what today is called *globalization* translated into exploration and the quest for new trade opportunities.

It can be argued that the period of time until the 17th century represented the first era of globalization: mercantilism. Mercantilism involves trading goods for profit. It was during this time that European countries set out in search of new resources and new trading partners and thereby established new trade routes and trading companies. Entities such as the East India companies were established to champion international trade and to mitigate its inherent riskiness—for instance, through the issuance of stock.

Exploration quickly turned from exploitation of trade opportunities to pursuit of ownership (of resources) as Europe spent centuries methodically colonizing land around the world. In a sense, this unified the globe in joining distant lands under common ownership. This can be called the second era of globalization—colonialism—as empires were created, maintained, and eventually torn apart. This was not the only period of time during which empires existed, but it was during this time that they reached their heyday.

European colonialism dates back to at least the 15th century; it was not until the 17th century, however, that England, France, and the Netherlands extended their empires overseas. Colonialism therefore dominated most of the 18th and 19th centuries. Although it was during this time that some colonies fought and won their independence and the right to self-determination, it was also during this time that the pace of colonization quickened in other areas of the world, such as Africa.

The 20th century can therefore be said to have heralded the third era of globalization: global conflict. It was during this time that colonies, one by one, were beginning to assert themselves. At the same time, imperialist countries were both resisting and finding themselves drawn into global warfare, including two world wars, which represented the fight for resources, territory, and, most of all, power.

Deterioration of colonialism during this era of global conflict began with World War I, as empires collided in a military clash that spanned much of the globe. This was then exacerbated by the pressures of the gold standard, which served as the operative monetary system at that time.

In many ways, World War II represented a continuation of World War I, in that Germany never really accepted the resolution of the first war. When Germany regrouped and reasserted itself, countries around the globe again found themselves in conflict through the same sort of entangled alliances and power struggles that characterized the prior war. This time, the resolution was certain.

World War II was a wake-up call: Its end signaled the beginning of global accountability. The message was sent that countries needed to work together to prevent such atrocities from reoccurring. This led to enhanced emphasis on self-determination for all peoples, which could be said to have laid the groundwork, at least in part, for the subsequent thrust toward the liberation of the remaining colonies and territories of the world.

The next era was that of decolonization, which took place in Africa, Asia, and the Middle East. The result of decolonization was the creation of a fractured globe, composed of disparate entities. In the wake of rampant imperialism, many countries began questioning and challenging one country's involvement in another country's affairs. As states struggled to establish their own identities, the emphasis lay on independence, not interdependence.

During this time, the United States and its allies entered into an era of unspoken discord with the Soviet Union and other Eastern European countries. As many have said, this Cold War was anything but "cold." It was a heated controversy between conflicting ideologies and revealed itself on multiple fronts. It was arguably more universal and widespread than any of the World Wars, encompassing everything from small skirmishes to full-blown conflicts. It spanned continents, with the Korean War (1950–1953), the Bay of Pigs (1961), the Cuban Missile Crisis (1962), the Vietnam War (1964–1975), and the Soviet-Afghan War (1979–1989).

Battles also took place without violence, such as the competition in science and technology, as each of the two superpowers struggled to better the other in exploring outer space. This was accompanied by significant investments in defense spending and a massive nuclear arms race. Even the Internet was born out of this conflict as the former Soviet Union's launch of *Sputnik* prompted the development of a special research organization, the Advanced Research Projects Agency (ARPA, which later evolved into the Defense Advanced Research Projects Agency, or DARPA). It was this entity that created an electronic network for military purposes that was subsequently commercialized as the Internet as it is known today.

Political tension and military sensitivity had a significant impact not only on governmental affairs but also on interaction between and among peoples around the world. Travel—particularly tourism in Eastern Europe—was severely limited and accompanied by little economic and/or business cooperation. Then, in 1989, the Berlin Wall came down, physically and metaphorically, and as it fell, so did the economic, social, and cultural separatism. By the early 1990s, Eastern Europe was transformed from a closed door into a new land of opportunity. This was coupled with a renewed interest in globalization as former enemies turned into cautious acquaintances. Businesses quickly identified partnership and/or joint venture prospects along with other avenues through which they could carve out opportunities in these newly liberalized economies.

As Eastern Europe opened up, most of Western Europe steadily became integrated into a single supranational and intergovernmental entity, the European Union, through the Treaty of Maastricht in 1992. As of 2007, there are 27 member states, including countries from Eastern, Western, and Central Europe. This has led to the removal of additional barriers to trade, travel, and communication. The overall effect of this has been to enhance globalization.

The late 1990s heralded the Information Age, which has advanced globalization arguably to yet another era. This has led to even more rapid globalization in the 21st century. Not only is the economic market for goods and services viewed as a global market, but the labor market is now viewed as a global workplace as well.

It appears that global awareness lies among the current challenges in this era of globalization. Although technology and the Internet have enhanced communication and technology, some people suggest that there is now so much information that it is difficult to filter out extraneous and/or erroneous information in order to identify that which is pertinent.

Global awareness is of particular importance because of the increasing role that companies are playing in global politics through their role in multinational supply chains. Thomas Friedman, author of *The Lexus and the Olive Tree* and *The World Is Flat*, argues that the current era of globalization is characterized most significantly by the "flattening" of the world. Countries are no longer defined by their core competencies so much as they have been integrated into worldwide corporate supply chains—of parts, products, processes, services, systems, or labor—where national origin is no longer relevant.

Joseph Stiglitz, winner of the 2001 Nobel Prize in Economics and former senior vice president and chief economist of the World Bank, challenges the impact of globalization. In both *Globalization and Its Discontents* and *Making Globalization Work*, he contends that it is essential to consider not only those benefited by globalization but also those made worse off. Although critical, he remains optimistic, though, as he asserts that a global society is ultimately best suited to address shared problems such as sustainability and poverty.

Globalization and Trade

It is important to keep in mind that globalization prior to this century was limited in large part by the cost and difficulty of travel and communication. Ships—which, prior to the mid- to late 20 century, represented the predominant method of travel—were costly and slow. This created a significant impediment to more rapid globalization. Advances in technology have enabled faster, cheaper, and more reliable travel and communication, and this has clearly paved the way for the rapid globalization we see today, particularly through enhanced trade opportunities.

Trade is essential to globalization. In a sense, it is the currency through which countries communicate with one another. In fact, globalization of politics, culture, and so on cannot exist without trade.

Trade occurs throughout the world because people desire different goods and services—people appreciate variety and choice. Through trade, countries are able to acquire increased availability of goods and services and more numerous and diverse consumption possibilities.

Low trade barriers are necessary for trade to occur. Early global barriers to trade included the limitations imposed by the barter system, transportation, and technology, which existed in addition to those erected by countries themselves, such as tariffs, duties, licenses, and quotas. Globalization has been significantly influenced by the imposition and removal of trade barriers over time.

An early influence on trade was the introduction of monetary systems. Prior to that, trade possibilities were severely limited by the barter system. For an exchange to occur, at least two parties had to have an interest in what each had to offer the other. With the introduction of currency, a wider range of transactions was made possible.

Trade has also been facilitated by advances in transportation. Initially restricted by land travel, trade benefited significantly from improvements in sea travel and, more recently, air travel. Furthermore, technology now tears down geographical barriers almost entirely by enabling virtual transactions to take place around the globe in real time without any sort of physical travel.

During the late 18th century, countries became aware of the steadily increasing amount of trade that was occurring throughout the world. The Industrial Revolution provided the world with record amounts of goods and supplies. Although industry in Europe and the United States grew significantly, it could not keep pace with the appetite of the domestic markets. Global trade therefore picked up the slack with regard to product surpluses. Certain countries with absolute or comparative advantages over other countries began to trade, or simply export and import goods, in order to maintain higher profits and get rid of the surpluses that they produced. Some domestic companies even began to cater to these international markets in the hope of tapping into the distant though large markets that appeared ripe for exploitation. This increase in trade resulted in the fostering of strong economic and political ties between various nation-states.

The early 19th century witnessed the effect of the growing interconnectedness of the world's countries as entangled alliances led to World War I. Even the United States, separated by an ocean, was dragged into the conflict. This war, directly involving seven countries and causing the deaths of millions of soldiers and civilians, was the first war in which so many countries were involved on so many fronts. Some people argue that World War I was the direct result of conflict caused by increased economic and political competitiveness. As interaction and/or integration escalated between countries through heightened levels of trade, these countries also experienced more opportunities for tension to arise.

Similarly, when the stock market crashed in the United States in 1929, the ripple effects were felt around the world. International trade fell sharply during the Great Depression that followed, and construction came almost to a halt in many countries.

The United States government responded by increasing trade restrictions through the Smoot-Hawley Tariff Act passed in 1930. In raising tariffs, this act arguably exacerbated the depression as other countries retaliated by restricting imports from the United States.

Although the Smoot-Hawley Tariff Act was short-lived, its effects have been long-lasting. It was, at least in part, responsible for the Bretton Woods Agreement in 1944, which established a set of principles to guide commercial and financial dealings among the world's major industrialized countries. These changes in foreign policies have had a major impact on trade. The lessening of self-interested, protectionist thought and easement of trade restrictions made transactions more viable and more desirable.

Bretton Woods also led to the creation of the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development, one of the five institutions that now constitute the World Bank. The Bretton Woods system remained in effect until the early 1970s.

The establishment of the General Agreement on Tariffs and Trade (GATT) in the 1950s can also be traced back to the experiences of the United States with the Smoot-Hawley Tariff Act. GATT was initially set up through Bretton Woods to help provide for post–World War II economic recovery. Its primary role lay in decreasing barriers to international trade. It is important to keep in mind that, unlike the IMF and the World Bank, GATT was an agreement, not an organization.

The final round of GATT negotiations between 1986 and 1994 led to the eventual creation of an organization, the World Trade Organization (WTO), established for the purpose of liberalizing trade around the globe. The WTO handles a range of responsibilities, including negotiation, implementation, and policing of trade agreements.

Efforts are also taking place regionally. The North American Free Trade Area (NAFTA) represents one such effort aimed at managing multinational trade. This agreement removed trade restrictions between the United States, Canada, and Mexico. Similarly, though on a much larger scale, the formation of the European Union removed internal trade barriers and, at the same time, facilitates external trade as well.

Global Organizations

Reflective of the world's recognition of countries' growing interconnectedness and interdependence, numerous agreements and organizations have emerged and continue to influence multinational political, economic, cultural, and social interaction in varying degrees.

Governmental Organizations

The first and foremost of these organizations is the United Nations (UN). Established in 1945, the UN is an international organization comprising 200 member states that endeavors to promote cooperation with regard to international law, international security, economic development, social progress, and human rights. Although the effectiveness of the UN is frequently challenged, it remains in existence more than 60 years after its founding.

The Global Compact is one of the UN's more recent initiatives. Officially launched in 2000, the Compact brings companies together with UN agencies, nongovernmental organizations (NGOs), and civil society in a voluntary effort to promote sustainable and socially responsible business. The Global Compact boasts more than 3,000 member companies from around the world as of 2007.

Organizations such as these are important in that they bring countries together as they confront similar and shared challenges. Again, the reality is that countries are interconnected. Sustainability, for example, is a global problem—not one created by or to be solved by a single country alone. These kinds of organizations bridge the gaps created by political strife.

Nongovernmental Organizations

In addition to those organizations linked to governmental efforts, NGOs endeavor to bridge the gaps created by commercial endeavors. Perceiving global business as a potential threat to local communities and fundamental human rights, NGOs—small and large—strive to offset the harm that businesses can and do commit.

Although the term *nongovernmental organization* was not coined until 1945, with the creation of the UN Charter, voluntary associations formed for humanitarian purposes actually date back more than a century. The International Committee of the Red Cross, for example, founded in 1863, was an early NGO (even though not labeled as such at the time). This was only the first of many. There are approximately 40,000 international NGOs in existence as of 2007, with an estimated 2 million domestic NGOs in the United States, many of which emerged within the past 30 years.

NGOs tend to perform two primary functions: advocacy and operations. They continue to influence multinational corporations (MNCs) and contribute to local and regional working environments both directly and indirectly. The Rainforest Alliance, for example, has had a significant impact on Chiquita and on how that company does business throughout Latin America. The Rainforest Alliance contacted Chiquita several years ago as part of the Better Banana Project, aimed at enhancing environmental awareness and sustainability. After agreeing to participate in the endeavor, Chiquita worked closely with the Rainforest Alliance and ended by drastically revamping systems and processes. The result is that not only is Chiquita more environmentally conscious today, but it is also generally more socially responsible.

In spite of the invaluable role that many NGOs have played and continue to play, there is still considerable controversy surrounding NGOs more generally. While their influence is often for the benefit of marginalized or vulnerable groups, many NGOs have their own agendas. What they are able to accomplish is limited in that they rely on the voluntary assistance and cooperation of others—NGOs do not enjoy any sort of legal mandate or special authority over those they endeavor to influence and/or protect. Furthermore, while many take seriously their responsibility to those they serve, this is a choice they make—their only real accountability is to those who fund them.

Regardless, they do play a vital role in the fabric of global society. In general, they do not affiliate themselves with a national entity but with a cause that can span geographic borders. Their goals tend toward alleviating some sort of pain or suffering or wrong. In this way, in spite of their alleged shortcomings, their presence is becoming increasingly significant, in terms of both their numbers and the magnitude of their impact.

Business Organizations/ Multinational Corporations

Increased globalization has led to the rapid proliferation of MNCs—organizations whose business operations and/or dealings span at least two countries. In fact, many MNCs do business throughout the world.

Although the presence of MNCs has increased in recent years, the MNC as an entity is not new. The Dutch East India Company, established in 1602, was one of the early MNCs, whose purpose was to fund trade and sponsor the importing of exotic goods to Europe. For nearly two centuries, it represented a powerful force in trade and politics. Not only was it a major player in business, but it also represented the Dutch government in relations with other countries.

Although MNCs today are not generally granted diplomatic privileges, their political importance can similarly rival that of small countries through their ability to influence economic, political, social, and cultural affairs. Whereas in the past, there were a relatively small number of MNCs, globalization has led to the emergence of an increasing number.

MNCs have played an important role in developing business around the globe. MNCs both build and serve international markets. In addition, in many developing and emerging countries, they have also contributed to the development of vital infrastructure, and they have identified and addressed needs where local governments were not situated to do so.

The operation of MNCs is not, however, without controversy. Not all have acted responsibly. In fact, the American public was so embarrassed by a wave of incidents in which American businesses failed to exercise proper discretion that, in the 1970s, the United States responded by enacting the Foreign Corrupt Practices Act (FCPA). This monumental legislation severely restricted the behavior of American businesspeople overseas by preventing them from engaging in explicit bribery, even when failure to do so would place American businesses at a competitive disadvantage. Although the FCPA was initially criticized heavily, it has more recently become the model legislation for the anticorruption movement around the globe.

MNCs continue to confront challenges as they operate across, between, and among national borders—often in uncharted territory. Local laws—particularly in developing or emerging countries—are frequently nonexistent or insufficient and fail to protect the interests of local communities or the MNCs themselves. In addition, the absence of proper regulation leaves them vulnerable to media backlash if their behavior is subsequently questioned.

Even countries in which MNCs operate have been known to resent the presence of these MNCs. MNCs are sometimes viewed as imperialistic as they move in, often without showing adequate respect for local customs and traditions. Their motives are arguably self-serving, and they address only those needs that interest them. As in the United States, where communities often suffer as companies relocate manufacturing facilities away from those communities, this sort of situation can be even more severe when an MNC moves out of a developing or emerging country. In addition, the continued operation of MNCs in poorer countries such as Bangladesh perpetuates poor government practices by creating a false sense of economic security.

Role of Business

As globalization has increased, businesses have taken on new and expanding roles. While business is often viewed as limited to profit generation, new opportunities are being identified for MNCs to generate additional profits as they make other significant contributions to society as well.

Relationship Between Business and Poverty

Globalization makes people more aware of poverty and their ability to help alleviate it. Globalization also enables businesses to contribute to improving the standard of living by creating new markets. In fact, new business opportunities linked to developing and emerging countries often lead to new potential buyers and new categories of products.

There are those who argue, however, that the problem with businesses is that they have traditionally been too focused on the top of the pyramid. If society is viewed as a pyramid, the smallest group at the top comprises the wealthy, while the largest group at the bottom comprises the poor. The University of Michigan scholar C. K. Prahalad argues that there is tremendous opportunity at the bottom of the pyramid—that businesses can both serve social ends and, at the same time, increase profits by targeting the poor.

Many MNCs nevertheless remain resistant to this line of thinking. Many of these companies, such as Levi Strauss and Company, endeavor to contribute to developing and emerging countries, not by changing their business models but by indirectly assisting local populations through their general contributions to local economies. For example, MNCs make valuable contributions by implementing educational initiatives, providing health care, offering job training, developing local infrastructure, and so on.

Despite the perceived potential of globalization, there is also a belief that globalization actually runs counter to improving economic conditions. Joseph Stiglitz argues that globalization has actually exacerbated the disparity between the rich and the poor around the world. In fact, he contends, globalization gives powerful countries the means with which to exploit less powerful countries.

There is also the argument that poverty is not being reduced through globalization at a level commensurate with the degree to which the rich are being made more prosperous. The poverty reduction rates are simply not keeping pace with the growth rates. This is problematic in that it reveals how the apparent positive consequences of globalization mask the underlying shortcomings that should be addressed and not ignored.

It is important to recognize these disparities because it is the only way they can be tackled effectively. The unequal distribution of wealth and resources deprives many of the poor of the means with which they could lift themselves out of poverty. Globalization alone does not solve their problems of lack of access to resources, illiteracy, poor health, and so on, which contribute to their inability to make meaningful contributions to their societies.

Contrary to this is the reality that many countries have emerged from poverty during the past 50 years only because of globalization and the enhanced roles that MNCs and NGOs have taken on. The same is true for China in recent years, as it is becoming a dominant force in the global marketplace.

China is where globalization is now. The same companies that withdrew and/or refused to do business in China in the 1990s as a result of the rampant human rights violations were among the first to reenter the country in the early years of the 21st century. Although there is a view that China has changed its social practices, a more compelling argument is the pragmatic one—that is, that MNCs today simply cannot afford not to be in China; China holds too much of a stake in the global marketplace and workplace as a result of its huge and growing population. In addition, the MNCs in China today tend to assert that the best way they can influence responsible social practices is by being there.

Levi Strauss and Company, for example, has therefore partnered with the Asia Foundation to reenter China. In addition to finding responsible outsourcing partners, through collaboration with the Asia Foundation, the company helps educate and inform workers throughout China.

Global Markeplace

The effect of having China in the global marketplace is proving increasingly profound in that it is changing how companies view their role in the market. Ferrari, for example, is confronting a significant challenge to its business model. The company previously stated that it would never increase its level of production, in spite of increasing demand, to protect the exclusivity of its cars. Demand for Ferrari cars, however, has recently spiked far beyond anticipation. This is in large part due to the increasing affluence in China, which is creating a new, large class of wealthy Chinese businesspeople who are placing orders. This problem of supply and demand is further exacerbated by the steadily growing Chinese population. The challenge Ferrari confronts, along with many others, is how to handle this explosive growth of the global market.

Global Workplace

In addition, the high cost of labor (and benefits) in the United States has arguably forced many companies—such as manufacturers in the apparel industry—to go overseas for labor. Since roughly the 1990s, there has been a trend toward increased offshoring and outsourcing. Offshoring occurs when companies relocate facilities and processes from one country to another—often from the United States or other Western democracies to a developing or emerging country. Outsourcing, on the other hand, is somewhat different in that it involves transferring responsibility for business processes to third parties.

Outsourcing has become particularly controversial during the past decade as media exposés uncovered the questionable, "sweatshop," labor practices endorsed by leading companies such as Walt Disney, Nike, and Wal-Mart. It was argued that these companies violated fundamental human rights by supporting practices such as child labor, excessive working hours, and unsafe conditions.

At the same time, globalization has enabled job creation and specialization. The presence of a global workplace enables businesses to shift their processes to locations where they can find the least expensive, most talented labor pool for the appropriate job functions. As more and more companies take advantage of the global workplace, however, increasing concerns are emerging regarding the loss of jobs in the United States and other Western democracies.

Peace Through Commerce

Increased globalization is also leading to a growing recognition of the connections between business, poverty, and political stability. While people disagree as to whether this correlation is primarily positive or primarily negative, few people deny that the interconnectedness exists.

One view is that business interferes with peace and can lead to political instability. The influx of strong multicultural influences can cause local peoples to lose touch with their own identities. In addition, as the economic landscape changes, this can lead to increased corruption and other negative behaviors. Development of business can exacerbate the economic gaps between the wealthy and the poor and, in some instances, drive the impoverished into greater despair. In the former Soviet Union, for example, there were no beggars until after the economy began liberalizing in the late 1980s and early 1990s. In addition, businesses can also contribute to instability and increased bloodshed by profiting from war. Some companies, for example, are in business to trade in weapons and arm warring states.

These are but a few examples of how increased commerce can have a negative impact on peace. There is also a strong argument that the development of business can help promote stability both by increasing the reliance of countries on one another through global trade and by contributing to local development and the reduction of poverty. Countries that need one another financially are arguably less likely to declare war on one another.

Economic development in the former Yugoslavia offers examples of this. Since the end of the civil war that led to the breaking up of Yugoslavia into separate republics, numerous business relationships have been developed among and between Bosnia, Serbia, Croatia, and Slovenia, for example. People who fought violently against one another just over a decade ago are now sitting down together to move their economies forward.

Korea is also recognizing that although peace has been attained, the situation is delicate. Commercial ties are therefore being developed, arguably in an effort to help cement that peace. An unprecedented event took place in Korea in May 2007. For the first time in more than 50 years, trains traveled across the demilitarized zone from the top of North Korea to the bottom of South Korea—one from north to south, the other from south to north. This signifies potential commercial activity that could cement the established peace. South Korea, in particular, is anxious to create travel and trade opportunities through North Korea into China and Russia to connect with the Trans-Siberian Railway.

The impact of commerce on peace and stability is thus complex and multifaceted and involves both negative and positive potential consequences.

New Business Opportunities

Businesses have quickly seized the opportunity to enter—and exploit when possible—this global marketplace. The Berlin Wall coming down signaled the presence of new markets to which they finally had access. Since the door opened, there has been no stopping the integration of business around the world.

This has also created a more heated business environment, for Western businesses now face the challenge of new competitors that are able to provide the same, or similar, goods and services for lower prices and, sometimes, higher quality. It is inevitable, however, that to remain profitable, more and more businesses are finding it necessary to acquire a global presence.

A problem is that globalization has also exposed businesses to new threats. Facilitation of information exchange has also opened a Pandora's box of intellectual property challenges. It has enabled business rivals in other countries to replicate leading brands and to sell their products at low prices—often without regard for quality. This has arguably caused brand dilution and created a significant threat to new product development.

Globalization has changed the business environment significantly. In many instances, it has lowered costs for the consumer by forcing companies to streamline processes and cost structures in order to remain competitive in a wider marketplace. At the same time, it has opened up new markets for companies to target; even though these companies are now faced with fiercer competition, they are able to reach a larger audience.

In fact, few businesses today—no matter where they are located—enjoy the luxury of being able to compete only locally, particularly as a result of the presence of the Internet and the ease of travel. Globalization has implicitly forced businesses to start thinking on an international scale.

Globalization Controversy

Not everyone agrees, however, that the effects of globalization are entirely positive. Although many people applaud globalization for its numerous positive contributions, there are significant concerns that cannot—and should not—be ignored.

Proglobalization

The argument in favor of globalization is intuitive and largely based on common sense and experience. The positive benefits of globalization are visible: increased communication, lower travel costs, increased product availability and diversity, to name a few. Generally speaking, globalization breaks down the geographic barriers between communities and countries to allow for unfettered trade.

Globalization increases the options available to people around the world. This applies to products and services as well as to ways of life and ideas. It can be argued that globalization is breaking down the barriers between cultures. This translates into a huge benefit for companies, who now have access to much larger markets.

In addition, through globalization, companies around the world are held to a higher degree of scrutiny. This is leading to a greater degree of accountability—for instance, with regard to the responsible treatment of global workers. There is an increasing push around the world today toward standardization of working conditions and responsible labor practices.

Countries are also becoming increasingly accountable for their political choices and legislative policies. As a result of globalization and increased multinational trade, countries are becoming more cognizant of and concerned about what is going on. Iraq, for example, although geographically removed from most of the world's superpowers, has nevertheless become a focal point of contention in recent years.

In fact, globalization can be said to contribute to peace between otherwise warring countries. This is true, for example, with regard to the relationship between India and Pakistan. In spite of their history of tension, ongoing business ties have created de facto sustainable peace between them.

Thomas Friedman, an advocate of globalization, argues that there are still problems but those problems are not insurmountable. For example, in *The Lexus and the Olive Tree*, he points out that it is inevitable that countries relinquish some of their sovereignty to global institutions to contribute to global economic prosperity.

Out of globalization has emerged an implicit, if not explicit, recognition of the interconnectedness of the world and countries' inherent interdependence. This is particularly visible with regard to the sustainability movement, which emphasizes ongoing change with regard to shared resources. Globalization is responsible for bringing diverse people together in common endeavors.

Antiglobalization

Opponents to globalization contend that globalization is, in fact, more destructive than constructive. Whereas many people choose to focus on the new opportunities that globalization affords the wealthy, they seem to overlook the intended and unintended consequences to everyone else. Among others, Joseph Stiglitz, in *Civilization and Its Discontents*, has criticized globalization for not delivering on its promise of economic development. According to Stiglitz, globalization can potentially perpetuate poverty around the world.

The problem—or point of contention—is that certain large companies act as gatekeepers and are able to exert considerable influence even in the absence of explicit political authority. This was true in centuries past for the East India Companies and remains true today for companies such as Wal-Mart. Today, Wal-Mart is criticized for the degree of pressure the company allegedly puts on suppliers. It has been suggested that Wal-Mart exercises de facto control over what products are imported for distribution to its customers.

Cultural imperialism and the homogenization of the world are also major concerns as the presence of MNCs becomes more widespread, particularly in developing and emerging countries. MNCs often fill in the gaps for local governments. In doing so, they are not always respectful of local customs and traditions, which can potentially become undermined as the presence of MNCs becomes increasingly overwhelming.

Interestingly, this also creates dependencies that can leave countries vulnerable. The situation pertaining to oil in the Middle East, for example, is effectively holding the rest of the world hostage. This could also happen with regard to other scarce resources.

Conclusion

The bottom line is that globalization exists. It is here today and will inevitably be there tomorrow. Now that the barriers have been broken down, they will be difficult to re-erect in the foreseeable future. Technology makes this virtually impossible.

Globalization has changed the lens through which many businesses view their identity. Increasingly, many are viewing themselves not just as independent operators or MNCs but as global corporate citizens, and they are voluntarily accepting the social responsibilities of global citizenship as they operate within global workplaces and serve global markets. While not every business views itself in this way, more and more of them are following suit.

Global Reporting Initiative

The Global Reporting Initiative (GRI) is a project formed in 1997 by U.S.-based Coalition for Environmentally Responsible Economies and the United Nations Environment Program to develop guidelines for sustainability or triple-bottom-line reporting. Sustainability reporting is based on the value of *sustainability*, defined as supporting the continued existence and welfare of oneself and identified others, and *transparency*, that is, being accountable to stakeholders who have a legitimate interest in organizational performance related to sustainable behaviors. The sustainability reporting framework is an expansion of the financial reporting framework that includes an organization's broader economic, social, and environmental impacts.

The GRI's framework for reporting organizational performance is intended to bring greater uniformity and comprehensiveness to sustainability reports. Without a common reporting framework and standards, it is difficult to compare reports from different companies. The GRI is regarded as the most widely known, supported, and comprehensive set of voluntary reporting standards. The process for creating the GRI guidelines involves extensive comment and feedback from representatives of business, accounting groups, investor organizations, activist groups, and other stakeholder representatives.

Over time, it has created a multistakeholder consensus process to develop and pilot test standards before publishing a draft to seek broader input interested groups.

The initial set of GRI guidelines was developed in 2000, and 50 organizations used the guidelines for reporting 2000 performance. Feedback from reporting organizations and users of the initial reports led to the second set of guidelines issued in 2002, and more than 150 organizations used them to report 2002 performance. In that year the GRI became a separate nonprofit organization with headquarters in Amsterdam, the Netherlands. Over the next 3 years, sector-specific supplements were developed for several large industries, including mining and metals, financial services, logistics and transportation, and telecommunications. The number of reporting organizations increased to 325 in 2003, 500 in 2004, 750 in 2005, and at least 950 in November 2006. The third version of GRI guidelines was released in October 2006 after an extensive comment and review period.

Most of the organizations that use the GRI guidelines for sustainability reporting are large multinational corporations that are highly visible global competitors, such as BP, Chevron, Exxon, PEMEX, PetroBras, Shell, Statoil, and Total in the petroleum industry and BMW, Daimler-Chrysler, Ford, General Motors, Nissan, Toyota, and Volkswagen in the automotive industry. A small number of public sector organizations also use GRI guidelines in their sustainability reports, such as Australia's Department of Environment and Heritage, New Zealand's Department of Corrections, and the United Kingdom's Ministry of Defence.

A sustainability report according to GRI guidelines includes information on the organization's strategy, operating profile, and governance and management systems in addition to data on 50 performance indicators related to economic activity, environmental impacts, and social impacts. The social impact category includes human rights, community impact, and product responsibility. In addition to the three categories of performance indicators, two types of integrated metrics are encouraged. One relates to systematic indicators that demonstrate how an organization's activities contribute to the economic, environmental, and social systems in which it operates. For example, a company might report on net job creation as a proportion of total new jobs in a region in which it has operations. The second integrated metric is a cross-cutting indicator, which directly relates two or more dimensions of economic, environmental, and social performance as a ratio. For example, an ecoefficiency measure related to a new technology may indicate the change in air pollutant emissions per increase in production level.

GRI supporters believe that organizations should be motivated to provide sustainability reports to improve relations with their stakeholders. Access to accurate and comprehensive information about its impacts on the economy, the environment, and society should increase the organization's reputation and level of trust that stakeholders have in it. These reports inform decisions beyond those supported by traditional financial reports. For example, a potential investor who is concerned about environmental preservation can more easily ascertain whether the organization is committed to that goal if it uses GRI reporting guidelines. Potential employees can decide whether they want to work for a firm, based on more complete information about employee benefits beyond legal minimums, equal opportunity policies and monitoring systems, and health and safety records. Communities can either welcome or resist an organization seeking to locate a new facility in their midst, based on GRI-provided descriptions of significant environmental impacts of principal products, services, and manufacturing processes.

An unresolved issue related to the GRI guidelines is credibility because few sustainability reports are audited by independent assurance providers. Questions have been raised about the appropriate qualifications and certification of assurance providers because experts in financial auditing are unlikely to have expertise in all facets of triple-bottom-line reporting.

Application of GRI guidelines is likely to expand to include a larger number of reporting companies in the future. These guidelines became linked to the United Nations Global Compact in October 2006 when the two organizations proposed an approach to the 3,000 companies participating in the Global Compact to use GRI guidelines when reporting their performance on the 10 Global Compact principles.

Golden Parachutes

A golden parachute is a provision in an employment contract that grants lucrative severance benefits to an executive if control of the company changes hands, as by a merger. Most definitions offered by legal authorities stress three elements: (1) a lucrative or attractive severance package, (2) available to a few selected senior executives, (3) in a change of control situation for the company. Some also define it as compensation to a chief executive officer or other C-level executive for losing his or her job. Others do not so restrict its availability to those who actually lose their jobs, but extend it as well to those who lose job status in the event of a change in control.

In common usage, the term *golden parachute* refers to large severance payments made when a change of control results in job termination. However, for tax purposes, the crucial element is change in corporate control, and the payment need not be to compensate for termination, but could be any type of compensation. It is also useful to distinguish a golden parachute from a normal severance payment. Usually, an employee dismissed for cause does not receive a severance payment, and the same is true when that employee leaves voluntarily. However, even a C-level executive who is fired for cause or simply resigns may receive a golden parachute, depending on the terms of the employment contract.

As a way to further distinguish golden parachutes from severance payments, the amount of a severance payment is based on years of service to the company, while a golden parachute will be based on the individual negotiation between the executive and the company. Even a CEO who serves for a short time period may wind up with a substantial golden parachute.

Scope of Coverage

Golden parachutes are usually included in the contracts for C-level executives (chief executive officer, chief operating officer, chief financial officer, and chief legal officer), but they sometimes appear in the contracts for executive vice presidents and other top officers as well. After the merger between Coors and Molson Companies, 11 top executives at Coors resigned, since they had change-of-control payment provisions in their contracts. None of the Molson top executives resigned, though, as they were not covered by such provisions.

Components

The pay components of a golden parachute may vary widely. It may include not only a cash payout, along with restricted stock or stock options, but also an annual pension, a departure bonus, medical benefits, and administrative and secretarial support. It may also include other imaginative perks, including payment of charitable donations in the executive's name or use of an executive jet.

Amounts

In their golden parachutes, CEOs typically receive two or three times the value of the base salary and bonus, as well as benefits, stock options, and pension payments. Presidents, COOs, CFOs, and other C-level executives typically receive one to two times the base salary, plus bonus, benefits, stock options, and pensions.

Some CEOs have negotiated golden parachutes that have allowed stock options to vest immediately, and thereafter payouts skyrocketed, according to one compensation expert. Some golden parachutes have had a platinum lining. For instance, Michael Ovitz received a severance payment exceeding $100 million from Disney; Phillip Purcell had an exit package of $114 million after his ouster as CEO of Morgan Stanley; and Jim Kilts, CEO of Gillette, received a golden parachute of $165 million after Procter & Gamble acquired his company. Those amounts raise questions of distributive justice, especially since a merger may trigger uncompensated layoffs of lower-level employees.

When a CEO receives a huge golden parachute after the company's stock value has plummeted, that offends shareholders and critics the most and raises questions of deservedness. Henry McKinnell of Pfizer, for instance, was granted a pension package of $83 million before his resignation and after the company had lost 46% of its stock value during his term of office.

Purposes

The original and key purpose of the golden parachute, dating back to the 1970s and 1980s, was to protect CEOs and other top officers in the event of takeovers that might lead to their ouster. They would then enjoy security in a market where other CEO positions might not be readily available and be more willing to take the job initially. Second, a golden parachute might better align the interests of CEOs with those of shareholders. Given the security that golden parachutes provide to CEOs and the compensation for future lost expected earnings, they would have no self-interest in resisting a merger or takeover that might enhance the value of shares, at least on a short-term basis. Top management would not have the incentive to interfere with the market for corporate control that includes potential takeover bids. In fact, some CEOs might view the sale of a company as a crowning event to their careers, and with golden parachutes, the CEOs would benefit both economically and from any positive publicity attending the sale of the company.

Another purpose of golden parachutes might be to deter an unwanted or hostile takeover, since the raider then absorbs the burden of making substantial payouts to the CEO and other senior executives. In that sense, golden parachutes might serve as poison pills and defenses to takeovers. In fact, a company might institute golden parachutes as events triggered by a takeover offer. Furthermore, golden parachutes might serve as recruitment and retention incentives, attracting senior executives to a firm where they might expect a substantial payout some years down the road and causing them to stick with a firm until that eventuality. When other companies have adopted golden parachutes, its defenders argue that an employer must adopt generous packages to keep pace and remain competitive.

Criticisms of Golden Parachutes

A major criticism of golden parachutes is that they entrench existing managers in their jobs by deterring takeovers. In that sense, they subsidize existing management at the expense of shareholders. When the golden parachute is eventually paid, it subsidizes the then departing managers at the expense of shareholders once again. A golden parachute might also constitute a reward for failure when management hastens to sell the company in the wake of a plummeting stock value.

To the extent that adoption of golden parachutes might signal future takeover bids, stock values might increase, benefiting shareholders. However, negative market reaction is even more likely, as golden parachutes often signal to shareholders that additional antitakeover measures will follow to prevent the eventual sale of the company.

Defenders of golden parachutes maintain that they guard the objectivity of management and allow it to best serve shareholder interests by providing an incentive to get top dollar in a sale or auction of the company, rather than protecting their own jobs. To that argument, critics respond that management has a preexisting fiduciary duty to serve shareholder interests and should not require an artificial incentive to live up to their obligations.

Critics also cite instances of "golden bungees," where golden parachutes are abused. Rather than executives simply redeeming their golden parachutes when a change of control occurs, they also jump back into the company in a different position. For instance, when Washington Mutual acquired Providian Financial, its CEO returned as head of Washington Mutual's credit card division, while also receiving his golden parachute. Shareholders oppose this type of abuse and have urged a "double trigger" to control payouts, requiring termination of an executive's employment to trigger the golden parachute.

Legal Controls

In normal circumstances, golden parachutes are completely legal. In abnormal circumstances, however, there could be legal constraints. In a bankruptcy situation, for instance, judges have disallowed golden parachutes as legitimate administrative expenses, while allowing retention pay for a broader base of employees based on years of service.

Directors, especially members of board compensation committees, might be found liable for violating their duties of due care and good faith to shareholders if they exercise insufficient scrutiny of exorbitant severance pay or golden parachutes. Although Delaware Judge Chandler ruled that the Disney board did not violate its fiduciary duty in approving a severance package of over $100 million for Michael Ovitz, who had been fired without cause, the case may have raised the bar for future board conduct. That the court even decided to hear the case indicated growing judicial concern over such pay packages. In his ruling, Judge Chandler acknowledged that the Disney board's approval "fell significantly short of the best practices of ideal corporate governance."

The Sarbanes-Oxley Act reformed accounting controls and oversight, while also mandating other changes in corporate governance, but it had no direct impact on golden parachutes or severance packages. In fact, by prohibiting loans to C-level executives, it might have indirectly created more pressure for lucrative severance packages.

Tax Aspects

There are three components of the internal revenue code that relate to golden parachutes. Section 4999 imposes a 20% excise tax, above and beyond the normal income tax, on "excess parachute payments," while section 280G makes such payments nondeductible to the corporation. Congress passed these provisions as part of the Budget Deficit Reduction Act of 1984. Denying deductibility to the corporation provides an incentive not to provide golden parachutes, and the imposition of an excise tax provides an incentive to the individual executive not to receive them. These provisions apply to the top 250 employees of the corporation, not just to the top executives. Finally, section 162(a) of the internal revenue code denies deductibility of any compensation in excess of $1 million unless it is performance based. Rewarding an underperforming executive with a lucrative golden parachute would trigger that provision.

While the goal of these provisions was to limit the use and amount of golden parachutes, that goal has not been realized. The impulse to both provide and receive golden parachutes persists. Corporations have even used tax gross-ups to circumvent Sections 4999 and 280G and to pay all the taxes of recipient executives, thereby preserving their incentive to receive golden parachutes. Tax gross-ups are very costly to corporations, but they remain willing to pay them in order to provide the incentives of a golden parachute.

Corporate Governance Aspects

Corporate governance relates to golden parachutes similar to the way in which it relates to other executive compensation issues and in the same way it relates to the various components of golden parachutes. The composition and practices of the board compensation committee are important, as are the roles of shareholders in pressing for reforms of executive compensation. Regulations surrounding stock options and restricted stock, often components of golden parachutes, are also important.

Even when CEOs or former CEOs who sit on the compensation committee of another CEO are considered independent, they often approve excessive severance packages and golden parachutes for their fellow CEOs. Hence, boards dominated by outside directors have adopted golden parachutes even more frequently than insider-dominated boards. Studies of social networking also reveal that CEOs with some connection to members of the compensation committee receive larger packages than those lacking such connections.

Where compensation committees do exercise some restraint on pay packages, they do so partly by hiring a pay consultant rather than leaving that up to the CEO. More than half of the top Fortune 100 corporations follow that practice.

Although board directors may adopt golden parachute provisions without shareholder approval, shareholders are exercising downward pressure on golden parachutes in three ways. First, statutory stock options, often a component of such parachutes, require shareholder approval within 12 months of action by the board of directors. Second, shareholder activists sponsor resolutions that call for acceptable levels of benefits. For example, the California Public Employees Retirement System has sponsored proposals calling for shareholder approval of severance packages in excess of 2.99 times the sum of the base salary and bonus. Shareholder resolutions on golden parachutes are among the issues that have garnered the highest percentage of majority shareholder votes, and golden parachutes are among the business practices that correlate most heavily to negative shareholder value. Third, shareholders have withheld votes for directors who sit on compensation committees that grant large severance packages, pensions, or golden parachutes. At Pfizer, for instance, some pension funds and other institutional investors withheld votes for the four directors in 2006 who sat on the compensation committee that approved of the CEO's pension. Such shareholder activism, over time, may reduce the scope and incidence of golden parachute payouts to top corporate executives.

Golden Rule, The

Do unto others as you would have others do unto you. Often referred to as the Golden Rule or the Ethic of Reciprocity, this ecumenical moral principle implores adherents to contemplate the feelings and preferences of fellow human beings before acting. Although the rule finds its prominence in Christian theology through the teachings of Jesus, its origin can be traced back to the Hindu tradition and a pronouncement circa 3000 BCE.

The Golden Rule is contained within the ethical systems of many of the world's most prominent religions such as Buddhism, Christianity, Confucianism, Hinduism, Islam, Jainism, Judaism, Sikhism, Taoism, and Zoroastrianism. Alongside these world religions, many prominent thinkers also incorporate the Golden Rule into their philosophies, including Plato and Socrates. The philosopher Immanuel Kant's categorical imperative disallows personal exceptions unless the same exception can be made for all others in similar situations without an irrational result. Similar to the Golden Rule, this Kantian categorical imperative requires people to think of others as ends instead of a means to an end and also about the consequences stemming from actions. Finally, from a purely secular viewpoint, both anthropology and psychology can claim a nonreligiously motivated origination of the concept of the Golden Rule. An anthropologist may argue that the rule is a cultural variation of the underlying human relationship principle of social reciprocity and that this principle has defined human organizations and human interaction for centuries. Correspondingly, a psychologist may argue that the reciprocity urged by the rule merely reflects the behavioral-cognitive trait of empathy.

But why is the Golden Rule compelling as a moral principle? The morality or immorality underlying a proposed action is not always apparent, and such unanalyzed uncertainty often leads people to act without moral clarity. The Golden Rule is compelling as a moral principle because it requires an actor to undertake a comprehensive ethical analysis *before acting.* First, the actor must analyze the potential consequences of the contemplated action on the primary recipient and assess how the actor would feel if the roles of actor and recipient were reversed. Second, the actor must look beyond the immediate recipient to others who may be remotely affected and assess how the actor would feel if the roles were again reversed. Because the Golden Rule is a moral principle and not a comprehensive ethical system, this sequential thought process will not result in a determination as to whether any particular action is moral or immoral. Such contemplation of consequences will, however, allow people to monitor their actions to determine whether they are acting in a manner consistent with their morals and, theoretically, lead them toward taking moral actions. The application of the rule also allows adherents to more clearly see the commonalities between themselves and others.

The Golden Rule has two common formulations—a positive formulation and a negative formulation. The positive formulation requires people to do unto others as you would have others do unto you. In other words, this formulation tells people what they should do. The negative formulation of the rule—often referred to as the Silver Rule—is do not do unto others as you would not have them do unto you. In other words, this formulation tells people what they should not do. While certain adherents claim that each formulation captures a different moral principle, other adherents claim that the Golden and Silver Rules encompass the same moral principle and need not be separated.

Analyzing the Golden Rule

The Golden Rule is deceivingly simplistic. Literally, the rule requires an actor to treat others in the same way that the actor would want to be treated in a similar situation. Such a literal reading of the rule raises two key interpretative questions. First, who are the "others"? Are they composed only of members of a specific faith community or members of humanity in general? Second, must an adherent strive only *to do good* or must the same person also *strive to avoid evil* although such avoidance of evil is not specifically mentioned in the rule? To address these issues, the Golden Rule has been subjected to the following distinctions: (1) the Complete versus Partial Distinction and (2) the Inclusive versus Selective Distinction.

The Complete Distinction requires adherents to abide by both the positive and the negative formulations of the rule. In other words, an actor must strive to both do good and avoid evil when acting. The Partial Distinction, on the other hand, only requires adherents to abide by the negative formulation of the rule. Therefore, actors must avoid hurting others through their actions but have no obligation to affirmatively help others. This distinction requires adherence to the Silver Rule and not the Golden Rule in its positive formulation.

The Inclusive Distinction of the Golden Rule requires adherents to treat all humanity—not merely members of a specific faith community—in accordance with the rule. This inclusive interpretation can be accompanied by adherence to either the Complete or Partial Distinction of the rule. The Selective Distinction, on the other hand, interprets the rule in such a way that it only applies to a select class of people and not to humanity in general. For example, a Christian adhering to the selective version of the rule need only treat other Christians—or possibly only members of a particular Christian denomination—in accordance with the Golden Rule. The Selective Distinction can be accompanied by adherence to either the Complete or Partial Distinction of the rule.

Criticism of the Golden Rule

The Golden Rule—despite its broad theological, philosophical, and secular acceptance—faces two prominent criticisms: (1) the Social Norms problem and (2) the Social Rules problem. The Social Norms problem results when an action violates a social norm but is nevertheless acceptable under the rule because the actor would not object to the same action if the roles were reversed. For example, an employee enjoying situations where other employees start frivolous arguments—completely unrelated to an employment relationship—acts in compliance with the rule by starting non-work-related frivolous arguments with other employees. Such argument starting violates the generally accepted social norm that it is impolite to start frivolous arguments with others in the workplace while at the same time apparently complying with the Golden Rule.

The Social Rules problem results when a person commits any act that violates an established social rule—such as a state or federal statute—and would not object to a similar violation if roles were reversed. For example, assume that an actor offers nonpublic investment information to a friend in the form of a stock tip and that the offeror would want, or even expect, the friend to reciprocate if roles were reversed. At this point, the offeror is acting in accordance with the Golden Rule but in violation of state and federal law.

Rule adherents argue that the critics' interpretations of the rule violate its spirit—a spirit requiring an actor to consider two aspects neglected by the two problematic actors above: (1) the dignity and consent of all recipients and (2) the secondary recipients as represented by societal segments and not just individuals. Therefore, in the argumentative employee example above, the actor would not adhere to the spirit of the rule by starting frivolous arguments because this action does not take into account the dignity and consent of the recipient—an individual who would not likely endorse this social norm violation. Just as a rational actor would not tolerate invasions of personal dignity and consent, such an actor should not treat others in an undignified and nonconsensual manner. As for the insider trading example, actors must consider that company stockholders are also indirectly affected by this insider stock tip. Therefore, assuming a role reversal, the actor must ponder a reaction as a stockholder harmed by insider trading and not just as the recipient of inside information. With this in mind, proponents argue that both the Social Norms problem and the Social Rules problem would be eliminated if actors complied with the spirit and not merely the literal interpretation of the Golden Rule.

Goodwill

Goodwill as a Disposition

"Goodwill" is a central concept in Western moral thinking. It has several meanings, even already in daily discourse. Common to the various meanings is that the concept refers to something internal to a person and that something is considered to be of moral value. Goodwill deserves moral esteem.

In common discourse, goodwill can first refer to a specific *disposition* of a person. As such, goodwill can be defined as the virtue of being prepared to accept the fair share of a burden, in the context of a situation in which a group of people wants to realize a goal that involves costs of some sort that must be borne by the members. Put briefly, a person of goodwill does not take advantage of others. Thus, we can say that a local library initiative is based on goodwill if people share their books on a voluntary basis without a judicially full proof return system in place.

In its most general meaning, the shared goal may only be deemed good subjectively by the members. A somewhat more qualified employment of the concept differs in this respect. Here, goodwill is necessarily linked to an objectively good moral cause, for which a person is willing to make a sacrifice. The sacrifice may even involve more than his or her fair share. An example of this employment would be to say that "All people of goodwill strive for world peace."

It is in this specific interpretation of goodwill as a disposition that the concept is relevant for the business context. Corporations (or market agents in general) are often called on to show their goodwill in this sense. Objectively good moral causes often mentioned nowadays are, for example, sustainability, nature protection, or the fight against poverty. Thus, oil companies are prompted by nongovernmental organizations to show their goodwill by investing in fuel efficiency, the development of alternative energy sources, wildlife protection, and so forth.

Goodwill as a Motive

The second and arguably the dominant interpretation of goodwill in common discourse employs the concept as referring to the *motive* a person has when performing an act. A person of goodwill in this sense has a "good heart" or "good intentions," morally speaking, when performing a particular act. This means that in acting, this person is actually motivated by morally true or morally proper motives, feelings, inclinations, or reasons. Within common discourse, this concept of properness must be interpreted rather broadly and includes, for example, feelings of sympathy, love, benevolence, a concern for the happiness of all, or a sense of duty. So when a person who is already busy decides to help a friend in need for the sake of (this particular) friendship, we may say that he or she acts out of goodwill. An example of a motivation that typically falls outside the reach of goodwill is self-interest. A person who acts out of self-interest does not act out of goodwill. This is not to say that self-interest must therefore be condemned as bad. In many instances, self-interest is an acceptable motive, morally speaking, but acting out of self-interest is not particularly good or valuable. So when a person who is already busy decides to help another person in need because she expects that this action to pay off in the long run, she is not acting out of goodwill.

Distinguishing Moral Value and Moral Rightness

In understanding goodwill as a concept and why it is so central to Western moral thinking, we must clearly distinguish the moral *value* of an action and its moral *rightness.*

From both a moral and a prudent perspective, society considers it very important that people act in accordance with all moral rules and moral principles. Moral rules and principles have a function in upholding society. A (general) disregard of moral rules and principles will threaten the possibility of society. If people act in accordance with all moral rules and principles, we call their actions morally *right.* Moral *value* is attached to conduct that is morally outstanding or good in the sense that the reasons behind this conduct are contributive to the realization of a society in which all people uphold all moral rules and principles for their own sake or autonomously. Motivations oriented toward this moral goal are true or proper moral motivations.

Crucial to understanding goodwill is to see that a society in which all people act *rightly* does not necessarily—or not even typically—coincide with a society in which people's conduct is morally valuable. People may have a lot of reasons to act morally right—in the sense of acting in accordance with moral rules and principles. They may, for example, worry about their reputation, fear legal punishment (if a moral rule also is a legal rule), or figure that some benefit will emerge from the act, such as a reward or the admiration of a person one wants to impress. Moral rightness—in the sense specified—therefore is not directly or necessarily morally valuable. Moral value arises only if a person is moved by a true moral motivation.

Taken the other way around, it also holds that the moral valuableness of an act does not imply that the action also is morally right. Sometimes action done out of goodwill is based on poor judgment or has terrible consequences. Still, the implications of moral value for moral rightness are more complex. Or perhaps it is better to say that there is some reasonable moral disagreement as to this issue within Western moral thinking. Some people maintain that the moral value of an action has no implications whatsoever for its moral rightness (e.g., because they hold that only the principle is relevant here that says that only consequences count). Others maintain that goodwill does affect the rightness of an action, even if its origin in goodwill cannot be a sufficient reason to determine an action right.

Good Intentions in the Business Context

The issue of goodwill and the related distinction between moral rightness and moral value is vital for understanding the complexities of contemporary discussions in business ethics, especially in relation to a phenomenon such as corporate social responsibility (CSR). CSR can be understood as the appeal to corporations to act out of goodwill. It can also be understood—or at least is often understood—as the appeal to corporations to act morally right. These two conceptions do not amount to the same thing. That is why sometimes corporations that make quite an effort in terms of advancing sustainability as a goal are still accused of window dressing or are treated with great suspicion by the public. Acting right does not imply acting in ways that are morally valuable and the public may think that this particular company is only acting the way it does out of self-interest.

Kantian Interpretation

Goodwill is not only part of the Western common discourse on morality. It is also the subject of philosophical investigation. A specialized philosophical account of goodwill has been worked out most notably by Immanuel Kant (1724–1804). His account has been very influential, even for our common understanding of goodwill.

Kant defined goodwill in terms of a pure motive for action. Persons of goodwill thus do not just act in conformity with rules and principles. They act out of a sense of duty in every situation in which it is necessary. This means that they are rationally committed to upholding moral rules and principles out of respect for morality.

Comparing the Kantian conceptualization with the common usages of the concept as motive shows that Kant's interpretation of what constitutes an appropriate motive is much more confined than common discourse on the subject. In common discourse, feelings such as benevolence and love can be considered to be included in goodwill. Within the Kantian account only the rational commitment to morality is accepted as goodwill. Still, Kantian goodwill is not something elitist. According to Kant, any person can acquire goodwill.

Kant was not very articulate on the issue of how goodwill relates to the moral rightness of an action. He seemed to believe that a person of goodwill also acts morally right, except perhaps in exceptional cases. This rather astonishing view is often explained by pointing out that Kant lived in a morally speaking homogeneous society. He was not bothered by the problem of moral pluralism that troubles even the persons of goodwill in our day and age.

Government Accountability Office (GAO)

The Government Accountability Office (GAO) is an agency of the U.S. federal government that reports to Congress and bills itself as independent and nonpartisan. Founded in 1921 as the General Accounting Office, its was renamed the Government Accountability Office (GAO) in 2004.

The GAO is assigned to monitor various governmental agencies and their expenses. It studies the effectiveness of governmental expenditures, focusing primarily on the executive branch. The GAO seeks to make government more accountable and effective in managing programs and spending tax dollars. The current budget for the GAO is approximately $500 million per year, and the office has a staff of slightly more than 3,000 people.

Because the GAO principally monitors the programs of the executive branch, it is specifically removed from the purview of the executive. The comptroller general of the United States heads the GAO. A special congressional committee recommends candidates for controller, the president nominates the controller, and the Senate confirms the controller for a single term of 15 years. The professional staff of the GAO is organized into teams such as “health care,” “defense capabilities,” and “acquisition and sourcing management.” The GAO is headquartered in Washington, D.C., and has 11 other offices in major cities across the United States.

As examples of its work, the GAO has recently issued reports on federal farm programs, crop insurance, the food stamp program, bankruptcy reform, Hispanic representation in the federal workforce, nuclear security, human trafficking, and intercollegiate athletics. All of the GAO’s reports appear on its Web site, and the public may request free printed copies of the reports as well.

The creation and dissemination of such a wide range of studies requires a variety of professional staff members, and the GAO offers career paths for analysts, information technology specialists, financial auditors, economists, attorneys, and communication analysts. It is not at all unusual for the GAO to issue a report on some highly technical practice of government; maintaining such a capability requires the GAO to have a staff of experts in many fields.

In spite of a long and generally well-maintained reputation for objectivity, the GAO does come under repeated criticism. Critics generally object to findings in specific reports rather than to the overall quality or objectivity of the agency. Nonetheless, conflict with Congress did lead to a significant reduction in the budget and staffing of the GAO; 2007 budget and staffing levels were about 27% lower than the peak levels of 1995.

Grasso, Richard (1946–)

Richard A. (Dick) Grasso, born in 1946, is well-known as the former chairman and chief executive of the New York Stock Exchange (NYSE) from 1995 through 2003 before being asked by the NYSE board of directors to resign in a high-profile compensation controversy.

Grasso overcame an improbable background to rise to one of the most powerful positions in the financial world. After dropping out of college and spending 2 years in the U.S. Army, Grasso was hired by the NYSE in 1968 as a floor clerk making $82.50 per week. Working primarily in customer service and marketing, Grasso (who first became interested in the stock market as a teenager and purchased his first shares of stock with money earned working in a pharmacy) immersed himself in the history, operations, and traditions of the NYSE, gaining a reputation of a quick study, hard worker, and outstanding marketer in spite of his modest education. After spending 27 years rising through the ranks, the NYSE named Grasso chairman and chief executive of the NYSE on June 1, 1995. Grasso became the first staff member in the NYSE's more than 200-year history to rise to the top position, a feat made even more surprising with Grasso's lack of a college degree.

During Grasso's tenure at the NYSE, the stock market experienced a period of unprecedented growth that dramatically enhanced the relevance of the NYSE in American business society. As chairman and CEO, Grasso pushed relentlessly to improve and expand the NYSE. He focused on bringing state-of-the-art technology to the NYSE trading, regulatory, and administrative operations and increased the visibility of the NYSE by increasing the number of the companies (especially international companies) whose shares were listed on the "Big Board" at the NYSE. In 2001, in the aftermath of the September 11, 2001, terrorist attacks, Grasso became a reassuring public face for the American stock market and successfully led the restart operations of the NYSE.

Despite his personal success story and recognized strong leadership of the NYSE, Grasso is best known for a scandal involving his compensation. In September 2003, it was revealed that Grasso had been given a deferred compensation package worth reportedly between $140 and $187.5 million by the board of directors of the NYSE. This compensation package caused immediate controversy because the handpicked members on the compensation committee came from NYSE-listed companies over which Grasso had regulatory authority as head of the NYSE. After criticism of the deal by the chairman of the Securities and Exchange Commission and several pension funds, the NYSE board voted to ask for Grasso's resignation, which he submitted on September 17, 2003.

Subsequently, on May 24, 2004, Elliot Spitzer, the New York attorney general, sued Grasso (along with the NYSE and one of its directors) citing violations of New York's Not-for-Profit Corporation Law in awarding Grasso an excessive compensation package. The suit asked a state court judge to rescind the pay package and to determine a "reasonable" level of compensation for Mr. Grasso. The suit alleged that (1) the NYSE board of directors was misled on various aspects of the Grasso's compensation package; (2) the compensation formula that resulted in the $187.5 million compensation package was flawed and under Grasso's control; (3) the compensation was not reasonable under New York state law for a nonprofit organization; and (4) Grasso's dual role as a regulator and NYSE employee raised an impermissible conflict of interest. On May 26, 2004, Grasso, in turn, sued the NYSE and its Chairman John Reed seeking payment of unpaid portions of his pay package, as well as damages for "besmirching his name." Both these cases are still pending.

Great Depression

The Great Depression was an economic downturn of unprecedented proportions. The stock market crashed, unemployment soared, banks closed their doors, spending on goods and services plummeted, and industrial production went into a tailspin. It is still looked on as a watershed event in our society that ushered in new philosophies and programs relative to the role of government in a market economy. To even begin to understand the depth of this economic downturn, it must be seen against the prosperity that existed just prior to the depression itself.

The period between World War I and the Great Depression was one of unprecedented prosperity. Many people became new millionaires, the stock market soared, and production of goods and services increased dramatically. The United States emerged from World War I economically and physically undamaged, giving it an advantage in world markets. Mass production methods were employed in many industries increasing production of goods and services. Several major new products, such as automobiles and electric power, created many new jobs and markets. Installment buying became popular and, coupled with the widespread use of advertising and new sales techniques, stimulated consumption of these products. Enormous profits could be made in stock market speculation, and low margin requirements made it possible for many people to participate. There were thus many reasons for this prosperity.

All this ended, however, when the bottom dropped out of the economy in 1929 with the start of the Great Depression. Statistics tell only part of the story. Unemployment soared to almost 25% of the workforce, affecting more than 12 million of 52 million workers in a nation of almost 122 million. Consumption spending slid by one fifth, and investment collapsed entirely. Waves of panic struck the banking system from 1930 through 1933, forcing more than 9,000 banks with deposits of $7 billion to close their doors. More than 9 million savings accounts were lost, and thousands of businesses went bankrupt. Panic selling hit the stock market and paper fortunes were lost overnight when the crash began.

There is still debate over the causes of such a drastic change in the fortunes of the country, but several emerge as major reasons for the collapse. The soaring stock market, for instance, was more the result of speculation than of increases in real physical wealth, and low margin requirements encouraged such speculation. People borrowed heavily to buy stocks and participate in the rise of the market. When the psychology of the market changed and investors sensed it had reached a peak, they began selling to get their money out of the market. Panic quickly set in, and the whole speculative structure collapsed rapidly.

The prosperity of the late 1920s was not shared by society's agricultural sector and working classes. Farm purchasing power steadily deteriorated throughout this period, aggravated by the inelastic demand for farm products. Coupled with this problem was a bad and worsening distribution of income. Most of the money in the 1920s went to those who were already wealthy rather than to workers with lower incomes. Smaller proportions of total income went toward wages and salaries. Much of the money received by the wealthy was reinvested in new productive facilities, causing an overextension of factory capacity. People simply could not buy all that the economy was producing.

The Smoot-Hawley tariff, passed by Congress in 1930, further aggravated the situation. Its very restrictive provisions caused other countries to pass retaliatory tariffs. This action curbed our exports to foreign countries when such markets were badly needed. With the decline of both domestic and foreign markets, business investment was sharply curtailed, and layoffs of workers increased. Finally, the Federal Reserve System adopted a restrictive monetary policy during the late 1920s, which some scholars believe was the major cause of the depression. This action cut off credit to business and resulted in lagging business investment through the end of the period immediately before the crash, further aggravating an already deteriorating situation.

Whatever the real causes of the depression, the long-term effects are quite clear. Franklin Delano Roosevelt won the election of 1932 by promising a new deal for the American people. This New Deal consisted of a series of public policy measures that was unprecedented in American history. The federal government assumed responsibility for stimulating business activity to escape the depression and correct abuses in the economy. It sought to relieve the distress being felt by business, farmers, workers, homeowners, consumers, investors, and other groups. In the famous 100 days following Roosevelt's inauguration, an unprecedented amount of emergency legislation was passed that plunged the federal government deeply and unalterably into the affairs of society and the economy. In all, during Roosevelt's first 2 years in office, 93 major pieces of legislation were passed that directly affected banking, business, agriculture, labor, and social welfare.

The depression was such a shock to the self-confidence of the nation and the distress it caused was so widespread that people were not willing to wait for the market to correct itself. The traditional view of an inherently self-correcting market system proved bankrupt to deal with the problems of the depression. People, including business leaders, wanted action, and they wanted it immediately. Many believe that Roosevelt, instead of being an enemy of the free market, actually saved the system and prevented a radical reform movement from gaining headway in moving the country toward some form of socialism. Roosevelt himself saw the New Deal as a set of programs to save the free-enterprise system by fusing welfare benefits and market reforms to a capitalist foundation.

Whether all this New Deal legislation actually pulled the economy out of the depression is a matter for debate. Unemployment never recovered from its 1929 low and gross national product in 1939 had barely attained its 1929 high. Some historians believe that the depression actually lasted until World War II when the war production period began. Although Roosevelt managed to restore confidence in democratic institutions and the American market by installing a more regulatory and welfarist federal presence, it appears that spending for rearmament before and during World War II was instrumental in bringing the Great Depression to an end.

Greenhouse Effect

The *greenhouse effect* is a term used to describe the trapping of heat in the earth's atmosphere that would otherwise escape into space. A naturally occurring greenhouse effect is essential to support life on earth because some heat is needed to maintain temperatures conducive to plant and animal survival. However, too much heat that is kept within the atmosphere because it is absorbed by the so-called greenhouse gases can lead to global warming. It is this problem of escalating concentrations of greenhouses gases that is typically linked to the greenhouse effect.

Most climate scientists now believe that increasing concentrations of greenhouse gases are a significant cause of climate change and global warming, and that these increases are due in large part to human activity rather than resulting from natural climate cycles. Assessment reports of thousands of climate research studies were issued by the Intergovernmental Panel on Climate Change (IPCC) in 1990, 1995, and 2001 and indicated that greenhouse gases are increasing in concentration, that climate changes are actually occurring, and that human activity is linked conclusively with increases in carbon dioxide, the most significant greenhouse gas. Based on a growing consensus within the scientific community and growing alarm by the general public, governments have begun to institute policies and programs to reduce the growth of greenhouse gases and meet the goals found in the Kyoto Protocol.

At the same time, controversies have continued since the late 1970s about the nature of the scientific phenomenon itself and its potential environmental, social, and economic impacts. A small group of scientists and other skeptics believe that what is labeled as the greenhouse effect is part of long-term natural climate cycles or that a warming climate will not have the dire consequences that supporters of the greenhouse theory predict. They point out evidence that climate changes have occurred regularly in the past without any suspected human cause, and that adaptation by plants and animals, including humans, has accounted for much of human history. The critics caution that some recommendations to address perceived climate change are unnecessary and economically inefficient because the costs of reducing greenhouse gases are high relative to the benefits achieved.

The Scientific Evidence

Concerns about the greenhouse effect began to be raised in the scientific community in the mid-1970s when measurements of carbon dioxide concentrations over a relatively short time period, 1958 to 1975, indicated an increase of 7%. Potential consequences of such increases were hypothesized, and a flurry of research studies and conferences sponsored by the U.S. Department of Energy, the National Academy of Sciences, and the World Meteorological Organization brought attention to the possibility of global warming to the environmental community and policy makers. It is important to note that life on earth exists because of the balance between the amount of solar radiation coming in to warm the atmosphere and the planet and the amount of infrared heat that leaves the atmosphere. The presence of some amount of naturally occurring greenhouse gases (water vapor, carbon dioxide, methane, nitrous oxide, and ozone) is essential to absorb part of the infrared heat and redirect it back toward earth. This is the naturally occurring greenhouse effect, and accounts for why earth can sustain life while the moon and other planets cannot. However, increasing amounts of greenhouse gases are believed to disturb the balance by absorbing even higher amounts of infrared radiation, thereby leading to higher temperatures and potentially devastating environmental and social impacts.

The role of human activity in increasing concentrations of greenhouse gases has been the subject of scientific study and debate for several decades. The now-conventional theory is that prior to the Industrial Revolution, human activity added very little to greenhouse gas concentrations, but with technological advances and industrialization came an escalation of energy use and population growth. Evidence in support of this theory comes from scientific studies reported by the IPCC in its 2001 assessment report on greenhouse concentrations. The IPCC supported the research findings that between 1750, just before the beginning of the industrial period, and 2000, carbon dioxide had increased in the atmosphere by 35%, methane by 143%, and nitrous oxide by 18%. Furthermore, it stated that human activity was conclusively linked to these increased concentrations.

The greatest contributor to higher greenhouse gas emissions is carbon dioxide from the use of fossil fuels for energy (about 85% of U.S. greenhouse gas emissions). Coal and petroleum release the highest amounts of carbon dioxide and somewhat lower amounts of natural gas. Electricity generation, transportation, and industrial processes are the heaviest users of fossil fuels. Population growth and increasing population density play a role not just because of the increase in demand for energy but also because of the destruction of forests that absorb billions of tons of carbon annually.

The consequences of the greenhouse effect are uncertain in terms of timing and magnitude because climate is extremely complex to model. It is expected that higher average temperatures will cause more precipitation as glaciers melt but some areas will experience severe drought. Growing seasons are likely to be affected as weather patterns shift. Sea levels will rise and existing coral reefs will die as ocean temperatures increase. Some species will benefit, while others will not. Best-case and worst-case scenarios continue to be refined but it is too soon to know how severe the environmental impacts of the greenhouse effect will be.

A substantial consensus about the nature of the greenhouse effect exists within the scientific community. For example, in 2005 the national science academies of 11 countries (Brazil, Canada, China, France, Germany, India, Italy, Japan, Russia, the United Kingdom, and the United States) issued a joint statement declaring that significant climate change is occurring, that greenhouse gases are a major cause of climate changes, and that immediate actions should occur to reduce greenhouse gas concentrations.

Criticisms of the nature or the dangers posed by a greenhouse effect continue to be expressed by a few scientists, policy makers, and free-market-oriented analysts. For example, the MIT meteorologist Richard Lindzer accepts some of the scientific evidence related to the greenhouse effect, such as that carbon dioxide concentrations and temperatures are rising, but he disputes the connection between the two and does not believe that human activity has much impact on these increases. Think-tank analyst S. Fred Singer is skeptical of the temperature and chemical concentration data collected in climate studies. He views some global warming as beneficial rather than detrimental to human populations. Both are highly critical of the alarmist rhetoric of environmental interest groups and the media.

Business Responses

Business responses to the potential for climate change have been mixed. Most companies in the fossil fuel and automobile industries have been reluctant to publicly accept the scientific consensus, but the companies that have done so have enhanced their reputations for being environmentally responsible. Many firms in other industries are investing heavily in energy conservation and converting to alternative sources of energy. The insurance industry has indicated its support for the greenhouse effect by incorporating the potential for climate change and more volatile weather patterns into risk assessment models.

Voluntary U.S. business responses have had some impact on reducing greenhouse gases. While the nation's gross domestic product rose by 51% between 1990 and 2004, the total U.S. greenhouse gas emissions increased 15.8%. This far exceeds the U.S. Kyoto goal of a 7% decrease from 1990 greenhouse gas emissions, but it is much less than would have occurred in the absence of voluntary business actions. The U.S. Environmental Protection Agency coordinates a number of energy efficiency programs, including Energy Star to promote energy-efficient products and buildings and the Climate Leaders program of about 100 U.S. corporations and nonprofit organizations that have committed to substantial reductions in greenhouse gas emissions. For example, chipmaker Intel Corporation has committed to a 30% reduction in greenhouse gas emissions per production unit between 2004 and 2010. Raytheon has pledged a 33% reduction per dollar of revenue between 2002 and 2009.

While uncertainties continue about the magnitude and timing of the impacts of climate change, the precautionary principle recommends that risk of serious harm be minimized. Based on the scientific evidence gathered to date, greenhouse gas reduction strategies are likely to grow in importance over the next decade.

Green Marketing

Green marketing refers to a broad range of activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants, with minimal detrimental impact on the natural environment. It involves adopting resource conserving and environmental friendly strategies in all stages of the value chain. Other synonymous terms such as *sustainable marketing* and *environmental marketing* have also been used to denote this term. They are perceived as cost-efficient, effective, and just tools of handling problems related to the impact of economic activity on the environment and are often a means of sustainable competitive advantage.

Several companies have proactively implemented green marketing programs to improve their business offerings in several different ways. Some recent notable examples follow:

- British Petroleum has committed to spending $350 million on energy-efficient products over several years and is aggressively promoting its environmental awareness programs.
- General Electric is spending $1.5 billion on its *Ecoimagination* in researching for less polluting technologies and promoting them as well.
- Starbucks recently announced the donation of $10 million over the next 5 years for clean drinking water around the world through the sale of its Ethos bottled water. The company already offers coffees that offer fair pay for growers and environmentally sound cultivation.
- 3M encourages employees to participate in its Pollution Prevention Pays program. Since 1974, the program has eliminated over $2 billion pounds of air, water, and solid waste pollutants from the environment.
- The largest home and garden center chain, Home Depot, has discontinued the sale of wood products from endangered forests since 2002.

In addition to firms, major global bodies such as the United Nations have urged better "green" planning by asking cities to hold tree plantings and cleanups throughout the world. Even buildings, such as the presidential library for Bill Clinton, offer a "green" focus and feature environmentally friendly construction. Industry-based associations are actively encouraging green marketing programs—the U.S. Green Building Council is responsible for certifying and promoting environmentally responsible and high-performance buildings, while the Green Seal organization awards green seals to products that meet rigorous environmental standards, which in turn helps consumers identify products that are environmentally safe.

History of Green Marketing

Although a major focus on green marketing began in the last three to four decades after the publication of Rachel Carson's *Silent Spring*, the history of green marketing in the modern era can be traced back to the 18th century when Benjamin Franklin urged France and Germany to follow England's practice of switching from wood to coal, which had saved what remained of their forests. Franklin also attempted to regulate waste disposal and water pollution in Philadelphia. He also left money in a widely publicized codicil to his will to build fresh water pipeline to Philadelphia due to links between bad water and disease, which ultimately led to the city's water department to be the first (in 1801) in America to supply drinking water to all its inhabitants.

The American Marketing Association held its first conference on ecological marketing in 1975 that attempted to bring together academics, practitioners, and public policy makers to examine marketing's impact on the natural environment. Concern for green marketing has escalated since the 1980s and 1990s after the growth of environmental ills such as ozone layer depletion, oil spills, and overflowing landfills. Since then, the U.S. Federal Trade Commission and the National Association of Attorneys General have been very active in monitoring green marketing claims as well as developing extensive documents examining green marketing issues.

Motivations for Green Marketing

There are several motivations for companies going green. Michael Jay Polonsky identifies five major reasons for firms' increased use of green marketing. They are as follows:

Lower Costs or Higher Profitability

Disposing of harmful by-products has resulted in substantial cost savings in many firms. In trying to minimize waste, firms often stumble across more efficient production processes that eliminate the need for some raw materials, thereby reducing costs. In other cases, instead of minimizing waste, these materials serve as another firm's input to production processes. Finally, developing more efficient new industries, for example, using oxygen instead of air in making steel, can enhance cost or profitability.

Competitive Parity

To keep up with the benchmarks set by the competitors, firms may try to emulate their environmental marketing position; for example, a manufacturer may stop deforestation in a sensitive area in response to a major competitor's similar action or a tuna manufacturer may stop using driftnets by following others.

Commitment to Social Responsibility

Many firms are beginning to realize that they are members of a broader global community and, therefore, must meet environmental objectives in addition to their profit-based objectives. As such, they take a proactive approach to embracing a philosophy of environmental social responsibility in their overall firm's culture. Some, such as the Body Shop and Ben and Jerry's, heavily promote their involvement in green marketing initiatives, while others such as Coke and Walt Disney World practice this philosophy and yet choose not to publicize it as much.

Consumer Demand

Several surveys have shown that both individual and organizational customers in most countries are becoming more concerned about their natural environment and are demanding firms to be responsive to these concerns. Photocopier companies such as Xerox, for example, introduced a "high-quality" recycled photocopier paper in an attempt to fulfill demands for less environmentally harmful products.

Governmental Pressure

Finally, governmental pressures are also being designed to "protect" consumers by reducing production of harmful products or by-products, modifying consumer and industry's use and/or consumption of harmful goods, or ensuring that consumers have the required information in evaluating the environmental composition of goods. Governments regulate the control of hazardous wastes, while most by-products are controlled through the issue of appropriate licenses. They modify consumer behavior by "inducing" consumers to participate in voluntary curb side recycling programs, or in other cases taxing them for irresponsible behavior. In the United States, agencies such as the Federal Trade Commission protect consumers by regulating misleading claims, thereby enabling them to make better-informed decisions.

Profiling Green Consumers

There are many ways of segmenting green consumers. For example, J. Ottman Consulting identifies three types of green consumers: "planet passionates," "health fanatics," and "animal lovers." Planet passionates are committed to maintaining a healthy environment and avoid waste and products with poor environmental records. Health fanatics, on the other hand, try to maintain a healthy diet and lifestyle by taking precautions against toxic waste, pesticides, sun exposure, and other environmental problems that might affect their health. Finally, animal lovers protect the rights of animals through vegetarianism, buying products labeled as "cruelty free" and "not tested on animals," and boycotting products such as fur and tuna.

Marketing research firm Roper ASW on the other hand divides the total population into five segments, out of which two segments are likely to buy green. "True blue greens" (9% of the population) are wealthy and educated and include environmental activists and leaders; "greenback greeners" (6% of the population) also share the same characteristics, yet are not always likely to sacrifice the comfort and convenience for the sake of the environment. Roper ASW publishes the Green Gauge Report about consumers' willingness to pay for green products, thus helping companies target their marketing strategies.

Finally, Ginsberg and Bloom have suggested that companies should follow one of four green marketing strategies depending on market and competitive conditions, that is, from the relatively passive and silent "lean green" approach to the more aggressive and visible "extreme green" approach—with "defensive green" and "shaded green" in between to be better prepared in helping their companies choose the most appropriate environmentally friendly approach to marketing.

Greening the Supply Chain

Greening the supply chain refers to firms integrating environmental issues within the new product development process, which include predevelopment activities, supplier's business practices, and product design and development. Environmental responsive companies take proactive posture in requiring a significant level of environmental responsibility in core business practices of their suppliers and vendors. Many companies have even begun taking a more proactive stance in ensuring compliance of their suppliers at the second- and third-tier levels. General Motors (GM) in a recent media release perhaps articulated it best, when they said that working with their suppliers, they can accomplish much more to improve the environment than GM could alone. Empirically, there is demonstrated evidence of a proactive supply chain management role in corporate greening and environmental strategies.

Suppliers too benefit by seeing greater operational efficiencies, cost savings, enhanced value to customers, increased sales, positive media attention, and positive ratings from socially responsible investment groups.

A recent report on the suppliers' perspectives on effective supply chain management strategies prepared by Business for Social Responsibility Education Fund talked with representatives from 25 suppliers in four industry sectors, that is, automotive, business services, electronics, and forest products, and found that an increasing number of companies are seeking to influence their suppliers' environmental practices. The types of environmental issues that firms are seeking to address with their suppliers varied by sector. Firms in the automotive and electronics sector received the most environmental requests from suppliers, while those in the forestry sector had mainly received requests to explain their environmental practices. The service sector had received the fewest environmental requests—most such requests came from the larger firms. Greening the supply chain themes include environmental responsiveness of top management, environmental policy, early product development activities, design for environment and life cycle assessment, cross-functional environmental coordination, supplier involvement, environmental database, specialist environmental knowledge, and environmental benchmarking.

Research Findings, Caveats, and Conclusion

The impact of green marketing on both marketing performance and consumer behavior has been thoroughly investigated. For example, research has shown that the market value of a firm declines slightly when green marketing initiatives are broadcasted. Announcements related to green products, recycling efforts, and appointments of environmental policy managers had insignificant effect on stock price reactions, while promoting green marketing produces significantly negative stock price reactions.

Consumers who have a positive attitude toward ecologically conscious living and negative attitude toward pollution are likely to buy green products. Further findings substantiate what is known as the "4/40" gap: Roughly 40% of consumers say they are willing to buy green products, but only 4% actually do. Environmentally conscious behaviors are most likely to occur when consumers perceive that their actions are likely to make a difference.

One must also be wary of "greenwashing" practices, which involves disinformation disseminated by firms so as to present an environmentally responsible public image. Such practices are usually promoted through the use of image ads, misleading product labels such as "all natural," "biodegradable," "organic," and so on, as well as public relations tactics such as having hollow mission statements and codes of conduct, sustainability reports offering only partial disclosure, hiring scientists who vouch for industry-funded research, feigning public support for hidden anti-environmental agendas as some major examples. Industry ombudsmen such as the Green Business Network and Green Life attempt to monitor and expose such practices and keep the public informed about what is legitimate and what is not. Green marketing can be a very useful and successful strategy for firms as long as they comprehend the underlying motivations of customers in choosing environmentally friendly products.

Green Revolution

The *green revolution* can refer to any major and innovative change in agricultural productivity, but more commonly the term is used to identify the radical changes in agricultural productivity that occurred in the middle and late decades of the 20th century. Historians sometimes speak of three agricultural revolutions. The first was prehistoric and occurred when humans first established relatively permanent settlements in which domesticated animals and farming replaced hunting and gathering as the primary food production. The second, beginning in the late 18th century, was fueled by advances in mechanical technology, land reform, as well as better understanding of animal breeding and crop rotation. The resulting revolutionary increase in productivity provided food for the exploding urban centers of the Industrial Revolution. In each of these first two agricultural revolutions, the growth in food production was caused primarily by a growth in the amount of land under cultivation.

The third revolution, what is more typically identified as the green revolution, occurred in the latter half of the 20th century when advances in plant genetics created higher-yielding varieties of crops, chemical fertilizers increased fertility, pesticides decreased losses, and industrial production methods and technology increased efficiency. The resultant increase in agricultural productivity was indeed revolutionary. Unlike the first two agricultural revolutions, the green revolution was fueled by increasing productivity from land already under cultivation rather than an increase in cultivated land area itself.

By the middle of the 20th century, population growth, especially within the world's poorest countries in Latin America, Asia, and Africa, threatened to overwhelm agricultural production. At mid-century, Mexico, with support from the Rockefeller Foundation, embarked on a program designed to increase agricultural production of grains such as wheat and rice. Through a combination of innovative plant breeding and improved farm technologies, Mexico went from a wheat importer to a wheat exporter within a decade. American scientist Norman Borlaug was credited with much of this work, and for this he received the Nobel Peace Prize in 1970.

This green revolution relied heavily on the creation of hybrid varieties that produced significantly improved yields per plant. Hybrids were developed that were better able to absorb fertilizers and nutrients, better adapted to local climate conditions, better able to resist pests, and were easier to grow, harvest, and transport.

Advances in agricultural and mechanical technologies contributed significantly to this revolution as well. While mechanized cultivation and harvesting had existed for several decades, by the middle of the 20th century this technology provided major and unprecedented improvements in cultivating, planting, weeding, fertilizing, and harvesting crops. New chemical fertilizers increased crop yields significantly, and new pesticides and herbicides reduced crop loss proportionately. Improved irrigation techniques contributed much to this revolution as well.

These technological advances resulted in an increase in agricultural productivity that was truly revolutionary. Yet these scientific and technological changes created social and ethical challenges that, if anything, have only increased over time. These present controversies have an historical precedent.

In 1798, early enough in the midst of the second agricultural revolution that its effects were not yet understood, economist Thomas Malthus published *An Essay on the Principle of Population, as it Affects the Future Improvement of Society.* Malthus famously predicted that population, advancing geometrically, was fast outpacing the food production, which advances arithmetically. Malthus predicted that poverty, famine, disease, and conflict would inevitably result unless humans consciously took steps to control population. Malthus failed to realize that he was living in the midst of the very agricultural revolution that would falsify his predictions.

Similarly, in 1972 the well-known Club of Rome report, *Limits to Growth,* predicted dire consequences if trends in resource use, population, pollution, and industrialization continued unchanged. Yet food and materials production over the following decades not only kept pace with population but made some real and significant gains. Some contemporary observers claim that those predictions of environmental disaster suffered from the same mistake that Malthus made. The *Limits to Growth* analysis, like Malthus, failed to appreciate an agricultural revolution that was occurring within its midst. The green revolution capitalized on the ability of human creativity, in the form of science, technology, and entrepreneurial skills, to keep food production in line with population growth. According to these observers, there is no reason to doubt that increases in productivity cannot continue indefinitely.

Critical Challenges

Yet several important challenges remain. First, many observers point out that increased productivity has not always translated into direct benefits to those people most in need. Famine and hunger remain major problems throughout the world. Factors ranging from war, political corruption, and simple market forces have prevented the benefits of this revolution from getting to those most in need.

A wide range of environmental problems has also been associated with the green revolution. The increased reliance on chemical fertilizers, pesticides, and herbicides has increased air, soil, and water pollution. Reliance on hybrids has translated into a loss of biodiversity, especially a loss of native plant species. Monoculture crops used to increase production face greater risks from disease and pests. Land degradation and desertification have accompanied many intensive farming techniques. Furthermore, some observers point out that the green revolution has created a greater dependence on fossil fuels. The increase in fossil fuels, used in everything from fertilizers and planting to harvesting and transportation, has created adverse environmental consequences.

Various social and political aspects of the green revolution have also drawn criticism. Plant and animal breeding technology has given way to genetically modified plants and animals, which, according to some critics, create greater and perhaps unknown risks. The green revolution has also resulted in the concentration of agricultural power and wealth. The technological resources that fed the green revolution are very expensive and the need for increased efficiencies has driven many smaller family farms out of business. Transnational corporations have gained ownership of specialized plant and animal hybrids and, more recently, of patents for genetically modified crops. As a result, they can exert economic and political control over farmers throughout the world. The concentration of agricultural power has also created giant industrial and factory farms that have been criticized for both their inhumane treatment of animals and the pollution created by animal wastes.

Thus, the green revolution provides an intriguing case study in business and environmental ethics. Significant social and economic benefits followed from the revolution in agricultural productivity that occurred in the later decades of the 20th century. Yet the challenges of this revolution, most of which were unimagined by the well-intentioned people who led the change, will remain for decades to come.

Green Values

Green values are the wide range of values appealed to in defense of environmental policy prescriptions. Environmental policies can be defended by reasons of prudence, morality, social justice to present generations, social justice to future generations, aesthetics, spirituality and religious conviction, historical significance, symbolic meaning, and economics. Green values also involve giving greater normative consideration to nonhuman interests and concerns, including the status of animals and other nonhuman natural objects; to the preservation of biological diversity; to the protection of ecosystems; and to the aesthetic impacts of human operations on the environment.

Environmental philosophers debate the possibility of reconciling this diversity of environmental values. Monists argue that unless a single unifying principle ultimately holds sway, environmental policy will remain relativistic and inconclusive. Value pluralists maintain that there can be a plurality of independent values that cannot and need not be reduced to a single unified theory.

Extending Moral Values

In general, values are what incline us to act in one way, or to choose one thing, rather than another. Thus, values are the perceived goods that provide us with a reason for action. The value that a person places on education leads him or her to study rather than play video games, and it provides him or her with a reason to study.

Philosophers have long distinguished the value of prudence (self-interest) from moral value. Prudence is the value of protecting one's own self-interest. A prudent person does not spray pesticides on the garden one is about to harvest. Moral values expand the range of this to include the impartial consideration of the interests of others. Moral values would, for example, prohibit dumping toxic wastes into a stream that flows onto one's neighbor's land.

Much work within environmental philosophy can be understood in terms of extending the range of moral value. As societies confronted a variety of new environmental challenges, philosophers began to consider the possibility that the domain of moral value was being too narrowly drawn. Disposal of nuclear wastes, for example, forces us to consider the value of human beings not yet living. A variety of other issues, from species extinction to the destruction of ecosystems, raised the possibility that moral value ought to be extended to nonhuman living beings as well. Animal welfare advocates extend moral standing to at least some animals on the basis of sentience or consciousness. Biocentrists argue that only life itself can provide a nonquestion begging ground for moral consideration and extend moral value to all living beings.

The shift to more holistic and ecological approaches to environmentalism suggests that moral value might be overextended when applied to nonhuman natural objects. While some might argue for the moral value of ecosystems and species, others prefer to explain green values in nonmoral terms. We might seek to preserve natural and wild spaces, for example, because they are beautiful, awe-inspiring, and majestic. Preserving biological diversity might be sought as an expression of religious or spiritual values. Protecting an endangered species is defended as symbolically valuable. Wilderness areas get preserved not because they are moral beings but for their historical and cultural meaning.

Instrumental and Intrinsic Values

A distinction between instrumental and intrinsic value can help explain the nature of such aesthetic, religious, spiritual, historic, and symbolic values. Philosophers have sometimes spoken as if the value domain is exhausted by the categories of moral value and instrumental value. Perhaps influenced by Kantian language of ends and means, subjects and objects, some philosophers suggest that if something is not an end in itself, not a moral subject, then it is a mere means and has only instrumental value. Since only autonomous beings are ends in themselves, the nonhuman natural world is reduced to having only instrumental value. But many environmental values cannot be reduced either to questions of moral standing or to mere usefulness.

Instrumental value is a function of how something is used and this value can be replaced by another object with equal or more efficient usefulness. For example, the instrumental value of having a garden might be replaced by a local grocery store. An object is intrinsically valuable, valued in itself, when its value depends on the unique object itself. Intrinsic value cannot be replaced with the substitution of another object, no matter how similar or useful. Accordingly, a garden might also have intrinsic value as the product of one's own creativity. This symbolic and aesthetic value is irreplaceable by a grocery store. This value inheres in, or is intrinsic to, this particular garden itself.

There are many environmental issues that do not involve intrinsic moral value. The concept of moral standing is stretched beyond recognition in claiming, for example, that a prairie, a wetland, or the Grand Canyon is a moral subject. But it is equally misguided to conclude that such things are to be valued simply for their usefulness. Many nonhuman natural objects possess intrinsic value and human beings would be doing a harm, not a moral harm but a harm nonetheless, in destroying them or in using them as mere instruments for human satisfaction.

Green Values and Business

What are the implications of these reflections for the social responsibility of business? According to a standard understanding of corporate social responsibility, business fulfills its social responsibilities when it responds to the demands of the marketplace while obeying the law and respecting minimum moral duties. Business may choose, as a matter of supererogation, to promote environmental values, but it is otherwise free to pursue profits by responding to the demands of the economic marketplace without any particular regard to environmental responsibilities. Insofar as society values environmental goods, for example, lowering pollution by increasing the fuel efficiency of automobiles, it is free to express those values through legislation or within the marketplace. Absent those demands, business has no special environmental responsibilities.

The problem with this approach is that it excludes any ethical responsibilities for individuals or business that emerge from those nonmoral intrinsic values found in nature. This standard would leave us with a very impoverished environmentalism. Perhaps some animals could be brought in under moral values, but the rest of the natural world could be valued only instrumentally, and we would be left with what is, at best, a conservationist ethic. A richer understanding of green values and practical reason, one with roots in Plato and Aristotle rather than in Kant, can support a more robust environmentalism. In this view, the *point* of ethics is to provide an answer to the (Socratic) question: How ought we to live? That is, ethics seeks to provide good reasons for doing one thing rather than another, for being one type of person rather than another. Individuals or institutions have ethical responsibilities (not categorical obligations in the Kantian sense) when doing one thing rather than another will produce or preserve something of value. To the degree that these values are more than mere subjective preferences, our reasons for acting are more than merely instrumental, hypothetical imperatives. In this sense, the range of environmental values previously described provide many good reasons for acting in ways that minimize harm to the natural environment. Some, but not all, of our environmental responsibilities involve moral responsibilities to other human beings. Some, but not all, are morally obligatory. In general, reasonable humans have ethical responsibilities to, and have good reasons to act in ways which, promote or preserve intrinsic value.

Of course, by claiming that green values should receive greater attention from the business community, one risks the possibility that such values will be co-opted by businesses' financial interests. Examples of greenwashing are a case in point. Some companies have learned that they can hide objectionable practices, or gain a marketing advantage, by appropriating the language of green values. Terms such as all-natural, recyclable, biodegradable, organic, and earth-friendly are often little more than a marketing ploy that uses the language of green values to promote products that have little if any environmental value.

Greenwashing

Greenwashing, a pejorative term derived from the term *whitewashing*, was coined by environmental activists to describe efforts by corporations to portray themselves as environmentally responsible in order to mask environmental wrongdoings. While the term has been used within activist circles since the late 1980s, it was not until 1999 that it was added to the *Concise Oxford English Dictionary* and officially recognized as part of the language. Consequently, some of the literature relating to greenwashing uses more neutral terms to describe this and related activities, including "environmental advertising," "environmental public relations," "green marketing," and "green communications."

The History of Greenwashing

The first instances of what environmentalists now call greenwashing appeared in the late 1960s as part of a corporate response to the modern environmental movement that was catalyzed by Rachel Carson's book *Silent Spring*. During the 1980s, the environmental movement gained momentum as a result of the Bhopal, Chernobyl, and Exxon Valdez disasters. By the early 1990s, polls suggested that consumers were more likely to buy products from a company that had a sound environmental reputation; corporations responded by portraying themselves, and more of their products, as environmentally friendly. By the mid-1990s, firms were spending millions of dollars on public relations activities aimed at "greening" their images and managing environmental opposition.

The term greenwashing was originally confined to describing misleading instances of environmental advertising, but as corporations' efforts to portray themselves as environmentally virtuous have diversified and proliferated, so have charges of greenwashing. The term is now used to refer to a wider range of corporate activities, including, but not limited to, certain instances of environmental reporting, event sponsorship, the distribution of educational materials, and the creation of "front groups." (Front groups, such as the International Climate Change Partnership and the National Wetlands Coalition, are organizations that pose as independent advocacy groups, but which in fact are funded by and promote the interests of a particular corporation or group of corporations.)

It is important to note that not all environmental advertisements or public relations campaigns can fairly be labeled greenwashing, as there are genuinely environmentally conscious companies that use advertisements and other means to promote themselves as such. The clearest cases of greenwashing occur when these media are employed by firms to proclaim (or in some cases merely imply) a deep-seated devotion to sound environmental practice (usually by pointing out some specific accomplishments in that field) in an attempt to distract from its otherwise lackluster environmental performance. For example, a company that advertises its sole laudable environmental initiative to distract from its more environmentally deleterious activities, or a company that, despite being a recalcitrant polluter, boasts about a marginal reduction in emissions at one of its factories, would be clear targets for a charge of greenwashing. Similar suspicions arise when corporations within environmentally problematic industries sponsor grassroots environmental events such as Earth Day, or when corporations with poor environmental track records distribute environmental education videos to schools.

Why Is Greenwashing Problematic?

The characteristics that render greenwashing subject to ethical criticism are related to, but differ somewhat from, those of other problematic types of promotional activities. Although a range of advertising and public relations techniques have been criticized for their potential to manipulate or coerce consumers, to manufacture desires, and generally to deceive the public, a certain degree of "puffery" or exaggeration has come to be expected, and in some cases considered acceptable, in the marketing of products or services. However, the use of similar tactics to publicize good corporate conduct—and in particular, corporate environmental achievements—has been deemed more problematic. One possible explanation for this is that companies guilty of greenwashing are not just *exaggerating* their environmental accomplishments or contributions: They are claiming to be environmental champions when they are in fact environmental villains. Thus, the charge of greenwashing seems especially apt in instances where corporate environmental communications are not just exaggerated, but tastelessly ironic.

Ethical worries about greenwashing extend far beyond the general unseemliness of the practice. One of the key concerns expressed by environmental activists is that greenwashing could result in unwarranted consumer and regulator complacency. Corporations that make exaggerated claims regarding their commitment to the environment might give consumers and government regulators false hope that corporations themselves are making great strides toward protecting the environment, leading consumers and policy makers to believe that current levels of mass consumption are sustainable and that further government regulation is unnecessary. Moreover, there is the fear that if one corporation in a particular industry gets away with greenwashing, other corporations will follow suit, thereby creating an industrywide illusion of environmental sustainability, rather than sustainability itself. A final worry is that greenwashing may engender cynicism: If consumers come to expect self-congratulatory ads from even the most environmentally backward corporations, this could render consumers skeptical of even sincere portrayals of legitimate corporate environmental successes. This could result in a failure to justly recognize the achievements of genuinely progressive corporations, thus eliminating one significant incentive for improving corporate environmental performance.

Conclusion

The concept of greenwashing should be of interest to a range of parties. First and foremost, greenwashing should be of interest to consumers. While many instances of corporate environmental communication are well-intentioned and truthful, not all are, and consumers who wish to "vote with their dollars" need to be aware of various kinds of corporate deception and spin. Second, environmentalists and corporate watchdogs, such as the Green Life and CorpWatch, are of course interested to spot, and point out, cases of serious greenwashing. The charge of greenwashing constitutes a significant and poignant piece of critical rhetoric (in the nonpejorative sense of "rhetoric"). Finally, students and scholars of business ethics should be interested in the concept of greenwashing, too. There has thus far been a regrettable shortage of academic attention to the concept, despite the term's prevalence and its normative richness. The charge of greenwashing represents a savvy, typically nonacademic criticism of corporate environmental communications. Academics ought to be attending to the significance of such lay evaluations: The growing prevalence of greenwashing as a practice, and as an accusation, signals a new complexity in the evaluation of corporate environmental performance.

Gross Domestic Product (GDP)

The gross domestic product (GDP) is the market value of all the final goods and services produced in a country in a given period. As early as the 19th century, the need to compile information on the evolution of an economy over time prompted economists to develop aggregate calculations of a country's total production. In 1942, the U.S. Department of Commerce published the first official set of national accounts: a set of statistics that measure the country's economic variables, the most important measures being GDP and gross national product (GNP).

The Economic Dimension of the Gross Domestic Product

In the GDP, all the goods and services produced are aggregated in terms of value, that is, in terms of the prices paid by the buyers. Because some goods are used to produce other goods (e.g., the steel used in the production of automobiles), adding up the value of all the products would lead to "double counting" (the steel would be counted twice, once as a product of the steel industry and again as part of the value of the automobiles). To avoid that, only "final" goods are taken into account, that is, goods that are not used in the production of other goods (in our example, the automobiles, but not the steel). Alternatively, we can add up the "value added" by each production unit (the value the steel company adds to the raw materials, supplies, and energy purchased from other companies; and the value the auto maker adds to the value of the raw materials and supplies obtained from other industries, etc.).

The GDP is calculated, as we said, using the selling prices in the period in question. Therefore, to compare the GDPs of two different periods we need to separate the change in physical output from any mere change in prices. To do that, we calculate the GDP in real terms, that is, in the prices of a given year (known as the base year, which tends to be the previous year). That effectively eliminates any change due solely to changes in prices. And as the size of a country's GDP will depend on the amount of production factors available, it is useful to calculate GDP per capita (total GDP divided by the country's population) as a measure of the volume of the income generated by one person in the country.

As we have seen, the GDP contains information about the scale and composition of a country's production, the income it generates, the size and makeup of its citizens' spending (in other words, the standard of living of its population), employment creation, and how these variables have changed over time. It also allows us to compare the economies of different countries, although this raises at least two further problems. One is what common currency to use for the comparison, because any changes in the exchange rate of the chosen currency may give rise to spurious changes in our comparisons of the GDP. The other is the fact that the purchasing power of the same monetary unit may be very different in different countries: Although one dollar is one dollar, whether in the United States or in India, you can buy a lot more with one dollar in New Delhi than you can in New York. For that reason, international comparisons tend to be made in terms of what one could purchase in each country with a certain amount of money, which corrects that effect.

Limitations of the GDP

The GDP is a very useful economic concept, but it is important to be aware of its meaning and its limitations, in economic, social, and ethical terms:

- The GDP includes the goods and services that are the object of exchange in the market, for which there are set prices, and certain other goods and services, such as the services of owner-occupied housing or the consumption of farm produce by farm producers, for which prices are imputed. But it excludes many goods and services that are not the object of exchange in the market, such as housework, child care and elder care (when not carried out as paid work), voluntary work, and so on. In other words, its scope is limited.
- It does not include illegal productive activities (drug trafficking) or undeclared activities (underground economy).
- It does not include activities entailing mere transfers of assets between people, such as the sale of a house (whereas the construction of the house is part of GDP), the sale of a company's shares, the increase in value of a work of art, donations, or thefts.
- GDP does not measure the value of a country's wealth, only the value of the goods and services produced. If, for example, a natural disaster destroys part of the country's productive capital or resources, which will not be directly reflected in the country's GDP, although it will be reflected indirectly if final production is reduced as a result of the destruction.
- It does not include the value of leisure—though it is assumed that the market wage should reflect it, at least ideally. Nor does it include spiritual, moral, or cultural values, unless they are reflected in the production of goods and services.
- Market prices do not reflect all the opportunity costs of production, nor the harm (and benefits) caused by economic activity outside the market, such as environmental damage or traffic congestion. Paradoxically, the GDP may not reflect the environmental damage caused by production or the insecurity resulting from crime, and yet it will reflect the value of the goods and services produced to combat those ills.

For all the above reasons, GDP is a useful concept, but it needs to be used and interpreted with care, especially when its growth is adopted as a policy objective. It may be legitimate to promote faster GDP growth, particularly in developing countries, in order to create better opportunities for the population. But that policy must meet certain conditions. It must (1) be sustainable, (2) be fair (problems of inequality and poverty), (3) be efficient, and (4) foster (or at least not obstruct) values such as social cohesion, quality of life, or moral values. (For a discussion on the use of other indices designed to overcome at least some of the limitations of the GDP, see the entry "Gross National Product.")

In any case, it is important not to confuse GDP with well-being or welfare. The GDP refers only to the production of goods and services, in other words, the material component of well-being. Giving absolute priority to that component may lead to ethically questionable postures, such as the predominance of "having" over "being," or the subordination of other human values to the attainment of material well-being.

Gross National Product (GNP)

The gross national product (GNP) is the market value of the goods and services produced in a given period by the domestically owned factors of production of a country. It is an alternative to the gross domestic product (GDP): Both share the same accounting principles, qualities, and limitations.

The difference between the two indicators has to do with the scope of the calculation. The GDP refers to goods and services produced within the country by factors of production owned by residents and nonresidents alike. In contrast, GNP refers to goods and services produced by factors of production owned by residents, whether the production takes place within the country or abroad. For example, the salary of a U.S. national who works in Belgium without being resident in this country will be included in Belgium's GDP but not in its GNP. Conversely, it will be included in U.S. GNP but not in U.S. GDP. Formally, GNP is equal to GDP plus any income (from labor and capital) earned abroad by domestic factors, less income earned within the country by foreign factors.

Ireland is an interesting case: In 2003, its GNP was equal to 79% of its GDP. The difference was due to the high volume of foreign investment in the country, the return on foreign investment being included in GDP, but not in GNP. In 2003, Ireland ranked 4th among OECD countries by per capita GDP (in purchasing power parity terms), and 17th by per capita GNP. That may reflect an ethical problem: the possible manipulation of transfer prices by multinational companies to generate most of their profits in Ireland, whose tax policy is particularly favorable.

Like GDP, GNP may be seen from three equivalent points of view:

1. *Expenditure based*: The value of domestic final expenditure on goods and services at market prices (which includes purchases of consumer goods and services by households; gross private domestic investment in structures, equipment, and software; residential investment and change in inventories; and government consumption expenditures and investment), plus the value of exports, less the value of imports.
2. *Income based*: All payments made in production, such as wages and other labor costs, interest, rental, depreciation, profit, and taxes paid by companies (less subsidies).
3. *Output based*: The sum of the value added by all the production units plus net taxes paid.

The Alternatives

To overcome the limitations of GNP and GDP as measures of well-being, various alternatives have been proposed. William Nordhaus and James Tobin, for example, proposed the Measure of Economic Welfare (MEW): an adjusted measure of total national output, including only the consumption and investment items that contribute directly to economic well-being. The calculation includes deductions for capital consumption, disamenities (e.g., pollution), regrettable activities (which do not contribute to well-being), and intermediate activities (whose contribution is already included in other items), such as the cost of national security and diplomacy and some personal business and travel expenses, and additions to account for the well-being derived from leisure and nonmarket activities and some capital services.

Another is the Index of Sustainable Economic Welfare (ISEW). It is calculated in much the same way as the MEW, based on the consumption component of GDP, with additions to take account of factors such as unpaid household labor and the net formation of man-made capital, and deductions to reflect resource depletion, income inequality, and environmental damage. It has been reformulated as the Genuine Progress Indicator (GPI), to include factors such as the value of volunteer work, the cost of crime and family breakdown, the cost of underemployment, ozone depletion, and so on. Generally speaking, these indicators yield a much lower rate of growth than GDP or GNP, particularly since the 1970s, and often enough a declining trend. With different goals in mind, the United Nations prepared the Human Development Index (HDI), which combines indicators of life expectancy, educational attainment, and adjusted real income.

Recently, economists have used international surveys to compare happiness indicators with GNP or GDP. Easterlin posed the paradox that rising levels of per capita GNP did not contribute to greater happiness. However, more recent studies have found a positive correlation between happiness and personal income, the generosity of the welfare state and life expectancy, and a negative correlation with factors such as average hours worked, environmental degradation, crime, inflation, and unemployment.

Guanxi

No literal translation exists for the Mandarin term *guanxi,* but it incorporates aspects of relationship building and the rights and duties that two or more parties have toward each other.

Confucianism, practiced in Mainland China, Greater China, and Southeast Asia, considers people as a part of the social network in which a person plays different roles. Confucius originally listed five relationships of unequal, bipolar contexts that defined Chinese society. As George Haley and colleagues identified, these relationships include

- Ruler–Minister
- Father–Son
- Husband–Wife
- Elder Brother–Younger Brother
- Friends

The five relationships have attendant, though unequal, ethical expectations and duties. For example, those relationships on the left side of the above list (ruler, father, husband, etc.) can extract more duties and obligations than those on the right (minister, son, wife, etc.). Outside these five relationships, individuals have no ethical obligations, except to maintain social harmony. Because of China's weak legal system, and the traditional and historical administrative bias against the Chinese merchant classes, Confucian relationships including *guanxi*, with their emphasis on trust and uprightness, defined Chinese business relations for centuries. The importance of *guanxi* in business environments was emphasized by the Confucian bias against the merchant class and the concept of profit. Book 4, paragraph 16 of *The Analects* states, "A gentleman understands what is moral. The Small man understands what is profitable." A full discussion of the sociology of Chinese relationships and their effects on the evolution of Chinese culture and society, including businesses, can be found in *From the Soil: The Foundations of Chinese Society*, by Fei Xiaotong (the founder of Chinese sociology and whose works the Chinese Communist Party banned until the 1980s; the People's Republic of China banned sociology itself as a discipline until 1976). Confucian expectations on *guanxi* and ethical conduct continue to affect interpersonal business behaviors and business environments in China.

The inequality of *guanxi* molds interpersonal ethics in Chinese business; different levels and intensities of *guanxi* receive different levels of treatments. Several researchers have provided empirical evidence of how *guanxi* affects diverse relationships in business and social environments. For example, A. K. M. Au and D. S. N. Wong in 2001 used auditors in Hong Kong and Chinese companies to show that *guanxi* correlates with moral reasoning. Au and Wong explored the effect of ethical reasoning on the relationships between *guanxi* and auditors' behaviors in an audit-conflict situation. Their research showed that auditors' behaviors in an audit-conflict situation were influenced by the existence of *guanxi* and the level of cognitive moral development of the auditors; *guanxi* influenced decisions in conflicts, and even auditors with high professional ethics were influenced by it. In 2002, D. Tan and R. S. Snell derived five Chinese moral principles from their research on work ethics in Chinese society. Tan and Snell's theory specifically addressed the Chinese habitual emphasis on interpersonal relationships. Earlier, H. K. Ma had also proposed relational hierarchy from the perspective of utilitarianism and classified interpersonal relations into relatives, friends, strangers, and enemies. Relatives refer to blood relations, while friends include close friends and confidants. Strangers span ordinary strangers and extraordinary strangers. The latter consists of the socially vulnerable (e.g., people with disabilities), children, and the social elite (e.g., Nobel laureates). The amounts of utilitarian acts vary with the types of the interpersonal relations, with relatives receiving the most attention and enemies the least.

In broader social and political contexts, corporate political strategy often distinguishes between transactional and relational approaches to political behavior. Amy Hillman and Michael Hitt have proposed that companies with higher perceived or actual dependence on government policy will likely use relational approaches to political action. Chinese Confucian culture strengthens relational approaches. *Guanxi* networks permeate Chinese society. To influence government decision making, companies attempt to build and to lock in long-term *guanxi* with government officials or departments. Transactional approaches to political action may lead to the break of government *guanxi*, which could result in subsequent, unbearable transaction costs.

Indeed, research conducted by George Haley and colleagues has shown that *guanxi* provides a core competence for Chinese and overseas Chinese companies giving them privileged access to Chinese and Southeast Asian markets and relevant strategic information that foreign companies do not have. The research identified that in China's modern business environments, companies had to maintain *guanxi* among three separate, though overlapping networks—business, government, and ethnic networks. Relationships or *guanxi* with the government assumed particular importance for business success in China. In her testimony before the U.S. congressionally mandated commission, the U.S. China Economic and Security Review Commission, Usha Haley elaborated on how *guanxi* moulds off the book subsidies from the Chinese governments to Chinese businesses and prevents effective implementation of the Word Trade Organization principles.

H

HAYEK, FRIEDRICH A. (1899–1992)

One of the most significant thinkers of the 20th century, Hayek is renowned for his critique of socialist economic planning and for a defense of classical liberalism that employs a theory of social evolution and spontaneous order. A recipient of the Nobel Prize in Economics in 1974, he made important contributions to political philosophy, the history of ideas, psychology, and the method of the social sciences. The fundamental problem of society is, for Hayek, not the allocation of resources but the coordination and utilization of the knowledge that is dispersed among millions of anonymous individuals. To meet this problem, Hayek argues for a rule of law to establish conditions of liberty, thereby allowing the emergence of a spontaneous social order of greater complexity than could be attained by planning.

Hayek served in World War I and subsequently enrolled in the University of Vienna, majoring first in law and then in economics. In 1931, he accepted a position at the London School of Economics (LSE), becoming a British national in 1938. Focusing on monetary theory and the business cycle, his early work also includes robust criticism of Keynes, whose theory, Hayek argues, neglects the temporal elements of economic production. During this same period, Hayek turns to the topic of "socialist calculation." In his contribution to his edited collection, *Collectivist Economic Planning: Critical Studies on the Possibilities of Socialism* of 1935, Hayek extends the theory of Ludwig von Mises, one of the great economists of the Austrian School, by arguing that without freely determined prices, socialist planners will not know what to produce, in what quantities, or by what methods. In *Economics and Knowledge* of 1937, Hayek takes up the problem of the utilization of knowledge. Given the subjectivity of individual perception, along with the dispersed and fragmentary nature of knowledge, the theoretical construct of economic equilibrium (the mutual compatibility of expectations) must be explained rather than assumed. Hayek suggests that under the right conditions, the knowledge of individuals would coordinate spontaneously, tending toward an order analogous to that which a designing mind might have wrought. With the publication of *The Road to Serfdom* of 1944, Hayek extends his critique of socialism, warning that well-meaning attempts to plan the economy would have deleterious effects not just on economic affairs but on the political, moral, and attitudinal character of individuals.

Hayek remained at the LSE until 1950, when he joined the University of Chicago; he also taught at Freiburg (1962–1967) and was an honorary professor at Salzburg (1968–1977). During the decade of the 1950s, he published, among other works, *The Sensory Order* (1952), a treatise on psychology (a draft of which he had composed three decades earlier) and *The Counter-Revolution of Science* of 1952. In this work, he defends methodological individualism and argues that the relevant facts of the social sciences are the beliefs and intentions of agents, not empirical data.

By the end of the 1950s, Hayek completed *The Constitution of Liberty* of 1960. This important work restates the ideals of classical liberalism and critiques both socialism and the welfare state. His political philosophy is grounded in an understanding of society that he traces to 18th-century philosophers such as Mandeville, Ferguson, Hume, and Smith. Social norms and patterns of conduct emerge over time in an unintended and evolutionary manner. Liberty, established through general and impartial law (and not through specific or particular commands), is essential to the emergence of spontaneous and beneficial patterns and institutions. These ideas are developed further in the three volumes of *Law, Legislation, and Liberty* (published in 1973, 1976, and 1979). Hayek focuses on the "abstract" and purpose-free rules necessary for generating a spontaneous order (explaining how such rules may run counter to deeply felt emotions). He also contends that "social justice" has no coherent application in a free society, and he elaborates the legal institutions required to preserve freedom.

Hayek's thought has relevance to several areas of business ethics. He is often noted for his rejoinder to John Kenneth Galbraith's contention that consumer preferences are the dependent creations of corporations and are therefore not urgent. Hayek counters that most desires (including those for art and music) have been produced by organizations or institutions of society, but this fact does not show these desires to be insignificant. More important yet, the demise of socialist regimes may vindicate the thesis that economic planning cannot surpass the productivity of markets. And the idea of society as a spontaneous order should prove fruitful for developing a business ethic attuned to the ongoing processes of markets. Finally, Hayek's contention that the basic economic problem of society is one of coordination raises an unrecognized implication for the stakeholder theory of management. If freely determined prices provide information that helps to coordinate multivarious plans and intentions, then is the manager who responds to stakeholders, rather than to prices, a disruptive force whose actions forestall the productivity that would otherwise be achieved?

Hazardous Waste

A hazard, in a technical sense rather than in day-to-day meaning, is the source of a potential harm, while a risk is the combination of the frequency of the hazard and the consequences of its occurrence. Hazardous wastes are broadly defined as those waste products that have a negative impact on human health and the environment when they are emitted or discharged into air, water, soil, food, and tissues. They are defined more specifically in the Basel Convention and in OECD Regulations for the Control of Transboundary Movement of Wastes Destined for Recovery Operations, agreed to by the OECD Council in 2002. According to the Basel Convention, the intergovernmental agreement administered by United Nations Environment Program, such wastes fall into the following categories: explosive, flammable liquids/solids, poisonous, toxic, ecotoxic, infectious substances. Other regulatory lists also act as national classificatory systems. For example, in the United States, the Resource Conservation and Recovery Act (RCRA), passed in 1976 and amended in 1984, 1992, and 1996, established the authority for the U.S. Environmental Protection Agency to control hazardous waste from "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste.

Risks Associated With Hazardous Waste

As global population grows, our economic development continues, and communication systems expand, environmental hazards have greater socioeconomic and biophysical impacts. Public opinion polls in the 1990s and early 2000s have shown that hazardous wastes are the most worrying of all environmental risks and hazards. They arouse most public controversy and challenge policy makers and the business and scientific communities alike to develop new ways of decision making to manage their storage, transport, and disposal. Researchers have found major differences between how the public, on one hand, and the scientific community, on the other, assess the risks associated with hazardous waste. Studies show that risks borne involuntarily, caused industrially, or that are difficult to pick up through our senses, such as nuclear irradiation, are perceived as higher. The question of acceptability of the risk goes back to trust in the organizations that produce, manage, and regulate the hazards.

The publication of Rachel Carson's *Silent Spring* in 1962 marks public recognition of the persistent effects of hazardous or toxic substances on the biosphere. It was not until 1975, however, prompted by the notorious episode of Love Canal, a small canal near Niagara Falls in New York State, where the Hooker Chemical Company had dumped toxic chemical waste for a decade, that the impact hazardous waste can have on human health emerged as a specific policy issue and a political phenomenon, with potential impact on government credibility as well as corporate performance. In the decades since, environmental justice movements concerned with hazardous waste have both proliferated and diversified. These often intractable disputes represent the failure of traditional forms of authority and organization in dealing with these problems. In this way, hazardous wastes are emblematic of many of the environmental problems facing society and reflect the new environmental, social, and economic pressures facing organizations of all types.

Implications for Business

Proponents of the business case for corporate social responsibility argue that apart from reducing costs associated with compliance, there are business benefits in reducing the generation of hazardous waste. They include more efficient resource use, improved quality, higher reputation, increased innovation, and new niche markets. As a result, some voluntary business efforts are under way, often led by industry associations, such as the American Hospital Association's agreement that member organizations would eliminate hazardous wastes such as mercury.

Investors and consumers can also react negatively to the risks associated with the creation of hazardous waste, such as high penalties and cleanup costs. This is more the case since regulators are increasingly releasing information on polluters to the markets (investors and consumers) as a means of pressuring companies to reduce their environmental impacts. On the other hand, there are also economic incentives for developed nations with more stringent environmental legislation to export their wastes to the developing world. Hence capital markets may act both as an incentive and a disincentive for firms to control their production of hazardous wastes.

In terms of government regulation, hazardous waste is controlled using three regulatory principles: the proximity principle, the polluter pays principle, and the precautionary principle. These principles are enshrined in much of the legislation and regulations concerning sustainable development in general and waste management in particular. The first two of these guidelines in decision making are relatively straightforward in their implications for business and government regulators. The proximity principle holds that the best place to deal with a problem is as close to it as possible. Polluter pays describes a wide gamut of financial incentives for firms to make preventative decisions but basically puts the responsibility for costs of any damage on those engaging in potentially hazardous activities. The precautionary principle holds that if there is scientific uncertainty associated with the disposal of potentially hazardous waste, then other options for the disposal or storage of the waste must be considered.

Applying this principle to the management of hazardous substances raises major difficulties for companies. Their effects on human health are often uncertain because their chemical composition and the specific source of the hazard are frequently unknown. Low-level hazardous waste may have cumulative effects, and different chemicals composing the waste may interact synergistically in unknown ways. Waste streams may be reclassified as hazardous as we develop more understanding of the impact of certain chemicals. Hence, for many companies, the hazardous nature of their industrial legacies may not emerge until long in the future, making their long-term risk profile and shareholder investment a cause for concern.

The Control of Hazardous Waste

The major international treaty dealing with hazardous waste is the Basel Convention of 1989, which by May 2006 was ratified by 164 countries and has been emulated in other intergovernmental arrangements. Its immediate purpose was to prevent developed countries, as their own governments tightened environmental legislation, from dumping their hazardous wastes in developing countries. However, it is also concerned with lessening the generation of hazardous wastes by taking an integrated life cycle approach that involves controls from the generation of a hazardous waste to its storage, transport, treatment, reuse, recycling, recovery, and final disposal. Signature nations are required to report annually on the generation and movement of hazardous waste. The convention allows for trade in wastes between signatory countries that have signed bilateral agreements concerning waste transfer.

Various regulatory regimes have attempted to set controls on hazardous waste, albeit in different ways. For instance, in the United States, RCRA addresses responsibility for activities related to generating, handling, and disposing of hazardous waste. The effect on business of the increasing controls on transboundary waste transfer and tightening national legislation is a shift to waste reduction to reduce or eliminate compliance issues. This is particularly evident in the electronics industry because of rapid obsolescence of products such as computers and cell phones, many containing toxic materials. The European Union is implementing strict new take back and recycling legislation for electronic waste products through various directives such as Waste Electronic & Electrical Equipment and End-of-Life Vehicles Directives. In Japan, the Law for Promotion of Effective Utilization of Resources embraces the principle of extended producer responsibility by requiring manufacturers to establish collection and recycling systems for used computers. This law now also addresses the recycling of small batteries containing toxic materials.

Ethical Issues Surrounding Hazardous Waste

A first ethical issue concerning hazardous waste arises from its longevity. This leads to the question of intergenerational justice—that is, whether risks to present generations should be decreased by transferring them to future generations. Such considerations are sometimes backed by the argument that future generations are likely to have a larger range of technological know-how and hence would be better able to deal with our problems. However, such a position is subject to both factual and ethical objections. Problems resulting from hazardous waste may actually get worse over time and hence become more costly to tackle. On ethical grounds, it has to be noted that just because A is better able to deal with B's problem, it does not follow that A has an obligation to actually do so. An attempt to address intergenerational justice is the neutrality criterion in nuclear waste management, which stipulates that risks to future generations should not be higher than those they would face without the interference by the present generation. In terms of nuclear waste, future generations should thus not be subjected to risks that are higher than naturally occurring background radiation.

Another intergenerational issue is linked to the notion of consent. Who would be eligible to grant consent as proxy of future generations and under what conditions? In practice, it can often be observed that present-generation stakeholders, such as host communities of proposed storage sites for hazardous wastes, do not consent to the siting of the facility. Consent by the present generation to the imposition of a risk would, however, be an important precondition for the consent of future generations, as one cannot assume that future generations would accept a condition that the present one does not.

Hazardous waste also creates a number of intragenerational issues, which center on the distribution of risks, such as living near a hazardous waste storage facility, and benefits, such as having access to cheap nuclear energy. There is indeed evidence in industrialized countries that underprivileged sections of the population have a greater likelihood of living next to hazardous sites and therefore bear a higher burden of the risk. Another issue of justice concerns the imposition of transport routes for hazardous waste on local governments, whether to dispose of waste on site or at some remote location.

Further intragenerational issues concern trade in hazardous waste. Although most such trade is between industrialized countries, an undefined proportion is exported, legally or illegally, from industrialized to developing countries. This export becomes a source of ethical concern where the importing country lacks the administrative expertise and technical resources to adequately deal with such waste. Burying hazardous waste in landfill facilities that are not properly managed or only partially controlled can lead to the contamination of ground water or agricultural land. Another concern regarding the externalization of risk from the

North to the South are the conditions under which workers in developing countries dismantle electronic components or decommissioned ships to recover recyclable materials: They may work unprotected from toxic fumes and other hazards. Such impacts are particularly problematic as developing countries have only scant economic resources they can devote to public health issues. Hence, coping with more urgent short-term problems, such as infectious diseases or infant mortality, diverts attention from the more long-term public health impact of hazardous waste.

Hazardous waste not only has a negative impact on the quality of air, water, and agricultural soil but by evaporating and turning into toxic rain, some forms of it can also reappear in areas far removed from the original location. This raises the question of whether decisions on modern manufacturing methods and the risks arising from these can be left to scientific experts and corporate executives. If public opinion is not sought and taken account of as valid—rather than dismissed as unscientific lay view—then ultimately the public may end up becoming disenfranchised. From an ethical point of view, the controversy surrounding hazardous waste concerns a clash between welfare gains and rights, in particular the right not to be harmed or put at risk. There seems to be general agreement among moral philosophers that protecting a person from serious harm is more important than any enhancement of societal welfare, whether accruing to that person or not. Such a conclusion is also backed up by reference to the social contract that binds human society. By virtue of being members of the same species, members of all generations, whether present or future, deserve equal treatment. This anthropocentric argument can, of course, be enlarged to encompass other species.

Health Insurance Portability and Accountability Act

The Health Insurance Portability and Accountability Act (HIPAA) was passed by the U.S. Congress and signed into law by President Clinton in 1996. There were two main concerns behind the law. The first is related to employees fearing to switch jobs due to the potential of losing medical insurance coverage for preexisting health problems such as diabetes or hypertension. HIPAA provides increased protection to employees in that situation.

The second concern behind the law was the increasing use of electronic storage of medical records. Such storage eases communications between, for example, the patient's health care provider and insurance company. However, it also increases the risk of sensitive health care information about a particular patient being shared with the wrong parties. Often, private medical records must pass through a number of hands during activities such as the processing of insurance claims. Even more hands are involved with the complex decision-making processes and auditing that take place in HMOs and hospitals. In addition, medical records stored on computer hard drives and portable storage devices such as CD-ROMs are vulnerable to hacking attacks and/or theft. The age of the Internet, in which sensitive personal information could potentially be shared worldwide, has heightened privacy and security concerns. HIPAA requires that both government agencies and private firms that have access to personal health information address such concerns.

Provisions Related to Protection of Employee Health Insurance

HIPAA regulates group health insurance plans in relation to their decision to offer or not offer coverage to patients with health problems. "Health problems" are broadly defined, and include illness (physical and/or mental), disability, and a poor genetic profile. The law allows benefit limitations on these conditions, but only if they are applied uniformly to all individuals with similar conditions. With the same caveat, a similar regulation allows group health plans to limit lifetime benefits.

The second set of provisions related to protecting employee health insurance concerns insurance coverage of patients with preexisting medical conditions. A "preexisting condition" is defined as one from which a patient suffers at least 6 months prior to the patient's enrollment in an insurance program. While excluding such conditions from coverage is allowed, there is a time limit for exclusion: 12 months for most individuals and 18 for those who enroll late. The next provision is designed to avoid the problem of patients fearing to take a new job due to loss of coverage for preexisting conditions. Previous insurance coverage counts toward meeting the 12-month exclusion, provided the break in coverage is less than 63 days. Thus, if an employee had more than 12 months of coverage in a prior job, he or she cannot lose coverage over the preexisting condition when accepting a new job with a new health plan.

The moral issues surrounding these health insurance regulations involve whether it is fair for a provider of health care coverage to deny such coverage to a patient with a previously existing medical condition. This issue has expanded to whether an insurance company can deny an individual coverage for a poor outcome on genetic testing, even if that individual does not yet have a disease. The insurance industry has argued that to make a profit, it is necessary to deny coverage to those with known serious medical conditions or poor genetic profiles. Critics argue that such policies only result in the healthy being covered by medical insurance, with the result that those who need health care insurance the most—namely, the sick—are the ones who are denied coverage. These concerns are extensions of a larger debate over the treatment of patients by insurance companies. These companies can freely contract with individuals and businesses and charge what they wish for coverage, something that hurts smaller businesses in negotiations for insurance coverage for their employees. In addition, the insurance industry's notion of "actuarial fairness" claims that it is morally acceptable to charge people different rates based on their likely burden on the insurance system. These issues play into more, even broader, debates over rights language ("is there a right to health care?") and justice ("is it really fair to deny the sick the coverage they need?").

Privacy Provisions

The major impact of HIPAA, and the major focus of discussion surrounding HIPAA regulations, has been on privacy provisions. These provisions apply to "covered entities," including health care professionals, health care facilities, such as hospitals and nursing homes, providers of health plans, such as insurance companies and HMOs, and Medicare and Medicaid—any entity having access to patient medical records.

It is not only information in an individual's medical records that is protected. Conversations among health care staff concerning a patient's treatment, information about an individual's medical bill at a health care facility, or personal information held by an insurance company is also protected. It is irrelevant whether such information is found in hard copy or stored on a computer hard drive or any other electronic storage device.

The HIPAA regulations give certain rights to patients regarding their own access and limiting others' access to health related information (e.g., requesting that a physician call the patient's office phone rather than home phone). If any patient requests a copy of their medical record, the health care provider has 30 days to provide it, although it can delay for an additional 30 days if it gives the patient a reason for the delay. Patients also have the right to correct their medical records if they are in error. They have the right to a notice detailing how their health information will be used and with whom it will be shared. If a provider wishes to use patient information for nonhealth reasons such as marketing, the patient must give prior permission. The patient also has the right to receive a report on when health care information was shared and the reasons for that sharing. The patient can get this report free once a year, and the health care entity is required to provide the report within 60 days of request, but it can take up to 90 days if it provides a reason. Although a patient may request that health information not be shared with others, such as other physicians at a clinic, the clinic is not required to agree to the patient's request. If a patient has a privacy-related complaint, that patient can file a formal complaint with the Department of Health and Human Services Office for Civil Rights.

Covered entities have responsibilities regarding the use and release of medical records. Most sharing of health information unrelated to a patient's health care, such as disclosures of health information to employers or potential employers of the patient, are forbidden unless the patient gives prior permission. Information shared must be the minimum necessary to make adequate disclosure given the purpose of disclosing such information. Health care providers and other entities covered under HIPAA are required to have a written privacy policy detailing who can see and use protected information and when it can be released to others. Normally, the patient will receive a copy of the privacy policy on the first visit to the health care facility. Covered entities must train employees in privacy procedures as well as appoint a privacy officer to enforce privacy regulations. Policies and procedures manuals must specify privacy provisions as well as include a list of those classes of employees having access to health care information. Companies that outsource business involving patient information to third parties must ensure that the third party will ensure the same protections for patient information as the outsourcing company. A contingency plan is required for emergencies, including data backup of patient information. Encryption of some computer data of medical records may also be required. Notes concerning mental health care are not meant to be shared and thus are held to a higher standard of protection. Covered entities may release health care information for certain public responsibilities, such as emergency situations, identifying a body, or determining the cause of death, public health needs (e.g., stopping an epidemic), medical research approved by an Institutional Review Board, regulation of health care entities, judicial and law enforcement activities, and national security. If a state law has privacy regulations that are stricter than HIPAA, a covered entity located in that state must follow the more stringent state regulations. Both private and public sector health care and insurance entities must follow HIPAA, and there are civil and criminal penalties (up to a $250,000 fine or 10 years in prison) for those who knowingly violate the privacy provisions.

Is HIPAA a Good Thing?

While consumer and privacy advocates have, for the most part, applauded HIPAA, some privacy advocates, along with health care providers and other covered entities, have concerns. On one hand, there is the danger of patient information being released to the wrong parties. This concern helped move HIPAA easily through Congress. If a patient's health care records, for example, are released to a potential employer, and it turns out that patient had cancer 8 years before, that company may not hire that individual. Or a man might not want his wife to know that he had a bout of gonorrhea 5 years before they were married; release of such information could be embarrassing and damage his marriage. Insurance companies might use the results of genetic testing to discriminate against patients if they gain access to that information. With one fundamental principle in medicine being nonmaleficence, "do no harm," it is important that health care providers not release sensitive information that could harm their patients. Privacy laws, such as HIPAA, are a result of that concern not to harm patients by releasing private, potentially sensitive information. In an age of greater ease in information sharing due to computers, many consumer advocates argue that HIPAA is a good start in protecting patients from unauthorized or unjustified release of their personal health information.

Critics, including some privacy advocates, have argued that the protections of HIPAA are too weak; some have further argued that *no* laws and regulations can adequately protect privacy. One example is a person filling out an application for health insurance. The application will ask health questions that the applicant is required to answer truthfully. Some of these questions may concern sensitive information such as the results of genetic testing. The application may request release of the patient's medical records to the insurance company. If the company argues that the entire record is relevant to its making an informed decision about coverage, then, these critics claim, HIPAA offers no meaningful privacy protection for the applicant.

Another source of criticism has come from covered entities such as doctors' offices and hospitals. They have complained of difficulty in understanding government regulations on enforcing privacy. There are concerns that overzealous hospital employees, fearful of being fined for HIPAA violations, may refuse to give information concerning a sick patient to the patient's close family members. In addition, increased regulation means increased costs. Larger companies may wish to hire a privacy officer rather than add those duties to one of the existing employees. Revamping computer programs and generating more paperwork also increase costs. It is estimated that implementation costs will be more than $17 billion over the first 10 years of the initiation of HIPAA privacy regulations. However, it is also estimated that covered entities could save up to $30 billion through administrative simplification (such as standardization of financial transaction formats and code sets). Whether HIPAA will increase the cost of health care or result in cost savings remains an open question. Whatever its merits as law, the passage of HIPAA has stimulated debate over the proper scope of privacy and confidentiality regarding health care records.

Health Maintenance Organizations (HMOs)

Health Maintenance Organizations (HMOs) are the primary vehicle for managed health care in the United States. An HMO is an organizational structure that insures participating members for health-care-related expenses through its coordination of the financing elements of medical care with the care provision aspects. In their role as insurer, provider, and administrator for health care coverage, HMOs attempt to fulfill three often conflicting agendas: the provision of high quality health services; the reduction of inefficiencies, both operational and economic, in such services; and the generation of financial profits for the owners of care provider systems.

The underlying philosophy behind the development and implementation of health maintenance organizations is the concept of managed care. Managed care is an approach to the provision of health care services that attempts to balance concerns for the application of effective medical treatment with administrative concerns for economic efficiency, as represented by cost control measures. A critical element in this balance between treatment and cost containment is an emphasis on preventive care—the effort to prevent serious disease through periodic preventive treatments such as annual physical examinations. Preventive care attempts to identify potential health problems before they grow both in severity and in treatment cost.

HMOs form a unique element of the U.S. health care system by offering a means to "manage" health care costs through the provision of prepaid health coverage for future services; in this fashion HMOs serve as both health insurers and health care providers. They operate largely as private, for-profit organizations within the U.S. health care system, which itself is a predominantly private (nongovernmental) medical services delivery system. Prior to the emergence of HMOs, most medical services in the United States were performed on a fee-for-services basis, with traditional health insurance offering posttreatment payments. Under this structure, the risk of excessive health care costs that would not be covered in full by these existing insurance plans tended to discourage some individuals from obtaining necessary medical treatment. Moreover, the cost of traditional insurance would often fall beyond the means of up to a quarter of the working population.

Because the United States does not provide comprehensive, universal, publicly funded health care for its citizens, the HMO was developed as a mechanism to lower health care costs and thus make health care more affordable for less affluent portions of the population. However, as HMOs are largely privately owned businesses facing pressures from stockholders (the owners of these companies) for profits, the structure and performance of health maintenance organizations in the United States embody the central dilemma that bedevils health care in the United States—the struggle between economic demands for profitability and medical demands for effective care. Complicating this situation are issues of equity in the availability and implementation of care, ethics concerning the nature of the decision-making processes in HMOs, and efficiency in a system that attempts to balance important issues of medical treatment with overriding pressures for cost containment.

The historical origins of HMOs date from the early part of the 20th century. In several areas of the United States, innovative physicians established prepaid medical service arrangements within their communities. The most significant large-scale developments among these early efforts were the formations of the Kaiser Permanente group and the Health Insurance Plan (HIP). The system that became Kaiser Permanente started in the 1930s as a supplier of medical services to industrialist Henry J. Kaiser's employees throughout the Western United States; after World War II, it expanded into a publicly available, comprehensive prepaid health plan that was open to all interested groups. In the eastern United States, HIP emerged in New York City during the 1940s as a medical provider for the municipal employees of that city. Two important elements of these and other early efforts toward prepaid group health coverage were the nonprofit status of many of these emerging providers and the emphasis these providers placed on preventive care as a means to reduce overall health care costs.

Innovative efforts such as these remained a relatively small and isolated force within the overall health care system in the United States, though, until the convergence of significant medical and economic forces during the 1960s. That decade witnessed a substantial growth in medical technologies and advances in medical practices. Unfortunately, these technological and practitioner advances also stimulated substantial cost increases for access to these medical improvements. By the late 1960s, the cost for medical care in the United States was rising faster than the annual rate of inflation, which at that time was approaching the double-digit level. As pressures for a solution to this growing financial problem began to coalesce at the federal level, the administration of Richard M. Nixon adopted the concept of health maintenance organizations as a means to restructure the national health care system through private initiatives rather than through significant government interventions or expenditures as in Canada and Western Europe. This politically driven approach culminated in the Health Maintenance Organizations Act (HMO Act) of 1973, which provided the structural foundations for the national growth of HMOs.

The HMO Act imposed several requirements on businesses and the emerging HMO industry. For businesses in the United States, it required any organization that provided health care coverage for employees to offer a health maintenance organization option in addition to traditional health insurance. To encourage the growth of HMOs, the act then provided government loans and grants to stimulate the development of new HMOs across the country. Furthermore, the act defined the range of basic medical services required of HMOs and, finally, it established pricing parameters that required HMOs to offer the same premium rate for medical coverage to all enrollees in a covered group, regardless of each individual's previous medical history. These guidelines emphasized the "group" nature of HMOs, where by spreading the costs of medical risks across large populations of participating members, HMOs could provide increased levels of coverage at reduced rates of cost. These mandates of the act also provided an operating framework where the privately run health care industry could continue to fulfill its historical role as arbiter of the critical medical and economic decisions involved in health care.

Ironically, though, this set of requirements contained in the HMO Act led not to a continued absence of government intervention in the decision-making processes of health care providers but instead to the establishment of a baseline of governmentally defined standards that federal and state regulators could then use to develop oversight procedures for the health care industry. Because of the separation of powers between the states and the central government as defined in the U.S. Constitution (and interpreted in subsequent judicial rulings), health care regulation in the

United States possesses a fragmented oversight structure: differing elements of the health care system receive oversight from various federal or individual state regulatory agencies, depending on how their roles and practices are defined. This situation has stimulated the growth of conflicting regulatory agendas, particularly in the struggle between the definition of necessary services and the containment of costs, which in turn establishes the basis for decisions of equity in the availability and provision of care.

Since the U.S. federal government exercises considerable influence over the definition of services and the pricing of medical procedures through its financial support for Medicare and Medicaid patients—many of whom receive their care through HMOs—federal guidelines regarding these elements have been routinely implemented as the governing standards within most HMO systems. Yet at the same time, insurance plans such as HMOs can generally only be regulated by state insurance regulatory entities. These separate sets of standards and guidelines have inevitably led to problems in defining levels of equitable access to care, and these problems then have been further exacerbated by the wide range of variability among states in their levels of health care coverage, health care costs, and oversight provisions. Moreover, this dual federal-state regulatory structure, combined with the fundamental tension in the health care system between effective caregiving and cost containment, has spawned growing conflicts involving who will be covered under HMO coverage contracts, what service these patients can obtain, and most important, what will be the treatment costs affecting these patients.

Accompanying these questions of equity, ethical and economic dilemmas have arisen concerning the fundamental nature and role of HMOs in the U.S. health care system. These dilemmas highlight the shifting roles of government, private industry, physicians, and patients as medical costs have continued to increase and care options—in both medical and financial terms—have continued to multiply.

The first of these dilemmas arising from the growth of health maintenance organizations is an issue that the HMO Act intended to solve: the definition and delivery of affordable care. Escalating costs have continued to have an impact on the U.S. health care system, especially from the late 1980s into the 21st century, when yearly health care cost increases were often double or triple the overall rate of inflation. While HMO rate increases have trailed those of independent health care insurers, they have still run higher than both the national average inflation rate and the growth of worker wages. With increasing health care costs overtaking many individuals' ability to pay, more people have found even the lower cost medical option of HMOs to be too expensive. Thus, the percentage of medically covered individuals within the United States has actually decreased, and medical insurance costs have continued to increase, despite the legislated intention of the HMO Act to address both these concerns.

The second dilemma facing HMOs is the ethical tension between the provision of medically appropriate services and the financial incentives for cost containment built into this privately operated system. As medical technology has increased in its scope, providing treatment options for an ever-broadening range of afflictions, the cost of providing these treatments has likewise increased. This situation can place HMOs in the position of choosing among regimens of treatment on the basis of cost rather than efficacy: employing less effective methods or medications to treat conditions because they are less costly, and restricting, if not actually denying, access to specialized treatment regimens solely because of their costs. Practitioners in the health care field have noted an increasing tension between their fulfillment of the Hippocratic Oath, which urges medical treatment on the basis of its effectiveness, and the achievement of financial objectives, which the stockholders of these privately held and operated organizations demand.

In many HMOs, doctors are not paid on the basis of the number of procedures they perform or the number of patients they see: They act as salaried employees for the HMO and its owners. In other HMOs, an administrative body negotiates contracts for treatment by external physicians and facilities not employed or owned by the HMO. Both these structural formats for caregiving insert a third party—the HMO administration—into what was formerly solely a doctor-patient relationship. This changing set of relationships has led to the third dilemma facing HMOs: the growing ethical and economic conflicts among the major stakeholders involved with HMOs.

Since the early 1980s, the U.S. health care system has moved increasingly from a network of fee-for-service medical practitioners performing their duties at nonprofit institutions (such as religious or university-run hospitals and clinics) to a system of both fee-for-service and salaried physicians increasingly performing their duties in for-profit medical facilities operated by large, publicly traded health care businesses. Since the parent organizations of many HMOs either own their medical facilities (as they have purchased formerly nonprofit institutions) or contract directly with other facilities for services at preset rates, the role played by business administrators in the determination of health care standards has increased dramatically. This shift in the central guiding rubric of many HMOs from medical service to medical administration has produced a marked change in the fundamental nature of the doctor-patient relationship. Prior to the growth of for-profit HMOs, the major stakeholders involved in medical decision making were the individual physicians and their patients; the administrators of the nonprofit institutions where caregiving took place allowed this doctor-patient relationship to proceed largely unimpeded, under the assumption that this "hands-off" approach would produce the most beneficial health care results. However, as the definition of "beneficial health care results" has gradually changed since the passage of the HMO Act from ensuring comprehensive medical care to pursuing business profitability, HMO administrations have played an increasing role in deciding what procedures can or cannot be offered to patients, what procedures will or will not be insured by the HMO, and which practitioners will be authorized to perform prescribed or approved medical services.

A final dilemma arising from the growth of HMOs has been their growing influence in national health care decision making—an influence built on their successful growth. Even with the critical increases in all U.S. health care costs, including those of HMOs, these organizations have still multiplied in size and enrollment as they have become the primary provider of "lower-cost" health care options. By the mid-1990s over half of the U.S. working population that had health insurance coverage belonged to HMO plans. Accordingly, what were once local decisions about patient care (which were relatively insulated from the demands of economic efficiency) have grown into administrative standards of regional or national scope for the provision and pricing of services. As private corporations, HMOs can exercise a wide range of discretion in determining what factors will influence these standards: medical, economic, ethical, or administrative. This has furthered the influence of administrative decision making, based on criteria of cost and availability, into such medically defined areas as the provision of appropriate medications, the application of medical procedures, and the availability of both preventive and postevent medical care.

HMOs have provided both some of the benefits envisioned by supporters at the time of the 1973 passage of the HMO Act and some of the disadvantages feared because of their emphasis on efficiency in both the medical and economic realms. Nevertheless, they remain a central element of the privately run U.S. health care system and have changed the landscape of health care in the United States.

Hedge Funds

A hedge fund is a private, loosely regulated, pooled set of investment monies managed by an individual or business for the benefit of the wealthy clients who contribute money to the pool. Hedge funds use a broad array of investment strategies, many originally conceived to protect a portfolio of stocks from the risk of a large market downswing. Alfred W. Jones, an American writer and financial journalist, is generally credited with creating the first hedge fund. In 1949 Jones created a fund that used leverage to buy or "go long" undervalued stocks, while simultaneously "short selling" overvalued stocks. By simultaneously buying some stocks and short selling others, Jones's portfolio was largely immune to general market swings. Today, hedge funds employ aggressive and sometimes speculative investment strategies and instruments that include short selling, buying on margin, program trading, swaps, various arbitrages, and derivatives. A hedge fund can invest in a variety of assets (worldwide) including securities (stocks and bonds), commodities, exchange currencies, and derivatives (futures and options).

The minimum investment in a hedge fund is typically high, usually $1 million, although recently some funds have altered this requirement to attract more investors. The large initial investment has raised concerns that hedge funds are financial vehicles only for the rich. The recent reduction in the minimum investment amount has likewise raised questions as to whether less wealthy investors (implicitly assumed to be less investment savvy) deserve more protection by the federal government. While an individual's initial investment is usually large, hedge funds are intentionally kept small enough to escape the federal and state regulations designed to protect investors in larger mutual funds.

Characteristics of a Hedge Fund

The two most common characteristics of hedge funds are the following: (1) the ability to "go long or short" and (2) the use of "leverage." Going long is the traditional method of buying a security (e.g., stock) at what is hoped to be an undervalued price and later selling it at a higher amount. This strategy profits by the amount the security rises in value. Going short is the process of first selling a security and incurring the obligation to buy it back at a later date. The strategy profits when the price of the security declines and the repurchase price is lower than the price for which the security was originally sold.

Hedge funds often implement strategies using a considerable amount of borrowing or leveraging of funds. Leverage is the straightforward borrowing of funds to increase the returns to an investment strategy. In the case of going long, a typical investor can only purchase a limited number of shares with their own money and the rate of return on the investment equals the rate of return on the security. A hedge can potentially earn a much higher return on an investment in the same security if they borrow money and purchase additional shares. If the cost of the borrowed money is lower than the rate of return on the security, this extra profit boosts the return on the fund's investment. In the case of going short, the fund is only required to deposit a fraction of the dollar amount of security value that has been sold to cover potential losses. In this sense, the fund stands to profit from the decline in the total value of the shares sold short with only a modest investment of the fund's money. However, the fund will incur the risk of substantial loss if the price of the security sold short does not move as expected because the fund must buy the security back at a higher price. This is the key element of leverage: The profits and losses associated with full security value are controlled by a fractional investment.

A common, distinguishing characteristic of hedge funds is the large performance fees charged by fund managers (usually between 15% and 25% of profits), in addition to a load fee and annual management fee. Fund managers are rewarded for the absolute return on the fund rather than performance relative to some benchmark, such as the return to the S&P 500.

However, the fund manager often has a significant amount of their own net worth invested in the fund. This may help to align the interests of the manager and fund clients. Hedge funds are often based offshore where investment regulations (by the SEC) may be more flexible, although fund managers are subject to penalties and criminal prosecution for fraud. The funds are typically offered within limited partnerships in the United States.

Hedge Fund Strategies and Sectors of Investment

The different strategies and sectors of hedge fund investment are quite broad and diverse. Historically, "equity hedge funds" have been the most traditional hedge fund type. These funds employ fundamental research to identify mispriced securities in the market. Managers buy undervalued stocks and short sell overvalued stocks, employing considerable leverage in the process. "Market neutral hedge funds" attempt to neutralize market risk by combining roughly equal long and short positions in the same, or different securities, commodities, or currencies, hence "hedging" a fund's market risk. Global "macro hedge funds" are another popular sector of investment activity. Fund managers attempt to identify temporary economic imbalances throughout the world and position themselves to profit when a restoration of equilibrium global relationships occurs. Hedge fund managers also look for investment opportunities in "emerging markets" in the global marketplace. In these less mature, high-growth emerging markets, it is difficult to obtain high-quality research material on investment opportunities because of poor information flows, and developing legal systems and market structures. All these market imperfections give rise to investment opportunities for hedge fund managers willing to expend the time and resources to uncover new investments. Currently, the most common emerging market regions are Asia, Eastern Europe, India, Latin America, the Pacific Rim, former Soviet Republics, and the Middle East.

Hedge fund managers may also operate within the "risk-arbitrage" sector where certain financial positions are taken to capitalize on specific events in a company. Usually, the events are associated with a merger, acquisition, divestment, or some other form of restructuring. One advantage of an investment that is "event driven" is that its success is typically unaffected by larger economic or market conditions. Other investment areas include "convertible bond arbitrage," where fund managers seek to exploit mispricing associated with the relationship between the price of a convertible bond, the price of the underlying stock, and the conversion factor. Hedge funds may also invest in "distressed" securities, where fund managers believe a company undergoing serious reorganization, restructuring, or bankruptcy may emerge in better shape than the firm's current share price reflects. "Mortgage-backed" securities are another area of investment sometimes tapped into by hedge fund managers. This market involves many derivative securities, which offer hedge funds the leverage they like to use.

Criticisms of Hedge Funds

The potential for large compensation from hedge fund performance fees may attract the brightest, sharpest, and shrewdest talent to manage these funds. However, many argue that, more commonly, the relatively loose regulation of hedge funds attracts unscrupulous fund managers. Basing performance fees on absolute return may also lead hedge fund managers to pursue progressively riskier investment strategies should initial investments not produce satisfactory returns. Hedge funds have also been criticized as an instrument only for the rich, as the minimum investment is usually $1 million, although this has changed recently.

Questions have been raised as to whether or not hedge funds create any true wealth, assuming that there is a fixed pie of return for which investors compete. Some contend that hedge funds are purely speculative vehicles given their unconventional investment strategies. Proponents argue that hedge funds are important catalysts for price discovery and efficiency in markets. Another criticism of hedge funds is that given the lack of regulation by the SEC, financial reporting and disclosure is, at best, less reliable. Cases of phony financial returns, misleading statistical reporting, fictitious financial statements, and outright fraud have been alleged. At the extreme, belief has grown that hedge funds have the potential to "destabilize" entire markets and economies.

With the recent growth in pension funds, endowments, and institutional investors, the hedge funds industry has come under increased scrutiny. The role and extent of government involvement in hedge funds continues to be an issue in the business and society literature.

Hedonism, Ethical

The term *hedonism*, from the Greek root word *hedone* (pleasure), is the multifaceted philosophy that individuals should maximize pleasure and minimize pain. Two major views of this philosophy are psychological hedonism and ethical hedonism. *Psychological hedonism* is the belief that all humans have been developed to desire pleasure, avoid pain, and that it is impossible for humans to pursue anything else. In contrast, *ethical hedonism* refers to the view that although it is possible *not* to seek pleasure and avoid pain, it is morally wrong to do so. Furthermore, ethical hedonists believe that pleasure is an intrinsic value (for its own sake) and all other values are a means to pleasure. For example, if you attended a rock concert, the concert itself is merely a means to attain pleasure (intrinsic value). Nevertheless, there has been a great philosophical divergence among hedonists as to whether pursuing pleasure will guarantee happiness. One of these philosophies was utilitarianism, which advocated for the *collective* pursuit of pleasure and minimization of pain. This changed the focus of ethical hedonism from an individual's happiness to the happiness of the society as a whole.

Major Hedonistic Philosophers

One of the first hedonists, Aristippus (ca. 435–350 BCE), was born in Cyrene, on the coast of North Africa, and traveled to Athens to became one of Socrates' disciples. Eventually, Aristippus opened his own school of philosophy in Cyrene and taught what is now referred to as Cyrenaic hedonism, which was a belief that there were two states, pleasure and pain, and that one should pursue the former and avoid the latter. Furthermore, Cyrenaic hedonists believed that all pleasures were good, should be pursued without guilt, and this would lead to happiness. In addition, they believed that bodily pleasures were more intense and more satisfying than mental pleasures. Consequently, avoiding bodily pain was equally paramount in their pursuit of happiness for the same reason.

Interestingly enough, followers of Cyrenaic hedonism did not believe in delaying pleasure just for the sake of receiving more pleasure later and, therefore, encouraged pursuing whatever gave one the most immediate pleasure. However, all unrestrained behavior was discouraged because then you would be controlled by your pleasures rather than controlling them.

Another ethical hedonist philosopher was Epicurus (341–271 BCE), born on the island of Samos and considered the most famous of all hedonists. Oddly enough, Epicurus had been charged by many for plagiarizing Aristippus's theory of pleasure and using Aristippus's teachings as if they were his own. Like Aristippus, Epicurus believed happiness was the highest good and pursuing pleasure and avoiding pain would attain this.

Yet there were some fundamental differences between these schools. One major difference between the Epicurean and Cyrenaic philosophies of ethical hedonism was that the Epicureans believed in the importance of mental pleasures. Another dichotomy was that the Cyrenaic hedonists believed in the quantity of pleasure, while the Epicureans pursued the quality of pleasure. For example, a Cyrenaic hedonist would prefer a larger portion of food, whereas the Epicurean hedonist would prefer the most pleasant of fine dining, even if the portion were not substantive.

At one point in his lifetime, Epicurus visited Athens and studied with some of Plato's disciples. As a result, Epicurus valued the Platonic virtues of wisdom, temperance, and courage (or the strength of the soul) and believed this would lead to happiness. But, unlike Plato, who held that the highest good was not pleasure but was an ideal form of that which represented the likeness to God, Epicurus believed happiness was in the natural world, not the transcended world above.

Furthermore, Epicurus viewed pleasure as the end of life and virtue as the way to do it. Epicurus was of the view that a happy individual was the one who attained wisdom of discrimination and reflection, which would ultimately lead to a blessed existence of painlessness. In his *Letter to Menoeceus,* Epicurus gave special attention to the correct calculation for attaining pleasure. He did not believe in overindulging in alcohol, bodily lusting, or eating, and even supported deferring immediate pleasure if it would avoid pain later on. Although many perceive Epicureans as individuals without any constraints regarding the attainment of pleasure, it was the Epicurean philosophy of reason and reflection that differentiated it from the Cyreniac philosophy of ethical hedonism. In fact, Epicurus leaned more toward asceticism (self-denial of sexual love) than the unrestrained behavior that many attributed to hedonism. This is further supported by another of his hedonistic philosophies that the greatest happiness does not originate for the unrestrained enjoyment of physical pleasures but from a life that is free from anxiety. Happiness, according to

Epicurus, was interrelated with the health of the body and the tranquility of the mind, which would lead to the health of the soul.

However, when the Industrial Revolution emerged, the focus of pursuing pleasure for an individual's happiness was replaced with the happiness of society as a whole. This ethical hedonistic philosophy was termed utilitarianism, which advocated pursuing the greatest amount of pleasure for the greatest number of people.

Jeremy Bentham (1748–1832), born in London, was credited with coining the term *utilitarian* from a letter he wrote to a friend in 1781. This term was based on the notion of the greatest happiness for the greatest number, which he had found from a copy of Joseph Priestley's *Essay on Government,* 13 years earlier. However, Bentham's starting point was with the psychological hedonist philosopher Thomas Hobbes (1588–1679), who believed that individuals have been created by nature to maximize pleasure and minimize pain and could not do anything for another person unless it first benefited them. Although he concurred with Hobbes's first part, Bentham believed it was possible to seek pleasure for another person for altruistic reasons.

Furthermore, Bentham believed he could create a hedonic calculus, which could be used in computing the pleasure or pain that would be the result of a certain action. In his essay, *An Introduction to the Principles of Morals and Legislation,* Bentham identified four measurement values of pleasure or pain endured by an individual: intensity, duration, certainty or uncertainty, and propinquity or remoteness. Intensity referred to the strength of the pleasure, duration was how long the pleasure would last, certainty or uncertainty was the likelihood or unlikelihood that the pleasure occurred, and propinquity or remoteness related to how soon the pleasure occurred. This was the first major section of his utilitarian theory.

The second section of Bentham's hedonic calculus was based on the number of persons affected by given actions, with reference to each of their values of pleasure or pain. It consisted of the four measurement values discussed above and the addition of three others: fecundity, purity, and extent. *Fecundity* was the likelihood that the action would produce more pleasure, *purity* referred to the pain that would accompany the action, and *extent* was the number of individuals who would be affected by the action. Bentham believed that we all intuitively use a hedonic calculus when faced with making decisions to maximize our pleasure and minimize our pain. Therefore, he developed this hedonic calculus of seven values to add a scientific aspect to his theory, which has also been called the greatest happiness principle of utility or felicity of expression.

Another utilitarian, a friend of Bentham's family, John Stuart Mill (1806–1873) disagreed with Bentham's approach to a hedonistic calculus and believed it to be too narrow. Strangely enough, Mill was credited for coining the term *utilitarianism* and was unaware of Bentham's term, utilitarian. Nevertheless, the dichotomy in their theories mirrored the difference between Aristippus and Epicurus. Bentham, like Aristippus, believed in the quantity of satisfaction and that all pleasures were the same. Mill, like Epicurus, believed that all pleasures were not the same.

In his work *Utilitarianism*, Mill stated that some kinds of pleasures were more desirable and more valuable than others were. However, one of his fears was that a decision maker might not have experienced all the pleasures, which would be relevant when judging which one pleasure would be more desirable. For example, a child who has played a game may believe that she will receive more satisfaction from it than if she attended a poetry reading. Mill believed that many individuals, like this child who may not understand poetry or has never experienced poetry, were unable to evaluate the difference in quality between two different actions. As a result, they would not be able to determine which of these actions would yield the most satisfaction to the majority affected by them.

Mill was actually criticizing Bentham's quantity of pleasure theory and proposing a quality of pleasure theory, termed utilitarianism. Mill contended that there were two different types of desires: a higher level and a lower level. The lower level desires were like those of an animal, while the higher level desires were more valuable and could only be appreciated by a cultured person. Therefore, Mill was actually concerned that if given a choice between funding a symphony concert hall or a bowling alley, those not familiar with the arts would not fund the symphony hall, which he believed *ought* to be funded.

Yet ethical hedonism continues in the 21st century. For example, Peter Singer believed that if it is in the power of another to prevent something bad from happening, without sacrificing anything of comparable moral importance, it should be done. In measuring utilitarian pleasure, he believes that those "better off" should be in a position just below the worst-off people. In addition, he advocates euthanasia, abortion, and suicide. Furthermore, he believes that it may be more compassionate to conduct medical experiments on people with permanent disabilities than on sentient animals.

Criticisms of Ethical Hedonism

However, ethical hedonism has experienced many criticisms since its arrival in the philosophical world. Epicureanism clashed with the Cynics, who believed that civilization is corrupt and destroyed individuals by making them weak in their quest for the finer things of life. Also, it clashed with the Stoics, whose philosophy grew out of Cynicism. Stoics believed in self-control, detachment, and acceptance of whatever circumstances were created by a divine plan. The Romans, during the time of Cicero, believed that hedonism would lead to excess luxury, laziness, and self-indulgence, and was antithetical to Christian beliefs. Yet there were several 18th- and 19th-century critics as well.

One such critic was Immanuel Kant (1724–1894), who did not believe that any acts should be considered based on satisfying the majority of those affected by given actions but rather based on if they were the just thing to do. For example, giving money to charity to feel better or receive a tax break would not be a reason to do it. Kant believed one must always conduct his or her behavior based on duty and that any pleasure received should not be a motivating factor.

Another critic, Henry Sidgwick (1838–1900), believed that pleasure is when an individual experiences a favorable attitude toward the feeling (of pleasure). In other words, any feeling can result in pleasure, even an overstimulated nerve in a rotting tooth.

George Edward Moore (1873–1958), also a critic, believed that pleasure is *a good* but denied that pleasure is *the only good.* For example, he believed that pleasure could be the pleasurable feeling itself or the pleasure that eventually results. In addition, he believed that there were three intrinsic goods: pleasure, friendship, and aesthetic enjoyment, and that right actions increase these things. Another major criticism that could be used currently is that Enron, Ford, Exxon, Dow Corning, and several other corporations appear to be using ethical hedonism as a rationale for some of their unethical behavior.

Hedonism, Psychological

Psychological hedonism is the view that all human action is ultimately motivated by desires for pleasure and the avoidance of pain. Since its defenders generally assume that agents are motivated only by the prospect of their *own* pleasures and pains, it is a form of psychological egoism. Psychological egoism is a broader notion, however, since one can hold that human actions are exclusively self-interested without insisting that self-interest always reduces to matters of pleasure and pain. As an empirical thesis about human motivation, psychological hedonism is logically distinct from claims about the value of desires. It is thus distinct from axiological or normative hedonism, the view that only pleasure has intrinsic value, and from ethical hedonism, the view that pleasure-producing actions are morally right. Psychological hedonism has been espoused by a variety of distinguished thinkers, including Epicurus, Jeremy Bentham, and John Stuart Mill, and important discussions of it can also be found in works by Plato, Aristotle, Joseph Butler, G. E. Moore, and Henry Sidgwick.

Psychological hedonists tend to construe "pleasure" very broadly, so as to include all positive feelings or experiences, such as joy, satisfaction, ecstasy, contentment, bliss, and so forth. Likewise, "pain" is typically understood so as to include all negative feelings or experiences, such as aches, discomfort, fear, guilt, anxiousness, regret, and so forth. Even construing pleasure and pain widely, however, it is implausible to think that all acts successfully produce pleasure or reduce pain. People are often mistaken about what will achieve these results, and in some cases aiming at pleasure is counterproductive (the so-called paradox of hedonism). Consequently, psychological hedonism is usually put forward as a claim about what agents *believe* or *take* to be pleasure producing and pain reducing. Hedonists also tend to assume that agents attempt to *maximize* their net pleasure over pain. They need not deny that agents frequently benefit others, however, since the thesis can be preserved by holding that other-benefiting actions are nonetheless hedonistically motivated. Hedonism itself is neutral as to which kinds of actions are a means to pleasure and about which kinds of experiences are pleasurable.

Psychological hedonism is usually defended by appealing to observations of human behavior, together with an implicit challenge to find alternative models of action that are equally explanatory and yet do not collapse into the hedonistic account. It would be refuted, however, by a clear case of nonhedonistic motivation. Standard counterexamples include the soldier on the battlefield who gives up his or her life to save comrades and the sacrifices of parents for their children. Hedonists usually respond to such examples by redescribing apparently altruistic motivations in hedonistically egoistic terms. The soldier, for example, may be said to have acted so as to avoid a lifetime of remorse. The fact that such redescriptions are possible, however, does not in itself make them plausible. Hedonists may also insist that attempting to obtain pleasure or avoid pain is part of what it *is* for something to be a motive. This move, however, transforms what purports to be a factual claim about human motivation into a trivial definitional truth.

Herfindahl Index

The Herfindahl Index, often called the Herfindahl-Hirschman Index (HHI), is a measure of market concentration, which can be defined as the percentage of total industry sales that are contributed by the largest firms in an industry. The HHI is a measure of the size of firms in a given industry and an indicator of the degree of competition in that industry. It is a more sophisticated method of measuring market concentration than the more common method that uses the four-firm concentration ratio (the percentage of industry sales made by the leading four firms in a given industry). This measure is of interest to antitrust authorities who are trying to determine the impact of a proposed merger on competition in an industry. The formula for calculating the index is shown below.

$$\text{HHI} = (\text{Share } 1)^2 + (\text{Share } 2)^2 + (\text{Share } 3)^2 + \ldots + (\text{Share } n)^2,$$

where the terms in parentheses (Share 1, Share 2, etc.) are the market shares for each firm, the last term (Share *n*) indicates the market share of the last firm, and the superscript 2 indicates the market share is being squared.

For example, consider an industry consisting of six firms with the following allocation of market shares:

Firm A = 30%; Firm C = 20%; Firm E = 9%

Firm B = 25%; Firm D = 12%; Firm F = 4%

The HHI would be (900) + (625) + (400) + (144) + (81) + (16) = 2,166.

The HHI was first adopted in 1982 by the Reagan administration and is calculated as shown above by squaring the market share of all firms in the market and summing the squares. The premerger HHI number is then compared with the increase in the HHI that will be caused by a proposed merger. The HHI can vary from 10,000, in the case of a pure monopoly, to a number approaching zero in the case of an atomistic market. If the postmerger HHI is below 1,000, the industry is considered to have low concentration and the merger is unlikely to be challenged. If the postmerger index is between 1,000 and 1,800, the industry is considered to have medium concentration and the merger is likely to be challenged only if the increase is more than 100 points. If the postmerger HHI is above 1,800, the industry is considered to be highly concentrated and the merger is likely to be challenged if the increase is more than 50 points.

An advantage of the HHI is that it gives added weight to the largest companies on the assumption that these firms can exercise greater market control. The index helps differentiate between one industry in which four players have equal shares and another in which one player has a 70% market share and the three others only 10%. The former industry would be more competitive and have a lower HHI index. A disadvantage is that the HHI requires a substantial amount of information in that the market share of every firm in the industry is needed. In practice, however, the smallest firms in an industry can usually be left out of the calculation and this will not make a significant change in the final index.

Hewlett-Packard

Hewlett-Packard (HP), the second largest computer company in the United States, was founded in 1939 by Bill Hewlett and David Packard. They were both graduates from Stanford University in 1934. The company originated from humble beginnings in a garage while they were still fellows at Stanford. The first product HP produced was a precision audio oscillator—used as a small night-light bulb to regulate a temperature dependent resistor in a critical portion of the circuit. The invention was one of many cutting edge designs that became the hallmark of excellence for HP. These types of products led to the firm being known as an innovator in developing precision instruments. HP over the next 50 years would develop many more breakthrough products that eventually provided it with a sizeable percentage of the precison measurement equipment market.

HP's corporate culture was modeled after a family-friendly environment driven by stability in a changing world. HP prided itself on using high ethical standards in conducting business activities. It invested not only in innovative concepts but in the very people who produced such ideas. Eventually, this collaboration between innovation and high ethical standards evolved into what is referred to today as "the HP way." It is important to note that HP is a company legendary for its innovations and respected widely throughout the industry as an institution with high business ethics. It has historically been recognized as an institution that practices social responsibility in every aspect of its business. Frankly, this was the legacy that HP's original founder left before retiring from the firm. HP has consistently been recognized for environmental excellence, energy conservation, engineering accomplishments, and most important, for having one of the best corporate environments to work in. The strategy of using breakthrough technology together with being a socially responsible firm led HP to become a leader in the technology field. HP was able to recruit top engineers to work for the firm, was successful in retaining top executives, and was renowned for having a great environment to work in. The company had this openness that exuded throughout the management ranks. It would be corny to say it had an open door policy, because it was much more than that. Employees actually believed in the company and were committed to the vision of the firm.

HP has developed a reputation over time for being an innovative company. It extended this perception in July of 1999, when it appointed Carly Fiorina as CEO. This appointment was significant because Fiorina was the first woman ever to serve as CEO of a company included in the Dow Jones Industrial Average, but in February 2005, Fiorina was forced to resign from her position as CEO. HP furthered that reputation when it appointed Patricia Dunn as the chairwoman of its board of directors. HP has always been a firm that was willing to take up socially contentious issues. Clearly having two females at the top of a Fortune 500 company helps to etch away at the myth surrounding the glass ceiling for women.

Recently HP had a setback that could have potentially destroyed its reputation and erased all the previous gains made over the past 70 years. In September 2006, a story was published that chronicled how the chairwoman of HP, Patricia Dunn, authorized a private detective company to search for the source of boardroom leaks to the media.

The purpose of this clandestine operation was to ferret out individuals who leaked confidential information regarding HP's long-term strategy to CNET. CNET Networks, Inc., is an Internet-based American media company in San Francisco cofounded in 1993 by Halsey Minor and Shelby Bonnie. A group of electronic-security experts spied on HP employees and business reporters, dug through their trash, and used a technique known as pretexting to obtain call records of HP board members and nine journalists, including reporters for CNET, the *New York Times*, and the *Wall Street Journal*. To obtain phone records, the investigators misrepresented themselves as the board members and journalists. Coincidentally, Dunn claimed she did not know beforehand of the methods the investigators were going to use in determining the source of the leak. One of the biggest mistakes HP committed was not doing the necessary due dilligence when hiring outside invesigators. It remains to be seen why HP contracted outside investigators in the first place—there's no question it hired the wrong ones.

It was later revealed that board members Gearge Keyworth and Thomas J. Perkins were the actual source of the leak. Subsequently, they were both removed from their position as board members. In addition, Dunn resigned as chairwoman of HP's board, and Mark Hurd, the CEO, was scheduled to succeed Dunn as chairman after the HP board meeting on January 18, 2007. Originally, California charged five people with four felonies, including conspiracy and identity theft. In January, the state dismissed its case against the fifth HP defendant, Bryan Wagner, a Colorado man believed to have been an employee of Action Research, when he pleaded guilty to federal charges relating to his role in HP's internal investigation of boardroom leaks. Under California law, the state cannot prosecute a defendant for conduct that has already been tried in another jurisdiction. On March 13, 2007, the three other remaining defendants—former HP attorney Kevin Hunsaker, private detective Ronald DeLia, and Matthew DePante of data-brokering company Action Research Group—pleaded no contest to a count of fraudulent wire communications at Santa Clara County Superior Court in San Jose, California. The trio was required to complete 96 hours of community service by September 12, 2007. Furthermore, the court stated that it would dismiss the case against them if this condition was satisfied. Similarly, in the same proceeding, Patricia Dunn did not enter any plea in response to the misdemeanor count, and the court exercised its discretion by dismissing the case against her.

On September 28, 2006, Ann Baskins, HP's general counsel, resigned effective immediately, hours before she was to appear as a witness before the House Committee on Energy and Commerce at which she would later invoke the Fifth Amendment to refuse to answer questions.

Even though HP is still combing through the tragic events surrounding Chairwoman Dunn's decision to monitor individuals, the company under the new leadership of Mark Hurd has continued to strive toward regaining that old HP standard for excellence. The stock has continued to perform exceptionally well. The company is achieving positive results from its strategy and is poised to regain its position as a leader in the electronics industry.

Hobbes, Thomas (1588–1679)

The powerful intellect of Thomas Hobbes was drawn to geometry, philosophy, the classics, ethics, history, and political theory. His reputation today turns especially on his political philosophy, which boldly advanced a materialist understanding of all things, denied free will, was atheist (beneath a thin disguise), and rejoiced in making the case that human beings are radically asocial and, if left alone, will tear one another apart. Not surprisingly, his books were sometimes banned, and he was often attacked as an enemy of religion and morality.

The practical thrust of Hobbes's political thought was conservative: He defended absolute monarchy and hence criticized liberty. But this conservative thrust took its impetus from the radical views listed above, and Hobbes thus is properly credited with being one of those groundbreaking thinkers who helped introduce the modern era at the expense of the intellectual world that preceded him, one dominated by Aristotle and the Scholastic thinkers of the Roman Catholic tradition.

Notwithstanding shallow bows to the religious tradition, Hobbes roots his anthropology and his politics in a naturalistic account of man. In lieu of the Garden of Eden and divine enjoinders to seek a heavenly perfection, Hobbes discovers an original condition of man in which we "enjoy" utter liberty, but our natures drive us into ceaseless and unmitigated conflict, a war of all against all. Under such circumstances, securing our earthly preservation is our first and most powerful preoccupation. Politics is merely the most important artifice in our struggle to secure our lives: We create a powerful state, if we are prudent, to distance ourselves as far as possible from the horrors of natural anarchy. To create this state, we agree with other potential citizens to limit our liberty and support a sovereign with all our power, in the calculated expectation that the sovereign will then see that it is in his interest to protect and advance the state over which he presides. This Hobbesian version of the social contract is thus binding on citizens, not on the sovereign—a point that would occasion objections from Hobbes's followers.

The creation of an absolute sovereign requires that a large measure of our natural liberty be surrendered; but Hobbes sees this as no sacrifice at all, for our natural liberty, though vast, is utterly without value: To be free to do whatever one wants is a deadly freedom, since others enjoy it as well. Absolute freedom is absolute anarchy, and for such antisocial creatures as Hobbes's human beings, absolute anarchy results in a life, as he famously put it, that is "solitary, poor, nasty, brutish, and short." It is on the foundations of a destructive absolute natural liberty for individuals that Hobbes makes the case for absolute authority of the sovereign.

Since Hobbes did not defend individual rights against governmental authority, he does not figure prominently in discussions of the history of capitalism. He did, however, attack prior ideas about inherent value or a just price, and this prepared the way for the market to become a key measure of value. Even of a human being, for example, Hobbes said, "The 'value' or 'worth' of a man is, as of all other things, his price; that is to say, so much as would be given for the use of his power." And Hobbes's attacks on loftier views of happiness or felicity paved the way for a new prominence of "acquisitive man." Hobbes stressed, for example, that there was no such thing as "the repose of a mind satisfied." To the contrary, happiness or "felicity" is the continual movement from a desire, to its satisfaction, to the emergence of a new desire, and so forth, ceasing only in death. Man is by nature a creature of desire and ineluctably a sort of consumer.

Hobbes's critique of liberty makes it right to distinguish him sharply from John Locke. Nevertheless, it was Hobbes who first proclaimed the right to life, Hobbes who first emphasized equality as a decisive political fact, Hobbes who first based his theory of asocial man and self-interested morality on a state of nature, and Hobbes who led the way in stressing the primary importance of rights sought by individuals for themselves rather than duties owed to either God or the political community. If the modern West is defined in significant measure by its candor and consistency in putting first the individual and his or her rights, Hobbes is one of its most influential founders.

HONESTY

Honesty is defined as being truthful or having integrity. Because these characteristics are generally regarded as desirable, honesty is considered a cornerstone for any social interaction. Its value is especially conspicuous in business because commerce requires a network of transactions between suppliers, consumers, employees, and the public. For a company to thrive, it must have the trust of all these entities, something that is possible only if they have confidence in the company's honesty. Indeed, a reputation for honesty is crucial to a company's sustainability and success.

Evidence that this is widely understood is found in many business practices. Employers often attempt to screen employees for honesty by, for example, checking on the facts included in a résumé or even requiring a lie detector test. Companies routinely include a commitment to honesty as part of their code of ethics or mission statement. Contracts can also be understood as a legal tool for enforcing honesty in transactions.

The impact of dishonesty on the fortunes of companies and individual employees is also clear. Employees are most likely to be dismissed and companies are most likely to be embroiled in scandal when they attempt to deceive supervisors, the public, shareholders, or regulators about a problem. In one recent example, the chief executive at Hewlett-Packard was obliged to step down after it was discovered that the company had attempted to plug information leaks by pretexting or using false pretenses to obtain personal information about reporters and members of the company's own board of directors.

Like other ethical concepts, honesty often proves elusive on closer examination. For one thing, the ethical question of when and whether people should tell the truth is easily confused with the epistemological question of whether people can know the Truth. Philosophers continue to struggle with the question of how Truth is to be determined, how it can be distinguished from error, and whether Truth can be communicated adequately by language. In addition, the points of view of different individuals create challenging issues about subjectivity and Truth, something that is obvious to anyone who has ever asked more than one person about what happened at a meeting.

Some critics also contend that 20th-century scholarship insisting all Truth is situated and vulnerable to deconstruction has seeped into public discourse and undermined the commitment to honesty as a default position. Also, in the empirical sciences, psychologists have evidence that many successful people and companies cultivate an optimistic, if not unrealistic, appraisal of their prospects. Positive thinking as well as public relations and spin control deliberately reinterpret facts to support a particular point of view, blurring the question of what is true. Harry Frankfurt and others have argued that such efforts erode a commitment to honesty because they focus on the task to be accomplished without attempting to honestly ascertain the facts of the matter.

Even Aristotle found it difficult to pin down honesty. Although he praised it as "noble," he also believed that honesty, like other virtues, was subject to the Golden Mean because it was vulnerable to excess and deficiency. Too much honesty becomes boastfulness or indiscretion; too little turns into false humility or leaving people in the dark about things they need to know. This understanding foreshadows contemporary tension between transparency and privacy. Some argue, for example, that honesty requires utter openness, especially about financial transactions. At the same time, many individuals and, for that matter, business entities claim that it is appropriate to keep financial information confidential.

When Dishonesty Is Forbidden

Because honesty is so difficult to define, many moral philosophers do not insist on a positive duty to be honest. Instead, they argue the less rigorous position that people have a negative duty to avoid dishonesty—a concept that is defined by two characteristics. First, dishonesty requires information that is, as far as the speaker knows, factually inaccurate. Second, it involves an attempt to communicate that information in a way that will mislead another person. Although a spoken lie is the most obvious form of deception, people can also be misled indirectly through dissembling. A company that sells counterfeit goods, for example, may not claim that they are genuine, but the appearance of the merchandise leads consumers to a false belief about their origin. Whether it is direct or indirect, dishonesty is the deliberate effort to convince the deceived person of something the deceiver does not believe to be true. Someone who is mistaken about the truth can be regarded as ignorant but not dishonest.

A few philosophers have taken the position that dishonesty of any kind is never justified. Augustine, for example, claimed that all lies are forbidden by God. Immanuel Kant is sometimes understood to have claimed that truthfulness is a duty that trumps most others. He contended that dishonesty undermined autonomy by treating other people as means and not ends. Lying to people even for their own apparent good is unacceptable according to Kant because it deprives them of the right to determine good for themselves.

Other philosophers have argued that other goods must override honesty under some circumstances. The legal philosopher, Hugo Grotius, for example, argued that honesty is owed only to those who deserve it. Indeed, many social scientists have observed that people often have different standards of honesty for those inside a favored group and those outside. A company may, for example, provide one version of the truth to upper management and a different version to labor, stockholders, or the press.

A few philosophers have actually argued that honesty is overrated. The Sophists of ancient Greece, for example, were committed to winning legal cases, not defending the truth—a legacy that is apparent in the legal profession today. Plato himself argued that politicians might need to use "noble" lies to keep their citizens content. Machiavelli and Nietzsche thought it legitimate for "superior" people to lie to their inferiors. A manager, for example, might justify misleading the sales department about a problem on the production floor, reasoning that it will undermine their morale if they know the truth and that, in any case, they are not in any position to solve the problem.

In fact, a person who is dishonest when others are trusting does have a competitive advantage. Evolutionary biologists point out that other living things regularly obtain survival advantages by deceiving both predators and competitors. There is considerable evidence that humans, too, have thrived in the past by being deceitful under certain circumstances. Most philosophers, however, are convinced that when animals band together into social units, the advantages obtained by deceit are short term at best.

This aligns with the commonsense intuitions of most people. Because they prefer that other people be candid with them under most circumstances, they are required by nothing more than the rule of reciprocity to be honest in return. Contemporary virtue ethicists argue that an honest person tells the truth, not because it is advantageous in a given situation but because the truth has intrinsic value to people who hope to have ongoing interactions. If people cannot assume that others are telling the truth, suspicion replaces cooperation and human society breaks down. Given the seriousness of this result, they insist that honesty must be the default position.

This approach does not rule out the possibility that dishonesty may be the right strategy under certain circumstances. In business, people often make a utilitarian analysis of honesty, deciding whether deception is warranted in light of potential risks and benefits. Companies, for example, routinely face issues about honesty in the marketing of their products. Advertising often involves a poetic rather than a scientific description of products. This is widely understood and tolerated by the public. When a company claims that a cleaning product smells "springtime fresh," consumers understand the statement as an opinion and not a verifiable fact.

On the other hand, blatant dishonesty in advertising is both illegal and self-defeating. The Federal Trade Commission (FTC), which is responsible for enforcing truth in advertising, points out that deceptive advertising can take many forms including misleading promises, incomplete or distorted descriptions and visual representations, partial disclosure of pertinent facts, misleading comparisons with other products, and false testimonials. The FTC requires companies to have evidence that supports statements of fact including claims that are implied by advertising. If, for example, a diet product claims to suppress appetite, a reasonable consumer would conclude that it leads to weight loss, and the company would need to substantiate those claims. Even when deceptive advertising does not run afoul of regulation, it risks alienating customers, who will feel betrayed when the product does not deliver what it has promised.

Evaluating the Consequences of Dishonesty

In evaluating the consequences of dishonesty, it is necessary to consider the harm done to both the deceiver and the deceived. The harm to the victim is most conspicuous. A lie always threatens autonomy because people who have been deceived look back on their decisions and realize that they might have made different choices if they'd had honest information. The harm to the dishonest person is often overlooked because liars tend to see only the advantages of their dishonesty. Sissela Bok points out that liars are harmed in three ways. First, their own sense of integrity is undermined. Second, they must expend energy in remembering the lie and, perhaps, telling other lies that reinforce it. Finally, should the dishonesty be uncovered, the person who practiced it is less likely to be trusted in the future.

Because it is difficult to make such an analysis on a case-by-case basis and because it is challenging to fully anticipate the consequences of dishonesty, many utilitarians try to determine rules that will help them decide when deception is acceptable. Even Aquinas proposed a hierarchy of deception. Malicious lies, told with the intent to cause harm, were the only ones he regarded as a mortal sin. Today, they are the lies most likely to be prosecuted as fraud. Jocose lies told in jest were considered less serious just as office pranks and April Fool's jokes are tolerated as annoying but harmless.

The third category, officious lies, continues to arouse debate. These minor deviations from the truth, undertaken because they will produce benefit or forestall harm, are well known in business. Mild forms of deception often seem justified or even necessary in social situations because they produce harmony among people who are actually quite different. When an employee, for example, asks about a colleague's weekend at the water cooler, there is no expectation of a thoroughly honest response. The gesture is understood on both sides as a superficial expression of courtesy. Similarly, an employee may feign an interest in the hobbies or children of a potential client. People justify these so-called white lies because they seem to do little harm, and they may create social benefits, such as a sense of commonality, that makes it easier to do business together. Far from being censured, these forms of dishonesty may actually be encouraged and rewarded.

Dishonesty to avoid harm is more problematic. Some people argue, for example, that it is acceptable to be dishonest in an effort to spare another person's feelings. Others point out that insincere compliments or inaccurate excuses are actually for the convenience of the dishonest person, so they cannot be justified as altruistic. Another form of officious lies deserves special attention from companies. Corporate policies can make people reluctant to admit mistakes because the penalties for error are perceived to be too great. Under these circumstances, people are more likely to be dishonest about errors and other problems. Businesses can reduce the incentive for this kind of dishonesty by redefining accountability in terms of problem solving rather than assigning blame.

One rubric for evaluating officious lies and, for that matter, other forms of dishonesty is proposed by Sissela Bok. She points out that honesty never needs justification but dishonesty must be able to meet three criteria: First, is there an alternative to dishonesty? If there is an honest way to avoid the unwanted harm or produce the desired benefit, it is preferable. Second, what are the moral reasons for dishonesty? Clarity about the principles that might justify dishonesty is crucial because then they can be weighed against the benefits of honesty. Finally, will the dishonest act pass the test of publicity? Lies are often motivated by self-interest that will not be persuasive to other interested parties such as employees, stockholders, the press, or regulatory agencies. Individuals and companies that apply these tests may, indeed, conclude that honesty is the best policy.

HOSTILE WORK ENVIRONMENT

A hostile work environment is created as a result of harassment that makes individuals feel uncomfortable and unwelcome. Speech or behavior that creates a hostile work environment is unwanted, uninvited, offensive to a reasonable person, and severe or pervasive enough to adversely affect the person's work environment. The speech or behavior may be verbal, nonverbal, and/or physical, and may be based on race, religion, sex, national origin, age, disability, veteran status, or, in some jurisdictions, sexual orientation, political affiliation, citizenship status, marital status, or personal appearance.

The primary challenge of harassment law is to define when speech or behavior becomes so severe and prevalent that it creates a hostile environment for the target. In general, when determining the existence of a hostile work environment, the court considers whether speech or behavior is appropriate in a workplace that strives to provide a pleasant, productive atmosphere for all employees.

Most antidiscrimination laws, such as Title VII, the Americans with Disabilities Act, the Age Discrimination in Employment Act, and various state and local laws, do not explicitly discuss harassment. These laws prohibit discrimination in the terms, conditions, or privileges of employment; however, the courts have interpreted these definitions to bar not only discrimination as it is traditionally understood but also harassment that may create a hostile work environment.

On its face, harassment law draws no distinction between slurs, pornography, political, religious, or social commentary, jokes, art, other forms of speech, and unwanted physical contact. All can be punished, so long as they are severe or pervasive enough to create an intolerable environment for a reasonable person. The vagueness of the terms *severe* and *pervasive* and the fact that the law is implemented by employers who have an incentive to be more rather than less cautious, means that the law may practically restrict any speech or behavior that an employer concludes may be found by the courts to be severe or pervasive enough.

In the current legal environment, it is not enough for employers to prove that they followed standard procedures in response to complaints of a hostile work environment; they also need to demonstrate that they have been proactive in preventing the behavior from occurring in the first place. A comprehensive harassment prevention program will include clear definitions of what a hostile work environment is and why it happens, ongoing assessment of the work environment, education for all employees, skilled professionals to administer the program, and effective and consistent follow-through on all complaints with a zero-tolerance response to violations.

Human Capital

Capital is an asset or advantage from which an economic return can be earned. Human capital is one of the various forms of capital. Human capital comprises an individual's knowledge and skills. Human capital can be broken down into general and specific forms. General forms of human capital, as the name implies, refers to knowledge and skills that can apply to a variety of settings and situations. Examples include a person's general mental ability and skills such as communicating, motivating, and information-processing that apply across settings and situations. Unlike general forms of human capital, specific forms of human capital tend to be of value only to targeted sectors or organizations. For these reasons, specific human capital is often further refined to reflect firm-specific and industry-specific dimensions. Firm-specific human capital refers to the knowledge, skills, and abilities that are particularly productive and valuable in working within the firm. Knowledge of internal operations of the firm, tacit knowledge of the eccentricities of various operational personnel, communication styles that are compatible with the culture of the firm, and the set of managerial skills "tuned" to the particular needs of the firm are all examples of firm-specific human capital. In comparison, knowledge of industry trends is indicative of a person's industry-specific human capital. Human capital is particularly important in more developed economies where upward of 50% of a nation's gross domestic product is knowledge based. Sectors such as the computer, software, pharmaceutical, and education industries are particularly dependent on human capital to compete.

Difference Between Human Capital and Other Forms of Capital

There are some key differences that distinguish human capital from more traditional forms of capital such as physical assets and financial capital. A key difference is that human capital resides inside individuals and individuals own their own human capital. While organizations may try to use an individual's human capital, the ultimate choice to deploy human capital rests squarely with the individual. Closely related to this point is the fact that human capital is a mobile good. It can leave the firm temporarily; such is the case when a person leaves at the end of the workday or it can be lost on a more permanent basis (e.g., when an individual quits current employment to work for a competitor). Thus, a major goal of most firms, usually through the Human Resources (HR) function, is to encourage employees and managers to share their knowledge and skills with others inside the firm and systematize such knowledge in the firm's routines and practices. When such sharing occurs, human capital is transformed from a private good to a public form of capital that the firm can choose to exploit for competitive advantage. A firm's HR practices should, therefore, devise ways to develop, enrich, and retain human capital and ensure that human capital stays within the boundaries of the firm.

Another pivotal difference between human capital and more traditional forms of capital is that human capital can actually appreciate, not depreciate, with use. It is important to note, however, that just as human capital can work to the benefit of the firm, human capital can also work directly against a firm's goals or mission. This phenomenon can take several forms. Specifically, whereas a production line or an oil field as forms of capital cannot refuse authority or become unmotivated, that very possibility is clearly evident with human capital. Said differently, human capital can resist authority or can even slow down or stop working with ebbs and flows of motivation. At its worst, human capital can be used to extort or exploit the firm in terms of theft, corruption, or sabotage. Indeed, over the last several years, there have been notable and well-publicized cases in which knowledge and skills were used to hurt, not help, a firm.

Another defining characteristic of human capital is that it is difficult to measure or assess. For instance, revenue per patent, percentage of employees holding an advanced degree, years of experience in a given profession, and turnover ratios have all been used to attempt to capture a firm's human capital. Very generally, education and amount of training are among the most widely accepted measures of human capital. Traditional proxies of general, firm-specific, and industry-specific human capital include educational level and pedigree, firm tenure, and industry tenure, respectively. Most experts on human capital suggest that to understand the value of human capital to the firm, one needs to examine how human capital contributes to a firm's competitive advantage.

Human Capital as a Source of Competitive Advantage

There are two broad theoretical perspectives that appear to embrace human capital as a source of firm competitive advantage. The first is that of the resource-based view (RBV) of the firm. According to the RBV, a firm can create and sustain a competitive advantage mainly by possessing, developing, and using resources. Not all firm resources are created equal, however, and for a firm to enjoy a true competitive advantage, the resource must be valuable, rare, inimitable, and nonsubstitutable. Unlike traditional forms of capital, human capital seems to meet most of these conditions and, as a result, provides a source for competitive advantage. Human capital is especially important for firms operating in complex and dynamic competitive environments, where the ability to rapidly notice, access, acquire, and assimilate knowledge and capabilities is critical to have advantage over competitors. While competitors can more easily understand and duplicate a firm's physical assets, it is very difficult to copy unique, complex, and tacit knowledge held by the employees of the firm. Therefore, both academics and managers tend to agree that human capital is the premier source of future competitive advantage for a firm. For instance, McKinsey and Company suggest that the most important corporate resources over the next 20 years will be talented individuals who are technically astute, globally aware, and sophisticated in thought. Economists and the like tend to agree by noting that traditional sources of advantage, such as financial capital and scale economies, are weakened by environmental forces such as globalization.

The other perspective closely related to the RBV described above is the knowledge and learning-based view of the firm. According to this perspective, firms enjoy advantages when they create new knowledge and then effectively use that knowledge in creating value-added products and services for superior returns. This perspective suggests that knowledge that is tacit, complex, and causally ambiguous helps firms create and sustain competitive advantages. Since individuals are the primary source of a firm's knowledge, firms with high levels of human capital and that can use such capital are likely to create and sustain competitive advantages. The processes of acquiring external knowledge and internally creating new knowledge are inherently human processes. Development of tacit, complex, and socially embedded knowledge is possible when a firm's human resources engage in "dialogue" to create new knowledge. This circumstance also suggests that for a firm to engage in innovation and entrepreneurial discovery, it needs to possess and/or develop requisite amounts of human capital. Both the RBV and knowledge-based perspectives suggest that compared with more traditional assets such as land, plant, and equipment, human capital provides more unique and enduring advantage to the firm by contributing to innovation, strategy development, and superior execution.

While human capital is important across all levels and functions of a firm, human capital of senior executives is pivotal from the perspective of firm strategy and competitive advantage. Human capital of the chief executive officer, other members of the top management team, and the board of directors becomes extremely critical in strategic decision making. These individuals often use their human capital to develop and formulate a firm's strategy. At the upper echelon of the organization, human capital is usually deployed to scan the internal and external environment, process relevant information for decision making, recognize and seize opportunities, and solve problems. Senior managers enjoy both tremendous scope and discretion in their decision-making process. In other words, when executives effectively deploy their human capital, they are likely to contribute to the firm's strategic advantage. Because of this contribution, executive human capital is highly researched and is also highly correlated with executive compensation levels: Those with higher levels of human capital are rewarded in the highly competitive executive labor market with higher compensation packages.

Human capital is of unequal value to the firm. In particular, human capital can either be a core or a peripheral asset. Core human capital reflects an individual's knowledge and skills that directly translate into firm benefits. Without core human assets, it is difficult for a firm to remain competitive. In contrast, some human capital is peripheral in nature, meaning that a person's knowledge and skills only weakly or tangentially affect a firm's ability to compete. Thus, the level of authority, the importance of the job, and the discretion afforded a particular person all influence how a person's human capital affects a firm's overall competitive stance.

Developing and Managing Human Capital

Human resource management practices (HR practices) can play a major role in ensuring the development, retention, and use of human capital for organizational advantage. One of the initial areas in which HR can have an impact on human capital is during the recruiting and selection stages of HR staffing. Rigorous and systematic selection standards ensure that a baseline level of human capital within the firm is achieved. Recruiting from diverse sources to include individuals from other firms and other industries is important since progressive firms attempt to seek and build a diverse set of skills and knowledge capabilities. Once individuals are hired and brought inside the boundaries of the firm, HR plays a critical role in developing human capital. Human capital can be developed through practices such as training, coaching, and mentoring. Indeed, a desired outcome of such efforts is an increase in learning, which improves individuals' knowledge and skills. HR managers need to ensure that employees and managers use their human capital to achieve organizational goals and outcomes. Perhaps the best way to ensure that human capital is used to support organizational goals is through well-designed compensation plans. For instance, variable pay plans that tie pay to some measure of performance is a mechanism to motivate individuals to use their human capital in a way that benefits both themselves and the firm. Another proven way to promote the sharing and deployment of an individual's human capital on behalf of the firm is to launch and administer a gainsharing type of plan. Gainsharing plans involve sharing financial gain between the employees and the firm for increases in productivity and profitability. One of the most notable benefits of gainsharing type plans is that they encourage employees at all levels to share their unique knowledge and skills on ways to improve processes through the "suggestion" component of a typical gainsharing plan. Without gainsharing plans that reward and recognize suggestions for organizational improvement, the knowledge and skills embedded within an individual are more likely to remain dormant and a private good. Finally, HR must ensure that their compensation plans are competitive with both the internal and external markets. If compensation equity is not monitored, HR runs the risk of losing their human capital to other firms, including competitors that are willing to pay more for an individual's knowledge and skills.

One common problem facing a firm is the decision to make or buy human capital. Recent well-chronicled cases within the technology and Web sector suggest that this make or buy decision toward human capital is driving a phenomenon termed *talent poaching*. Talent poaching is when a firm allows a competitor to train, develop, and "make" human capital and then offers a higher compensation package to the individual to lure the human capital from the very firm that spent so much on creating and developing it. One unintended consequence of talent poaching is that firms have less incentive to invest in the making and developing of human capital because trained and talented individuals may be lured away by a competitor. Because of this reduced incentive, many individuals choose to develop their own human capital rather than expecting an organization to do so. Hence, developing human capital is now more of a personal responsibility as opposed to a corporate one.

The role of human capital may well rest in a firm's ability to create social capital. When two or more individuals collaborate and share knowledge and skills, the human capital of the individuals is transformed to social capital, which can then be effectively used by the organization to pursue its strategies. This social capital is particularly important since sophisticated, refined, and potent knowledge is best achieved through combination, exchange, and collaboration. Also, some evidence suggests that tacit knowledge, a type of knowledge that is difficult to codify and also difficult for competitors to imitate, is best created when more than one person is involved. If, indeed, superior learning can only result from social interaction, then the imperative of the firm is to combine human capital in a manner that produces social capital. Keep in mind that the value of social capital is directly related to the quality of its inputs—namely, human capital. Thus, individuals with superior levels of knowledge and skills are a necessary, but not sufficient, condition for producing high values of social capital. An ancillary benefit of this human capital to social capital relationship is that social connectedness may help anchor or at least slow the mobility of human capital out of a given firm.

Ethical Considerations in Managing Human Capital

It is quite clear then that human capital should be managed; but what is particularly intriguing from an ethical vantage is the question of *how* human capital should be managed. Unlike traditional forms of capital, people holding human capital have emotions and feelings. For this very reason, attempts to manage human capital like other entities, such as factors of production that are bought and sold regularly, should be met with caution. If human capital is viewed primarily as a *fixed* asset that cannot be bought and sold in the market, firms would continuously invest in the development and utilization of human capital in their employees. On the other hand, if it is approached as a *variable* cost or asset that can be bought and sold through market transactions, companies may not invest in developing human capital and may even lose their existing human capital. Importantly, embedded in each orientation is an ethical concern regarding the inherent worth of an individual and a firm's obligation to consider the emotional factor that also accompanies an individual's knowledge and skills. Of course, this added emotional dimension is absent in traditional forms of capital and, for that reason, poses challenges to those who manage human capital.

If we think of human capital from an individual's perspective, some additional interesting ethical issues arise. For example, it is likely that people with high human capital will have greater influence and bargaining power inside an organization. As a result, they may be able to bargain for higher compensation, which will further widen the already large compensation gap in the organization. Another interesting issue is the appropriation of the value created by human capital. If a person with high human capital creates a certain amount of value to a firm, how much of that created value should be received by the person versus the firm? Another issue concerns the treatment of humans as a "resource" or a "piece of capital." Since business tends to exploit its capital and resources, there is a real danger that people will be treated as a resource that firms can increase and decrease whenever they want to do so. This approach could dehumanize the managerial ranks along with the labor force.

As long as developed nations continue to move away from traditional manufacturing as an economic engine in favor of technology, knowledge, and service type sectors, human capital will likely only increase in importance. Consequently, those who can effectively manage this unique form of capital are more likely to successfully compete in the new knowledge-based marketplace.

Human Genome Project

The *Human Genome Project* (HGP) is a U.S. government project with the goal of mapping the entire genetic structure of humans. The project has raised a host of ethical issues and has complicated existing ethical topics involving genetics. Among these issues are those surrounding both prenatal and adult genetic testing, the proper use of genetic information and genetic profiling, gene therapy, gene patents, genetic enhancement of individuals, and issues involving the just distribution of genetic resources.

A *gene* is the fundamental unit of heredity. It is a *nucleotide* (a sequence of DNA) that contains instructions for making proteins, the basis of cellular structure and metabolism. The *genome* refers to the DNA contained in each cell, including so-called junk DNA (more than 98% of DNA), which does not code for proteins. The *genotype* is the entire genetic structure of the organism, which includes all the genes in the organism. The *phenotype* refers to the physical traits of an organism; these are not only determined by the genotype but also by environmental factors. *Genomics* is the study of genes, focusing on their role in disease processes. *Pharmacogenomics* studies the way in which drugs interact within a person's body based on that individual's genotype.

History of the Human Genome Project

In 1984, the Department of Energy (DOE) sponsored what was later labeled the "Alta Summit" in Alta, Utah. Ostensibly, the conference's goal was to find better means of detecting mutations in atomic bomb survivors, but discussions expanded to encompass genetic research in general. The summit catalyzed further discussion, including the possibility of mapping the human genome. As a result, Charles DeLisi, director of the DOE Health and Environmental Research Programs, formally proposed the Human Genome Project in 1986. After considerable debate and two failed bills in Congress, the HGP was funded as a joint project of the DOE and the National Institutes of Health (NIH), and it began in 1990. The goal was to complete the mapping of the human genome by 2005. In 1998, Craig Venter's company, Celera Genomics, began its own version of the HGP. His goal was to patent genes and gene sequences for eventual profit via selling rights for their use to pharmaceutical firms and other interested companies. His work was more cost-efficient than the federal project, costing only 10% of the official HGP. It is possible that the competition between the two projects speeded the process of sequencing the genome, and on June 26, 2000, U.S. President Clinton and U.K. Prime Minister Blair jointly announced the completion of a rough draft of the human genome. The full project was "completed" in 2003, 2 years ahead of schedule, with Celera and the NIH/DOE group making the announcement on April 14. Work on details and potential applications of the HGP will go on indefinitely.

Potential Benefits of the Human Genome Project

The HGP is thought to have great potential for improving human health. First, the genes associated with debilitating and fatal diseases could be identified. Genes for cystic fibrosis and Huntington's disease, a genetic-linked disease in which victims, usually around the age of 40, begin to suffer degeneration of brain tissue and eventual death, have already been discovered. The HGP opens the possibility of discovering genetic links to such conditions as Alzheimer's disease and some cancers; the BRCA gene, for example, has been linked to a higher risk of breast cancer in women. Once the genes linked to a disease are identified, research can then focus on methods of gene therapy to cure or mitigate such gene-linked conditions.

A second, more controversial, potential benefit of the HGP is the possibility of improving the human species. If certain genes could be found that are linked to athleticism or high intelligence, then gene therapy could be used to make "designer babies," with genetic traits correlated to the skill of their parents' choice. Many geneticists dispute the possibility of such improvements, arguing that (1) most genetic-linked traits do not involve only a single gene but rather the interaction of multiple genes and (2) the environment plays an indispensable role in the expression of the phenotype.

Ethical Issues Involving Prenatal Genetic Testing

Many of the ethical issues surrounding the HGP are the same ones that are raised by genetic research as a whole. The reason is that the success of the HGP will lead to more successful uses of existing genetic techniques. For example, if the HGP results in specific genes being identified as correlated with a serious health problem, such as abnormally high cholesterol, then it may be possible to use existing techniques of gene therapy to alter the affected genes. Issues arise surrounding the moral rightness or wrongness of gene therapy, whether somatic, in which the therapy targets the tissues or organs of the individual with a genetic disease and thus affects only that individual, or germ-line, in which the therapy targets the germ cells (sperm or egg) and thus the changes in the genetic code are passed on to the individual's descendants. These issues had been hashed over many times before the HGP became a reality, and the debate will intensify due to the success of the project.

As the techniques of identifying prenatal genetic problems improve, moral debates over issues such as abortion move to the new context of gene testing and gene therapy. If a fetus is identified as having the gene for cystic fibrosis, should the parents carry the fetus to term or abort the fetus? Some have argued that it is best for parents to abort on utilitarian grounds, for a child with cystic fibrosis will suffer a great deal before dying at a relatively young age. Opponents of abortion believe that since the fetus is a human person it is morally wrong to abort the fetus. They also argue that considerable pressure may be placed on the woman to have an abortion in such situations. But the issue becomes even more complex when extended to diseases that are not as strongly genetically linked. What if genetic testing determines that a fetus has a gene correlated with a greatly increased chance of breast cancer or a greatly increased chance of early onset heart disease? If there were no gene therapies available to alter the affected genes, would it be morally acceptable to abort a fetus for having these propensities? What if a fetus has a gene that is linked to a greater chance of schizophrenia or autism? Would abortion be acceptable in those situations?

In the future, gene splicing and recombinant DNA technology may become accurate enough to eliminate a gene-linked condition from the fetus before birth. Although somatic gene therapy on an embryo is relatively uncontroversial, germ-line therapy raises a host of issues about the advisability of altering human evolution and about the unintended negative consequences of "permanently" eliminating a defective gene from the human genome.

Genetic Testing, Genetic Information, and Genetic Profiling

First, a set of issues arises concerning how to deal with genetic information. The HGP has already led to the discovery of genes linked to tendencies for breast cancer and arteriosclerotic heart disease, and this list will expand over time. Suppose that a gene is discovered that is directly linked to a fatal disease; Huntington's disease, for which a gene has already been discovered, is an example. Huntington's is one of the potentially fatal diseases for which there is no effective treatment. It is an autosomal dominant disease; if one parent has the disease, the children have a 50:50 chance of having the disease. If a father knows he has Huntington's disease, should his children be tested? Even if some or all of his children have the disease, they will most likely not suffer symptoms until around age 40 (though they may suffer symptoms earlier or later). Some adult children of Huntington's patients do not wish to be tested for the disease. The question arises as to whether there is a moral obligation for those who have a strong potential of having a genetic-linked disease or being a carrier of the disease to receive genetic testing. Advocates of patient autonomy could argue that testing is up to the patient alone; a possible utilitarian response is that testing is necessary so fewer children with genetic disease will be born.

Advice concerning options after genetic testing is often given by genetic counselors, most of whom claim to be value neutral in their approach. They argue that neutrality is necessary because of past abuses (by the eugenics movement in the United States and by Nazi Germany) in which extreme control was placed over reproduction. In the United States, this involved sterilizing thousands of people with mental illness and mental retardation; in Germany, it involved selective breeding to create a "super race." Genetic counselors wish to avoid any hint of coercion. Thus, even in situations in which a child is tested for genetic defects, and it is thereby discovered that the male guardian is not the biological father of the child, genetic counselors do not believe that he should be informed. Critics argue that there is no such thing as value neutrality—that even the claim that "we should be value-neutral" is itself a value judgment. In addition, genetic counselors placing patient autonomy above other principles, such as beneficence or nonmaleficence, are making a value judgment. Critics argue that genetic counselors should admit from the start that they are not value neutral and that they should lay out what their values are.

A second issue surrounding genetic information involves health and life insurance coverage. As more genes are discovered that are correlated with an increased risk of major diseases, such as heart disease and cancer, insurance companies can use genetic testing to either deny insurance coverage (either completely or for a specific condition) or raise rates for people testing positive for genes connected with such diseases. Insurance companies may require genetic testing before offering coverage. In addition, life insurance companies could deny coverage to individuals or charge higher rates based on their genetic profiles. What is new about such denials of coverage is that the individuals denied do not actually have the disease but a genetic tendency for higher risk of getting the disease. Insurance companies argue that they should have the right to make decisions concerning coverage based on genetic testing. They claim that such decisions are in accord with actuarial fairness since higher risks mean higher costs for the insurance company because individuals at high risk for debilitating diseases often suffer from those diseases. Expensive treatment implies expensive claims, and these raise the insurance costs for everyone else. Critics reply that it is unfair and also a form of discrimination to penalize individuals for genetic susceptibilities, for not every susceptibility is translated into disease. Plus, people can no more help the genetic profile with which they are born than they can help their race or sex, and genetic discrimination is no different from racial or sexual discrimination.

There is also the possibility that employers will reject job applicants due to their genetic profiles. Critics argue that this is also a form of morally unjustified genetic discrimination. Most states have laws against genetic discrimination in health insurance and employment, and a few have laws against such discrimination in life insurance. Most of these laws restrict the genetic information available to an insurance company. But critics say that such laws concerning the privacy of genetic information are difficult to enforce and that insurance companies will find loopholes and find ways to gain access to genetic information from applicants (such as asking leading questions about genetic history on insurance application forms or requiring medical records to be sent to the insurance company).

Ethical Issues Surrounding Gene Patents

With the mapping of the human genome and a better understanding of the functions of particular genes, there is an increased demand for research on genes, not just for the purposes of pure science but also to find new treatments for diseases. Both the government and private firms have engaged in genetic research, and both have taken out large numbers of patents on DNA products. In the United States, a DNA product such as a gene or gene fragment can be patented if it is developed in such a way that it is in a unique form not found in nature. Some critics have argued that genes should not be patented at all, and information about them should be publicly available and access to their use should be available for free to both the government and to private firms. They claim that even if a laboratory can synthesize DNA and its components, they are still products of nature and are the property of humankind. Advocates of gene patenting argue that if the government or industry spends money to isolate a DNA product in a way that is not found in nature, then the product is, in a sense, "artificial," and the firm's intellectual property rights over that product should be protected.

The U.S. Government holds the largest number of gene patents, followed by several biotech and pharmaceutical firms. One problem that has arisen in the patent process is the following: Since gene fragments of the same gene may be patented (as well as the gene itself), several firms may hold patents on parts of the same gene. But this results in ambiguity regarding patent rights over that gene. Suppose Company 1 wishes to do research on "Gene A," but Company 2 owns patents on several fragments of Gene A. Do both companies own the rights to the gene? If so, would Company 1 have to pay Company 2 a licensing fee? One danger is that due to multiple patents and confusion over ownership of DNA products, licensing fees could multiply and become exorbitant, driving up the cost of pharmaceuticals and other products developed from research on genes. Critics of the present patent system have argued that there is a need for an agreement to bring order into the chaos of multiple patents on parts of the same gene. Some suggest that a commission composed of people from different professions, including bioscience, business, philosophy, theology, and law, meet to agree on precisely where the limitations of patents on DNA products should lie.

Another potential problem is related to the increasing concentration in the pharmaceutical industry due to mergers forming megacorporations, combined with big pharmaceutical firms expanding their research and development into genetics. As more and more companies merge, and pharmaceutical firms buy smaller biotech firms, the control they wield over genetic research and patents is growing. The knowledge and technology needed to effectively carry out research and development based on genetics is very complex, and increased company size offers an advantage in terms of resources and efficiency. But if control over genetic research and patents becomes concentrated in the hands of fewer companies, this raises the danger of monopolies, with the resultant risk of higher prices for products developed from genetic R&D.

Ethical Issues Surrounding Genetic Enhancement

The HGP will lead to the discovery of more genes connected to diseases, some with diseases directly linked to one or a few genes (such as cystic fibrosis and Huntington's disease), others correlated with diseases not directly gene linked, such as coronary heart disease and cancer. But it may also lead to the discovery of genes associated with nondisease traits, such as height, athletic ability, and intellectual ability. Much discussion has raged over using gene therapy to "improve" human beings. Part of this discussion relates to the older debates over the moral acceptability of germ-line gene therapy. Proponents of germ-line therapy argue that it could eliminate debilitating gene-linked diseases from the human species, such as Huntington's, cystic fibrosis, or sickle cell anemia. Opponents are concerned about the ramifications of rapid changes in a genetic code that developed slowly through evolution. They also argue that since the phenotype is partly due to the interaction of genes, we do not know the overall effects of permanently altering the germ line. In addition, they are concerned that some negative gene-linked traits, such as sickle cell trait, are conducive to human survival in certain environments: In the case of sickle cell anemia, it provides protection against malaria. Critics argue that the long-term results of permanently altering the human genetic code are unknown and potentially dangerous.

Even more controversial is the possibility of altering genes to produce traits that society considers positive, such as increased height, athletic prowess, intellectual ability, or artistic talent. Even if done at the somatic level without passing on traits to the germ line, these types of "improvements" are controversial, for they raise the specter of eugenics. There are fears related to both Nazi attempts to produce a "super race" of individuals and to the eugenics movement of the early 20th century. This movement was primarily focused on eliminating "undesirable" traits from the human population ("negative eugenics"), such as mental retardation. Unfortunately, this led to the forced sterilization of significant numbers of people who were either mentally ill or mentally retarded. The "new eugenics," based on contemporary genetics and the possibility of gene therapy, opens the possibility of "positive eugenics" in which genes for "positive" traits such as mathematical ability are inserted into a germ cell. Some writers have mentioned the possibility of parents choosing "designer babies" with the genetic traits of their choice.

Supporters of genetic enhancement argue that parents should have the right to make autonomous reproductive choices, including the choice of the genetic traits of their children. If there are traits most people in society would consider positive, such as mathematical ability, then it is morally acceptable for parents to agree to genetic manipulation of an embryo so that it gains the gene for this trait. We already support improvement of people's abilities through education and athletic training; what could be wrong with extending this to genetics? Opponents reply that there is a danger of creating two classes of people: Those whose children have received gene-linked positive traits and those who either choose not to have genetically enhanced children or those who cannot afford it. This could lead to discrimination against those "genetically less endowed."

But some geneticists say that the whole discussion may be a moot point. They argue that the debate is based on a false view of genetic determinism that does not stand up to scientific scrutiny. They argue that due to the strong influence of gene interactions, the complexity of gene therapy, and the powerful role the environment plays in phenotype, it will not be possible to program traits such as mathematical acuity or athletic ability into humans. Even limited success would lie in the far future.

Justice and Distribution Issues

The data from the HGP are freely available online. However, the fruits of the HGP, such as new genetic testing products, new drugs resulting from pharmacogenomics research, and so forth, are not free. Will genetic testing and effective drugs developed from genetics research be only available to those who are relatively well off? Will developing nations have effective access to the fruits of genetic research? If drugs are developed that are tailored to an individual's genetic code, it will be expensive to develop drugs for large populations. The danger is that the smaller populations treated will be those able to afford such drugs, and others will be left out. Questions of justice and fair distribution of resources arise. Should companies be required to discount their resources to help those who are economically disadvantaged? Or is the free market the best way to lower costs in the long run and make the products of genetic R&D available to the widest population?

Humanities and Business Ethics

The humanities have been variously defined, through the ages, to incorporate a range of subjects, including literature, philosophy, history, language, and more recently, even film. The unifying theme of these arts and disciplines is inquiry into human culture, although they may be distinguished in contemporary institutions from certain so-called performing arts, such as music and dance, and fine arts, such as painting and sculpture, which also explore what it means to be human. The lines between the humanities and the sciences and applied disciplines are often perceived to be clearer, in that we study the former for their supposed intrinsic value and the latter for instrumental purposes. Needless to say, the way in which institutions define and distinguish disciplines is often imprecise and reflects the worldviews of an epoch and those within it.

It is worth noting, given the above context, that business has never seriously been considered to be among the humanities. This is despite the fact that the endurance of business as a social institution depends on its capacity effectively to serve the needs and wants of human society. This service-oriented conception of business has been contrasted with the dominant conception of business in which owners employ managers as their agents to maximize the value of their property through efficient response to an abstract and amoral market demand. Moreover, the prevailing application among business ethicists of a moral theory that aspires above all to be general and reasonable does not easily reconcile with a humanistic ethic that values particular context and emotional compassion in seeking to answer how humans, including businesspersons, should live. In short, the juxtaposition of the humanities and business ethics faces numerous challenges requiring clarification.

Empirical Science and Normative Inquiry

Business scholarship has in recent decades been dominated by quantitative and scientific disciplines, and while business practice has in some respects moved beyond financial performance as the only meaningful indicator of business performance, it has not moved beyond the general prejudice that what matters to business must be quantified. These attitudes are one source of tension between the humanities and business ethics, although it is notable that business management has been viewed to be as much an art as it is a science. Meanwhile, normative ethics scholarship suffered years of neglect, particularly by the American and British analytic tradition, for being speculative rather than scientific. These attitudes are another source of tension between the humanities, which often raise more questions than they answer, and business ethics, whose practitioners often desire moral certainty. Even among laypersons who share a regard for ethics as being practically important, there are widely divergent views as to whether ethics consists of a rational system of absolute moral rules or is instead radically subjective, circumstantial, and/or emotional.

These diverging views about business and ethics have contributed, not surprisingly, to a scholarly debate about whether business ethics is properly empirical science (and thus not humanistic in approach) or normative inquiry (and potentially but not necessarily humanistic) and, consequently, to a chorus of voices claiming that the two are complementary and perhaps inseparable. Traditionally, empirical science is defined as the study of what is, whereas normative inquiry is defined as the study of what should be. Within the terms of these definitions, the argument for integration goes roughly as follows: Strictly empirical research cannot, without normative context, help human beings by answering what should be done to improve on what is. Strictly normative research cannot, without empirical context, be related to practical matters of importance to human beings. Therefore, advancing business ethics scholarship and the related goal of moral improvement in business requires an integration of empirical and normative research methods. Still, this convergence of research methods leaves fundamental questions unanswered. Whereas business ethics has tended to focus on the moral question, "What should I do?" the starting point for Aristotle was the broader ethical question, "How should one live?"

The diverging views about business and ethics have further contributed to a public debate about the basic purpose of business ethics education. One side argues that business ethics can and should be taught as a morally prescriptive system of laws and rules defining the limits of appropriate behavior. This argument is often linked to the economic argument that long-term financial performance is tied to so-called ethical performance, where ethical performance is essentially compliance with legal and prescriptive moral requirements. Another side is sympathetic to the claim that ethics is inherently imprecise. This latter claim can lead to significantly different conclusions: Business ethics is merely a descriptive exercise and need not be taught, or business ethics education is essential to cultivating ethical reflection and understanding in a more congenial setting than in the throes of business practice. Those who arrive at this latter conclusion are perhaps most sympathetic to the view that the humanities and business ethics belong together.

Using the Humanities to Understand Business Ethics

The debates summarized above hark back to an ancient quarrel between philosophy and poetry that Plato sought to resolve by banishing poets from his ideal society. His main grounds for doing so were that the potential benefits of art (which he thought could be enlightening and educational) were outweighed by its costs (it did not convey genuine knowledge and could be destructive of moral character). Aristotle, in contrast, thought poetry and certain other arts essential to the good life and good community, reasoning that the pleasure poetry afforded through imitation was essential to its capacity to contribute to moral improvement by depicting things as they might be.

Most business ethics courses use teaching methods inspired by the humanities, most often literature. Case method is based on the notion that business schools must ultimately prepare students for how to act in the so-called real world. Moreover, many courses in law and business use variations on the Socratic method. These methods, whether the raw material comes from the humanities or not, are committed to the ideal of learning general lessons from the particular experiences of others, real or fictional. However, business school case studies rarely have the valuable endurance, particular immediacy, emotional impact, and providential insight that good literature can provide. Aristotle's theory of ethics, which was more concerned with cultivating pursuit of the good life than with specific moral rules, made good use of his theory of poetry. As Nussbaum represents Aristotle, poetry, even more than history, is an essential complement to moral theorizing because it exhibits four key features of the Aristotelian ethical view: noncommensurability of the valuable things, the priority of particular perceptions, ethical value of the emotions, and ethical value of uncontrolled happenings. Furthermore, another recognizably Aristotelian claim is that a story, which is ordinarily a complete whole, can teach what unfinished experience cannot.

Accordingly, in addition to the influence of the humanities on business school pedagogy, the use of the humanities as a didactic instrument is common but by no means institutionalized:

- Numerous scholarly articles and books have been published examining the application to business of moral lessons from specific works of literature, drama, and film, as well as the use of such works in the classroom.
- Business ethics students have read novels, stories, and poems, viewed film, art, and even architecture as the basis for classroom discussions of business ethics topics, and performed dramatic acting in the learning process.
- A scholarly journal has been launched to explore the uses of film in understanding ethics, including but not limited to business ethics.

So, for example, the vanity and foolishness of such fairytale characters as the emperor in Andersen's "The Emperor's New Clothes" has been compared with that of fallen business executives; the Faust legend examines how much it would take for human beings to sell their souls; Rand's *Atlas Shrugged,* a fictionalization of her capitalist philosophy, attributes social and technological advancement to a few visionary leaders, whereas Tolstoy argues in his analysis of the military hierarchy in *War and Peace* that it is the collective activity of many people, rather than a few leaders, that moves the force of history; Shakespeare's *Hamlet* demonstrates the pain of being trapped in a difficult moral dilemma, while *Macbeth* illustrates the trials of organizational politics; and Achebe's *Things Fall Apart* and Conrad's *Heart of Darkness* explore the dark side of colonialism, often fueled by economic conquest. Beyond moral theory and literature, Plato's early Socratic dialogues can be used to study the nature of morality and the justice of the legal system—a theme that returns in King's historic "Letter from Birmingham Jail"; and Aristotle's theory of friendship sheds light on the unabashedly instrumental nature of most business relationships. Film, which is frequently produced by studios owned by big business, is more often than not hostile to big business, whose stereotypical mantra about greed being good is uttered by *Wall Street* corporate raider Gordon Gekko; meanwhile, the focal point of *Do the Right Thing,* a family-owned pizzeria in a racially polarized Brooklyn neighborhood that might as well be a world away from Wall Street, raises the issue of the responsibility of a business to the community it serves.

These examples suggest limitless potential applications of the humanities for understanding business ethics. They may well have the practical value of helping us explore moral dilemmas, but they also importantly communicate what it is to be human; that is, many characters throughout history and literature are materially self-interested, but they are not all equally so, as agency theory has tended to presume. Arguably, the increasing presence of business ethics itself in the standard business school curriculum is further evidence of its "humanization." On the other hand, the question of whether a business education should be humanized by requiring humanities texts and humanities-based courses in the business curriculum poses not only a logistical challenge but also a theoretical paradox. If the fundamental value of the humanities is intrinsic—that is, independent of immediate, functional objectives—then does not using them as a practical instrument undermine their real value?

Business Ethics and Humanity

The contrasts—between business as private property and service institution, empirical inquiry and normative inquiry, financial performance and social performance, moral prescription and description or ethical inquiry, instrumental and intrinsic value—may be exaggerated above for effect, but they are representative of a diversity of intellectual and practical perspectives that influence the extent to which business ethics and the humanities can be said convincingly to form a productive relationship. The uneasy presence of the humanities in business ethics education also raises important issues regarding the role of humanities in business ethics and business more generally. The goal of humanizing the business curriculum involves, most important, a shift in perspective about business practice, from a scientific endeavor pursuing quantitative performance targets to a human endeavor carried on by human beings to serve human demands.

The humanities have been credited with the capacity to enlarge our view of what it means to be human (whether or not in business), teaching us to think critically about business texts and other business phenomena, making us reflect on the foundations of business, and helping us cultivate a sense of community in business. However, contemporary artists and their advocates often do not see their works as primarily instrumental in purpose and quantifiably measurable in value. In fact, it has been argued that artistic and humanistic pursuits are often undervalued by capitalist markets in which the common unit of measure is financial. The humanities remind us that there is more to human value than financial performance, a lesson that does not necessarily teach us anything practical about what to do when faced with a particular dilemma between financial and social performance. What the lesson might do that is of relevance to business is remind us also that there is more to business value and human value than financial performance.

The value of the arts and humanities has been characterized as intrinsic rather than practical, instrumental, or even measurable. This position is represented by Kant's famous notion of purposiveness without purpose and the idea that art (and the humanities, for the sake of this argument) constitutes a disinterested pleasure. Contrast this perspective with that of business, which is fundamentally "interested," as exemplified by the term we use to describe the growth in our capital that results from doing nothing more than lending it temporarily for another's use. While the view that the primary value of the humanities is intrinsic is controversial, relatively modern, and overly simplistic, and the view that the primary value of business is instrumental is perhaps unfair, this contrast illustrates one final way in which the humanities can be (ironically) useful to business ethics: by challenging the foundations of any pursuit we undertake solely with the objective of being paid. Although capitalists have suggested that such an objective is not only defensible but morally obligatory, the suggestion fails to acknowledge the instrumental good that business can do for society as well as the intrinsic good that some businesspeople derive from business activity. Finding ways to value these goods would be the best evidence of the humanizing of business and thus of the value of the humanities to the ethical objectives of business.

Human Nature

Human nature may be defined as the essence of the human species and consists of all the characteristics and behaviors that are inherent in human beings. While inquiries into human nature have occupied philosophers both classical and contemporary, practical men and women frequently attribute one or another experienced injury or benefit to some element of human nature and make decisions informed by their own hopes and fears. Advocates of business ethics often look to human nature to explain abuses or to propose a path of change.

What Makes a Human Being?

Humans are distinguished from animals by their ability to use tools, develop language, and reason. These last two are closely connected in that the practice of logic is intertwined with the structure of language. While rhesus monkeys have been taught to use sign language and domesticated animals are capable of understanding spoken words, the development of a formal language is unique to human beings. Indeed, humans have created a diversity of spoken and written languages, and the vocabularies of these languages reveals commonalities and differences among cultures. Written language permits a more detailed historic record and enhanced opportunities for self-consciousness and specialized labor.

In biological terms, the "human" is a mammal, large brained, has an "s"-shaped spinal column, an erect posture, opposable thumbs, an ominivorous diet, binocular vision, speech, practices bipedal locomotion, and dwells on the ground. The human or hominid is preceded in the mammalian chronology by pongids (apes or monkeys). Pongids and hominids share several characteristics with humans: their group living, their careful socialization of children, and their capacity for learning, among others.

The human brain is supple and responds to environmental challenges through reconfiguring its neural pathways. An individual's loss of a sense leads to a process in which the other senses compensate, and a new synthetic understanding of the environment emerges. Damage to the brain stimulates a reassignment of functions among the healthy parts of the brain. The individual's need to process information and interact with the environment stimulates the development of appropriate areas of the brain. The chemistry of the brain is thus altered. Nurture and broad experience may affect nature.

Humans live in groups, not as isolates. Human survival is crucially dependent on primary and secondary groups, from the dyad and nuclear family to larger kinship patterns. Families depend on an overarching organization or complex of organizations, ranging from the tribe and confederations of tribes, to the political structures of the city and nation-state. Pongids share the primary and secondary group structures in which humans live, but they lack the more complex political and economic institutions that characterize human experience.

One basic need satisfied by social organization is continuity in food supply. Participation in social organization with this purpose is not optional. A primary function of the economic system is to assure the availability of food and accommodations and, beyond this, to guide the distribution of wanted goods consistent with cultural values.

Religion has emerged among humans to explain and guide shared experiences of birth, illness, death, love, hurt, and disaster. These explanations are organized into a superstructure that provides reasons, names, and rationales, confers membership, allocates power, and promulgates a charter to order society. Religions proliferate but societies have more recently turned to secular forms of organization in which the influence of religion can still be discerned. Religions constitute one of the oldest forms of social organization and continue to shape business practice, political movements, and statecraft. Religion is an important element of culture that stands along with biology in explaining human behavior.

Determinants of Human Nature

Biology

Biologists have documented much of the human genome and, in doing so, have revealed fundamental elements of human nature. In a very real but limited sense, the genetic code accounts for human nature. Human DNA provides the biological basis for human consciousness, from which derives the human capacity for learning and the complex knowledge transmitted by culture. While the ancient Greeks speculated about fixed forms and ideas determining human nature, contemporary scholars find evolving intelligences, in dialogue with one another and interacting with the environment.

Human evolution is the process through which humans emerge within nature. That humans are animals has led some to claim that humans are inherently violent and aggressive, as some animals appear to be. Evolution is often described as the "survival of the fittest," which is taken by "Social Darwinists" like the 19th-century sociologist Herbert Spencer and his contemporary disciples to mean that humans necessarily struggle with one another, with some destined to lose. Konrad Lorenz argued that humans possess an aggressive instinct but proposed means to subdue it.

Charles Darwin did not intend that evolution be equated with violent competition. Rather, he emphasized the question of reproductive advantage. That is, the evolution of a species is the consequence of the development of characteristics that contribute to differential reproductive success in the local environment. Reproductive success is not necessarily a function of violent competition within or between species. The 19th-century social critic Petr Kropotkin and modern evolutionary biologists have demonstrated that cooperation within and between species also plays a critical role in promoting the survival of offspring. As discussed below, animals and humans have been said to practice a reciprocal altruism in which cooperation emerges as a strategy for survival.

Consider as well the process of symbiosis. Species may evolve in such a way as to intimately depend on conditions produced by other species and may even live within their bodies. This is far from Thomas Hobbes's and Spencer's war for survival.

Culture

Humans are unique in regard to the role played by culture, rather than biology, in shaping individual behavior. Culture is the set of values and customs in which individuals are socialized and that bind a community together. Cultural values shape but do not determine behavior because individuals and groups have the capacity to examine their culture's assumptions and subject them to analysis. Socrates counseled that "the unexamined life is not worth living." Descartes explored the uncertainties of his own existence, and every generation brings a new round of questioning.

Moreover, cultures may coexist, merge, or fragment. Cultures and nations may share boundaries but varied cultures may also blend in a single nation. Shared beliefs and behaviors rather than physical location or political jurisdiction characterize cultures.

The logical structure embedded in many of the languages of the world facilitates questioning. The concept of opposite or negation invites an experimental mind to invert culturally transmitted propositions. Any culture, however conformist, inspires movements of dissent and reformulations of received doctrine. No culture is fully stable.

It is possible almost everywhere to find borderlands where cultures mix and traditions bend or erode. Authority and challenges to it coexist in the borderlands and throughout the contours of cultural evolution.

Clyde Kluckhohn, a cultural anthropologist best known for his survey of the many definitions of culture, called culture an abstract description of the trends toward uniformity in the words, deeds, and artifacts of a human group. Kluckhohn and other anthropologists have noted that cultures are dynamic and are characterized by processes reinforcing both stability and change. Geography and legal jurisdiction shape but do not determine cultural change.

Anthropologists have found considerable differences among the peoples of the world in their practice of gender roles, in their construction of race and class, in their conception of the individual and the collective, in their interpretation of family responsibility and the extended family, in their treatment of elders and assessment of tradition, in their assessment of the proper relations between workers and managers (laypersons and clergy, amateurs and experts), and in their attitudes toward progress. Kluckhohn found these questions to be central to the differentiation of cultures: the conceptions of inherent good or evil in human nature; the perceived relationship of humans and nature; the emphasis on past, present, or future; the conception of life as being, becoming, or doing; and the patterns of emphasis in primary relationships.

Management scholar Geert Hofstede sought to apply the concept of culture to a business context. He surveyed the global population of IBM managers to illuminate national differences in values. He found national differences on the acceptance of power differentials (power distance), individualism (vs. collectivism), masculinity (vs. femininity), the tolerance of uncertainty, and future (or present) orientation. GLOBE researchers at the Thunderbird School of Management amended his model, identifying nine cultural dimensions: performance orientation, assertiveness, future orientation, humane orientation, institutional collectivism, in-group collectivism, gender egalitarianism, power distance, and uncertainty avoidance.

From an anthropological perspective, patterns of uniformity and divergence are of equal interest. The Hofstede and GLOBE models appear to emphasize uniformity rather than change and differentiation. They also assume the narrow vantage point of the multinational manager and cultural variation is understood in relationship to the constituent parts of a multinational enterprise. However, the multinational enterprise is perhaps too culturally specific to serve as a framework for comprehending cultural variation.

The United Nations Universal Declaration of Human Rights emerged from a process in which representatives from the world's nations debated the notion of rights in the aftermath of World War II. That such a document was written with broad international support underscores the possibility of communication and understanding across cultures. Beneath the evident cultural differences on dimensions like individualism and collectivism across the globe, there are underlying problems about the relationship of the individual to the group. Even violations of the

Declaration reveal similar patterns of social control and resistance across cultures and nations.

Diversity: Relationships of Gender, Race, Class

The wide variation in cultural practices across the globe and the visible differences among races and genders have inspired theories of difference and inequality. Explorers and scholars who recorded differences among races and cultures in the 18th, 19th, and 20th centuries, in many cases, assumed a fixed hierarchy of ability and intelligence. These views are increasingly contested by egalitarian perspectives that emphasize the complexity of language and belief systems in disparate civilizations. French anthropologist Claude Levi-Strauss studied the religions and other beliefs of so-called primitive societies and discovered similarities in the detail and complexity of understanding and argument. Franz Boas and more contemporary anthropologists have questioned the concept of race, noting that race accounts for minuscule differences in the genetic code and that there are far greater genetic differences within rather than between the races.

In the United States and many other industrialized nations, women increasingly participate in the labor force. Despite this, there are persistent disparities in income and occupational distribution. While feminists, professional groups, and trade unions agitate for corrective action, there remain significant constituencies who argue for a return to traditional gender roles.

Debate Over Essentialism

The ancient Greeks and particularly Plato and Aristotle contributed profoundly to the historical development of ideas about human nature. In various ways, they advanced the argument that human nature is fixed and personal qualities unalterable. Plato and Aristotle argued that human beings, animals, and things were expressions of underlying forms. For Plato, the material world known by sensation was merely a shadow of a more fundamental reality of unchanging forms or ideas perceived by the intellect or reason. Most important among forms is "goodness," accessible only to reason.

On the other hand, Aristotle saw form and matter as intertwined. According to Aristotle, humans share the same underlying form but differ in their material manifestations. The human soul or mind consists of the distinctly human faculties including consciousness and reason. From the material world come individual differences.

Aristotelian philosophy validates experience as a source of knowledge. Aristotle believed that the forms manifested in all living and inanimate things are accessible to the human mind through experience coupled with reason.

Like Plato, Aristotle embraced inequality among humans and rationalized a rigid class system. Aristotle specifically endorsed slavery as natural and argued that most slaves were mentally inferior to their masters. He placed humans at the peak of a hierarchy of all life-forms but suggested that some humans were brutish or animal-like, particularly non-Greeks.

Aristotle identified human fulfillment with the exercise of reason in a life of activity and social engagement. He proposed practical wisdom, moderation, courage, and justice as principal virtues to guide living. Virtue lies in the mean between extremes, and extremes of wealth and poverty produce manifold injustice.

Platonic and Aristotelian philosophies continue to shape modern thinking. Plato's notion of the separation of mind and body or "dualism" is reflected in Christian teaching about the soul's independence from flesh. Contemporary arguments about the superiority of reason to emotion recall his work.

Platonic idealism has an analog in the free market model in neoclassical economics. Many economists view the market as the underlying reality of economic life even as they de-emphasize the violations of neoclassical assumptions posed by the details of corporate power and the experience of individuals and groups at work. Institutionalists, Marxists, and other dissenters within economics have sought to counterpose the social realities of poverty and exploitation with the abstract formalism of economic models. Economists' adherence to the ideal of free markets, like Platonic idealism, is rooted in a preference for mathematical structures over subjective experience.

Aristotle's conception of human differences, characterization of human virtues, and empiricism have been influential. Modern conservatives find in Aristotle a justification of aristocracy in the political and economic realms. On the other hand, Robert Solomon and others have developed paradigms of multiple virtues in business ethics relying on Aristotle's works.

Forms in Platonic and Aristotelian philosophy represent means to explain what is common and what is different among humans, animals, and things. Contemporary scientists struggle with the same questions and have found that the DNA code constitutes a modern equivalent for form among living things. However, DNA does not determine all aspects of human nature or individual differences. For example, it is probably only one of many factors influencing intelligence.

Scholars and practitioners continue to debate the relevant contributions of nature and nurture to intelligence. The Intelligence Quotient is premised on the notion that there is one fundamental kind of intelligence that has a fixed and unequal distribution among the human population. Critics such as Howard Gardner now argue that there are multiple forms of intelligence, including social and emotional varieties, that depend on context and are not necessarily correlated. Others have suggested that apparent cultural differences in intelligence are an artifact of testing, in which culturally specific approaches to reasoning are privileged. Most important, critics find considerable evidence for the notion that individuals have multiple paths of intellectual development open to them and that they are not handicapped by a fixed amount of intelligence.

Given the near-universality of complex hierarchies in the business world and the phenomenon of the "pecking order" among animal species, it is tempting to say that hierarchy and inequality are embedded in human nature. From Plato and Aristotle to contemporary ethologists such as Desmond Morris, this has been the view. Others condemn this notion as an anthropomorphic fallacy. Dominant chimpanzees or roosters do not claim superiority relative to the others in their group. Their dominance is highly constrained and relates to the ordering of events rather than to the quality of existence. It is only among humans that hierarchy rations access to necessary goods.

Counterposed to the essentialist views of Plato and Aristotle are models of a malleable and flexible human nature. Jean-Jacques Rousseau, Karl Marx, John Dewey, and even the 20th-century management scholar Douglas McGregor argued that the reconstruction of social institutions could initiate new patterns of human development. Rousseau argued that humans were essentially good but corrupted by existing civilizations. He called for a new social contract informed by the "general will," freed of corrupting sectarian interests. Karl Marx imagined an emancipated human nature of unlimited capacity following socialist revolution and the transition to communism. Dewey believed democracy to be the key to the enhancement of ordinary individuals' abilities. McGregor argued that a more participatory approach by managers would uplift and fulfill most workers. The debates about the scope of human malleability and improvement are embedded within contemporary political discourse.

Behaviors Based in Human Nature

Self-Interest Versus Altruism

One of the most important debates in business ethics revolves around the relationship of self-interest, competition, profit-maximizing, and human nature. The obverse question is the relationship of altruism inherent to human nature. What are the relative shares of altruism and self-interest in the fundamental nature of the human actors?

Some argue that examples of altruistic behavior abound in nature. Care for family members is a characteristic seen in a wide variety of species. The careful protection of eggs by penguin parents is a remarkable demonstration of willing self-sacrifice. Of course, biological urges are supplemented by cultural traits in human society; the balance of cooperation and competition in animal nature does not determine the balance in human nature.

The care shown by a parent for a child is often explained as selfish in that it helps preserve the parent's genes. However, the wolf pack's embodiment of extended family and the human concern for community and humankind (described in robust form in Kristin Monroe's *Heart of Altruism*) cannot easily be construed as self-interest. It is noteworthy that neither narrow self-interest nor broad social solidarity, strictly defined, requiring either a developed personality or a science of politics, is present in the animal world.

Economists Samuel Bowles and Herbert Gintis posit that strong reciprocity and basic needs generosity are fundamental human motives. They contend that anthropological research and game theory suggest that people are not stingy, but that their generosity is conditional on context. By strong reciprocity, they mean a propensity to cooperate and share with others in a similar position, even at personal cost. By basic needs generosity, they mean a virtually unconditional willingness to share with others and assure them some means of subsistence. Evolutionary biologists find evidence of reciprocal altruism as an evolved behavior. Anthropologists find altruism and self-interest embodied in varying combinations in existing and ancient cultures.

Some have argued that altruism is linked to a particular formulation of self-interest. Altruistic service to others requires a healthy self, without which one's service may lack consistency and effectiveness. Someone who fails to attend to his or her health and other needs cannot be reliably helpful to others. Sustainably altruistic behavior, whether for business leaders, philanthropists, community activists, or helping professionals, cannot involve self-destruction. Altruism may be linked to a conception of self-interest that is broadly construed so as to be consciously embedded in the social. The altruist judges the welfare of others to be intertwined with his or her own interests.

Despite the long tradition of writing and argument that humans are inherently social (supported by Plato and Aristotle and their Christian interpreters among others), individualistic conceptions of human nature have grown in influence in the United States and Western Europe since the 18th century. Social contract models like that of Thomas Hobbes and John Locke played a critical role in the revolt against monarchical absolutism and feudal privilege; individual rights and reason were key to this process. Both Hobbes and Locke hypothesized that humans were equal in the state of nature but endorsed a civil society of individualism and unequal property relations. Individualistic ideas were a potent solvent that shook the feudal order to its foundations. Canadian political theorist C. B. Macpherson identified a contradiction in the "possessive individualism" of Hobbes and Locke between the logic of individual liberty and exploitative property relations.

The 18th-century political economist Adam Smith was one of the great architects of the capitalist system. One of his important contributions was to link individualism to a self-regulating natural order. His best known work, *The Wealth of Nations,* introduced the concept of the "invisible hand" guiding the self-interested behavior of economic actors toward the public good. Modern individualists continue to pay tribute to Smith's conception of the invisible hand. Objectivists like Ayn Rand add to Smith's embrace of markets a belief in the moral superiority of capitalists.

Despite Smith's celebrated role as an exponent of laissez-faire capitalism, he did not argue that selfishness was a sufficient explanation of human behavior. He worried that self-interest often led businessmen to conspire against the public and called attention to "sympathy" as a motive coexisting with selfishness. Indeed, he raised questions about the morality of individual capitalists.

Utilitarian philosopher Jeremy Bentham contributed much to the classical model of "economic man," the individual as utility maximizer practicing a hedonistic calculus. In this analysis, market transactions generate the greatest happiness of the greatest number, and no other motives need constrain self-interest. However, even within utilitarianism more complex views of human nature have emerged. John Stuart Mill found happiness to be something more than the sensation of pleasure. Mill's emphasis on the quality of happiness and his concern for workers' conditions in free markets led him to contemplate means to introduce a measure of solidarity in economics, thereby adding to self-interest as the primary human motive. Smith and Mill considered together reveal a developing argument for social responsibility to restrain capitalist excess within the classical economic paradigm.

Capitalists and socialists, reformers, reactionaries, and revolutionaries of all stripes have posited views of human nature that validate their political analyses. Capitalists find self-interest everywhere. Socialists find altruism prominent in both "primitive" and civilized societies. Ayn Rand and modern objectivists continue to argue for an atomistic individualism and interpret human interaction as a form of rational contracting.

Good and Evil

War and violence have bedeviled humanity throughout recorded history. While Rousseau posited a noble savage and Marxian socialists have forecast human perfectibility, Saint Augustine and succeeding generations of Catholic and Protestant thinkers have asserted the principle of original sin.

Immanuel Kant thought the human mind capable of discerning moral duties or categorical imperatives through the application of reason. Because reason is an inherent human capacity, the perception of duty is embedded in human nature. This does not mean that humans will always do that which is good. Their capacity to reason provides the opportunity to make choices, and these choices may reflect selfish interests and violate duty.

The 20th-century Protestant theologian Reinhold Niebuhr elaborated a view of human nature in which good and evil coexist and define the arc of human practice, and democracy is justified as a constraint on evil and a means to develop the good. Niebuhr warned of the children of light and the children of darkness, both of whom do evil as they dwell in illusion. The children of light assume that human nature is perfectible and fail to recognize the damage they do as they aggressively pursue what they regard as the good. The children of darkness know of no law apart from their own will and narrow interest. Niebuhr held that powerful corporations routinely abuse their power, both through the naïve optimism of the children of light and the manipulative cynicism of the children of darkness. Niebuhr's moderate pessimism about human nature led him to argue for extensive regulation of corporations, but he also warned of abuses in the exercise of governmental power.

Reason and Emotion

Philosophers from classical to modern times have cited reason as the faculty that distinguishes human beings from animals. It must be conceded that primates have the capacity for physical problem solving, but they lack the ability to consider abstractions and formulate principles. This gives humans the capacity to distinguish self-interest from group and societal interests and to choose rules for decision making.

While Plato and other dualists considered emotion to be inferior to reason, and others have linked emotions and the flesh to moral corruption, emotion plays a critical role in human behavior. It cannot be so easily distinguished from reason. Emotion provides information. When one experiences emotional pain, one recognizes a peril in the path of decision making. Pleasure reveals a favorable association. Emotions illuminate some of the personal and social consequences that derive from one's choices and situation. One is free to employ reason in the consideration of emotion. While Jeremy Bentham was probably a reductionist in his construction of a hedonistic calculus for human behavior, it is equally suspect to dismiss pleasure and pain as irrelevant to human action.

The Life Cycle

A challenge posed by human nature to the business world is the recognition of the life cycle. The utilitarian model premised on economic man fails to fully acknowledge the ways in which humans mature and develop distinct needs (rather than wants). Humans are distinguished from other mammals by their survival long past child-bearing years. Older humans have much to contribute to society based on their experience, and children have much to learn from society, but neither reality is fully reflected in any company bottom line. Industrialized societies now face difficult questions relating to the funding of private and public pensions given widespread employer pressure to attenuate historic commitments to retirees. The elderly face increased poverty and exclusion.

Social Responsibility and Solidarity

Business leaders, scholars, and the public at large vigorously debate about whether corporations owe society anything more than profit-maximizing. The advocates of profit-maximizing and of social responsibility often turn to conceptions of human nature to explain their positions. If rational self-interest is a sufficient explanation of human behavior, then corporate social responsibility receives little reinforcement from human nature. Classical notions of the social contract and contemporary economic models reinforce the notion of the atomistic individual. If, on the other hand, altruism is sustainable at the individual and group levels, then there may be a variant that is appropriate to the business enterprise. A third possibility is that human nature leaves individuals and groups with a wide array of choices and in no way determines the configuration and practice of business enterprise.

Of the three propositions, the weakest appears to be monistic interpretation of human nature and business practice as self-interested. Certainly anthropologists' survey of human behavior and social institutions finds multiple patterns of self-interested and altruistic behavior. Individuals' loyalty to tribes, businesses, or movements cannot be fully explained by self-interest. It should be noted that profit-maximizing corporations depend on considerable self-sacrifice from employees.

Social psychologist Lawrence Kohlberg describes the process of ethical development according to which an individual learns to behave according to the dictates of successively broader communities, from the family to peer groups and ultimately global humanity. Parental approval and avoidance of punishment determines the behavior of the child, but abstract principles may guide the decisions of adults.

Underlying this process is an expanding social consciousness. Humans see the consequences of their actions and derive lessons from what they see. They easily perceive their dependence on immediate and extended families. As they mature, they may increasingly identify commonalities with other individuals and families. They observe an array of "experiments" in which individuals and families pursue varied options with respect to patterns of cooperation and conflict with relevant others. As a result, they forge bonds of identity linking the local, regional, national, and perhaps global networks.

Regardless of one's values and background, one has the potential to embrace a consciousness of kind with global dimensions. This is true of the hard-nosed business conservative as well as the international unionist. What distinguishes the two is the choice of others with whom to identify. In neither case is the individual self-sufficient.

Social consequences may extend to considerations of the natural world. Humans cannot sever their relations with the natural world, but they can learn better how to evaluate the natural consequences of their actions. The human capacity to perceive consequences, experiment as to behaviors, identify with others, and invent ways of living and working together provide the intellectual and social context for conceptions of social responsibility.

Behavioristic psychologists like James McConnell and B. F. Skinner viewed human behavior as a set of responses to stimuli in which conscious choice is absent. This perspective recognizes few differences between rats and humans and omits culture as a significant element of human existence. On the other hand, if one accepts the notion of consciousness, one can see in cultural variety the multiplicity of social choices humans have made as well as the consequences. One might speak broadly of a "consciousness of kind" (following Giddings), ranging from familial (nuclear, extended) to group, nation, species, and nature. This "consciousness of kind" follows the contours of association and solidarity through which individuals and groups demonstrate their identity with and fidelity to others.

There is considerable opportunity for choice in the way in which business institutions reflect individual, group, and societal priorities. The multiple paths to corporate social responsibility depend on choices as to the institutionalization and reconciliation of the self-interests and altruistic concerns that coexist in human nature.

Consider Kant's maxim that one should treat others as ends and never solely as means. This categorical imperative has been interpreted by some to require the overhaul of organizations. Labor cannot merely be a factor of production and thus a means but must become an end as well. Producer cooperatives, employee ownership, collective bargaining, and employee involvement may be more consistent with Kantian ethics and represent means to reconcile the self-interested and altruistic motives in human nature.

HUMAN RIGHTS

Basic human rights are moral rights that apply to all persons in all nations, regardless of whether the nation in which a person resides acknowledges and protects those rights. It is in this sense that basic human rights are said to be *inalienable.* Human rights can also be aspirational in the sense of specifying the ideal rights to which individuals ought to be entitled. The 1948 *Universal Declaration of Human Rights* is aspirational in this sense. To think about human rights in a meaningful way, it is helpful to answer certain philosophical questions about their nature. Three of the most basic questions are the following: How can human rights be justified? What basic human rights exist? How do human rights differ from other rights, such as legal rights? Let us consider each question in turn.

Philosophical Foundations

Human rights are rights enjoyed by humans not because we are members of the species *Homo sapiens* but because fully functional members of our species are persons. Personhood is a metaphysical category that may or may not be unique to *Homo sapiens.* To be a person one must be capable of reflecting on one's desires at a second-order level, and one must be capable of acting in a manner consistent with one's considered preferences. The capacity to reflect on one's competing preferences and to act in a manner consistent with one's second-order preferences is a key feature of personhood and one that distinguishes persons from mere animals. It is in this sense that the idea of personhood is properly understood as metaphysical rather than biological.

Rights theorists with a wide range of commitments readily agree that persons enjoy a basic right to individual freedom and that other persons have a duty not to restrict or constrain the freedom of others without strong justification. Sometimes, as in the case of John Locke, this right is merely assumed or asserted. Modern rights theorists such as Robert Nozick, Loren Lomasky, and Onora O'Neill typically ground this claim in Kant's second formulation of the categorical imperative, which holds that one must treat other persons always as an end and never as a means only. Kant provides a sustained defense of the doctrine of respect for persons, and he and his interpreters specify in detail its practical implications. Respecting other persons requires that one refrain from interfering with their decisions and actions. Typically, one person is justified in limiting the freedom of another only when her own freedom is unjustly restricted by that person. One traditional way of capturing this sense of a liberty right is that individuals should be free to as much liberty or freedom as is compatible with like liberty or freedom for all.

There is little controversy among rights theorists regarding the plausibility of a negative right to liberty or freedom. However, there is significant controversy over whether or not there are positive rights to certain economic and social goods. Positive rights entail not merely negative obligations on the part of others to refrain from certain actions, but a positive obligation to fulfill the right of the rights holder. One positive basic right that is often defended is the right to physical well-being. For example, if individuals have a right to economic aid or health care to ensure their physical well-being, then others have a duty to provide them with such assistance. The state may be called on to fulfill these duties, but in weak or corrupt states such duties may be neglected. And in states where market values trump consideration for positive human rights, such rights may also be neglected. Under such conditions the burden of fulfilling such obligations seems to fall on individuals, but most individuals are not well positioned to meet such obligations. Furthermore, even in cases where the state does meet such alleged obligations, traditional libertarians would argue that it is illegitimate to tax some citizens in order to ensure the well-being of others. Have we then reached an impasse?

Arguably, there are at least two philosophically sound reasons for thinking that we can move beyond this apparent impasse. First, there is an influential and persuasive argument that holds that the distinction between negative and positive rights is unsustainable. Second, there is a widely influential set of positive arguments that can be used to support both a right to freedom and minimal welfare rights, such as the right to subsistence or well-being. Let us consider each argument in turn.

Henry Shue has famously argued that the very distinction between negative and positive rights that the preceding analysis presumes is artificial and inconsistent with social reality. For example, consider the right to physical security (i.e., the right not to be harmed). It is possible to avoid violating a person's right not to be harmed by refraining from certain actions. However, it is not possible to protect a person from harm without taking proactive steps. At a minimum, Shue argued, law enforcement agencies and a criminal justice system are required so that individuals are not left to defend themselves against forces that they are unable to defeat on their own. The existence of these social institutions is predicated on positive actions in the forms of design, implementation, administration, and taxation. In this way, it can be seen that the protection of a prototypical negative right requires positive actions and not merely the avoidance of particular actions. Since negative rights entail both negative and positive duties, the notion of negative versus positive rights loses its meaning. There are only rights and corresponding duties; but the duties that correspond to these rights are both negative and positive. There is, then, Shue concluded, a strong argument against a theory of rights that includes negative but not positive rights.

Much of the most important and influential work on human rights has been produced by Kantians. Rather than beginning with rights claims, Kantians begin with obligations or duties to respect other persons. These duties constrain the pursuit of ends, whether they are self-interested goals or projects pursued on behalf of other parties such as shareholders. Respecting persons involves both negative obligations, such as refraining from using others as mere tools via physical force, coercion, or manipulation, and positive obligations, such as supporting physical well-being and the development of basic human capacities. When they stand in the appropriate relationship to an obligation bearer, persons have rationally justified rights-claims against them. Rights take the form of side-constraints that bound the moral space in which agents may pursue ends without unjustified interference by other agents or institutions. For example, a minor child has legitimate rights-claims against her parents regarding her physical well-being and the development of her human capacities by virtue of her relation to them. The morally legitimate ends of parents do not include actions that substantially undermine the physical well-being or normal development of their child. Similarly, a convenience store owner has a rights-claim against those in his community to be free from assault and robbery. The morally legitimate ends of other community members do not include actions that would undermine the freedom of the store owner.

Wherever corporations conduct business, they are already in special relationships with a variety of stakeholders, such as workers, customers, and local communities. In their global operations and in their global supply chains, corporations have a duty to respect those with whom they have relationships. Corporate managers, then, have obligations to both ensure that they do not illegitimately undermine the liberty of any persons and the additional obligation to help ensure that minimal welfare rights to physical well-being and the development of basic human capacities are met within their spheres of influence. For example, corporations have sufficient power and coercive influence to ignore the labor and environmental laws in many developing nations. These host nations typically lack the police and judicial infrastructure necessary to enforce such laws. Host nation governments may also be fearful that if they enforce their own laws, then the corporations may move their operations to nations that are willing to ignore local laws. However, such laws are essential for the protection of the basic rights of the citizens of developing nations. For this reason, it has been argued that corporate managers have an obligation to ensure that local host nations' laws are respected.

Human Rights Versus Legal Rights

Human rights are moral rights that apply to all persons in all nations, regardless of whether the nation in which a person resides acknowledges and protects those rights. Human rights attach to persons and not merely to citizens. Human rights differ from legal rights in that, unlike legal rights, the existence of human rights is not contingent on political institutions. This is true despite the fact that the enforcement of human rights typically does rely on institutional mechanisms.

Many nations grant their citizens certain constitutional or legal rights via foundational documents or legal precedent. However, the rights that are protected vary among nations. Some nations ensure that the rights of citizens are protected by effective policing and an independent judiciary. Frequently, however, poor citizens and disfavored groups are not provided with the same level of protection for their legal rights as the economic and political elite. Persons who are deprived of their rights do not thereby cease to have those rights. Employers may deny employees or other stakeholders their inalienable right to freedom and well-being, whether or not local governments are complicit, but in doing so they in no way diminish the legitimacy of the claims of their employees to those rights. However, by virtue of their failure to properly respect these stakeholders, such employers succeed in diminishing their own standing in the community of rights holders.

In the weak and failed states where many multinational corporations operate, they are often the most powerful institutions in existence. In such cases, corporate managers are uniquely situated to help ensure that the basic rights of individuals within their spheres of influence are protected. Many corporations have embraced this obligation. For example, Mattel ensures that all the factories in its global supply chains meet basic human rights standards. Nike provides microloans to community members in the areas where it has large contract factories, thus providing additional help to improve the economic well-being of these communities. And Adidas ensures that the basic rights of workers in its contract factories are respected while using its occupational safety expertise to help noncontract factories in those same communities improve working conditions.

Are Human Rights a Western Concept?

At this point in our discussion, it is worthwhile to consider an objection to the foregoing argument concerning human rights. This criticism stems from the observation that the idea of human rights emerged from the Western philosophical tradition but is taken to be universal in its applicability. The claim is then made that human rights are of less importance in the value systems of other cultures. For example, it is argued that "Asian values" emphasize order, discipline, and social harmony, as opposed to individual rights. In this view, the freedom and well-being of individuals should not be allowed to interfere with the harmony of the community, as might be the case, for example, when workers engage in disruptive collective action in an effort to secure their rights. This view might also be used to defend the claim that the moral norms that govern Asian factory operations should emphasize order and discipline, not such basic rights as freedom and well-being.

Several points may be made in reply to this objection. First, Asia is a large region with a vast and heterogeneous population. As Amartya Sen and others have argued, to claim that all, or even most, Asians share a uniform set of values is to impose a level of uniformity that does not exist at present and has not existed in the past. Second, in secular, democratic Asian societies such as India, respect for individual rights has a long tradition. Indeed, there are significant antecedents in the history of the civilizations of the Indian subcontinent that emphasize individual freedom and well-being. For example, Amartya Sen has noted that in the third century BCE, the Emperor Ashoka granted his citizens the freedom to embrace whatever religious or philosophical system they might choose, and at the same time he emphasized the importance of tolerance and respect for philosophical and religious beliefs different from one's own. Third, even if it was the case that Asian cultures shared a uniform set of values that de-emphasized human rights, this would not by itself provide good reasons for denying or disrespecting the rights to freedom and well-being. This is because the justification of human rights provided above is grounded in rational arguments that are valid across cultures.

The critic is likely to retort that such a view reflects Western prejudices grounded in Enlightenment ideals. This response is unpersuasive. Diverse intellectual traditions have emphasized the importance of values derived from reason, rather than mythology, traditionalism, mere sentiment, or some other source. For example, in the 16th century, the Mughal emperor Akbar arranged to have philosophers representing diverse religious and philosophical beliefs engage in rational discussions regarding the merits of their competing views and sought to identify the most persuasive features of each view. In so doing, Akbar was able to emphasize the power and force of rational analysis. Given that a similar emphasis on rational analysis concerning values may be found in the histories of other non-Western cultures, the claim that such analysis is uniquely Western is unpersuasive.

Hume, David (1711–1776)

David Hume was Scottish. One of the great philosophers, Hume's wide-ranging thought incorporates a skeptical attack on the power of human reason along with an explanation of how the natural operations of mind and conduct generate beliefs and contribute to the formation of moral and political order. Hume suggests that we are guided less by abstract reason than by stable currents of passion, sentiment, and custom. A significant influence on his peers, including Adam Smith, and a popular figure in Enlightenment Scotland, Hume has also provided a powerful legacy to contemporary philosophers. Born in Edinburgh, he studied at the University of Edinburgh and later served as the Librarian to the Faculty of Advocates.

During his lifetime, Hume was most famous for his essays—some of which first appeared in 1741 (*Essays, Moral and Political*)—and for his six volume *History of England.* However, his major work is *A Treatise of Human Nature.* Disappointed with its reception, Hume revised the *Treatise,* publishing *An Enquiry Concerning Human Understanding* and *An Enquiry Concerning the Principles of Morals.* Although differing in style from the *Treatise,* their content is similar. Other major works include *The Natural History of Religion,* a naturalistic explanation of religious belief, and *Dialogues Concerning Natural Religion,* published posthumously. In the *Dialogues,* Hume offers forceful criticisms of the Argument from Design, a powerful 18th-century argument for the existence of God.

Seeking a science of human nature, Hume devotes the first book of the *Treatise* to the understanding, the second to the passions, and the third to morals. The contents or perceptions of the mind are either ideas or impressions, but all ideas arise from impressions of sensation or internal impressions (passions or feelings). Reason is concerned with matters of fact or relations of ideas. Knowledge of matters of fact is founded on belief about cause and effect, but causal relations cannot be proved a priori; they can be gleaned only from the customary association of one thing with another. From the habitual experience of one object following another, we come to believe that these objects share a causal connection, even if there is no rational justification for assuming that future experiences of causation will be the same as in the past. Hume also contends that there is no justification for positing a self beyond particular impressions and ideas of the moment, nor is there reason for predicating a world that exists independent of us. Even without rational justification, we are, Hume explains, naturally constituted to believe in causality, a world external to ourselves, and a continuing self.

When he turns to consider the passions, Hume notes how, via a process of sympathy, we may come to share the passions and feelings of others. It is in fact the passions, and not reason, that motivate action, and because morality has a motivating force, morals must involve the passions. Moral judgments arise from the sentiment that occurs on considering, from a general rather than a partial point of view, the actions and qualities of other agents. The rules, or conventions, of justice—primarily rules of property—first emerge as a response to circumstances such as scarcity and limited benevolence. Rejecting any notion of a social contract, Hume argues that governments and laws find their justification in utility and that a cautious moderation is the appropriate attitude toward politics.

In his *Political Discourses,* which are essays devoted to economic questions, Hume distinguishes between money and wealth, argues for free trade, attacks several theses of mercantilism, and suggests that commerce helps rather than hinders moral and social progress. In *Of the Jealousy of Trade*, he argues that competitive trade is not a zero-sum game but a mutually beneficial condition of economic growth. In *Of Commerce* and *Of Refinement in the Arts*, Hume defends economic growth, arguing that commerce has significant and positive consequences for individual happiness, the enhancement of knowledge, the development of sociability and humane relations, and the maintenance of liberty.

I

IDEAL OBSERVER THEORY

Ideal observer theory purports to give the meanings of ethical terms or to provide normative standards by showing what judgments an ideal observer would make and what reactions an ideal observer would have. There are many different versions of the theory. Other ethical theories employ aspects of ideal observer theory as well. The most notable of ideal observer theories is that of Roderick Firth, but Adam Smith offers one of the first versions of the theory. Others who employ aspects of ideal observer theory are Richard Hare, in his discussion of the archangel as part of his two-tiered theory of moral thinking, and John Stuart Mill, in his use of the benevolent spectator as part of the explanation of his utilitarian theory. However, Hare's archangel and Mill's benevolent spectator are best considered ideal observers in the service of consequentialist ethical theories. Still other ideas that share some important similarities with ideal observer theories include Kurt Baier's "moral point of view" and Thomas Nagel's "view from nowhere." These share with ideal observer theory the requirement that moral judgments must be made from an objective standpoint if they are to be correct.

The requirement of objectivity is the main characteristic of ideal observer theory. Correct moral judgments are objective and impartial as well as devoid of particular interests, concerns, and attachments. Some versions, specifically Firth's, add omniscience as a necessary attribute of the ideal observer. Smith requires knowledge for the ideal observer, although not omniscience. For us to employ such a theory in decision making, we must imagine what it would be like to have those attributes, some of which are impossible for us to have. Our judgments are thus in an important respect always tentative since ours may not match the judgments of the ideal observer, given our less-than-ideal circumstances.

Firth's account is the most thorough and sophisticated version of ideal observer theory. He identifies and explains six characteristics of the ideal observer: (1) omniscience with respect to nonethical facts, (2) omnipercipience, (3) disinterestedness, (4) dispassionateness, (5) consistency, and (6) normality in all other respects. This combination of characteristics has the result that the ideal observer is also completely impartial, which is of great importance to the absolutist, or objective, character of Firth's analysis of moral terms. According to Firth, the ideal observer's impartiality results from disinterestedness and dispassionateness. Consistency, however, does not result in impartial decisions. Rather, impartial decisions will be consistent. Firth points this out by reminding us that it makes sense to say a person is consistently partial, so as to remind us that consistency is not enough to make for impartiality.

These six required characteristics of the ideal observer are intended to be significant but conceivable. If the ideal observer did not meet these requirements, we would not want to take his or her judgments as giving meaning to moral terms. Firth's analysis is such that moral terms are given meaning by the reactions of an ideal observer. So, for statements in which an ethical term is predicated on some act, agent, or characteristic, the ethical predicate is given its meaning by how the ideal observer reacts to that act, agent, or characteristic. For example, if we were to analyze the statement "Murder is bad," the term *bad* will reflect the ideal observer's negative reaction to or disapproval of the term *murder,* just as in "Giving to charity is good" the term *good* reflects the ideal observer's positive reaction to or approval of the term *giving to charity.* It is worthwhile to note that the ideal observer may also react with moral indifference, passing no moral judgment on an act.

Smith's version of ideal observer theory is different from Firth's. Rather than treating disinterestedness and dispassionateness as key characteristics, Smith argues that we offer moral approval when we sympathize with another, disapproval when we do not. Sympathy is then the agreement of moral judgments. Smith's ideal observer reacts both to the agent and to those who are affected by the act in question. The judgment of the observer takes all aspects of the act—who is involved, what the motivations of the agent are, as well as the intentions of the agent and consequences of the act—into account. While Smith's observer is informed of the facts of the case, he or she is not omniscient, and the judgments made may be changed later. Smith's ideal observer thus renders moral approval or disapproval and generates moral judgments accordingly. Smith's ideal observer sets a normative standard for moral judgments, whereas Firth's gives meaning to moral terms.

Hare and Mill both use an ideal observer in their consequentialist theories. For Hare, the archangel (who is akin to an ideal observer) makes the moral judgments that are to guide us in everyday life, and those judgments are the ones that are most clearly reflective of the ethical theory. The archangel's judgments give meaning to our moral terms, and to use moral terms correctly our judgments must match the archangel's when we are paying attention to all aspects of the moral theory. This is the most reflective and definitive tier of Hare's moral theory. The other tier of moral thinking in Hare's theory depends on the judgments of the archangel being correct according to the principles of the theory. Judgments from this tier are to be used in ordinary circumstances. For Mill, the benevolent spectator (who is akin to an ideal observer) is one after whom we are to model our own judgments. The key characteristic of the benevolent spectator is impartiality, which is also of great importance to Firth's ideal observer. The benevolent spectator makes moral judgments that are beneficial overall but that do not rely on a particular interest in those who benefit.

Some Criticisms

Common criticisms of ideal observer theories express worries about the knowledge requirements of an ideal observer, the possibility or lack thereof of the existence of ideal observers, whether or not ideal observer theories have problems dealing with questions of absolutism and relativism, and what effect all these problems might have on the meanings of our ethical terms if we subscribe to this kind of theory. Some of these criticisms can be dealt with relatively easily and are no more damaging than the criticisms of any kind of moral theory, but others are more problematic for the plausibility of the theory.

As noted above, Firth's knowledge requirement for ideal observers is quite strong—omniscience. It has been argued by Richard Brandt that this requirement is far too strong because it takes us out of the running for being ideal observers and makes the observers less "human" than we might want. One proposal is that it might be enough that the ideal observer has all the ethically relevant facts of a situation to make his or her judgment. Yet we might worry that an ideal observer without *all* the facts might have some false beliefs that would affect the judgment made in the situation. We might also worry that to specify the ethically relevant facts, we would need to employ other judgments of the ideal observer, and thus we would confront a circularity problem to identify those ethically relevant facts. Smith's version might also fall victim to a circularity criticism since the ideal observer's morality depends on his or her own judgments according to his or her own sympathies. In addition, we may worry that Smith's observer's judgments may be later changed on his account.

The second problem concerns the possible existence of ideal observers. On the one hand, if there are no ideal observers, we might think using such a fiction to give meaning to our ethical terms or to give a normative standard for judgments is dubious. The idea here is that we can only suppose what an ideal observer's judgments would be, and since we are not omniscient or do not possess the required knowledge, disinterest, and dispassion, our judgments will often be mistaken (this can also be construed as a merit of the theory since moral disagreement is easily accounted for).

On the other hand, if there is more than one ideal observer, we may run into ethical disagreements among them, rendering our ethical terms' meanings or normative standards questionable. This criticism, if persuasive, is troubling. The criticism goes like this: We could have two ideal observers who meet all the conditions of an ideal observer and yet due to differences in psychological makeup or circumstance or perspective make different moral judgments about one situation. They have at their disposal all the facts and are both disinterested and dispassionate yet still react differently to an ethical situation. Some have argued that the situation described is inconceivable, that if the two ideal observers are omniscient, disinterested, and dispassionate, they *must* by definition of those concepts make the same judgment. Others claim that there is good sociological and psychological evidence to suggest different judgments are possible. A question about the criticism is whether the sociological and psychological evidence would be applicable to an ideal observer as opposed to a human being. The differences between ideal observers and humans concerning sociology and psychology might render such evidence useless in accounting for differences in making judgments. Although we want to explain and account for moral disagreement among people, it is less clear whether moral disagreement among ideal observers can be seen as a virtue of the theory.

This is also the problem about absolutism and relativism. If the judgments of the ideal observer are supposed to be absolutist, holding true for everyone at all times as Firth contends, disagreement among ideal observers would challenge his account's absolutism. If we do end up with a relativist ideal observer theory, it is unclear how the ideal observer's judgments give meaning to our moral terms. This possibility of difference is part of Smith's account. He endorsed the idea that cultural differences would make for differing judgments of ideal observers.

Related theories such as Nagel's and Baier's do not involve an observer but a position from which we are to make moral judgments. These positions would befit an ideal observer, however. The "view from nowhere" and the "moral point of view" attempt to get at the same kind of objective and impartial judgments without positing an observer per se and thus avoid some criticisms.

Connections to Business

The characteristics of the ideal observer can be useful in making ethical decisions related to business. For example, if a stakeholder theory is correct, the ideal observer would have little trouble identifying the widest possible set of stakeholders and weighing their claims. Ideal observer theory can serve as an important reminder to those making business decisions, of both moral and nonmoral import, to strive to be dispassionate and objective. A further application of ideal observer theory to business decision making might be in mediation, where a mediator takes on a role similar to that of the ideal observer in that he or she is to be disinterested. Another application might be in the endorsement of a publicity requirement. The ideal observer from this standpoint has nothing to hide from others about his or her decision-making process. The absolutist quality of Firth's theory, for example, can also be useful for business insofar as it requires that we all use moral terms the same way and prohibits a business from making exceptions for itself that it would not give to others.

Identity Theft

Identity theft, also known as identity fraud, occurs when an individual's personally identifying information is used without permission and/or knowledge by someone else (often a stranger). It is a form of impersonation that enables someone to commit fraud and generally results in financial harm to the individual and financial gain to the impersonator. During the past decade, the increasing amount of personal information available on the Internet has made this a growing concern.

A person's identity refers to that information that distinguishes him or her from other people. In some ways, it encompasses a person's accomplishments and is closely connected to reputation. A person's identity relates to information that exists, whereas a person's reputation reflects opinions about a person's identity.

More specifically, particularly in the context of identity theft, identity refers to the pieces of information that are linked to personal and/or financial value. This set of information comprises both public and private information. For example, a person's telephone number and street address, often available in the public domain, are connected to a person's identity. Confidential information, such as a person's social security number, mother's maiden name, PIN numbers, credit card numbers, and so forth, also contributes to a person's identity. By acquiring access to this information, an individual can impersonate someone else to perform fraudulent transactions, often for financial gain.

Interestingly, there are generally two forms of theft at play. First, there is the theft of the individual's personally identifying information because the information is acquired and/or used without the permission of that individual. The theft that takes place is different from theft of property in that the original owner still has access to his or personal information. The difference is that the value of that information has been depleted because, once misappropriated, it no longer relates uniquely to the original individual but now also points to the imposter as well. Second are the benefits associated with the impersonation. While identity theft is often associated with financial gain (i.e., the theft of money), it can also be used to acquire unauthorized entry, privileges, and/or benefits.

Techniques

Although identity theft is ostensibly on the rise, it is not a new phenomenon. Prior to the Internet, unscrupulous people stole mail or rummaged through other people's trash (dumpster diving) to obtain personally identifying information such as credit card numbers. Others have been found to have eavesdropped on private conversations in public venues to obtain that sort of information (shoulder surfing). According to a 2003 survey by *Privacy & American Business,* only a small portion of identity theft—16%—is attributable to friends, relatives, or coworkers. People nevertheless remain wary of the people with whom they do business because anyone to whom you give your credit card or other personal information (i.e., in a bank, store, etc.) has the opportunity to misappropriate that information.

Two new techniques for facilitating identity fraud have emerged as a result of society's growing use of and reliance on the Internet and e-mail. Phishing, for example, occurs when someone impersonates a trusted entity in electronic messages aimed at securing confidential information such as log-in names and passwords. For example, some phishing attempts target the customers of banks and online payment services such as PayPal. These messages often urge individuals to log on to their accounts via provided Web links. In fact, the Web links are fake, and the messages end up tricking people into disclosing their personal information to strangers. The Web links are actually tools used by phishers to capture the desired personal information (i.e., account numbers, passwords, etc.) so that they can then use that information for their own purposes.

The second way in which e-mail and the Internet are exploited for fraudulent purposes is through spam. Spam refers to unwanted, unsolicited e-mail messages, often used for mass advertising. Fraud can occur through spam e-mail as mass messages are used to cheat people by enticing them to buy fake products or pay a fee for a useless or nonexistent service or luring them in some other way to give up money under false pretenses. Many of these messages direct recipients to Web sites that invite them to input personal information in exchange for the opportunity to receive gifts or win awards. These range from a $50 gift card of a department store to a chance in a lottery.

Technology has added new dimensions to concerns surrounding identity fraud. The increasing amount of personally identifying information that is created, exchanged, stored, and maintained in computer-based databases creates new vulnerabilities. The Internet provides a virtual playground for hackers, as do personal computers—used in most offices today. The skillful thief can rifle through electronic data to find what he or she needs without authorization.

Impact

Within recent years, it appears that, while the number of reported instances of identity theft has arguably decreased, the magnitude of financial harm has increased. According to a 2006 survey cosponsored by Javelin Strategy and Research and the Better Business Bureau, the actual number of adult victims of identity fraud in the United States has decreased from 10.1 million in 2003 to 8.9 million in 2006. The dollar amount suffered by victims as an aggregate has, however, increased from $53.2 billion in 2003 to $56.6 billion in 2006. This is in addition to significant out-of-pocket expenses reported by victims that increase losses by 10% or more.

Tremendous tangible and intangible costs are borne by both victims and businesses. The costs to individual victims, in addition to the dollar amount of actual losses, remain significant. Along with financial consequences, victims also suffer damage to their reputation and credit report and substantial lost time. According to a recent survey issued by the Federal Trade Commission (FTC), 15% of victims reported that their personally identifying information was misappropriated for use in nonfinancial ways, such as to obtain government documents.

According to a 2003 survey conducted by the Identity Theft Resource Center, victims on average spend 600 hours regaining their identities and repairing the harm. This same survey reports that the emotional harm associated with identity theft is equivalent to that experienced by victims of violent crimes.

Major costs accrue to financial institutions and other businesses as well. Business losses attributable to identity theft totaled $47.6 billion in 2002, according to the FTC survey. These financial costs are in addition to costs associated with loss of trust and damage to reputation. Additional costs are linked to increased security measures that businesses are finding it necessary to implement to protect the personal information of customers as much as possible.

Account hijacking (i.e., unauthorized access of bank accounts) is reportedly the fastest growing form of identity theft, according to the 2003 Identity Theft Resource Center survey.

Legal Framework

Identity theft is a crime. That having been said, from a legal perspective it remains a sort of moving target in that it transcends physical, geographic boundaries. It is also difficult to prove. While an individual can claim losses, those losses are not always attributable to a clearly identifiable person, particularly since the thief operates under the guise of a stolen identity. In the United States, local, state, and federal enforcement agencies handle investigation and prosecution under general laws.

Specific privacy and data protection legislation exists in other countries to offer protection from and compensation for identity theft. In Australia, for example, control over identity theft falls under the auspices of the Office of the Privacy Commissioner. In the United Kingdom, personal data are protected by the Data Protection Act, a British act of Parliament that governs proper use of personal data collected and used by organizations.

Responsibilities of Individuals and Businesses

There is no doubt that the victims of identity theft suffer significant unsolicited harm. It is also true, however, that some victims leave themselves vulnerable to this sort of harm. People who value their personal information have an obligation to take reasonable precautions to protect that information, if for no other reason than that, in many instances, they are in the best position to keep that information secure. All sorts of shredders and shredding services are available today to prevent dumpster divers from acquiring anything useful relating to a person's identity. Furthermore, Internet users can choose what information to reveal online and under what circumstances. Any individual who discloses personal information on nonsecure Web sites does so at his or her own risk.

This is not to say that individuals are always in a position to prevent the theft of their personally identifying information. In fact, according to the FTC survey, 49% of the victims of identity theft do not know how their information was stolen. People can, however, remain vigilant regarding the security of their identities. Regular monitoring of accounts, for example, can provide for early detection of suspicious behavior. Approximately 26% of the victims only become aware of the theft because of reports of suspicious activity by businesses (i.e., credit card companies, banks, etc.).

The arguably greater responsibility therefore falls on the shoulders of businesses. First, it is the responsibility of companies that gain access to personally identifying information to protect that information from unauthorized disclosure. This means that companies have to take particular care in choosing the people they hire and in training them to safeguard customer privacy. In addition, they have an obligation to create and implement systems to protect data from theft.

Second, it is also the responsibility of companies to monitor accounts to detect suspicious activity. American Express regularly verifies unusually large purchases with the account holder before authorizing payment. Similarly, Discover often requires account holder verification after several subsequent gas purchases in a short period of time. Self-serve payment systems, such as gas stations, are particularly vulnerable to accepting stolen credit cards. While this creates an inconvenience for automobile travelers, it represents one way Discover is able to mitigate losses linked to stolen credit cards.

Conclusion

The harm to individuals and businesses resulting from identity theft is significant and sometimes irreparable. Once a person's identity is stolen, while he or she can recover financial compensation, the associated emotional damages are much more difficult to repair. Businesses, too, suffer substantial costs linked to identity theft. Although a legal framework aims to prevent and punish identity theft, it nevertheless remains the responsibility of individuals and businesses to safeguard the personally identifying information in their care.

Immigration Policy

Immigration is the movement of individuals who are citizens of one country to residency within another country. The gamut of reaction from host countries runs all the way from a xenophobic refusal to accept immigrants (e.g., China and Japan) to being a country that makes immigrants part of its national identity (e.g., the United States). For historical, demographic, and economic reasons, the Western Hemisphere and Anglophone countries (the United States, Canada, Australia, and New Zealand) have a long tradition of immigration. The economic growth that accompanied the formation of the European Union (EU) has led to the influx of eastern Europeans and Muslims to western European countries such as Germany and even to Sweden. These countries are now beginning to experience some of the same problems that the United States has faced for some time.

Immigration may be looked at from the point of view of the immigrant or of the host country. The motivation of the immigrant may be either negative or positive: escape from undesirable political, economic, or social conditions or attraction to better such conditions. In other words, the major motives for immigration have been the desire to live under a different kind of regime or to better oneself and one's family economically.

From the point of view of the host country, there is a concern for the impact on national identity, the economy, the environment, unemployment, welfare, crime and security, education, culture, family life, religion, race relations, and domestic politics in general. Immigration, therefore, has always had an important political dimension and an economic dimension.

Precisely because of its economic and political dimensions, immigration is an important concern for businesses. Immigrants bring special benefits to employers and the economy of the host country and added costs both to employers and to society at large. The recent phenomenon of globalization has underscored both those dimensions. In what follows we shall focus on the United States, but we shall also show the extent to which these issues have become global.

Let us begin with some terminological clarification for those countries that have immigration. A *citizen* (or *subject*) of any country is any person born in that country or its territories or who has been *naturalized.* A person may have *derivative* citizenship if at least one parent was a citizen. An *alien* is any person who is not a citizen. Aliens may be of two types, temporary residents or permanent residents. *Temporary* aliens include tourists, students, and so forth. Temporary aliens also include refugees and *asylees. Refugees* are persons currently outside their country who are unable or unwilling to return to their country of nationality because of fear of persecution on account of race, religion, or membership in a particular social group or because of political opinions. Asylees are refugees who have been granted temporary alien status in another country. *Guest workers* are aliens who have been given special permission to reside and work in a country for a specified and limited period of time.

Immigrants are aliens who have been granted *permanent* residency; that is, they can reside in the United States and work without restriction, and they are protected by law, but they cannot vote in elections. Asylees and refugees may apply to become immigrants or permanent residents through *naturalization.* Immigrants may become naturalized citizens of the United States by fulfilling the following six requirements: They must be at least 18 years of age, achieve basic literacy in English, demonstrate some knowledge of U.S. history, have resided in the United States for 5 years, reflect sound moral character, and take an oath of allegiance.

Illegal immigrants are those who have entered the country illegally, that is, without permission and a designated status (*undocumented aliens*), or who have stayed beyond the legally permissible time period.

There are five important immigration questions:

1. What is current immigration policy?
2. What has been its evolution (history)?
3. What sort of impact does this have on businesses and businesspeople?
4. What are the social costs of immigration?
5. What is the future of immigration policy?

Current Immigration Policy

The 1986 Immigration Reform and Control Act (IRCA) prohibited employers from hiring undocumented aliens and imposed penalties. The 1990 Immigration Act provided for a 160% increase of admissions for employment-based immigration. Employment-based immigration is divided into five subpreferences. The first is for those with extraordinary ability, outstanding professors and researchers, and certain multinational executives and managers. The second is for professionals who because of exceptional ability will substantially benefit the economy, culture, education, or welfare of the United States (licensed nurses and physical therapists, for example, because of chronic shortages in those fields). The third is for those workers, skilled and unskilled, in fields in which there is a shortage of U.S. workers. Certification by the Department of Labor is required for admission of those in the second and third categories, and all but those of exceptional ability must have a U.S. employer petition for them. The fourth preference is for special immigrants, such as religious workers and former longtime employees of the U.S. government. The fifth preference provides for immigration of investors whose investments will create a minimum of 10 jobs in the United States.

There are some serious controversies in implementing employment-based preferences. Since the Department of Labor must certify that there is a shortage of available and qualified workers and that the hiring of aliens will not adversely affect local wages or working conditions, the burden of providing such evidence falls on the prospective employer. There is now a global market for talented individuals from around the world, so one question we now face is not whether there is someone in the United States who can do the job but whether someone from outside the United States can, in the estimation of potential employers, do the job better. This bears a distinct analogy to the issue of outsourcing. The process has generated a whole body of highly technical and complicated law. In addition, employers must pay at least the prevailing wage. This has led to controversies in determining the prevailing wage or what types of jobs are substantially comparable with the one being offered. This regulation brings into play the same economic questions that surround the minimum wage law.

In IRCA there is a provision to sanction employers who employ unauthorized aliens. It is unlawful to employ any individual (whether or not that person is an alien) without having proper documents. The employer is required to examine, and retain a verification form thereof, the potential employee's U.S. passport, a certificate of U.S. citizenship or naturalization, an unexpired foreign passport endorsed by the attorney general and authorizing U.S. employment, or a resident alien card (green card). The employer could be subject to a cease and desist order as well as a civil fine for hiring, recruiting, or referring violations. A pattern of IRCA violations may mean a criminal penalty of up to $3,000 for each unauthorized alien, imprisonment for up to 6 months, or both. The 1996

Illegal Immigration Reform and Immigrant Responsibility Act (Simpson Act) imposed sanctions on employers of illegal aliens.

Further penalties against employers are currently contemplated. Some employers prefer to hire "illegals" not only because of low wages but because no benefits are paid as well.

IRCA provides for a special counsel to investigate allegations that an employer has discriminated against individuals on the basis of national origin or citizenship status. If a complaint is made that an employer is engaging in an unfair immigration-related employment practice, a hearing will be conducted by an administrative law judge, who may require the hiring of the individual as an employee or the payment of back pay, and can even award attorney's fees to the prevailing party.

Evolution of U.S. Immigration Policy

Immigrants do not automatically and easily become members of a new culture. There are ties and loyalties to old identities; there is a period of transition sometimes lasting several generations, often difficult, in accepting a new identity; some immigrants never become fully acculturated or even accepted by the host culture; some even return to their former countries.

The history of immigration policy in the United States reflects the evolution of attitudes toward national identity. Thomas Jefferson was concerned that immigrants from monarchies would not support republican government; George Washington and the authors of the Federalist Papers were concerned that immigrants would challenge federalism. Benjamin Franklin was concerned that the large numbers of Germans in Pennsylvania would lead to German becoming the official language of the state. From 1820 to 1860, more than 10 million immigrants, mostly Irish and German Catholics, entered the United States. This led to an anti-immigration movement within the Protestant Anglo-Saxon community in the cities of the Northeast.

A second huge wave of immigration occurred in the first two decades of the 20th century. This led to the 1921 National Origin Quota Act. To maintain the then present ethnic and cultural balance, the annual limit of immigrants from a given nationality was set at 3% of the numbers already present (as of the 1910 census). In 1924, Congress passed the National Origins Act and set the 1890 census as the base year for quotas; it reduced the quota to 2%. Naturally, the resulting system favored Anglo-Saxon and other immigrants from northern and western Europe.

Here we witness a recurrent theme: Older established ethnic communities attempt to maintain what they take to be traditional culture by limiting immigration to countries of their own origin or perceived sharers of the same culture; more recent immigrants perceive discrimination and seek to achieve some sort of numerical parity. Some racial, ethnic, or religious groups already within the United States see themselves as penalized because they are a minority, and they believe that increasing their numbers will gain for them the respect they deserve.

Perceived or alleged discrimination is also connected with another phenomenon in U.S. politics. From the very beginning, immigrants were targeted as clients by political parties. The general presumption at present is that immigrants are more likely to vote for the Democratic Party than for the Republican Party. Some liberals and many radicals argue that the problems of the United States (racism, bigotry, economic exploitation, crime, welfare dependency, etc.) are the result of a lack of democracy resulting from the domination of the United States by the descendants of western Europeans. Greater or true democracy will come about, it is alleged, when the population is demographically altered, and immigration is one way of achieving that end. Foreign-born women have an average of 2.25 children, whereas U.S.-born women have 1.93 children.

In 1965, Congress abolished national origin quotas. That system was replaced by a series of preferences for relatives of present citizens or resident aliens. In addition, there are limits on any one country of 20,000 and a numerical ceiling for immigrants from the Eastern Hemisphere of 170,000. In 1968 Congress set a ceiling for immigration from the Western Hemisphere at 120,000 annually. Three fourths of all immigrants now come from Asia and Latin America. The 1990 Immigration Act introduced the Diversity Program, or "lottery visas," to correct the consequences of the quota system with regard to "underrepresented" countries.

Republicans (comprising classical liberals and conservatives) reopened the debate on immigration by calling attention to the increase in illegal immigration, especially across the California and Texas borders from Mexico. Compounding the problem of its illegality were the facts that "illegals" (a) do not reflect any rational policy of who should be allowed to come and (b) do not assimilate easily both because of their illegal status and because they often speak a different language, usually Spanish, which exacerbates growing social problems of crime and welfare dependency. Approximately 28% of immigrants above the age of 5 live in households where no one above the age of 14 speaks English. That is much higher than the rate (18%) for immigrants who arrived before 1980.

Conservatives identify the United States with a specific set of values (personal autonomy, individual rights, free market economy, rule of law, limited government) historically originating in Protestant northern and western Europe, especially Great Britain. They argue that the United States has absorbed and can continue to absorb immigrants who subscribe to those values or who can assimilate those values without disrupting the conditions that permit those values to continue to flourish among those who are already here. They insist that it is important to identify the cultural background of potential immigrants, that rates of immigration are important to the absorption process, and that speaking the English language is a crucial part of the absorption process. They argue that in the beginning of its history, the United States had a preference for those from northern and western Europe, most especially those from Great Britain, since these people are most likely to have shared the same cultural values. At the same time, the United States has steadily modified its policy by lifting exclusions as circumstances changed.

Neoconservatives see the United States as having two missions, not only the preservation of current values at home but also the promotion of those values worldwide. Legal immigrants are welcome to the extent that they can serve that double mission. Legal immigrants are welcome to the extent that they already subscribe to and practice those values, and they can also serve as a positive example to their previous nation and culture.

The historical demographic pattern has been for immigrants to cluster in cities (for economic opportunities) and neighborhoods (for maintaining some kind of cultural continuity—Chinatown, Little Italy, Little Havana, etc.). The existence of ethnic neighborhoods both eases and frustrates the transition to assimilation. It eases the transition by allowing newly arriving immigrants to benefit from the experience of older immigrants. It exacerbates the transition by allowing some to immunize themselves from change. This is a continuing problem for those at the low end of the economic spectrum. However, many new immigrants come with the possession of a large amount of capital, business expertise, high levels of education, and the presence of other family members who have already made the transition.

Economic Impact

Economic considerations have always loomed large in immigration. For example, the importation of slaves was a concern to all states, free and slave alike. Some slave states acted to prohibit the international slave trade, and some free states insisted that slaves entering the state would be free. Some slave states insisted that the movement of free blacks was essential to the preservation of the institution of slavery, and some free states erected barriers to the entry even of free blacks.

With the demise of slavery, the major concern was that immigrant labor might constitute a threat to domestic labor. In 1882 Congress passed the first immigration law targeting a specific ethnic or racial group, the Chinese Exclusion Act, which suspended immigration of Chinese laborers and forbade admitting Chinese to citizenship. In the same decade, Congress passed the Contract Labor Laws, which excluded cheap foreign labor that would depress the labor market and provided for deportation of aliens brought in violation of contract labor laws. A head tax was used to further discourage immigration of those likely to price their labor more cheaply than the existent workforce.

In the first decade of the 20th century, almost 8.8 million immigrants were admitted. The majority were from southern and eastern Europe and were slow to assimilate. As with the Chinese, Congress passed restrictive measures to discourage immigration. The addition of a literacy requirement in 1917 effectively barred numbers of illiterate southern and eastern Europeans, and an eight-dollar head tax further discouraged their immigration. Though these measures made it more difficult to immigrate, Europeans were not barred as were Asians.

In 1942, in response to a manpower shortage due to the Second World War, foreigners, mostly Mexican farm workers, were permitted to enter temporarily to work. This was extended in the 1951 U.S.-Mexican Migrant Labor Agreement (*Bracero program*) and then repealed in 1964.

In 1952, the Immigration and Nationality Act (McCarran-Walter Act) addressed issues of both national identity and economics. It preserved the quota system but added a quota for Asians (repealing Japanese exclusion) and added skilled workers. This act established a preference system preferring first those with needed skills and professions and then family members of those already citizens. Immediate relatives of citizens and permanent resident aliens were put in the highest category, while those of "exceptional ability" or in the professions were relegated to the third ranking.

Welfare and Social Problems

Article IV of the Articles of Confederation denied "paupers, vagabonds, and fugitives from justice" the privileges and immunities of citizenship. It was also standard practice for states to quarantine ships bearing passengers with infectious diseases. Other state concerns were the regulating of the movement of criminals in an effort to protect citizens from crime, persons with diseases in relation to public health, and those likely to become public charges.

Every major immigrant wave since the mid-19th century has brought with it a serious increase in crime, including organized crime. The Personal Responsibility and Work Opportunity Reconciliation Act and the 1996 Illegal Immigration Reform and Immigrant Responsibility Act (Simpson Act) are both intended to discourage poverty-stricken aliens from coming into the country illegally. They accomplish this by restricting the eligibility of noncitizens for public benefit programs. The Personal Responsibility Act emphasizes that self-sufficiency has been a basic principle of U.S. immigration law since the earliest immigration statutes. Prior to 1965 there were very few opportunities even for legal immigrants, but with the vast expansion of welfare, since then things have changed. Prior to 1965, immigrants either relied on their own capabilities and the resources of their families, their sponsors, and private organizations or they returned to their country of origin. According to a study done by the Urban Institute in 1994, the greatest impact of the presence of undocumented immigrants is on the states' public education systems, not the federal benefit programs that were always off-limits to them. The estimated expenditure for providing public education to undocumented aliens across seven states for fiscal year 1993 was $3.1 billion (as compared with $1.9 billion estimated to have been collected in taxes from these same "illegal immigrants").

The current grounds for exclusion are the following: communicable diseases, including HIV; physical or mental disorders dangerous to others; mental retardation; insanity; psychopathic personality; drug addiction or drug trafficking; chronic alcoholism; conviction of a crime of moral turpitude (theft, fraud, child abuse, violence, prostitution, polygamy); conviction of crimes with sentences totaling more than 5 years of prison; being a pauper; being a beggar; likelihood of becoming a public charge; illiteracy; being involved in espionage, sabotage, or terrorism; being a member of a communist or totalitarian political party; participation in Nazi persecutions; being a graduate of a foreign medical school planning to practice medicine; having been previously deported; being convicted of immigration fraud; being a stowaway; being a draft evader in the United States; and violation of a child custody order.

Future of Immigration

The debate over immigration will continue. There are three clearly identifiable major positions on the issue: liberal, libertarian, and conservative. Adherents of liberalism view aliens of all kinds (legal immigrants, illegal immigrants, asylees, etc.) in the same category. Once here, there is no difference between someone who entered legally and someone who entered illegally. In addition, aliens are viewed as belonging in the same category as the domestic poor or underclass. Since adherents of liberalism are likely to believe that people are naturally good and corrupted only by their environment, any problems that aliens have are seen as the product of structural barriers in the host nation such as discrimination. All aliens should be given full access to all welfare benefits. Adherents of liberalism tend to look on critics of immigration the same way they look on critics of welfare rights—as mean-spirited people standing in the way of progress. Hence greater government involvement is needed, specifically in the area of welfare rights. This also means that voting in elections becomes more important to provide broad-based support for the liberal legislation that will promote social reform. As a consequence, liberals tend to view immigration as part of a larger domestic agenda to enhance the welfare state. Immigrants are looked on as potential converts to this political agenda (in keeping with the liberal assimilation of immigrants to the poor). Illegal immigrants cannot vote. Therefore, liberals favor an amnesty and any other program that will increase the number of immigrants or aliens who will stay and who can be naturalized as citizens and thereby become eligible to vote. The liberal position is reflected, in part, by the American Civil Liberties Union (ACLU). The ACLU, among its many activities, helps refugees and immigrants facing deportation. The liberal position is also reflected by the American Friends Service Committee. This Quaker organization opposes sanctions on employers of illegal immigrants and documents what it identifies as human rights violations committed by law enforcement agents against immigrants. The foremost liberal think tank on immigration issues is the Brookings Institution.

Adherents of libertarianism are also generally favorable to immigration. But the similarities end there. Adherents of libertarianism insist on a distinction between legal and illegal immigration and view all immigrants as potential entrepreneurs, not as the poor or dispossessed. They also tend to believe that all or most immigrants could be great successes if only the welfare state did not corrupt them once they were here. If we do away with the welfare state and allow free markets to operate, then the poor and the immigrants will all succeed. Every success story of immigrants who become successful entrepreneurs in the United States becomes an argument about the failure of liberal social engineering as a domestic policy. Some doctrinaire libertarians advocate totally open borders both to allow the market to determine success and to undercut the notion of a sovereign state, which they see as a constant threat. Other libertarians, those who recognize that the world is not at present a totally free market, advocate controlled immigration but stress that economic benefits should be the sole or major criterion for admission. The libertarian position is best represented by the Cato Institute. The most influential libertarian publication on immigration is Julian Simon's *The Economic Consequences of Immigration.*

Conservatives share with libertarians a distrust of the liberal welfare state and of liberal immigration policies because they see such policies as intended to increase political support for the liberal welfare state. They do not trust liberal affirmations about ending illegal immigration as sincere since liberals always call for amnesty of those already here and oppose returning illegal aliens to their country of origin. Conservatives point out that in recent presidential elections, the Hispanic vote was greater for Democrats than for Republicans. Hispanics tend to live in 26 cities in nine states that control two thirds of the Electoral College vote. But conservatives do not share the libertarian belief that a free market economy solves every social problem. Conservatives favor tighter control over immigration and greater stress on criteria that reflect cultural support for individual responsibility. Conservatives argue among themselves about which factors (national origin, religion, family, etc.) are most relevant. They also advocate a moratorium on immigration to better assimilate those who are already here and to inhibit the massive naturalization of supporters of the liberal welfare state. The conservative position is most notably reflected in the work of the Heritage Foundation. The best known conservative work on immigration is Peter Brimelow's *Alien Nation.*

Immigration Reform and Control Act of 1986

Through the Immigration Reform and Control Act of 1986 (IRCA), Congress sought to regularize the status of millions of undocumented immigrants in the United States, regain control of the country's borders, and meet the needs of certain industries that relied on foreign-born labor through three major mechanisms. First, employer sanctions made employing anyone not a citizen or otherwise authorized to work by the federal government unlawful and subjected employers to civil and criminal penalties. Second, many persons who had been living in the United States without permission were enabled to apply for a legal status that led to Lawful Permanent Residence (LPR) and the possibility of naturalization. Third, agricultural workers who could demonstrate certain past employment were also able to achieve LPR. IRCA's enactment, procedures, and benefits were controversial from the start and have resulted in much litigation and disputes over eligibility that continue into the 21st century.

In 1978, Congress established the Select Commission on Immigration and Refugee Policy to investigate immigration in the United States and to recommend immigration law reform. The Commission had three goals: maintaining national borders, respecting the rule of law, both in terms of enforcement at the border and due process for those placed in immigration proceedings, and fostering an open society dedicated to welcoming a reasonable number of immigrants annually and providing a path to citizenship and full social participation. Congress received reports that anywhere from 0.6 million to 12 million undocumented persons lived in the United States, with the best estimates falling between 3.5 and 6 million persons.

IRCA revealed the complexity that exacerbates the difficulty of immigration reform in this nation. IRCA evolved out of a congressional effort to reconcile conflicting objectives such as encouraging an open democracy by furthering freedom of movement, trade, and tourism while retaining secure borders. Congress intended to prohibit unauthorized work without compromising civil liberties or encouraging new discrimination against citizens who might appear to be foreign-born. In addition, Congress sought to encourage economic growth without intensifying the economic magnet that pulls migrants across borders. Finally, Congress attempted to resolve the justice issues raised in treating a large population that lives out of status, in part, due to an overburdened immigration process in which many fall through the cracks and that divides families into different legal statuses that force otherwise eligible families to live apart for many years.

Through IRCA, Congress attempted to balance these needs by adopting most of the Select Commission's recommendations. First, Congress sought to stop unauthorized immigration by turning off the magnet of jobs. Second, Congress offered legalization to most persons who had been living in an unlawful status since 1982. Third, Congress provided legalization to farm workers who could show past employment.

IRCA first broke new ground in limiting the freedom of all U.S. citizens to seek employment wherever they chose by requiring virtually every employer to initially determine whether an employee was either a citizen or otherwise authorized to work by the federal government. Almost every new employee hired after November 6, 1986, filled out an I-9 form with copies of documents that demonstrated both identity and citizenship or work authorization. IRCA required the employer to document this information and empowered the government to issue warnings, impose fines, and seek criminal penalties should a pattern or practice of hiring unauthorized workers be found. Penalties were also established for record-keeping improprieties, although employers could rely on a good faith defense if documents appeared to be valid.

Fears that employers would refuse to hire certain persons due to concerns of violating employer sanctions provisions necessitated enactment of nondiscrimination provisions prohibiting employers from discriminating against eligible applicants who might appear foreign-born or who might have a foreign accent, a form of discrimination known as "national origin discrimination," which might not otherwise be covered by the nation's other antidiscrimination laws. IRCA established an Office of the Special Counsel for Immigration-Related Unfair Employment Practices to investigate and review any claims.

Second, the legalization provisions initiated a number of new lawful immigrant categories. Congress established a new category of lawful presence called Lawful Temporary Resident (LTR). Otherwise admissible applicants who could show that they had been living continuously in the United States in an unlawful status since January 1, 1982, and who applied within a 1-year window from May 5, 1987, until May 4, 1988, could become LTRs. More than 2.7 million persons applied within the 1-year period, with almost two thirds eventually becoming LTRs. IRCA set up a formal procedure for LTRs to apply for LPR and eventually apply for U.S. citizenship. IRCA also recognized the role of nongovernmental agencies designated as a Qualified Designated Entity (QDE) in assisting in the education and preparation of LTR applications. A special appeals process provided review for denied applications.

Third, the Seasonal Agricultural Worker (SAW) program also permitted undocumented farm workers to apply for LTR status. Given the exigencies of migrant farm work, with workers often moving frequently during a growing season, the SAW provisions set up two different grounds for eligibility; one required a worker to show a minimum of 90 days of agricultural employment each year for a continuous 3-year period, and the second required one to demonstrate 90 days of agricultural employment within a 1-year period. All members of the first group automatically became LPRs on December 1, 1989, with members of the second group obtaining their LPR status on December 1, 1990. Approximately 1.3 million workers received SAW documents.

IRCA's success in legalizing almost 3 million persons cannot be minimized, but the act itself did not accomplish all its goals. First, by leaving a large gap between the 1982 eligibility date and the application period of 1987 to 1988, IRCA undermined its own goal of wiping the slate clean and starting anew with no unauthorized persons living in the United States. The very quick time frame from enactment to establishing the process for the 1-year window for applications left many legal issues unresolved, and litigation continues almost two decades later. The discrimination issues have not been easily remedied and continue to pose difficult issues for employers. Resolution of the discrimination issue has also led to proposals for a national identity card that raises great concerns among civil libertarians, although IRCA specifically precluded such a card. Finally, the 2000 Census estimates that 7 million unauthorized immigrants reside in the United States, which exceeds the number Congress had sought to reduce through this legislation.

Impartiality

The concept of impartiality figures in ordinary morality and philosophical discussions of morality in several ways. A virtue in many everyday contexts, impartiality is widely seen as crucial to the very meaning of morality. Moreover, normative theories of various types view impartiality as central to moral justification and see themselves as reflecting, displaying, or building in some way on this value. In recent years, however, some philosophers have challenged the priority that traditional ethical theories place on impartiality.

Impartiality in Everyday Life

To be impartial is to be free from bias or prejudice, to be detached, objective, and disinterested, and to favor neither one side nor the other on a given question. Because we expect and require impartiality from judges and public officials, whose job it is to administer policies and enforce the rules without playing favorites, impartiality is sometimes seen as primarily a public virtue—not just a desirable trait of government agents, but also a defining feature of the rule of law and of modern, rationalistic bureaucracy. But we also demand impartiality from Little League referees and, in certain contexts and in certain ways, from teachers and employers. Morality may even require impartiality within personal relationships. Parents, for example, should not favor some of their children over others.

But impartiality has its limits, and it may have to be balanced against other legitimate moral concerns. Sometimes, indeed, impartiality would be inappropriate or even wrong. Although teachers should be impartial, good ones also cater to the particular needs of their charges, sometimes lavishing more attention on some children than they do on others. And no one expects parents to be impartial between their own children and those of other parents. It is helpful therefore to distinguish the group in regard to which a person is supposed to be impartial and the respect in which the person is supposed to be impartial with regard to members of that group. For example, an employer must be impartial with respect to the religion of employees but not their job performance. In contrast, when socializing outside work, the boss is free to favor coreligionists. Identifying in this way the group toward which, and the respect in which, one is to be impartial may allow us to pinpoint the moral rationale behind the required impartiality, such as fairness, for instance, or some role-based responsibility.

Impartiality and the Nature of Morality

Most philosophers believe that moral judgments must be reversible and universalizable. If it is right for you to do X to Frank, then it must be right in an exactly reversed situation for Frank to do X to you. More generally, if one judges something right or wrong, then one must make the same judgment about any other situation the universal properties of which are the same. As a result, many philosophers believe that taking the moral point of view means looking at things in a detached and impartial way and acting on the basis of considerations that are objective and free from personal bias. For this reason, some deny that egoism is, properly speaking, an ethical theory at all.

Impartiality seems central to the moral enterprise. Some philosophers have tried to capture this thought by offering ideal observer or impartial spectator interpretations of morality. According to these, moral judgments are judgments that would be endorsed by a fully informed observer, one who transcends any particular point of view and looks instead at things dispassionately, impersonally, and objectively. Sometimes this device is intended merely to elucidate our concept of morality; other times it is used to generate substantive normative principles, frequently of a utilitarian sort.

Utilitarianism requires us always to act so as to bring about as much overall happiness as possible. Because it views the happiness of each person as equal in value to that of any other (including the agent) and because it requires the maximization of net happiness without regard to the identity of individuals or the distribution of happiness among them, utilitarianism takes impartiality to an extreme. But many other normative theories also see themselves as respecting the fact that morality is objective, and not simply an expression of personal opinion or interest, and that each person matters just as much as, and no more than, any other person. For example, the categorical imperative of Kant, the original position of John Rawls, and the contractualist theories of writers such as Thomas Scanlon and Brian Barry can be seen, each in its own way, as grounded in an impartial respect for person.

Partialists Versus Impartialists

In the past two decades, some communitarians, virtue theorists, feminists, and other philosophers have denied that impartiality is a fundamental component of morality or an overarching value. They see utilitarianism, Kantianism, social contract theories, and other popular normative systems as committed to an impartiality that violates everyday moral experience. Not only is it impossible for human beings to attain the impartiality, neutrality, and detachment these theories require; the pursuit of impartiality is also incompatible with family ties, with personal relationships, and with virtues such as loyalty and patriotism. According to the partialists, morality is primarily a matter of particular attachments, personal relationships, and individual commitments, rather than an abstract injunction to treat all others impartially.

Impartialists respond by distinguishing first-order impartiality from second-order impartiality, that is, impartiality as a guiding principle of daily conduct from impartiality as a test to be applied to the selection of the moral rules or principles one is to follow. A normative theory might strive to justify its rules on impartial grounds, and yet those rules permit certain kinds of partiality. Utilitarians, for example, might permit parents to show special regard for their own children on the basis that it maximizes well-being overall for parents to do so. It remains an open question, however, whether this response removes all possible tension between morality, on the one hand, and personal relationships and other apparently admirable forms of partiality, on the other.

IMPLIED WARRANTIES

A warranty is a guarantee or promise surrounding a commercial transaction. An express warranty is an explicit guarantee or promise openly and voluntarily offered by one party to the other to cover a specific transaction. An implied warranty is a guarantee or promise mandated by law, ordinarily running from a seller to a buyer, concerning the fitness or value (the "merchantability") of the product or service being sold. Exactly what warranties are mandated, how long they run, whether and how a seller can disclaim any of them, and what remedies are available if any implied warranties are breached are all determined by the specific laws covering the transaction. In the United States, implied warranties are usually enacted and enforced under state law, while some transactions are covered by federal law, and a few transactions can be governed by both federal and state laws that are applicable.

Under the Anglo-American common-law system, a warranty comprises a promise between a seller and a buyer that a product or service will meet designated criteria of use or value; and if there is a failure to meet any criterion in whole or part, some remedy (such as compensation, repair, or replacement) will be forthcoming. A warranty is typically given by the seller to the buyer in explicit form such as a written document, detailing the specific promises associated with the particular sale. (In some transactions, buyers might also make certain promises that legally constitute a warranty that protects the seller: for example, that a license limitation for use of a patent will not be violated and the buyer will indemnify the seller if a breach results in legal action.) This express warranty is agreed between the parties—sellers and buyers—of the product or service at the time of sale and forms the foundation of the contractual agreement between them, along with the usual terms surrounding delivery and price.

Another form of warranty has become common—particularly though not exclusively in the United States, where the promises and criteria and remedies are determined by operation of law, not by agreement of the parties. In such cases, a legislature or court decides for the parties what promises a seller owes a buyer (or vice versa)—beyond any express promises about which the parties might negotiate and eventually agree. In some cases, these implied promises can lawfully be disclaimed by the seller (i.e., they will not come into existence if proper notice is tendered by the seller to the buyer before the transaction is settled). Still, in most consumer transactions, applicable statutory provisions and court decisions severely limit or deny altogether a seller the ability to disclaim any implied warranties that run in the consumer's favor.

Implied warranties may be best known from ordinary consumer transactions, both large and small in nature, but they also are mandated in many other commercial transactions. For example, under Article 2 of the Uniform Commercial Code (UCC)—a code that has been adopted in some form by every state in the United States—there is an implied warranty of merchantability, whereby goods are held to six established criteria that circumscribe the quality, quantity, fitness for use, and even packaging of the goods.

Similar language is embodied in international treaties, such as in the United Nations Convention on Contracts for the International Sales of Goods (CISG), to which more than 60 developed and developing countries are signatories, and potentially covers a significant proportion (up to two thirds of the movement) of commercial goods in international trade. According to its Article 35, the seller is bound to supply goods according to criteria covering the quantity, quality, general and particular fitness for use, and packaging to preserve and protect the goods.

The specific terms (standards, remedies, permissible disclaimers, etc.) associated with an implied warranty of merchantability and with which most consumers are familiar in the United States is a function of the Magnuson-Moss Warranty Act, federal legislation that stipulates minimum criteria for warranties of consumer products nationwide. Importantly, it provides the national legislative foundation for individual state enactment of consumer protection and product liability laws, not least of which are statutes commonly called "Lemon Laws," enacted by the several states safeguarding consumers in the sales and leases of new and used vehicles. For example, California consumers are protected under the Song-Beverly Consumer Warranty

Act and Tanner Consumer Protection Act under that state's civil code, which together provide a variety of implied warranties, legal presumptions, and remedies, including mandated repairs, purchase price refunds, and compensatory and punitive damages, if vehicles present problems that substantially impair the use, value, or safety of the vehicle. These protections run concurrently with the term of the manufacturer's express warranty.

The UCC and CISG likewise provide for implied warranties that arise by a course of dealing and usage of trade. Under these provisions, if a particular sale is one of a pattern of regular transactions between the parties or is a type of transaction that regularly occurs between the seller and other buyers similarly situated to the current purchaser who intends to use the good or service in a specified vocation or trade (e.g., a construction company purchasing building materials from a buildings supply firm—regardless of whether the construction company has previously dealt with that supply firm), the terms of the current transaction will be so interpreted and thereby shall import implied warranties from previous or similar dealings. Article 1 of the UCC details the expansive range of such usages and courses of dealing covered, including places, vocations, and trades wherein expectations can arise, and so implied warranties will be imposed.

In addition to merchantability, a warranty of fitness for a particular purpose can also be implied. This promise is imported into the contract by operation of law when the sale is made to a buyer who is informed or assured that the product or service at the core of the transaction is fit for the particular purpose envisioned; that is, not only is it to be held merchantable in general terms (e.g., this SUV will function as a new transportation vehicle ought, or that computer will operate as computers of its type should) but should also meet the need for the purpose specified (this SUV on the showroom floor is capable of towing the buyer's boat and trailer, or that computer as manufactured can function as expected in the context of rough handling and wide temperature variations regularly encountered in the buyer's anthropological fieldwork).

A variety of other warranties can be implied by operation of law. For example, many states provide for an implied warranty of

- workmanship for construction projects (an implied promise running from builders and home renovators to home buyers and owners);
- marketable title or title free of encumbrances for real estate transactions (from a real estate seller or agent to a buyer);
- good title to chattels (from a seller of personal, moveable goods to a buyer);
- seaworthiness in marine insurance (from an insured of a ship to the insurer);
- habitability of rental residential property (from landlord to tenant);
- quality and wholesomeness of foods (from seller to consumer);
- fair or noninfringing use of intellectual property (from licensor to licensee or vice versa in appropriate transactional settings); and
- a promise that professional services will be rendered with reasonable care (running from professionals to their clients).

Other specialized legislation can provide for additional, distinct warranties. Under the Uniform Computer Information Transaction Act (UCITA), for example, there is an implied warranty of accuracy of informational content covering software programs and data sold or licensed to buyers that otherwise fall outside the reach of the UCC. These sorts of warranties relating to intangibles (specifically, digital goods and services) are likely only to increase in the future as UCITA is adopted and applied by more states to a variety of cyberspace products and services.

As initially noted, though this entry uses the language of promise and contract, none of these implied warranties are technically promises or guarantees properly so called that are contractually agreed between the parties. Rather, implied warranties are statutory or court-mandated obligations that are held against one party for the benefit of another. Just what the proper extent or range of these obligations should be and what remedies are appropriate for their breach are matters of business ethics and public policy and not (typically) reserved as a function of the bargain to be struck in the market by the parties to the transaction.

These implied warranties are generally mandated when one party is in a naturally weak position relative to the other or is at some significant bargaining disadvantage, such as an individual consumer negotiating with a large business operator. In those cases, the asymmetries in market power and information about the product or service can be great, unfairly advantaging the seller against the buyer. The implied warranty becomes a principal means of helping level the contractual "playing field" for that transaction, by enhancing the weaker party's power or access to pertinent information, both before and after conclusion of the transaction. In other cases, such as those referencing trade usage in commercial transactions where the parties are likely to be more closely equal in bargaining strengths, the mandate typically permits one party to disclaim an implied warranty, with that disclaimer then becoming a matter for negotiation before the final deal is struck. Implied warranties then arguably help raise the levels of trust—between market actors in individual transactions as well as their general confidence in the market itself—that aid the market to operate smoothly, ultimately benefiting all parties.

In addition, implied warranties are invoked when a society, speaking through its political leaders and court officials, determines that some transactional terms concerning one party's obligations toward the other are simply not to be permitted; disclaiming those obligations are not and are never to be part of any bargain between the parties, regardless of their relative levels of wealth or business sophistication, the mutual desire of the parties involved, or any resulting benefit to market operations. They represent political and ethical judgments of what deals should and should not be, rather than pragmatic responses to market imperfections or power imbalances. These obligations are also the ones most likely to be assessed punitive damages when a court determines they have been breached, even when the material loss to the damaged party is minimal.

Incentive Compatibility

Incentive compatibility means that the interests of two or more individuals are aligned; in contrast, when interests are not aligned, the incentives governing behavior are said to be incompatible. From an organizational perspective, incentive compatibility means that the incentives that motivate individual members in their actions are consistent with the organization's goals.

Incentive compatibility is important in situations in which there is asymmetric information, that is, when at least one participant in an interaction does not know perfectly what another participant knows or does. The problem is that the participant with the more complete information might use that information in a way that benefits him or her at the expense of others. Incentive compatibility means that the interaction is structured in such a way that the participant with the more complete information is motivated to act in the interest of the other party (or has less incentive to exploit his informational advantage). For instance, if an insurance company offers a discount to people who do not engage in high-risk behaviors, such as smoking or skydiving, then persons who engage in such behaviors might try to identify themselves as low risk to take advantage of the discount. This type of problem is known as adverse selection—high-risk persons know they are high risk but have an incentive to "select" or identify themselves as low risk. An incentive-compatible solution would ensure that people who engage in high-risk behaviors identify themselves as such. For example, if the insurance company requires a medical exam for all persons reporting themselves as low risk, then high-risk persons may have less incentive to misrepresent themselves. Similarly, if workers promise to work hard in exchange for a high fixed salary, and if the boss cannot directly observe worker effort, then the workers might have an incentive to shirk. This type of problem is known as moral hazard—after obtaining employment, the workers work less hard than promised, thus creating a "hazard" for the boss. An incentive-compatible solution would ensure that workers work hard as promised. For example, the boss could pay workers on commission, with pay tied to observable performance measures, thus mitigating the incentive to shirk.

In economics, incentive compatibility is used as one of two important constraints in an optimization problem in which a person (such as a firm owner) must rely on others to maximize some social welfare criteria (such as profits). The *participation constraint* ensures that people want to participate, in that they are at least as well off by participating as they would be by not participating. The *incentive compatibility constraint* ensures that people are motivated to behave in a manner consistent with the optimal solution. Usually this means that the compensation people receive when the desired outcome is achieved is at least as high as the compensation they could earn when some other outcome occurs. For example, suppose a factory owner needs employees to work in his or her factory. The participation constraint ensures that some people would rather be employed in the factory than do something else. The incentive compatibility constraint ensures that the employees are motivated to act in the owner's interest.

The notion of incentive compatibility is widely used in the analysis of business and societal issues. For instance, considerations of incentive compatibility have been shown to be relevant to the design of appropriate compensation structures within firms, the regulation of business, the structure of efficient taxation rules, the organization and operation of auctions, and the development of poverty alleviation programs. Importantly, incentive compatibility has implications for business ethics. Many ethical problems in business—fraud, breaking of promises, corruption, tax evasion, misrepresentation of products or people—arise because the incentives people face are incompatible with agreed-on business or social goals. Accordingly, solutions to business ethics problems can often be found by the establishment of appropriate incentive-compatible mechanisms.

Incipiency Doctrine

The Incipiency Doctrine is a rationale used to evaluate and potentially block mergers that might result in harm to competition among American businesses. It arises under the Clayton Act and is used in evaluating whether the effect of a proposed merger may be to substantially lessen competition or to tend to create a monopoly. If so, the potential harm that could result from the merger is deemed under the Incipiency Doctrine to be sufficient to block the merger. In addition to the difficulty of determining whether harm will, in fact, result from a merger, the type of harm that may result has not been clearly defined, thus leading to confusion about when to apply the doctrine.

Antitrust laws in the United States such as the Sherman Act, the FTC Act, and the Clayton Act contain provisions describing unlawful business practices. The Clayton Act, an amendment to clarify and supplement the Sherman Antitrust Act of 1890, was passed by Congress in 1914. Whereas the Sherman Antitrust Act prohibited monopolies, the Clayton Act was designed to define illegal business practices that were conducive to the creation of such monopolies or that result from them. Although the Clayton Act prohibited stock purchase mergers that resulted in reduced competition, loopholes existed, allowing individuals to find ways around the Clayton Act by simply buying up a competitor's assets. The Celler-Kefauver Act was passed by Congress in 1950, in part to address such loopholes, and strengthened Section 7 of the Clayton Act by prohibiting one firm from securing either the stocks or physical assets of another firm if competition would be reduced as a result of the asset acquisition. The legislative history of the 1950 amendments contains a dominant theme evidencing a fear of what was considered to be a rising tide of economic concentration in the American economy. In stating the purposes of their bill, both its sponsors, Representative Celler and Senator Kefauver, emphasized their fear, widely shared by other members of Congress, that this concentration was rapidly driving the small businessman out of the market. Congress appeared to see the process of concentration in businesses as an increasing tide and, to stem that tide, provided authority for arresting mergers at a time when the trend to a lessening of competition in a line of commerce was still in its incipiency or onset. Thus the Incipiency Doctrine was born. The Celler-Kefauver Act 1950 amendments included descriptions of illegal business practices designed to block mergers, the effect of which may be to lessen competition substantially or to tend to create a monopoly. In using such language, Congress indicated that its concern was with probabilities, not certainties. The language makes it clear that courts have the authority to declare mergers illegal that didn't necessarily in themselves represent a lessening of competition but rather represented the onset of a trend of lessening competition.

The Incipiency Doctrine was never fully and clearly defined, although a number of significant court cases cited the legislative history of the Celler-Kefauver Act and its Incipiency Doctrine to rationalize the blocking of mergers. The doctrine at a minimum appears to call for strict antimerger enforcement due to a perceived fear of trends toward concentration, although the understanding of how to achieve that enforcement as well as the application of the doctrine itself has varied throughout the years. The Incipiency Doctrine calls for a variety of predictions about the anticompetitive effects of mergers that may include leading to small decreases in competition, causing an industry trend or wave toward mergers and looking further into the future for possible harm.

Income Distribution

Income distribution, the apportionment of total national income among all the individuals and families in a country, is an issue closely tied to the way business operates within a society. In any market economy, it is business that generates most personal income, not only through wages and benefits but through interest, dividends, and stock appreciation as well. Therefore the distribution of income is a central concern of business ethics, for evaluating both the fairness of particular business practices and the overall contribution of business to the well-being of society.

Income distribution is generally measured in one of two ways. The simpler way is to divide a society's total income into segments, such as tenths or fifths, based on either per capita or family income. These slices can then be compared with one another at either a given point in time or over an extended period. Thus one can compare, for example, how much income growth the top 10% experienced over a decade compared with the bottom 60%. A more mathematically sophisticated measure is the Gini coefficient, which gives a single number indicating the income distribution of an entire society. This coefficient ranges from 0 (perfect equality) to 1 (all income is received by a single individual), and it is especially useful for comparing distributions between nations.

The social and economic significance of income distribution depends on its interaction with other trends regarding a particular society, especially changes in the absolute level of average or median income. Increasing disparity is less significant in an environment in which most individuals are experiencing growing incomes compared with a situation where median income stagnates or even declines since the latter situation is more likely to weaken social solidarity and political unity.

Over the past generation, the United States has experienced this second, more contentious, set of circumstances. According to the Census Bureau, the Gini coefficient for the United States, which held fairly stable at about 0.40 between 1967 and 1977, has risen steadily since then and hit 0.46 in 2000. Furthermore, figures compiled by the World Bank put American society at the high end of income inequality among industrialized nations. U.S. income is more unevenly distributed than income in Japan, Korea, Taiwan, Australia, Canada, all of Europe (including Turkey), and India, though it does remain a more equal distribution than in China, Hong Kong, and Singapore and a number of poorer countries.

This rising inequality in income distribution in the United States coincides with the nation's weakest generation of average income growth. Until the mid-1970s average compensation tended to track increases in productivity over time. During the postwar generation between 1947 and 1973, for example, both productivity and average family income grew 103% in inflation-adjusted dollars. In contrast, between 1973 and 2003, productivity grew 71%, while family income increased only 22%. Furthermore, according to figures compiled by the Department of Labor, average hourly compensation (adjusted for inflation) has actually declined slightly since 1973 for the four fifths of the population not working in professional or managerial occupations.

Some have argued that tracking compensation over time produces unduly pessimistic results because income numbers do not adequately capture the improved quality of life that comes from innovation. This argument, however, fails to recognize how important innovation has been throughout almost all of American history and how it has traditionally occurred side by side with wage increases. The postwar generation not only doubled its pay but also saw the introduction of television, transistors, commercial jets, home air conditioning, plastics, new medical treatments, and a variety of other product breakthroughs. It would be difficult to argue that a business sector that generates new products but does not share the financial gains from productivity improvements with most of its employees contributes as much to society as a business sector that does both.

The issue of fairness in income distribution has been highlighted in recent years by the well-publicized relative rise in executive compensation in the United States. In 1978, the average CEO earned about 35 times the salary of the average worker. This ratio doubled by 1989, just as the bull market started on Wall Street, and then hit 300:1 in 2000, as the market peaked. It has since come down to 185:1 in 2003, but this ratio remains more than five times what it was a generation ago, a period when American business was the envy of world.

A number of factors have been offered for this divergence in income. These include the following: increasing returns to certain kinds of vital technical and professional knowledge, weakening of union power to organize workers or bargain effectively, subcontracting work to less generous employers, movement (or even the threat of movement) of manufacturing overseas, declining value of the minimum wage, less generous benefits for workers and retirees, and a growing reluctance by employees to demand a raise in an era in which downsizing has become routine. Others put the responsibility on new ways of compensating executives through stock options and other means that tend to reward short-term cost cutting, including the cost of labor. While all of these explanations appear to be somewhat plausible, researchers find that none of these, alone, can explain either the timing or magnitude in this sea change in American income distribution, suggesting that a number of factors share responsibility for this change.

Whatever the precise causes, some people find this trend problematic from an ethical perspective. Income divergence raises important questions about fairness and organizational commitment when the benefits of success predominantly accrue to a few. For ethicists influenced by Rawls, such a trend threatens to violate his rule of fairness—that gains to the productive few should not be at the expense of the least fortunate.

Libertarians, on the other hand, would be more cautious about making assumptions regarding the ethical implications of increasing income inequality. Unless inequality is generated by coercion or fraud, or by favoritism on the part of government toward one group at the expense of another, libertarians view fluctuations in the relative fortunes of different individuals as a normal part of the operation of markets as the demand for various skills, experiences, and professions shifts over time. Nonetheless, many business ethicists have argued for two decades that corporate executives need to honor and preserve implicit social contracts and, following Kant, to treat employees as stakeholders having ends of their own. Implementing such advice requires grappling with the reality of a diverging distribution of income.

INDIVIDUALISM

Individualism espouses four basic ideas: (1) the intrinsic value, or dignity, of the individual human being, (2) individual autonomy or self-direction, (3) privacy, or the freedom to be left alone from outside interference, and (4) the right and duty of self-development (pertinent to most, if not all, conceptualizations of individualism). The normative conceptualization of individualism includes, at a minimum, these four elements, whereas the methodological definition—equally important but not the main focus of this entry—has a different emphasis. Methodological individualism refers to the idea that individuals, not some collective, constitute the ultimate unit of analysis in describing social relations. In other words, based loosely on definitions provided by Friedrich Hayek and George Homans, there is no other way toward an understanding of social phenomena but through our understanding of *individual* actions directed toward other people and guided by their expected behavior. In his influential book on individualism, Steven Lukes showed how the methodological and normative conceptualizations of individualism have been intertwined.

The introductory paragraph alluded to the distinction between normative and methodological aspects of individualism, with the former being the focus of this entry. However, another fundamental distinction, made by Friedrich Hayek, is between *true individualism* and *false individualism. True individualism* acknowledges the limitations of human knowledge and the possibility of social order that emerges spontaneously from individuals' actions. In contrast, *false individualism* has no confidence in the invisible hand but instead places great confidence in collective, rationalistic guidance of social relations or social engineering. According to Hayek, this distortion of individualism tends to lead to socialism and collectivism.

As is apparent by now, the different meanings and applications of *individualism* are multifaceted and range from political science to sociology to psychology and, most important in this context, to ethics. In short, individualism is a worldview that is very difficult to capture in one catchall definition. Paying tribute to this diversity of conceptualizations, I first present a brief overview of the basic elements and outcomes of individualism and describe different perspectives or manifestations of individualism in different disciplines. The entry then delves into the linguistic history of the concept, discusses implications for the field of business and society, and canvasses some critiques of individualism.

Elements and Outcomes of Individualism

The aforementioned four ideals or values are central to the individualistic worldview. First, individualists do not regard the good of the state, race, class, or some other social group as the ultimate value. Instead, they uphold the dignity of the individual as the ultimate moral principle. Although some trace this doctrine of the intrinsic value of the individual human being to the New Testament, respect for individual dignity lost some of its meaning in the Middle Ages. According to Steven Lukes, this doctrine was deemphasized in medieval times because of the overriding importance of law, the Church as the main legal institution, and the organic conception of society. Then, the doctrine of the dignity of the individual was openly proclaimed during the Italian Renaissance. Three philosophers whose work focused on this first element of individualism are Immanuel Kant, Jean-Jacques Rousseau, and Thomas Paine. Kant explained one implication of this doctrine, namely, that individuals—*because of their dignity*—cannot serve merely as the instruments of others. This first element, which is really the overriding and pivotal moral axiom of individualism, has found expression in the 1776 American Declaration of Independence and in the 1948 Universal Declaration of Human Rights by the General Assembly of the United Nations.

The second element of individualism is the idea that an individual's actions or thoughts cannot, and must not, be determined by agencies or causes outside the individual's control. Thus, Steven Lukes applied the label of self-direction or autonomy to this idea. Some philosophers, such as Kant, see a place for objective, universal principles in the autonomous human will. Others consider individualism to be an escape from obedience to social standards or customs and, thus, move it closer to ethical subjectivism. However, both variants of this second element, whether epistemologically objectivist or subjectivist, reject determinism. While many economists regard economic freedom as the essential element of an efficient capitalist system, some sociologists and psychologists, such as Erich Fromm, see autonomy and freedom threatened by the increasing corporate and market-based order of Western civilization. Those interpretations of autonomy form the great paradox of individualism: Autonomy is the sine qua non of capitalism, but—at the same time—capitalism itself may diminish or threaten autonomy (at least according to some analyses).

Third, individualism presupposes privacy, which, according to Lukes, refers to a sphere that is not the proper concern of others. In this private realm, the individual is or should be left alone by others and should be able to do and think whatever he or she chooses. Isaiah Berlin linked privacy to negative liberty. According to Benjamin Constant and Hannah Arendt, this idea of liberty refers to the peaceful enjoyment of personal independence, which may not be renounced in the interest of the state or some other collective. Whereas ancient civilizations (ancient Greeks and Romans) typically devalued the private sphere in favor of public life, religious mysticism but also secular liberalism emphasized the necessity and sanctity of the private realm. Most modern interpreters of this third element (such as David Riesman) regard conformity to some prescribed collectivist ideal (e.g., “Communist revolution”) as fundamentally opposed to individualism. Interestingly, advocates of socialist collective ideals such as unity (e.g., Mao Tse-Tung) concur with this interpretation.

Fourth, most conceptualizations of individualism include the goal of self-development. This value originated with the German Romantics, who in their *Weltanschauung* made a cult of the formation and development of individuality. (Although Aristotle also praised self-development, he did so in the arguably communitarian tradition of a virtue ethic situated within the institutions of the Greek city-state.) Thus, this distinctly modern element of individualism emphasizes individuals’ uniqueness and diversity. Most individualists (such as the early German Romantics but also Ralph Waldo Emerson) emphasize the need for development of one’s own character in opposition to society or social conformity (which is the main distinguishing feature from Aristotle’s conception of self-development). However, a second vein (in the Marxist or socialist tradition) redefined self-development as communal, that is, as impossible without community with others or without dependence on society. John Stuart Mill, influenced by Wilhelm von Humboldt, and other utilitarian philosophers tried to merge both (the atomistic and collectivist) traditions of individualism in his emphasis on individual happiness *and* its aggregation as the ultimate arbiter in moral decision making.

Frequently underpinning these four elements of individualism is the assumption that individuals’ needs, interests, or purposes are given and independent of a social context. Steven Lukes calls this assumption the element of the abstract individual. The contours of this idea, which run counter to social constructionism or communitarianism, were introduced in the introductory paragraph of this entry as “methodological individualism.” Social constructionist and communitarian philosophies hold that individuals are constituted by (the different roles they occupy in) society. In those conceptualizations, popular with writers on both the political right and left, individuals do not exist apart, and thus cannot be abstracted, from society. Yet many psychologists (e.g., Sigmund Freud), sociologists (e.g., George Homans), and quite a few experimental and behavioral economists reaffirm the view that individuals can indeed be analyzed without a necessary reference to society. This is also expressed in Niklas Luhmann’s radical yet logically compelling thesis that individual/psychological systems form the *environment* of social systems, which goes to show that not all sociological theories support collectivism.

Different Manifestations of Individualism

In different social spheres or disciplinary contexts, individualism may manifest itself differently. For example, political individualism includes (a) a view of government as based on the individually given consent of individuals, (b) political representation as the representation of individual interests (not stakeholder group interests), and (c) the purpose of government solely as purveyor of individuals’ wants or interests and protector of individuals’ rights. This last aspect of political individualism shows a bias toward laissez-faire (as opposed to welfare) liberalism with minimal government, as prescribed by Thomas Jefferson. Individualism can also manifest as religious, epistemological, or methodological individualism—with different foci (in his 1973 book, Lukes presents further explanations and examples of these other forms of individualism). But the two manifestations that are most important to consider for the present purpose are economic individualism and ethical individualism.

Economic individualism is the belief in the economic liberty and private property of individuals and implies an opposition to economic regulation and welfare state policies. Hence, economic individualism is not only conceived as a description of economic reality but also, more important, a normative set of political *desiderata.* Many 20th-century Austrian and neoclassical economists (Ludwig von Mises, Friedrich Hayek, Milton Friedman) regarded the defense of "free civilization" as one of their central scholarly tasks because a market system with minimal state interference and maximum economic liberty is seen as both most economically efficient and morally desirable. For example, Hayek explains how this normative economic view would abolish economic planning, progressive taxation, and the exclusive control of education by the state or some other authority.

Ethical individualism regards morality as individual in nature. It follows from carrying the second element mentioned above, autonomy, to its logical conclusion. With the ideological decline of Christianity as the objectivist foundation of moral certainty, advocates of ethical individualism took center stage in moral philosophy. Nineteenth-century philosophers Soren Kierkegaard and Friedrich Nietzsche are exemplars of ethical individualism—as well as the French existentialists (such as Jean-Paul Sartre) in their emphasis on the importance of individual choice. Ethical individualism generally presumes that the individual is the source and creator of moral values and principles. This way, it bears great affinity to ethical subjectivism but still must not be confused with ethical egoism. Ethical egoism is, roughly, the doctrine that one's object of morality should be oneself. One of the most famous advocates of this doctrine is Ayn Rand. An individualistic worldview is necessary for ethical egoism, but ethical egoism is not a necessary outcome of individualism.

Historical, Geographic, and Semantic Roots

The discussion so far has hinted at the fact that there are about as many definitions of individualism as there are writers about it. This is unsurprising because *individualism* has its semantic roots in so many different countries and contexts.

French conservatives and reactionaries coined the term *individualisme* in pejorative reference to the ideas of the French Revolution and the Enlightenment. They saw those ideological and historical developments as serious threats to social order and stability. In particular, Catholic restorationists in France in the 1800s, such as Joseph de Maistre, were adamant that too much freedom and too little religion would destabilize post-Enlightenment Europe. They advocated the imposition of a hierarchically organized, harmonious social order as a means of constraining individualism. Alexis de Tocqueville used the term with fewer pejorative connotations than did most of his French contemporaries, but he was still quite suspicious of what he assumed was one important consequence of individualism: the withdrawal of individuals from public life into a private sphere and the consequent weakening of social bonds. Only active citizenship (which Tocqueville observed in America) could, in his view, prevent democracy's own destruction, which individualism may enable through individuals' retreat into their private lives.

In Germany, the term preserved some of its pejorative connotation when it was used by German socialists and nationalists (such as Friedrich List) as a rallying cry (and indeed straw man), which had to be overcome with a less abstract, more holistic economic order. However, since the Romantic era, the German term of individuality has strong positive overtones with its celebration of genius and originality. However, as it was soon transformed into the previously mentioned type of "false individualism," it ominously foreshadowed 20th-century German history: the *Volk* as the organic basis of individualistic self-expression, invested with the power and almost mystical quality to unify heterogeneous individualities, especially when governed by an individual whose genius was seen as self-evident.

Swiss historian Jacob Burckhardt integrated the French and German meanings of the word in his influential analysis of the Italian Renaissance. Individualism, in his view, not only combined the notions of self-direction, escape from authority, and withdrawal into the private sphere but also engendered a simultaneous emphasis on self-development and cultural refinement. In this sense, the Renaissance ideal of a human being can be regarded as the exemplar of the four elements of individualism as described above.

American conceptions of individualism generally embrace capitalism and liberal democracy. Some U.S. authors, such as Emerson, attributed to individualism a mystical quality as a tool for self-improvement. American Social Darwinists (in particular William G. Sumner), following Herbert Spencer, were less idealistic because they emphasized the necessity of individualistic competition as a mechanism that facilitates the weeding out of the weak. The evolutionary logic of survival of the fittest rather than individual self-improvement was seen as the guarantor of societal progress. Importantly, in the United States, individualism is not synonymous with individuality, originality, or creativity (as it is in Germany, for example). Several perceptive writers (such as Friedrich Hayek and Richard Rapson) have gathered some evidence that, paradoxically, American individualism seems to require individual conformity and voluntary submission to tradition to function well.

Implications for Business and Society

Arguably, the most important implication of individualism is the creation and reinforcement of individual rights. Without individualism, considerations of positive aggregate outcomes could outweigh and overrule individual rights. In contrast, individualism reaffirms the necessity of respect for the individual, who must not be made subservient to some *Gemeinschaft,* or community.

Similarly, individualism forced many scholars in business and society to abandon amorphous concepts such as "society at large" or "public interest." Individualism suggests that interests, needs, and moral motivations can only be inferred at individual levels of analysis. Such epistemological doubts about the attribution of morality to collectives are rooted in an individualist philosophy. Some business and society scholars (e.g., Manuel Velasquez) are even skeptical of the attribution of moral responsibility to organizations.

Individualistic values may also have important implications for organizational behavior. Managers in more individualistic cultures typically lay greater emphasis on, for example, employee independence, competition, or individual rewards than do managers in collectivist cultures. Consistent with the second principle of individualism, they may emphasize autonomous decision making rather than collaboration. Some organizational researchers believe that, of all the cultural and ideological influences, the individualism-collectivism dimension may have the greatest impact on management practice.

Critiques

Individualism has been a key element of Western civilization and progress, but it has recently come under fire from many sides. First, many on the political left believe that markets cannot be left to their own devices. They do not have confidence in the invisible hand as the generator of optimal outcomes. Instead, they may propose a starting point of either "false individualism" or explicit collectivism in postulating the necessity of a broader, visible steering mechanism that constantly interferes with markets. As was pointed out before, false individualism usually lays much greater emphasis on reason and deliberate design as the guide of human action than does true individualism. According to such rationalistic views typically embraced by the political left, spontaneous order is either impossible or ultimately doomed because it degenerates into chaos or exploitation. Without a steering mechanism (e.g., the setting of a minimum wage), the free market would not produce optimal outcomes that are actually consistent with human dignity.

On the other hand, many conservatives embrace a collectivist tradition more explicitly than does the left and doubt that moral decision making can be left to the autonomous individual. In this sense, some people generally considered to be right wing are opposed to the liberal connotations of individualism. Conservatism often presumes an ethical absolutism to which individuals *must* (be made to) subscribe. Unlike many doctrines of socialism with typically totalitarian outcomes, which, according to Hayek, can have individualistic roots, the starting *and* end points of particular types of conservatism are explicitly collectivist and can have coercive overtones.

A more recent intellectual movement, communitarianism, shares quite a few features with the right-wing attack on individualism, although it presents itself in the guise of a middle-ground, moderate philosophy. According to communitarians, the common good prescribes or determines what is right. Thus, this kind of collectivism starts with the teaching of shared values because, according to communitarianism, civic virtue is impossible without them. It can be implemented either at subsocietal levels (e.g., church, family, neighborhoods) or higher levels of government. Many communitarians prefer their own collectivist "deep community" to the "shallow community" of individualism. They do not seem bothered by evidence presented by feminists such as Marilyn Friedman or liberals such as Jeffrey Reiman that many types of community may be oppressive to women (such as the family or church). In some ways, communitarianism can be interpreted as a rebellion against voluntary decision making and individualistic tolerance, in other words, against not being able to force one's values on others.

Another modern doctrine that harkens back to the past and firmly opposes individualism is the sort of tribalism that has spawned modern terrorism. Many terrorists proclaim to act for the good of some (i.e., their own) collective that overrides concerns for individual lives. Individuals, whether they are victims or suicidal perpetrators of this tribalism (which is manifested as a collectivist egotism), can be sacrificed for some higher cause without concern for their rights or indeed survival.

The discussion has alluded to the fact that many critiques of individualism are flawed. However, they all raise one troubling point: Does individualism contain the seeds of its own destruction? The social nature of humanity and the social search for meaning in our lives may limit the usefulness of individualism as a guide for human action. As history has shown, the urge to find larger meaning ("beyond ourselves") may give rise to the emergence of frequently dangerous collectivist doctrines. However, in this context, it is important to keep in mind that individualism is not opposed to social connectedness and community (see McCann's book *Individualism and the Social Order*); in fact, many advocates of individualism (such as Hayek) affirmed both individualism and the social nature of human beings.

Individual Retirement Accounts (IRAs)

An Individual Retirement Account (IRA) is a personal savings account which allows taxpayers in the United States to set aside money for retirement, while offering tax advantages. The umbrella term for the concept is legally Individual Retirement Arrangement. The IRA can either be an annuity (typically deferred) or a trust set up that meets specific criteria the Internal

Revenue Service (IRS) has defined. This trust and funding by financial instruments makes it an account, and thus the term *Individual Retirement Account* is the most common name by which IRAs are known.

Traditional IRAs and Roth IRAs

Congress established IRAs in 1974 to encourage people to save toward their retirement. Contributions may be made to traditional IRAs if the taxpayers received taxable compensation during the year and were not age 70.5 by the end of the year. Individuals who are age 50 by the end of the tax year for which the contributions are being made may make an additional catch-up contribution. Taxable compensation includes wages, salaries, commissions, tips, bonuses, or net income from self-employment; it does not include earnings and profits from property, such as rental income, interest, and dividend income, or any amount received as pension or annuity income, or as deferred compensation. Married couples are allowed to establish a special "spousal IRA" when only one spouse has earned income.

A traditional IRA is allowed whether or not the taxpayer is covered by any other retirement plan. However, if the taxpayer or spouse is covered by an employer retirement plan, contributions may not be fully deductible. Determining whether contributions made to a traditional IRA are fully or partially deductible also depends on the income and filing status of the taxpayers and whether or not they receive social security benefits. Generally, amounts in a traditional IRA (including earnings and gains) are not taxed until distributed. After taxpayers turn 70½, mandatory minimum distributions based on life expectancy tables are required, which will be taxed as ordinary income, other than any nondeductible contribution portion.

Penalties apply to withdrawals made before reaching the age of 59½, although exceptions can be made for withdrawals for medical expenses, qualified education expenses, and first-time home buyer expenses. Assets (money or property) can be transferred, tax-free, from other retirement programs (including traditional IRAs) to a traditional IRA. These transfers can be from one trustee to another, through rollovers, or through transfers incident to a divorce. Any excess contributions made to IRAs are subject to an excise tax.

A traditional IRA can be an individual retirement account or an annuity. It can be part of either a simplified employee pension (SEP) or an employer or employee association trust account. The trustee or custodian for a traditional account must be a bank or other entity approved by the IRS to act as a trustee or custodian. Money in these accounts cannot be used to purchase life insurance policies, and assets in the account cannot be combined with other property, except in a common trust fund or common investment fund.

As an alternative, an individual retirement annuity may be set up by purchasing an annuity contract or an endowment contract from a life insurance company. The entire interest in the contract must be nonforfeitable and it must provide that no portion can be transferred to any person other than the issuer. There must be flexible premiums so that if compensation changes, payments can also change and contributions are limited. Distributions must begin after age 70½.

The Taxpayer Relief Act of 1997 established Roth IRAs, championed in Congress by Senator William Roth of Delaware. There are no age limits on when Roth IRAs can be set up and contributions made. Unlike contributions to a traditional IRA, no part of a contribution to a Roth IRA is deductible. The benefit of a Roth IRA is that income earned by the Roth IRA is not taxable to the owner (or the owner's beneficiary) when withdrawn if certain requirements are met. The maximum amount that can be contributed to a Roth IRA is the same as the maximum amount that can be contributed to a traditional IRA. However, if an individual makes a contribution to a traditional IRA, the amount that can be contributed to a Roth for any tax year is reduced by that amount contributed to the traditional IRA. Distributions are never mandatory, regardless of age, and any distributions taken from a Roth IRA are not taxed as long as certain criteria are met.

Amounts can be converted from a traditional IRA into a Roth IRA if, for the tax year of the withdrawal from the traditional IRA, the modified adjusted gross income for Roth IRA purposes does not exceed a specified amount. All or part of the assets from a traditional IRA can be withdrawn and reinvested in a Roth IRA, which are then called conversion contributions. Income distributions from a traditional IRA that would have been included in income had they not been converted into a Roth IRA must be included in gross income at the time of conversion.

Other Types of IRAs

An SEP is a written arrangement that allows small businesses that do not have any other type of retirement plan to make deductible contributions to a traditional IRA (an SEP-IRA). Generally, distributions from SEP-IRAs are subject to the withdrawal and tax rules that apply to traditional IRAs. An SEP-IRA is based only on employer contributions, and vesting is immediate. Any employee who is at least 21 years old, has been employed for 3 of the 5 preceding years, and has earned a minimum compensation of $450 in the current year is eligible to participate. There are three formulas that may be used to allocate contributions to an SEP-IRA: a flat dollar amount, a specified percentage of eligible compensation, or a Social Security integration formula. SEP-IRAs are easy to set up and maintain compared with other retirement plans, and no annual tax returns are required. The employer contribution is optional, which eliminates the problem of required contributions in years when cash flow is a problem.

A Savings Incentive Match Plan for Employees (SIMPLE) IRA is a tax-favored retirement plan that certain small employers (including self-employed individuals) can set up for the benefit of their employees. Employees may choose to reduce their compensation by a certain percentage each pay period and have their employers contribute the salary reductions to a SIMPLE IRA on their behalf, up to a specified maximum amount each year. The employer is then required to match up to 3% of employee pay or make a 2% nonelective contribution. SIMPLE IRAs require little documentation and no annual tax filings. Employer and employee contributions are both vested immediately. Although it is possible to reduce the contribution percentage in designated years, these may not be reduced to zero.

INDUSTRIAL POLICY

Industrial policy is a form of government influence on business sectors and firms within an economy. Industrial policy has been both distinguished from and closely associated with other forms of government planning and intervention in the marketplace, such as a nation's competition policy, its trade policy, or its macroeconomic policy. Definitions of industrial policy vary. Many traditional definitions have been fairly narrow ones, such as the selective and strategic targeting of certain business sectors and/or firms over others to receive greater government support to improve or take advantage of their productivity and competitiveness. Definitions of industrial policy have also shifted somewhat in recent decades, and industrial policy often has been more broadly described as government interventions to support multiple or particular economic goals, such as increasing exports or R&D spending, that assist a nation's industries and firms. The paragraphs that follow the next one assume a fairly narrow definition of industrial policy, and then later paragraphs introduce additional or broader viewpoints that have been suggested.

Debate concerning an appropriate role and strategies for government intervention to promote more national economic growth can be traced back centuries. Certain government interventions to assist business activities have generally been supported. Examples include spending on education and the physical and social infrastructure in a country, as well as programs offering low-cost loans and incentives for small businesses. Nonetheless, arguments for forms of industry policy, even subsidies or protection for promising, infant industries from threatening competitive markets, have often been raised. Strong critics of industrial policy, particularly some neoclassical economists, question the effectiveness of government interventions, versus the role of free markets and more laissez-faire attitudes, to determine business sector "winners and losers." Other critics of industrial policy stress that such research, planning, and interventions can have positive impacts on targeted business sectors, but they question its effectiveness in terms of the overall costs versus benefits for the nation's economy.

Countries differ significantly in the extent to which industrial policy is accepted as a legitimate government role and applied. France and Japan, for example, have had mixed results with more formal and elaborate types of industrial policy, while the United States has applied industry policy in more of an inconsistent and ad hoc manner. For example, political pressures following unusual or unexpected events in the United States led to loan guarantees for Lockheed and Chrysler in the 1970s, the closing of savings and loan companies after the crisis in that business sector in 1989, and cash assistance and loan guarantees for the airline industry after attacks on the World Trade Center and Washington, D.C., in 2001.

Issues involving industrial policy have been investigated using tools from econometrics as well as from academic specialties such as sustainable development, technological change, political science, international relations, and others. Early studies of government interventions targeting selected industries or sectors, particularly within command economies employing central planning, did not generally support the effectiveness of these forms of industry policy. The rapid economic development and success of certain East Asian countries in the 1970s and 1980s fueled studies of their individual patterns of investment in selective industries, along with their macroeconomic policies and various government/business/society relationships. It was thought that much more sophisticated planning and careful execution of industrial policy might prove beneficial for both more advanced and emerging national economies.

Financial and other problems confronting some of these East Asian economies in the 1990s and intensive research investigating selective sector investments in these individual nations tempered initial optimism that these strategies might also be applied effectively elsewhere. A diversity of policies and their varying consequences led to complicated analyses and simple conclusions. In addition, plans for selective sector investments were not always implemented consistently during planning of time horizons in certain countries. Yet when compared with factors such as sound macroeconomic policies, level of investment in human capital, and other factors often associated with productivity, these selective sector investments appeared as a less important contributor. In some cases, these selective sector investments also had adverse effects on financial markets, in addition to consequences for disfavored business sectors. This and other forms of industry policy demanded competencies and integrity from government officials and civil servants that were not always present, particularly in many less developed countries. Political forces and constituencies favoring certain business sectors were created that could not always be overridden when economic conditions changed. New and more promising sector opportunities or innovations were also difficult for government officials outside these industries to identify and evaluate appropriately.

There has been less criticism for selective sector support from government in the case of less developed countries undergoing early stages of industrialization compared with such sector selection practices in more developed countries. Additional and complicating factors for these more developed economies, such as European Union (EU) versus member nation priorities or World Trade Organization (WTO) concerns about subsidies and protections, have resulted in calls for other government strategies to improve national competitiveness and productivity. Among these broader suggestions for more effective government interventions have been reforms of the financial sector so that developmental funds flow appropriately to promising industries; use of incentives, instead of directives, from government that are contingent on evidence of productivity and export success; efforts to promote continuing diversification and upgrading of exports; and support for any industry clusters or new learning networks from which spin-off and spillover potentials might occur. Unlike typical networks or voluntary partnerships of business companies, networks involving business and other institutions are being encouraged and facilitated in certain countries. The main purpose for such networks is the creation of learning opportunities through the voluntary exchange of information and dialogue about experiences and factors contributing to productivity and performance improvement.

Research on national productivity in the context of global competitiveness and the role of government in fostering these goals continues, even if many theorists and researchers view traditional notions of industrial policy as discredited or outdated. If industrial policy is an evolving paradigm, it now seems to encompass multiple government strategies and activities in light of emerging global concerns and complications such as terrorism or pandemic flu protection. Selective investment in certain business sectors is just one of many possibilities, and it and broader strategies are influenced by many contingent factors or societal needs.

Industrial Revolution

The *Industrial Revolution* refers to a period of economic, technological, and social transformation that occurred primarily in Great Britain beginning in the 1760s and ending approximately 80 years later. The major innovations associated with this revolution include steam powered manufacturing, cheaper and higher quality iron and steel, increased use of chemicals in industry, the invention and diffusion of railroads, and the appearance of the first large, mechanized, high-output factories for producing cotton textiles and some other consumer goods. Some historians argue that this was only the first of two such revolutions, and a second Industrial Revolution took place in the United States and, to a lesser extent, Germany during the last decades of the 19th century. This second revolution was characterized by the emergence of giant industrial corporations that exploited petroleum and electric power in both their manufacturing and their products.

The impact of the initial British revolution was felt most dramatically in a handful of industries, leading some to argue that the term *revolution* exaggerates overall trends. Others defend the term by pointing out that industries most thoroughly transformed had an overwhelmingly disproportionate impact on the workings of the British economy and on patterns of world trade. The cotton industry, for example, had gradually climbed to 6% of British exports in 1784, but 50 years later, cotton textiles accounted for 48.6% of a much higher total of exports. Even traditional industries were transformed during this era, if somewhat less dramatically. Josiah Wedgewood, the grandfather of Charles Darwin, made himself the most successful pottery producer of his time by applying steam power, chemistry, factory organization, and rail transportation to his ancient craft. As a result of such innovations spreading throughout the economy, the volume of industrial output in Britain, which grew about 1% a year between 1700 and 1780, increased by 3% to 4% annually over the following 80 years, an extended explosion of industrial output unprecedented in world history up to that time.

Among the many factors that help explain the timing and location of the Industrial Revolution, two in particular stand out. The first is Britain's preindustrial coal industry, which supplied a major source of heating fuel before 1760. This coal industry did not only provide power for industrial machinery and an essential input in the new metallurgy; mining coal stimulated demand for the first steam engines to run mine-pumps and the first railroads to transport the heavy mineral to ports. Perhaps the more important factor, however, was the heavily commercial nature of British society at the eve of the revolution. For more than two centuries, first English and then Scottish agriculture had been undergoing their own transformations. Dramatic changes in the uses and ownership of agricultural land, loosely referred to by historians as "the enclosure movement," led to increased commercial husbandry, higher agricultural productivity, and the destruction of peasant self-sufficiency. These in turn stimulated a number of interdependent and reinforcing developments: greater use of wage labor, growing consumer markets, innovations in farming technology, and a willingness to invest in roads, canals, and shipping to further strengthen this market system. As a result, when the powerful woolen goods lobby blocked the importation of Indian cotton goods, the textile center of Manchester already possessed the necessary labor, technology, energy, banking, and transportation infrastructure necessary to support the world's first consumer industry based on mechanization and mass production.

Historians agree that the Industrial Revolution eventually raised living standards, and its technology changed daily life significantly in other ways as well, such as making practical the production of mass circulation newspapers. The revolution, however, produced losers as well as winners. Precious metals coinage seized from the Indian subcontinent helped finance the revolution, and slave labor in the American South fed the cotton mills of Manchester. Closer to home, the new processes spawned new externalities in the form of industrial pollution, unhealthy work environments, the obsolescence of many once respected craft skills, and pressures toward long workdays to maximize the value of the expensive new equipment.

These new, frightening social problems generated a variety of responses. The Luddites, a group of skilled craftsmen who felt threatened by these innovations, sabotaged industrial machinery, risking execution in the process. Workers dissatisfied with their pay and working conditions organized themselves in the workplace and in the political arena, leading to industrial unionism and eventually the world's first labor-based political party.

Politicians, thinkers, and artists joined the discussions and even the agitations. Charles Dickens and Elizabeth Gaskell wrote about the terrible working conditions in factories. Revolutionaries, including Karl Marx and Friedrich Engels (who managed his family's Manchester factory), argued that the negative impact of industrialization was inevitable under a system of market competition based on the exploitation of wage labor. John Stuart Mill, an employee of the East India Company, helped found modern liberalism by acknowledging the benefits of markets and technology while invoking the utilitarian tradition to argue for political reforms aimed at ameliorating their negative consequences. More practical-minded reformers such as Robert Owen attempted to practice manufacturing without the usual social costs. Still other critics and reformers took a more "conservative" stance, arguing that unbridled industrialization and unchecked greed betrayed traditional values and threatened the social fabric of the nation. Among more conservative figures, Ashley Cooper, Earl of Shaftesbury, stands out for leading the campaign to regulate the factory workday.

As the Industrial Revolution spread around the world, so did many of these associated social problems and the responses to them. The "Lowell Girls" of the first factory town in the United States struck in 1836 against wage cuts and unhealthy working conditions. In the mid-19th century, Bishop Leo Ketteler of Mainz initiated a Catholic approach to the labor question that was later enshrined in the papal encyclical *Rerum Novarum* of 1893. Today, the antisweatshop movement, composed of unions, religious groups, political figures, and college students, continues the tradition of trying to assure that industrial growth occurs responsibly and to the general benefit of all the groups that it affects.

Inflation

Inflation is a continued and sustained rise in the general price level or, equivalently, a continuous decrease in the value of money. Thus, it is not an increase in just one price or a few prices but in a large number of prices at once; not a one-time increase, but an increase that spreads out over time; and not a temporary, reversible increase, such as the increase in the prices of certain consumer goods around Christmas, but a sustained increase. Usually, inflation is measured by the change in some price index, based on a broad basket of goods and services, such as the gross domestic product deflator or the consumer price index.

What Causes Inflation?

Many different factors may cause the price of a good to increase on a one-time basis: an increase in demand for that good, a reduction in supply (a bad harvest, for example, in the case of some farm produce), an increase in production costs (wages, raw materials, energy), an increase in taxes on that product, and so forth. But an increase that affects most, or nearly all, prices can only be caused by something that affects the entire economy, such as a general increase in wages (above the increase in productivity) or in the price of oil and other imported raw materials (due, for example, to a depreciation of the currency) or in taxes on production or sales. Nevertheless, events such as these may explain one-time price increases, but not continued and sustained increases in the prices of large numbers of goods over an extended period.

There is a broad consensus among economists that inflation can only be caused by an excessive increase in the supply of money in a country over a period and that a continued, sustained, and excessive increase in the money supply may turn a one-time increase in a few prices into full-blown inflation. That is why inflation is often said to be a monetary phenomenon: too much money chasing too few goods. If a country's financial system creates more money—that is, more purchasing power—than the value of the goods available, there will be a "bidding war" among potential buyers. That leads to price increases, which are passed on from one market to another and persist over time.

Therefore, to understand inflation, we need to understand how the money is created and controlled, in other words, how monetary policy is designed and implemented. But if it is public knowledge that excessive growth of the money supply leads to inflation, why do governments and central banks promote it or allow it to happen? There are many reasons why they might do that: to stimulate demand and production, to avoid a recession due to cost increases, or as a consequence of mistakes or accidents. Whatever their motives, the monetary authorities choose a short-term advantage—often a political advantage, such as winning an election—at the cost of a long-term disadvantage—higher inflation.

Nevertheless, the most common cause of excessive growth in the money supply, leading to high inflation, tends to be the financing of the budget deficit: When a government spends above its means, it is tempted to ask the central bank for a loan, and that loan will give rise to an increase in the amount of money in the economy. In many countries, the ultimate cause of what is often chronic high inflation is the government's inability to finance public spending out of its regular revenues, prompting it to resort to inflationary means of financing the deficit (of course, this will not happen if the deficit is not financed by the central bank).

Consequently, wherever inflation is high and persistent, it tends not to be an isolated "disorder" but part of a much broader "illness" whose clinical picture usually includes inappropriate fiscal policies, incompetent governments, a central bank hostage to government pressure or interests, lack of monetary policy tools, and so forth. In the long run, the price increases may become self-perpetuating: If money is constantly losing value, consumers will try to spend it as quickly as possible, which will increase the pressure on prices to the point where hyperinflation sets in—with prices rising at an annual rate of more than 1,000%. Hyperinflation occurred in Germany after World War I, when the rate of growth of prices reached 3.25 million percent in a single month (August 1923), and more recently in several Latin American countries (Bolivia, where the annual inflation rate reached a peak of 23,447% in August 1985, Argentina, where the highest annual rate was 20,266% in March 1990, etc.).

Economic and Social Effects of Inflation

Inflation is more than just an economic problem; it is also a social, political, and ethical problem and has far-reaching consequences. As a rule, inflation has its most severe effects when it is unpredictable, when the economic agents are unable to protect themselves against it (e.g., because regulations limit price and income flexibility), and when it varies considerably over time.

Under a fixed exchange rate (a rate the government sets and maintains as the official exchange rate, usually in terms of a major world currency, such as the U.S. dollar), a country that has higher inflation than other countries will become less competitive. That may result in lower output growth, higher unemployment, or even a recession. Moreover, to maintain the fixed exchange rate the central bank must buy its own currency and sell the foreign currency to which it is pegged, and this operation is limited by the amount of foreign currency reserves owned by the central bank. When this limit is reached, the national currency will suffer a sudden, large devaluation that will accelerate inflation, disrupt production, and cause severe adjustment costs to the country and, probably, a recession. And if the financial markets fear this outcome, an acceleration of inflation may discourage foreign investment and even cause a capital flight, hindering or even stopping sustainable economic development.

Inflation gives rise to economic inefficiencies that may reduce the country's capacity for growth. For example, if inflation is high and variable, it may be difficult for companies to distinguish between changes in relative prices (i.e., the prices of some products compared with others) and changes in the general price level, and this can result in mistaken decisions about investment, technology, and markets. Also, as uncertainty increases, the maturity of credit is shortened; this makes it very difficult to finance companies' investments in the long term.

Inflation is a tax on money (keeping a dollar bill for 1 year with 10% inflation is equivalent to losing 10 cents of purchasing power). Accordingly, households and companies try to reduce their cash holdings, which leads to financial stress. In conditions of high and variable inflation, cash management becomes more important than production efficiency, and speculation may be more profitable than a job well done.

Also, when taxes are progressive (i.e., the tax is larger as a percentage of income for those with larger incomes), as income tax is in many countries, inflation accentuates the tax progression (unless appropriate corrective measures are taken) by pushing the tax base up into higher tax brackets, without any corresponding increase in real income. In a sense, citizens' wealth is expropriated.

High inflation brings about a potentially unjust redistribution of income. Inflation tends to hurt those on a fixed income, such as a state pension (unless subject to periodic review) or, in some cases, a rent or a wage. It also leads to a redistribution of wealth. Those who hold cash (inflation is a decline in the value of money) or fixed income securities, for example, stand to lose. Thus, particularly if inflation is unexpected, creditors tend to lose, while debtors win. After an episode of high inflation, savers may find that their wealth has evaporated, unless it was invested in financial instruments whose value kept pace with inflation or which generated sufficient income to offset the loss of purchasing power.

In society at large, high and variable inflation will generate ill feeling and conflict, if only because employees will see how prices increase day by day while their wages increase only once a year. Whenever inflation is high, people think that "someone" is to blame and tend to pin the blame on some minority or on "speculators" or "big business," nurturing social rejection, violence, and so forth. Moreover, in an environment of high inflation, important ethical and social values, such as honesty, industry, and saving, deteriorate: It "doesn't pay" to be honest because you end up forfeiting your assets, while others who resort to more morally questionable methods make significant gains.

Also, inflation tends to spread. A rise in one price leads to a rise in another (probably because of the same underlying cause, or as a defensive reaction); prices push up wages, and wages push up prices, in a continuing spiral. So people who expect inflation increase prices, because their defense mechanism is precisely to try to increase whatever prices they control and, in the case of employees, their wages. For all these reasons, a country is unlikely to be able to maintain a stable, low rate of inflation unless it explicitly makes that an economic policy objective.

How Can Inflation Be Reduced?

If it is true that inflation is a monetary phenomenon, reducing a country's inflation rate will be a task for monetary policy. Basically, the monetary authority—the central bank or the government—will have to curb the growth of the money supply by draining liquidity from the financial system and raising interest rates. And that will almost always be a traumatic process. Because of the credit squeeze, households will curtail their demand, and many will find themselves in financial difficulties. Companies will start to lose money, halt their investments, cut back their spending, and lay off workers. And the country is likely to see a slowdown in the rate of growth, or even a recession.

Many countries that have tried to reduce inflation have found that implementing a restrictive monetary policy is not enough. The policy must also be credible, which is to say that the authorities must have a firm political will to reduce inflation, that is, to bear the economic, political, and social costs of preventing prices from rising, particularly in a recession. In practice, an anti-inflationary policy may have high social and human costs, and governments must bear them in mind and try to mitigate them. Ultimately, however, they will have no choice but to take whatever steps are necessary, just as a doctor will carry out emergency surgery to save a patient, however painful it may be.

Also, a monetary policy will only be credible if it is compatible with other macroeconomic policies, above all exchange rate policy (the exchange rate, if it is not fixed, must be compatible with the inflation target) and fiscal policy. An effort to bring inflation under control will not be credible if the government does not undertake to reduce its budget deficit and stop financing it with central bank borrowing. Finally, the battle against inflation will be easier if institutions and policies are in place to facilitate price adjustment: labor market flexibility, competitive markets, abolition of price and wage controls (so-called incomes policy), and so on.

Once the inflation rate has been brought down, monetary policy will have to be aimed at keeping it down. The rate of growth of the money supply must be sufficient to finance the potential growth of the economy, in real terms, plus a strictly limited inflation rate. And, once again, that will require a credible deficit-containing fiscal policy, a sustainable exchange rate (frequent devaluations fuel inflationary expectations, which drive up the costs of imported products, and then inflation), moderate cost growth (wage pressure must not exceed the moderate increase in prices plus reasonable productivity growth), . . . and a fair dose of good luck.

All of this brings us back to the attitude a socially responsible government should take toward inflation. The most important thing is not to allow unduly expansionary policies, which merely generate inflation. Excessive, unexpected money supply growth has a stimulating effect on the real economy, just as a stimulant does on a normal person; yet the effect soon wears off, while the dose needed to achieve the same effect keeps on increasing. Usually, getting inflation under control is an arduous process that may have high economic, social, and human costs. For that reason, it is best to avoid inflationary policies and tackle rising inflation as quickly as possible to put in place moderate monetary policies that keep inflation low and stable—because macroeconomic stability is a necessary (but not a sufficient) condition for the prosperity of nations and the well-being of their citizens.

Information Costs

The term *information* is generally assumed to mean a message. It usually takes an audible or visible form and involves a sender and receiver. Information is meant to change the way the receiver perceives something, to have an impact on judgment and behavior. The term *cost* has traditionally been viewed as the value of inputs that have been used up to produce something. Since the inputs have been used up, they are not available for use anymore. Putting the terms *information* and *cost* together adds an interesting twist because the inputs that comprise a message may not be used up and may well be available for other uses. The issue becomes how much someone is willing to pay for information, in other words, what the value of information is. From the catchphrase "Information is power," we can imply that information is highly valued.

The cost, or value, of information is difficult to determine because information is intangible, immaterial, highly fungible, and nonexclusive. Information can be replicated at little or no cost. Its use is infinite because it doesn't wear out or deteriorate. Information's value may increase as it is exchanged or interchanged with other information. The production of information goods involves high fixed costs and low marginal costs, as well as high sunk costs involved in creating information. Fixed costs are related to assets or expenses whose total costs do not change in proportion to the amount of information that is produced, such as rent and utility bills. Marginal costs change as the quantity produced changes, and in the case of information this would include the cost of the media on which the information is distributed, for example, a digital video disk. Sunk costs are those that have already been incurred and that cannot be recovered to any significant degree, for example, the costs of obtaining the information. Since information is relatively inexpensive to replicate, it has perfectly increasing returns. Once the initial investment is made, information can be reused at no additional cost.

These properties cause several dichotomies. The first is that users want information to be free, while its producers may want it to be expensive. The rationale that information should be free is based on the fact that information is cheap to distribute, copy, and recombine. This is juxtaposed with the concept that information may be expensive because of its immeasurable value to the recipient.

A second dichotomy is the value of information related to time and distance. Buyers of information may be willing to pay a premium to be among the first who possess it and act on it. Information generally costs more the closer the purchaser is to its collection. In addition, the quality of information may degrade over time and over distance, since much of its use is contextual, or as it becomes obsolete or untrue with time. However, it is also possible that the value of information increases over time because it is compounded.

A third dichotomy is information's scarceness and familiarity. Items typically become more valuable when they are scarce. People may be willing to pay for information that is not generally known. While the exclusive possession of certain information may make it more useful, some researchers have found that its intangible value increases as it becomes shared. It is recognized that the availability of information and the free flow of data are the cornerstones of a democratic society and market economy. Sharing information resources means that organizations can make their resources available for other projects and may enable quick responses in emergencies; for example, information sharing among several governments helped contain the SARS outbreak to a limited geographical area.

There are three important considerations in the cost of information. These are reciprocity, reputation, and altruism. Reciprocity is a mutual or cooperative interchange of favors or privileges. Often, the holders of information will provide it if they expect others will provide them with information when they are in need. Reputation is the general estimation in which a person or organization is held by the public. Information is more valued if the reputation of the provider is good. Altruism is the practice of placing others before oneself and exhibiting unselfish concern for the welfare of others. Sometimes, providers of information make it available for the good of society.

The cost of information may be affected by the market structure. A monopoly on information occurs when one group has exclusive control over the means of producing or selling it. Monopolies may cause costs to rise. The most common method of maintaining monopoly control of an information resource is the enforcement of copyrights and intellectual property laws. Monopolies also arise in the information market when the information is difficult to copy, because of its medium, or too complex for someone else to assemble comprehensively. Likewise, the value of information may decrease the more it is replicated. Trade barriers, such as censorship activities of governments, may also affect the cost of information.

Ethical decisions regarding the cost of information affect the ability to access information and to pay for it (e.g., the digital divide illustrates the gaps in the ability to access information and may result in disparities among cultures, classes, and races), the availability of information (e.g., censorship, as seen in China's policy of limiting its citizens' access to information about the 1989 uprising at Tiananmen Square), and sharing of information (e.g., patents and copyrights may limit how information is copied and used).

Informed Consent

Informed consent is a legal and ethical condition of voluntary agreement based on adequate knowledge and understanding of relevant facts, implications, and consequences when participating in research or undergoing a diagnostic, therapeutic, or preventive measure. Subjects must be in possession of all their faculties without impairment of judgment at the time of consenting. Furthermore, subjects may not waive or appear to waive any of their legal rights or release or appear to release the investigator, the sponsor, the institution, or agents thereof from liability for negligence.

Although the legal concept of informed consent is most commonly associated with medical procedures and research studies, it also has ethical relevance in the broader context of business, particularly in protecting employees from potential privacy violations by employers. Certain legal guidelines have been enacted to protect employee rights to informed consent, such as the Polygraph Protection Act of 1988, which not only prohibits most employers from using a polygraph (lie detector) as preemployment testing but also requires exempted employers to obtain the informed consent of their candidates prior to testing. The concept of informed consent in this sense has as much to do with business ethics as business law since employers in the United States continue to enjoy a great deal of latitude in choosing when, where, and how to limit the privacy of their potential and present employees.

Informed consent implies deliberation and free choice. Subjects must be allowed to deliberate on the basis of sufficient information of what exactly they are consenting to and how it may affect them in the future. And, of course, such information needs to be in language the subject can understand, minimizing legalistic or other specialized vocabulary. Sometimes employers assume that merely informing their workers of a pending privacy intrusion such as monitoring employee Internet use, installing hidden cameras, drug tests, personality tests, or criminal and health background checks is to comply with this rule. After all, the employee has been informed and is usually free to quit at any time. But this common assumption overlooks the pressures, expressed or implied, exerted on employees to conform to organizational policy. Not only is there social pressure to conform; often employees cannot expect to obtain gainful employment elsewhere at short notice. When these factors are in place, which is often the case, the subject is informed of the procedure, but genuine consent is difficult to ascertain. This is why polygraph tests have been forbidden as a condition of hire for most jobs that do not require a high degree of security clearance. The legal claim here is that subjects should never be coerced into sacrificing their right to privacy unless there is a greater interest in preserving the public from undue harm.

Thus, contractarians tend to interpret informed consent as placing equal emphasis on consenting as being informed. They point out that if employees cannot opt out of the procedure, full consent has not been obtained. Employers will then reply that none of their common screening procedures will be possible if most candidates opt out. This is the point at which ethical and legal dilemmas occur. Most ethicists maintain that employers do have the right to invade their employees' privacy without their full consent so long as a strong case is made for the necessity of the procedure, namely, to protect the public and/or business from a clear and present danger sufficient to override the right to privacy. Still, libertarians claim that all private employers should have the right to infringe on their employees' privacy within the confines of the law, so long as employees are informed of the infringement. Coercion would thus be acceptable in a capitalist system in which employees are free to leave jobs at will.

Polygraph Tests

Courts have upheld the Polygraph Protection Act, which bans the use of lie detector tests unless there is potential for significant harm if the test is not used, say, as a screening procedure. Thus, private security firms are exempted, including drug companies, specialized government contractors, and "ongoing investigations of economic loss or injury." And even when such tests can be used, the employer must clearly explain the test's purpose and the reason why the employee is expected to take it.

In addition, the subject has the right to consult with someone better able to explain the workings and limitations of the test. In this case, independent studies taken together have found polygraphs, which function by detecting a person's physiological reactions such as heart rate, blood pressure, and respiration when answering specific questions, to be only about 53% effective. Finally, subjects retain the option to reject the test and cannot be fired on the basis of a polygraph test "without other supporting evidence."

If we extend this standard to other invasions of employee privacy, employers would have to justify those procedures by showing that the public and/or business would be in significant jeopardy if they were not carried out. Interestingly, although this standard is partly upheld in widespread screening policies, it is just as often disregarded in other ways, even within the same company. Common examples are drug and personality tests, employee monitoring, and criminal and health background checks.

Drug Testing

Companies often require drug tests when screening job candidates. Advocates usually defend the practice on the basis of three ethical arguments:

1. Drugs are illegal, and the company prefers not to hire anyone who habitually engages in illegal activity.
2. Drugs lower job performance, and the company has a right to expect the highest performance possible.
3. Drugs are harmful, and the company has a duty to protect itself and the public from such harm that could be caused by employee drug use.

While these arguments have merit, they are nevertheless highly controversial in business ethics literature. First of all, it's not clear that employers have a right or interest in ensuring that their workers never engage in any kind of illegal activity. For example, it might be in the interest of employers to know if job candidates have ever cheated on their taxes. Nevertheless, most employers would never consider asking candidates for their latest tax return despite the fact that doing so might provide an excellent indication of moral character in an area that would seem highly relevant to myriad occupations especially in financial industries. This is why political candidates routinely disclose their tax returns to the public while campaigning. But it remains a widespread ethical belief that employers should not go so far as to audit tax returns when screening applicants. And this is the case even in business sectors where such information is highly job relevant. Thus the drug illegality contention is considerably weakened by such inconsistency. Still, libertarians maintain that private employers should be free even to ask for tax returns to screen job candidates. The fact that this is considered by many as unacceptable does not in itself make it so.

When this is pointed out, defenders often respond by appeal to the second argument, namely, that drugs lower job performance. Hence they are more job-relevant than, say, tax returns. Although this may be the case for certain drugs in certain professions, for example, heroin and cocaine use by surgeons and airline pilots, it does not usually seem so elsewhere. Interestingly, such professions are in such high demand for qualified candidates that they are often the last to require drug tests since most applicants would not willingly submit to them. A serious question of fairness arises here when privacy intrusions are selectively carried out only in professions in which workers are less skilled and easily replaced.

But with respect to decreased performance, it is neither obvious that any drug use, especially off the job, will decrease any job performance nor that employers have a right to demand the highest performance possible from their workers. If, however, performance slips significantly below acceptable levels, the employer may then have the right to investigate and attempt to correct the problem. If a drug problem is involved, then offering treatment may be appropriate. Contractarians argue that to preemptively invade *any* employee or candidate's privacy in anticipation of *any* potential lowered productivity is to disregard a possible abuse of power. But libertarians maintain that employees have no positive right to a job—only negative rights against harm—and since the employee is free to leave at will, no real harm is done.

The third argument concerning potential harm is much less controversial. As stated above, Congress and the courts have already upheld this standard exception to full employee or candidate consent with respect to polygraph tests. But it only applies to those professions in which a clear and present danger to the public or business overrules the right to privacy. Hence most jobs do not meet this criterion. Employers who cannot meet that high standard convincingly before invading employee privacy with drug tests cannot make use of this defense. Instead, they must advocate a weaker standard such as a right to protection from any potential harm.

Personality Testing

Personality tests are another common example of privacy invasion by employers. Many of the ethical problems concerning polygraph testing also apply to personality tests, which can vary widely in accuracy depending on the scientific quality of the test. Often, highly personal questions are asked in a context that critics argue conveys a thinly veiled expectation of absolute submission to authority. Taking personality tests can therefore be most unpleasant, making subjects feel violated and demeaned by projecting the image of an exploitative work environment. In addition, many personality tests are of dubious reliability. The Myers-Briggs test, for example, which millions of candidates take each year, has been found to be unreliable in independent tests, attributing a different personality type to subjects 53% of the time on different days.

On the other hand, when the questions are not overly personal or demeaning, and assuming they are scientifically valid and reliable, personality tests may be useful in determining which positions applicants would be best suited for. They tend to categorize candidates into a relatively small number of basic categories such as the classic introvert or extrovert. To many, such tests are relatively harmless and simplify the complexities of management decision making. Nevertheless, participation is usually less than fully voluntary since testing is often required as a condition of employment. Still, critics contend that people rarely fall squarely within a given personality type in all social contexts and that most personality tests are therefore invalid as they oversimplify human nature and employee potential.

Employee Monitoring

Employee monitoring via cameras, e-mail, or Internet use is a more invasive intrusion on privacy than are drug and personality tests. Hence employees are often given more detailed disclosures of the reasons for such policies. Nevertheless, it's not always clear that such practices are morally justified. Again, if we apply the Polygraph Protection Act standard, there would have to be a clear and present danger to the company such as theft of expensive equipment or highly sensitive intellectual property. Of course, this is usually the case, as such surveillance systems are considerably expensive.

However, critics argue that when such dangers are not present, those intrusions can contribute to an oppressive work environment likely to erode employee loyalty, thereby increasing theft and absenteeism. Indeed, critics point to independent studies indicating that overreliance on employee monitoring can help create the very problems it seeks to solve. But defenders argue that businesses have a right to protect their property even if it means undermining an atmosphere of trust. Indeed, employee theft amounts to billions of dollars in losses to U.S. businesses every year. These staggering costs provide a strong incentive for companies to install hidden and/or unhidden cameras. The result is that many Americans have become inured to the increasing prevalence of security cameras in the workplace. Complex concerns such as these are best addressed on a case-by-case basis.

Criminal and Health Background Checks

Companies routinely conduct criminal background checks of their perspective employees. Full disclosure of such policies is usually given to obtain informed consent. The reasons for such background checks are fairly obvious, especially for certain positions such as those involving children in which there is a need to protect the public from, say, pedophiles that have an extremely high rate of recidivism. There is widespread agreement that checks of this kind are entirely ethical since they clearly uphold the potential harm standard. But critics argue that conducting background checks indiscriminately is an unwarranted invasion of privacy that systematically impedes those with criminal records from obtaining gainful employment. The social costs of such exclusion are arguably great as they include higher crime rates and taxes to cover increased legal and punitive costs. Still, companies may have a right to protect themselves from potential criminals with existing records. To this, many critics reply that criminal backgrounds should not be the litmus tests they so often are—excluding candidates from further consideration. Other factors should be considered such as the severity and job relevance of the crime(s) as well as recent personal and professional references. If such factors are also taken into account and the policy is disclosed to job candidates, then a high standard of informed consent is fairly balanced by the employer's right to self-protection.

Health background checks, however, are not (as of yet) common practice. Although health records are entirely confidential, a company's insurance providers sometimes require new hires to disclose myriad costly preexisting medical conditions. Once disclosed, coverage can be denied or employee premiums can skyrocket. Critics argue that this is tantamount to discrimination and that informed consent has not been upheld when preexisting conditions are a litmus test for obtaining affordable health care through employment. Since certain health conditions can make medical coverage extremely costly, many have argued that those conditions should be insured by the government.

In-Kind Contributions

Nonprofit organizations are often the recipients of in-kind contributions as well as monetary contributions. In-kind gifts are noncash transactions that involve goods or services donated by individuals, corporations, and associations. Instead of cash, the nonprofit organization receives some other gift that assists in carrying out its mission. Common examples of in-kind contributions are donated space, office supplies, printing and shipping, health aids, land, technical advice, discounts not otherwise available, and many other types of goods and services. In 2003, the value of in-kind contributions accounted for nearly 50% of all giving, surpassing monetary giving from both foundations and corporations in the United States.

While in-kind contributions are as widely varied as the missions that drive nonprofit groups, there are generally three categories of contributions. First, it is common for businesses to give products, supplies, and equipment to nonprofit organizations. A charity that supports children may receive products for meeting clients' needs (e.g., diapers and baby clothing) and operating the organization (e.g., furniture and office supplies). Second, nonprofit organizations are often allowed to use facilities and services for free or a reduced fee. A women's shelter hosting a dinner and silent auction may receive in-kind donation of a hotel ballroom and a catering discount to reduce expenses and increase proceeds from the event. Finally, some firms donate professional services and employee expertise to nonprofit organizations. All organizations need legal, marketing, and tax advice, but these services are expensive. Instead of raising funds to cover these expenses, a nonprofit manager may seek in-kind donations of time and expertise.

While most nonprofit organizations have plans for increasing financial resources, fewer have formal in-kind contribution strategies. A formal approach to in-kind gifts goes beyond a "wish list" to include a broad analysis of the organization's needs and ultimately allows the nonprofit organization to use monetary funds for directly supporting clients and enhancing programs. Gifts In Kind International assists both nonprofits and businesses in meeting their goals for in-kind contributions. The organization, which is the third largest charity in the United States, uses online technology to match business donations to the specific needs of nonprofits around the world. Gifts In Kind has facilitated more than $4 billion in "product philanthropy" since 1983 and works with 200,000 charities and nearly half of Fortune 500 companies in the United States and other countries.

Given its significance and potential benefits, it is important for nonprofit organizations to properly document and account for in-kind contributions. A key task is to determine the value of contributions, which is typically based on fair market value or the cost to the organization if the goods and services were not donated. For example, if a software firm donates new software packages to a nonprofit hospital, the software is likely to be valued at the price the hospital would have paid to receive the software. If the software is dated or used, the fair market value would be determined differently. Once the in-kind gift has been valued, it is recorded as both an expense and a contribution in the general ledger. This accounting reflects the fact that the gift represents a contribution as well as an expense normally incurred for operating the nonprofit organization and/or its programs. Finally, the donor should receive a signed receipt that describes the in-kind contribution, its estimated value, the date of donation, and other details.

Donors receive several benefits from their in-kind contributions. First, certain donations may be tax-deductible up to twice the cost of the donated goods and services. Second, donations may reduce inventory handling and carrying costs for firms that contribute products normally sold to customers. Third, these contributions demonstrate a commitment to the community, provide evidence of social responsibility, and often lead to positive recognition and other intangible rewards.

Insider Trading

In a broad sense, insider trading is obtaining information from nonpublic sources and using it for purposes of enhancing one's financial advantage. In a narrower sense, it refers to the purchase or sale of securities of a company, to the benefit of the seller or a third party, using inside information, understood as nonpublic information that the seller possesses as a result of having a fiduciary relationship with the company in question.

Inside information tends to be about something that may have an impact on the expected return or risk of a company: investment projects, appointments to the management team, plans for (or results of) research on new products, and so forth. For example, the purchase of shares of a pharmaceutical company by one of its managers hours before the public announcement of the results of research into a new drug that is likely to make the share price rise sharply would be classified as insider trading.

The person possessing inside information may be a manager or employee of the company who has a relationship of loyalty with the company; or a person or organization (legal counsel, advertising agency, auditor, consultant firm, or bank) that has dealings with the company, under a similar relationship of trust; or a person (a relative or friend, an employee of the bank) who has received information from one of the above. Inside information does not include public information or information made available to the public (to a journalist who is writing an article about the company, for example) or any information a person may obtain by his own effort and ingenuity, using licit means (such as the information obtained by a financial analyst by studying press reports and published accounting records of the company). Obviously, the legal and moral problem is about how inside information is used, not the mere fact of possessing it.

Close to insider trading are conflicts of interest, which can arise in any situation in which an interest interferes, or has the potential to interfere, with a person, organization, or institution's ability to act in accordance with the interest of another party, assuming that the person, organization, or institution has a legal, conventional, or fiduciary obligation to do so. An example might be an investment bank that uses the information it has about one customer to benefit another.

Often, insider trading is said to be a victimless crime, the suggestion being that it does not in fact have any moral consequences because the extent of the damage (which often takes the form of lost income) is unknown or because we cannot say exactly who suffers the damage or because the supposed damage is shared among large numbers of people in very small amounts, whereas the benefit tends to be highly concentrated. Yet it poses some interesting ethical problems, deriving from the fact that the person who carries out the insider trading has an informational advantage that outsiders lack—although that does not make every insider trading transaction immoral.

Ethical Arguments

There are three ethical arguments against insider trading: (1) It is (or may be) unfair for ordinary investors, (2) it hurts (or may hurt) a property right of the firm, and (3) it threatens a fiduciary relationship among the firm, its shareholders, and its employees. A fourth argument is that insider trading can cause harm to the ordinary investors or to the market, and we will discuss it under the economic arguments.

1. The fairness argument focuses on the disparity of information between the two parties to the transaction. There are two versions of this argument. According to the first one, insider trading is unfair because the two parties do not have equal information. But it is impossible that all market participants have the same information: In a free market economy, there has to be different (asymmetrical) information; otherwise, there would be no need for a market. Moreover, there is no moral right to equal information: We have a right to truth, but not necessarily to the whole truth. For example, we are not morally obligated to tell the other parties in a transaction everything that would be in their interest to know—for example, the buyer of shares in a company who has good reason to believe that it will earn extraordinary profits is under no moral obligation to reveal that circumstance to the seller.

The second version of the fairness argument accepts that some disparity of information could be fair but argues that insider trading will be unfair if the insider has information that is not accessible by hard work and ingenuity to the other party. The problem with that argument is that the notion of equal access to information may be attractive in principle, but we do not know how it can be applied in practice. In ordinary life we all have inside information about a lot of things, and we all try to obtain it and benefit from it, without that raising any problems of justice toward others (obviously, there would be injustice if the inside information were obtained by theft, fraud, espionage, or other criminal means). To sum up, an abstract concept of fairness alone cannot settle the insider trading issues.

2. The second argument concerns who the owner of the information is, how it is acquired, and what entitles people to make use of it. Information always belongs to somebody, and there is no doubt that companies have a right to the information about their affairs, be it news of mergers, scientific or technological discoveries, or investment plans. In that sense, managers, employees, or even shareholders (and also consultants, auditors, bank employees, tax inspectors, etc.) who know such information possess a good that belongs to the company and must use it to the company's benefit (unless they receive the company's permission to do otherwise), or at least they are not entitled to make use of it against the will of the firm, either for their personal advantage or for the profit of other people, any more than they are entitled to the company's assets.

It has been argued that if managers or employees stand to gain from any inside information that they themselves generate, they will be more likely to engage in innovative and entrepreneurial activities. That may be so, but the reverse may also be true: They may engage in activities that are of no interest to the company but that benefit them personally; or they may sow unfounded or manipulated news stories, again for their own benefit.

There are others, apart from shareholders, managers, and employees, who may claim a right to be informed about the company: bondholders, bankers, customers and suppliers, employees, the local community, and so forth. Each has a right to certain information—the information that concerns them—because a law, a contract, or a code says so. But in no way does that include the use of such information for their benefit.

A more complicated case would be if, by chance, a person receives inside information as a result of, say, overhearing a conversation in the street or receiving an e-mail by mistake. Must that person respect the company's right to such information? This is not a case of inside information, as this person is not an insider, but it is much the same as when a person finds an object that someone else has lost: The object still belongs to its owner, who is entitled to claim it back—although, in the case of information, it is not lost, but simply shared. We can conclude that information cannot be used against the company's will, just as a found object cannot be retained against the (implicit) will of its owner. Nor is there any obligation to share such information with others, much less make it public.

3. The third ethical argument on insider trading is that of trust. The managers, employees, or advisers of a company who use inside information for their own benefit or that of third parties betray the trust the company has placed in them. Likewise, the bank employees who know a company's secrets because of their job at the bank are in the same situation with respect to the bank and with respect to the company.

Obviously, disloyalty must be judged in light of the circumstances. A shouted conversation in the street cannot be said to be secret; but if it takes place in a private office, it can. Some information will be trivial and does not have to be kept secret, whereas other information is important (and we can assume that the latter is what insider trading is about).

To sum up, insider trading must be analyzed in the context of the relationships among the firm, its shareholders, and its employees (and other stakeholders), insofar as it threatens the fiduciary relationship that is central to business. It is not necessarily immoral, unless it violates the trust that the company has placed in those people, either inside (managers, employees) or outside (advisers, financial intermediaries) the company, or infringes the company's right to own its information, so that the use of such information by other people amounts to misappropriation. This not being the case, the use of inside information may be ethical, unless it causes harm to other investors or to society at large.

Economic Arguments

Some economists claim that insider trading is ethical, and should be legal, because it is positively beneficial, insofar as it enhances the efficiency of the financial market as a mechanism for gathering, storing, processing, and diffusing information. In the simplest terms, trading based on inside information makes the market price come to the "true" price sooner than it otherwise would, and this has clear economic benefits to the market in general.

In the financial markets, it is assumed that the price of an asset is equal to the discounted present value of the future flow of expected net returns, taking the asset's risk into account. It is also assumed that if the market is efficient, it will react to each new item of information about those variables by instantly modifying the asset's price. Therefore—the argument goes—the flow of information to the market should be as free as possible; whether the flows take place via insider trading or not is irrelevant. Moreover, if the information comes from an internal (and, therefore, reliable) source, it may be less uncertain (though that need not be the case).

However, the argument that insider trading fosters market efficiency is highly questionable because what we are talking about here is not important information that would otherwise remain hidden for a long time but information that is due to be made public in the very near future. In such cases, the benefit to society of receiving that information slightly earlier will be minimal, while the private benefit—and the moral harm—may be substantial. And most likely it would be best if the information were disclosed to the whole of the market, as is generally required by law. Also, the mere possibility of insider trading may erode the investors' confidence, pull the investors out of the market, and reduce its efficiency.

In any case, critics reply that trying to justify insider trading on the grounds of efficiency is too much like saying the end justifies the means. In the capitalist system, the goal of efficiency must be subject to ethical conditions, and the mere possibility of obtaining extraordinary profit through insider trading may encourage immoral behavior, such as information theft or espionage, or market manipulation.

INSTITUTIONAL FRAMING

Frames are the cognitive categories or schema people use to describe, interpret, and sort events, issues, and entities for themselves and others to understand and predict their environment. Institutions can be described as a set of societal rules or expectations that govern interactions and/or as organizations created to achieve a specific, collective purpose. The concept of institutional frames considers both descriptions. Institutional frames provide one a context for understanding the complex interrelationships among organizations and their policies, processes, products and services, and relationships with stakeholders.

Numerous social science disciplines including communications, economics, psychology, social psychology, political science, and organization studies use the concept of frames to explain a multiplicity of phenomena. Scientific inquiries have focused on the nature of frames and how frames influence a variety of outcomes including how risks are perceived, how decisions are made, how political issues are perceived, how social dilemmas are resolved, how ambiguity and change are managed, and how leadership is exercised. Although various disciplines use different terms to refer to and discuss frames, all converge on the concept that individuals do not passively perceive their environment. Instead, they actively (and often unconsciously) sift through information, constructing and applying meaning to their surroundings. The process of framing involves active interpretation of objects, events, and issues. Frames are interpretive devices that individuals use to understand their own world and that can be strategically used to shape the sense-making of others.

Cognitive frames are analogous to picture frames. Imagine framing a photograph: The way the photograph is matted and framed highlights some aspects of the photograph more than others. Certain matt colors and frame shapes can dramatically alter the appearance of the photograph, making particular aspects of it central and other aspects peripheral, and cutting some out entirely. A cognitive frame operates the same way: A given frame may emphasize certain aspects and angles of an issue, entity, or event and de-emphasize or ignore other aspects. The way we frame an issue shapes our perception of reality and informs our future action.

Threats and opportunities are examples of important and commonly discussed frames in the organizational literature. When an individual categorizes or interprets an event as a threat, information is perceived and processed differently compared with how it would be if the event were categorized as an opportunity. Framing an event as a threat may initiate defensive strategies, whereas framing an event as an opportunity would most likely result in more innovative and creative responses. Similarly, research on ethics and framing suggests that if managers do not initially frame an issue as having ethical implications, ethical reasoning and decision making will not occur.

Organizational researchers have used institutional framing to help explain decision-making behaviors affecting various corporate stakeholder groups. For instance, how business strategy is framed is demonstrated to affect decision-making style. When decision makers frame their company's strategy as "cooperative," decisions tend to be made participatively. When strategy is framed as "entrepreneurial," decision makers tend to act autonomously. Also, the presence of sanctioning systems within an organization affects whether decision makers hold "business frames" or "ethical frames." Business frames trigger decision makers to engage in cost-benefit analyses when deciding to act cooperatively versus competitively. Ethical frames are more likely to trigger cooperative behavior, regardless of the existence or strength of the sanctioning system.

The way the purpose of the corporation is framed is an important subject within the domain of business and society. The ownership theory of the firm frames a corporation as an entity owned by the shareholders. This frame defines the sole purpose of the corporation as maximizing the value of the firm for stockholders. From this perspective, shareholders' interests always take first priority over any other stakeholder group. Business leaders who frame the raison d'etre of business as maximizing shareholder wealth are unlikely to make decisions and take actions that explicitly consider stakeholder concerns.

Conversely, stakeholder theory frames the purpose of the corporation as creating value for society. Framed as such, corporations must make a profit, thus creating economic value, but they must create social value as well. The stakeholder frame suggests that along with the interests of the stockholders, the interests of multiple stakeholder groups, such as employees and customers, must also be considered.

Institutional framing affects the perceptions of those both within and outside of the organization. It is advantageous for an organization to use framing in an effort to garner support and legitimacy from its internal and external constituents.

Instrumental Value

Instrumental value refers to the value that something has in virtue of its being conducive to something else of value. As such, to value something instrumentally is to value it as a means to some other end. For instance, currency has merely an instrumental value to most persons, insofar as it enables them to procure other goods and services that they value. Instrumental value is contrasted with intrinsic value. To value something intrinsically is to value it in and of itself, for its own sake, and not as a means to anything else. Furthermore, something that is of instrumental value can come to lose that value: when it is no longer necessary to achieve the end in question, when something else is found that can be used to achieve that end equally well, or when the end in question is no longer desired. However, the intrinsic value of something cannot be replaced by something else or lost in a similar manner. Since people only value things instrumentally insofar as they are means to something else of value, many philosophers hold that people must value some things intrinsically; otherwise there could be no instrumental value. It is important to note that the categories of instrumental and intrinsic value are not necessarily mutually exclusive, as something might have both an instrumental and an intrinsic value for a person. For example, a person might value a piece of artwork intrinsically as an aesthetic object as well as instrumentally as an investment.

Although attributions of instrumental and intrinsic value are not necessarily mutually exclusive, a number of concerns in contemporary business ethics turn on the extent to which some business practices reduce certain values to the merely instrumental level. While there is much debate on what precisely can have intrinsic value, there is a large vein of philosophical ethics that maintains that persons have intrinsic value. Deontological theories, such as Kantian ethics, typically stress the intrinsic value of persons as ends in themselves. To recognize someone as having intrinsic value is to recognize his or her value independent of the projects or desires of others. Since persons, on such views, have an intrinsic value, it is morally wrong to treat them as mere means toward one's own ends. This entails, on most deontological accounts, a basic duty of respect for others and, often, acknowledging a corresponding set of human rights that ought to govern our interactions with others. Such views would rule out coercive or deceptive practices and prescribe behavior toward others that enhances their autonomy and respects their individual value.

In this vein, a number of business practices have been singled out as instances in which persons are treated as having merely instrumental value. For instance, deceptive advertising practices and predatory marketing to vulnerable groups have been seen as paradigmatic cases in which consumers are treated as mere instruments for the generation of revenue, at the cost of failing to respect their individual worth. Likewise, employers are accused of treating their employees as having a merely instrumental value when they subject them to working conditions that are inherently dangerous or degrading or that infringe on their basic human rights. Criticisms of the latter sort have been particularly prominent in regard to the use of sweatshop labor in undeveloped countries.

More general concerns about commodification and consumerism can also be tied to issues involving questions of intrinsic and instrumental value. Some critics, for example, argue that commodification refers to social practices that reduce nearly everything to mere commodities that are viewed only in terms of their monetary, and thus instrumental, value. Such critics contend that the commodification of things such as art, education, knowledge, and even personal relationships has led people to overlook what they take to be the intrinsic nature of such goods. Similarly, critics of consumerism maintain that the rampant consumption of unnecessary and trivial goods found in postindustrial economies involves a leveling of all value to mere instrumental value and in doing so undermines people's ability to recognize and engage with social goods of intrinsic value.

Finally, there is also a good deal of contemporary debate in business ethics about the value of the natural environment. Traditionally, much economic thinking and, perhaps as a result, many business practices treated the environment as having a merely instrumental value. In particular, the environment was seen as only providing instrumental value in the form of natural resources. As such, natural ecosystems, biological diversity, and even the existence of particular species of flora or fauna were seen as having no value except in relation to human production and consumption. Many contemporary environmental ethicists argue that this view was responsible for much of the environmental degradation, pollution, and other environmental problems that currently exist. These environmentalists argue for a more biocentric view that recognizes the intrinsic value of elements of the natural world. If they are correct, then businesses might have some responsibilities toward the environment that are not merely reducible to their responsibilities to other persons. Of course, whether or not such critics are right will turn upon a more careful examination of the nature of intrinsic value itself.

Integrative Social Contract Theory (ISCT)

The term *integrative social contract theory* (ISCT) was coined by Tom Donaldson and Tom Dunfee, two business ethicists at the Wharton School of the University of Pennsylvania who, as a philosopher and a legal scholar, respectively, elaborated a methodology for developing norms for corporate morality on the basis of a social contract model. As in the work of classical contract theorists such as Hobbes and Locke, who used the contract model to specify the principles for the legitimate exercise of power by the state, ISCT seeks to specify the principles for socially responsible corporate conduct on the basis of a social contract model especially adapted for this purpose.

An explicit goal of the ISCT project was to improve on the practical guidance of general ethical theories such as utilitarianism, Kantianism, virtue ethics, or the stakeholder model. By their very nature, these general ethical theories will always remain insufficiently specific to provide concrete practical guidance. The general thrust of the ISCT project can be seen from the examples with which the project was introduced, Royal/Dutch Shell's dispute with the Ogoni, an indigenous people living in the Niger Delta, and the bad publicity over the *Brent Spar* affair. The idea here is that in any practice of foreign direct investment there may well arise conflicts between (usually stricter) moral norms in the home country of the firm and the (generally more lenient) standards practiced in the host country. ISCT then presents itself as an instrument preeminently suited to resolving these kinds of conflicts.

At the core of all contractarian approaches is the idea that all parties involved in the social contract ("the contractors") voluntarily *consent* to whatever the terms of the contract are. Any social contract theory must therefore give some characterization of the parties to the contract and their motivation to come to agreement. ISCT describes the contractors as motivated by a mix of preferences, in which some are greed driven, some altruistic, but in which most are simply somewhere in between and do not know to which economic community they will belong or their personal wealth. But they have settled understandings of deep moral values, which are used as ingredients for the moral norms the contract will sanction.

Having thus characterized the choice situation, ISCT argues that contractors will agree on a procedural model of four steps that will help specify some universal principles, called hypernorms, which may be presumed to be valid in all places and circumstances. The core idea of the ISCT model is that any conflicts among local norms can be reconciled by these universal principles. And as more empirical evidence is gathered, these presumed hypernorms acquire a stronger status (and supposedly more moral authority).

Criticism of ISCT

Ever since the beginning, commentaries have pointed out some major ISCT problems. For present purposes these criticisms may be divided into challenges of the empirical applicability of the project and the more conceptual criticism of the actual setup of Donaldson and Dunfee's social contract model. Many empirically oriented commentaries have criticized the project in its present form for failing to specify more concrete hypernorms. Conceptual commentaries point out that the contract model is only suited to formulating formal principles that still require an act of judgment by practitioners before they can provide concrete practical guidance.

Integrity

Integrity can be defined as the quality of being honest and morally upright. Integrity is a crucial foundation for all trustworthy stakeholder relations in business. More specifically, integrity is both a personal and a social capacity to coherently process moral awareness, deliberation, character, and conduct, to regularly render balanced and inclusive judgments regarding moral results, rules, character, and context, to routinely demonstrate mature moral reasoning and relationship development, and to design and/or sustain morally supportive intraorganizational and extraorganizational systems. The four dimensions of integrity are process, judgment, development, and system capacities; they both enable and reflect moral coherence, moral wholeness, moral maturity, and moral environment.

Process Integrity and Moral Coherence

Process integrity capacity is the coherent alignment of individual and collective moral awareness, deliberation, character, and conduct. The need to address lapses in process integrity capacity is evident by the frequent disconnect between business moral rhetoric and actual behavior that provokes stakeholder criticism of moral hypocrisy, for example, multinational corporations that tout their public relations images of being responsible corporate citizens while engaging in morally objectionable practices that pollute the natural environment and exploit indigenous workers.

Ordinary language definitions of personal integrity as embodying cohesive and sincere adherence to moral principles and commitments refer to process integrity capacity. A person of integrity is commonly understood to be one who is morally aware (i.e., perceives, discerns, and is sensitive to moral issues), demonstrates both autonomous reflection and interdependent moral deliberation in the analysis and resolution of moral problems, is ready to act ethically (i.e., exercises intellectual, social, moral, emotional, and political virtues that build strong character and motivation to act ethically), and engages in responsible, aligned, and sustainable conduct (i.e., takes action that is consistent with personal moral resolutions on a regular basis, even at great personal sacrifice, and can publicly applaud the moral justifications for doing so). Moral coherence between belief and expression, awareness and deliberation, word and deed, and among moral judgments, commitments, and actions is a hallmark of authentic personal integrity.

Moral coherence also entails social process integrity. Teams, firms, cities, and institutions, for example, with high process integrity capacity are more likely than competitors to be aware of and rapidly respond to multiple stakeholder moral concerns, arrive at balanced decisions that form sound policies, and build supportive moral systems that sustain business and social excellence. They exhibit a coherent unity of purpose and action in the face of moral complexity rather than succumb to collective inertia or biased decision making.

Judgment Integrity and Moral Wholeness

Integrity also entails moral wholeness that is enabled by and reflected in judgment integrity capacity. Judgment integrity capacity is the balanced and inclusive use of key ethics theories and dialogic resources in multiple stakeholder relationships to analyze and resolve individual and/or collective moral issues. Ethics theories can be organized into four categories: teleological ethics theories (emphasizing moral results/purposes), deontological ethics theories (emphasizing moral rules), virtue ethics theories (emphasizing moral character), and system development ethics theories (emphasizing moral contexts). Personal moral wholeness is determined by the degree to which an individual in interaction with multiple stakeholder relations achieves good results, follows the right rules, cultivates virtuous character, and sustains morally supportive contexts throughout life without underemphasizing or overemphasizing any of these factors. On the other hand, ruthless individuals who overemphasize the achievement of good short-term financial results while violating moral and legal rules, forging vicious character traits such as callous insensitivity to others and destroying morally supportive contexts, demonstrate a lack of moral wholeness and dishonor the diversity of stakeholder relationships.

At the social level, exhibiting moral wholeness and judgment integrity capacity for teams, organizations, cities, and institutions means optimally achieving good results (profits in the private sector, votes in the public sector, and donations in the nonprofit sector) by adhering to standards of right conduct and following the right rules, while habitually developing virtuous character traits in moral work climates and creating or sustaining morally supportive intraorganizational and extraorganizational contexts. All four theories and their arguments communicated in a dialogic relationship, with appropriate emphases for each issue, are necessary for inclusive and balanced analysis and resolution of moral issues. Business leaders who refuse to engage in the moral dialogue process and unilaterally insist on overemphasizing or underemphasizing good results, right means, virtuous character, and/or morally supportive contexts incur the same adverse consequences as business leaders who cannot handle behavioral complexity, that is, offended individuals, neglected opportunities, eroded trust, and corrupted environments.

The moral wholeness of social judgment integrity capacity is also demonstrated by the extent to which specific moral principles guide role relationship decisions in the private, public, nonprofit, and corporate domains. In the private domain of shared interests, for example, role relationships between doctor and patient, producer and consumer, or teacher and student, moral wholeness is demonstrated by the extent to which the moral principles of equality, decency, reciprocity, and honesty are included in and guide transactional and participatory ethics decisions. In the private domain of conflicting interests, moral wholeness is demonstrated by the extent to which the moral principles of justice, honoring diversity, and beneficence are included in and guide recognitional ethics decisions. At times morally whole persons give precedence to the rights of others over their own interests out of respect for retributive justice, the inherent value of relationship diversity, and beneficence, that is, avoid doing harm, repair or compensate the harm you did, prevent harm being done by others, avoid bringing about conditions that generate harm, and do good wherever and whenever you can to sustain trustworthy relationships.

In the public domain, for example, role relationships between elected officials and citizens, public employees and government authorities, and public administrators and natural resources, moral wholeness is demonstrated by the extent to which the moral principles of public deliberation, fairness, civic cooperation, concern for the common good and public trust, secure civic reciprocity, and responsible natural stewardship are included in and guide representative and ecological ethics decisions. In the nonprofit domain, for example, role relationships between donors and recipients, volunteers and NGO administrators, and needy populations and international aid agencies, moral wholeness is demonstrated by the extent to which moral principles of cultural openness, transparency, respecting resource boundaries, compassionate sensitivity, accountable generosity, planetary citizenship, and emancipation are included in and guide civil society and philanthropic ethics decisions. In the corporate domain, for example, in role relationships between employees and employers, suppliers and distributors, and investors and managers, moral wholeness is demonstrated by the extent to which the moral principles of meritocratic justice, respect for ownership rights and multiple stakeholder interests, legal growth and responsible property management, corporate citizenship, and triple bottom line accountability are included in and guide market ethics decisions.

Developmental Integrity and Moral Maturity

Developmental integrity capacity is the cognitive and affective final improvement stage of individual and collective moral reasoning and caring relationship formation capabilities from an initial stage of preconventional self-interested concern (morally immature, selfish connivance) through a stage of conforming to external conventional standards (partially morally mature, external-governing compliance) to a final stage of postconventional commitment to universal ethical principles and responsive caring relationships (morally mature, self-governing civic integrity). Postconventional principled moral reasoning and caring relationship prioritization demonstrate moral maturity. Morally mature leaders are living examples of developmental integrity capacity who have internalized their identity-conferring commitment to universal principles such as justice and responsive caring relationships, are emotionally attuned to their stakeholders, and elevate the moral expectations and performance of stakeholders to the level of social integrity. Erik Erikson, for example, regarded integrity as the highest stage of personal ethical and psychological development.

Individual and collective connivance is the lowest stage of moral development, characterized by the use of direct force and/or indirect manipulation to determine moral standards. Business leaders and work climates that sustain this stage of moral immaturity are either issuing threats of force (e.g., "Get it done now or else") or developing exclusively exploitative relationships based on mutual manipulation (e.g., "I'll lie for you if you lie for me") to enact a moral jungle. Firms and societies that abuse their members perpetuate this moral immaturity.

Individual and collective compliance is the intermediate stage of moral development, characterized by either conforming to popular work norms or adherence to externally imposed standards. Business leaders and work climates that sustain this stage of partial moral maturity abandon the moral jungle and are either admonishing employees to secure peer approval (e.g., "Everyone in your work group must follow these traditional standard operating procedures") or commanding them to comply with organizational hierarchy and/or externally imposed regulations (e.g., "You must conform to government regulatory standards or you will be imprisoned"). Corporate external compliance efforts prevent criminal misconduct and limit corporate legal liability, but they do not enable responsible internally governed moral behavior. Compliant business leaders whose highest moral aspirations are to stay out of jail are not operating at the level of commitment to developmental integrity.

Individual and collective commitment to integrity is the highest stage of moral development, characterized by the use of substantive democratic participation and/or internalized respect for universal moral principles and caring stakeholder relationships as a basis for determining moral standards. Business leaders and work climates that sustain this stage of moral maturity are either identifying and satisfying the wishes of the majority (e.g., "Everyone should participate in public deliberations and vote, but the majority opinion will prevail in policy formation") or eliciting commitment to universal moral standards (e.g., "Whatever policies we adopt by consensus must meet universal standards of justice, care, and global citizenship"). Firms and societies committed to developmental integrity standards act like morally mature citizens on behalf of other internal and external stakeholders—domestically and globally.

System Integrity Capacity and Moral Environment

System integrity capacity is the demonstrable capability to design or sustain organizational moral infrastructures and extraorganizational relationships that provide a supportive moral environment for ethical conduct. The system contexts within an organization and outside it can either support or inhibit ethical action; for example, the morally impoverished environment of a corrupt organization located in a crime-infested city in a bribery-riddled nation on a heavily polluted planet inhibits viable institutionalization of system integrity capacity. Individuals and collectives that design or sustain supportive moral environments at the intraorganizational and extraorganizational levels demonstrate system integrity capacity.

At the intraorganizational level, system integrity leaders design or sustain purposes, policies, processes, and procedures that not only meet legal compliance standards, for example, conformity to the revised U.S. Federal Sentencing Guidelines and the Sarbanes-Oxley Act, but also support relational integrity, for example, individual respect for employees as citizens; secure trustworthy, reciprocal interpersonal work relations; empowered, justly compensated, and collaborative teams; use of organizational ethics needs assessments and system moral performance improvement measurements; and reward/reporting systems that hold all employees accountable to ethical standards.

At the extraorganizational level, subnational entities such as cities, states, or regions, national sociopolitical cultures, and international human and nonhuman standards create moral environments that enhance or inhibit process, judgment, and developmental integrity capacities. For example, since business leaders and firms are a part of the system of domestic civil society, the extent to which they form cooperative partnerships with city, state, regional, and national sociopolitical leaders to cosponsor projects that mutually support human flourishing and intergenerational coprosperity indicates their capacity for designing and sustaining domestic system integrity. In addition, since business leaders and firms are a part of the system of global civil society, the extent to which they promote responsible industry standards globally, support international laws, treaties, and standards for free and fair trade, endorse global human and natural sustainability standards, for example, the Global Compact principles of respect for human rights, fair labor standards, natural environment stewardship, and anticorruption and the Earth Charter provisions of caring for the community of life, ecological system integrity, socioeconomic justice, and democracy, nonviolence, and peace, indicates their capacity for designing and sustaining global system integrity.

INTELLECTUAL CAPITAL

To speak of intellectual capital is to speak of a new class of assets that emerged toward the end of the 20th century and rapidly achieved strategic, financial, and economic significance in the world of business and the affairs of society. While these intellectual assets were long recognized in some inchoate sense, and referred to as “goodwill” by accountants and financial executives, it wasn’t until the end of the 20th century that they became formally recognized and monetized, got placed on par with the traditional physical and financial assets, and began to gain their ethical character.

Economically, intellectual capital is the asset base of a new, knowledge-based economy that is producing significant levels of equity and wealth based on the formalization of ideas, innovation, and creativity. Equally important, intellectual capital has achieved immense significance strategically and managerially in the world of business because of its ability to create new enterprise value, establish differentiation in the marketplace, and deliver often sustainable competitive advantage. Thus, socially and culturally, this new class of assets articulates an expanded role for knowledge and creativity within civilization.

The concept of intellectual capital embraces the products and creations of thinking and feeling, the arts and the sciences, the professions, and the world of business insofar as they are treated as assets and leveraged for business or enterprise purposes. Specifically, in the world of business, intellectual capital includes all the ideas and creations that have become central to the modern enterprise, such as brands, intellectual property portfolios, innovation, knowledge, and the competencies and talents of human capital.

Early Terminology and History

When defining *intellectual capital* one must articulate it with regard to a set of terms and phraseologies that are often confusingly similar, with each describing a dimension of intellectual capital as seen from the perspective of a particular profession and its body of knowledge.

Intangible assets, goodwill, nonfinancial assets, intellectual property, intellectual assets, and *knowledge-based assets* are discipline-specific terms that are often used interchangeably and more or less synonymously to refer to what, at its most articulate, has become known as *intellectual capital.*

Intangible assets and *goodwill* are accounting and financial terminologies that predate the 21st-century understanding of intellectual capital. Such terms are used by accountants and financial professionals to refer to the "intangible" entities or factors of financial analysis that couldn't readily be captured and reported in the traditional documents of financial reporting such as the balance sheet and profit and loss statements. Thus, for example, until the turn of the 21st century, any monetary value allowed to brands and intellectual property was commonly captured as goodwill.

Intellectual property of course has long been recognized in modern law as those ideas, inventions, processes, names, and creations that could be protected and asserted under the law as patents, trademarks, copyrights, and trade secrets. At least since the European Renaissance, the economic and political significance of ideas and inventions has been acknowledged in some form or another, often as business monopolies or commercial grants that were bestowed on a citizen of the realm by a monarch or noble. Near the end of the 20th century, as it became clear that intellectual property had previously unrecognized economic and strategic significance and was thus a business asset that could be deployed to deliver competitive advantage, lawyers and managers began to refer to it in its strategic deployment as an *intellectual asset.* And soon a new discipline, referred to as *intellectual asset management,* began to emerge. During the early 21st century, intellectual asset management sufficiently formalized itself to become the topic of numerous scholarly publications, journals, seminars, conferences, and corporate strategies.

Simultaneously, economics and the emerging knowledge management and informational technology practices began to refer to the same intellectual phenomena as *knowledge-based assets.* As the production process for creating intellectual assets became increasingly clear, data were collected and turned into information and, finally, knowledge, and *knowledge-based assets* became the operational term for increasingly palpable intellectual assets.

Strategically, and at the senior and executive levels within corporations, *intellectual capital* became the synthetic terminology used to refer to all the intangible, intellectual, knowledge-based material and goodwill that could be managed and fruitfully leveraged toward some strategic business purpose.

Ethics and Intellectual Capital Practices

The managers of both tangible and intangible assets are, of course, always bound by the generally accepted ethical constraints commonly associated with society and business, the responsibility to manage and optimize enterprise assets within the law for the good of the business and its shareholders, and the concern with matters of mismanagement, misappropriation, fraud, and greed.

However, intangibles, because of their imprecise nature and volatile dynamics, also invoke new, often subtle considerations of intellectual property infringement, interference in business relations, unfair competition, failure to report assets, and regulatory and compliance violations. It is with this management and deployment of intellectual capital assets that ethical issues can emerge. The primary ethical issues that have emerged around intellectual capital assets may be classified as concerning the creation, the monetization, or the responsible management of intellectual capital assets.

The Creation of Intellectual Capital Assets

In many cases, the ease with which intellectual assets such as a trademark or a patent can be created has led to forms of abuse that, while not always prima facie illegal, may misappropriate intellectual material or unfairly block competition from market access. The earliest such form was a practice that became popular in the closing decades of the 20th century and that was known as *trademark banking.* In such cases, large corporations that could afford to file innumerable trademark applications adopted the practice of registering often large numbers of trademarks in case they decided to use them and to prevent competitors from adopting the same or similar names for their own purposes. In such cases, organizations would prepare and sell some small token of an apparently new product under the desired trademark so as to be able to comply with the minimum requirement of interstate commerce for filing a trademark registration. Then they would file a formal application for that product name, often followed by related or similar versions of the name, intending to abandon the trademarks after 5 or 6 years if they had not used them or when they no longer had critical commercial value to the organization or its competitors.

Similarly, during the 1990s, large corporations began filing what later became know as *junk patents* to prevent competitive technologies from entering the marketplace. In these cases, a large company would build a wall around their existing technology by filing many patents with incremental and often insignificant differences. When representative of novel expansions of a core invention, building a "thicket" around a valuable technology is a wise and generally accepted way of protecting a core technology. However, when an array of "junk patents" is simply a "log in the public road" blocking a competitor from gaining legitimate access to a market, it becomes an unethical practice.

At first both trademark banking and patent thickets simply seemed like smart strategic thinking, and they were eagerly embraced by many large organizations. In time, however, it became increasingly difficult for legitimate market entries to find names they could trademark as so many were taken up by apparently legitimate trademark registrations that actually had no presence in the marketplace. Inventions and innovation were also frequently blocked by junk patents, preventing innovations from reaching the public marketplace. In both cases, while originally accepted as a way of expanding and insulating valuable intellectual property from infringement, once it began to prevent legitimate competition from entering the marketplace it became unethical and even illegal in some cases. The line between best intellectual asset practices and unethical practices is subtle, and it is easy for a brilliant strategy when taken to an extreme to become unethical, anticompetitive, monopolistic, and even predatory.

The Monetization of Intellectual Capital Assets

Because intellectual assets are much more volatile than are the traditional physical and financial assets, these assets are more susceptible to manipulation. Primary among the ethical problems that have emerged with the monetization of intellectual assets are the "min-maxing" of intellectual assets, causing fluctuations in asset valuation, and the matter of "hidden assets," or unreported intellectual assets.

During the early 1990s, boards of directors and visionary executives wielding the then new power of the expanded intellectual asset market capitalization of their company gave birth to the modern stock-based mergers and acquisitions strategy. Suddenly, even in relatively cash-poor companies, new growth was possible through the pooling of assets allowed in stock-based business combinations. In many such cases, as no cash or debt was involved, executives became star performers by acquiring businesses, delivering apparently unending corporate growth, and providing stock price appreciation—while simultaneously building their careers and personal wealth. As the buying of corporations progressed, and the orderly exiting of executives with their newfound wealth proceeded, it became clear that deal-makers had manipulated or otherwise justified intangible asset valuations to enhance the value of or to ensure the consummation of a business deal, while often knowing that such maximized valuations would later be hard to maintain in an ongoing business.

The discovery of valuable intangible assets and how they could be leveraged to effect highly valued merger and acquisition transactions made it also likely that many deals would be consummated at values that were unsustainable because the intangible asset valuations, arrived at without a proven intangible asset valuation methodology, had been set high on enthusiasm. As the highly volatile nature of intangible assets became more understood, financially unsustainable, overvalued transactions that benefit only the short term began to be seen as unethical. While temporarily gaining from the peaks of stock appreciation, in the end longer-term shareholders later had to reconcile the losses driven by the speculation and unsustainability of the respective asset value. *Making the deal* was often more important than the later insolvency of overvalued deals and their impact on long-term shareholder value.

Subsequently, to discourage such manipulation, the Financial Accounting Standards Boards passed new regulations that require intangibles acquired in a business combination be recognized on the balance sheet and to be tested annually for the impairment of their value, with overvaluations entailing a write-down in enterprise valuation. Prior to impairment testing, when no write-downs were required, it was easier to put together overvalued or poorly valued mergers or acquisitions that allowed some financiers, corporate executives, and investors to make large amounts of money, only to leave the company with overvalued assets and large, potential write-offs later.

During the early years of the 21st century, regulations and ethical best practices identified this min-maxing of intangible assets as a form of market manipulation, thus sharpening the ethical focus on fair and accurate valuation and long-term shareholder benefit.

At another extreme lies the ethical problem of "hidden (intellectual) assets," which remain unrecognized to reduce financial reporting volatility and remain undisclosed to investors. Somewhere between the requirements of disclosing "material assets" and the realization that intellectual assets are extremely volatile and can experience dramatic shifts in value lies the proper and ethical accounting recognition and enterprise management of intellectual assets.

In this respect, managers are often caught between formalizing and gaining managerial control over intangible assets and leaving them "hidden" and unrecognized to avoid being held financially accountable for them. Building the asset base of the organization with a volatile intangible asset that could be difficult to manage, fluctuate in value, or unfavorably affect the stock price of an organization can be premature or irresponsible. However, recognizing valued intangibles, such as "brands" and "patent portfolios," even though they could affect enterprise valuation if they were recognized, is essential to gaining managerial control over such assets.

For many, the ethical solution lies in recognizing that intangible assets move through stages of concretization, ranging from being entirely intangible to being well-identified, formalized, managed, and eventually benchmarked, valued, and possibly monetized. The place at which they are adequately concretized and stabilized to allow meaningful management is the point at which they become a potential financial reporting disclosure. At that point, to keep them out of financial reporting documents may be to act unethically. To underscore the ethical and legal responsibility to disclose and manage material assets, during the beginning of the 21st century, organizations began to experience not only SEC censure for the failure to disclose material assets that affect financial performance, and Sarbanes-Oxley reprimands for failing to establish internal controls for such assets, but also the first shareholder lawsuits for a failure to manage intangible material assets.

The Responsible Management of Intellectual Capital Assets

Unmanaged or poorly managed intellectual capital assets represent liabilities to investors and culpabilities to management. Assets that have not been identified and formalized cannot be managed and optimized to deliver enterprise performance.

In cases where the rigor brought to the management of tangible and financial assets doesn't also characterize the management of intellectual assets, organizations are unable to certify either proper managerial controls or the veracity of the financial reporting document; in doing so, they also renounce the opportunity to monetize and securitize their intellectual capital assets, thus leaving assets underleveraged and unoptimized. Because it is an ethical responsibility to manage and optimize enterprise assets, the failure to do so is an ethical failure on the part of management.

While broad and frequently undefined security interests during the latter quarter of the 20th century would often include statements in contracts that bound or included reference to "all intellectual property," it was only during the 1990s that this practice was replaced by intangible asset-specific agreements that broke new financial and monetary ground by defining, for example, specific patents or trademarks and their assigned values, much as equipment or inventories may be specified in contracts surrounding tangible assets.

Soon thereafter, intellectual assets began to make their appearances as the substance of traditional financial vehicles allowing, for example, royalty streams associated with intellectual property to become securitized in the public markets, intellectual property pools to emerge to set industry or application standards, sales and license-backs of intellectual property to become increasingly common, and intellectual assets to be used to secure debt or as credit enhancements in banking transactions.

The Ethical Future of Intellectual Capital

These and other ethical issues typify the issues of right and wrong in managing intellectual capital assets, which is so important because of their ability, when handled ethically, to enhance the fulfillment of strategic purposes and the creation of new levels of individual and societal prosperity and well-being.

The most optimistic observers have suggested that, just as we watched an Industrial Revolution unfold across the 19th and 20th centuries, the 21st-century economy will, with the rise of intangible assets, behold the unfolding of an era of intellectual capital assets that may last as long as, if not longer than, the former tangible asset era and generate levels of global wealth and human well-being that are as different from the dawning 21st century as that time is from the world of commerce at the beginning of the Industrial Revolution.

It is perhaps no coincidence that intellectual capital has emerged at the same time that tangible assets have begun to approach optimal levels of efficiency and leverage, and the traditional industrial era markets have begun to reach maximum levels of saturation, signaling that maximum possible levels of consumption have been reached.

Thus, the priorities for knowledge, the opportunities for creativity, and the focus of innovation will drive future economic growth. At the turn of the 21st century, the ethics of these increasingly conscious choices are characterized by discussions of corporate social responsibility, personal privacy, intellectual property ethics, environmentalism, globalization, social policy, and the greater good.

Furthermore, the shift to intellectual capital drives a great focus on its means of production—these being thinking, imagination, invention, innovation, know-how, and creativity. Accordingly, ideas and talent will become the currency of an era of intellectual capital that will place a high premium on the ability of individuals to imagine and create. This represents a substantial shift in our modus operandi as a society and will require the development of creative capabilities among many that previously had been limited to the few. Progressively, more corporations are likely to become engines of innovation, increasing the importance of education, while individuals will become more right-brain focused, emotionally intelligent, primarily concerned with meaning and purpose, and alert to the ethical fabric of society.

As intellectual capital becomes the new means of production, and as we shift paradigms from an industrial era and an industrial economy based on labor and tangible assets to a new economy based on intangible assets, information technology, the advancement of knowledge, and the creations of the mind and intelligence will become increasingly essential to the advancement of society, culture, and civilization.

Intellectual Property

Intellectual property, as distinguished from real property, pertains to products of the mind (or intellect)—it refers to those rights or entitlements that attach to intangibles such as artistic expressions and technological inventions. Protection is afforded to intellectual property to encourage development of ideas, expressions, and processes for commercial gain.

Types of Intellectual Property

There are various types of intellectual property. Distinctions are made according to the nature of the proprietary innovation.

Copyrights

Intellectual property such as computer software, video games, songs, and movies are granted legal protection in the form of a *copyright.* A copyright is a set of exclusive legal rights accorded to the expression of a particular literary, artistic, or scientific work. Any moral rights are separate and distinct from the legal rights. The purpose of copyright law is to protect and promote creative endeavors by deterring unauthorized use.

Copyrights are not granted automatically. For material to be protected, it must reflect some degree of originality. Furthermore, copyrights are not indefinite; in fact, they typically expire after a predetermined period of time (typically, 50 years).

A fair use exception excludes some uses of copyrighted material from legal protection. To determine whether the fair use exception applies, the purpose of the use is considered, along with the nature of the work. Copyrighted material is often given fair use treatment when used for educational purposes. Also considered are the proportion used, compared with the size of the whole, and the effect of the use on the potential market for the copyrighted material.

The granting of copyright protection is defended on public policy grounds. First and foremost, copyright law provides an incentive for creators to share their ideas with the public, and, at the same time, it militates against intellectual piracy. Through copyright law, copyright holders can enforce their rights through civil lawsuits.

Patents

Patents are issued with regard to systems, processes, and other inventions. New mechanical contrivances, for example, are appropriate subjects for patent protection. A patent offers the patentee exclusive rights for a defined period of time—often 20 years—in exchange for sharing information with the public about the protected systems, processes, or other inventions. The proprietary right allows the patentee to restrict others from making, using, or selling the patented invention until the term of the patent expires.

A condition for a patent to be granted is that the patentee provide a written description of the invention in sufficient detail so that another person could reproduce that invention. Once a patent is granted, the patentee's rights can be enforced through the vehicle of civil lawsuits.

Four reasons are generally offered to justify the protection of intellectual property rights: disclosure, innovation, product investment, and design development. Generally, patents are given to encourage inventors to share information about their inventions. Through disclosure to the public domain, inventors are able to build on the inventions of others. Without the protection of patents, inventors might be reluctant to share their creations with the public.

Patents are also widely considered economically beneficial. The promise of exclusive rights to an invention is believed to promote innovation of new systems, processes, and devices. This encourages companies to invest in research and development up front because of the anticipated financial returns often linked to the patenting of successful inventions.

Finally, patents arguably provoke new innovations in that, once a patented invention exists, competitors are inspired to develop new designs to work around the patented invention. In this way, the patent system promotes technological progress and economic growth.

Trademarks

A trademark is a distinctive symbol or sign to which commercial value is attached because of the connection between the symbolic representation and organizations, products, or services. Trademarks distinguish organizations, products, and services from those of their competitors. Traditionally trademarks have taken the form of names, phrases, symbols, designs, and images.

The primary purpose of a trademark is to identify organizations, products, and services in the marketplace. Rights are enforced to protect the ability of organizations to benefit financially from their investment in distinguishing their products and services through a brand image from those of competitors. For rights to be enforced, however, trademarks must be registered.

To be registered, a trademark must be distinctive. Fanciful designs and made-up words (i.e., *Kodak* as a camera company) are often de facto eligible for trademark protection. Similarly, arbitrary words (i.e., *Apple* as the name of a computer company) are also considered acceptable, although apparent trademark infringements, as with Apple Records, must sometimes be resolved through negotiation and, often, compensation. Suggestive words (i.e., *Salty* for sailing equipment) can serve as legitimate trademarks, whereas descriptive or generic marks (i.e., *Salty* as used with saltine crackers) are not protected.

Unlike copyrights and patents, trademark rights do not expire within a predetermined time period. For rights to be enforced, however, the trademark owner must continue to use the trademark.

Public policy considerations underlie the granting and enforcement of trademark rights. In fact, trademarks are generally considered to benefit consumers. While companies are able to reap the financial benefits of establishing strong brand reputations and linking those reputations to identifiable trademarks, the consumers benefit from making more informed decisions about the companies, products, and services in which they invest.

Ethical Considerations

The granting of intellectual property rights is often controversial. Assigning rights to intellectual contributions creates negative rights, in that rights attributed to intellectual property involve excluding others from using that property. This can arguably stifle competition and inhibit consumer choice and artistic appreciation.

Furthermore, intellectual property rights are distinguishable from the rights that attach to real property in that their abridgement does not result in harm, other than perhaps the financial loss of opportunity costs to the innovator. Even this is not certain, however. Many musicians, for example, argue that Internet-based file-sharing actually increases their name recognition and the popularity of their songs. When intellectual property is shared or copied, there is no tangible loss.

Not all information, expressions, or ideas are eligible for intellectual property protection. Some argue that the choice of what is protected is arbitrary, serves commercial interests, and is not linked to inherent moral entitlements.

Conclusion

It is generally assumed in the United States that free market societies must protect intellectual property to reward innovation and promote economic growth. Individuals and businesses assume and expect that their information, expressions, and ideas deserve the protection of copyrights, patents, or trademarks. The emergence of the Internet, however, has introduced increasing challenges to this framework. On the one hand, technology facilitates the infringement of digitized intellectual property. At the same time, the Internet increases the exposure of intellectual property to other cultures that have different values and regulations pertaining to intellectual property, its use, and its protection.

Interest Groups

Interest groups are associations of individuals or of organizations that form to advance a common political, economic, or social agenda. The political science discipline sees interest groups as crucial to the American political system and as complementary to the political parties. People organize into associations and interest groups for nonpolitical purposes as well, as part of their economic, social, and religious existence. In the political realm, meanwhile, interest groups articulate and advance the political positions and beliefs of citizens, while the political parties attempt to aggregate those positions into coherent party platforms. For instance, during the New Deal Era, the Democratic Party of President Franklin D. Roosevelt aggregated the interests of farmers, industrial unions, big cities, and the southern states in what was known as the New Deal coalition. Interest groups include professional and occupational associations, business and trade associations, labor unions, farm organizations, religious organizations, education organizations, cause-oriented citizen groups and lobbies, legal foundations, think tanks, and public and private foundations.

Political Pluralism

Political scientists such as David Truman, Edward Banfield, and Robert Dahl have defined the structure of political power in America as political pluralism, with interest groups serving as the foundation of the system. The premises of political pluralism feature the key roles that interest groups play, along the following lines:

- Power is measured by outcomes of decisions—those who occupy formal governmental positions may not exercise as much power as do informal institutions such as interest groups.
- Coalitions of minorities rule on issues—the majority democratic sentiment is not as important in determining policy decisions as the actions of organized and intense publics.
- Different groups dominate on different issues—business may win on some issues, labor on others, and environmental groups on still others.
- Internal divisions within classes exist on issues—even business groups do not march in lockstep and may disagree with one another on trade, regulatory, and antitrust issues.
- Leadership roles and resources differ from group to group—while business may enjoy more economic resources, labor might be able to mobilize more people, and citizen groups might possess greater moral rectitude and commitment.
- Power alignments vary over time—while labor unions possessed more power in the 1940s, social movements exercised more power in the 1960s and 1970s, and business won more political battles in the 1980s and 1990s. Power fluctuates over time, and the political pendulum swings from one era to the next.

Types of Interest Groups

The concerns, issue focus, organizational structure, and tactical approaches vary from one interest group to another, along the following dimensions:

Economic (business, labor)	Noneconomic (cause oriented)
Multi-issue	Single issue
National	Local or grassroots
Mainstream	Activist or militant
Membership	Nonmembership

While economists claim that self-interest drives economic and political decisions, not all groups necessarily focus on economic concerns. While business and labor groups might usually be so driven, the self-interests of other groups might relate to noneconomic causes such as the environment, cultural and historic preservation, or consumer safety and privacy. Regarding issue focus, an environmental group might focus on multiple issues, such as air and water pollution, hazardous waste, and global warming, or it might focus on a narrower single issue, such as rainforest protection or animal rights.

Regarding organizational structure, a business group might be organized solely at the national level, such as the Business Roundtable, a group of 160 corporate CEOs, as might an environmental group, such as the World Wildlife Institute. Alternatively, other groups might organize and be active at the state and local levels, such as the chambers of commerce in virtually all cities and the many state chapters of the Sierra Club.

Most interest groups are in the political mainstream, using an assortment of traditional political tactics that include lobbying and litigation. That would include business and labor groups and even the major national environmental and consumer groups. Such groups lobby both the legislative and executive branches, often including participation in regulatory agency proceedings. Meanwhile, grassroots activist groups often use militant tactics such as protests and boycotts. Such groups include local environmental, civil rights, religious, and consumer groups. Community organizers often focus their protests on specific companies, such as the various campaigns around the country to prevent Wal-Mart from building stores in their communities.

Decentralized groups at the grassroots level usually depend on local memberships for their meager financing, while national groups may be either member or nonmember organizations. Some business groups are confederations of local chapters and/or corporations throughout the country, such as the Chamber of Commerce of the United States. Meanwhile, some citizen groups and think tanks have few or no members at all and rely on foundations, corporations, or wealthy patrons for their funding. Decisions in such groups are more centralized in the hands of founders, key staff members, or board members.

Selective Versus Collective Incentives

Public choice economists who believe that all decisions are based on self-interest argue that interest groups must provide selective incentives to their members or supporters to remain viable. They argue that people will not support groups simply out of altruism. Economist Mancur Olson was the leader of this line of thinking in the 20th century. His theory does not mean that groups cannot organize to protect the collective good, only that such groups must also provide selective benefits to their members. For example, the Sierra Club sponsors trips and wilderness hikes for its members, and even sells merchandise, while also lobbying to protect the environment. Critics of Olson maintain that some cause-oriented groups can and do exist by appealing to the public interest or ideological motivations of their members, demonstrating that certain individuals are not driven simply by self-interest. Meanwhile, it is still possible for cause-oriented groups to evade Olson's dilemma by ignoring any membership base entirely and relying on corporate philanthropy or foundation support for their existence. Most citizen groups have taken just this approach.

Business Groups

Business groups, called trade associations, are specific to a given industry and provide a range of selective benefits to their members. Those benefits include lobbying on issues crucial to their members, proprietary information on industry trends and public policy, and training for and communication with industry members. Other business groups, fewer in number, encompass groups that cut across industries and take positions on issues common to the corporate community. Such groups include the Chamber of Commerce of the United States and the National Association of Manufacturers. They necessarily have a more difficult time arriving at consensus positions with which their diverse memberships agree. Business will also develop formalized or ad hoc coalitions with other corporations on specialized issues. For example, manufacturers that use steel have combined to lobby against protection for U.S. steel producers, and food manufacturers that use sugar have coalesced to oppose price supports and quotas for U.S. sugar growers.

Labor unions have been on a steady decline since the New Deal. Meanwhile, business groups have been on the ascent, especially since 1975. During the 1960s and early 1970s, social movements on civil rights, consumerism, women's rights, peace, and the environment challenged the power of business. Business responded in the mid-1970s by imitating some of the tactics used against it—building grassroots lobbying networks, supporting national and regional litigation centers, developing national and regional think tanks, and engaging in public policy philanthropy. For the first time in any serious way, business joined the fight over the power of ideas.

As business developed a wider range of political tactics after 1975, its agenda of political issues also expanded. No longer was it content to fight narrow battles over tax and regulatory issues. It engaged in battles over grand issues that faced the corporate community in general, such as tort reform, winning more of those battles at the state level than at the federal level. Through organizations such as the Public Affairs Council, the Citizens' Research Foundation, and the Committee for Economic Development, it also joined the debate over campaign finance reform. Finally, in 2005 and for the first time in American history, business through the National Association of Manufacturers and the U.S. Chamber of Commerce lobbied in favor of a U.S. Supreme Court nomination, that of John Roberts for chief justice of the United States.

Interest Groups and Regulatory Politics

Two so-called capture theories reflect the comparative political power of business groups and citizen groups, or of economic and noneconomic groups. One theory applies to economic regulation and the other to social regulation.

Capture Theory and Economic Regulation

The more conventional theory is that of the iron triangle, developed by Nobel prize–winning economist George Stigler, and relates to the political power of business groups over economic regulation. He demonstrated that in industry-specific regulatory agencies, such as the Interstate Commerce Commission, incumbent regulated firms had the incentive and ability to capture the agency established to regulate them. By doing so, they would promote the creation of entry barriers against new competitors and protect existing firms from onerous regulations. The firms in the industry and their trade associations played a dominant role in capturing the agency in question.

The tactics used by the industry were economic in nature—providing important information and future employment to regulators to influence favorable treatment of the incumbent firms and to provide campaign contributions to members of congressional committees with oversight responsibility of the agency, ensuring that the agency would not stray from its favorable treatment of the leading firms. This gave rise to the concept of an iron triangle, with industry at one corner of the triangle extending its influence to the regulatory agency and to congressional committees at the other points of the triangle.

Capture Theory and Social Regulation

A milder form of the capture theory relates to social regulation and speaks to the power of noneconomic citizen interest groups. By its very nature, social regulation is economywide in nature and extends beyond a specific industry. For instance, the U.S. Environmental Protection Agency regulates air pollution caused by a host of industries, from utilities to paper companies to steel companies. The agency's broad scope necessarily lowers the incentive for any particular company or industry to attempt any capture of its policies. Environmental and health groups, however, have a far greater incentive since they have a wider range of interests in the agency's decisions. Hence, they will consistently be policy actors in agency decisions.

Although they lack the economic clout and resources of industry as tools of influence, citizen groups do possess other tools and can provide negative incentives to prevent the agency from violating the public good and showing any favoritism to industry. Those negative incentives include lobbying and litigation and, most important, exposure and negative publicity. In such campaigns, the news media serve as willing collaborators with citizen groups and as a transmission belt for any negative information. Hence, the political actors at the various points of the social regulation triangle now change to become the agency, citizen groups, and the media.

Certainly, these alternative capture theories do not fully explain any particular agency decision, whether in the context of economic regulation or of social regulation. The influence of business in economic regulatory decisions and of citizen groups in social regulatory actions might be overwhelmed by other variables specific to a given policy dispute. However, the logic of the two theories does help explain the overall difference in decision patterns in economic regulations and social regulations. The political backlash to the tighter iron triangle of economic regulation also explains the wave of economic deregulation that existed from the late 1970s onward. After exposing the nefarious impacts of the iron triangle, economists and other policy analysts were able to overcome the power of special interests through the power of good ideas to create economic deregulation.

Interest Group Values

One way of comparing the values related to the universe of interest groups is through application of the values of liberty, equality, efficiency, and community. Civil liberties groups such as the ACLU and libertarian think tanks such as the Cato Institute relate of course to liberty. Civil rights groups and some labor unions advocate equality concerns. Business typically adheres to efficiency interests, while environmental groups that promote better quality of life relate closely to communitarian values. Obviously, some groups would represent a hybrid set of related values. Many human rights groups, for instance, would embrace both communitarian and egalitarian values, while many business groups would embrace both efficiency and libertarian values.

INTERGENERATIONAL EQUITY

Intergenerational equity is a conception of justice or fairness regarding the distribution or the availability of material and social goods for future generations. According to proponents of this concept and its application, members of each generation possess a natural and cultural inheritance from past generations and, thus, are beneficiaries as well as custodians with a duty to pass along key aspects and benefits of this heritage to future generations. Issues pertaining to the concept of intergenerational equity that have been raised and debated include ecology and sustainable development, income or social security, accumulation and payment of national debt, educational investments, health care, and technological risks and benefits.

Although obligations to future generations have long been expressed in political philosophy and governance documents, the concept of intergenerational equity has received spirited attention in recent decades. Some of this attention extends from the work of John Rawls and his concern for this and other forms of distributive justice. Intergenerational equity has been discussed, though, from various ethical theories: utilitarianism, deontology, social contract, the ethics of caring, and virtue-centered ethics. For example, justice or equity might be considered among virtues, such as compassion, that could be demonstrated toward those in future generations.

The issue of intergenerational equity with regard to the natural environment arose during the 1972 Stockholm Conference on the Human Environment. This conference led to the creation of the United Nations Environment Programme (UNEP) and the application of the concept of intergenerational equity to part of developing international law concerning the natural environment. The UN-sponsored Brundtland Commission released a report in 1987 urging that economic development take into account planetary ecological limits. The report popularized the conception of sustainable development as development that meets present needs without compromising the ability of future generations to meet their own needs.

Advocates for intergenerational equity have claimed that market mechanisms cannot ensure that certain scarce resources are protected for future generations. Multiple business competitors over time can deplete natural or cultural resources through a "tragedy of the commons" effect. Short time frames and narrow interests in conceptualizing organizational goals, along with uneven power distributions among those making important decisions concerning resource usage, are among the factors commonly cited as criticisms of typical marketplace processes. Those supporting a strong position on intergenerational equity and sustainable development stress that each generation should conserve levels of the diversity, quality, and human accessibility of natural resources so as not to restrict the options available to meet the needs and values of future generations.

Alternative positions that argue for fewer obligations or sacrifices toward future generations include those who believe that (1) present consumption should not be constrained since it is not certain that future generations will exist, (2) unconstrained present consumption will not diminish the well-being of future generations, or (3) future technological innovations will provide for acceptable resource substitutions in the future. Robert Solow, as a prominent economist, for example, expresses technological optimism with regard to issues of intergenerational equity as well as emphasizes the difficulty for decision-making or policy-making purposes of knowing or predicting the preferences and values of future generations.

Proponents of the concept of intergenerational equity have difficult challenges in developing effective decision processes for actually implementing this concept. Human biases and differences in perceptual/cognitive frames influence actual decisions that are made with regard to potential impacts on future generations, and such biases can lead to disagreements concerning types and degrees of future obligations. Problems of stakeholder representation and forms of accountability hinder more satisfactory decisions. Future generations cannot actually be represented in critical decision-making forums, and therefore the potential interests and values of future generations in these processes can fail to be raised. Strong advocates of intergenerational equity seek ways of improving representation for future generations in the marketplace as well as in political, legislative, and judicial decision processes. This representation would involve broader stakeholder participation in improved decision processes that have longer time horizons and that more thoroughly consider diverse gains and consequences of these decisions. Broader stakeholder representation in such important decisions also affects "buy-in" or willingness to commit to sacrifices or discipline that might be necessary to achieve more intergenerational equity. Fuller representation might come from special interest groups or advocates. One example of an intergenerational interest group is the Foundation for the Rights of Future Generations (FRFG). Established in 1996 as a "think tank" and an agent for social and political change in support of intergenerational justice and sustainability, FRFG is based in Germany and has members around the world. The organization rejects notions of generational war, has a culture of discussion and dialogue, and focuses on learning about intergenerational issues and change.

Beyond specific representation or broader stakeholder participation in decision-making processes, other changes have been suggested by proponents for intergenerational equity to establish and implement improved policies. Even aspects of the role and functioning of existing institutions have been questioned, particularly current applications of particular institutional tools and instruments, such as regulations, taxes, laws, standards, incentives, and investments in R&D.

There is limited agreement among theorists in various academic disciplines on better approaches to calculating and comparing opportunities for welfare or well-being across many generations. The issue of fairness across generations has been studied through forms of measurement of the aggregate welfare or quality of life that has been and might be available to cohorts living in different generations. Economists generally favor forms of utility comparison using quantitative approaches and assumptions of exchangeabilty or fungibility of different forms of capital. Some suggest the creation of trust funds or capital savings over time to compensate for the loss of natural or cultural resources. These economic approaches of quantitatively accounting for future utilities relative to present utilities through substituting and discounting mechanisms have been criticized, though. Although appropriate for certain types of cost-benefit and other economic analyses, such discounting of future well-being into a present value scheme has been questioned when applied to public versus private goods and in the case of multigenerational time dimensions.

Environmental advocates often insist that a set of natural or ecological qualities should be saved for future generations since this natural capital cannot easily or simply be exchanged or compensated through other forms of capital. Complications for comparisons of utility or other forms of well-being across generations generally involve lack of knowledge about the future. Questions include the following: How far might obligations extend into distant generations? What identities, characteristics, and needs might these people actually have? To what extent can we anticipate the effects, many unintended, of present decisions on future conditions?

Business or private sector participation in recent international deliberations on sustainable development, such as in the Johannesburg Summit in 2002, has been increasing. Improved dialogue and learning by business and other relevant stakeholders concerning the complex factors and difficult choices associated with responsibility for future generations has been emphasized by those advocating intergenerational equity.

INTERNAL AUDIT

Internal auditing has two key functions. First, it provides management with information on the extent to which the control systems are working effectively. This is especially relevant for those responsible for the governance of an organization. Second, it can deliver advice to management for improvements in the functioning of control systems.

An internal audit is executed mainly by people working within the organization. In contrast, external or independent audits are performed by public accounting firms. External audits attest to and report on the effectiveness of internal controls to the audit committee and the company's officers as part of the preparation and issuance of an annual report. The cooperation between internal and external auditors may be restricted depending on applicable regulatory requirements. In general, the information of internal auditing activities can be passed on to the external auditors to review whether the controls of the audited company are adequately evaluated and documented.

Internal control systems relate to the policies, procedures, practices, and organizational structures and are designed to provide reasonable assurances that business objectives will be achieved and that undesired events will be prevented or detected and corrected. Generally, effective control systems require seven coherent elements:

1. Compliance with norms and procedures to prevent violations of the law
2. Organizational leadership that promotes a culture of compliance
3. Screening of employees in high-risk functions
4. Training, education, and communication over compliance norms
5. Internal monitoring and auditing
6. Maintenance of appropriate disciplines and incentives
7. Corrective actions when violations occur

Internal auditing is thus a part of the comprehensive internal control systems. Interactions between the elements of the control systems are crucial, and therefore internal auditors need to cooperate with all those involved.

The application of internal auditing activities has accelerated due to the imposition of standards and regulations requiring organizations to demonstrate the effectiveness of their control systems. The Federal Sentencing Guidelines (United States), effectuated in 1991, the Cadbury report (United Kingdom), published in 1992, the COSO report (United States), published in 1992, and Sections 302 and 404 of the Sarbanes-Oxley Act, enacted in 2003, are especially relevant in this respect.

The main social function of internal auditing reflects its added value for stakeholders of organizations in demanding that boards demonstrate publicly that they are in control of their organizations. To fulfill this function, internal auditors need to apply and uphold ethical principles of integrity, objectivity, competency, and confidentiality. To achieve this, it is important that the internal audit function be adequately resourced and competently staffed, and that it have direct reporting lines to the audit committee, the board, and the chief executive officer.

Internal auditing professionals are internationally represented by the Institute of Internal Auditors (IIA), established in 1941. Internal auditing is used increasingly in privately owned organizations and governmental and nongovernmental institutions. In 2005, the IIA represented more than 100,000 auditors in 160 countries.

INTERNAL REVENUE SERVICE (IRS)

The Internal Revenue Service (IRS) is the largest bureau within the U.S. Department of the Treasury and is responsible for enforcing federal statutes relating to the reporting and remission of income and other taxes by individuals and organizations through the promulgation of treasury regulations to interpret and apply these statutes, and through the administration of procedures collecting taxes and transferring them to the U.S. Treasury.

Predecessor Institutions to the IRS

On August 5, 1861, the Revenue Act of 1861 imposed an apportioned real property tax, and the first federal income tax, to finance the prosecution of the Civil War. The income tax portion was a flat tax, but the federal government did not establish the infrastructure to collect it before July 1, 1862, when the Revenue Act of 1862 superseded this act with a progressive scheme of taxation and withholding requirements for employers. The 1862 act also created the Bureau of Internal Revenue (BIR), a federal agency for collecting the tax, under the leadership of a commissioner of internal revenue. Due to the unpopularity of the tax, and changing budgetary needs of the government, this legislation underwent almost annual amendments through 1870, and in 1872, Congress allowed it to expire.

In 1894, Congress passed the Wilson Tariff Act, which reinstated the income tax, and created a dedicated income tax division within the BIR. However, 1 year later, in *Pollock v. Farmers' Loan & Trust Co.,* the Supreme Court struck down the new tax as unconstitutional because it was a direct tax and not proportionate to the respective populations of the states. With the tax defunct, the BIR dismantled the income tax division.

In 1909, President Taft promoted a constitutional amendment to authorize the federal government to impose income taxes directly, without the sort of apportionment requirement that the Supreme Court had raised in its ruling in the *Pollock* case. That same year, Congress enacted a 1% tax on net corporate incomes exceeding $5,000. With Wyoming's ratification of this 16th Amendment to the Constitution in 1913, Congress acquired the power to enact a broad-based income tax. It repealed the corporate income tax of 1909, and it imposed an income tax on natural persons of 1% of net personal income exceeding $3,000, with a surtax of 6% for incomes greater than $500,000. That year marked the publication of the first Form 1040, a tax form for individuals for reporting their income and calculating and remitting this tax.

The Revenue Act of 1918 codified and systematized the tax laws then in force and created a progressive income tax scheme with a marginal rate of 77% for the BIR to administer, largely to finance the nation's effort in World War I.

The following year, a sufficient number of states ratified the 18th Amendment, rendering illegal the manufacture, sale, transportation, importation, or exportation of alcoholic beverages, and this began the Prohibition era. The responsibility of enforcing Prohibition fell on the commissioner of internal revenue, pursuant to the Volstead Act, which Congress passed in 1919. It would be more than one decade before the Department of Justice would assume this duty. In the meantime, the BIR participated in law enforcement activities, including an undercover operation through its intelligence unit that gathered evidence for the eventual conviction of gangster Al Capone.

The tax rate had declined dramatically after the war, to 24% by 1929. It rose again during the 1930s, to help finance the New Deal. With the repeal of Prohibition in 1933, the BIR resumed collecting taxes on alcohol, and it also assumed this responsibility for taxes on tobacco and for enforcing the National Firearms Act. It would remain responsible for these duties until its Alcohol, Tobacco, and Firearms Division would split off to become a separate federal bureau in 1972.

Through the early 1940s, the scope for income taxation on individuals remained modest, with a small percentage of the population paying the tax. By the end of World War II, most of the working population was paying some tax. To manage the growing burden on the BIR arising from the dramatic increase in the reporting and remission of taxes, Congress passed the Current Tax Payment Act of 1943, which formalized the requirements for employer withholding of income taxes and estimated quarterly payments by taxpayers whose income did not fall under this regime.

Establishment of the IRS as a Nonpartisan, Civil Service Agency

The BIR had operated according to a political patronage system through World War II. In 1952, President Truman promoted a plan to restore public confidence in the bureau by reorganizing it, decentralizing its services, and professionalizing its workforce by bringing it within the career civil service system. President Eisenhower endorsed the plan the following year and changed the bureau's name to the "Internal Revenue Service." The institutional role for the IRS has been to implement policy, rather than to formulate it, and, since that time, only the commissioner and general counsel have been political appointees, subject to Senate confirmation.

The IRS has largely conformed to this nonpartisan, civil service role, despite periodic scandals, for example, President Nixon's pressure on Commissioner Donald C. Alexander to use the IRS to intimidate his political enemies in the 1970s and the October 2006 order of Commissioner Mark W. Everson to suspend tax collection actions against delinquent taxpayers until after the fall 2006 midterm elections, during the second Bush administration. The latter incident elicited heated criticism from four former commissioners from both political parties for its damage to the reputation and credibility of the IRS as an impartial agency.

Modernization of the IRS and Expansion of Its Operational Scope

The IRS made its first major investment to enhance its technological infrastructure by opening the National Computer Center in Martinsburg, West Virginia, in 1961. Four years later, it began to offer toll-free telephone support for taxpayers. In 1986, the IRS began to allow some taxpayers to file their returns electronically. By the early 2000s, it was actively encouraging individuals to file electronically, and it was imposing electronic-filing requirements on corporations, including exempt organizations, in phases.

With the passage of the Employee Retirement and Income Security Act in 1974, Congress assigned responsibility to the IRS for the formidable task of regulating employee benefit plans.

Major Changes in Tax Policy and the Implicit Repoliticization of the IRS

During the Reagan and first Bush administrations, the concern for controlling the spiraling federal budget deficit and the objective of reducing the proportion of the tax burden on capital and corporate interests led to several landmark pieces of legislation, including the Economic Recovery Tax Act of 1981, the Deficit Reduction Act of 1984, the Tax Reform Act of 1986, the Omnibus Budget Reconciliation Act of 1987, the Technical and Miscellaneous Revenue Act of 1988, the Revenue Reconciliation Act of 1989, and the Omnibus Budget Reconciliation Act of 1990. The legislation that passed early in the Reagan administration heralded dramatic decreases in several taxes, with an uncertain legacy in terms of the putative objective of promoting economic growth. The 1990 act raised some taxes slightly, and support for this legislation from President George H. W. Bush reflected a reversal of a campaign pledge, a change in position that harmed his credibility among the public and likely contributed to his loss during his reelection bid in 1992.

To help justify their positions on tax policy, President Reagan, President George H. W. Bush, and other leaders in Washington characterized government agencies, including the IRS, as institutionally dysfunctional and inherent impediments to economic growth and personal initiative. This ethos reflected the ambivalence of the American electorate toward the IRS and the tax system. On one hand, there was a desire to enhance the effectiveness and fairness of the tax collection process and to ensure that every taxpayer paid an appropriate share of taxes. On the other, there was a concern for the negative effects of taxation on economic growth and for the impliedly menacing presence of an active IRS bureaucracy.

This ambivalence among the public and the combative rhetoric of politicians regarding tax policy and the IRS increased pressure on the organization and dampened the morale of many of its employees in the 1980s and 1990s. Meanwhile, although these pieces of legislation led to some efficiencies in the administration of tax laws and the collection of taxes, the budget deficit continued to grow, in part because of escalating military expenditures and health care costs and the acute recession from 1990 to 1992.

With the passage of the Omnibus Budget Reconciliation Act of 1993, and the tax revenues and reduced welfare costs arising from the formidable economic expansion of the 1990s, President Clinton and

Congress were eventually able to eliminate the budget deficit and realize the first budget surpluses in many years. During this period, the IRS also pursued several initiatives and enforcement actions to increase its efficiency and effectiveness in collecting taxes, including renewed attention to international transactions, payments for personal services, investigations of tax shelter abuses, and operations of exempt organizations.

Major Enforcement Activities and Organizational Developments After the Mid-1990s

The impetus for IRS scrutiny of exempt organizations arose out of numerous high-profile scandals affecting religious, charitable, and educational organizations and led to the Coordinated Examination Program (comprehensive multiyear audits) for universities. Other products of this period were legislation and regulations in the mid-1990s to impose "intermediate sanctions" on leaders of exempt organizations for "excess benefit transactions," that is, excessive salaries and benefits. These sanctions were "intermediate," in that they were less than revocation of an organization's exempt status (the principal previous remedy), but were more than doing nothing. These sanctions applied to the individuals who realized these inappropriate benefits, rather than to the exempt organizations themselves. After another round of high-profile scandals in the early 2000s involving exempt organizations, Congress and the IRS again moved to stiffen public- and private-sector compliance requirements involving this sector, which by 2003 managed approximately $2 trillion of assets.

The IRS Restructuring and Reform Act of 1998 dramatically reorganized and modernized the IRS according to progressive management practices in the private sector, to reflect a stronger customer service focus by migrating toward a functional configuration and away from the traditional geographic model. It took about 2 years for the IRS to implement many of the changes, including reconfiguration into four main sections: (1) Wage and Investment Income, (2) Small Business/Self-employed, (3) Large and Mid-size Business, and (4) Tax Exempt and Government Entities. This legislation also enumerated a "Taxpayer Bill of Rights" to establish standards for due process in dealing with taxpayers and to encourage taxpayers to seek assistance from the IRS without fear. These standards arose out of public- and private-sector discussions beginning in 1981 and built on formal versions from 1988 and 1996.

In the wake of the terrorist attacks of September 11, 2001, an additional mandate for the IRS was that of assisting in monitoring transactions, especially involving international payments to and from putative charities, ensuring compliance with exempt organization tax laws and regulations, and remaining vigilant for abuses that supported funding for terrorist activities around the world. When it discovered suspicious activities, the IRS worked closely with domestic and foreign law enforcement agencies to investigate them and to take enforcement action when necessary. These efforts were in addition to increasing cooperation with fiscal authorities around the world over many years to conclude, administer, and enforce tax treaties and other cooperative agreements.

Among the more controversial initiatives within the IRS in the early 2000s was the project to privatize some collections activities, a process that got under way in the fall of 2006. A handful of private collections agencies received thousands of names of taxpayers with delinquent balances of $25,000 or less that the taxpayers did not contest, along with private information about the taxpayers to enable collection of the debts. The agencies' contracts with the IRS called for them to retain fees of almost 25% of the amounts they collected. While the IRS said that it did not want to resort to this method for collections, at a minimum because it was more expensive, it said that it had no alternative because of Congress's refusal to appropriate funds for additional revenue officers.

The Contemporary Mission and Operations of the IRS

The IRS describes its contemporary mission as follows:

> Provide America's taxpayers top quality service by helping them understand and meet their tax responsibilities and by applying the tax law with integrity and fairness to all.

This mission statement describes the IRS's role and the public's expectation about how the IRS should perform that role:

- In the United States, Congress passes tax laws and requires taxpayers to comply.
- The taxpayer's role is to understand and meet his or her tax obligations.

- The role of IRS is to help the large majority of compliant taxpayers with the tax law while ensuring that the minority who are unwilling to comply pay their fair share.

Internal Revenue Code Section 7801(a) authorizes the secretary of the treasury to administer and enforce the internal revenue laws of the United States. This is the statutory authority that underwrites the existence of the IRS. Section 7803(a) provides for the appointment of a commissioner of internal revenue to administer and supervise the execution and application of the internal revenue laws.

Among the means for executing and applying these laws is the promulgation of treasury regulations to interpret and apply the Internal Revenue Code, as amended. The IRS also publishes administrative rules in the form of revenue rulings and private letter rulings. The former, just like treasury regulations, can furnish reliance for taxpayers generally, while the latter are valid only for the parties to whom the IRS issues them. The IRS regularly publishes its announcements and pronouncements in the *Internal Revenue Bulletin,* and it provides additional procedural guidance for taxpayers in its *Internal Revenue Manual* and by issuing revenue procedures, tax counsel memoranda, and technical advice memoranda.

In addition to its headquarters in Washington, D.C., the IRS maintains dozens of field offices in and around federal buildings, military bases, diplomatic posts, and other facilities around the world, as well as regional service and processing centers to process returns and applications, to respond to taxpayer inquiries, to conduct research, and to perform other taxpayer services.

International Business Ethics

The question of what ethical norms, if any, should guide the conduct of business across national boundaries is the primary subject of international business ethics. We live in an era of increasing economic globalization. While trade among nations has been an important feature of the global economy for centuries, recent years have seen a rapid increase in international trade. Multinational corporations (MNCs) are powerful actors on this global stage, and their influence is increasing. Outsourcing of the production of consumer goods to developing nations is a standard feature of nearly all MNCs that design, market, and sell apparel, footwear, electronics, toys, and household goods. In response to increased demand for natural resources, MNCs in the extractive industries have increased their exploration and extraction operations throughout the world. And, increasingly, all MNCs that market to individual consumers are targeting relatively affluent consumers across national boundaries. These are staple features of the global economy. Typically such globalizing strategies enable MNCs to meet increased demand, offer goods and services to customers at lower prices, and at the same time enhance their own profits.

MNCs operate in a multitude of political jurisdictions and so are subject to a multitude of legal frameworks. Frequently, the laws regarding matters such as the treatment of customers, the treatment of employees, and protection for the environment are significantly different in different host nations. In the case of developing economies, consumer protection, worker safety, and environmental safeguards are often poorly developed or nonexistent. Even when such laws exist in developing nations, the law enforcement and judicial apparatus necessary to ensure compliance does not exist. MNCs operating in such nations are often free to determine for themselves whether or not they will adhere to host nation laws. As a result, MNCs must determine for themselves what minimum moral standards ought to be adhered to in their global operations.

Global Justice

Global justice has become a centrally important issue in moral and political philosophy in the era of economic globalization. The facts that inspire much contemporary work on global justice are increasingly well known. Nearly 1 billion people are malnourished and without access to safe drinking water. Approximately 50,000 human deaths per day are attributable to poverty-related causes. When the attention of trade economists is called to these stark facts regarding global poverty, they are wont to point to the need for economic liberalization in the interest of job creation in the world's poorest nations. They argue that the exploitation by MNCs of cheap labor supplies, abundant natural resources, and lax regulatory regimes allows developing countries to expand export activities and to improve their economies. This economic growth brings desperately needed jobs, which cause labor markets to tighten, which will eventually force MNCs to improve the treatment of workers to attract workers. As wages rise, workers spend more and local economies expand. However, the present-day costs in human health and welfare of such development schemes are frequently at odds with basic ethical norms. Workers are often treated as disposable tools, and local environments are often polluted in ways that harm human welfare and inhibit future well-being. Furthermore, critics of this strategy of alleviating global poverty point out that the global labor supply is so vast that the theoretically sound idea that tighter labor markets alone will lead to improved working conditions is, in practicality, implausible.

Most of the philosophical literature concerning global justice may be divided into two competing views. First, proponents of the *cosmopolitan* view maintain that a system of global socioeconomic justice must be grounded in core ethical norms such as respect for basic human rights. Cosmopolitans see political institutions as a means of ensuring respect for such universal norms. Nation-states that contribute to the violation of basic rights, or merely tolerate the violation of such rights, are problems that must be overcome. Typically, cosmopolitans advocate a global system of government, such as a federal system, that has both the power and legitimate authority to compensate for failed states, stabilize weak states, and successfully coerce successful states into respecting relevant ethical norms. Furthermore, some prominent cosmopolitans regard a global government as an effective means of imposing a global fair distribution of wealth via taxation of the world's affluent populations and redistribution of those resources to the world's poor.

Second, proponents of the *political* view of justice maintain that a system of global socioeconomic justice should be grounded in political systems, rather than in core ethical norms such as human rights. Essential to the legitimacy of political systems in this view is the idea that state legitimacy is grounded in the democratic origins of the political systems. Proponents of this view of global justice, such as John Rawls, maintain that justice should be understood exclusively as a political value, rather than a moral value. They see justice as a virtue of sovereign states, one that legitimately extends to the citizens of such a state as a result of the willingness of citizens to honor the laws of the state and defend it against the aggression of other states. Socioeconomic justice, in this view, is the product of shared political relationships; as such, obligations of justice do not extend to noncitizens.

Protagonists on each side of the debate over global justice focus mainly on the obligations and interrelationships of nation-states and to a lesser extent on the obligations of individual persons. However, nonstate actors such as MNCs also have a profound influence on global justice. MNCs have capacities that enable them to have a significant impact on global justice. First, MNCs and their contractors employee hundreds of millions of workers and as such have a direct impact on the welfare of those workers. Second, MNC environmental practices have a direct impact on both the local communities in which they operate and the entire global community insofar as those practices have an impact on global climate change. Third, MNCs manufacture countless products, such as pharmaceuticals, water filtrations systems, high-yield crops, and wireless global communication systems, that can be used to dramatically improve the welfare of the world's poor. Finally, MNCs wield considerable coercive influence over sovereign-state governments, local governing authorities, political elites, labor unions, contractors, and individuals. The coercive influence that modern MNCs are inherently capable of wielding is not grounded in military power but rather economic power. This influence has been used to enhance the profits of individual MNCs and their owners, but it has also been used to improve the welfare of the citizens of the nations in which MNCs operate. Stories of MNCs engaging in the unjust exploitation of workers, despoiling local environments, and illegitimately interfering in the affairs of sovereign states are commonplace. Less well known are stories of MNCs employing legions of workers at just wages and in safe and humane working conditions, engaging in sustainable environmental practices, and cooperating with the needs and demands of local governments. MNCs are capable of respecting basic ethical norms and of acting as agents of global justice, yet the global justice literature has largely ignored these important global actors.

Proponents of the political view of justice, such as John Rawls, are least well equipped to account for the role of MNCs in promoting global justice. This is because MNCs are transnational actors operating across national boundaries. While MNCs are legitimately subject to the conceptions of justice of the sovereign states in which they are based, they are normally free to ignore that system of justice when they operate outside the political boundaries of that state. Furthermore, MNCs based in democratic nations frequently operate in developing nations that lack basic democratic institutions such as equal voting rights, multiple political parties, democratic elections, politically neutral militaries, and an independent judiciary. The laws in place in these nations lack democratic legitimacy. The concern here is not merely that the laws of nondemocratic regimes lack legitimacy, but that in the absence of such legitimacy proponents of the political view of global justice can offer MNCs no guidance regarding the appropriate norms of behavior in such nations. Of course, a single world government, the political legitimacy of which is grounded in the democratic will of the global population, could provide the necessary guidance. However, such a solution is not regarded as realistic by many theorists and is regarded by others as one of the worst possible solutions to global injustice given the loss of sovereignty this would entail.

Proponents of the cosmopolitan view are better equipped to account for the role of MNCs in promoting global justice than are proponents of the political view. Since cosmopolitans maintain that there are core ethical norms that ought to be respected by different political systems, the fact that some political systems lack democratic legitimacy poses less serious challenges. The crucial step here is to recognize that MNCs, and not merely states, can act as agents of global justice. We can see this better if we imagine a democratically legitimate but weak state. Typically, weak states lack the institutional means to act as a proper agent of global justice. For example, such a state may be unable to protect the basic rights of its workers or to protect its environment against toxic pollution. An MNC that operates in such a state may be better equipped than the local government to ensure that basic ethical norms are adhered to in its operations. Similarly, MNCs that operate in states that lack democratic legitimacy are in a position to model respect for core ethical norms in their operations. In doing so, they may advance the cause of global justice in even the most transparently illegitimate nation-states.

Ethical Norms

If the claim that MNCs are properly regarded as agents of global justice subject to the constraints of ethical norms can be established, it is still necessary to identify those ethical norms. One common view regarding the ethical norms that corporate managers must adhere to holds that it is the obligation of managers to maximize profits while adhering to certain side-constraints on their actions. Proponents of this view typically emphasize the positive impact corporations can have on the welfare of society and argue that managers who expend corporate resources on activities that are not focused on corporate profits are, in effect, stealing from shareholders. Typically, defenders of this view adhere to broadly libertarian attitudes toward markets, governments, and individuals. Libertarians hold that it is the obligation of publicly held corporations to maximize profits for shareholders within the bounds of certain moral side-constraints. The most well-known defender of this view is Milton Friedman, whose stockholder theory of the corporation remains influential despite having been subjected to significant criticism. In *Capitalism and Freedom,* Friedman argues that the normative function of the corporation is to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition, without deception or fraud. The rules are determined by the will of the majority of citizens in democracies. Actions that do not violate these rules are permissible, whereas actions that violate them are not.

As Denis Arnold has argued, this view provides no guidance for MNC managers operating internationally. This is because, as was noted above, many nations in which corporations operate lack democratic institutions. Furthermore, he argues that even if such a democracy were found to exist, one that acted always in a manner consistent with the will of the people and never at the behest of corporate lobbyists, basic ethical norms would still need to be operative irrespective of the will of the people. For example, one's liberty right should trump a majority of citizens in a democratic society who approve of slavery.

The United Nations "Draft Norms"

One set of ethical norms that is a prominent feature of contemporary public discourse, especially as it pertains to globalization, is that of human rights. The promulgation of the United Nations Universal Declaration of Human Rights, together with the advocacy of organizations such as Amnesty International and Human Rights Watch, has led to the widespread acceptance of human rights as a basic tool of moral evaluation by individuals of widely divergent political and religious beliefs. This increased popular attention to human rights has prompted a resurgence of interest in theorizing about human rights in recent years.

The UN Declaration of Human Rights has well-known conceptual limitations. First, it presents a list of rights that would ideally be granted to individuals (e.g., the right to paid vacation time) rather than a rigorously grounded set of core ethical obligations. Second, the U.N. Declaration does not distinguish between the ethical obligations of different global actors and instead implicitly concerns itself with the obligations of nation-states to their citizens. More recently, the U.N. Working Group on the Methods and Activities of Transnational Corporations has produced "Draft Norms on the Responsibilities of Corporations and Other Business Enterprises With Respect to Human Rights." These draft norms articulate a robust list of ethical obligations and specifically identify MNCs as responsible for their fulfillment. Furthermore, once adapted, adherence to these norms on the part of corporations is to be monitored and verified by the United Nations. The list of basic rights identified by the Working Group includes rights that enjoy relatively universal acknowledgment in a wide range of regional and international codes, and agreements such as equal opportunity, nondiscrimination, collective bargaining, and safe and healthy working environments. However, the Draft Norms go well beyond this, stipulating, for example, that corporations must

- seek to ensure that "the goods and services they provide will not be used to abuse human rights";
- contribute to "the highest attainable standard of physical and mental health; adequate housing; privacy; education; freedom of thought; conscience and religion" for all people; and
- ensure that "human rights, public health and safety, bioethics, and the precautionary principle" are respected in all their environmental practices.

Unsurprisingly, the Draft Norms have met with strenuous resistance from business interests. Part of this resistance is due to the fact that the Draft Norms attribute such a wide and imprecise range of obligations to MNCs and do so without the benefit of a conceptual scheme for distinguishing between the basic ethical obligations of MNCs on one hand and states on the other.

Integrative Social Contracts Theory

One influential view among social scientists working in business ethics is integrative social contracts theory (ISCT). Developed by Thomas Donaldson and Thomas Dunfee, this social contracts approach for determining the ethical norms for economic ethics has three core components: hypernorms, macrosocial contracts, and microsocial contracts. At the global level, there are "hypernorms." These are the fundamental principles or norms by which lower-order norms are to be derived. The sources of these hypernorms are intentionally left unspecified by Donaldson and Dunfee. Hypernorms are divided into three distinct categories: procedural, structural, and substantive. Procedural hypernorms set the terms for contracting microsocial contracts implied in the macrosocial contracting situation. The terms specified are the right to exit the microsocial community and the right to exercise one's individual voice within the microsocial community. Structural hypernorms are described as the principles that support the core background institutions of society. These include the right to property, the right to fair treatment under the law, and necessary social efficiency. Finally, substantive hypernorms specify fundamental conceptions of the right and the good, especially with respect to economic activity.

These hypernorms are derived from outside the macrosocial contracting situation. Substantive hypernorms such as prohibitions against bribery and gender discrimination are said to emerge from the convergence of religious, cultural, and philosophical beliefs around certain core principles.

Hypernorms are identified and validated by macrocontractors who are imagined to convene in a sort of parliament of humanity. These rational global contractors would, according to Donaldson and Dunfee, derive a macrosocial contract for economic ethics that gives moral free space to microsocial economic communities so long as the microsocial contracts were compatible with hypernorms and authentic local norms. By microsocial contracts, they mean the extant agreements, both formal and informal, that exist within companies, industries, and other economic groups. The hypernorms agreed to by macrosocial contractors are necessarily general and lack specific moral guidance.

As a system of international business ethics, ISCT has been criticized on two primary grounds. First, several theorists have argued that it is relativistic with respect to substantive hypernorms and thereby fails to meet the theory's own internal standards of viability. Second, critics of ISCT argue that by invoking religious and cultural norms as a basis for hypernorms, while eschewing traditional ethical theory, ISCT fails to provide reasonable grounds for businesses operating on the global stage to adhere to any one set of hypernorms. In defending ISCT against criticism, Donaldson and Dunfee deny that their theory is relativistic and point out that their theory is the first to focus on the relevance of microsocial contracts in everyday economic life.

Kantian Rights and Duties

Kant's second formulation of the categorical imperative famously holds that individuals must always "act so that you treat humanity, whether in your own person or in that of another, always as an end and never as a means only." This principle constitutes the core of the Kantian doctrine of respect for persons. Respecting people requires honoring their humanity, which is to say it requires treating them as ends in themselves and not merely as a means to an end. This means that it is impermissible to treat persons as mere tools for the accomplishment of one's own ends. Kantians believe that persons ought to be respected because persons have a unique dignity that mere objects lack. Persons have dignity because they are self-governing beings.

Kantian agents act autonomously, and when they do so the principles they act on are grounded in morality rather than in mere inclination. Considering the proper role of self-interest will help clarify this point. Kantians hold that it is wrong to act out of self-interest when doing so conflicts with certain impartially determined moral norms such as respect for other persons. For example, suppose that a supply chain manager knows that he will be rewarded with a significant bonus if he can reduce costs by 19%. In pursuit of this bonus he decides to impose a unilateral 10% cut in the amount the MNC pays a major supplier for apparel of the same quality and quantity as before. The supplier faces the same material and energy costs and is already operating with a narrow profit margin. The only way for the supplier to meet the MNC's demand is to reduce labor costs. However, for the order to be completed on time, the same number of workers is required. The only option for the supplier is to forgo health and safety maintenance in the factory and not pay all legally required wages and benefits. In this way, the supply chain manager's actions result in workers being treated as mere tools and not as ends in themselves. In this case the pursuit of self-interest is unethical because it is accomplished by harming the dignity of factory workers. However, a creative supply chain manager may be able to work with a supplier to enhance efficiency and productivity in the factory and thereby cut costs. In this way, a supplier may be able to obtain the desired cost reductions in an ethical manner, and his self-interested pursuit of the bonus would be ethically permissible.

Kantians begin with obligations or duties to respect other persons, rather than beginning with rights claims. These duties constrain the pursuit of ends, whether they are self-interested goals or projects pursued on behalf of other parties such as shareholders. Respecting persons involves negative obligations, such as refraining from using others as mere tools via physical force, coercion, or manipulation, and positive obligations such as supporting physical well-being and the development of human capacities. When they stand in the appropriate relationship to an obligation-bearer, persons have rationally justified rights-claims against them. On the Kantian account, rights take the form of side-constraints that bound the moral space in which agents may pursue ends without unjustified interference by other agents or institutions.

Whereas liberty rights to be free from being constrained or assaulted hold against all who would cause such harm to others, welfare rights appear to hold only when certain relationships exist. For without such a relationship, there appear to be no bearers of obligations and so the claimed rights could not be established in any binding manner.

If the world's poor have claim-rights, who are the corresponding obligation-bearers? One answer is that in cases where relationships already exist in the global economy, rights-claims are binding on specific obligation-bearers. Wherever MNCs do business, they are in relationships with a variety of stakeholders, such as workers, customers, and local communities. In their global operations and in their global supply chains, MNCs have a duty to respect those with whom they have relationships. MNC managers, then, have obligations to ensure both that they do not illegitimately undermine the liberty of any persons and that minimal welfare rights are met.

Critics of Kantian accounts of international business ethics argue that because of its theoretical foundations, it is susceptible to all of the criticisms that have been mounted against both Kant's ethics and Kant's metaphysics. Since this is the case, they argue, Kantian international business ethics is not a viable research project. Kantians respond by arguing that the resurgence in work by Kant scholars and Kantian ethicists in recent years has reinvigorated Kantian ethics and disarmed many traditional criticisms. Furthermore, they argue that elements of Kantian ethics, such as the doctrine of respect for persons, can be assessed independent of other elements of Kant's philosophy and have been shown to merit allegiance in their own right.

Labor Practices

Arguably, the use of global "sweatshops" for the manufacture of consumer goods is the most well-known human rights issue involving U.S. businesses since the collapse of South Africa's apartheid regime. Nongovernmental organizations (NGOs) have led boycotts and waged media campaigns against companies that they believe exploit factory workers in the interest of excessive profits. Responding to such critics, MNCs have made significant efforts to eliminate the worst abuses of worker rights in their contract factories. MNCs have significant coercive economic influence over suppliers. Typically, MNCs set the price at which they will purchase goods from contractors, and as a result they have considerable influence regarding working conditions. In many cases, contract factory owners may not have the resources to improve working conditions and wages without assistance from the MNC. Given this imbalance in power, MNC managers are well positioned to help ensure that the employees of its contractors are respected. In addition, MNCs can draw on substantial economic resources, management expertise, and technical knowledge to assist their business partners in creating a respectful work environment.

An efficient mechanism for MNCs to improve working conditions is via the adoption and implementation of voluntary codes of conduct. Such codes are created voluntarily by MNCs and are not based on the laws of any one nation but are instead designed to help managers and suppliers ensure that the basic rights of workers are protected. The mere voluntary adaptation and promulgation of a code of conduct is insufficient. Instead MNCs must oversee the full-scale implementation of their codes. A firm that merely produces a code and provides it to a contractor without further action sends a message that a similar lack of attention is all that is expected from its contractors. Serious and effective integration of a code throughout an organization's culture requires that a firm hold its contractors to the same standard regarding respect for employees to which it holds itself.

However, some companies are too small to contract for the use of all of a subcontractor's capacity but must instead place orders that represent a small percentage of a supplier's capacity. In such cases, the company has little influence over the contractor. This is especially true if the subcontractor is dealing with multiple companies at the same time, each with somewhat different standards or codes for the treatment of workers. Nonetheless, companies genuinely interested in ensuring that workers in their supply chains are treated with dignity at work can collaborate with one another to ensure that uniform standards are adopted and implemented. Efforts of this kind can help ensure that smaller and medium-sized companies meet their obligations regarding the preservation of basic human rights in their global supply chains.

Some theorists of economic globalization who are concerned about the welfare of the world's poorest people contend that what are needed are not fewer sweatshops but more sweatshops. These individuals argue that improving sweatshop conditions and respecting worker rights will result in greater harm than good. They argue that a free market eventually improves both working conditions and the overall economic well-being of host nations. Because the existence of more sweatshops will facilitate this process, such theorists argue that what is needed is more sweatshops, not fewer. In reply to this view, Kantians such as Denis Arnold, Norman Bowie, and Laura Hartman argue that morally imaginative MNC managers can voluntarily choose to improve working conditions and wages in their global factories, without laying off workers, while remaining competitive within their industry. In support of this claim they cite the current respectful treatment of workers at MNCs such as Motorola, Mattel, Nike, Adidas, and other companies.

Natural Resources

The ethical management of natural resources is an issue of increasing importance to managers of MNCs. Since the Industrial Revolution, Westerners have consumed vast quantities of resources with little attention to efficiency or conservation. More recently, growing Asian, eastern European, and Latin American populations have begun to emulate Western, consumer-orientated lifestyles. These consumption patterns place significant demands on natural resources such as oil and coal and global commons such as the oceans and the atmosphere. MNCs encourage such consumer demand via marketing and make choices regarding production and design that directly affect the global environment. Increasingly, the global environment is at risk and with it the welfare of human populations.

MNCs do not always meet minimal ethical obligations regarding the protection of the natural environment. For example, over an 18-year period, Texaco dumped hundreds of millions of gallons of toxic waste into the Ecuadorean and Peruvian Amazon. Critics correctly pointed out that in doing so Texaco ignored prevailing industry standards and put the health of the inhabitants of those regions at risk. However, it is important to keep in mind that critics of MNCs are not always correct about the moral status of MNCs' environmental actions. For example, in the late 1990s Royal Dutch Shell planned to sink the obsolete deep-sea oil rig *Brent Spar* 150 miles off the coast of Scotland at a depth of 6,000 feet. Shell engineers had determined that this was the most environmentally friendly manner of disposing of the rig. The international environmental group Greenpeace disagreed and waged a public relations campaign against Royal Dutch Shell to stop the sinking of the *Brent Spar.*

Greenpeace leaders erroneously claimed that the *Brent Spar* contained 5,500 tons of oil that would escape and contaminate the North Sea. Shell claimed that only 50 tons of oil remained on board and that this amount of oil would not have a substantial negative impact on the ocean environment. When the rig was eventually dismantled, 152 tons of oil was found to be on board. This estimate, while it was three times the amount claimed by Shell, was 36 times less than the amount claimed by Greenpeace. Despite the fact that its position was well supported by scientific evidence, Shell lost the public relations battle to Greenpeace. In the end, Shell was forced to dismantle the rig on land. Shell's total costs came to $97.6 million, as opposed to its initial estimate of $14.4 million. The environmental costs of disposing of the rig on land, as opposed to deep-sea disposal, were substantial as well. The energy spent was equivalent to 875,000 gallons of gasoline and more than 11,000 tons of atmospheric CO_2 emissions.

The *Brent Spar* case illustrates that the science matters when assessing controversies concerning corporate environmental practices. Greenpeace was able to win the public relations battle with Shell, despite vastly overestimating the environmental harm of sinking the *Brent Spar* in the North Sea, because of superior public relations management. However, Greenpeace's position was scientifically unsound, and in the end its actions appear to have led to greater environmental and economic harm than if Shell had disposed of the rig as it initially planned. All environmental issues faced by MNC managers have an important scientific component. In many of the most controversial cases, such as global climate change and the use of genetically modified organisms, many of the facts are contested. In such cases it is necessary to consult the best available scientific evidence and only then make appropriate ethical and strategic judgments regarding MNC practices. However, as illustrated in the *Brent Spar* case, it is also necessary to successfully manage one's ethical stance.

Climate Change

During the 1980s and 1990s there was substantial debate over the existence of global warming. Today, the scientific debate is largely over. In 2001 a consensus emerged in the global scientific community that global climate change (GCC) is occurring and that it will have a dramatic and adverse impact on ecosystems, nonhuman species populations, and human populations. Global warming is occurring primarily as a result of anthropogenic CO_2 emissions. The increase in average global temperatures is expected to alter weather patterns, resulting in droughts and floods in many different regions and a rise in the global mean sea level. Scientists predict the extinction of a huge number of plant and animal species as a result of climate change. Among human populations, the negative impacts of climate change will be disproportionately borne by the world's poor since they are least well equipped to alter their geographical and environmental circumstances.

A basic principle of justice holds that it is unfair to require others to pay for the costs of benefits one has secured for oneself without their uncoerced consent. The atmosphere is a common resource, one that the global community holds in common. U.S. industries make use of a disproportionate level of atmospheric resources on a per capita basis. At the same time, the harm caused to present generations of non-U.S. citizens will be disproportionate to their use of atmospheric resources. So too, presumably, will the harm be to future generations. Denis Arnold and Keith Bustos argue that those who enjoy the benefits resulting from burning fossil fuels, and thereby contribute to GCC, ought to pay more for such benefits than those who do not enjoy such benefits. In the United States the transportation and electricity generation sectors are the two sectors that contribute the most to the total U.S. CO_2 emissions. For example, between 1990 and 2003, the transportation sector contributed an average of about 31% of total CO_2 emissions from fossil fuel combustion in the United States. Arnold and Bustos have argued for a historic accountability for CO_2 emissions by corporations that is effective from 2001 forward. They argue that corporations that failed to take proactive measures from 2001 forward are morally blameworthy for this failure. They argue further that corporations that have not sufficiently reduced energy emissions would be justified in being penalized by governmental agencies with a carbon tax.

In response, many libertarians and others argue that corporations are merely responding to consumer demand and that it is the obligation of consumers to alter their consumption patterns to reduce CO_2 emissions. For example, consumers should choose to use public transportation or drive smaller, more fuel-efficient cars rather than to drive large, energy-inefficient sport-utility vehicles. In this view, the obligation to reduce carbon emissions, if any, falls on individuals and their elected representatives.

Looking Forward

International business ethicists are beginning to confront a range of new issues tied to rapid increases in economic globalization. First, some companies, such as Royal Dutch Shell, Adidas, Mattel, Merck, and BHB Billiton, have taken on roles as ethical leaders within their sectors of the global economy. It remains to be determined whether such companies will be rewarded for such leadership with competitive advantages so that ethically challenged MNCs will feel pressure to act more consistently with basic ethical norms. Second, MNCs based in recently industrialized nations such as South Korea, Brazil, China, and India are beginning to take a more prominent role on the global stage. These MNCs have the opportunity to "leapfrog" into the forefront of the ethical conduct of global business by following the examples set by the most ethically forward-thinking global corporations. Some companies, for example India's Tata group, appear to be demonstrating such leadership in their global operations. It remains to be seen how many emerging MNCs will follow suit. Third, not all companies that operate globally are large MNCs. Small and medium-sized companies have supply chains that extend across national boundaries. They also outsource many services abroad. Typically such companies lack the resources necessary to closely monitor activities at their suppliers or global service providers. One challenging issue confronting managers at such organizations, as well as business ethicists, is how to ensure compliance with basic ethical norms by their suppliers or global service providers. Finally, the role and responsibilities of NGOs in promoting global justice is beginning to come under increased scrutiny. NGOs frequently market themselves as the ultimate defenders of human rights and global justice. However, NGOs have mixed records when it comes to accurately representing the practices of MNCs. As has been the case with the corporate world, we may expect to see ethical leaders emerge among these organizations. The emergence of a core group of NGOs with ethical integrity should allow careful observers of debates concerning the practice of business in a global economy to render more informed judgments. NGOs should be held to the same high ethical standards as the MNCs that they themselves critique.

International Labour Organization (ILO)

The International Labour Organization (ILO) is a specialized agency of the United Nations (UN) headquartered in Geneva, Switzerland. The ILO was formed in 1919 as an agency of the League of Nations through the negotiations of the Treaty of Versailles. It was created in response to labor and social movements that resulted in worldwide demands for social justice and higher living standards. In 1946, the League of Nations was dissolved, and the ILO became the first specialized agency of the newly formed UN. It received the Nobel Peace Prize in December 1969 for its work in social justice and its ability to institute positive change throughout its history.

The overarching purpose of the ILO is to promote humanitarian labor standards and labor rights and improve worldwide labor conditions so that social justice and economic health are supported and maintained. Its goals are to strengthen worker rights, improve working conditions, create employment, and provide information and training opportunities. It fulfills its mission and goals with its unique structure, the annual International Labour Conference, and through its Governing Body and the International Labour Office.

The ILO has a unique tripartite structure composed of representative governments, employers, and workers, all participating as equal partners. The Governing Bodies include 28 governmental members, 14 employer members, and 14 worker members. Ten of the government seats are held by countries of primary industrial importance, and the remaining 18 seats are elected every 3 years from countries representing a broad geographic distribution. The employers and worker members elect their own member representatives in separate electoral colleges.

The International Labour Conference is held each year, convening member country delegates who represent the tripartite structure: government, employers, and workers. The conference provides an international forum for discussion of world labor and social problems. Minimum international labor standards and the broad policies of the ILO are adopted at the conference. These standards are presented in the groups's Conventions and Recommendations and may address issues such as freedom of association, the right to organize, the right to engage in collective bargaining, the abolishment of forced labor, equality of opportunity and treatment, and other standards regulating conditions of work-related issues. In addition, the governing bodies are elected, and work programs and budgets are adopted at the conference every 2 years.

The work of the ILO is guided by its constitution and its governing body throughout the year. The director-general oversees the ILO's secretariat, known as the International Labour Office (Office), where the operational headquarters, research center, and publishing house are located. The International Labour Office employs 1,900 officials of more than 110 nationalities in 40 field offices across the world. Its research and documentation center produces studies, reports, and periodicals. There are also 600 experts who participate as technical specialists. Technical specialists work with the field offices to promote the strategies and work of the ILO through the Technical Assistance Program for Cooperative Development. This program is one of the primary tools for translating the fundamental principles and rights of the ILO into practice.

Conclusion

The ILO serves an important role in addressing the world's labor issues. With its lengthy history, defined purpose, and international presence, it has the ability to create global influence. It uses its influence in a wide range of roles. For example, it may recommend sanctions on a country engaging in forced child labor in an effort to impose negotiations on labor standards that have previously failed. On the other hand, it may be commissioned to complete a study that explores employment policies and practices regarding women in nontraditional jobs.

Social justice is a dynamic concept. Critics say that the ILO's influence may provide a viable solution that quickly evolves into a new set of challenges that create a different ethically charged circumstance. In addition, its authority is as strong or as weak as its member country representatives. These members are susceptible to unique pressures that are specific to the history and politics of their respective countries, particularly economies long impoverished that are realizing newfound economic progress. The pursuit of economic development and prosperity does not always blend with social justice without ethical consequences, particularly in the case of a country that has not previously had a strong focus on its labor rights and practices. Furthermore, its policies may be incongruent with a country's established labor standards and policies. For instance, most states in the United States maintain an at-will employment relationship between employer and employee. This legal doctrine dates back to the late 1800s, and it specifies that an employee works at the will of the employer and that either party may terminate an employment relationship without liability and without cause (unless formal employment contract agreements specify otherwise). One of the declarations of the ILO's Fundamental Principles and Rights states that employers will commit to "the elimination of discrimination in the workplace." At-will employment principles depart from the protections identified under discrimination laws, so compliance with both the at-will doctrine and the ILO's policies are at odds, creating an ethical and moral conflict between two well-established visions of terms of employment.

Despite its challenges, the ILO serves as a moral compass in its role in setting labor standards and promoting social justice. It is a voice that is heard, whether the desired outcomes of its negotiations are successful or not. It raises awareness of labor issues and social injustice. Furthermore, its network of workers permeates the majority of industrialized countries, which creates a worldwide forum for dialogue on important labor issues that arise.

International Monetary Fund (IMF)

The International Monetary Fund (IMF) is an international governmental organization, operating as a specialized agency of the United Nations Organization. Headquartered in Washington, D.C., the IMF was established to manage the international financial and balance of payments systems and to help its members manage their currencies and national financial accounts. As outlined in the IMF's charter, its articles of agreement, the institution's primary purposes include the promotion of international monetary cooperation and exchange stability, thereby aiding the expansion of international trade and ultimately the overall economic prosperity of its members by helping to maintain high levels of employment and increase levels of real income.

The IMF's membership comprises only countries, those recognized as sovereign nation-states. There is no provision for joint membership of economic or monetary unions of states, such as the European Union. Rather, individual states join as independent members. Membership has grown from 29 states, at the IMF's founding in December 1945, to a total of 184 states as of June 2005.

The IMF was to become one of a trio of international economic organizations (what Sir Joseph Gold, a leading international lawyer handling the novel legal affairs of the IMF from its inception, called a "trinity of comparable institutions") envisaged near the end of World War II. These three institutions—a cooperative monetary fund, a development bank, and a global trade organization—were together to help rebuild the national and international economies devastated by the war and to ensure that the economic ravages of the Depression era that presaged the war would not recur.

The IMF the and International Bank for Reconstruction and Development (IBRD, otherwise known as the World Bank) were crafted during a meeting of 45 government representatives at Bretton Woods, New Hampshire, in July 1944. Led by Lord John Maynard Keynes of the United Kingdom and Harry Dexter White of the United States, charters for these two institutions were drafted to manage the international economic affairs of member states. These two institutions are thus commonly referred to as the Bretton Woods sisters. (The third institution was stillborn: The global trade organization's charter, drafted in 1947, found insufficient political support, and in its place was crafted the General Agreement on Tariffs and Trade, or GATT, which came into force in 1967 and finally evolved into the World Trade Organization, or WTO, only in 1995.)

Under the articles of agreement, ultimate authority for the functioning of the IMF resides with its board of governors. This board comprises one governor plus one alternate governor, appointed by each member, and meets annually. The managing director of the IMF is appointed by the governors and acts as the board of governors' chair. Though the governors gather together formally only once each year, provision is made for communication and voting between annual sessions. In practice, significant power has been delegated by the governors to a board of executive directors (currently numbering 24), who, with the IMF staff under the leadership of the managing director and three deputy managing directors, direct day-to-day operations and decide how best to manage IMF resources.

Members are assigned quotas or subscriptions, amounts that must be paid into the IMF's common fund. This amount is determined primarily by an assessment of the country's size, its relative economic strength, and vibrancy. The quota of the United States is the largest of all members (contributing just more than 17% of the IMF's prime resources), with Palau having the smallest (contributing 0.001%). While members operate as sovereign equals, voting power is related to quotas by an intricate formula. Every member receives 250 "basic votes" on membership—thus recognizing equality, plus one additional vote for each specified quota increment—thus recognizing key differences in economic and political power. Hence, the United States also controls 371,743 votes (just more than 17% of all votes that can be cast), while a country such as Palau controls 281 votes (0.01% of all votes available).

When the IMF was established, currencies were fixed; that is, the value of every currency was linked to each other currency by a set formula, determined by the IMF, and ultimately to gold. Currencies were permitted to vary from this par value only within a very narrow band above or below that set. In addition, the U.S. dollar became the world's reserve currency, meaning that all currencies were in practice valued against and quotas were fixed in U.S. dollars, and the United States guaranteed it would convert dollars to gold. When a country was assigned its quota, it was to pay a substantial portion of that quota into the IMF in gold or U.S. dollars and only the remainder in its own currency.

After a series of international monetary crises during the 1960s, this regime of fixed exchange rates was replaced by a floating regime after 1971, when the United States, finally, formally decoupled the dollar from gold and no longer guaranteed conversion. In place of gold, the IMF in 1969 created the Special Drawing Right (SDR), which operates as a unit of account and reserve asset. The value of an SDR is set by weighting a basket of key currencies, including the U.S. dollar, the euro, and the Japanese yen. SDRs are then distributed to members as a percentage of their quotas, thereby increasing reserves available for members to draw on, while replacing reliance on gold under a defunct fixed exchange regime. Quotas are now denominated and paid in SDRs, along with the member's own currency.

As a cooperative monetary fund, the IMF technically does not "loan" monies to its members who need assistance, even though that term is commonly used even in the IMF's own publications. Rather, when a member seeks aid, currencies are "purchased" (e.g., tendering Brazilian reais in exchange for euros), with the stipulation that a member will repurchase its currency at some future date, usually within 1 to 3 years' time (e.g., by swapping euros or SDRs for the Brazilian reais originally tendered). Such exchanges should not exceed 300% of a member's quota. In this manner, a country can obtain the exchange currency it needs to manage its monetary affairs without disrupting capital markets. (There are IMF loan programs for extending resources beyond this quota calculation, but those resources are drawn from special funds and are often arranged conjointly with the World Bank.)

Such exchanges are typically arranged under IMF conditionality: A country will access those resources only after arranging a specific plan to manage its economy so that the member can regain stability and grow. IMF technical assistance to member states is thus deemed critical to achieving its overall mission, both before a crisis arises, to help members avoid macroeconomic difficulties, and after resources are disbursed to manage a crisis that has arisen. This makes the process of surveillance and regular consultation as required under the articles of agreement between the IMF and member states quite important, with the IMF publication series a source of valuable comparative data for policy makers and foreign investors in all member states.

Nevertheless, criticisms have been urged concerning the effective and ethical operation of the IMF. Matters such as its governing structure (control by a few developed countries), conditionality (too much external control over a developing country's economy, with too little attention paid to impact of conditions on the poor), and creation of resources (too few SDRs available for development) have been advanced even by those otherwise in broad agreement with IMF purposes and operations.

International Organization for Standardization (ISO)

The International Organization for Standardization (ISO) is the world's leading institution for standard development, having published more than 15,000 standards in many diverse fields ranging from traditional activities, such as agriculture and construction, to the newest developments in fields such as mechanical engineering, medical devices, and information technology. More recently, in 2004, ISO decided to further extend its activities by starting the development of an international standard addressing the *social responsibility* of organizations.

ISO is a truly global organization—a network association among 157 national standardization bodies worldwide—representing both government institutes and private, industry associations. It was founded in 1947 with the overall mission "to facilitate the international coordination and unification of industrial standards." Its modus operandi in the process of standard development is based on some key concepts. (1) *Market-driven approach:* Any ISO standard setting initiative is based on results of an assessment that indicate a need for a standard by an industry or business sector. (2) *Technical competency:* The development of each standard is the responsibility of a specific technical committee of experts nominated by national standard bodies. (3) *International consensus:* The whole process is based on the search for consensus on a draft agreement among the technical committee members first and the wider ISO membership thereafter. (4) *Representation of interests:* Within each technical committee ISO seeks a wide representation of different competencies and interests, including those of industry, government agencies, labor, consumer associations, environmentalists, experts from academia, and so forth (this tendency has been affirmed with the development of ISO 26000, the ISO standard on social responsibility [SR]).

Among the family of standards developed by ISO, the most famous are undoubtedly ISO 9000 ("quality management," primarily focusing on the customer's and other regulatory requirements to enhance customer satisfaction) and ISO 14000 ("environmental management," dealing with the organization's environmental challenges such as pollution and other harmful effects on the natural environment), which have been adopted by more than 700,000 organizations worldwide. While most ISO standards are highly specific to a particular product, material, or process, both ISO 9000 and 14000 are *management standards,* that is, standards that refer to management systems that *any* organization has to put in place to manage its processes and activities and ultimately improve its performance in the areas regulated by the standard itself. This also means that they are *generic* standards, that is, they are designed to be applied by organizations of different sizes, large and small, and operating in different industry sectors, manufacturing or services, or by different types of organizations, such as private firms, public administrations, or governmental departments.

The ISO Standard on Social Responsibility

In 2004, ISO formally decided to initiate the development of a new international standard for SR: ISO 26000. With regard to the nature of the standard, ISO decided to produce a guidance document, that is, a standard not intended for third party certification but able to provide meaningful guidance to all kinds of organizations on SR issues. In recognizing the uniqueness and originality of this area of work with respect to its traditional standard-setting activities, ISO created a new international working group designed to ensure balanced representation of six different stakeholder groups: industry; government; labor; consumers; nongovernmental organizations; and service, support, research, and others, as well as geographical and gender balances. A precise reference was made to existing quality and environmental management systems to build on the intellectual and practical infrastructure of ISO 9000 and ISO 14000 management system standards. The ISO Advisory Group on Social Responsibility pointed out possible benefits of an active engagement by ISO in the field of social responsibility:

> From a standardization perspective, international SR standardization is desirable if it facilitates trade, in particular by harmonizing an unnecessary proliferation of overlapping national, regional, and other SR initiatives. From a public policy perspective, international SR standardization is desirable if it helps to increase SR actions by (1) leading to the development of better SR regulations; (2) helping

organizations to implement SR more easily; and (3) helping to create economic incentives to undertake SR actions.

Moreover, the need to create a "level playing field," not only for private organizations but also for developing and developed countries, is seen as a further benefit of an internationally accepted SR standard.

With regard to the features of the standard, ISO decided to base the new standard on the same, general approach of ISO quality and environmental management systems (i.e., policy; planning; implementation and operation; performance assessment; improvement; and management review). The following elements have been considered as the basic areas on which the ISO SR standard should provide guidance:

- Compliance with relevant international norms pertaining to environmental, consumer, and fair labor standards, human rights, and health and safety protection
- Processes for meaningful stakeholder engagement
- Development, implementation, and communication of SR and ethics policies, including those pertaining to antibribery and corruption
- Training of the workforce, including executives and management
- Relations with communities, philanthropy, outreach, and involvement
- Measurement and regular reporting to the full range of stakeholders and the general public

Standards Strengths and Weaknesses

There are a number of considerations concerning the development and implementation of standards in business, highlighting the potential benefits that can be generated but also the potential limitations of standards use. On the positive side, the following benefits can be pointed out:

- *Clarification and conformity:* Standards help eliminate confusion, particularly in new fields, by clarifying what the state of the art is and by defining a common language and appropriate methodologies. Moreover, they facilitate the worldwide compatibility of technology and the establishment of internationally accepted practices.
- *Assurance:* Through mechanisms of third party certification, or independent conformity assessment, standards provide consumers and other stakeholders a reliable way of evaluating product quality and other relevant aspects of the organization's management, processes, and performance.
- *Operationalization:* Standards provide practical frameworks to apply general concepts—such as "quality" or "environmental management"—in day-to-day business processes and operations.
- *Innovation and know-how:* Standards can be applied by any organization, regardless of the field in which it operates or its size, type, and geographical location; therefore, they facilitate the process of diffusion of innovation and technology (and knowledge) transfer.

On the other hand, potential weaknesses of standards include aspects such as the following:

- *Rigidity:* By focusing on compliance with a set of requirements, standards may induce less flexibility in organizational processes and reduce creativity and innovation in management.
- *Cost:* To apply a management standard within an organization and obtain independent certification requires a certain level of investment by the organization itself—in terms of the necessary competencies, time, and financial resources—which may be particularly burdensome for small and medium-sized businesses.
- *Enforcement:* Being adopted on a voluntary basis, standards cannot rely on strong enforcement mechanisms, such as those available to laws or other mandatory requirements. Therefore, the legitimacy of standards also depends on the credibility of third party certification.

Like many other global organizations, the ISO has not been immune from criticism concerning its management procedures—faulted as being too slow, bureaucratic, and not responsive to society's concerns—and the legitimacy of its governance structures, which may generate conflicts between the requirements of international standards and local (national) social and cultural norms or even legal and other regulatory frameworks.

Particularly in the field of SR, the issue of "bureaucratization" remains an open concern because the establishment of standards inherently favors the development of *formal* routines that can be operationalized (and verified), and this in turn generates the risk of losing touch with the importance of the standard's *substantive* content (i.e., the focus on concepts such as ethics, individual responsibility, and organizational culture).

International Trade

International trade encompasses the exchange of goods and services between residents of different countries. The bulk of international trade consists of what economists describe as "merchandise trade," or trade in physical goods. The other category is services trade, the exchange of nonphysical goods. The largest categories of merchandise trade are machinery and transportation equipment, agricultural products and foodstuffs, and crude oil and petroleum products. The largest categories of services trade include business, professional and technical services, insurance and finance, and travel and transportation.

Some Characteristics of International Trade

The increasing prominence of international trade is illustrated by the fact that the growth of world merchandise trade has consistently outpaced the growth of world production since the middle of the 20th century. As a result, an increasing percentage of world production over time has been dedicated for sale in foreign countries rather than domestic economies.

Notwithstanding the importance of China as a major trading nation, international trade primarily takes place among developed countries. There are several reasons for this. One is that agriculture accounts for a larger share of production in developing countries than in developed countries, and nontariff barriers to trade are particularly onerous in the case of agricultural products. A second is that international trade reflects, in part, a taste for product variety on the part of consumers. The demand for product variety, in turn, is positively related to a nation's standard of living. A third reason is that the majority of international trade is carried out by multinational companies (MNCs). The location and distribution of MNC production facilities reflects the geographic pattern of foreign direct investment, and developed countries are most often the host and home nations for foreign investors.

Several other characteristics of international trade are worth noting both for purposes of information and for contributing to a better understanding of several major controversies surrounding international trade. One is the prominent role played by MNCs in the international trade process. An MNC is a company with affiliates in foreign countries. The bulk of international trade consists of goods shipped among affiliates of MNCs. Hence, the growth of international trade is mirrored by the growing economic importance of MNCs. Those who are concerned that MNC activities have adverse impacts on both host and home countries are therefore skeptical of the social benefits of international trade.

A second characteristic to note is the predominance of intraregional trade. In the three major economic regions of the world, namely the European Union, North America, and Asia, trade involving countries within each region is greater than trade across those regions. The importance of intraregional trade in part reflects the growth of regional trade agreements such as the North American Free Trade Agreement (NAFTA).

Critics of regional trade agreements argue that the world, especially developing countries in Asia and Africa, would be better served economically by strengthening and extending multilateral trade institutions such as the World Trade Organization (WTO).

Factors Promoting International Trade

Several phenomena have been cited as underlying the dramatic growth of international trade summarized above. One factor is technological change, particularly as it has affected telecommunications and transportation. From the adoption of the telegraph through the spread of the Internet, innovations in telecommunications have reduced the real cost of communicating over long distances and speeded the dissemination of information about economic conditions and developments in distant markets. Consequently, it is less costly and easier for companies to do business at a distance. Moreover, the marriage of computer and telephone technology has spawned the emergence of computer-based management information systems that enable MNCs to better and more cheaply manage far-flung affiliate business activities, including the export and import activities of foreign-based affiliates.

The transportation sector has also enjoyed remarkable improvements in technology that have both lowered the costs of transporting goods long distances and expanded the range of goods that can be shipped. For example, containerization of ship cargo along with the adoption of surface transportation systems that can move containers to and from ports is a major development facilitating the efficient and safe transportation of goods internationally. Double-hulled, large oil tankers are the basis for the major growth in exports of petroleum and petroleum products from oil-rich regions such as the Middle East to oil importers such as China and the United States. The jet airplane along with declining airfares has facilitated the ability of MNCs to quickly move technicians, salespeople, and managers throughout their global organization to facilitate efficient worldwide operations.

Without gainsaying the importance of these technological developments, many economists believe that the single most important factor encouraging the growth of international trade has been government efforts to reduce barriers to international trade through the creation of multilateral and regional trade agreements. From the General Agreement on Tariffs and Trade (GATT) to the WTO, the nations of the world, through these multilateral agreements, as well as regional agreements such as NAFTA, have implemented major reductions in tariffs and other barriers to trade, particularly for manufactured goods. Certainly, major barriers to international trade still exist, particularly in agriculture and services; however, the trend toward expanding regional trade associations and deepening multilateral trade liberalization remains in place.

The Economic Basis for International Trade

The underlying rationale for international trade is the theory of comparative advantage, developed by the British economist David Ricardo in the 18th century. The theory posits that countries can improve their real standards of living by specializing in the production and exportation of goods in which they have *relatively* low costs while importing goods for which they are *relatively* high-cost producers. Equivalently, countries should specialize in producing and exporting goods that are relatively cheap in their home markets and import goods that are relatively expensive.

The concept of comparative advantage is illustrated by the information summarized in Table 1. The illustrative example involves two countries, the United States and China, and two goods, steel and cloth. While the example is obviously a gross simplification of reality, it illustrates the principle of comparative advantage as well as more complicated examples. The information shows that China uses 5 units of labor to produce a unit of cloth and 10 units of labor to produce a unit of steel. The United States is assumed to use 2 units of labor to produce a unit of cloth and 3 units of labor to produce a unit of steel. Another simplifying assumption here is that labor is the only input for producing steel and cloth. Again, the assumption doesn't change the logic of the discussion.

Table 1 Assumed Labor Requirements per Unit of Output

	Product	
Country	*Cloth*	*Steel*
United States	2	3
China	5	10

Note that the United States is assumed to need less labor than China does to produce either cloth or steel. The United States has an absolute advantage in producing both cloth and steel because it can produce both products with fewer inputs than does China; however, the United States is relatively low cost in the production of steel, while China is relatively low cost in the production of cloth. To see this, imagine that the United States stopped producing 1 unit of steel and used the labor that was saved to produce cloth. It could produce an additional 1.5 units of cloth since 3 units of labor used in cloth making would result in (3/2) or 1.5 units of cloth being produced. In China, if 1 unit less of steel were produced, the economy could increase the production of cloth by 2 units, that is, 10 units of labor divided by the required 5 units of labor per unit of cloth. Another way of viewing the situation is that the U.S. economy would need to give up two thirds of a unit of steel for each unit of cloth produced domestically, whereas the Chinese economy would only need to give up 0.5 units of steel for every unit of cloth produced domestically. In terms of economic sacrifice, it is cheaper to produce cloth in China and steel in the United States.

Domestic prices for steel and cloth in the two countries should reflect the assumed differences in relative costs. For example, since steel production in the United States requires 1.5 times the amount of labor per unit of output required for cloth production, steel would presumably cost 1.5 times as much as cloth in the United States if all steel and cloth sold there was domestically produced. By the same logic, the price of steel would be twice that of cloth in China assuming that all the steel and cloth sold there was domestically produced. In effect, steel is relatively cheap in the United States, and by deduction, cloth is relatively cheap in China. Therefore, to the extent that consumers in the United States want more cloth, they would be better off buying it from Chinese suppliers, while consumers of steel in China would be better off importing steel from suppliers in the United States.

In fact, by opening up international markets for trade in cloth and steel between the two countries, such as by eliminating tariff and nontariff barriers to trade, export and import agencies would engage in precisely the behavior predicted by the simple theory of comparative advantage as described above: Namely, companies would go into business importing cloth from China for sale in the United States while importing steel from the United States for sale in China. As this process took place, the price of steel relative to cloth would fall in China and rise in the United States as steel left the United States for China while cloth entered the United States from China and as steel entered China from the United States while cloth left China for the United States. Eventually, the relative prices of the two goods in the two countries would converge to the point where further international trade was not profitable, given transportation and other costs of serving foreign markets. The trade that does take place between the two countries should, of course, benefit consumers in both countries since they are able to import specific products at prices lower than those being charged by domestic sellers.

The simple logic of the theory of comparative advantage is compelling, if not intuitively obvious; however, even those critics who readily accept the logic of Ricardo's theory question the overall net benefits to economies arising from unrestricted international trade. Some specific reservations to the economic argument for free trade are discussed in the next section.

Some Criticisms of International Trade

A variety of criticisms have been leveled against international trade in conjunction with a growing and vocal opposition to the "globalization" process. Since it is impossible to be comprehensive in cataloging the criticisms, this portion of the entry focuses on what are arguably the most prominent or most durable criticisms.

Unemployment

Perhaps the most long-standing and fundamental complaint about international trade is that imports displace domestic production and lead to increased unemployment in the domestic economy. An appropriate response to this complaint is that increased exports enhance employment opportunities in the domestic economy; however, many of those who lose their jobs or suffer reduced wages as a consequence of increased imports may not be able, for one reason or another, to move quickly into activities that are expanding as a result of growing exports. For example, older workers may find it difficult or uneconomical to spend significant periods of time acquiring additional education or new skills necessary to work in expanding businesses. Workers living in rural areas may find it economically difficult to afford higher-priced housing in urban areas where most new jobs are likely being created. Perhaps of greatest relevance, some domestic workers may need to accept lower wages and reduced benefits, with the associated hardships, to maintain their jobs.

To the extent that increased international trade benefits society overall, it seems "appropriate" for government to offer assistance to those who suffer significant economic hardship from increased imports. In fact, most developed governments do have programs to assist domestic workers who can document significant economic injury from growing imports. What is noteworthy is how relatively few workers, particularly in the United States, apply for assistance under those programs. In the past, the burden of adjusting to import competition has been disproportionately borne by workers in unionized manufacturing industries such as steel and automobiles, in both the United States and other developed countries. In fact, these have been relatively slow-growing industries with a declining workforce anyway, thereby helping to mitigate the need for major labor market adjustments to international trade. More recently, increased imports from countries such as India and China are occurring in major and growing sectors such as electronics and software. Hence, labor market impacts of international trade in developed economies such as the United States may be larger in the future than in the past.

Unfair Trade

The argument that expanding exports to trade partners will create new (and possibly more highly paid) employment opportunities to replace those "lost" due to increased imports is undercut somewhat by protective measures undertaken by a country's trading partners that discourage exports by other countries. Critics of international trade frequently argue that trade might be free, but it is rarely "fair." Measures that promote a country's exports, while discouraging imports to that country, encompass a range of actions that are often labeled unfair trade practices. They include suppressing an appreciation of the exporting country's currency, laws and regulations that are particularly costly for foreign firms to obey, government subsidies to domestically owned firms, and a failure on the part of some governments to enact or enforce environmental regulations, minimum wage laws, worker protection laws, and other corporate obligations that other countries have put in place.

One point that should be made with respect to the unfair trade argument is that trade will still follow the basic pattern dictated by comparative advantage; that is, countries will still be encouraged by market forces to export goods that are relatively cheap domestically and import goods that are relatively expensive domestically. Hence, if unfair trade practices are being pursued by certain governments, they will affect trade only to the extent that they alter established patterns of comparative advantage. For example, if developed countries have minimum wage laws while developing countries do not, products produced using relatively unskilled labor will be even more expensive in developed countries compared with developing countries. This will accentuate the comparative advantage that developing countries have in goods that are produced using relatively large amounts of unskilled labor.

A second point is that unfairness is in the eye of the beholder. For example, workers in developing countries might not place the same importance on occupational health and safety as do workers in developed countries. For the former, abundant and relatively well-paying jobs are of primary importance. Hence, workers in developing countries might see it as unfair for their governments to implement the same occupational health and safety laws as the United States does under duress from the U.S. government, particularly if it leads to fewer or lower-paying jobs available in those developing countries.

The Race to the Bottom

Closely related to the unfair trade argument is the argument that free trade will inevitably lead to a weakening of social legislation, including environmental regulations, and an erosion of public spending in developed countries. The basic notion is that companies will relocate production facilities to countries that do not have social and environmental legislation but that do have low tax rates because there is relatively little government spending. The resulting loss of jobs and income tax revenue will put pressure on governments in developed countries to change public policies to make them more similar to those of developing countries to discourage "outsourcing" of domestic jobs. Outsourcing in this context can be thought of as the relocation of production capacity abroad while serving the former production location by exporting from the new location.

Critics of globalization presume that MNCs systematically prefer to locate in low-tax political jurisdictions characterized by weak social and environmental regulations and that appeals to notions of morality to change this preference are likely to be futile; however, there are theoretical reasons to question the validity of the presumption. In particular, skilled, educated workers essential to operating modern businesses arguably prefer to live and work in safe and clean environments, where their children can receive good educations and where there is good public infrastructure in the form of roads, parks, and the like. Such preferences are likely to encourage more rather than less social spending by government, as well as environmental and occupational regulations and laws more prevalent in developed countries.

The available empirical evidence also fails to provide any convincing support for the race-to-the-bottom concern. In particular, there is no evidence that MNCs significantly favor investments in countries with weaker environmental protection laws when other factors are held constant. Moreover, over the past four decades, government spending on social programs as a share of national income has risen in the developed world notwithstanding an explosive growth of international trade.

Economists therefore continue to defend international trade as an important channel by which countries, especially developing countries, can improve their living standards. At the same time, critics of international trade continue to raise the specter of powerful MNCs weakening the sovereign power of federal and local governments to enact policies that are not in the economic interests of big business. In this respect, international trade raises a basic concern about trade-offs between economic and noneconomic objectives that characterizes most economic policy issues.

—Steven Globerman and Brian K. Burton

Internet and Computing Legislation

As a business and public tool, the Internet is in its infancy, especially when compared with other forms of communication technology such as radio, television, and the telephone system. It follows then that the relevant government legislation is also in its infancy and that the regulatory and legislative pace is fast and evolving very quickly. As with other major shifts in the culture, with the Internet, the government has struggled to understand its potential impact on business and society, how it is both similar to and different from other forms of communication, and what public policy role the government should assume. Because of this, most of the legal framework that applies to and affects the Internet emanates from regulatory and judicial bodies interpreting existing law rather than from legislative actions. This is especially true when issues such as equal access, copyright protection, and consumer privacy are considered. In these and similar cases, existing law, written in another time for other business and technology situations, is being interpreted in the context of new applications of a new emerging communications medium.

Society and governments view communications technologies and their associated systems as vital public infrastructure, increasingly necessary for conducting private and governmental business. At heart, all communications technologies, from the telephone and telegraph to satellite television to the Internet, share common features: They move "information" of some type (pictures, voices, data); they require a network of common users to be practical and valuable; they spawn innovation and foster economic growth; and they convey societal and business advantages to those who have access to them over those who don't. It is these last two features that inform (involve?) most government regulation of communication technology. Universal access to communication services, fair pricing, and ensuring usage for public good have driven communications legislation in the past and likely will do so in the future.

In that context, early communications legislation, and now Internet and computing legislation, has been concerned with two sometimes competing aspects of public policy: promoting growth, usage, and public access to communications media, while also attempting to specify and at times control how that medium is used and what "content" it may communicate.

All such modern legislation has its roots in two predecessors: the Communications Act of 1934 (which established the Federal Communications Commission and addressed radio broadcasting) and the Modified Final Judgment, a judicial ruling in 1984 that governed the dismantling of the AT&T telephone monopoly. Both were primarily concerned with placing restrictions on companies: specifying what broadcasters could not do, placing limits on ownership, and erecting barriers to cross-market services (e.g., preventing long-distance telephone carriers from entering local phone markets). The main focus was on preventing monopolies and unfair pricing and controlling the influence of broadcasters.

Both predecessors reflected the fact that until the 1960s there was a clean division in the primary forms of communication: Radio broadcast only sound (broadcast meaning communicating from one sender to many receivers), television broadcast pictures and sound, and telephone carried sound from a single point to another single point. The 1960s started a revolution in electronic technologies, eventually creating new opportunities for the existing telephone infrastructure (particularly in carrying data), jump-starting the cable television business, creating new ways of transmitting data and voice, and blurring the formerly clean lines of communications media. Data could be carried on telephone lines. Pictures and sound would eventually be translated into data. By the mid- to late 1990s the telephone network (in the form of Internet services) could "broadcast" radio, television, and music. Television technology (especially cable networks) could be used for transmitting the same data, making it possible to provide telephone services, television, radio, and data communication through the same network. In the intervening 60-plus years between 1934 and the late 1990s, a confusing, overlapping, sometimes conflicting, and ultimately unworkable collection of regulations and policies were created by a variety of state and federal entities.

The first successful attempt to address the changes was the Telecommunications Act of 1996, signed by President Bill Clinton on February 8, 1996. The act covers almost all segments of the communications industry, including broadcast radio and television, cable television, telephone service, and Internet and online computer services. For all of these the act attempts to simplify the regulatory environment. Most critically, the act eliminated cross-market and cross-industry barriers, allowing companies to provide service in multiple sectors (e.g., cable companies offering telephone services, long-distance companies offering local telephone services) and promoting competition in previously near-monopoly environments. Arguably, the loosening of restrictions is considered by some to be a major factor in the growth of affordable high-speed communications access not only to business but also to the home, setting in place the necessary infrastructure for the explosive growth of the Internet in the next 10 years.

Specific to the Internet, the Telecommunications Act of 1996 included Title V, the "Communications Decency Act of 1996" (CDA). Title V attempted to place limits on what could be transmitted over the Internet, prohibiting "indecent" or "patently offensive" and/or harassing materials from being transmitted, e-mailed, posted on Web sites, or used in chat rooms or online discussion groups. In doing this the act posited a clear parallel between radio and television broadcasting and the Internet, and it applied to the Internet the standards already in place for public broadcasters. In contrast, though, the CDA also exempted operators of Internet services (Internet service providers [ISPs], chat room providers, etc.) from liabilities arising from the content that third parties placed on the Internet, in that context drawing a clear line separating traditional publishers and broadcasters from Internet operators. (In fact, newspapers were now held to a double standard. For example, classified ads for housing placed in print editions of newspapers could not be discriminatory, but the newspaper was protected from legal harm if a similar ad placed on a newspaper Web site classified section discriminated against a protected class.)

Civil liberties organizations immediately reacted to what was viewed as an infringement on free speech rights, arguing that the Internet is a unique communication medium, more like a newspaper than television, and should be protected by the First Amendment. Opponents argued successfully that because the CDA preempted parents' prerogatives of deciding what was or wasn't appropriate for their children, because the phrase "patently offensive" had no clear legal definition or precedent in law, and because the restrictions extended beyond commercial speech, those parts of the CDA were clearly unconstitutional. By 1997, the Supreme Court had ruled the content-oriented parts of the CDA as unconstitutional and concluded that the Internet deserved the same free speech protections as other print media.

In response to the Supreme Court CDA ruling, Congress passed the Child Online Protection Act (COPA) on October 21, 1998. Specifically targeting the World Wide Web, COPA makes it a crime to use the Internet for "any communication for commercial purposes that is available to any minor and that includes any material that is harmful to minors" without restricting access to minors through means of a credit card, debit card, adult access code, or digital age verification certificate. While COPA was more narrowly constructed than the CDA, it was nonetheless seen by civil liberties organizations and many others as again infringing on free speech rights, especially with regard to language that applies "contemporary community standards" to judge which materials would be harmful. Legal challenges began on October 22, 1998, and continued over the ensuing 6 years, culminating in a Supreme Court decision blocking enforcement of COPA because of its overly restrictive language. The Supreme Court sent the case back to the lower courts with a charge to investigate changes in technology, especially parental controls and sophisticated Internet filtering, which would be more effective than a broad Internet pornography law.

Fundamentally, the CDA and COPA were attempts to apply traditional legislative thinking and constitutional ideas (control of content, definitions of obscene material, free speech protections) to a new technological phenomenon that was not only unique but also only in its infancy. Congress critically misjudged the Internet and assumed it was a communications medium rather than an enabler of business and personal innovations that would transcend its original intent of being a robust, survivable network connecting distributed computers. While focusing on obscene materials, Congress was not able to anticipate a wide range of Internet-related issues that would arise from innovative application of the basic Internet technology, including piracy, copyright, free speech, and privacy questions. Because the cycle of technologic innovation is much shorter than that of legislative response, private citizens and businesses would create new uses for the Internet that would inevitably outpace legislative efforts to respond.

Arguably preeminent among these uses is electronic commerce, in which the Internet is used to replace and augment traditional commercial transactions and which has created new types of transactions that did not exist in a pre-Internet world. And, where commerce flows, taxes are soon to follow. From a taxing perspective, the Internet presented new problems and opportunities for government taxation. As many commerce-based taxes are location dependent, the "locationlessness" of the Internet allowed most transactions to be outside traditional taxing mechanisms. In addition, the global reach of the Internet, coupled with global logistics and delivery capabilities, expanded the range of commercial transactions and hence the possible number of government entities desiring a piece of the tax pie.

In the United States, by the mid-1990s individual states began the process of imposing taxes on Internet access and on e-commerce transactions, based on the location of the transacting parties. States required ISPs to monitor locations and provide the government with detailed information for tax purposes, and the prospect of at least 50 separate jurisdictions imposing differing requirements on ISPs forced the discussion to the national level. Proponents of a tax-free Internet argued that tax burdens would stifle the growth and innovation of the Internet and related services and should be banned for Internet commerce and access. Alternatively, states argued that e-commerce would reduce taxes from traditional commercial transactions to such a degree as to harm states' revenue streams and that they should be allowed to tax Internet access to make up the shortfall. In response, Congress passed the Federal Internet Tax Freedom Act (F-ITFA), which was also signed into law on October 21, 1998 (along with COPA). The F-ITFA imposed a 3-year moratorium for local, state, and federal taxes on Internet access, as well as multiple or discriminatory taxes on e-commerce transactions. (States which had such laws on their books before October 1, 1998, were allowed to continue collecting taxes.) The moratorium has been extended twice and is now set to expire in

November 2007. As with the Supreme Court decision on COPA, the F-ITFA was put in place to provide time to study how e-commerce issues would develop and mature over time.

On a different but no less important front, the Internet has created enormous pressure for laws dealing with copyright protection and prevention of piracy of digital content. As writing, video, music, movies, software, and most other content have been digitized, legal and illegal copying have become simplified to the point of triviality. Combined with the Internet's capabilities to quickly move large amounts of data between computers, copying and distributing copyrighted materials literally exploded onto the Internet. (At one point in the mid-1990s, it was estimated that 80% of all communications capacity at U.S. colleges and universities was being taken up by students trading music and movie files.) Again, legislative and judicial action has been slower than technical innovation, creating tremendous opportunities for copyright infringement, illegal copying, and piracy of all manner of digital content. (The classic example of this phenomenon was Napster, a service on the Internet started in 1999 specifically designed to allow individuals to "share" music over the Internet. By compiling inventories of songs that had been digitized and stored on private computers, between 25 and 40 million users shared songs across the Internet, essentially violating the copyrights on almost every song that was copied. Napster was subsequently sued by artists and record companies and was eventually shut down by the courts and forced into liquidation in late 2002.)

In response to the increased level of copyright infringement, Congress passed the Digital Millennium Copyright Act (DMCA), signed into law by President Clinton on October 28, 1998. The DMCA was the U.S. implementation of the World Intellectual Property Organization (WIPO) Performances and Phonograms Treaty and the WIPO Copyright Treaty, both of which were designed to address global copyright issues brought about by technological and social changes related to improved communications and digitization methods. In addition to increasing penalties for copyright infringement on the Internet, the DMCA specifically criminalized any attempt to defeat software- and hardware-based copy protection systems being developed by copyright holders to protect their works from illegal use and copying. As with the CDA, the DMCA also limited the liability of ISPs arising from copyright infringement and copy protection circumvention initiated by their customers or users.

As the Internet matures and society continues to find new uses for this tool, the legal landscape will change to include laws specific to the Internet rather than merely including laws that are written for other media and are then applied to the Internet. In addition, the global nature of the Internet will force nations to standardize laws across national boundaries. The key issue will be balancing public interests with governmental and business interests and creating an environment that continues to promote innovation and universal access.

Interpersonal Comparison of Utility

Utilitarianism posits that the ethical good is the greatest good for the greatest number. This moral principle implies simple aggregation of individual utilities without accounting for interpersonal comparisons. Needs and tastes may differ, however, and two problems appear paramount in determining what the greatest good actually is. The first problem is variety: How do we allow for the different needs of men and women, poor and wealthy, Christian and Taoist, and so forth? The second problem, given such variety, is interpersonal utility judgment: Who is in a position to make the comparisons necessary for maximizing the good?

Both problems received notice in classical utilitarianism. Jeremy Bentham maintained in *The Rationale of Reward* that utility is a simple calculus of personal pleasure and pain, so he resolved the problem of variety by stating that the game of pushpin had objectively equal value to poetry. John Stuart Mill, in *Utilitarianism,* replied by distinguishing between higher and lower pleasures (or pains) and suggesting that lovers of lower pleasures know only half the story. Mill had to address the problem of judgment, in consequence, so he distinguished sages, who can solve the problem, from fools, who cannot.

Mill's reference to those who "know" both sides of the comparison necessarily introduces the theory of knowledge into the problem of judgment. Marxist and feminist epistemologists, referred to as perspectivists and standpoint theorists respectively, have argued that those in disadvantaged social positions will gather superior knowledge of many social situations, for the simple reason that their survival demands it. If these theorists are right, then the disadvantaged might be the sages that Mill refers to, despite his apparent intention that the bourgeoisie would hold that position. Research cited by Martha Nussbaum suggests that perspectivism may be false, however, insofar as the truly downtrodden may set their sights so low that they will not voice very pressing needs, even when asked to do so. The problem of judgment may be intractable.

A proposed solution to the problem of variety is to substitute a theory of human flourishing for the utilitarian focus on pleasure (or pain). Both Amartya Sen and Nussbaum argue that a decent standard of living might be a revised goal that would require very different resources for different people. Interpersonal differences between elderly women and children with disabilities, then, would entail different specific demands for social resources that allow for individual capabilities for flourishing, though these distinct demands may be considered approximately as the same abstract right. This approach may lead back to the Marxist notion of somehow transferring resources to individuals with greater needs—on someone's judgment.

Interstate Commerce Commission (ICC)

The Interstate Commerce Commission (ICC) was the first major regulatory agency created in the U.S. government, and the first independent regulatory commission. The commission regulated the rates and business practices of interstate shipping by railroads and, later, trucking companies and barge lines, from 1887 until significant deregulation under the Staggers Rail Act in 1980, and final termination of the agency at the end of 1995. Some remaining functions were deposited in a new Surface Transportation Board (STB).

The design and functioning of all subsequent independent commissions have been influenced by the ICC. Regulatory tools that originated in legislation applying to the ICC also became the models for methods of regulation used extensively not only elsewhere in the federal government but in most state governments as well. In addition, the creation and evolution of the ICC have been the focus of intense study by scholars seeking to understand how regulation begins and changes over time.

Origin of the ICC

The construction of railroads in the mid-19th century was rapid and speculative, resulting in considerable overbuilding; multiple lines connected population centers, often with significant overcapacity. Railroads competed to steal market share from rivals, setting rates below actual costs, that is, engaging in "cutthroat competition." The goal was to drive competitors out, so that rates could be raised to supracompetitive levels, that is, permitting the collection of monopoly rents. Thus, shippers faced frequently varying transportation costs.

In addition, geography, the technical characteristics of goods, and market conditions led to price discrimination across shippers, localities, and commodities. Secret rebates went to the largest shippers. Railroads faced competition over longer hauls, at least in the shipment of bulk commodities, from barge traffic. But that was often not the case over short segments, for example, to rural areas away from major water routes. Hence, railroads created long-haul/short-haul differentials in their rates, charging more for shorter runs than for the longer runs that faced competition.

So-called "value-of-service" pricing set higher rates for shipment of "higher-valued" manufactured goods. Such goods had fewer shipping alternatives than did bulk commodities that could go by barge. Bulk commodities were more sensitive to shipping costs because such costs were a relatively higher part of their final price than for manufactured goods. Thus, elasticity of demand for rail transport was higher for bulk commodities than for manufactured goods. The railroads took advantage of this by charging higher rates for manufactured goods.

Shippers of bulk commodities, such as farmers; small shippers paying higher rates than larger competitors; producers in interior locations without a competitive means of transport; and manufacturers paying higher shipping rates bristled at such discrimination by the railroads. Even some railroad managements were unhappy about the instability in the industry and their inability to create steady, predictable rate conditions and shipping traffic that consistently met capacity.

Thus, for different reasons, there was considerable support for regulation that would eliminate the abuses and stabilize the industry. Initial attempts at regulation at the state level—many in partial response to the Granger movement of farmers centered in the Midwest—met failure as railroads bribed legislators and "captured" the regulation in a number of states. Historians now recognize that support for regulation came from multiple groups with the diverse interests noted above, that is, from farmers, merchants, and shippers in river towns; manufacturers and eastern, including New York, merchants; independent oilmen in Pennsylvania chafing against the competitive disadvantage they faced because of the high rebates extracted by Rockefeller's Standard Oil for large shipments; and so on.

In the U.S. Supreme Court's decision in *Wabash, St. Louis and Pacific Ry. Co. v. Illinois,* 118 U.S. 557 (1886), the Court invalidated the state commissions by applying the U.S. Constitution's commerce clause to railroad transportation crossing state boundaries—the states could not regulate within their state boundaries if the transport was interstate in character. The effect of the decision was to mobilize support for federal regulation. In their 1989 study of congressional voting on the Interstate Commerce Act, Thomas Gilligan, William Marshall, and Barry Weingast found that constituency effects, working through the institutional structure of Congress, that is, committees, seemed to be reflected in the vote—for example, legislators with constituents adversely affected by long-haul/short-haul differentials voted accordingly. The act received broad support from multiple interests whose congressional representatives responded to those interests.

The Interstate Commerce Act of 1887 established standards for the treatment of shippers: Rates had to be "reasonable and just"; there was to be no "unjust discrimination" in rate setting, that is, secret rebates were outlawed; undue or unreasonable preferences were not to go to any person, company, firm, or type of traffic; and long-haul/short-haul differentials were forbidden.

Value-of-service pricing remained legal, however, and some authors, such as Ann Friedlaender, argue that this was done deliberately to provide an incentive to develop the West: Shippers of bulk commodities, such as agricultural products or mineral ore, would be encouraged by the rate structure to locate in the West, shipping their goods eastward and enjoying what amounted to cross-subsidies from the higher rates for shipment of manufactured goods inside the developed East.

The economic importance of the new regulatory agency can perhaps be seen from the fact that when the Dow Jones stock average began in 1885, 12 of the 14 stocks it included were railroad stocks.

Evolution of the ICC

The ICC was established inside the Department of the Interior. But the White House changed parties in the election of 1888, with Benjamin Harrison becoming president. According to Louis Brownlow, Senator John H. Reagan of Texas, former postmaster general of the Confederacy, who had been a major player in passage of the 1887 act, did not trust Harrison, a "railroad lawyer." As a result, he helped engineer a bill in the rump Congress that met after the election, signed by President Grover Cleveland in the last days of his first administration, that took the ICC out of the U.S. Department of the Interior and made it an "independent" commission—inside no department of the federal government, floating freely in administrative space. It was an invention copied to this day, rationalized on the basis of the claim of promotion of impartial, expert, and nonpolitical decision making but originally done on the basis of a political calculation.

The first chairman of the ICC, Thomas M. Cooley, was a distinguished legal scholar who gained legitimacy for the new commission's process by making its procedures work like a court of law. This created a precedent followed in most subsequent regulatory agencies, making U.S. regulation highly judicialized, with use of detailed administrative procedures, a judge-governed process for adjudication of cases, and reliance on adversarial development and examination of case evidence.

The initial reactions of railroad executives were mixed, though at least some observed that the commission could promote long-needed stability. At the same time, it was recognized that opportunities existed to take advantage of the commission's limited powers and limited staff.

In the 1890s, Supreme Court decisions constrained the ICC's powers. By the turn of the century, however, the commission gained members determined to acquire new enabling legislation that would permit it to reassert its control of the railroads. The approach of these members, and of those in the Congress that soon provided this legislation, reflected the views of the Progressive Movement as well as of a Progressive president, Theodore Roosevelt. Government would be removed from politics and run like a business, but in the public interest. Government officials were to behave like professional public servants, and regulators were to remain free of the taint of business influence, regulating industry so as to retain the benefits of a market, but under government controls. Among the new ICC members was Franklin K. Lane, later secretary of the interior, one of the most able officials ever to serve in the U.S. government. He joined the commission in 1906. At his untimely death in 1921, he was so popular and widely respected that many considered that, had he not been born in Canada, he would have been a likely candidate for president.

As a result of scholarship in the last half of the 20th century, ICC regulation was widely discredited; the effects of commission regulation on consumers and even the regulated industry were criticized. But it is important to recognize that the ICC in its earlier decades was considered by those who administered it—and, indeed, by a public who respected it—as a noble experiment to control an industry whose abuses would reappear without such controls. The highest norms of public service were reflected in such ICC commissioners as Thomas Cooley, Franklin K. Lane, and the long-time chair of the commission in the 1920s and 1930s (and, for a time, coordinator of transportation), Joseph Eastman. It was only relatively recently, in 1883, that the Pendleton Act had created the Civil Service System, bringing the merit system to the U.S. government. Thus the ICC was the centerpiece of a new set of expectations for the behavior of government officials in the United States; it was in its first decades the laboratory for what constituted a new ethics of the public service. Thus, among the legacies of the commission were not only the sometimes ineffective design of independent commissions, the rigidities (as well as due process benefits) of a new administrative process, and the particular industry-protective regulatory tools, such as rate-of-return regulation, that were introduced in the commission but also a view that the public service could and should be conducted with the highest dedication to the public welfare.

A steady flow of Progressive legislation restored and expanded the ICC's powers. These included the Elkins Antirebating Act of 1903, the Hepburn Act of 1906, the Mann-Elkins Act of 1910, and the Valuation Act of 1913, which led to a massive study by the ICC to value railroad properties in order to be able to regulate rates and investment. The stream of new legislation culminated in the Transportation Act of 1920, a watershed in the history of regulation in the United States. One effect of the act of 1920 was to establish rate-of-return regulation as the standard model for economic regulation in the United States; it was copied in many regulatory settings across the federal and state governments. Economic regulatory agencies were to set rates based on a study of the fair rate of return. In practice, this was difficult to do accurately and at any rate tended to protect the industry, guaranteeing its continued existence, if not its consistent profitability. Rate setting, like other activities of the commission, was done on a case-by-case basis, perpetuating the legalistic model established by Judge Cooley.

Over time, the size of the commission itself grew, from 5 to 9 to 11 (in later years reduced to 7 and to 5), with commissioners assigned to “divisions” of the commission, to which some decisions were delegated. The sheer number and complexity of this casework caused much of the commission’s work to be further delegated to staff members and inhibited overall policy making and planning by the commission. Carriers had to submit detailed lists of tariffs for the shipment of every item between every pair of locations for commission review. The commission also controlled routes for service, starts and stops of service, mergers, and many other features of the provision of transportation services.

A new technology of transportation—motor vehicles—raised new issues for the ICC. Trucking companies had competitive advantages over regulated railroads. They could set and adjust their rates to gain quick competitive advantage over the railroads, who would have to ask the ICC for rate adjustments in a relatively lengthy process. Large trucking companies, however, feared competition from smaller truckers and disliked the rate wars that destabilized the industry. A railroad group, the Association of Railroad Executives, helped write new legislation that brought the large truckers into the ICC in the Motor Carrier Act of 1935, treating them as if they were railroads. The effect was to erect barriers against interstate competition by smaller, nimble trucking competitors, who would not want to pay the expense of maintaining elaborate lists of tariffs—shipping rates that had to be approved by the ICC—for the shipment of any item between any two interstate locations.

The regulation of air transportation, under the Civil Aeronautics Act of 1938, which was later performed by the Civil Aeronautics Board, copied ICC regulation and narrowly escaped becoming part of the ICC itself. The Transportation Act of 1940 added major barge lines to the ICC’s authority, and the ICC’s task became one of allocating traffic among three modes of transportation—railroads, trucks, and barges—according to what is now recognized as a mythical theory of what kinds of traffic and rates were proper across the different modes. In essence, the ICC became a protector of these regulated modes of transportation, approving their rates so as to stabilize conditions of competition among the modes. Indeed, representatives of the companies would haunt the ICC’s tariff filing room and file challenges whenever companies filed tariffs that undercut their rate pricing.

Criticism of the Effects of ICC Regulation

Because the system of regulation under the ICC was consistently deferential to each mode of transportation, shipping rates were maintained at higher than the competitive level. Although in its last decades the ICC tended to serve transportation company over consumer interests, the effect of its regulation was also to perpetuate a system of transportation that lacked innovation and was resistant to change. Despite their protection, transportation companies still struggled. The agency itself seemed unable to do systematic transportation planning, was slow to react, and was unable to innovate. Except in several notable cases, its leadership was consistently mediocre. The administrative process, dominated by case-by-case reviews, was unable to view issues from a perspective other than that of cases and produced long delays in decisions. In 1970, a muckraking but careful overview of the ICC’s performance directed by Robert Fellmeth (as part of a Ralph Nader study group) found serious administrative deficiencies. The appearance of potential industry favoritism was inescapable. Of the last 11 commissioners to have left the ICC at that time, 9 either took jobs in the regulated industry or practiced law before the commission. The other two retired. Senior ICC staff members had very long tenures and no inclination to change ICC practices. Over numerous advisory committees and liaison groups in which the agency participated to assist it in gathering information and developing policy, none had any representatives of consumers.

Deregulation of the ICC

By the late 1950s, studies by economists had established that the effects of ICC regulation did not seem consistent with the nominal purpose of the agency. Regulation had frozen into place an industry that had performed less well than other industries while not protecting the interests of consumers and shippers—precisely the reason that had led to regulation in 1887. Pressures to reform the agency mounted. Under the Staggers Rail Act of 1980, signed by President Jimmy Carter, many of the rate- and route-setting powers of the ICC were deregulated. The general trend since then has been improvement in the financial performance of the railroad industry, together with lower shipping rates for many, though not all, shippers.

The ICC Termination Act of 1995 transferred some of the functions of the ICC to a new agency, the three-member STB, and to other federal agencies, eliminated other functions, and abolished the ICC at of the end of that year. Ironically, the STB remained, functionally, an independent commission, though administratively located inside the Department of Transportation. Thus the demise of the ICC was actually partly symbolic in that significant regulatory functions continued in the STB, while members of Congress took public credit for terminating the oldest of the federal regulatory agencies. But the influence of the old ICC lives on in the administrative processes of the independent regulatory commissions and of other regulatory agencies in the federal and state governments of the United States.

Intrinsic Value

Intrinsic value is traditionally understood to be the value a thing has in virtue of its own nature, or its own intrinsic properties. Thus, a thing has intrinsic value "in itself" or "for its own sake" or "in its own right." This implies that intrinsic value is "nonderivative" or "nonrelational" since things that have intrinsic value do not have it because of their relation to other things. For example, many writers argue that pleasure is intrinsically valuable because pleasure is good in itself and not because of its relation to something else. Other things sometimes said to be intrinsically valuable are, for example, happiness, virtuous acts, knowledge, or experiences of beauty, friendship, or love. Contrasted with intrinsic value is extrinsic value, which is the value a thing has in virtue of its relation to something else and not in itself or in its own right.

Final Goods and Instrumental Goods

Closely related to the distinction between intrinsic and extrinsic value is one between final goods and instrumental goods. Final goods are things desired or chosen for themselves or for their own sake. Instrumental goods are means or methods selected to accomplish final goods. For example, suppose you are looking at job openings on the Internet. Someone asks you why you are doing this. You reply, "I am trying to find a job." The rest of the conversation continues—Why do you want a job? So I can make money. Why do you want money? So I can provide my family with a decent standard of living. Why do you want to do that? So I can be happy. Why do you want to be happy?—Now what do you answer? Probably that you do not want to be happy for the sake of something else but for itself. Thus, happiness is your final good, and all the steps you take to achieve happiness, the means you use to move toward that goal, are instrumental goods.

Final Goods and Intrinsic Value

A controversial issue is how to characterize the relation between intrinsic and extrinsic value on one hand, and final and instrumental goods on the other. Consider first the relation between intrinsic value and final goods. There are several possibilities. One is that something is intrinsically valuable if and only if it is a final good. Thus, all final goods are intrinsically valuable, and only final goods are intrinsically valuable. If so, to say that something is intrinsically valuable is just to say that someone values that thing for itself or as a final good. Call this possibility "subjectivism" since intrinsic value is tied to what is desired or chosen for its own sake by some person.

A second possibility is "modest objectivism." Modest objectivists believe that the only things that are intrinsically valuable are certain human experiences. However, they deny that what makes such experiences intrinsically valuable is that they are valued for themselves, that is, that they are final goods. Instead, they argue that some experiences are intrinsically valuable by virtue of their own nature or their own intrinsic properties. For example, modest objectivists claim that happiness is valuable in itself or in its own right and not merely because happiness is valued for itself by some people.

A final possibility is "total objectivism." Like modest objectivists, total objectivists argue that things have intrinsic value by virtue of their own nature and not because they are valued by some person. However, they deny that human experiences are the only things that are intrinsically valuable. They argue that intrinsic value can be exemplified by, for example, natural states such as biodiverse environments, old-growth forests, wilderness areas, and other things that exist independent of human experience.

Until fairly late in the 20th century, modest objectivism was the mainstream philosophical view about intrinsic value. More recently it has to a large extent been displaced by various forms of subjectivism and to a lesser extent by total objectivism.

Instrumental Goods and Extrinsic Value

Instrumental goods are means used to achieve a goal. Hence, instrumental goods have derivative value; they are not chosen for themselves but for the sake of the goal. It seems, then, that instrumental goods have extrinsic value. However, if the three positions discussed above can be mirrored in the distinction between instrumental goods and extrinsic value, then subjectivists, modest objectivists, and total objectivists could each have a different understanding of the relation between instrumental goods and extrinsic value. For example, subjectivists could argue that things have extrinsic value only because they are valued as instrumental goods by some person, while modest objectivists might claim that some means to ends can contribute to final goods in ways that are not instrumentally valuable and so have extrinsic value that is not simply instrumental.

According to several writers there are things that have extrinsic value but are not means to ends. For example, the copy of the Declaration of Independence in the National Archives derives its value from its relation to the founding of the United States. Since it has derivative value, it is not intrinsically valuable in the traditional sense, but neither is it instrumentally good. Thus, its value is extrinsic but not instrumental. There are many things of this kind. They are of no particular instrumental use, but we value them for their relation to something else. Our lives would be much the poorer were they lost or destroyed.

Intrinsic Value and Ethics

Many ethical theories construct an account of "the right" on the basis of "the good," that is, intrinsic value. Thus, ethical theories often appeal to intrinsic value either to explain why some things are ethically right and others wrong or to justify choosing one action instead of another or to ground judgments of what is ethically appropriate or worthy. For example, classical utilitarians claim that actions that create intrinsic value, which they take to be states of pleasure or happiness, are ethically right, and actions that create intrinsic disvalue, that is, unhappiness or pain, are ethically wrong.

Intrinsic value plays a different role in ethical theory depending on whether one is a subjectivist, modest objectivist, or total objectivist about intrinsic value. As one might expect, this complicates things. Subjectivists, for example, believe that intrinsic value just is whatever is valued for itself by some person. But people can have final goods that are distinctly undesirable from an ethical point of view. For instance, exceptionally cruel or malicious people might choose the pain of others, or destruction and disorder, as their final good. If so, then from the fact that something is a final good, and hence intrinsically valuable for subjectivists, one can infer nothing about whether that final good is ethically acceptable, worthwhile, or admirable. To show that it is ethically acceptable, subjectivists need an independent argument, one that, on pain of circularity, does not appeal to intrinsic value.

A subjectivist might reply that, as a matter of fact, people only choose final goods that we know are ethically acceptable. For example, suppose, as some writers claim, that happiness is everyone's final good. Thus, as cruel, malicious, or even evil as someone might be, happiness is what they really want. It is not their final good that is the ethical problem but the means they use to achieve it. However, other writers argue that this is much too restricted a view of human potentiality and of the possible range of human choice and desire. Not all people choose happiness as a final good, and even if, in their quest for their final good, they manage to achieve happiness, it is a by-product or side effect of their choice, not the reason they choose it.

In contrast to subjectivists, modest objectivists use intrinsic value to construct an account of what is ethically acceptable, worthwhile, or admirable that does not depend on what people might happen to desire or value as a final good. A typical example of modest objectivism in ethics is classical utilitarianism, which uses intrinsic value in two ways. First, for classical utilitarians, the fact that something is ethically acceptable, worthwhile, or admirable is explained by the fact that it is intrinsically valuable. For example, the fact that happiness is an ethically acceptable final good is explained by the fact that happiness is intrinsically valuable. Second, utilitarians argue that if one action creates more intrinsic value than another, then we are ethically justified in performing the first instead of the second. Thus, intrinsic value plays a dual role in classical utilitarianism: It explains why some things are ethically acceptable and justifies doing some acts as opposed to others.

Cruel and malicious people also cause trouble for utilitarian ethical theories. If happiness is intrinsically valuable, then any happiness such people get from their misdeeds is intrinsically valuable. Are utilitarians thus committed to saying that happiness derived from cruelty or that malice is ethically worthwhile, that is, that it is a good thing that such people are happy? How they might escape this conclusion is a topic for the next section of this entry.

Finally, total objectivists believe that intrinsic value can be exemplified in things that exist independent of humans, such as states of the natural environment. They face two different problems. The first is that they need to show how we can know that natural states, for example, wilderness areas, exemplify intrinsic value. This is an epistemological problem, one that goes far beyond the limits of this entry. It is fair to say, however, that all the proposed solutions to the problem are extremely controversial. The second is that they need to show that the intrinsic value exemplified by wilderness areas is ethically relevant to persons. In other words, unless the intrinsic value of wilderness is in some way intimately related to human interests, concerns, and desires, what ethical pull can it exert on us? Why should it be a part of our ethical deliberations, judgments, or actions? If total objectivists cannot convincingly answer this question, then the intrinsic value of the wilderness and other natural states has no obvious relevance to ethics. On the other hand, if it does have an intimate relation to human concerns, then it is not clear in what sense it is independent of humans.

Objectivism and the Usefulness Objection

Objectivists argue that intrinsic value comes in different amounts or degrees. For instance, a situation in which many people feel pleasure has more intrinsic value than one in which no one feels pleasure. Now, a difficulty is determining how much more, and the reason this is important is because situations with more intrinsic value are supposedly more significant or important from an ethical point of view. Thus, we need a reasonably precise way of measuring intrinsic value. However, there is no widely accepted method for measuring pleasure or anything else said to be intrinsically valuable. The best that most writers have been able to do is come up with rough intuitive judgments, often disputed by other writers, that, for example, situation X has more intrinsic value than Y. It is an open question whether these rough judgments will bear the ethical weight often placed on them.

A second difficulty is that several writers argue that intrinsic value comes in different kinds as well as different amounts. For example, pleasure is one kind of intrinsic value, knowledge another, and virtue still another. Because these are different kinds of value, a different kind of measurement is needed for each one. However, no one knows what these might be. Furthermore, there is no agreement about how we might compare one kind of value with another and so arrive at a final judgment about the ethical significance of value present.

Of course, proposals have been made about how to measure intrinsic value. One of them, made by G. E. Moore, suggests that to measure intrinsic value we need to see it in the context of what Moore called an organic unity. Basically the idea is that we must be aware of the "big picture" before we make any judgments about amounts of intrinsic value. For example, a malicious person might derive happiness from the pain he causes, but when we take into account his evil motives and all the unhappiness his actions cause for other people, we see that the total situation is intrinsically bad, not good, and so not ethically acceptable. Thus, his happiness, while intrinsically valuable, is part of a larger situation that is not intrinsically valuable.

Moore's proposal seems intuitively right, but it still does not allow us to make the specific assessments of value needed to justify specific actions or policies. For that we need accurate results, but at best we can get only vague indications. Given all this, the question is whether intrinsic value is of any real use in practical ethics. If we cannot make reliable estimates of intrinsic value, then it is hard to see how we could make reliable judgments about what we ought to do based on those estimates. If this is right, then even if intrinsic value helps explain why some things are right and others wrong, it is of little or no use in helping decide which specific actions are right or wrong.

Intrinsic Value in Business

Businesses, we are often assured, are in the business of satisfying the needs and wants of customers. Thus, business is one of the instrumental links in the chain that leads to intrinsic value. From an ethical point of view this is surely a strength of business since people have lots of needs and wants that ought to be satisfied. But it is also the place at which many of the traditional objections to business are made. One such objection is that businesses typically do not discriminate between those needs and wants that ought to be satisfied and those that do not. Long experience shows that satisfying some of our needs and wants is not conducive to long-term pleasure or happiness and so is incompatible with creating intrinsic value. However, businesses often appear unmindful of this issue and will supply anything that is legal regardless of its long-term effect. Moreover, the argument continues, business tries as best it can to create needs and wants, where none existed before, with little thought to the long-term consequences for customers. Business creates customer demand to accommodate its own interests, not to create the means to intrinsic value for the people business claims to serve. Since businesspeople are well aware of the damaging consequences of creating and satisfying needs and wants that are in the long term harmful rather than helpful, business as a whole is not merely an amoral institution, it is an immoral one.

The usual response to this argument is that business is not, and ought not to be, the authority on what is best for individuals. That is left for individuals to decide and to bear the responsibility for decisions made. Business is in no position to substitute its ideas of the good life for the judgment of persons who live those lives. If someone decides that using a product or service is not in his or her interests, the solution is simple—do not purchase it. If a sufficiently large group decides that a product is harmful, then laws can be passed to prohibit it. This is an appropriate exercise of individual and social control and provides a straightforward solution to the problem of regulating products that some think harmful.

A second objection is that businesses do not satisfy some legitimate wants and needs. Products and services are provided for money, but not all who genuinely need them have the money to pay. Thus, they are unjustifiably—some say unscrupulously—denied the means they need to give their lives the intrinsic value that all persons deserve.

The response is that business serves a vital function in society that it cannot fulfill without making a reasonable profit. If business were forced to provide goods and services to everyone, regardless of his or her ability to pay, then it would not survive long. This would be to the detriment of everyone, both those who can pay and those who cannot. Thus, providing for those who cannot pay is not a problem business can solve. It is a social and political problem, and if it can be solved at all, it can only be solved by social and political methods.

INTUITIONISM

Ethical intuitionism (or intuitionalism, also known as moral intuitionism) is the doctrine that ethical beliefs can be justified noninferentially through intuition. It designates those philosophical systems that consider intuition as our fundamental moral basis.

Intuition is both a psychological and a philosophical construct signifying knowledge or perceiving something without deductive or inductive reasoning. The knowledge or perception results from an amalgamation of cognition, affect, common sense, and ethical sense, all used to formulate moral rules for ethical decision making.

Moral intuition is characterized by some moral philosophers as a kind of apprehension of moral truth akin to mathematical knowledge, in which certain self-evident axioms are understood by mathematical intuition. For instance, one is justified in believing the proposition "Parallel lines never meet" by reflecting on and adequately understanding the proposition's content. Ethical intuitionists claim that such self-evidence also holds for certain ethical propositions (e.g., "It is prima facie wrong to deliberately cheat customers"). Nonetheless, while in mathematics, principles claimed to be self-evident are precise and largely agreed on by the experts, in ethics, so-called self-evident principles are vague and widely disputed. Consequently, various intuitionists differ on the nature of the moral truths that are apprehended via intuition.

People frequently face difficult moral choices such as whether to hire people with disabilities despite their lower productivity levels or whether their company should relocate overseas. They do so by intuiting what to do, relying on *subjective* feelings. Hunches, flashes of insight, and "executive experience" might be regarded as intuitive knowledge.

Examples of intuitions that most people would agree are moral truths include the following: Enjoyment is better than suffering; it is unjust to punish a person for a crime that person did not commit; courage, benevolence, and honesty are virtues; and if someone has a right to do something, then nobody has a right to forcibly prevent him or her from doing so. In each case, the appearance of truth is intellectual; you do not perceive that these things are true with your five senses.

Examples of ethical claims that are *not* intuitive, even for those who believe them, include the following: The United States should not go to war to defend other countries but only to defend itself; taxation for welfare purposes is unjust because it involuntarily takes money from some citizens; and capital punishment is wrong. Although these propositions appear true to many, they do not count as intuitions since they depend on other beliefs.

Therefore, while reason underlies the basis of most theories of moral philosophy, it has a more limited role to play in intuitionism. Although some basic truths are known without reason, once these truths about prima facie obligations are known, reason along with other knowledge can be used to form other ethical beliefs. For instance, the notion that "Taxation to raise welfare program funds is unjust" depends on beliefs such as "Most welfare recipients lazily avoid work" and "Most people's taxes are already too high," and so it is not directly apprehended. Nonetheless, intuition has a role in one's concluding that the taxation for welfare is wrong, for intuition informs this individual that taking people's money for uses those people disagree with is prima facie wrong.

In addition to reason, religion provides another general ethical foundation. Christian religious ethics, for example, inspired by *divine revelation* and *divine command theory,* implies that we are innately sinful and need God to reveal moral truth to us. Intuitionism, on the other hand, suggests that moral truth is known by intuition rather than by either divine revelation or reason.

Intuitionism's Truth Claims

Intuitionism generally makes six truth claims, based largely on the work of 20th-century philosophers G. E. Moore, W. D. Ross, and H. A. Prichard. However, not all intuitionists subscribe to all these truth claims.

1. Moral truth is about simple constructs like "good," which are inexplicable through words. Nonetheless, moral common sense suggests the veracity of these truth claims. Hence, while the concept "ought" cannot be readily defined, its characteristics are clearly discerned as entailing a duty to act on what is good.

Moore argued similarly regarding the moral claim "good": Goodness is an indefinable, nonnatural property of which we have intuitive awareness. For instance, if someone defines "good" as "socially approved," we should ask, "Are socially approved things good?" If "good" means "socially approved," this question should not be significant. But this question is significant, showing that "socially approved" is not the definition of "good." It is not the "obvious wrongness" of many socially sanctioned actions that refutes this definition, but the fact that the question is meaningful shows that this is not at all a definition.

2. *Moral realism:* There are *objective* moral truths, existing independent of human thinking or feeling. For instance, hatred is wrong in itself, and it would still be wrong even if everyone approved of it. Intuition can sense such truths.

Consequently, intuitionism should not be confused with *emotivism,* which suggests that moral judgments are merely expressions of *personal feelings* and are *not* expressions of facts. When emotivists say "This is wrong," they really mean, "I don't like it." Emotivists' moral judgments are expressions of attitudes. Thus, if a manager believes that making a minor cosmetic change in a product and calling it "new and improved" will bolster sales without hurting anyone, that is an emotivist moral decision. The emotivist's only *moral authority* is oneself.

3. Moral truths are self-evident to a mature mind through a kind of immediate, intellectual awareness or "intuition," the foundation of our ethical knowledge. To arrive at the self-evident principles of morality requires reflection and intellectual maturity. Hence, a true ethical judgment is self-evident as long as we are reflecting clearly and calmly and our judgment is not distorted by either (1) self-interest or (2) faulty moral upbringing.

4. These self-evident beliefs are sufficient in themselves for their justification. The central intuitionist claim is that an agent's noninferential understanding of moral propositions is sufficient for the agent to be justified in believing the proposition. Such beliefs are not justified inferentially but rather intuitively by reflecting on and adequately understanding their content.

5. Evaluative facts cannot be reduced to natural facts. Such *ethical nonnaturalism* suggests that moral philosophy is fundamentally autonomous from the natural sciences. This contrasts with *naturalism,* a philosophical perspective, popularized by the philosopher David Hume during the 1700s, that holds that all phenomena can be explained by natural causes and laws, and so moral truths can be discovered by observing and experiencing the world. The moral philosophy consequentialism is naturalistic in that it focuses on actual outcomes to determine if an act is morally justified. G. E. Moore rejected this philosophy and called it the "Naturalistic Fallacy," believing something is good or bad in itself rather than because of any effects it produces.

6. Our innate knowledge of moral truths gives us reasons for action independent of our desires, again differentiating intuitionism from emotivism. Ethical intuitionism is essentially an externalist theory, arguing that there is no essential internal connection between moral beliefs and motives and that there is no essential reason that the belief "X is wrong" leads to a desire not to do X. Hence, ethical intuitionism denies internalism—the view that moral beliefs function as a motivating factor, that is, that there is an internal connection between one's belief that "X ought to be done" and that person's motivation to do X.

Variations in Intuitionism

Although not all intuitionists agree on the exact nature of intuitionism, nonetheless, all ethical intuitionists agree in characterizing intuitions as cognitive mental states that do not depend on observation or inference.

The first literature on intuitionism suggested that moral intuitions result from an independent sixth sense, the "Moral Sense," often considered synonymous with conscience. Consequently, people distinguish rightness with their moral sense, analogous to perceiving odors with their olfactory sense. This thinking was rejected by some intuitionists because people lack independent verification that such a sixth sense exists.

Ethical intuitionism has also varied in its popularity over the past several centuries. It was the dominant moral theory in Britain from the 18th century through the first third of the 20th century. However, its popularity waned by the mid-20th century—it was apparently the victim of the rise of both logical positivism (which says that only empirically verifiable ideas are significant) and philosophical naturalism. More recently, however, hostility toward ethical intuitionism has subsided, and some recent work suggests it might be enjoying a resurgence of interest in academic philosophy.

Advantages and Disadvantages of Intuitionism for Moral Decision Making

Advantages of Intuitionism

Intuitionism provides several benefits for ethical decision making:

- If something strikes us as intuitively wrong it probably is. This is embodied in the cultural truism "When in doubt, don't," keeping the businessperson from moral lapses most of the time.
- We will not end up with a hurt conscience and can therefore be guilt-free and pass the "sleep test," thereby conserving energy for business and personal endeavors.
- Intuitionism is simple to implement; no hard thinking or philosophical calculations are required. Intuiting can become a habit of thought resulting in quick decision making, so important in the fast-paced business world. Hence, by default it is probably the most widely used approach in solving everyday life and business ethical dilemmas.
- This approach is often experience based (although, strictly speaking, it is not supposed to be so). The well-seasoned manager presumably knows best.
- Independent people, notably senior business executives, appreciate that there is no authority to answer to but one's self.
- Everybody has an innate awareness of right and wrong (the law or general revelation of conscience). For instance, most people are intuitively aware that murder, rape, child beating, stealing, adultery, and disrespect for parents are wrong.

Disadvantages of Intuitionism

There are some serious problems with intuitionism:

- Not everyone shares the same innate awareness of right and wrong. There is lack of agreement when it comes to gray areas such as binge drinking, cheating on tests, and the medieval sins of gluttony and usury; that is, not all intuitions are equal—some are more credible than others since (1) some intuitions are stronger, or more clearly seem true, than others; (2) some intuitions are more widely shared than others, and, all else being equal, an intuition that many agree with is more likely to be true than is an intuition that many disagree with; (3) some intuitions have simpler contents than others and are therefore less prone to error; and (4) some types of intuitions are more open to bias than others. For these reasons, intuitions should not be embraced uncritically.
- There are no objective standards by which to judge intuitionism's accuracy. However, the intuitionist would say that the experience is so powerful that it is self-authenticating. Nonetheless, most intuitionists would admit that at most, some moral truths are self-evident.
- It is often difficult to justify intuitive decisions. In business, scientific, objective analytical decision making is preferred to relying on subjective feelings. One does not justify a business proposition by announcing, "I just feel this would be the right thing to do." Yet, with intuitionism, at best, decisions are made on an emotional basis and then rationalized after the fact ("I honestly did what I thought was right"; "I made a good faith effort"). Unfortunately, conscience is then used as a license or rationalization of bad behavior.
- Our self-interested tendency is to rationalize our behavior, convincing ourselves that an action is excusable,

at least in a particular instance ("It is lawful, so I'm respecting the law"; "He did it to me, so I'm just reciprocating"; "They had it coming to them, thus I'm serving justice"; "Everyone is doing it, so I'm just respecting the culture around here"). Such rationalizations are perhaps the biggest cause of unethical behavior in a business world demanding rational analysis. When such people say something is right or wrong, they are really just expressing their preferences and then using moral language to give greater persuasive power to their argument.

Nonetheless, intuitionism reminds us not to act when our conscience is violated. A pang of conscience is a warning to stop and reflect on the rightness of what you were doing. One final caveat: You cannot justify your action simply by saying you were following your conscience.

Invisible Hand

The *invisible hand* is a phrase, originally used as a metaphor by Adam Smith, that summarizes how social and economic outcomes arise without design or explicit agreement. The *invisible hand* refers, then, to how individuals, interacting in purposeful ways, could bring about a result that was not part of their intention. Such an unintended outcome is sometimes referred to as a spontaneous order, but the concept of the invisible hand is employed to designate either the *process* by which the pattern or outcome is produced or an *explanation* of that process. In either sense, the idea should be kept distinct from the notion of a hidden hand that purports (as Robert Nozick describes) to explain seemingly unpatterned events as, in fact, the result of someone's intention or design. The invisible hand has been employed to explain the division of labor, the emergence of a medium of exchange, the growth of wealth, the patterns (such as price levels) manifest in market competition, and the institutions and rules of society.

Adam Smith and Others

Adam Smith invokes the phrase, on two occasions, to illustrate how a public benefit may arise from the interactions of individuals who did not intend to bring about such a good. (Smith also employs the phrase in a third instance—in the essay "History of Astronomy"—to describe how the god Jupiter produces disorder.) In Part IV, Chapter 1 of *The Theory of Moral Sentiments* of 1759, Smith explains that as wealthy individuals seek their own interests, employing others to labor for them, they "are led by an invisible hand" to distribute the necessities that all would have received had there been an equal division of the earth. In Book IV, Chapter 2 of *The Wealth of Nations* of 1776, arguing against import restrictions and explaining how individuals prefer domestic over foreign investments, Smith uses the phrase to summarize how self-interested actions are so coordinated that they advance the public interest. In these two instances, a complex and beneficial structure is explained by basic principles of human nature and economic interaction. However, there are other occasions in which Smith employs the idea of the invisible hand without invoking the phrase itself. In the opening paragraph of Chapter 2 of Book I of the *Wealth of Nations,* he describes how the division of labor is not the result of far-seeing wisdom but a gradual outcome of a natural "propensity to truck, barter, and exchange." Later in this same treatise, he delineates how individuals are so guided by prices that the supply of goods tends to meet demand. More generally, Smith explains how the patterns of commerce, including the overall creation of wealth, arise out of individuals responding to and endeavoring to succeed in their own local circumstances. Although Smith often refers to economic agents as self-interested, he does not mean to suggest that their motivations are selfish. Rather, the agents are motivated by beliefs and intentions that manifest their local knowledge and particular concerns (including those relating to their families) rather than some broader conception of a public good.

Smith devises the phrase *invisible hand,* and even incorporates the notion of unintended outcomes into his account of the emergence of moral standards (in *The Theory of Moral Sentiments*), but he was not the first to use this idea. Earlier in the 18th century, Bernard Mandeville had contended that prosperity could be brought about only if individuals were permitted to act on their self-interest as constrained by a rule of law. Mandeville also set forth an account of how moral norms might develop among egoistic creatures prone to love praise and flattery. David Hume's account of the conventions of justice (*A Treatise of Human Nature,* 1739–1740) seems to assume their unintended emergence via an invisible hand process. And further along in the 18th century, Adam Ferguson, in his *Essay on the History of Civil Society* of 1767, maintains that many institutions—such as language, property, governmental structures, and some traits of character—are, as he writes, "the result of human action, but not the execution of any human design." In the 19th century, in *Principles of Economics* of 1871, Carl Menger, the father of the Austrian School of Economics, traces the origin of money not to contract or legislative act but to a process in which individuals seek to secure an item, not of immediate need, that may be exchanged for a more desired good. In *Problems in Sociology and Economics* of 1883, Menger articulates the idea of a genetic theory that reconstructs, out of the purposive acts of individuals, the "organic institutions"—language, law, money, and the market itself—that were not otherwise intended.

In the 20th century, Friedrich Hayek has most notably used the idea of the invisible hand, contending that the market itself is an unintended or spontaneous order. Within that order there are other patterns, such as market prices and rules of conduct, that manifest the unintended coordination of disparate actions. Hayek describes how the prosperity of the market (or "Great Society") is possible only because the general and abstract laws that constitute its framework allow for spheres of liberty within which individuals can make use of their own knowledge to produce and to experiment. The disparate and dispersed knowledge of anonymous individuals is coordinated by prices that signal to individuals how best to meet one another's expectations. Hayek has also defended the invisible hand evolution of moral and cultural norms. His theory, though not a consistently stated one, seems to suggest at least two lines of cultural evolution. In his earlier works (such as *The Constitution of Liberty,* 1960), he propounds a thesis that rules will gradually evolve in an unintended and trial-and-error fashion. Under a framework of law that is general, impartial, and protective of private property, rules will emerge and survive that will, in general, transmit knowledge relevant to success in a variety of circumstances. In his later works (e.g., *Law, Legislation, and Liberty,* 1973), he suggests that the unit of evolutionary selection is not the rule but the whole group: A rule survives only insofar as it is practiced by a population that itself is favored by some evolutionary process.

Invisible Hand Explanations

We may distinguish the invisible hand as a metaphor for unintended processes (and their outcomes) and as a type of explanation. An invisible hand explanation may be invoked for any complex state of affairs that is, was, or could be an unintended outcome of individual actions. Such an explanation, which is a descriptive or value-free rather than a normative account, may be of two basic types. The classic, Smithian, explanation is a genetic account of how a structure, pattern, or regularity comes into existence; such an account typically involves an aggregative or equilibrium process in which small adjustments combine or accumulate into a larger result. The other type of explanation, often taking on a functionalist form, explains the survival or persistence of a regularity in terms of some specific property that contributes to the survival of that pattern (e.g., that the regularity has some effect or function that contributes to the survival of the society). These two general types of invisible hand explanations are sometimes merged into a single account, but they are, in principle, separable.

The classic invisible hand explanation of emergence must illuminate how a pattern arises unintentionally (or "spontaneously") from some initial conditions or circumstances. Such an explanation proceeds in three stages: (1) Along with a specification of the initial conditions, there must be some description of the agents (including, for example, their rationality, knowledge, and moral beliefs). These initial conditions may, of course, vary from one explanation to another, and there is no requirement that the agents possess perfect information or be completely rational. (2) Some lawlike principle(s), or some description of a stable mechanism, is employed to describe the process by which the outcome emerges. The lawlike principle could, for example, express some feature of human nature (e.g., that human beings are generally motivated by self-interest or that human beings relish praise). (3) Finally, there must be a narrative of how agents, situated in these circumstances and acting in conformity with the lawlike principle, would bring about a structure, pattern, or norm that was not part of their intention. There must be a plausible case that the resultant structure, pattern, or norm was not intended. Given that intention, at both the individual and collective level, is a matter of degree, it follows that the invisible hand process is also a matter of degree. Finally, in any such explanation, one may distinguish whether the outcome arises at some specified moment (synchronic) or over the course of time (diachronic). In an evolutionary explanation of *emergence,* the aggregation may occur over time, perhaps as a cumulative process of trial and error in which individuals imitate other successful persons. On the other hand, an evolutionary explanation of the *persistence* of a pattern or structure takes either a biological or cultural form, depending on whether, say, the gene or a cultural regularity is the unit that contributes to the survival of either individuals or groups.

As an illustration of an explanation of emergence, consider how Mandeville attempts to show how moral norms develop out of conditions in which there is no morality and in which agents are often ignorant and not fully rational. He appeals to a natural desire for praise and flattery as the lawlike principle that allows the emergence of norms of evaluation via a cumulative process of praise and flattery. And, as already mentioned, Adam Smith maintains that the division of labor results from a natural "propensity to truck, barter, and exchange." More recently, Robert Nozick has sought to show that in anarchical conditions governed by natural rights, a state could emerge without violating those very rights. In so doing, he uses lawlike assumptions about the economic behavior of firms (private protection agencies), as well as some commonplace assumptions about human action.

Reflections and Implications

Hayek suggests that many of the rules, structures, and patterns of society are the outcomes of invisible hand processes. However, it is an open question as to whether such a broad conclusion is correct and, in particular, whether moral norms are the outcomes of such spontaneous processes or reflect the influence of reason or biology. Hayek also contends that unintended processes that occur under certain conditions are preferable to designed structures: Only an invisible hand process could generate a society of great complexity, for only a spontaneously ordered process allows the coordination and use of dispersed, and often tacit, knowledge. Insofar as important outcomes may be achieved if individuals are allowed to act on their own local knowledge, the invisible hand provides a theory of how a society can be prosperous without being designed, directed, or planned by a sovereign. Although there is no doubt that many unintended outcomes are beneficial, their positive character will, in large measure, depend on the conditions that provide the framework for the invisible hand process. Therefore, it is important to understand the nature of the laws and conditions that underlie successful invisible hand processes.

Yet even if an unintended outcome is beneficial, the fact of that benefit does not imply that this outcome is the *only* good or value that society should embrace, for there may be other values (e.g., equality of some sort) that compete with the benefit produced by the invisible hand process. Nonetheless, invisible hand processes might secure the ends that would otherwise be sought through legislative or regulatory efforts. And even well-intentioned legislation may elicit unintended and deleterious consequences. For example, although the "sweatshop" wages of some developing nations may seem low, a consideration of invisible hand processes might suggest that the situation may be improved not so much by prohibiting or regulating such wages (which may increase unemployment, thereby depressing wages further) but by permitting the competitive process to continue, thus increasing the demand for labor and raising wages. Similarly, although well-intentioned policies of foreign aid may have plausibility, the aid may serve to support corrupt governments or to subsidize projects or industries that would not otherwise succeed. Such aid may strengthen the forces that would forestall the development of a legal framework that would provide the conditions for an invisible hand process that would (by allowing individuals to interact freely and to risk their capital securely) generate prosperity.

Such reflections suggest that the concept of the invisible hand has relevance to two major theories of business ethics—social responsibility and stakeholder theory. If there are spontaneous processes of coordination in society, then the operation of business firms, under conditions of the rule of law and with an eye to profits, may bring about better consequences than if owners and managers also expended company funds toward some specified set of social responsibilities. And if the idea of the invisible hand challenges the idea of social responsibility, then it may also test the stakeholder theory. This theory suggests that managers should take into account the claims and concerns of various classes of stakeholders. But if market prices are the invisible hand mechanism that coordinates the knowledge and expectations of disparate and anonymous individuals, then attention to stakeholders may lead managers to act contrary to price information, perhaps disrupting the invisible hand process. This may or may not be a welcome event, but it is a relevant consideration for business ethics.

IRON TRIANGLES

The term *iron triangle* has been used both by scholars and by muckraking popular writers to refer to the alignment of interests and actions among three key actors in public policy making in the United States: regulated industry or other special interests, the oversight committees in the legislature, and the regulatory agency or other bureaucracy. The typical outcome of this alignment is the production of both specific regulatory decisions and regulatory policies, including the regulations themselves, that tend to protect and promote the regulated industry. For example, in recent years, critics of the U.S. Food and Drug Administration (FDA) have argued that pharmaceutical companies, with the support of Congress, have had undue influence in the decisions of the FDA, resulting in the marketing of drugs whose sometimes dangerous side effects have not been tracked by the FDA or reported in a timely way by the companies.

Sometimes the role of the regulatory agency is played by a public bureaucracy that has the ability to make decisions or allocate resources that are important to the industry. For example, the so-called *military-industrial complex* may be seen as an iron triangle among oversight committees in Congress, the Defense Department or particular branches of the military, and components of the defense industry. The term *military-industrial complex* was introduced in President Dwight Eisenhower's Farewell Radio and Television Address to the American People on January 17, 1961. The speech was written by the political scientist Malcolm

Moos. In the speech, Eisenhower warned that "in the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced power exists and will persist."

Concern over the ill effects of the undue influence of private power was not new at the time of Eisenhower's speech. This theme was common, for example, in Populist complaints in the 19th century, New Deal era criticisms of business, and the work of critical economists and political scientists of the mid-20th century such as Horace Gray and Grant McConnell. Political scientists of that era, such as Merle Fainsod, Samuel Huntington, Marver Bernstein, and, later, scholars such as Edwin Epstein, began to develop models linking the efforts of interest groups with the institutional structures in government that they sought to influence.

Bernstein's life cycle model is perhaps the best known. In it he argued that a regulatory agency follows a path of maturation, from aggressive regulation supported by the activist interest groups instrumental in the agency's creation as a response to a social or economic problem, to an old age in which those groups no longer provide active support and are replaced by the regulated industry. Over time, via repeated interactions in which the agency adjusts to the positive and negative pressures coming from the industry, the industry "captures" the regulatory process. Congress either gives little attention to the agency or provides oversight that responds to the industry's interests.

Core Logic of the Iron Triangle

The classic iron triangle is structured by the incentives that flow among its actors, as well as the opportunities provided by the institutions that populate the system. The same basic logic applies at any level of government, with appropriate adaptations of the argument (see Figure 1). The core logic is described by Roger Noll and by Barry Mitnick, among others: The regulated industry is a significant economic actor in the constituencies of a set of legislators. Because the legislators desire to be reelected, and because they need the votes of constituents as well as funds to pay campaign expenses, they are sensitive to the requests of the industry. The industry can influence votes via its own employees and the dependence of the constituency on the economic success of the industry. In addition, either via its political action committee(s) or via allies, the industry can steer important resources to the elected politicians to aid in their campaigns. As a service to their district, and to promote their reelection, legislators seek to serve on committees of oversight that handle the most significant industries in their districts. Thus, legislators on such committees are predisposed to listen to the policy communications that come from such industry in their districts. The legislators are able to originate legislation that promotes the industry (and to stop legislation that is hostile to it); they are gatekeepers for the industry. Although they may not have a direct role in appropriations, they may be able to influence the funds that go to support activities in the industry, whether through authorizations or through quid pro quos (e.g., vote trades) with legislators who do serve on appropriations committees.

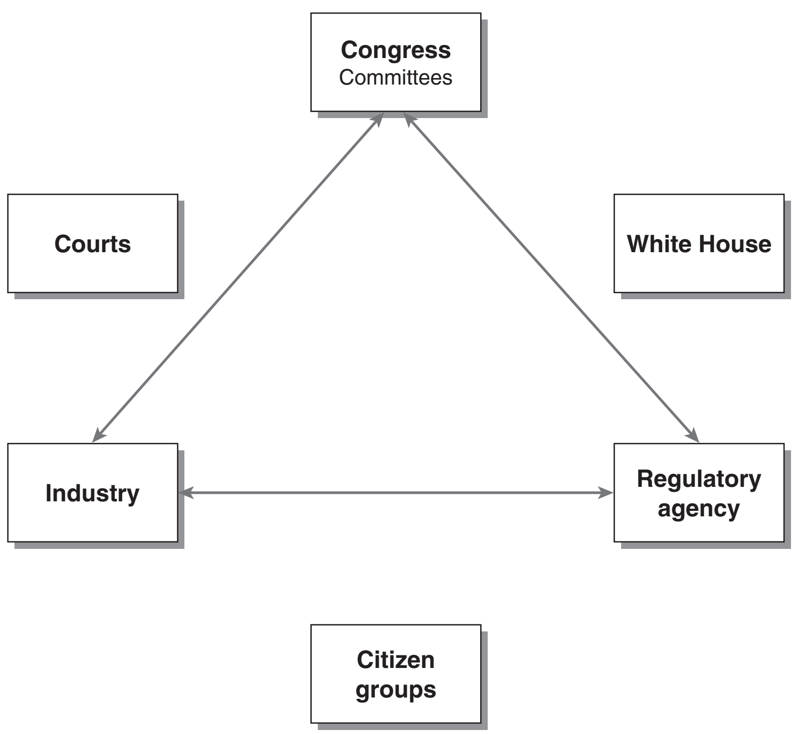

Figure 1 Iron Triangles and Jelly Hexagons

Note: A description of the relationships within the triangle, as well as the relationships among the six actors in the policy subgovernment—the "jelly hexagon"—appears in the entry text.

The regulatory agency receives a budget from the legislature. The size of that budget is influenced by perceptions of the agency's performance, holding the existence of any pending social or economic problems in the area constant. Poorly performing agencies are likely to receive less. For example, criticisms of the Interstate Commerce Commission's performance made Congress reluctant to appropriate funds for it in the years before its termination and replacement by the Surface Transportation Board, a smaller agency. The actual performance of an agency is difficult to measure, and perceptions of its performance are influenced by reports of the media and, especially, by complaints from the regulated industry that go to the legislators on the oversight committees. Thus, the agency is motivated to defend its budget by reducing complaints in the media and from the industry.

Oversight hearings in regulation do not attract much attention unless they deal with a pressing social or economic issue and are often perfunctory in character. Officials in the agency also prefer them to be this way because it is usually only poor performance, such as a social or economic issue that the agency has failed to deal with adequately, generating wide popular discontent, that produces more elaborate, media-rich hearings. Agency officials who testify at such hearings are invariably held up for scorn in the media and sharply criticized by legislators responding to constituent complaints. This threatens their existing jobs, as well as making their prospects of a remunerative position after government service less likely. Thus, agency officials are led to anticipate the desires of the legislators on the oversight committee, consulting with them on an informal basis, and adjusting the actions of the agency to be responsive to them. Agency officials also know that they will be responsible for implementing new legislation that is assigned to their agency and that they may have to write regulations to fill in the areas of discretion that the usually vague laws leave for them. They will want to do this in a way that satisfies the legislators.

Most areas of regulation deal with arcane, highly technical issues specific to the industries being regulated. Regulators must become familiar with these issues and must acquire the professional expertise on which regulation in the area is based. To satisfy the demands of the administrative process, which in the U.S. federal government is based on the Administrative Procedures Act of 1946 and its amending legislation, there is a high demand for submission of what is termed "substantial evidence" to create a record that allegedly supports the decision-making process in the regulatory agency. Often, the best and easiest source of such information is the regulated industry. Because the industry often controls the supply of information essential to the regulatory process, regulators become dependent on it. Of course, they see information that is structured to make the industry's case. In addition, personal relationships grow around the many contacts necessary to conduct the regulation. Regulators come to see executives in the industry as people with the same issues as anyone else trying to make it in business, rather than as adversaries trying to dupe them into granting favorable rules and decisions. Because few others than the industry itself actively follow the regulatory process, regulators find that they receive continual respect and even prestige from the industry in their roles as industry regulators. No one else seems to care.

Appointments to the top positions in the agencies are often determined by presidential staff members (or, at other levels of government, by the staffs of the chief executive at that level); the president may not even meet the appointees. There is little public attention to the appointments, though the industry pays close attention and seeks to influence appointments. Usually, regulatory appointments are people who are at least not hostile to the industry and for whom confirmation by the U.S. Senate is likely because legislators perceive that their constituencies will take no issue with the appointments. Legislators from districts or states where the industry is important are likely to put holds on nominations of prospective regulators opposed by industry in their constituencies. Thus, new top regulators are usually not committed to regulating against the fundamental interests of the industry they regulate.

Finally, after making a personal investment in knowledge of the industry and its areas of professional expertise, regulators look for ways to cash in on this knowledge and expertise once they leave the agency. The data show that top regulators, such as independent regulatory commissioners, and top administrators in single-headed bodies, do not on average stay their entire terms of appointment, nor do they even stay for an entire presidential administration, if the setting is the U.S. government. Thus, these regulators are frequently looking for their next job. The one place that is sure to have an interest in employing them, as long as they have not acquired a reputation for poor personal performance as a result of adverse public hearings, is the regulated industry. The regulated industry will even hire regulators who have been more aggressive in dealing with them because of their expertise both in the industry and in the conduct of such regulation.

In their classic 1970 muckraking study of the Interstate Commerce Commission, Robert Fellmeth and associates found that 9 of the last 11 commissioners to have left the commission at the time of the study had gone to work in the regulated industry or as lawyers representing it. The other two commissioners simply retired. The traffic between government and the private sector and back again has even acquired the name *the revolving door.* It is not uncommon for all three actors in the triangle to take part in this: Top congressional staff members, often attorneys, may be appointed to top regulatory positions as a reward for service to congressional leaders, only to later rotate out to industry or to Washington law and lobbying firms that represent the industry. Often, regulators have held other jobs in government and rotate to the regulatory body from another government job. Of the five members of the Federal Communications Commission in 2006, three were attorneys; two were former congressional staff members; one was an industry lobbyist whose duties involved advocacy to Congress; four of the five had had jobs elsewhere in government before their appointments to the FCC; and the fifth had extensive experience in politics.

Especially in past decades, the most common profession of a top federal regulator was the law. This is a highly fungible profession, of course, but what it allows regulators to do is to move to Washington law firms or, sometimes, lobbying firms, after their service, and provide legal services to the industry they lately regulated. Conflict-of-interest laws are not difficult to end-run in this regard. As long as the former regulator is not the attorney of record in representations before the agency, she or he can still provide consulting services to industry clients during the period of exclusion under these laws and to his or her own law firm colleagues at any time. Having relied on the industry for information, received respect and prestige from the industry, gotten to know people in the industry as reasonable, credible folks, and seen the opportunity of future employment in or dealing with the industry, regulators in this iron triangle find that, over time, their decisions as regulators tend to favor the industry.

Thus, going around the triangle, we end up with legislators who take actions in the industry's interests, as well as regulators who do the same. The industry gets what benefits it. The structure of the triangle is remarkably stable, as long as the incentives stay the same, and no new actors enter to confuse the flow of such incentives.

This rational choice model of the iron triangle assumes that regulators are often self-interested or become so after being exposed to the incentive system in which they are embedded. Yet the model itself is overly simplistic. It is not hard to find cases of regulators, both historical and of more recent service, who viewed their roles as being stewards for the public interest or arbitrators of how the public interest should be pursued in the area being regulated. In addition, regulators who are civil servants, that is, below the appointed levels, are often highly professional in orientation, especially in areas requiring technical expertise. They see their roles more as implementers and problem solvers, rather than as de facto servants of the industry. In some historical contexts, belief in the desirability of a regulation that in practice protected the industry has been joined with dedicated service to the public. One example is Joseph Eastman, the longtime chairman of the Interstate Commerce Commission in the 1920s and 1930s. For him, any suggestion that his selfless dedication to the goals of transportation regulation represented protection of the modes in that industry (railroad, trucks, barges) against competition with one another—a conclusion reached by modern economists—would have seemed insulting.

Yet one cannot dispute that iron triangles were and are real and are actively maintained and defended by the industry, political, and bureaucratic actors who run them. Iron triangles were very common in U.S. regulation before the last decades of the 20th century and remain active in a number of regulated areas today. For example, those in agriculture, such as navel oranges, are particularly protective of the industry.

Beginning in the early 1970s, however, the public interest movement began to supply counterpressures that often cracked and even rusted the triangles away completely in some issue areas. For example, muckraking work by Fellmeth and associates revealed an Interstate Commerce Commission whose rate-setting policies protected each of three modes of transportation, railroads, trucking, and barges, against competition. Such citizen groups, often founded in the early years as a result of the entrepreneurship of Ralph Nader, provided an alternative source of information about the industry, both to the legislature and to the regulatory agencies.

In addition, beginning in the late 1960s, the operative standards for judicial review changed, with appeals courts in the United States much more willing to provide reviews of the substance of agency decisions—whether, for example, the substantial evidence collected by the agency actually supported the decisions made by the agency—rather than of only whether they followed their procedures. Finally, in a few high-profile cases, the president actually became involved, either in agency decisions or in agency appointments as a result of notable agency failures (e.g., the bribery case at the Environmental Protection Agency [EPA] during President Reagan's administration). All these things raise doubts as to whether the triangle will function as described above, with guaranteed benefits to the industry.

With three additional actors (courts, public interest groups, the appointing executive), the iron triangle becomes a hexagon. Mitnick terms this a "jelly hexagon" because the outcome—benefit to the regulated industry—is no longer certain. Indeed, the common structure of policy making today among many such interest areas has been termed an *issue network* by Hugh Heclo; it is also called a *policy subgovernment*. In such a system of policy making, the set of people participating is often remarkably stable—they are often leaders of interest groups, industry lobbyists, and legislators who are reelected almost indefinitely, together with their key staff members. Hence policy making takes on the character of an iterated game, in which actors stake out positions in policy space, look for allies, and seek to build support. The outcomes can rotate as now one, and now another, of the interests emerge triumphant on any given issue. Interest groups in such systems often act in concert, creating what Paul Sabatier calls "advocacy coalitions." Indeed, as early as the mid-1970s, Jeffrey Berry, in his classic study of public interest groups, found extensive use of coalitions in advocacy.

Critics of policy making in federal and state governments raise questions about the ethical character of any government that seems to exist only to steer benefits to an industry, without some general debate about whether such benefits truly serve the public interest. Even governance by a policy subgovernment, which in effect negotiates the terms of new laws and regulations, constitutes an essentially undemocratic system. Here we see that the agents who act as representatives of different interests, both those of industry and those of assertively "public" character, and who thus determine the content of our laws, are only partly those agents who are elected by the people. In such a government, critics see the claim of democracy as little more than a convenient myth that brings stability and helps establish the institutional rules within which the actual work of interest representation and of regulation occurs.

—Barry M. Mitnick

Islamic Ethics

Islam provides individuals with guidance that encompasses the entire range of their spiritual and material experience of living, including teachings that offer direction about the proper conduct of individuals and groups for mutual benefit and in the service of God and in accordance with the "laws of nature." Islamic ethics is therefore a vast and continuously evolving project; this summary includes an overview of the origins of Islam, the sources of ethics in Islamic thinking, some examples of ethical teachings as reflected by the life of the Prophet Muhammad, and ethics in business practices within Islamic societies.

Origins of Islam

Islamic tradition holds that Muhammad first received revelations from God (Allah) while fasting and meditating in a cave outside the city of Mecca, in the year 610. These revelations continued throughout Muhammad's life, and his oral transmissions were eventually collected, organized, and recorded to form the Quran, Islam's holy book. As the first Muslim, Muhammad bore witness and took a vow (Shahada) of submission to Allah, a vow that included acceptance of the biblical story from Adam to Christ. Through force of personality and leadership, and by his own example as a Muslim, Muhammad, by the time of his death in 632, had united most of the Arabian tribes into a single community (Ummah).

Muhammad's faith of Islam (literally meaning submission to God) came to extend far beyond the Arabian Peninsula to include most of the vast Persian empire and parts of Byzantium, and within a century encompassed lands ranging from western India and Central Asia through northern Africa. Later, this Islamic World (Dar al-Islam) expanded into Spain and penetrated parts of France and eastern and southern Italy. Malaysia and Indonesia, currently among the most populous Islamic countries, did not embrace Islam until the 14th century, when Arab traders transported the faith along with their wares. Today Islam is the world's second largest and fastest growing religion, with more than 1 billion followers worldwide, including many millions in the West.

Sources of Islamic Ethics

Islamic morality, ethics, and jurisprudence are all derived from two primary sources that together constitute Sacred Law (Shariah). The first is the Quran, revealed to the Prophet Muhammad. The second source, and perhaps most accessible, is the Sunnah, or life of the Prophet, which was transmitted through sayings attributed to Muhammad himself, as well as by detailed narrations of his life that can be traced to his contemporaries. Instead of constituting a formal code of morality or ethics, the hadiths are rather a guide for everyday living, and, although their historical validity is often the subject of debate, Muslims believe in their authenticity and follow them closely.

The Quran often uses phrases that are "reminders" to the faithful to pay attention to their religious faith and to remember Allah and their obligations to neighbors and society. In Islamic cities and villages this reminder is manifested on a daily basis through the calls to prayer (*namaz*) of the muezzin. The Quran goes beyond addressing a single individual's obligations since it also prescribes a doctrine for the community as a whole that is both social and political in nature and that has morality, compassion, justice, honesty, peace, tolerance, and self-sacrifice as its basis.

Muhammad as Example

In contrast to the more exalted pronouncements in the Quran, the Sunnah refers to many specific incidents in which the Prophet was the protagonist and which serve to illustrate proper behavior. Muhammad did not claim he was a divine being, and Islam doesn't treat him as such; rather, he was an ordinary human being who listened carefully to—and then orally transmitted—the divine message. Muhammad himself believed that the model of his life was the best means by which to show humanity the way of salvation. As a merchant, statesman, and warrior, Muhammad was a man of this world as much as he was a religious and spiritual leader, and there were plenty of opportunities for his society to observe the Prophet in action.

While working as a wealthy merchant in the midst of the free enterprise world within which Mecca served as a hub, Muhammad was steadfast in living a simple life and in supporting the defenseless, the poor, orphans, widows, and slaves. In Islam, therefore, the concern for social justice and responsibility is dominant and permeates throughout society, business included.

Business and Charity

Muhammad himself was successful as a businessman who bought and sold merchandise for profit, and consequently the Quran has a number of chapters (suras) that deal with how to trade justly. He encouraged Muslims to undertake economic activity in the same spirit as they did their daily prayer, honestly and with purity. For example, the Quran is clear that people should conduct business in a straightforward manner and not seek to gain unfair advantages. Muhammad produced injunctions against selling spoiled or overpriced goods; he was intolerant of lying and cheating merchants and of monopolist speculators who kept back grain to sell at a high rate, while also forbidding underpricing to secure a deal that would hurt a competitor; he believed that resources should not be used in the production of unnecessary goods until the needs of all had first been addressed; and he pressed employers to be fair to their employees and to pay them promptly.

The Prophet prohibited the taking and giving of interest (*riba*). Most likely he took this position because Mecca, where he spent most of his youth, had a reputation for brutal financiers. It was not uncommon, for example, for lenders to use violent means, such as raids on unlucky merchant homes, to extract loan repayments and interest when caravans were lost to bandits. Generally, Islam does not allow gain from a financial activity unless the financial capital is also exposed to the risk of loss; the idea is that the entrepreneur and the investor or lender should proportionately share both the profit and the loss of the business activity in such a way that the lender in fact becomes a partner in the enterprise (*musharakah*). To this day Islamic banks distribute a percentage of their income among depositors as profit sharing through equity participation, instead of paying interest. Islamic law does allow higher payment than fair market value if the goods are purchased on credit but for immediate delivery. It is a fundamental principle of Islam that rewards be the result of real efforts, not speculation or the leverage of unfair advantage.

Muhammad was a social reformer who actively taxed the wealthy to support the poor, and he expected the rich to leave something in their will for the less fortunate. Income inequality and class ranking is certainly permitted to occur within Islam, but one of the pillars of the religion requires Muslims to contribute every year a portion of their wealth to charities that benefit the poor (*zakat*). The amount of *zakat* varies by type of wealth, with 2.5% being the *zakat* for cash holdings. In Islamic societies this obligation is taken over by the state, which includes *zakat* in its tax structure.

Women and Business

During his lifetime Muhammad accomplished a great deal on behalf of women, not the least of which was to put an end to his society's practice of female infanticide. With Islam, women acquired unprecedented rights, such as the ability to choose their husbands, own property, keep their earnings separate, and enter into contracts independent of their husbands or fathers. Islamic societies were among the first to recognize inheritance for women: In Islam a wife can inherent wealth from her own family, has the right not to share it with her husband, and can be fully in charge of managing her assets. According to some estimates, close to 40% of total private wealth (nongovernmental) in Saudi Arabia belongs to women. This validates the notion that even during the Prophet's lifetime women were already fully engaged in economic activities and that Islam doesn't in itself raise barriers to women's economic involvement but that any such barriers have cultural and tribal, not religious, origins. Equality in economic activity stems from equality between men and women as spiritual beings.

Leadership

Jihad refers to religious struggle, either literally, as when Muhammad's Muslim community first established itself in the midst of violent opposition, or figuratively, as is the case with "internal" jihad, which refers to the effort required for human beings to better themselves and which is a core ethical principle of the faith. Muhammad often made references to how this personal Jihad might be carried out in specific cases, such as by prayer, by caring for one's parents, or by being a just and ethical leader, and he referred to this type of struggle as the "Greater Jihad."

Reflecting on the teachings of the Prophet, the 12th-century Islamic scholar Muhammed ibn Zafar wrote that a wise leader must be guided by ethical considerations and that he (or she) must always trust God's guidance, be knowledgeable, perceive facts as they are, be prepared for all eventualities, and be fast in correcting mistakes.

Conclusion

The Islamic prescription for human behavior is based on concepts of justice and humanity as recorded in the Quran and practiced by the Prophet Muhammad and his followers. A study of Islamic ethics is thus best approached by first understanding the Quran, the life of the Prophet, and the society that served as their ground of creation. As the modern world moves forward, Islam will continue to contribute, along with other world religions, to the ongoing dialogue regarding the ethical future of human societies and their business practices.

Is-Ought Problem

The is-ought problem in ethics arises from the is-ought, fact-value distinction. It is the problem of moving from the factual to the normative, of obtaining a prescriptive claim from a set of descriptive claims.

The problem was first raised by David Hume in the 18th century; he pointed out that while many ethicists make claims about what ought to be solely from the basis of what is, there is a big difference between the two, and writers make an imperceptible switch from *is* claims to *ought* claims with no explanation offered. He argues that the move to the *ought* introduces a new relation or affirmation that needs to be clarified and justified. But he can find no justification, the implication being that such a move cannot be made. According to Hume, knowledge of anything is based either on logic and definitions or on observations, but *ought* statements are seemingly not able to be known in either way, and thus it would seem that there can be no moral knowledge.

In the 20th century, G. E. Moore also questioned the supposed link between the *is* and the *ought* from a related though different direction. Many philosophers, ethical naturalists, held that moral terms are completely definible in nonmoral terms. Moral judgments are a subspecies of empirical judgments, and moral terms stand for purely natural characteristics. They tried to prove some of their claims about ethics by turning to an analysis of the meaning of the term *good* in the sense of intrinsic moral goodness, holding, for example, that *good* can be defined in terms of one or more natural properties that we already understand, such as *pleasure* in the case of hedonists, or that which promotes human survival in the case of evolutionary ethics, or the satisfaction of desires, and so forth. But, Moore points out, we can always ask, for example, whether pleasure is always good and whether it is not a contradiction to say that some pleasures are not good or some satisfactions of desire are not good, and this holds for any empirical property or set of properties that can be offered. These are significant questions regardless of what properties are substituted; the questions are neither obvious nor trivial. But according to naturalism, asking these questions should make no more sense than asking if daughters are always female, and a negative answer would be as obviously contradictory as to say that some daughters are not female. Moore concludes from this that value cannot be analyzed or defined, and any attempts to do so will necessarily fail.

Moore, in defending ethical nonnaturalism, argued that a fallacy is committed when one identifies moral properties with natural or empirical properties. The moral property or quality of good in the sense of intrinsic goodness is simple, indefinable, nonnatural, or nonempirical and must be immediately grasped by a moral intuition. Moral qualities can be known neither by sense experience, as they are nonsensible, nor by defining them in terms of some sense quality, for they are simple and hence indefinable. Rather, a primitive ethical term stands for an objective reality that we must recognize directly with what he calls an immediate nonnatural grasp or nonnatural intuition.

Analogously, if one wants to understand the meaning of *yellow,* one has to be shown examples of it; it will do no good to learn that *yellow* names the primary color between green and orange on the spectrum or that the perception of yellow is stimulated by electromagnetic radiation within a certain range of wavelengths or even that ripe lemons are yellow. Moore argues that these do not provide the meaning of *yellow,* and to take any or all of them as a definition of *yellow* would be to commit the same fallacy that is committed when "pleasure is good" is taken as a definition of *good.* One must immediately experience the color yellow through an immediate sensible grasp or natural intuition.

Moore calls the fallacy involved the naturalistic fallacy in ethics because it involves confusing a natural object, such as survival or pleasure or satisfaction of desire, with the nonnatural property of goodness, but the naturalistic fallacy is an instance of a more general type of fallacy that is committed whenever a statement saying that something has a simple indefinable property is taken as a definition of it.

Many people tend to use the phrase *naturalistic fallacy* to characterize inferences claiming that because certain types of behavior are natural they are therefore morally right, or because certain types of behavior are unnatural they are therefore morally wrong. Although such inferences can be analyzed as fallacious, this is not at all what is at issue with Moore. Moore is concerned with the metaphysical and epistemological foundations of ethics, and this use of the term *naturalistic fallacy* is a misapplication, to say the least.

The challenge to the move from any descriptions of what is to prescriptions concerning what ought to be is one that must be met "head-on" by any descriptive or naturalist ethics. Many ethicists, finding the challenge to be one that is impossible to meet, have embraced moral skepticism of some sort or various forms of noncognitivism or relativism. While noncognitivism takes various forms, the position usually taken as most representative of that movement is A. J. Ayer's emotive theory, which holds that moral utterances are neither true nor false, for they are meaningless, nonfactual utterances. These utterances are purely emotive and serve such functions as evincing the emotions of the speaker or influencing the emotions of others to conform to those of the speaker. Ethical relativism takes the position that there are no universally valid moral principles. Morality is purely conventional, and moral claims are valid if they conform to the conventions of the particular culture (cultural relativism) or individual choice (individual relativism).

The is-ought dichotomy has been highly influential in the manner in which business ethics has developed. Scholars interested in business ethics seem, for the most part, to have split into two camps in delineating two kinds of business ethics, the normative and the empirical. The former is considered to be a prescriptive or value-laden approach and the latter an explanatory, descriptive, and/or predictive approach concerned with empirical facts. While the two domains may be held to rely on each other in a practical relationship, they are two differently oriented conceptual sets with distinct methodologies. There are attempts to bring normative and empirical inquiry together under one big conceptual tent, but these are still usually understood in terms of the endeavor of trying to bring into a symbiotic relationship two distinct realms, facts and values, the realm of *is* and the realm of *ought.*

American pragmatism, best represented in ethics by the philosophy of John Dewey, affirms a naturalism that, with its enriched understanding of experience and nature, undercuts the is-ought dichotomy. Empirical experience can include the immediate experience of value, and value need not be a nonnatural property to be a real, irreducible, indefinable quality. *Ought* claims develop as experimental guidelines concerning how best to act to enrich value experience for all those affected by one's actions.

The issue of the is-ought dichotomy has led ethics down many diverse paths, and the problem of obtaining an *ought* from an *is,* introduced by Hume and reinforced by Moore, remains one of the major issues in ethical theory.

Jainist Ethics

Jainism is an ancient religion that originated in India. The Jains, primarily concentrated in India, numbered approximately 3.2 million in the latest census, but Jains also live in other parts of Asia, East Africa, Europe, and North America. Jains believe that their religion is eternal, although the earliest historical record of Jain activity dates from about 850 BCE. There are two main sects of Jainism, the *Digambara* and the *Shvetambara*. *Digambara* means "sky clad," and its male ascetics renounce all clothing. *Shvetambara* means "white clad," and its male and female ascetics wear white robes, which are a sign of purity.

Along with Buddhism, Jainism is considered to be one the great non-Vedic heterodoxies, in that it rejects many of the precepts from the Hindu sacred texts, the Vedas. Jainism does share, however, several doctrines with the other two traditions—for example, reincarnation, karma, and liberation. Etymologically, the religion's name derives from the Sanskrit word *jina,* which means conqueror in English. The term was used to describe certain teachers, who were spiritual conquerors, able to overcome human passions, attain enlightenment, and escape the cycle of reincarnation. The great Jainist teachers, who are considered omniscient albeit human, are called *tirthankaras*, which means "fordmaker." Their teaching provides a spiritual ford across the ocean of rebirth. The last *tirthankara* was Vardhamana Nataputta, called Mahavira, who was a contemporary of Buddha during the sixth century BCE. Mahavira is sometimes wrongly referred to as the founder of Jainism.

The Three Jewels, or guiding principles, of Jainism are right faith, right knowledge, and right practice. Jainism stresses renunciation, even for the laity, although expectations for their right practice are lower and somewhat different from those for the monastics. The five main ethical principles of right practice are *ahimsa* (nonviolence), *satya* (truth), *asteya* (nonstealing), *brahmacharya* (chastity), and *aparigraha* (nonpossession). The laity is responsible only for the associated "Lesser Vows," which parallel the "Great Vows" of the ascetics. Laypeople also have three "Subsidiary Vows" and four "Vows of Instruction."

Ahimsa requires the ascetic to reject the killing of any life form (including insects and microscopic beings) and to avoid harming them in any way. Laypeople must avoid the pointless destruction of life, and this principle limits their potential occupations. *Ahimsa* also governs the way that laypeople follow the other principles, in that they may be overridden to avoid violence. *Satya* requires monastics to avoid all lying and other hurtful speech, while laypeople must avoid them as much as possible. In business, laypeople are expected to avoid deception regarding the goods that they are selling. *Asteya* requires ascetics to avoid all theft and even the desire of someone else's property. Laypeople must observe the external aspect of this principle, by not stealing or otherwise taking property that does not specifically belong to them. *Asteya* prohibits all forms of business fraud, and recent commentators have also claimed that it prohibits tax evasion. *Brahmacharya* requires celibacy for the monks and nuns, including the avoidance of sexual thoughts and desires. They should also avoid any activity that might stimulate sexual impulses. Laypeople are expected to be monogamous and faithful in marriage.

Like the monastics, they should avoid desire when it comes to nonspouses. *Aparigraha* requires the ascetics to renounce all possessions and any attachment to them. They must not even think of the things renounced. The laity must avoid excessive attachment and end desires for more than is just for them to have. Religious giving is expected. In business, they must consider their profession to be a means to social benefit, rather than an end in itself.

The first "Subsidiary Vow" for laity restricts travel to minimize the destruction of life forms, which is ironic in that the monks are required to be traveling mendicants. The other Subsidiary Vows call for laypersons to avoid excessive enjoyment of material goods and to abandon various spiritually harmful activities. The four Vows of Instruction relate to religious practices: restricting activities, performing the *samayika* ritual, fasting, and religious and charitable giving.

Jain laypeople tend to be merchants because farming and various craft and industrial vocations involve the destruction of life forms. Trade rather than production better facilitates the practice of *ahimsa,* with banking and the gem industry as historically the most common fields. Concern for all life forms leads Jainism to reject the modern industries and manufacturing practices that cause pollution and the use of animal products. The Jain worldview thus overlaps with contemporary environmentalism, although the underlying motivations differ.

Jainism has been likened to Protestant Christianity and the Protestant work ethic, in that it supports commercial practice through principles of self-reliance, self-restraint, and responsibility. One important way that they differ is that in Jainism, business practice has not separated from its religious origins. Credit is both an economic and ethical notion. A business family's credit depends not only on its financial standing but also on its social position, reputation, and moral and religious conduct. Good behavior is seen as indicative of internal piety. Bad behavior, such as unscrupulous business practice, may result in short-term profit, but Jains hold that such people will suffer in the end, through loss of credit and bad karma (used here as destiny due to wrong actions).

Following the notion of karma, wealth and poverty are considered reward and punishment for past and present deeds. Voluntary poverty is virtuous but involuntary poverty is not. Wealth and commerce are not considered sinful per se, but they do bring their own particular moral and religious hazards related to conflicts with renunciation. Jains avoid these hazards by rejecting conspicuous consumption and by making large charitable donations to the building of temples, schools, hospitals, etc. The term *punya* (merit) can be used for any good action, moral or religious, but it most commonly refers to a generous public donation, and it results in good karma for the donor. Karma also has a this-worldly impact because outward signs of piety are crucial in business communities dominated by Jains and contribute to a positive business reputation.

JEWISH ETHICS

Jewish ethics is part of an unbroken ancient religious tradition dating back more than 3,000 years. The Jewish Bible and the Talmud serve as the foundation of the Jewish religion. In Judaism, the notion of a covenant between God and Israel where both parties bear legal and ethical responsibilities is one of the most central themes.

Five Themes of Jewish Ethics

The following five themes of Jewish ethics were selected out of the vast ocean of Jewish literature because they are relevant to contemporary decision makers, especially in the context of business. There is no claim that this list is exhaustive or that it includes the most important issues in the history of Jewish ethics. Furthermore, the descriptions and interpretations that follow are not necessarily universally accepted in Judaism. The claim *is* being made, however, that these themes provide a useful and practical launching point for a consideration of the use of Jewish ethics in business.

Judaism underscores the importance of right actions. It is certainly not the case that Judaism is indifferent to right intentions and correct beliefs as has sometimes been asserted. Perhaps no value is more important in Judaism than the study of *Torah*. Nevertheless, in Judaism, there is a clear preference for appropriate actions and good deeds. As one famous Talmudic sage noted in the Ethics of the Fathers, "Say little and do much."

Traditionally, it has been understood that Jews have been commanded to observe 613 *mitzvot* or commandments. These *mitzvot* are contained in both the Written *Torah* (the Jewish Bible) and the Oral *Torah* (the *Mishna*, *Talmud*, and related commentaries) and have been identified and elaborated in every generation by Jewish scholars for thousands of years. In Judaism, it is believed that human action is necessary for both human welfare and for God for repair the world (*tikkun olam*).

There is a famous and often quoted rabbinic statement cited in the Jerusalem Talmud that illustrates the seemingly unlimited power of right action and good deeds. "Whoever destroys a soul, it is considered as if he destroyed an entire world. And whoever saves a life, it is considered as if he saved an entire world."

Jewish ethics is focused on the here and now. In every instance, the rabbis made an attempt to interpret, develop, and apply Jewish law and ethics in light of contemporary social and economic conditions.

Judaism teaches that each individual person is endowed with free choice (see especially Deuteronomy 30:19). Further, Judaism rejects outright the belief in original sin. The ancient rabbis meticulously and creatively interpreted every single word of the Written *Torah*. A good example of this can be found in their understanding of the following biblical verse. "And God saw all that He had made, and found it *very* good. And there was evening, and there was morning, the sixth day" (Genesis 1:31, italics added). In this case, the rabbis asked themselves why the text included the seemingly extraneous word "very"? How does this word add to the meaning of this verse, as it must? Here is how they answered this question:

> Rabbi Nahman said in Rabbi Samuel's name: "Behold, it was good" refers to the Good Desire; "And behold, it was very good" refers to the Evil Desire. Can then the Evil Desire be very good? That would be extraordinary! But without the Evil Desire, however, no man would build a house, take a wife, and beget children.

This is an extraordinary idea and it is fundamental to an appropriate understanding of Jewish ethics. According to one contemporary Talmudic scholar, this statement represents an unqualified rejection of ethical dualism (the doctrine that holds that two forces—one for evil and one for good—exist within a human being). According to the ancient Rabbis everything comes from God and is therefore good. The Evil Desire is so called because of its destructive side, but at the same time the need for desire and its positive overtones is emphasized.

In Jewish thought, neither selfless love nor selfish love is seen as ideal. One of the most often quoted passages in Jewish ethics is Hillel's famous dictum, "If I am not for myself, who will be for me? And, being for myself only what am I?"

Hillel's view captures the dialectic between individual autonomy and the individual's responsibility to the community. In Judaism, both poles are seen as necessary components to energize an appropriate and life-affirming ethic. Interestingly, Hillel formulated his insight not in the form of a statement but as questions, leaving it to each individual to formulate an appropriate answer in light of existing (but changing) circumstances. Hillel's dictum echoes the biblical commandment to "love one's neighbor as one loves oneself" and foreshadows Maimonides well-known endorsement of the "golden mean" in ethics.

At the heart of Jewish ethics is the idea of covenant. It is a truism to note that the idea of covenant or *brit* is deeply rooted in the rich soil of biblical narrative. It is a term that describes not only the climactic events of the revelation at Sinai but is also a term that echoes through every book of the Bible. Covenant is the central organizing theme of biblical thought.

For the purposes of developing a full blown Jewish ethics it is useful to provide a contemporary definition consistent with traditional Jewish sources. Covenant may be defined formally as a voluntary agreement among independent but equal agents to create a "shared community." The primary purpose of the agreement is to self-consciously provide a stable social location for the interpretation of life's meanings to help foster human growth, development, and the satisfaction of human needs.

This definition is meant to highlight three aspects of *brit*. First, they are purposely ambiguous and open-ended, thus allowing for change and growth. Second, they are long term in nature. And third, covenants are respectful of human integrity.

Jewish ethics is dependent on open and free dialogue. No modern Jewish thinker has done more to promote the notion of dialogue as central to Jewish ethics than Martin Buber. Throughout all of his writings, but especially in his book *I-Thou,* Buber expressed a deep and profound appreciation for interpersonal communication and human connection. As Buber stated, "God is not in me, and God is not in you, but God is what is between us." Or, on another occasion, "When two people relate to each other authentically and humanly, God is the electricity that surges between them."

Buber's understanding of dialogue is well grounded in traditional Jewish sources. For example, in Genesis, Abraham responds to God's decision to destroy Sodom by engaging God in a conversation. Abraham asks God, "Will not the judge of the whole earth act justly?" In rabbinic writings, even a cursory examination will show that dialogue among the rabbis is the defining characteristic of Talmudic thought and engagement. No rabbinic phrase captures this idea better than the expression "It [Jewish law and ethics] is not in heaven."

None of these five themes listed above is unique to Judaism and Jewish thought, but each of them is integral to it. Given the human ability to choose freely, Judaism underscores the importance and significance of human action. Such action is taken in the context of covenant and is based neither on selfless love nor on selfish love but seeks a middle ground. Reciprocal responsibility is strengthened through study, discussion, and dialogue.

Using Jewish Ethics to Understand Contemporary Business Problems

Jewish ethics, with its emphasis on free choice and right action, contains no inherent bias against business. With its this-worldly and practical approach, Jewish ethics contains numerous texts and sources useful to contemporary business.

Although a full elaboration of this point is beyond the scope of this entry, consider three examples and how they relate to the themes discussed above.

Corporate Social Responsibility

There is little doubt that among the most important issues in business ethics today is the notion of corporate social responsibility, especially a responsibility to the least well-off members of society. This concern is consistent with the very foundations of Jewish ethics, especially as understood in the prophetic writings. Consider just one example from Amos, Chapter 58:

> Hear this, you that would swallow the needy and destroy the poor of the land saying, when will the new moon be gone, that we may sell grain? . . . Making the epha [ancient unit of measure] small and the shekel great, and falsifying the balances of deceit? That we may buy the poor for silver, and the needy for a pair of shoes.

From a Jewish perspective, it would be impossible to defend a view of the corporation that holds that its sole purpose is to maximize profits for shareholders. Any view that rejects the rights of all stakeholders would be inconsistent with the themes identified above, especially Judaism's insistence on finding the appropriate balance between individual autonomy and the individual's responsibility to the community.

Sustainability

Like corporate social responsibility, sustainability is emerging as a key variable in business ethics. While there is yet no one definition for sustainable business practices, it is clear that business must now factor long-term environmental and social impacts into the decision-making process in addition to financial considerations. There is a recognition that each generation must leave behind a world at least as healthy and rich as the one it inherited.

To more fully understand the appropriate contours of sustainability, it is simply not enough for one person, firm, or even country to go it alone. A reasonable conception of sustainability flows from a shared and just consensus beyond national borders. While there is certainly no necessary reason to include a vocabulary derived from religious sources in this dialogue, common sense dictates a familiarity with something like the idea of a covenant as an important consideration in this discussion.

Accountability

The call for increased transparency and accountability is critical to the well-being of an economic system based on free and autonomous business enterprises. Corporate accountability can be defined as the systematic and public communication of information that is designed to justify an organization's decisions and actions to various stakeholders. According to this definition, corporate accountability is primarily a form of ethical communication directed toward those parties who are affected by corporate activities and outcomes. It is an attempt by the corporation to explain itself in a reasonable and meaningful way to the society in which it operates.

During most of the last century, corporate accountability was successfully achieved almost entirely through the use of corporate annual reports. Although the annual report continues to play a crucial role in communicating useful information to stockholders and other interested parties, the concept of corporate accountability has broadened dramatically in recent years.

To legitimately justify an organization's decisions and actions, corporate accountability is now viewed and described by many as a dialogue between the corporation and its stakeholders and not as a monologue on the part of management. This means that corporate accountability requires listening to a company's diverse stakeholders as well as responding to them. It also means that business ethics would be well served by a thorough examination of the religious roots of dialogue, both ancient and modern.

Conclusion

This entry makes no claim to provide an exhaustive or an authoritative characterization of Jewish ethics. Rather, it has attempted to highlight a number of the most prominent themes in Jewish ethics: right action, free choice, balance, covenant, and dialogue. These themes were chosen because they are especially useful to help understand and resolve contemporary business ethics issues. Great care should be given to any attempt at mixing religious thought and business practice. The religious ideas examined here grew out of social and economic conditions very different than those we face today. Nevertheless, if we maintain an attitude of pragmatic realism and reasonableness, and if we hold our focus on building better and more equitable democratic societies, religious resources can play an important role in promoting business ethics.

Job Security

The concept of job security relates to the level of stability a job has over time. In addition to the actual stability of a job, job security also relates to the perception held by an employee that his or her job is secure. Historically, job security held a central role in the psychological contract between workers and their employers. The employee believed that in return for providing his or her services and loyalty, the employer would provide stable employment. However, there is a sense that the contract has been broken, that the work rules have changed, driven both by employer and employee actions.

The employment relationship takes a number of forms, from temporary or contract employment intended for a specific term or project duration, to a relationship perceived by the employer and/or the employee as a long-term commitment. That relationship can be covered under the terms and conditions of a specific employment contract, as is the case in a unionized employment relationship, or simply exist as long as it satisfies the needs of the parties. In such an "at-will" employment relationship, both parties retain the right to end the relationship for any reason or for no reason.

In the United States, the employment relationship is based on the doctrine of employment at will. This doctrine holds that in the absence of a specific employment contract, an employee can be terminated for any reason or no reason, and in turn the employee can quit for any reason or no reason. Under this doctrine, employers were under no legal constraints to provide secure or stable employment. They could terminate any employee, at any time, with no requirement to provide justification to the employee. In the

1970s and 1980s the courts began to weaken this doctrine, holding that employer actions could create an implied contract that changed the relationship from "at will" to one of "just cause." Shifting to a "just cause" doctrine of employment requires an employer to provide a valid and justifiable reason for terminating a worker and allows the worker to challenge that reason in court. The courts found that statements in employee handbooks or made by managers, which implied career-long employment, or job security for good performance, were sufficient to limit the employer's right to terminate without reason or cause. Thus, to protect their rights to terminate employees "at will," many employers began explicitly to indicate to all new hires, and periodically to existing employees, that the employment relationship between the company and worker is one that is "at will" and that they may be terminated at any time without the need for a reason. Such declarations had the effect of highlighting for all employees the tenuous nature of the employment relationship and further eroded perceptions of job security. The doctrine of employment at will, while somewhat restricted by a number of court rulings and statutes, is still the prevailing employer-employee relationship in the United States and holds that flexibility in the employment relationship is more important than security.

In European countries, the employment relationship is based on regulations and statutes that give much greater protection to the worker and make it much more difficult for employers to terminate them. Many believe that the flexibility employers have with regards to terminating employees in the United States is, in part, the reason that unemployment in the United States tends to be consistently lower than in EU countries. The argument goes that in the United States, an employer would be more willing to add workers as business needs require, knowing that those workers can be removed should conditions warrant, while in EU countries, employers, knowing that once hired they will not be able to terminate the worker easily, will hold off hiring new workers for as long as possible. To address this structural unemployment, several European governments sought to modify existing work rules early in the 21st century that would make terminating younger workers easier for employers, giving employers greater flexibility in terminating workers. These proposals have generally been met with widespread protests.

Japan has long been viewed as providing lifetime employment. Following World War II, the practice in large firms in Japan was to hire a worker directly out of school and retain him or her until a mandatory retirement age (originally 55 years but now 60 years). This was not a mandated requirement but an implicit agreement honored widely by both employer and employee. This led to the corresponding practices of promotion from within and seniority-based pay. In the Japanese scheme of lifetime employment, higher wages were tied to longer seniority, thus providing the financial incentive for individuals to remain with one firm. Those not employed by large firms went to work in economic sectors protected by the government from international competition. This system resulted in extremely low unemployment. However, that system began to weaken in the 1990s. By the end of the 1990s, unemployment among young workers reached nearly 10% and part-time employment made up nearly 24% of all employment, with the government advising its citizens to get used to the idea that lifetime employment could not be sustained.

In the United States, labor unions offered one way of limiting the seemingly arbitrary and insecure nature of employment under the "at will" doctrine. In the 1940s and 1950s unions were able to offer a degree of job security by negotiating specific labor contracts that specified who could be terminated and for what reasons; this remains a key issue in today's labor contract negotiations. However, unions are less able to provide job security when the threats to job security stem from the forces of globalization. As both products and labor can be sourced globally, many jobs have moved to countries where the supply or cost of labor is more advantageous. In addition to job loss due to globalization, U.S. workers' perception that companies have a reduced commitment to workers has been fueled by the large numbers of high-wage jobs eliminated in the auto, rubber, steel, and other industries through advances in automation and robotics.

While concerns over job security have always existed, there is a perception that in the past the concern was based on more manageable issues related to one's performance or the financial performance of his or her employer. Both were factors on which the employee either directly or indirectly could have some impact. However, today workers are frequently reading reports of job losses or layoffs impacting tens of thousands of employees from single employers as a result of mergers or other major market disruptions. Furthermore, in the era of 24/7 media coverage, not only are facts reported, but the most compelling personal stories are found, which highlight the consequences of job loss on a personal level, adding to the anxiety and insecurity of all.

The commitment that workers are willing to make to employers is also changing. This is caused in part by the perception of decreased employer-provided job security and in part due to increased educational opportunities and greater mobility. Today, individuals may be less likely to believe that their careers are defined by location or company. The idea of working for several different companies, and even changing career direction, is more acceptable to today's workers.

However, despite the widespread perception that job security has declined, there have been a number of studies that challenge that conventional wisdom. Job security and job stability are measured through a number of metrics, including tenure, separation rates, retention rates, and worker perceptions.

The data on job stability present a picture suggesting that job stability has not changed dramatically in the U.S. workforce. Studies indicate that in the 1990s average job tenure rose and the percentage of employees with more than 10 and 20 years of seniority with the same firm had increased. Another study compared the careers of older men in 1969 to those of older men in 2002, examining the average of the longest jobs held by the men in each cohort. In 1969, the men averaged 21.9 years, whereas in 2002, they averaged 21.4 years. In both cohorts, slightly more than half the men held one job over 20 years. Similarly, U.S. Bureau of Labor Statistics data show that the median job tenure of all workers more than age 25 has remained stable from the 1980s to the present. While the majority of studies support the position that job stability has not changed over time, some that challenge that view, especially those who focus on white-collar mid-level managers.

Despite data that suggest jobs in the 2000s are not substantially less secure today than they were in the 1980s and 1990s, the perception that jobs are less secure has grown with several surveys indicating that nearly half of the respondents worry that a member of their household will be out of work in the near future. Part of the reason for this disparity between empirical data and perceived security lies in the psychological concept of "salience bias." For example, many believe that air travel is dangerous because a few high-profile air crashes do occur, even though there is overwhelming evidence that air travel is among the safest forms of travel. Similarly, high-profile examples of job loss have a disproportionate impact upon public perception. When icons of U.S. industry like General Motors or AT&T have large and well-publicized downsizings, this seems to prove that a great transformation of economic conditions is taking place.

Regardless of what the empirical data suggest about the long-term trend in job stability, the prevailing perception of job security has a significant impact on the employment relationship. In the 1990s, workers were more concerned about losing their job with the next year than they were in any period during the 1980s. This led Alan Greenspan, former chair of the Federal Reserve, to conclude that concerns over job security have had a dampening effect upon wage growth. Similarly, Robert Reich, former secretary of the U.S. Department of Labor, asserts that as workers become more anxious over retaining their job, they are investing less in firm specific capital and more in developing general skills and a network that would help them in the event of job loss. Thus, whether the nature of employment has undergone a structural change toward less security and stability, or the increased awareness of the topic and the threats organizations face has led to an increased perception that jobs today are less secure, there are significant implications for both workers and organizations. These range from a decreased willingness to accept jobs in areas with fewer alternative employment opportunities, reducing the desirability of many small and medium sized towns, to investment decisions that employers make about the training and development of their workers.

Johns-Manville

The Johns-Manville Corporation was a pioneer in the use of Chapter 11 bankruptcy as a strategic defense against exposure to product liability lawsuits. Manville was a major supplier of insulation materials. Unfortunately, asbestos was one of Manville's main insulation products. Exposure to even small quantities of airborne asbestos particles can cause debilitating and often fatal lung disease. There is evidence that Manville knew of the link between its asbestos and lung disease as early as the 1930s. An appeals court judge even held that Manville had engaged in a conspiracy to hide that link. Not surprisingly, the industrial workers who had been exposed to asbestos began to file lawsuits in increasing numbers during the 1970s and 1980s.

In 1982, faced with this burgeoning potential liability, Manville sought protection in the bankruptcy court through a reorganization that created two separate entities: an operating company whose assets would be shielded from asbestos liability and a trust that would handle payouts of asbestos-related claims. The trust was funded by a grant of 50% of Manville's common stock and 20% of the operating company's profits (a payment that continued until the operating company was sold in 2001). Shareholders opposed the arrangement as a dilution of their equity but the bankruptcy court accepted the company's plan in 1986.

The original formula for payouts from the trust was 100% of a claim's settled value on a first-come, first-served basis. The number of claims against the trust quickly swelled, however, and as of 2004 the trust was paying just 5 cents on the dollar for claims.

The Manville case raises serious ethical questions about how to apportion the assets of a firm between shareholders, creditors, and victims when the firm is faced with liability claims that approach or even exceed the value of the firm itself. Shareholders naturally feel that as owner-investors they are entitled to retain the firm's equity value and profits. Yet creditors believe that they have a binding claim based on prior corporate promises. And, of course, victims of the company's products claim that they are entitled to be made whole for injuries that were not their fault. If the bankruptcy court does not shield firms when they are exposed to such enormous liability, the odds are that those victims who file their lawsuits early may receive full compensation while creditors and other victims will receive little or nothing. However, if the court accepts this strategic use of the bankruptcy laws, it is likely that no injured party and no creditor will be fully remunerated. Shareholders, in either case, are likely to lose both equity value and future dividends.

Justice, Compensatory

Compensatory justice concerns making a person whole after a wrong by another person. Key in determining the amount of compensatory justice is determining the value of what was lost. In some situations determining the cost is simple: What were the actual expenses incurred as a result of the wrongdoing? In other situations such as damage to a reputation, pain and suffering, and loss of expected benefits in the case of breach of contract, calculating the amount of damages due is very difficult.

Conditions Required to Establish Duty to Compensate

Traditionally, three conditions are required to find that a person has a moral obligation to compensate an injured party:

1. *The action that caused the injury was morally wrong, legally prohibited, or negligently committed.* If you are prevented from achieving a particular goal

because I deliberately put blocks in your way, perhaps intentionally spreading a false rumor about your ability to perform a contract, then you would be entitled to compensation.

2. *The person's action must be the real cause of the injury.* If I use my money to purchase a defective forklift for the company and you are injured, then I am responsible for that injury. If my connection to the injury cannot be established, then I am not liable.
3. *The person's injury was inflicted voluntarily.* In this instance "voluntarily" means that I intentionally caused the injury or I acted negligently, with such a disregard for the consequences of my action that I am held morally liable for the injury.

To diffuse the financial liability, the community may choose to bundle resources for compensation, such as the purchasing of insurance, to spread the costs of compensation more equally across the community. The degree to which the community should demand reallocation of resources without regard to fault in causing injury is a perennial source of controversy.

Compensatory Damages in Breach of Contract

Historically, three measures of compensation may be due to a person who has suffered damage because another defaulted on a contract.

First, a person may receive compensatory damages to protect the restitution interest. This allows a court to deprive the person who defaulted on the contract any gain that resulted from the breach of contract. The purpose of this award is to prevent unjust enrichment to the party who is in the wrong.

Second, the person may receive compensatory damages to protect the reliance interest. If a person purchased goods or services to fulfill the contract, the cost of those goods or services should be repaid. If someone forgoes another opportunity in reliance on the contract, that lost revenue may also be recovered.

The third measure of compensation is protection of the expectation interest. This compensation is made to place the person in the position she would have been in if the promise had been performed. Thus, if a person expected a certain amount of profit from the contract being honored, the party in breach of the contract may be required to compensate the nonbreaching party for the profits that were expected.

The ethical basis for the first two types of compensation is malfeasance, deliberately choosing to not honor a contract or to keep one's word. In these situations, theorists agree that compensation is due. The ethical basis for the third measure of compensation is nonfeasance, granting damages for something that was never done. Theorists do not agree on this basis for compensation. The argument is that one should not recover damages for a failure to receive the anticipated financial benefit. Regardless of the theoretical controversy, the courts consistently recognize all three types of compensation.

Compensatory Damages in Tort

The most typical form of compensatory justice in tort law is the award of money. The idea is, to the degree possible, to use money to put the injured person back into the position he would have been in before the injury. This interest is recognized when the injury was intentional as well as a result of negligence.

Actual damages, the first type of compensation, are not controversial. The moral obligation of the one who caused the damage is to pay the actual expenses of the one who was injured. These damages may be hospital bills, personal expenses for care, or loss of income due to the act.

Consequential damages are more controversial because of the difficulty of proof. A common example is determining appropriate compensation for pain and suffering, which can only be inferred from the seriousness of the injury.

Problem Cases

Two situations are problematic in the area of compensatory justice: (a) no-fault or strict liability and (b) affirmative action. In the case of no-fault liability or strict liability, the notion is to place responsibility for compensation of damages either in a pool of persons through insurance or with the person who is most able to absorb the cost of the injury, the corporation. In this sharing of responsibility, one person is not given the overwhelming burden of meeting the financial obligations, but the risk is diffused through the community. The notion behind affirmative action is that those who have benefited from the wrongdoing of another should be required to compensate the victims of the wrong. Thus, particularly in the distribution of community goods such as jobs or contracts, those who have historically been unable to compete fairly should be compensated. The critique of affirmative action has been that those who were not directly responsible should not be required to compensate those who have indirectly been harmed.

The moral basis for compensation is our personal interest in preserving our life and our bodily integrity. The second protected interest is our right to preservation of our property. The moral justification for compensatory justice has always been the concept of responsibility for action: if a person takes intentionally or negligently takes an action that injures another, the damage caused should be compensated. To the degree that the connection between actual agency and damage is lost, such as with pooled responsibility or affirmative action, arguments for compensatory damages become weak and theories of distributive justice become more persuasive.

Justice, Distributive

Distributive justice concerns the way in which the resources of a society are to be justly distributed among its members. The theory of distributive justice attempts to answer the following question: "How should the scarce goods of society be allocated among claimants?" Thus, distributive justice contrasts with other questions of justice such as compensatory justice, commutative justice, retributory justice, and so on. Distributive justice is also sometimes called social justice or economic justice.

The theory of distributive justice assesses alternative distributional principles, outcomes, and institutional arrangements of a society from a moral perspective. For example, some would consider a society in which goods are unequally distributed to be *prima facie* unjust based simply on that unequal distribution. By contrast, other theories focus exclusively on the justness of procedures in a society with respect to the transfer of goods from one person or group of persons to another. For example, some would see any interference with strict property rights as unjust, even if such interference were designed to bring about a more equal distribution of goods across the members of a society.

Theories also differ on the question of which goods can be justly or unjustly distributed. These goods could range from various social and political rights, such as voting privileges, to awards and honors, to the material goods of a society, such as those that can be valued in monetary terms. In contemporary discussions, the overwhelming focus of concern is the distribution of material and financial resources. This is due partly to the fact that questions of the just distribution of various nonmaterial resources seem to be settled issues, at least in industrialized societies. For example, the question of how voting privileges should be allocated across individuals or groups based on wealth, race, and gender are no longer controversial in many societies.

Many theories focus on the distribution of material and financial resources, rather than the full range of things valuable for human life, because so many of the good things in life are incommensurable, plus they may not be subject to redistribution. What goods are to count in assessing whether a distribution is just: money, beauty, life prospects, well-being, resources, intelligence, or even happiness? Some of these desirable features of a human life are not subject to very effective redistribution, such as beauty, intelligence, happiness, and life prospects. Many are incommensurable with others. For example, how can we value the relative worth of intelligence, beauty, happiness, and money? It seems reasonable that possessing these virtues or assets in some measure adds to the quality of human life, but the contribution of each of these to the quality of a human life cannot be readily assessed in terms of the others. For example, we are told that money cannot buy happiness, but as Aristotle duly noted, a life of destitution is unlikely to be fully happy. What is the trade-off between money and happiness in general? It seems that there is no answer to such a question and that the trade-off between any two of the assets or qualities on the list will differ from person to person—some place a relatively higher value on beauty compared to intelligence than do others.

This entry focuses on the question of distributive justice as it pertains to the distribution of wealth, services, and material sources, as this is the most important area of current discussion and it is the aspect of distributive justice that is most relevant to the ethics of business and the role of commerce in society. Because these resources can be denominated in money, at least to a reasonable approximation, this entry will speak of the distribution of wealth, considered not only to embrace money but also to include the entire range of material goods and services that a society might possess and be able to allocate or reallocate.

Given this concentration on the just distribution of wealth and material resources, the issue of distributive justice is critical to business because businesses generate the overwhelming bulk of wealth and material resources in modern industrial societies. The question of how the rules of society are to be established to govern the distribution of wealth intimately affects the well-being and rights of all those who work or who establish businesses.

Some theories of distributive justice address how to move from a current distribution to one that is supposedly just. Such schemes depend upon the proper identification of a just distribution and then focus on how to redistribute wealth to achieve that distribution. Much public discourse and many governmental programs are directed to this end. For instance, government welfare programs aim at achieving a supposedly more just distribution of wealth. Similarly, colleges and universities routinely charge children of wealthy parents more than they charge children of less wealthy parents, and they justify this practice in part by an appeal to principles of distributive justice. This entry will consider only static theories of distributive justice rather than attempting to discuss theories that specify how society should move from a current supposedly unjust distribution to a future supposedly just distribution.

Egalitarianism

One of the simplest, and for many one of the most intuitively appealing, conceptions of a just distribution is egalitarianism—the view that all members of a society should have the same wealth, material resources, and access to services. According to this view, all persons are equally worthy of respect and consideration, and this implies that everyone should have the same allocation of societal wealth. For a strict egalitarian, considerations of the person's contribution, effort, and desert do not come into play. Instead, egalitarianism views a just distribution as one in which all persons share equally.

A problem for egalitarianism, again a difficulty that besets a number of theories of distributive justice, is the question of the time at which the just distribution is to be achieved. If one could achieve such a distribution at one point in time, the next moment would see the distribution become unequal. In an egalitarian world, is the goal to set an equal distribution at one moment and let the future play out as it will, or is the task to maintain an equal distribution over time, including perhaps even over the entire span of a human life?

A second criticism of egalitarianism focuses on considerations of social welfare. It is clear that such an equal distribution will not maximize welfare across all the members of a society. For example, you may value money more than another. In such a circumstance, it is clear that the total well-being of society could be increased by a distribution that gives you more money than another. This problem arises even in the simplest case of imposing an equal distribution of just a single asset such as money. But the issue is really more complex and difficult. Assume now that there are two goods that are to be subject to an egalitarian distribution: money and leisure. A distribution that gives every person the same money and the same hours of leisure per week will be vastly inferior to other distributions. If one person values leisure more than another who places a higher value on money, both persons are worse off in the egalitarian distribution than they could be in another. Specifically, in this example, the money-loving person could perform some task for the leisure-loving person for compensation, with the result that the welfare of both would increase. The problem becomes even more intense as additional goods and services are brought into consideration for redistribution. Note also that an initially equal distribution, followed by free exchange among members of a society, will be immediately subject to the timing problem discussed above.

Related to the timing question is the implication of human psychology for the viability of egalitarianism. We might call this a problem of incentives. If an initial redistribution of resources gives everyone an equal starting endowment, then each person will have incentives to manage his or her resources well going forward. However, it is virtually certain that considerable differences in subsequent distributions will quickly follow, either due to superior resource management or due to simple luck. In either case, the egalitarian distribution that seems important to these theorists will be upset. If the egalitarian distribution is to be reestablished periodically through time, incentives to manage resources well and to contribute to the social product will be greatly reduced. Such persistent egalitarian policies would undoubtedly create a society that is much poorer in the aggregate than one in which incentives were preserved better. Some egalitarians, however, concede this point but insist that the principle of equality is paramount and more desirable than an arrangement with greater aggregate social wealth.

Egalitarianism is a prime example of what Robert Nozick has called a "patterned" theory of distributive justice, a theory that holds that a just distribution is one that conforms to a certain pattern of distribution—in this case, one of equality. Such patterned theories are subject to serious criticism in that they appear to conflict with widely accepted views of people's rights. To take the simplest case, it seems that egalitarian theories of distributive justice are entirely incompatible with even the most rudimentary conception of property rights. The effort to achieve an equal distribution will necessarily require the compromising of the property rights of some to distribute to those with less. In response, the egalitarian might assert that property rights are certainly not to be taken as generally inviolable and conceivably might be justly abridged to secure other values. However, even if this be granted, egalitarianism seems to conflict with other rights that are even more basic. Some see egalitarianism as incompatible with any robust conception of human freedom. This is especially apparent for an egalitarianism that seeks to maintain an equal distribution across time, because such a policy would dramatically restrict the freedom of an individual to work to acquire additional resources and would necessitate a program of constant interference with the activities of all to restore the equal distribution. When one considers the incentive destroying effects of constant rebalancing of assets to achieve equality, it is evident that such a society would be markedly poorer than one with a modicum of respects for property rights.

As a final objection, egalitarianism seems to entirely neglect the idea of desert—the view that some can deserve more than others due to the contribution they make or the efforts they undertake. For egalitarianism, the only feature of human life that matters in determining a just distribution is the simple fact of personhood. For an egalitarian, the differences in people and the differences in what people do cannot give rise to one person's deserving more than another. In short, egalitarianism seems to require the total abandonment of the intuition that some person can justly deserve more than another in virtue of what a person contributes or the effort a person makes.

Resource Egalitarianism

Resource egalitarianism, a theory most closely associated with Ronald Dworkin, asserts that a just distribution is one that gives each person an initial endowment of equal resources from which they can construct a life. Beginning with this starting point of equality, people are then free to make whatever life they wish and they are responsible for subsequent differences in outcomes, with whatever outcomes result being considered just.

To explore resource egalitarianism, let us assume that everyone possesses an equal package of natural endowments. That is, we simplify by assuming that everyone has the same total capacity for achieving their life prospects, even though that equal capacity may be composed of different bundles of intelligence, beauty, health, physical vigor, and so on. Under this simplification, resource egalitarianism advocates giving everyone the same initial endowment of those resources that a society can distribute, such as wealth and access to education. After the initial distribution of resources, people then assume freedom to act and they are responsible for the resulting outcomes. Dworkin explains this view by imagining a society of shipwreck survivors landed on a deserted island with some rescued stores from the ship. For this society, the problem is to divide all of the resources to create an initial starting point of resource equality. Dworkin imagines an auction in which everyone receives the same money endowment and can bid on a division of lots on the island and tools and stores rescued from the ship.

Resource egalitarianism is clearly directed to resolving some of the problems with strict egalitarianism that were noted above. On Dworkin's island, under the initial simplifying assumption of equal natural personal endowments for everyone, the resolution of the timing problem is clear. There is to be a one-time distribution of resources. It is also relatively clear that the resources to be distributed are things such as land, tools, and other things that money can buy. After the distribution of resources, each person will have clear incentives to manage his or her resource allocation well. Also, the assumption that everyone has the same total packet of natural endowments seems to address the issue of maximizing social wealth. One reasonable interpretation of equal natural endowments is the view that every person is equal in capacity to use his or her resource endowment effectively.

However, some problems remain. Dworkin's desert island situation does not resemble the actual problem of allocating resources equally in real society. On arriving on the deserted island, no one has a prior claim on particular assets. For example, no one seems to have a claim on land, because the island was conveniently bereft of any initial inhabitants. Also, the stores saved from the ship do not have any owners among the survivors. For example, by contrast, it could have been one person's previously owned trunk of valuable resources that happened to wash ashore. Thus, Dworkin has imagined a situation in which a society is created from a convenient starting point. In actual human life, however, people arrive in a preexisting social order in which others have standing claims on resources. When one is born today, there are no unclaimed resources awaiting distribution to the new arrival. Thus, it seems that resource egalitarianism must repudiate the preexisting rights claims of putative owners of resources. According to this theory, it would seem that a person born today would have the same claim on resources as an existent person who has worked to create the resource pool that greets the new arrival. This leads into a second problem area for resource egalitarianism in terms of desert. On what basis does a newly born person deserve an equal share of resources that he or she did nothing to help create? Presumably, resource egalitarians are committed to the view that the principle of equality trumps such rights claims and issues of desert.

To this point, we have considered resource egalitarianism under the vastly simplifying assumption that everyone has an equal total package of personal natural endowments. Of course, this is far from true, as we know that some people are born with enormous personal gifts, while others come into the world with limited talents and with dramatic physical and mental disabilities. In this more realistic situation, resource egalitarianism maintains that the resources of society should be redistributed so that each person has the same total life prospects. Thus, a person with serious physical disabilities might need considerable resources for nursing, therapy, and so on in order to have the same life prospects as another person would.

This more robust and realistic version of resource egalitarianism retains the potential problems with rights and desert already noted. It also involves additional complications. With the recognition of different natural endowments and a commitment to distribute resources to create equal life prospects for all, the problem of what goods to distribute and how to implement a distribution returns to prominence. For example, consider a three-person world in which one person has an average endowment of intelligence, health, beauty, and so on; a second person is otherwise similar but has serious physical limitations; the third is also similar to the first but suffers remarkably low intelligence. What kind of redistribution would establish equal life prospects for these three people? In actual circumstances, it is not clear what should or even could be redistributed to create the intended equality. The force of this objection is perhaps not so apparent, given the level of abstraction for the analysis. In a real society, any implementation of ideals will always be imperfect and approximate at best. Furthermore, virtually all ideals of justice will face similar difficulties of implementation.

A more serious objection to the redistribution of assets required by resources might be called the "invasion of personhood" objection. In our simple three-person society, resource egalitarianism would require that considerable resources must be transferred to the two people with disabilities from the one person without disabilities. What resources are those likely to be? It seems that equality of resources would require that much of the labor, wealth, and life prospects of the person without disabilities must be taken from her to benefit the other two individuals. Here the issue is not merely the abrogation of a person's property rights, but it seems that the resources that will be appropriated are much more integral to one's personhood. This objection essentially asserts that such resource egalitarianism would interfere with a person's basic liberty to an impermissible degree.

Utilitarianism and Welfarism

Although better known as a theory of ethical conduct, utilitarianism also has strong implications for distributive justice. In the context of distributive justice, utilitarianism requires the maximization of pleasure across all members of society without regard to the distribution of that pleasure among persons. While originally cast in terms of maximizing pleasure, variants of utilitarianism can also specify the maximization of happiness, preference satisfaction, or personal welfare. As such, utilitarianism also requires the maximization of social welfare—the sum of welfare across all individuals in a society, again without regard to how that welfare is allocated among persons.

Utilitarianism clearly contrasts with egalitarianism and resource egalitarianism. While both versions of egalitarianism were primarily concerned with achieving an equal distribution across persons, utilitarianism totally neglects the question of who gets the benefits of welfare and focuses entirely on maximizing the sum total of welfare. We might say that utilitarianism focuses exclusively on creating a larger pie, whereas egalitarian theories focus on the just way to divide the pie.

Because it focuses on outcomes, whether those be conceived as pleasure or welfare, utilitarianism also clearly contrasts with resource egalitarianism, which was concerned with an equal distribution of resources with which individuals would then be free to create the outcomes they choose. In this respect, utilitarianism is closer to egalitarianism—at least versions of egalitarianism that focus on outcomes. But utilitarianism also contrasts with those forms of egalitarianism because utilitarianism focuses on total social welfare, rather than on achieving an equal division of welfare across persons. Because of this shared focus on outcomes, utilitarianism also inherits some of the problems of outcome-based theories of egalitarianism. One basic question is that of measurement—how is one to measure welfare, given that different individuals have different personalities and tastes? For example, will transferring money from person A to person B increase or diminish social welfare? In other words, utilitarianism faces its common problem of the "interpersonal comparison of utility"—how can we compare the welfare that one person enjoys with those enjoyed by another?

However, this difficulty of comparing welfare attainments between persons may be perceived as a mainly technical problem. Instead of focusing on the welfare of individuals, we could consider matters at a broad policy level. For example, some utilitarians hypothesize that, as a practical matter, utilitarianism might require a roughly egalitarian distribution of wealth. Because wealth exhibits diminishing marginal utility, the welfare maximizing distribution might be one in which everyone has approximately the same wealth. However, the real criterion of the correct distribution remains the one that maximizes total welfare.

If the utilitarian social planner wants to institute policies to maximize aggregate welfare, he or she must also consider the effect of social policies on the behavior and rights of citizens. Because each person's welfare is part of the total, it might be the case that the welfare maximizing policy would be to allocate resources to those who do nothing to increase total welfare. Under such a distributional scheme, some would receive benefits without working to create social wealth and incentives across society might be destroyed. Alternatively, because the policy is to maximize aggregate welfare, the welfare maximizing policy might be to force some people to work against their will. Even if this policy maximized welfare, many would see it as a serious invasion of the rights of those unwilling workers.

Moral criticisms have been lodged against utilitarianism as a theory of distributive justice. First, it gives no weight to the principle of equality. As we have seen, the welfare maximizing distribution might be one of rough equality but it need not be. Utilitarianism has also been criticized on the grounds that it gives inadequate respect to persons and their individual rights. Because the theory views persons merely as repositories for welfare and is concerned only with total welfare, it does not take account of persons as individuals. Because the theory focuses only on total welfare, it might require the seizing of assets from one person and the distribution of those to another. Thus, utilitarianism gives absolutely no consideration to property rights as such, unless respect for property rights happened to be the welfare maximizing policy. Finally, because of its single focus on maximizing aggregate welfare, utilitarianism ultimately does not even respect the basic liberties of persons. In strict theory at least, utilitarianism infamously appears to justify the possibility of enslaving some if doing so would maximize social welfare.

Rawls's Theory of Justice

The most influential work on distributive justice in the last 100 years is undoubtedly John Rawls's massive *A Theory of Justice* published in 1971 and later modified and refined in *Political Liberalism* and *Justice as Fairness: A Restatement.* Rawls attempts to create a theory of distributive justice that addresses some defects of earlier theories, such as the problems with rights and incentives discussed above with respect to other theories.

Rawls's theory centers around two principles of justice. The first principle concerns the rights of citizenship and personal liberties. Everyone is to have the maximal set of liberties consistent with everyone else having those same liberties. This implies that all are to have equal rights of citizenship—the right to vote, to have a voice in political decisions, and so on. We can construe this first principle as either a guarantee of rights or as a principle of distributive justice in which the benefits of liberty are to be distributed on an egalitarian basis—everyone gets the same basic set of liberties. This first principle has absolute priority over the second principle. The rights and benefits of citizenship granted by the first principle are not to be bargained away for any material advantage, and it is clear that the first principle does not embrace considerations of social and economic well-being.

The second principle of justice focuses on social and economic matters and has two parts. According to the second principle departures from social and economic equality are to be allowed under only two circumstances: (2a) "the difference principle"—that they lead to advantages for the least advantaged person or persons in society and (2b) that these inequalities are attached to positions and offices that are open to all persons under conditions of equal opportunity. This second principle is quite egalitarian in underlying spirit, even though it clearly intends to allow inequalities to exist under certain constrained conditions.

In allowing for social and economic inequalities that raise the condition of the worst off, Rawls is attempting to allow for incentives to come into play. For example, consider a brilliant medical researcher who could contribute vastly to the well-being of all by diligently pursuing her research and creating an important vaccine. In a purely egalitarian system, she might prefer not to work and the benefits of her creativity would be lost to society. Under Rawls's Principle 2a, she would be allowed to have a greater income than others because doing so would improve the condition of the worst off in society. In this example, creating a vaccine might well help many others besides the worst off, but that would be an incidental benefit.

As a second example, consider a talented entrepreneur who has the potential to create a business that would offer benefits to the worst off, perhaps in the form of jobs or in the form of superior cheap products that meet basic human needs. In the Rawlsian framework, the entrepreneur could justly receive superior social and economic enrichment, because his efforts would provide benefits to the worst off. Note that the condition here focuses on the absolute position of the worst off. It is possible to allow economic differences if they both raise the absolute position of the worst off even while making their relative position worse. As a final example, consider a plastic surgeon who performs purely optional cosmetic surgery for the rich. The surgeon's efforts do not affect the position of the worst off—they cannot become his patients. Therefore, in the Rawlsian scheme, such a surgeon could not receive superior social and economic benefits.

Principle 2b is also important because it places further significant restrictions on departures from egalitarianism. The requirement of equal opportunity for Rawls is quite far reaching. First, it considers current differences in social and economic circumstances as violating the condition of equal opportunity. For example, positions of political authority cannot be open to only the wealthy or the well connected. It also seems that children of wealthy parents should not have access to costly educations that are not available to children of less wealthy parents, especially as a superior education is likely to lead to further differential advantages.

But Principle 2b goes quite far beyond an attempt to eradicate the effects of differential social and economic circumstances—it also covers differences in natural talents and abilities, such as intelligence, health, athleticism, and personal appearance. Rawls claims that such individual traits are morally irrelevant in that they are the product of a "natural lottery," just as being wellborn is a function of a "social lottery." Some persons get a great genetic endowment by chance; others do not. In both the natural and social lotteries, the outcome is merely the luck of the draw for an individual and morally irrelevant according to Rawls. As the talents and abilities awarded in the natural lottery do not depend on choice or effort, they cannot be justly rewarded with superior social and economic circumstances.

Rawls believes that the undeserved natural talents and abilities encapsulated in various persons—intelligence, beauty, and so on—properly belong to society as a whole. The natural lottery merely places them in some human vessels and not in others. Within the Rawlsian framework, one of the problems for a theory of justice is how to gain access to those resources for social benefit without violating the basic rights of the persons who are those vessels. For example, the brilliant medical researcher discussed above cannot be enslaved to research for the good of society because such enslavement would violate the first principle of liberty. Therefore, Rawls is prepared to allow the researcher superior social and economic benefits if, and only if, doing so would create advantages for the worst off.

Criticisms of Rawls's theory come from several quarters. Egalitarians object to the permitted departures from equality by arguing that relative inequalities matter as well as absolute inequalities and that permitting any inequality results in a society with objectionably strong class differences and reduces a sense of community among peoples. Utilitarians criticize Rawls as fundamentally abandoning the principle of maximization. By permitting inequalities only if they raise the position of those who are worst off, Rawls makes impossible many welfare enhancing benefits for others. For example, why prevent cosmetic plastic surgery for the wealthy if it benefits the surgeon and patients while leaving the worst off undisturbed? Perhaps more sympathetically, what if the position of the badly off, but not worst off, could be improved by allowing some inequalities? This seems to be ruled out according to Rawls. For example, it seems that Rawls's theory would not permit an inequality that benefits the working poor but that did not benefit the destitute.

Advocates of maximal liberty criticize Rawls for too narrowly defending liberties in the first principle of justice. For example, the first principle does not protect property rights at all, and some see the restrictions on freedom and the redistributive intent of the difference principle as violating fundamental liberties. Resource egalitarians object to Rawls for failing to adequately compensate the losers in the natural lottery because they believe that those who are disadvantaged in the natural lottery should be awarded additional resources to compensate them for their natural disadvantages.

As a final objection, consider the view that Rawls too narrowly construes the nature of personhood. By viewing the intelligence of an individual as a social asset, he or she denies that such a feature of a person is integral to that individual's personhood. By contrast, some would find such an integral feature of a person as largely constitutive of what it is to be a person, or at least to be that person. On such a view, interfering with an individual's free exercise of that intelligence and attempting to capture the benefits of its employment would be an unconscionable violation of an individual's basic human rights.

Libertarianism

Libertarian theories of justice focus on the protection of individual liberties rather than being concerned with the actual distribution of social and economic benefits that happens to occur. In its simplest statement, the libertarian maintains that a just distribution of social and economic goods is whatever actual distribution happens to result from the uncoerced and just actions of individuals. Thus a libertarian theory would find egalitarian theories, for instance, quite irrelevant. Libertarian theories are very much in the spirit of John Locke's *Second Treatise of Civil Government*, and the most prominent recent theory that might be characterized as libertarian was advanced by Robert Nozick in his *Anarchy, State, and Utopia.* Nozick's theory consists of three principles: justice in original acquisition, justice in transfer, and rectificatory justice. While acknowledging that a complete theory of justice would require a treatment of rectification, Nozick focuses almost exclusively on justice in original acquisition and justice in transfer.

According to Nozick, if some social or economic good is originally acquired in a just manner and it is transferred in a just manner to others, then the resulting outcome or distribution is just, and a person holding such a social or economic good is justly entitled to its possession. There is no other way in which one can justly come to hold some social or economic good. Coercively removing such a holding from someone is unjust. This theory of justice focuses only on procedures, not outcomes. If goods were justly acquired originally and were justly transferred subsequently, then whatever distribution of goods that results is just.

Compared to the theories we have considered above, it is important to note that libertarian theories tend to focus on the history of holdings rather than a particular pattern of holdings. On Nozick's view, the history of original acquisition and subsequent transfer determines the justice of a holding. This contrasts markedly with views that Nozick criticizes as patterned theories. For instance, egalitarianism requires that a distribution must meet a pattern of equal holdings to be just.

Regarding the just original acquisition of a holding, Nozick largely follows the spirit of John Locke and begins by contending, with Locke and against Rawls, that one owns oneself, including one's natural talents, abilities, and labor. For goods originally in the commons, one acquires title to them by mixing one's labor with them in a way that increases their value. For Nozick this justifies the original acquisition, subject to the "Lockean Proviso" that this original acquisition must leave "enough and as good" in the commons for others. For goods that are justly acquired originally, the question of just distribution entirely depends on the justness of subsequent transfers. Just transfers are those that occur without coercion, force, fraud, or deceit. Thus if a seller correctly describes a good and willingly sells it to a purchaser who voluntarily pays for it with good funds, then the transfer is just.

Libertarian theories in general, and Nozick's theory in particular, are highly compatible with a strong system of property rights and market economies. The principle of self-ownership, which is central to both Locke and Nozick, argues against redistributive efforts, with Nozick going so far as to compare income taxation to slavery. Full ownership of oneself and one's labor contrast very strongly with Rawls's view of a person's natural talents and abilities as a common societal resource. Nozick further argues that systems of taxation and redistribution violate the Kantian ideal of treating people as ends-in-themselves. If the talents, abilities, and labor of individuals are goods within the control of society and may be coercively deployed for the benefit of others through taxation and redistribution, Nozick argues that such treatment fails to respect the dignity and rights of individuals and treats them merely as means to achieving some putatively social good.

Libertarian theories have been attacked from a wide variety of perspectives. First, many of the theories considered above find libertarian views largely irrelevant. If we view the present arrangement of holdings of social and economic goods as predominately infected by original acquisitions that were largely unjust, followed by a series of various unjust transfers, then the present-day distribution of holdings might be seen as largely irrelevant to identifying a just distribution. This criticism does not even need to oppose the reasoning of libertarian theories but dismisses them as virtually irrelevant to the conditions that obtain in human history and in today's society.

Against the account that libertarians give of just original acquisition, some critics deny that the "mixing of one's labor" with the commons could confer the dominion over property that libertarians claim. For instance, why should mixing my labor with the commons give me property rights over goods formerly in the commons instead of merely dissipating my labor into the commons? Similarly, even if the mixing of my labor increases the value of some item formerly in the commons, why should that act give me exclusive control and dominion over that good? Notably, someone else might have been able to mix their labor with the item in the commons and create greater social value by doing so. Critics argue that libertarians have not given, and are unable to give, an adequate account of just original acquisition.

Some critics attack the libertarian view of freedom and liberty as too narrow. Libertarian ideals of individual freedom and liberty focus on the conception of self-ownership and the property rights that are supposed to flow from that self-ownership. Thus, libertarians emphasize "negative freedom," essentially maintaining that one is free if one is not coerced. Other views of freedom focus on "positive freedom," emphasizing abilities, resources, and capacities to realize one's goals and aspirations. According to these critics, the narrow view of freedom adopted by the libertarians is incorrect and therefore cannot support libertarian positions regarding property rights. This same attack on the libertarian conception of freedom is also used to counter the libertarian argument regarding respect for persons and the requirement that persons be treated as ends-in-themselves. On this criticism, another way of treating persons as ends-in-themselves is not only to respect their negative freedoms but also to adopt a social organization that empowers people with positive freedoms, and such a requirement might require redistributive principles that run counter to a libertarian conception.

The Capabilities Approach

In the debate over distributive justice, "capabilities" refers to the abilities of individuals to have the resources to create meaningful and fulfilling lives. In this sense, capabilities would embrace the material wealth necessary to sustain human life at a level of functioning well beyond subsistence. One cannot achieve a full life on a starvation wage. Similarly, education and health are required too. This approach to distributive justice is most closely associated with Martha Nussbaum and Amartya Sen and most fully developed and encapsulated in Sen's *Development as Freedom.* This approach to justice is highly consonant with a positive conception of human freedom. Its focus is on what people can do with their lives and the resources necessary to achieve.

In a rich society with relatively few poor people, the capabilities approach might require a redistribution that stopped well short of egalitarianism. The distribution recommended by the capabilities approach might well set a resource minimum below that of resource egalitarianism as well. A society might be sufficiently wealthy to provide basic capabilities for a rich life to everyone without reducing the wealth to a position of equality. By contrast, in a poor society, even an egalitarian distribution might not give everyone the capabilities for a full life. For the rich society just described, the demands of the capabilities approach are fairly clear, but this is not the case for a poor society. For example, in a poor society an egalitarian distribution might dramatically reduce the capabilities of all beyond the level sufficient for a full and rich life. In such a situation, does the capability approach require that the rich give up not only the excess resources beyond that necessary for a full and rich life but that they also give up their own capabilities for a full rich life too?

Distribution by Desert

According to desert-based theories of distributive justice, people come to deserve social and economic benefits through the actions they perform or the virtues they possess. In accordance with this view, a just distribution is simply one that gives people what they deserve. The question then becomes, On what basis do people come to deserve something? With respect to contemporary discussions of distributive justice, people are generally said to become deserving through one or more of several factors related to increasing social welfare. First, one might become deserving simply by contributing to social welfare. For example, a worker might deserve compensation for the work he or she does because that work creates products that benefit others. Second, the effort that someone makes might make him or her deserving of compensation. A student might be said to deserve a good grade due in part to the effort he or she made in a class. Third, one might deserve reward due to the costs incurred in an effort to provide an increment to social welfare. Someone who sacrifices personal wealth to increase social welfare might be thought to deserve a reward in compensation for that sacrifice.

All of these desert bases are similar in that they are backward looking—one deserves something now in virtue of actions performed in the past. So, desert-based theories of distributive justice do not really address incentives. This contrasts with the Rawlsian view that justice might allow someone extra resources if doing so would create incentives for that person to perform future actions that improve the position of the worst off. Egalitarianism is not generally regarded as a desert-based theory, but we might say that egalitarianism is a desert-based theory with a very narrow conception of the basis for desert. Under egalitarianism, one deserves material goods simply in virtue of being a person rather than through performing any action or increasing social welfare.

The concept of desert is similar to that of entitlement, the difference being that entitlement generally refers to desert within the context of a particular institutional framework. For example, within the institutional framework of a market economy, one might become entitled to riches if he creates products or services that others value and are willing to purchase. If we approve of market economies, we might also say that one deserves the profits that arise from legitimate market-based transactions. This distinction allows the possibility that you can be entitled to what you do not deserve, and you can deserve that to which you are not entitled. For example, if egalitarianism is the correct theory of distributive justice one would deserve an equal share of material resources, but if the economy is organized according to free market principles, one might not be entitled to any such resources. Similarly, if one follows the rules of a game, one could be entitled to be the winner of the game. However, if the rules are defective, it is possible that a person who is entitled to be the winner might not deserve to be the winner.

Desert-based theories generally face the problem of specifying which contributions to social welfare might be deserving. If I work, does that mean I deserve compensation, and if so, how much do I deserve? Merely saying that contributing to the economy creates a basis for desert does not really say how the goods of the economy are to be distributed with sufficient specificity. While some other theories share this problem, others do not. Egalitarianism, for example, specifies quite exactly the principles for how much each person is to receive, even if implementation is difficult. Desert-based theories need to connect the desert basis with further principles to specify the actual distribution more clearly. As we have seen, one way of making this specification is to endorse market-based transactions as correctly specifying how reward is to be allocated. Furthermore, if the only basis for desert is taken to be a contribution to social welfare, then it might seem that desert-based theories are incomplete. A newborn infant makes no contribution to social welfare, but would we want to say that the infant does not deserve any care or sustenance?

Feminist Approaches

Feminist approaches to ethical theory are actually quite diverse and continue under rapid development. Thus, this entry attempts mainly to focus upon just two common themes: justice in the public versus private sphere and the relative importance of justice versus caring.

In contrast with the history of ethical thinking in the West and its focus on the public sphere, many writers in the emerging feminist tradition focus on the private sphere of home, family, and interpersonal relationships. In general, they attack what they see as the male-dominated focus on distributive justice operating only in the public sphere and a disregard for injustices that may be perpetrated against women in the private sphere. For example, paid work in the United States is typically documented and leads to social security payments in later life. By contrast, unpaid work in the home receives no public recording and generally does not receive any subsequent public benefits or acknowledgment.

A number of feminist writers argue against the traditional nuclear family as a system that creates distributive injustices for women. The fact that women bear a disproportionate obligation in child-rearing and that women's work in this context is generally unpaid lead to injustice, they maintain. These theorists often maintain that there exists a rigid distinction between the public sphere in liberal Western societies, in which the political system distributes society's goods, and the private sphere, which has been free from governmental intrusion. This makes the private sphere a zone in which injustice persists and one in which redress is necessary. These writers generally attack liberalism and want to make the distinction between the public and private sphere less distinct. For example, some advocate that homemakers and child rearers have the value of their work recognized by inclusion in the social security system. Against this view, critics point out that the demand is unclear and perhaps quite counter to women's real interest. Just how much intrusion by government in the previously private sphere of the home do feminists truly wish? Further, some see that women have done much better in liberal societies with a strong public/private distinction than they have in more traditional societies.

Some feminist writers also attack what they see as the long-standing focus of the Western ethical tradition on rules and moral judgments. They believe that caring and nurturing relationships, traditionally the province of women, deserve greater moral weight. Instead of being so concerned with what justice demands, these authors argue that perhaps we should be much more involved with the giving of care. Some of these authors see caring relationships, notably the relationship between mother and child, as forming the basic relationship for understanding morality. In a sense, then, this is an attack on the importance of the traditional principles of distributive justice.

Global Distributive Justice

Perhaps due to globalization, the entire topic of global distributive justice has gained increased attention. Demands of egalitarianism have traditionally been applied to single societies or nation-states. John Rawls, in his later work for example, makes this restriction explicit. However, why should the demands of justice stop at the confines of a particular society, geographical area, or political unit?

This line of reasoning has vast implications for actual social policy. Egalitarianism might be controversial as a policy within the United States, but if justice were to demand egalitarianism across all humans, the income and distributional effects would be even more radical. A similar issue obtains for the capabilities approach. Does the world contain enough resources to provide the capabilities for a rich human life to all?

Extending the province of justice from one society to all humanity causes fewer issues for other theories, such as libertarianism and desert-based theories. Libertarianism focuses on the procedures for acquiring and transferring assets, and the needs of others do not come into play. Similarly, if desert-based theories are applied globally instead of being applied to just one society, the desert bases might not be changed at all. The exploration of the question of global justice is in its infancy, but it seems clear that the extension of the sphere of justice to all humanity can have enormous policy implications.

Justice, Retributive

Retributive justice concerns fairly blaming or punishing people for their wrongdoing. Descriptions of retributive justice are found throughout recorded history. Often the notion of retributive justice is described as "an eye for an eye," a concept that provides the basis for Western theories of punishment.

Those who favor punishment based on concepts of retributive justice believe that treating people as responsible adults is core to recognizing the essential humanity of each person. To not deny someone the privilege of being held responsible for his or her choice is treating them as less than a full human being or as a child. Thus, those who align themselves in the deontological tradition—duty and rationality governing our search for the ideal—are often vocal proponents of retribution for wrongdoing.

In recent years, the principle of retributive justice has been moderated by the idea of rehabilitation, providing people the skills and resources necessary to avoid a life of crime. The belief behind the theory of rehabilitation is that people basically are good and violate the laws only because they believe they have no other choice. Theorists in this camp believe that illiteracy and poverty are two of the greatest drivers causing people to choose a life of crime. Thus, those who align themselves in the teleological tradition—seeking happiness while living a virtuous life—are often vocal proponents of rehabilitation.

The tension between the two approaches was seen in the sentencing of ex-Adelphia CEO John Regas. The court sentenced the ailing 80-year-old to 15 years in prison, which seemed a moderate punishment compared to the 215-year sentence sought by the prosecution. However, rehabilitation is clearly not an objective as the 15-year sentence seemed designed to send a message to all other executives who might be considering bending—or breaking—the rules.

Social Purpose of Retributive Justice

While in a community and even in individuals the pendulum swings between the desire to punish and the desire to rehabilitate, the idea of retributive justice is important in establishing and maintaining social norms. Neil Vidmar suggests that before the desire to retaliate occurs, the perpetrator must have intentionally violated a norm or rule of the community. When the violation threatens the personal self, status, or internalized group values, those who are aggrieved become angry. That anger often becomes focused on the perpetrator and is released or dissipated during the punishment.

Thus, desire for retributive justice is often emotion laden and can lead to mob action, as seen during mob lynchings or "self-help" responses to injustice, which inflame an entire community. The 1992 Los Angeles riots, named the "Rodney King uprising," erupted after the acquittal of white officers who were charged with assault in the televised beating of Rodney King. In that situation, the community believed that the judicial system failed to punish appropriately and so took the law into their own hands. Because of situations such as those particular riots, many who argue against severe punishment believe that retribution is in fact nothing more than vengeance or revenge, thus punishment should be severely curtailed.

Retribution Distinguished From Vengeance

Robert Nozick asserts that retribution differs from revenge in that a social norm—a wrong to the community—has been committed. This wrong is of greater significance than a slight or injury that is unintended but can result in a desire for revenge. Further, retribution is constrained by the legal community. Every effort is made to ensure that the punishment is proportional to the wrong. The constraints of the legal system strive to strike a balance between a healthy sense of anger at the violation of a personal or community norm and unbridled anger that may result in the desire for revenge not being satiated.

Because seeking revenge in a rational and measured way is difficult, retribution demands impartiality. The judge who is meting out the punishment is not to have any personal interest in the offense. An example of the testing of the limits of impartiality came when a Colorado judge was overseeing the trial and sentencing of an arsonist who set a national forest on fire. The fire came within yards of the judge's home. The determination was made that even though the judge's home was threatened, he was able to be impartial and fairly apply the law in the sentencing of the convicted arsonist.

Retribution is also to be emotion free. To ensure an appropriate punishment, one is not to get satisfaction from the specific incident of retribution. One meting out punishment may have a hatred of wrongdoing but should hold no particular bad feelings against the person being punished. Finally, retribution is principled and rejects collective guilt. In this way, those who commit similar crimes are given similar sentences. Also, the individual who committed the crime is punished, not every person who is part of the same racial or ethnic class.

Conditions Required for Retribution

Three conditions are traditionally required to find that a retribution for a wrong is permissible.

1. *People are capable of knowing what they did.* If a person is incapable of knowing what they did because of mental incapacity or insanity, then retribution may not be appropriate. Determining what punishment is appropriate if the person voluntarily became mentally incapacitated due to use of alcohol or drugs is always perplexing. The general rule is that self-imposed incapacitation does not relieve a person of responsibility for the act. A second problem arises if the person became incapacitated after the event. One solution is to place the person in a mental hospital until he or she regains "sanity." This solution sometimes results in the anomaly of people serving more time in the hospital than they would if they were jailed for the offense.

2. *The person being punished must be the person who actually committed the wrong.* Correctly identifying the perpetrator is important to meet this requirement.

Furthermore, scapegoating or punishing someone who is not responsible for the action but who is a representative for the offending group or person is not permitted.

3. *The punishment must be consistent and proportional to the wrong.* Retributive justice depends on meting out everything proportionately to what the action deserves, either positively or negatively. In terms of punishment, retributive justice results in the deprivation of goods or in actual punishment. Fines that are imposed should bear some relationship to the damage caused by the wrong that was committed.

Punishment as a Deterrent

One of the functions of punishment is to act as a deterrent to members of the community from taking actions that are against the community norms. Many long-term studies show mixed results. Some studies indicate, for example, that the death penalty does not deter murders. Other studies indicate that longer sentences neither deter crime nor reduce recidivism. Other research shows that in times of greater punishment, the crime rate appears to go down.

One intriguing approach to deterrence focuses on both the frequency of enforcement and the severity of the punishment. To effectively deter crime, the legal system must either have infrequent enforcement with very steep penalties or frequent enforcement with more modest penalties. Infrequent enforcement with low penalties tends to have no deterrent effect; frequent enforcement with very high penalties leads to overcrowding of prisons and overwhelming the system.

Punishment as Method of Balancing Power Between the Injured and the Perpetrator

Another purpose of retributive justice is to counteract the perpetrator's dominance over the victim. The community is able to stand in solidarity with the victim and demonstrates that the action of the criminal is not acceptable to the community. During the past 20 years, the practice of having a victim advocate center in the judicial system of the United States has gained in popularity. These advocates are able to present evidence to the court to ensure that the interest of the victims is articulated. From time to time the desire for revenge will result in dissatisfaction with the resolution of the criminal case. In those cases, care must be taken to remember that the primary function of retribution is to restore the honor of the state, the community as a whole, not to make the victim happy with the result.

Conclusion

Perhaps the most famous attempt of a community to use the tools of restorative justice to stop the cycle of revenge fueling retributive justice was the Truth and Reconciliation Commission in South Africa. Designed to mitigate the ongoing anger and violence resulting from years of apartheid, the Commission brought together victim and perpetrator to meet, dialogue, and hopefully forgive.

Key to the success of this effort was the genuine remorse on the part of the perpetrators. Indeed, all of the research on retributive justice indicates that the remorse of the perpetrator is a significant factor in determining the severity of punishment deemed appropriate by a jury and judge. The more genuinely remorseful the perpetrator, the more likely the jury is to show mercy and the victim is to extend forgiveness.

Retributive justice thus becomes a critical tool for assuring that the norms of the community are upheld, cycles of violence and vengeance are stopped, and ethical balance is restored to the community. To have maximum effectiveness, judges and juries charged with the administration of justice must carefully weigh the claims of both the victim and the perpetrator to find the proper balance between justice and mercy.

Justice, Theories of

The question "What is justice?" is the first problem addressed by Plato's *Republic.* It has remained a central question in all moral, legal, and political thought. There are narrow and broad uses of the terms *just* and *justice.* In its narrowest sense, justice is close to lawfulness, and a just act is a legal one, meaning primarily that it is not illegal. Another narrow use is procedural, with the sense that certain decision-making procedures deliver a product that a state calls justice.

In its broader senses, which are of the greatest interest to philosophers and other theorists, justice is thought of as an attribute either of acts, including transactions and decisions; of conditions, including rules and laws; or of entities, including persons, gods, societies, and states.

Aristotle held that the creation and maintenance of justice was the most important task of the state. A just state was ruled in the interests of the whole population, while an unjust state was ruled in the interests of its ruling class. Aristotle distinguished between distributive and commutative justice. The first deals with the distribution of rights, benefits, costs, and responsibilities within a class, for example, among citizens of a state, among family members, or among stakeholders in a corporation. The second, now widely known as retributive justice, deals with the treatment of individual persons or interests—for example, in a transaction or in meting out punishment. This second way of thinking about justice involves consideration of what people deserve according to some standard, such as law or precedence. Poetic justice, in which one unexpectedly gets what he or she deserves, is a notion of retributive justice. The distributive notion of justice involves, as Aristotle has it, treating equals equally and unequals according to their relevant inequality—so that, for example, juveniles and adults are accorded differing rights and responsibilities with regard to alcohol, marriage, driving, and voting. Injustice would clearly arise from treating a member of one class according to the rules laid down for the other class.

Today, theorists are unlikely to assert that there are two distinct conceptions involved in our thinking about justice, though most will agree that we have notions about justice that can be at odds with one another. Each of several employees might deserve all of the bonus dollars available in a given year, but it might still seem more just to divide the money among them. In that case, the desire for a kind of distribution is apparently at odds with the desire to give what is deserved. Some contemporary theorists emphasize the notion of distributive justice while others emphasize individual rights and thus the retributive notion of justice.

The concept of social justice takes justice as the attribute of a society in which a certain pattern of distribution is roughly realized throughout the most important institutions of society. To discover the right distributions, John Rawls attempts to produce a hypothetical social contract. His basic idea is that a contract made under certain constraints will guarantee justice. These constraints involve assuming a "veil of ignorance"—we choose social arrangements from behind this veil by supposing that we must enter the world our policy choices create, though we are ignorant about how we will enter it, meaning that we might enter it in any condition of wealth or poverty, health or ability, race or gender. The veil of ignorance ensures choices for political and social arrangements that will be acceptable to all because it prevents choices based on discrimination among types or classes. By ensuring impartiality in decision making, it guarantees fairness in the distribution of benefits and costs in a society, and hence a just society. Many have argued that Rawls's method of achieving impartiality refers all decisions to rationality alone, apart from habit, passion, or prejudice. However, that claim has often been rebuffed with the suggestion that Rawls merely rationalizes moral intuitions that may themselves be rationally unfounded or unappealing.

For Robert Nozick, Rawls's thinking concentrates too heavily on the outcome of transactions and thus violates our sense for the just transaction. Nozick defends unequal accumulations of private property as results that, rather than being good in themselves, can be reduced only at the cost of denying significant rights. Starting from John Locke's assumption that individuals have rights, and that their rights include the right to engage in activities that do not harm the rights of others, Nozick develops rules for just transactions. So long as transactions are just, their outcomes must be just. On that basis Nozick is able to defend social stratification and huge differences in accumulated private property, while also arguing against socialist schemes for redistribution as covert justifications for injustice. Nozick's thinking has often been challenged on the ground that it does not deal with the notion of a just original acquisition, nor with the justice or injustice of the historical conditions into which individuals are born. Rawls's theory of justice as fairness is frequently held up against Nozick because it addresses those areas.

When justice is taken as an attribute of acts, the retributive notion of justice is highlighted, as demonstrated by Nozick. When it is taken as an attribute of social conditions, the distributive notion is paramount, as in the case of Rawls. When justice is taken to be an attribute of persons, or parts of persons, such as intentions or other states of mind, theorists tend to find acts and conditions just or unjust according to whether the just individual would recommend them. These views subordinate justice to a theory of virtue and turn legal and political theory into adjuncts either of the theory of the just individual or the theory of the impartial judge. Aristotle famously took this course. Plato took the same course, defining justice as "performance of one's proper function"—which is usually taken to mean something close to minding one's own affairs. For Plato, each of the three parts of the soul needs its own virtue to rule it. The appetites require temperance. The emotions require fortitude. The intellect requires prudence. But the entire soul, taken as a unity, requires justice—assuring that the virtuous soul does not squander itself on minor affairs. Plato's view entered into Christian doctrine under the rubric of the four cardinal virtues. The apotheosis of justice as an attribute of beings is reached in the monotheistic view of a deity who, as the ultimately just being, is the only proper adjudicator of the universe.

The question of whether positive law, meaning law as "posited" or laid down by lawmakers, can be judged as just or unjust by appeal to a higher law, usually called natural law, is a perennial concern of political theory. Natural law, if there is such a thing, would be a body of law binding on people because they are human, rather than because of local customs or powers. It would also be the basis for natural justice, meaning justice to which people are led by their natures alone, rather than by rules or rulers. Many medieval philosophers, including Thomas Aquinas, attempted to derive natural law from an even higher, divine law. Immanuel Kant and others objected to this approach by claiming that it makes natural law into a species of positive law—namely, law as posited by God—while also eliminating the possibility of an objective natural justice to which God must conform because he knows what is just. Thomas Hobbes, Locke, and Kant offered theories of natural rights on the basis of their understanding of natural law. These are supposed to be rights people have because of their natures, not because of political structures, and are often said to be inalienable due to the fact that human nature is inalienable. The theory of natural rights survives in the contemporary theory of human rights. Procedural conceptions of justice tend to reduce the list of human rights to procedural concerns, so that instead of rights to life and liberty, for example, one has rights pertaining only to adjudication before an impartial judge and perhaps to an appeal of that decision to another impartial judge.

Natural law is often appealed to as a standard for criticizing positive law. However, objections to positive law need not be understood as deriving from insight into a law behind the law. Skeptics about natural justice include the positivist school of legal scholars, who recognize no basis for justice outside of positive law. Others, such as Karl Marx, deny natural justice but nevertheless admit that people are prone to the illusion that there is such a thing as natural law, and aim to accommodate that illusion by setting up states and creating conditions purportedly in accord with it.

The most time-honored way of rejecting the notion of a standard to which all positive law must conform arises from viewing positive law as convention. A convention is a human contrivance that solves a problem, as exemplified by laws requiring either that one drive only on the right or only on the left side of the road. It seems unlikely that there is a higher standard that could decide which of these contrivances is more just. The theory that law is conventional was held by Marx, who thought of justice as the set of legal decisions made by and in the interests of a ruling group. Rawls also holds that laws are conventions. Unlike Marx, however, he also holds that just laws are conventions that anyone will see the advantage of maintaining. Wherever conflicting interests and claims require means of resolution, few will deny that the fairest means of deciding between those claims ought to prevail, and Rawls thinks he can ensure the fairest means. Marx can offer as a means only the decisions of a preferred ruling group, such as the proletariat rather than the bourgeoisie.

Meanwhile, Nozick appears to hold that law is not merely conventional and that it cannot be contained strictly within positive law. His libertarianism rests on something outside the realm of conventions, such as inviolable natural or human rights, because he holds that it is always or almost always unjust to have a convention that allows rights pertaining to the outcomes of transactions to supersede the rights realized within transactions, so that, for example, a restriction on the amount of a region's media that a single interest can own must always or almost always be unjust. Conventionalist and positivist approaches sense something too restrictive in Nozick's thinking about the writing and proper use of public conventions such as law. Justice, these theorists like to point out, presupposes conflicting claims and interests. Impartially adjudicating claims has the statistically predictable result that at least occasionally one's claims will be treated more harshly than those brought by others. Thus it looks unrealistic to hold that the rights realized within transactions must always be of greater merit than those pertaining to the outcomes of transactions. At least occasionally, they assume, claims supporting otherwise just transactions will have less merit than those concerned with preventing the outcome of those transactions.

Just Price

The classic idea of the just price is that it is a sum of money roughly equal to the real value of an object in an exchange. Modern economic theory gives considerable attention to the mechanisms of price-setting but tends to be agnostic with regard to the question of whether prices are or can be known to be fair or just. The question itself is often regarded by economists as a relic of a primitive precapitalist society. On a more practical level, though, the justice of prices is a very real concern for business, law, politics, and even religion, to say nothing about anyone who must attend to the affairs of daily life. While acknowledging the limitations of premodern economic theories, it is still the case that the concept of just price is meaningful and in some contexts genuinely useful.

History of the Concept

The starting point for most traditional discussions is the *Nicomachean Ethics* of Aristotle. In his treatment of the larger topic of justice in Book V, he indirectly offers some principles for treating the issue of fair price. The context is a discussion of what he calls "rectificatory" justice, which is that part of justice that concerns transactions between persons and that rectifies or makes equal the situation of the parties to a transaction.

To illustrate the essence of a voluntary transaction, Aristotle chooses the sale of goods. The sale is just when the objects exchanged are comparable in value and unjust when one party receives less than he gives.

Aristotle says little about how the value of objects ought to be determined, but he does recognize that value is not intrinsic to the objects exchanged. Indeed, he insists that the real root of value is human need (*chreia*) and that money becomes a measure of this. On his account, the fact that a voluntary transaction proceeds is a sign that the parties have satisfied themselves that they are exchanging objects (or money for objects) of equal value.

Therefore, a price, which is the value of an object in an exchange measured in money, is known to be just when persons who need or desire that object willingly pay the price to receive it. To put it another way, the price is just when it is an accurate measure of the value of the object in that place and time. No one, in Aristotle's view, would voluntarily sell something for less than its value nor buy it for more than its value, in the context of the exchange.

In adopting this view, Aristotle and the just price theorists who followed him, implicitly reject a subjective theory of value as a meaningful concept for analyzing exchanges. What matters is not the value that a particular individual might place on an object in an exchange but the value that would be assigned to it by a market, that is, by the common estimation of knowledgeable persons who have no special interests in the matter. One person may attach a very high value to my house because he or she has pleasant memories of children growing up there—and that person may be unwilling to sell it for that very reason—but the subjective value that person grants to the property has nothing to do with its value in exchange (at least, not for a classic just price theorist).

Roman law offers two other helpful contributions to the practical resolution of questions of justice in pricing. The foundation of Roman law concerning sales is the principle of freedom to bargain. According to this principle, buyers and sellers, acting in good faith, are free to agree to whatever terms they wish in a transaction. Unless fraud is involved, willing parties to a transaction have no grounds to sue for a remedy if they later decide that the transaction was unfair in its terms. The assumption is made, as in Aristotle, that the terms are fair if all parties have willingly agreed.

The second Roman legal contribution is the doctrine of *laesio enormis* or "great injury." This was an innovative principle that provided grounds for a lawsuit if, under certain circumstances, the price paid for a parcel of land was unfair. Specifically, if, subsequent to the sale of a tract of land, the seller, or his heir, came to believe that he had received an unfairly low price for the land, he could sue the buyer. If the suit was successful, the buyer was required to restore the land to the seller or to pay the difference between the actual purchase price and the "fair" price.

In commenting on the passage from Aristotle discussed above, Thomas Aquinas, an important representative of medieval thinking about price, agreed that the value of an object does not derive from the "dignity of its nature" (*secundum dignitatem naturae ipsorum*) but rather from human "need" (*indigentia*). He acknowledged that one way of determining value might be to assess the costs involved in making the object available for a transaction, but in his later work he seemed to prefer to base a judgment of monetary value upon the common estimation of the community. Of necessity this estimation is highly dependent on time and circumstances. Nevertheless, a seller (or a buyer, for that matter) cannot legitimately take advantage of the distress of another and enrich himself o herself. To be fair a price must be available to all, regardless of the circumstances of the buyer or seller.

For Thomas, then, the price that an object would fetch in the marketplace is presumed to be the fair price. In general, sellers and buyers are guilty of a sin of injustice if they knowingly conclude an exchange at a price which differs from what one of them believes the fair market price to be. Circumstances of scarcity or special demand may justly raise the market price to some degree, but perhaps only modestly. In practice, the human need for the necessities of life imposes limits of profitability upon the sellers of necessities, whose ownership of them is contingent.

In its principles, medieval thinking about just price is congenial to modern pricing theory, but another dimension of the medieval doctrine provoked later misunderstandings. Medieval lawyers and theologians (who provided spiritual counsel to merchants) were skeptical about the fairness of markets and not without reason. Markets were often imperfect, and this permitted merchants to exploit individuals and communities. As a consequence, these thinkers defended the common practice whereby authorities in the community set prices and wages arbitrarily. Most prices set in this way were understood to be just by definition since they resulted from a legitimate exercise of civil or religious authority.

It may be the defense of this practice that provoked modern economists to assume mistakenly that ancient and medieval thinkers grounded the concept of just price in a notion of objective or natural value, or perhaps even a labor theory of value, rather than the common estimation of a market. In truth, however, every influential ancient or medieval thinker defended the notion of just price as that price determined by common estimation or the market.

Just Price in a Modern Economy

Drawing on the traditional analysis of just price, three conditions can be identified that must be satisfied if a price is to be considered just. (The price in a transaction in which these conditions are not satisfied may still be just but only incidentally so.) These conditions can be accommodated to a modern economy.

The first condition is that the buyer and seller must both be adequately informed about the relevant characteristics of the thing sold. Neither a buyer who is unaware of a hidden defect nor a seller who is ignorant of special characteristics can be said to have truly estimated the value of a thing. Buyers or sellers who are ignorant in one of these respects, therefore, cannot be said to have acted voluntarily.

Second, both buyer and seller must be free not to conclude the transaction if either is dissatisfied with the price. A more contemporary way of putting this is to say that buyer and seller must both be free to negotiate the price. This condition may be satisfied when there are multiple buyers and sellers in a marketplace—such that a buyer is free to seek another seller and a seller free to seek another buyer.

Third, both buyer and seller must be free from extraordinary pressures or constraints with respect to the transaction. A transaction in which one of the participants acts under duress, out of fear, or because of extraordinary need fails to satisfy this condition.

In a developed economy these conditions are ordinarily satisfied for most consumer purchases, though in some important instances this is very clearly not so. Relevant information is generally available, though packaging or advertising can sometimes conceal or mislead. Buyers can seek another merchant or a substitute product, while sellers can wait for another buyer. And neither party is normally under extraordinary pressure. There are, however, some common transactions where the conditions for just price cannot, in principle, be satisfied. These include sales under monopoly (single seller) or monopsony (single buyer) conditions or the sale of some items (some pharmaceuticals, for example) where the purchasers are almost always under some unusual pressure.

Note, however, that sales of singular items (a parcel of land, a unique work of art, a historical artifact) can usually meet the ordinary conditions for just price.

In these other circumstances a judgment about the justice of a price can still be made by considering upper and lower limits to prices or estimating what price would result if there were a functioning market for the item in question. Just prices are normally to be found within the boundaries described by the cost of bringing an item to the sale (the lower limit) and the value of the benefit derived by the purchaser (the upper limit). Under normal circumstances, no one would sell an item for less than he paid to acquire it. Similarly, no one would buy an item for more than the cost of an acceptable substitute or for more than the cost of the harm he hoped to avoid by purchasing the item.

The case of pharmaceuticals is more subtle. Some medications are very costly to develop and bring to market. Companies would not reasonably invest in developing a new medication if they thought that sales of the product over a period of time would not compensate for the investment and provide a profit. On the other hand, many individual patients may not be able to afford the sophisticated medications they require and their need may be desperate.

Nevertheless, the high price for these medications may well be just, even though individual patients find it unaffordable. The special circumstances or limitations of a buyer do not make a price unjust but they may call into play other resources from the larger community to insure that both seller and buyer are able to obtain what they need.

In sum, a just price is always an estimation, even in unusual situations, of the value that would attach to the object of a transaction in a properly functioning market.

JUST WAGE

Alasdair MacIntyre has explained that when speaking of justice, we are always faced with the question of "whose justice" and which tradition. In facing the definition of a just wage, we encounter a similar problem as well as a further complication of application: Whose justice and whose application of justice to wages? This entry will explore two visions of justice and their applications to wages, which can be generally divided into a "market" or "neoclassical," or "strategic" notion of a just wage *and* a communitarian, social, or Aristotelian/Thomistic notion. Both sides agree that a just wage is fair and equitable compensation for work; however, what constitutes fairness in the determination of a just wage is the basis of significant controversy. At the heart of this controversy is an understanding of what good is exchanged in the wage between employer and employee as well as two different notions of a corporation. This entry lays out the underlying values and principles of each perspective and then applies these different principles and values to a particular case.

A Market View of Just Wages

For those who advocate a market understanding of wages, the buying and selling of labor is much the same as buying and selling any other good or service, with its price being determined by the interaction of supply and demand. In the event that quantity supply and quantity demand are not in equilibrium, then the price of labor (the real wage) will adjust upward (to alleviate a shortage of labor) or downward (to alleviate a surplus) to reestablish the equilibrium market clearing price. This understanding of wages has two principal values that inform its notion of whether a wage is just or not: freedom—the ability to freely exchange so as to protect one's autonomy and efficiency—the ability of the market to reward those who contribute to production.

In terms of freedom, this market function provides the ability of individuals to freely contract with others in pursuit of their own self-interests and utility preferences. Freedom of exchange through the price mechanism will allow a wage to adjust according to both parties' perception that what they receive in value is at least as much as what they surrender. In terms of efficiency, the market allocates the amount of a wage predicated upon talent, effort, and contribution of what it produced. Those with more education, greater productive skills, more ingenuity, harder work ethic, etc., directed toward providing goods and services that people want, will be rewarded according to their contribution. John Bates Clark, the originator of the marginal productivity theory of income distribution, argued that the distribution of income is regulated by a natural law, and when this law operates without friction, people are provided the amount of wealth they have created. While this process may create initial inequality, in the long run its efficiencies will eventually raise all boats, since it creates proper incentives for people to acquire education and skills as well as to work harder and smarter.

Interruptions or "friction" in this market process, through the state, unions, or other nonmarket entities, will weaken the role of price signals and disincentivize people from higher education, skill development, and risk taking, which will lower the efficiency of the market, producing less wealth and consequently resulting in greater injustice. It will also lessen the freedom of employers and employees by preventing them from acting according to their own preferences, unnecessarily limiting their freedom and consequently curtailing their autonomy, all of which reduces the possibility of justice.

Corporate human resource policies, influenced by the market view of wages, define compensation in "strategic" terms: the purpose of pay is to attract, reward, retain, and motivate employees who best achieve the strategic goals of the organization. These strategic goals tend to be economic in nature: beating the competition, growing market share, enhancing quality, raising customer satisfaction and retention, increasing efficiency, motivating performance and maximizing shareholder wealth—goals that create the proper incentives to generate greater efficiencies in the organization. Key here is the proper alignment of pay to performance that strengthens the strategic direction of the company.

According to the market view of wages, paying employees according to their skill or contribution will increase efficiency whereas failing to pay according to their talent and skill will decrease efficiency. To reduce pay of talented employees in order to reduce labor rates will often foster turnover, resulting in poor morale and lower reputation of the firm. It will also increase opportunity costs by missing out on future business opportunities, all of which increases labor costs and lowers efficiency, which results in a less stable organization.

The obvious question for this market/strategic view of wages is what happens when human performance is not a major determinant of organizational performance? What happens when jobs require little skill, a large labor supply, and weak protection for workers? From a strategic perspective higher pay and benefits have no apparent pay back in terms of producing benefits for the strategic goals of the corporation. In this situation, it is unnecessary to raise pay, largely because employees have no other company to work at, limiting the inefficiency of turnover within the firm. Such low pay will also provide proper incentives for employees to seek more education and skill development, which will increase their value to organizations.

The bottom line for this market/strategic view of wages is that people and organizations must be free to negotiate and contract the wage price. This freedom will produce justice by allowing markets to determine wages based on the contribution of production. This in turn will produce the greatest efficiencies precisely because one is neither overpaying nor underpaying for individual contributions. Here justice and injustice derive not from equality or inequality but from the consequences of efficiency and inefficiency that create the conditions for more or less wealth. A just wage is what produces the greatest amount of wealth to be distributed according to contribution, effort, and skill.

A Communitarian View of Just Wages

A market understanding of justice is very different from the communitarian view of an Aristotelian/Thomistic view of justice. Justice within this perspective is a habit that directs the person's actions to the good of the other so as to contribute to stronger bonds of community. A just wage here refers to employers' and employees' habit of heart and mind to pay and receive wages that helps to build authentic relationships between the two. A just wage is not simply only about the amount given or the efficiencies produced but also about the intentions of the parties involved and ultimately about the relationships that are necessary to establish a community of work.

The key to understanding a just wage within this view of justice, then, is whether the wage fosters "right relationships" between employer and employee. Justice comes from the Latin *ius*, which means "right"; that is, the just person is in *right relation* to others, or well disposed toward another. Within this communitarian virtue tradition, "right" is not understood individualistically in terms of "my rights," especially in terms of private rights to have autonomy over body, property, or company; but rather predicating itself on the social nature of the person, it sees that one is right when one is in right relationship with another.

When the word *justice* is used in reference to wages, the question is what the characteristics of "right relationships" between employee and employer are. According to Josef Pieper, key to this relationship is that both parties recognize that the wage given can never fully account for the work done, precisely because work is always "more" than its economic output or instrumental value. If this insight of incommensurability of the wage is not recognized and that the wage is reduced to the market value of the work, then the wage becomes a mere exchange and, depending on the power relationship, one party will instrumentalize and manipulate the other to his or her interests. Therefore, it is better to avoid speaking of wage as primarily an *exchange*, and to speak of pay instead as part of a work *relationship* between employer and employee, a relationship that when it is in right order can serve to strengthen a community of work.

The principles of need, contribution, and order begin to describe what a right relationship looks like in determining a just wage. These three principles define a just wage as being simultaneously a living, equitable, and sustainable wage.

Need and a Living Wage

When an employer receives work from an employee, they participate not only in an economic exchange but also in a personal relationship. In order for this relationship to flourish, an employer must recognize that employees (in particular full-time adults) "surrender" their time and energy and so cannot use it for another purpose. A living wage, then, is the minimum amount due to every independent wage earner by the mere fact that he or she is a human being with a life to maintain and a personality to develop.

Contribution and an Equitable Wage

Yet a just compensation is a complex system within a complex organization. It cannot be determined by only one principle such as need. The principle of need is *necessary* for determining a just wage, but alone it is *insufficient*, since it only accounts for the consumptive needs of employees and does not factor in their productive contributions to the enterprise. Because of effort and sacrifice as well as skill, education, experience, scarcity of talent, and decision-making ability, some employees contribute more to the organization than others, and are "due" more pay. In other words, a living wage, while a minimum floor, is not necessarily an equitable wage. To honor someone in the wage relationship is to recognize his or her talents and efforts. An equitable wage, then, is the contribution of an employee's productivity and effort within the context of the existing amount of profits and resources of the organization.

Order and a Sustainable Wage

But pay is not only income for the worker; it is also a cost to the employer, which has a significant impact on the economic order of the organization. A just wage cannot be determined without considering the effect wage and reward levels have on future resources. There is an ecological principle operative in pay systems: Actions cannot be taken without reactions. Without the foresight of how a living and equitable wage will affect the economic order of an organization, a just wage becomes a high sounding moralism that is impractical. A sustainable wage, then, is the organization's ability to pay wages that are sustainable for the economic health of the organization as a whole.

These principles, as well as the fundamental insight of justice, will help a manager to realize that there are at least "three bottom lines" to a just wage: needs of all employees, the different contributions of each of the employees (internal equity and external equity), and the economic order of the organization. The manager of a company will often find these principles in tension with each other and will be tempted to emphasize one or two but ignore a third. These tensions are very real and raise an obvious question for this communitarian view of wages: What happens when employers cannot pay a living wage without violating a sustainable wage? What happens when paying a living wage could lead one to bankruptcy? Within this communitarian tradition, justice is located at different levels in society. While only individuals are capable of virtue, social justice emphasizes that any individual firm's living wage can only be an *instance* of a *social* achievement founded in cooperation with other employers, employees, unions, government, and other social institutions. For, apart from a comprehensive commitment—a social commitment—to a living wage, those who decide unqualifiedly to pay living wages in highly competitive, commodity-driven, price-sensitive markets risk economic disadvantages that cannot long be borne. If the market wage in the industry is below a living wage, and there is no place to reduce labor costs, employers who decide to raise wages unilaterally will price themselves out of the market. Obviously, this constraint becomes increasingly decisive in international markets. It is here that the virtue of social justice is most appropriate—indirect employers such as the state, employer associations, unions, in collaboration with direct employers who together seek to find ways to foster conditions for people to grow.

Applications of Theory

To understand the differences between market and communitarian understandings of just wages, we need to examine a case to see how each of these views of justice will understand the determination of a just wage. Reell Precision Manufacturing is a producer of hi-tech clutches and hinges for the office machine and computer industries in St. Paul, Minnesota. The company faced the following situation in 1996: The actual market wage or "sustainable wage" for assemblers in the company was $7 per hour ($14,000 per year). In 1996, their estimate of a living wage in St. Paul was $11 per hour ($22,000 per year). The question for the management team was how to make up the difference. The $4 discrepancy between a living wage and a market wage was a tension between the desire of management to pay according to need and market reality. While the management of Reell desired to pay its employees a living wage, management was all too aware that customers would only pay for the "instrumental value" of work. If Reell would pay $11 per hour to its employees while competitors paid $7, Reell's cost disadvantage would increase their likelihood of losing customers, thus projecting the company in an uncompetitive situation.

How would the two perspectives of a just wage evaluate this case? First, both perspectives would most likely agree on the problem at Reell—namely, that low wages at Reell were merely a symptom of a much larger problem of how the company worked. When work is designed to use $7 of talent, it is difficult to pay people anything more than that amount. Prudence dictated that the living or what Reell management called the target wage could not come automatically. The reason the company called it a target wage was that it was something it worked toward. When an employee is hired with no experience and no skills, the company pays the worker the market rate ($7 per hour or whatever it is at the time) but then makes a commitment to move that employee to the target or living wage ($11 per hour) through training and skill development. So when employees learn the skills and gain experience, which Reell provides, their pay goes up accordingly.

Where the differences between the market and communitarian views come about is over why be just and where justice is located. In understanding the differences, it is important to key in on several terms utilized in their descriptions of a just wage: freedom, intention, efficiency, consequences, and relationships.

Within the market view of a just wage, this focus on intention within the communitarian view of just wages is a bit puzzling, since the location of justice is not found in intentions and internal qualities of people but in the external results of actions, and in particular, the results of what markets produce. Actually from its vantage point, the intentions of Reell management seem to reflect more of management's enlightened self-interest than any altruistic reasoning for employees. Reell was simply trying to improve the efficiencies of its assembly line, which was the basis of increased pay. Management did not raise wages until employees were able to raise their skill level that would be commensurate with market rates. What generated justice in this case was not the intentions of management but the efficiencies of a new management system and the consequences of this to generate greater wealth to pay employees according to their contribution. Attempting to locate justice in intentions and relationships misplaces the focus of management on generating greater efficiencies.

A communitarian view would respond with a similar accusation that the market view has misplaced the location of justice. The reason why intentions matter so much is that they form the character of the person, which in turn determine the nature of relationships between employer and employee. Justice is to be observed not merely in the distribution of wealth but also in regard to the kind of community of work that is established. If Reell's management was only concerned with generating greater wealth, there is a good chance they would not have developed the target wage. It was principally management's concern for employees' needs that generated such a target wage policy, not a strategic calculus for greater efficiency and wealth. This is why the communitarian view of justice insists on calling a wage a relationship and not simply an exchange. Exchanges tend to generate contracts with minimal responsibilities, not covenants, which produce strong bonds of communion. Covenants inspire collaboration, goodwill, creativity, and even sacrifice, which in most, but not all, situations will generate a more vibrant, dynamic, and, in the long run, more efficient and productive company.

The market view would respond that this communitarian view is attempting to get more out of the corporation than it can provide. Corporations are not families. They are places of exchange that need to be efficient so as to generate wealth for future survival of the company. The question of meaning and character is a noneconomic reality and belongs largely in the private or cultural domain. Business is an economic institution and its focus must be placed on increasing efficiencies and wealth creation. To begin to speak of a "community of work," formation of character and other noneconomic issues confuses the roles of business and culture.

At this point the communitarian view would point to the assumption of the market view of wages of the separability of private and public spheres of life. The communitarian view would argue that one of the reasons why the relationship of employer and employee is so important in business is of its influence on the culture and vice versa. People's private and public lives are not separable divides but are realities that are distinguishable but never divided from each other. If wages are not livable, equitable, and sustainable, they cannot bear the relationship of real community, which will negatively impact the kind of society in which we create.

Where the market and communitarian view of wages would agree is where the company's responsibilities lie in light of their virtue. Both would argue that Reell (or any firm) is not responsible in justice to pay employees in excess of a market or sustainable wage (a wage consistent with the sound financial management of the firm), even if that wage falls below a living wage. To do so would unjustly place Reell—and all the firm's employees—at risk of economic failure. In a market economy no firm can be obligated to pay without regard to labor costs' effect on its competitive position, since that would amount to the imprudent choice of self-defeating means (what often destroys justice is not prudence but a false prudence). For the communitarian perspective, Reell does have an obligation in justice to create right relationships with employees to work toward a living wage. This is why Reell can pay less than a living wage so long as it is working toward correcting the situation through some set of means such as training and skill development. From the market perspective, Reell is only obligated to move down this route if it increases efficiencies and produces greater wealth.

This argument of course can go on, but one sees the importance of the underlying assumptions of both viewpoints. For the market perspective, a wage is an exchange commensurate with the price determined by a market. A just wage is defined by the creation of efficient labor markets that generate more wealth to be distributed. The level of analysis is principally focused on the aggregate outcomes of such markets, which produces the greatest amount of wealth. For the communitarian perspective, a wage is a relationship that cannot be only determined by market price mechanisms. A just wage is principally found in the relationship between employer and employee and the bounds of communion that are created between them. The level of analysis is focused on the particular relationships generated in particular companies and whether such relationships create communities of work where people flourish.

K

Kant, Immanuel (1724–1804)

Immanuel Kant was born April 22, 1724, in Konigsberg, East Prussia. (Today, Konigsberg is called Kaliningrad and is in the part of Russia that is just above Poland and split off from the main part of Russia.) Kant was one of nine children. He attended the University of Konigsberg and then for the next 15 years served as a tutor to wealthy families in East Prussia. During this time, Kant's financial resources were severely limited. Finally, in 1770 Kant was appointed Professor of Logic and Metaphysics at the University of Konigsberg. During the first 10 years of his professorship, Kant published output gave little hint of what was to come. Most of his essays were in the natural sciences. Kant made his most notable contributions after the age of 50, when he made major original contributions to epistemology and metaphysics, ethics and aesthetics, and, toward the end of his life, political philosophy.

Kant's contributions to philosophy in the traditional sense began with the publication in 1781 of his monumental *Critique of Pure Reason*. This major contribution to epistemology and metaphysics showed that knowledge was a cooperative enterprise on the part of both reason and experience. As Kant put it, concepts without percepts are empty and percepts without concepts are blind. By this he meant that the content of knowledge came from experience (percepts) but that this content had to be organized according to certain concepts. Otherwise experience would be a booming, buzzing confusion. In this way Kant showed that the rationalists and the empiricists who had been warring for over two centuries were both partly right and partly wrong. Kant also showed that at the theoretical level the traditional questions of metaphysics—are we free, is there a god, and is there a promise of immortality—cannot be answered.

For the next 17 years, Kant was unimaginably productive in terms of both the quantity and quality of his work. In ethics, his emphasis on duty and the consistent following of maxims of action have been so influential that deontology is often simply referred to as "Kantian ethics." His two most important works in ethics are *The Foundations of the Metaphysics of Morals* and the *Critique of Practical Reason*. Kant also made major contributions to aesthetic theory (*The Critique of Judgment*) and to political philosophy and the philosophy of law (*The Metaphysics of Morals Part 1*). Kant represents the classic statement of the retributive theory of punishment. One of his last works, *Perpetual Peace*, was a forward-looking proposal aimed at bringing the state of war between nations to an end. In the philosophy of religion, Kant articulated a rationalistic theology that complemented his ethical theory. Finally, Kant is identified as the classic thinker of the Enlightenment with its emphasis on universal values, cosmopolitanism, and rationality.

Since Kant never traveled far from his birthplace, spent his entire university career at the University of Konigsberg, and never married, it might appear that he led a rather dull life. However, he was a popular lecturer, was known for his charm and wit, and frequently entertained. On receiving his professorship, his financial situation improved and he was served by his loyal servant Lampe.

Kant was rather rigid in his activities. He retired promptly at 10 and Lampe awakened him each morning at 5. His walks along the riverbank were so punctual that it is said the housewives of Konigsberg set their clocks to his walk. Although Kant was slight in build and his health was considered fragile, he lived until 1804, dying just short of his 80th birthday.

Kantian Ethics

Immanuel Kant (1724–1804) is arguably the greatest ethical theorist philosophy has produced. However, his writings on ethics are difficult to understand, and his ethical theory has been subject to multiple interpretations and to considerable criticism. Kant's ethics is the central theory in a branch of ethical theory known as deontology (duty-based ethics). Indeed Kant's ethics is so prominent in deontology that "Kantian ethics" and "deontology" are often treated as synonymous terms.

Goodwill

Kant begins the *Foundations of the Metaphysics of Morals* by asking what is intrinsically good, that is, what is good in and of itself rather than being good for something else. Kant considers a number of possibilities—obvious ones such as wealth and power and less obvious ones such as intelligence, wit, and other talents. All are found wanting. Why? Because they can all be misused for immoral ends. When one reflects on the matter, only goodwill passes the test of being intrinsically good.

Interpreters of Kant have often identified goodwill with good intentions and thus said that Kant's ethics is an ethics of good intentions, of doing right because it is right. On this interpretation, Kantian ethics looks like ordinary morality. If there is something in it for you, then even if your action conforms to morality, it is not really moral because it is not motivated by morality. "Honesty is the best policy" is a principle of prudence for Kant rather than a moral principle. In business ethics, behavior that contributes to the bottom line is rejected as truly moral by the person on the street. "That company is just doing good because they make money from it" is what is often said.

The problem with this interpretation is that the emphasis on intentions is too psychological. Kant is looking toward reasons rather than motivation in the psychological sense. An action is right if it is performed for the right reason and the person of goodwill is the person whose actions are based on or are in conformity with good reasons.

The Categorical Imperative: The Universal Law Formulation

To understand how goodwill reasons about a moral issue, one must understand the role of maxims and the distinction between hypothetical and categorical imperatives. Although it is tempting to say that Kant's ethics evaluates the ethics of actions, that is not strictly correct. What need to be evaluated are the maxims on which one acts. Some maxims are hypothetical because they are means to an end. "If you want an A, you need to study" and "If you want to have a good reputation, you cannot overcharge a child" are examples of hypothetical imperatives. If you do not care about getting an A or about having a good reputation, then there is no need to study or avoid overcharging the child. On the other hand, a categorical imperative is one that binds you no matter what your other goals or purposes are. A categorical imperative obligates you with no ifs, ands, or buts. Kant's first formulation of the categorical imperative presents this demand: Act only according to that maxim by which you can at the same time will that it should become a universal law.

In explaining this formulation, the imperative resembles the formal principles of reasoning, and thus Kant's ethics is sometimes called formalistic. It is evident that if something is to count as a reason for you, it is to count as a reason for anyone like you in relevantly similar circumstances. Thus, to use one of Kant's examples, if, whenever you are in grave financial difficulty, you have as your maxim to promise to repay a loan with no intention of doing so, you must be willing to allow everyone to act on that maxim. However, such a maxim could not become a universal law because if it did no one would make a promise. Such a maxim would be self-defeating. Indeed such a maxim would be self-contradictory because it would imply that you endorse a world with promises and that you endorse a world without promises. Many of the actions that we learn as young children are wrong are just those actions whose maxims could not be universalized without being self-defeating. Stealing is wrong because if a maxim permitted stealing to be a universal law, then it would undermine private property on which stealing depends. A universal maxim that permits stealing is self-defeating. So is a universal maxim that permits cheating. Thus Kant has shown the reason why it is wrong to lie, cheat, and steal. Universalized maxims permitting these activities would be self-defeating and thus irrational.

Maxims that permit an individual to lie, steal, or cheat when universalized create maxims that are contradictory in the logical sense. Such maxims are conceptually contradictory because they would assert something like "It is permissible for me to steal" and "It is not permissible for me to steal." However, Kant also believes that the categorical imperative requires that we help others and develop our talents. Kant believed there is nothing conceptually contradictory in denying that we ought to help others, but he believed that a denial of beneficence results in a contradiction in the will. Kant says that the reason there would be a contradiction in the will is because situations can arise in which one would need the love and sympathy of others but could not ask for it, since one had denied beneficence (love and sympathy) to others. Although some have rejected Kant's arguments here, contemporary Kantian ethicists have interpreted Kant in ways that make his argument quite plausible.

Critics of Kant have focused on the difficulty of providing the appropriate maxim to see if it passes the test of the categorical imperative. Consider the act of lying. If the maxim is very general, such as, "It is OK to lie," then lying would be absolutely prohibited under all circumstances. Kant actually took an absolutist perspective with respect to lying and argued that lying was always wrong under all circumstances. That is why some have criticized Kant for having an ethic of absolute rules. But most Kantians would agree that lying is morally permitted in certain circumstances, to save a life, for example. Of course the maxim could be amended to say, "One should not lie except to save a life." That maxim can become a universal law of nature. However, if one allows maxims that are highly specific, then they could be made so specific that they would just apply to you or to you and a select group and the whole force of the exercise of seeing if maxims could become universal laws would be defeated. The proper formulation of maxims remains one of the active areas of debate in Kantian ethics.

Kant's Theory of Freedom

Kant's ethics is an ethics of respect for persons. Why should persons be respected? Kant noted that persons were different from everything else in that they were the only things on earth that could act from a law of their own making. Or to put it in other terms, persons are the only things on earth that can act on the basis of universal laws and thus are the only things on earth that can have goodwill. In other words, persons are free. Indeed, human freedom is the ground of Kant's ethics.

It is important to note that Kant's theory of freedom has two components. The first one is negatively free in that one is not simply a cog in the causal chain in nature. But the second is positively free if one can act on laws of one's own. To put it another way, one is positively free if one can act on the basis of categorical imperatives. It is tempting to say that either we act as part of a causal chain on the basis of sufficient causes or we act from laws of our own making. Kant argued that for free actions, there are both causal explanations and rational (law-giving) actions. How is that possible? Early interpreters of Kant defended a two-world explanation where we were subject to the empirical world of cause and effect and an intelligible world of freedom. But many found the two-world scenario as creating an unbridgeable dualism. Contemporary Kant scholars speak of two standpoints rather than two worlds. Whether the two-standpoint perspective resolves the issues depends, in large part, on whether one is a compatibalist with respect to free will and determinism. Compatibalists believe that free will is possible in a deterministic world.

Kant himself argued that it was impossible to have sense experience knowledge that we are free, but as rational and ethical beings we had to presuppose that we were free. Of necessity we think we are rational and moral (capable of following laws of our own making including the categorical imperative). This is Kant's transcendental argument for freedom. The fact that we all must see ourselves as free rational moral creatures gives us a dignity that is beyond price.

The Categorical Imperative: The Respect for Persons Formulation

Kant's ethics can fairly be characterized as an ethics of respect. Kant believed that each person recognizes that he or she is free in the full sense and that he or she is bound by the moral law. This recognition provides the basis for each person's claim to respect. Applying the universal law test here, Kant argues that if I make a claim for respect, then in turn I must honor the same claim made by every other person. After all, each person, Kant believed, recognized his or her freedom and obligation to the moral law. He thought that people should always treat others and themselves with respect.

In nearly all personal interactions, especially in business relationships, each person gains something from the relationship. The fact that another person is providing you with something you want does not automatically mean that you are using another as a means in a way that is morally offensive. Kant's position is that you cannot use another as a means *merely*. Thus, loving relationships and business relationships pass the moral test so long as one is not using another solely as a means.

It is this formulation of the categorical imperative that is most often appealed to in applied ethics. In business ethics, for example, Kantian scholars try to determine what respecting other stakeholders requires of managers or what the business firm should look like if it were organized along Kantian lines.

The Categorical Imperative: The Kingdom of Ends Formulation

Although many interpret Kant's ethics as an individualist ethics, the categorical imperative applies to human communities as well. Since institutions are composed of persons, all persons in the institution must be treated with respect; they must be seen as having dignity. In a business situation this means that people cannot just be treated on a par with capital or machinery. Kant's term for these communities or institutions was *kingdoms of ends*. In such communities, the categorical imperative insists that people act as if they were legislating members in the universal kingdom of ends. What rules should govern a kingdom of persons? Only those that can be universalized should. By requiring universalization, one is sovereign because in some sense one makes the rule, and of course since it is universalized one is also subject to the rule. In other words a moral community is one where the obligatory nature of the first two formulations of the categorical imperative is recognized.

One can argue that Kant's ethics is defined by the categorical imperative. Who is the person of goodwill? The person who acts on maxims that are based on the obligatory nature of the categorical imperative.

Perfect and Imperfect Duties

Kant distinguished between obligations that always bind us such as "Don't lie" and "Don't cheat" and duties such as the duty of beneficence, which bind us only to a certain extent. The former duties are perfect duties, the latter are imperfect duties. What does it mean to say that imperfect duties bind only to a certain extent? Consider the imperfect duty of beneficence. Each of us is obligated to help another, but no one is obligated to always help others. In other words, we are not obligated to help everyone who needs aid whenever they need it and we are in a position to do so. That would make morality too demanding. But how beneficent are we required to be? Kant provided few clues to help in answering that question, and various answers have been proposed by contemporary Kantian ethicists.

Duties to Oneself and Duties to Others

Some ethical theories do not emphasize duties to ourselves. However, Kantian ethics certainly does. There is an absolute prohibition (duty) against suicide. There is an imperfect duty to develop one's talents. Servility is a moral fault because it undermines one's claim to respect.

Duties That Can and Cannot Be Enforced by Law

In the *Metaphysics of Morals*, Kant turned his attention to more specific moral duties. He distinguished those that could be enforced by law (externally required) from those that could not be so enforced and thus were enforced internally. In discussing the former, Kant developed his theory of law, property, and penal justice. In that first section of the *Metaphysics of Morals* known as the "Metaphysical Principles of Right," Kant defends an absolute duty to obey the sovereign and a retributivist theory of punishment that included a strong endorsement of capital punishment. Many contemporary Kantian ethicists are somewhat embarrassed by these positions and have attempted to develop a Kantian position that would provide for civil disobedience or would reject capital punishment and other features of a harsh retributivism.

The second section of the *Metaphysics of Morals* is called the "Metaphysical Principles of Virtue," which describes the duties that cannot be enforced by law. For Kant, virtues are those character traits that enable us to obey the demands of the categorical imperative in the face of obstacles that stand in the way of our obedience, while vices are those character traits that indicate a weakness in the face of obstacles that stand in the way of obedience. The key to virtuous behavior is control over oneself, which again shows the centrality of freedom in Kant's ethical theory. In addition to freedom, the concept of respect for persons is the guiding force in developing a set of specific duties of virtue. This can be seen, for example, in Kant's discussion of concepts like servility.

Criticisms of Kantian Ethics

Despite the great influence of Kant, a number of criticisms have been leveled against his views. The difficulties in formulating the appropriate maxim as well as determining just what is demanded by imperfect duties have already been noted. It is argued that Kant emphasizes reason at the expense of emotions or the moral sentiments of sympathy and caring. Indeed, if someone is beneficent out of the emotion of caring, Kant would not consider the act of caring to be truly moral. Some critics see the problem as Kant's overemphasis on duty. People may do the right thing for a variety of reasons. Why should the presence of prudence and sympathy eliminate the morality of the action as Kant seems to say?

Others have argued that Kant does not say enough about the virtues. Of particular importance is the criticism that Kant misunderstands and does not give sufficient room for our particular obligations—that is, obligations to friends and family. Some of the harshest critics say that for Kant, the interests of your spouse or closest friend are no more significant than the interests of a stranger. After all, each is a person with equal moral worth, so how could Kant justify giving special treatment to a friend? In business relationships, it seems that loyalty might not be permitted because it requires treating some relationships as special. Kant's ethics is an ethic of impartiality, but doesn't morality sometimes at least require that we ought not be impartial?

Contemporary Responses

These criticisms have been carefully examined and responded to by a score of contemporary ethicists. There is consensus that Kant's ethics is not a system of absolute moral rules and that Kant is not a rationalist in the sense of determining our duties on the basis of rational insight. Kant's ethics does allow facts of human nature to play a role in ethical judgments.

Other criticisms have forced some amendments to Kant's ethical thought. Some contemporary Kantian ethicists have supplemented moral decision making by the categorical imperative with various theories of moral judgment or by introducing rules of moral salience. Some Kantians have argued that the mere presence of emotions like sympathy or even prudential reasons do not by themselves eliminate the morality of an action so long as the motive of duty is sufficient for the action to be done. For example, particular relationships might be justified by universalizing them. In other words, maxims where friends or family may be given preferential treatment may be universalized and be instances of respecting the humanity in a person. In this way contemporary Kantian ethicists have tried to find a place for particularity and the moral emotions while still being true to the central ideas of Kant's ethics.

KEIRETSU

The Japanese word *keiretsu*, which literally means "series," denotes a set of companies that are loosely lumped together by cross-shareholding and/or long-term transactional relationships such as assembler-supplier relationships. *Keiretsu* can best be understood as an intricate web of economic relationships that links banks, manufacturers, suppliers, and distributors.

There are two types of *keiretsu*: the horizontal and vertical types. The big, leading firms that form the core of a *keiretsu* are horizontally linked by capital and transactional relationships, and each core company ties up with many subcontracting firms, which are in vertical relationships with the core companies. The firms that are vertically connected with the core companies through subcontracting contracts and that can obtain financial and technological support from the parent company are usually termed as affiliated subcontracting companies.

The "Big Six" enterprise complex (Mitsui, Mitsubishi, Sumitomo, Fuyo, Sanwa, and Dai-ichi Kangyo Group), which are also known as the Kigyo Group, constitute a horizontal *keiretsu*. The Big Six enterprises have different historical origins. The former three were established shortly after World War II, following the American occupation authorities' dissolution of the family-owned conglomerates known as *zaibatsu*. The latter three were organized around the newly developing big banks in the 1950s and 1960s: Fuji Bank, Sanwa Bank, and Dai-ichi Kangyo Bank. In addition to the Big Six, Toyota, Hitachi, Toshiba, and Sony form their own *keiretsu*, termed the Independent Corporate Group.

A feature of the Big Six *keiretsu* is that it has within itself a central bank, a general trading company, an insurance company, an iron and steel company, and a chemical company. As an example, consider the Mitsui Group, which includes Sakura Bank as its main bank, Mitsui Trust & Banking, Mitsui Mutual Life, Mitsui Marine & Fire, Mitsui Bussan, Japan Steel Works, and Mitsui Toatsu Chemicals. Each of the core firms has subcontracting companies under its control, and the subcontracting companies on their part are forced into competition with each other to obtain better contracts from the parent firm.

Close capital ties, long-term contracts, and financial and technological support are considered to be the advantages of the foundation of a *keiretsu*. According to a recent economic theory, *keiretsu* can contribute toward economizing transaction costs; therefore, the structure has economic rationality. However, the existence of *keiretsu* is said to be representative of the closed system of the Japanese market for foreign investors and firms, and it has hampered free trade. The other problem with *keiretsu* is that many affiliated subcontracting firms are "locked" or remain "captive" in long-term transactional relationships with the core companies, making it easy for the core companies to subordinate and control the subcontracting firms.

In the 1990s, during the decline of the Japanese stock market, stable shareholding among the core companies began to decline. As a result, the *keiretsu* were in the process of dissolution and regrouping. For example, Mitsui Bank and Sumitomo Bank merged to form Mitsui-Sumitomo Bank in 2001. The subcontracting companies, on their part, have begun to be more market orientated and now tend to move away from *keiretsu* relationships.

Kohlberg, Lawrence (1927–1987)

Lawrence Kohlberg, a psychologist and a professor at Harvard University, investigated the individual's moral reasoning, which led to the creation of his theory of moral development. Born in Bronxville, New York, Kohlberg began his career as a developmental psychologist in the early 1970s before moving to the field of moral education where he fashioned his well-known stages of moral development, which traced an individual's progression of moral reasoning across identifiable, universal moral perspectives. Kohlberg died under suspicious circumstances, probably suicide, after contracting a parasitic infection, which caused him to suffer for 16 years.

Kohlberg's work was influenced primarily by Jean Piaget, a cognitive developmentalist. Based on a long-term study conducted at Harvard's Center for Moral Education, Kohlberg recorded responses provided by his male subjects, beginning at age 7 through adulthood, to hypothetical dilemmas that required the subject to make a moral choice. However, Kohlberg was not concerned primarily with the subject's moral choice but with the moral reasoning provided in support of that choice. Based on his results, Kohlberg concluded that an individual progresses sequentially through six identifiable, universal stages of moral reasoning, which could be more generally classified into three levels.

At the Preconventional Level (Stages 1 and 2), an individual understands "right" and "wrong" in terms of the personal consequences involved, such as punishment, rewards, or an exchange of favors, or focuses on the imposition of physical power by authority. Avoidance of punishment and unquestioning deference to power are highly valued at this level. Reasoning at the Conventional Level (Stages 3 and 4) emphasizes performing good or right roles, maintaining traditional or acceptable order as determined by a group or society, or meeting others' expectations. Adherence to the Golden Rule or following the Ten Commandments is characteristic of this reasoning level. In the Postconventional Level (Stages 5 and 6), the individual defines moral values and principles apart from established moral authority and relies on self-chosen principles, from a set of universally acceptable principles, to guide reasoning.

Carol Gilligan, Kohlberg's student and later colleague, raised objections to Kohlberg's work, which used all male subjects. Gilligan argued that Kohlberg's model espoused a "theory of justice," a predominantly masculine cognitive process based on adherence to ethical principles. Gilligan advocated a "theory of care," which is often found among females and emphasizes the maintenance of relationships. Kohlberg and his associates responded to their major critics by addressing issues of stage sequencing, subjectivity in the moral reasoning scoring method, gender bias, or the lack of cross-cultural universality. In each of these responses, empirical support was offered in support for Kohlberg's theory and stages of moral reasoning, resulting in the continued use of his theory by developmental psychologists years later.

Kyoto Protocol

The Kyoto Protocol is an international agreement to reduce greenhouse gas emissions by establishing reduction targets for participating nations. It is an amendment to the United Nations Framework Convention on Climate Change and was signed in Kyoto, Japan, in December 1997. The Protocol is based on the belief that increases in carbon dioxide and other greenhouse gases are a major cause of global warming, a position supported by the Intergovernmental Panel on Climate Change. It is modeled in many respects on the Montreal Protocol, an international agreement that focuses on the reduction of ozone-depleting substances to restore the planet's ozone layer, which is widely regarded as a success. By contrast, the Kyoto Protocol was off to a slower start in achieving significant progress in meeting greenhouse gas reduction targets.

The Kyoto Protocol went into effect in February 2005, 90 days after the Russian Federation signed the agreement, thus reaching the threshold of participation to initiate its provisions. The Protocol calls for the reduction of the six primary greenhouse gases: carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. The most significant human-caused sources of greenhouse gas emissions are use of fossil fuels (especially petroleum and coal), deforestation, and use of chlorofluorocarbons.

The Kyoto Protocol separates countries into two categories: Annex 1 and non-Annex 1. Annex 1 countries include industrialized countries that belonged to the Organisation for Economic Co-operation and Development in 1992 and the so-called economies in transition, which include the Russian Federation and a number of central and eastern European countries. Annex 1 signatories produced most greenhouse gases and agreed to reduce emissions collectively by 5.2% below the levels occurring in 1990 by deadlines between 2008 and 2012. Non-Annex 1 countries are developing countries, such as Brazil, China, and India, which have signed the Protocol but do not have targets for controlling the growth of greenhouse gas emissions yet.

Annex 1 countries committed to specific reduction targets in the Protocol. For example, the European Union (EU) agreed to use a joint approach by its then 15 members to meet an 8% overall reduction in emissions. The United States offered to meet a 7% reduction over 1990 emissions levels, while Canada and Japan agreed to a 6% reduction. The Russian Federation agreed to a 0% reduction, meaning that it would not exceed its 1990 emission levels. Several countries were permitted small increases in emissions to allow for modest growth, for example, Norway at 1% and Australia at 8% over 1990 levels.

Countries may meet their targets within their borders in many ways, such as by improving energy efficiency, by shifting energy sources away from heavy reliance on fossil fuels, and by planting forests. The Kyoto Protocol also encourages the use of three market-based "flexible mechanisms" to allow Annex 1 countries to meet their targets at lower costs. These flexible approaches are the clean development mechanism, joint implementation, and emissions trading. The clean development mechanism allows Annex 1 countries to implement emission reduction projects in developing countries in return for certified emission reductions. Joint implementation allows an Annex 1 country to aid in an emission reduction project in another Annex 1 country, while counting the emission reduction credits toward its own country. Finally, emissions trading allows for the trade or sale of emission reduction credits between Annex 1 countries.

A good example of joint implementation is occurring within the EU. In 2002 when the EU ratified the Protocol, the then 15 member countries decided on the goals to reach the 8% overall reduction from 1990 emission levels. Some member countries accepted larger reductions, such as Germany and Denmark, which are committing to a 21% reduction, while others were permitted to increase their emissions but at a lower rate than what would have occurred without the Protocol, such as Greece limited to 125% and Spain to 115% of 1990 levels.

Critics of the Kyoto Protocol focus on several issues. Early criticisms were based on lack of sufficient scientific evidence on which to establish the phenomenon of global warming and the role of human activity in influencing climate. Another criticism is the failure to establish targets for the developing countries whose economic growth was likely to trigger a large increase in greenhouse gases. A third issue was the high cost of limiting fossil fuel use and taking other steps to reduce emissions. Thus, two large producers of greenhouse gas emissions, the United States and Australia, decided not to ratify the Kyoto Protocol after initially signing it. These countries represent one third of the industrialized world's greenhouse gas emissions. The United States instead is developing its own approach of setting voluntary greenhouse intensity reduction goals, which would reduce emissions per unit of overall economic output but are likely to increase emissions as a whole. Australia chose not to ratify the Protocol because it did not include clear targets for developing countries and because the United States would not agree to comply. It argued that only 1% of greenhouse gas emissions would be controlled unless all the major emitting countries committed to meeting Kyoto targets. Nonetheless, Australia indicated a commitment to meet its Kyoto targets despite abstaining from ratification.

In 2006, on the 1-year anniversary of the Kyoto Protocol coming into effect, progress in meeting the 2008 to 2012 targets was judged to be slow, and concerns were expressed about the commitment of countries to meet their targets. The EU's carbon trading program had been operating for 1 year with mandatory participation by companies in energy-intensive industries, such as electricity generation, iron and steel production, and manufacturing of glass, pulp and paper, and cement, but the impacts of the emissions trading program were still to be measured. The European Environmental Agency predicted that only the United Kingdom and Sweden would be able to meet their Kyoto targets by the 2008 to 2012 deadline through current efforts, while other EU countries would need added projects and policies to meet their targets. Many other participating industrialized countries were also behind schedule in meeting their targets.

Impacts on business are likely to be significant as they adapt to reducing greenhouse gas emissions. Emitters in Annex 1 countries are dealing with mandated participation in conservation projects, carbon trading, and clean development programs while companies outside of Annex 1 have to decide whether to engage in voluntary reduction efforts, whether government-sponsored or oriented toward satisfying other stakeholder concerns. Companies with "green" technologies, such as photovoltaic solar panels or wind energy systems, are in a favorable position to increase revenues from higher demand for clean energy alternatives.

Performance in implementing the Kyoto Protocol was significantly lower in its first 10 years compared with the 1987 Montreal Protocol, on which it was modeled. Ratification of the Montreal Protocol by participating countries occurred much more rapidly, and by 1997 it was ahead of meeting its goals. The Kyoto Protocol was ratified much more slowly by participating countries, and two of the largest producers of greenhouse gas emissions, the United States and Australia, have still not ratified the Protocol although they express commitment to the goals of greenhouse gas emission reduction. Experts predict that the 2008 to 2012 goals will not be met by all industrialized nations without a much stronger commitment by governments, businesses, and consumers.

Explanations for these differences between the Montreal and Kyoto Protocols focus on the nature of the problem, the costs of achieving emission reduction targets, and the number of actors that would be significantly affected. Global warming is a much more contentious and difficult problem to address than ozone depletion because of the greater complexity and uncertainty in scientific evidence and because energy is central to economic welfare and growth compared with the relatively narrow uses of ozone-depleting substances. Second, the aggregate costs to meet Kyoto targets are high even with market-based flexible mechanisms such as emissions trading compared with compliance costs for phasing out ozone-depleting substances when substitutes were easily identified, produced, and distributed. Finally, ozone-depleting substances were largely produced by a few large corporations in a few industrialized countries, so cooperation and monitoring were more easily achieved. By contrast, the use of fossil fuels and deforestation occur virtually everywhere on the planet, and it is much more difficult to implement agreements to achieve a collective good for large numbers.

L

LABOR UNIONS

A labor union is an association of employees that advances member interests through collective bargaining with an employer. Areas of negotiation typically include wages, benefits, work rules, and other conditions of employment, such as hiring, discipline, and termination of employees.

A significant power imbalance between employers and employees during the early stages of the Industrial Revolution (1760–1830) led to the formation of unions. Employers took advantage of a labor glut caused by large numbers of agriculture workers who, searching for a better life, flooded cities for nonskilled factory jobs. The workers hoped for decent wages, job security, and respect for their labor. Instead, managers dictated the conditions of work based on their own interests and paid very low wages to those willing to work long hours in unhealthy work environments. There was always someone willing to do the work.

Labor unions organized workers based on their common interests. Unions defended workers against abusive employers and negotiated wages on their behalf. A union organizer, often risking his or her own employment at the company, inspired unfairly treated employees to collectively withhold their labor in an attempt to financially cripple the business. If replacement workers, referred to as "scabs," did not cross the picket line (see the University of Bridgeport case discussed below), then the employer would have to negotiate with the union for better wages, benefits, and working conditions. Unions collected dues from members to pay for safety net features, such as funds for striking families, and administrative expenses. Despite current legal protections, certifying a union continues to require courage by employees leading the unionizing effort. Labor union accomplishments include higher wages, shorter hours, prohibitions on child labor, grievance procedures, and worker's compensation.

This entry describes the process of certifying a union and presents empirical research examining the impact of unionization. Next, the roots of "class conflict" analysis between employers and labor is explored in the writings of Adam Smith, particularly his understanding of the wage issue. This is followed by a summary of labor union history in the United States and other selected nations, the problem of union corruption (particularly in the Teamsters union), a profile of the union organizer Cesar Chavez, and the ethics of union management tactics. The entry concludes with a survey of the current status of unions around the world and a brief discussion on the future of unions.

The Process of Certifying a Union

In the United States, workers have the legal right to be represented by a union. Prior to 1935, employers could refuse to negotiate with a union. The National Labor Relations Act of 1935 codified regulations governing the process of certifying a union. These regulations have been modified by subsequent legislation, most notably by the Landrum-Griffin Act of 1959.

Unions are typically initiated by an employee responding to a workplace injustice or by an external union recruiter. The process begins with union organizers clearly defining the bargaining unit in terms of work commonality. Unions represent a particular job classification rather than everyone employed by a particular business. For instance, airplane pilots and airplane maintenance employees belong to two separate unions based on the type of work they perform. For the certification process to continue, 30% of the targeted employees must sign a confidential authorization card or petition requesting union representation.

Unions often recommend that at least 70% of the employees sign these cards as a sign of solidarity before incurring the financial and psychological costs associated with certifying a union. It takes tremendous courage for an employee to lead a union organizing effort. Whereas forming a union may give hope to some employees, other employees may not welcome an external third party participating in work-related decisions, thereby creating dissension among coworkers and conflicting loyalties.

Next, the union organizers present the authorization cards to the National Labor Relations Board (NLRB), which then notifies the employer. The employer can either accept the union as the employee representative based on the confidentially signed authorization cards or request that an election be held under the auspices of the NLRB. Typically, employers require an NLRB-sanctioned election. After the NLRB establishes an election date, the union and the employer can lobby employees to vote for or against unionization.

There are strict rules governing what employers can and cannot do during the preelection time period. For instance, employers cannot threaten to terminate the union organizers nor promise employees incentives to vote against the union. Employees vote by secret ballot on the established date. If more than half the employees in the proposed bargaining unit vote in favor of unionization, the NLRB certifies the union. Following certification, the employer and the union must negotiate with each other in good faith. Violations of these rules can be submitted by either party to the NLRB for a hearing.

The Impact of Unions: Empirical Evidence

A significant amount of research has been conducted comparing attributes between union and nonunion organizations. In their classic book *What Do Unions Do?*, Richard Freeman and James Medoff reviewed the empirical research on the impact of unionization. The findings can be categorized in terms of impacts on wages and benefits, governance, employee turnover and layoffs, and productivity.

In comparison with nonunion facilities, unionized facilities have the following impacts:

- *Wages and benefits impacts*
  - Higher employee wages, particularly for less educated, younger, and more junior employees
  - Higher fringe benefits, such as pensions and life, accident, and health insurance
  - More wage equality by increasing blue-collar earnings relative to the higher white-collar earnings
- *Governance impacts*
  - Less decision-making flexibility for managers due to contracted work rules
  - Fewer subjective and arbitrary management decisions due to documentation requirements
  - Greater procedural protections for employees, particularly those with high levels of seniority
  - Greater employee voice in determining work rules and other conditions of employment
- *Employee turnover and layoff impacts*
  - Less turnover
  - Greater employee protection against job loss
  - Greater likelihood of using temporary, rather than permanent, layoffs during economic downturns
  - Fewer wage cuts during economic downturns
- *Productivity impacts*
  - Higher levels of productivity

The higher levels of productivity associated with union facilities are attributed to a variety of factors. Managers often complain about the restrictive rules and lack of flexibility in managing a unionized workforce. In some instances, local unions have falsified the number of hours union employees work, the number of union employees working, and the job qualifications of union employees, which create productivity problems. Some local unions also refuse to perform any tasks that are not clearly stated in their contracts. But research has found that organizations with unions attract more productive employees because of higher wages and better job security. In addition, the employee "voice" provided by unions results in more efficient work processes and resolutions to employee grievances.

Owner Objections

Are the higher wages and benefits associated with unionization good or bad? The answer often depends on one's point of reference. Neoclassical economists maintain that unions artificially increase wages, which in turn leads to inflation. Higher labor costs reduce the amount of money available for other purposes, such as profit, advertising, or capital expenditures. Higher labor costs also put firms at a competitive disadvantage, motivating them to relocate to nonunion regions of the United States or to developing nations with less stringent labor laws.

According to classical economic theory, private property rights are at the foundation of a free market economy. Owners, and their management representatives, have the legal right to determine the rules and regulations governing workplace activities as long as they do not conflict with existing laws. Unions bring into the workplace a third party that creates dual loyalties, where both the employer and the union compete for the employee's loyalty. Owners complain that unions are insensitive to the impact of wage increases on the organization's existence.

But from a worker's perspective, higher wages mean more disposable income. Unions represent the interests of workers in this wage conflict between competing class interests—a conflict noted in the original conceptualization of capitalism by Adam Smith.

Unequal Bargaining Positions in Adam Smith's *Wealth of Nations*

Throughout economic history, the issue of employee wages has been framed in terms of a zero-sum game. In *The Wealth of Nations*, the Scottish moral philosopher and economist Adam Smith writes admirably about the many virtues of an economic system that Karl Marx would later refer to as capitalism. Smith argues that individuals should be extended liberty to pursue their own interests in economic matters, free of government dictates and impositions that restrict economic behavior. Self-interested individuals will pursue economic activities that benefit their own economic well-being, which, coincidentally, also increases a nation's overall wealth. The pursuit of economic interest, Smith argues, typically occurs within a moral framework because individuals are naturally restrained by a sense of justice and by their conscience. When these moral restraints break down and harms are generated, then a strong system of justice must take corrective action.

Smith distinguishes between self-interest and selfishness. Self-interested individuals take into account the interests of others. Selfish people care about their own interests to the exclusion of others. In the opening sentence of *The Theory of Moral Sentiments*, his treatise on ethics, Smith claims that no matter how selfish people are assumed to be, they are guided by some principles that make them interested in the well-being of others. People are trained by parents, teachers, and friends to be both other-regarding and self-interested, but not selfish. Looking after your own welfare relative to others is a virtue, not a vice. Whenever selfishness arises, it is discouraged.

Writing within the economic context of the 1700s, Smith discouraged employers from misusing their economic liberty when determining employee wages. Smith observed that in many circumstances owners and employees negotiate wages. These two parties have competing interests. Employees naturally form coalitions among themselves to request high wages. Owners naturally form coalitions among themselves to offer low wages. Being fewer in number, owners can remain unified more easily and force compliance on employees who need wages to pay for that day's food. According to Smith, owners often outlast striking workers because they, unlike the striking workers, have accumulated stocks and savings to draw on.

Smith points out that this power imbalance is codified in law. Great Britain's parliament passed laws prohibiting employees from conspiring to raise wages but there were no equivalent laws against owners conspiring to lower wages. This was to be expected because the members of Parliament had greater affinity and interaction with manufacturers and landlords, sharing common interests and backgrounds. Members of Parliament were also recipients of gifts and privileged stock from business owners.

Given all these negotiation advantages, Smith notes, some owners pay subsistence wages, insufficient money for the purchase of food and shelter. This is shortsighted and selfish. Smith appeals to the owners' moral sentiments, including their self-interests, not to abuse their economic power. Well-fed and motivated employees work better than those who are frequently sick and disheartened. Smith reasons that workers must earn a wage sufficient to sustain themselves and their families. Otherwise, they will be unable to raise the next generation of workers.

But some employers were either unmoved by, or ignorant of, Smith's moral arguments and took advantage of their unequal bargaining power. As a result, the natural tendency of workers to form coalitions for the purpose of increasing wages evolved into labor unions.

The Growth of Unions in the United States

Labor unions are an equalizing force, leveling the playing field between owners and workers. They evolved out of the medieval guild system and industrial mutual aid societies that assisted workers based on their common interests. The unions counteracted the strong coalition of politicians, judges, and business owners, who feared that higher wages would threaten the profitability and competitiveness of local businesses.

The unequal power positions between owners and laborers accompanied the arrival of European settlers to what became the United States and was evidenced in rules and regulations governing work relations. The early laborers consisted of four classes of people: indentured servants, criminals with minor offenses, kidnapped peasant children, and African slaves. White servants and black slaves who attempted to run away from abusive employers were whipped and branded with the letter "R" for runaway. A Maryland slave owner was acquitted of murder in 1656 after he had killed a slave by pouring hot lead over him.

A free laboring class emerged in the port cities of Boston, Philadelphia, and New York. Northern merchants preferred to employ freemen rather than slaves and indentured servants because freemen did not have to be housed, fed, or sheltered. English laws that placed limits on maximum but not minimum wages were adopted in the British colonies. At the time of the Revolutionary War, approximately 75% of the three million colonists were, or had been, indentured servants, and 16% were African slaves.

The first recorded strikes in the colonies were conducted by groups of journeymen tailors in New York City and shoemakers, printers, and carpenters in Philadelphia. In 1786, Philadelphia printers conducted the first successful strike for increased wages. Six years later Philadelphia shoemakers formed the first local union. But in 1805, a jury composed of merchants found eight shoemakers guilty of engaging in a criminal conspiracy to raise wages. The merchants feared that the higher wages would force businesses to abandon Philadelphia for another city. Persecution against unions drove organizing efforts underground, forcing many of them to become secret societies.

The Industrial Revolution reached the United States from Great Britain in the early 1800s, and the first factory appeared in Waltham, Massachusetts, in 1815. The workforce consisted of newly arriving immigrants, including seven boys and two girls under the age of 12, who worked from 5 o'clock in the morning to 7 o'clock at night. In addition to long hours, features of factory life included low wages, poor ventilation, payment in scrip redeemable only at a high-priced factory store, girls living in boardinghouses leased by the company and other workers housed in crime-ridden slum tenements with high mortality rates, and a severe fine system for the purpose of maintaining discipline.

The formation of labor unions and obtaining worker rights were hindered by strong political opposition. Throughout the 1800s, business representatives attended local, state, and national political conventions and meetings with bags of cash available to those who pledged to vote for their preferred candidates or probusiness legislation. In 1840, Philadelphia strikers won the right to work only 10 hours a day; this became the standard for federal employees. But 40 years later, approximately 80% of all laborers were still working a minimum, rather than a maximum, of 10 hours a day.

Some union organizers were inspired by the revolutionary thoughts of Karl Marx and Friedrich Engels, who wrote in response to the inhumane working conditions they documented in Western Europe. Marx and Engels argued that owners of the means of production stole a portion of wages from workers, calling it surplus value, or profit. In the *Communist Manifesto,* published in 1848, Marx and Engels declared that the workers of the world should unite against their oppressor, the greedy capitalist, and take ownership of the means of production.

Union leader Samuel Gompers opposed the affiliation of the union movement to secure worker rights in the United States with a revolutionary political party, or any political party for that matter. He also opposed violent unions, such as the secret society of immigrant Irish mine workers, known as the Molly Maguires, that intimidated and killed unscrupulous mine owners and the police who protected their property rights. Following a national uprising of railroad workers in 1877, Gompers helped found the Federation of Organized Trades and Labor Unions to unite independent labor unions, which in 1886 became the American Federation of Labor (AFL). On May 1, 1886, unions across the nation declared a strike in support of an 8-hour workday. Proponents maintained that a day should be equally divided into three parts: 8 hours for work, 8 hours for personal interests, and 8 hours for rest. More than 300,000 people participated in the strike. In a rally at Chicago's Haymarket Square, anarchists led protestors in a confrontation against police. A bomb blew up, shots were fired, and police and civilians were killed, leading to massive rioting and more strikes.

Some business leaders, such as Andrew Carnegie, had conflicting feelings about unions. In response to the growing union movement, Carnegie wrote that trade unions, on the whole, were good for both laborers and business owners. He argued that salaried managers, representing their own interests rather than the interests of owners or laborers, were the source of the problem. Carnegie recommended that wages be directly linked to the price of the product or service. He favored the 8-hour workday only if it were widely adopted, so that everyone competed based on the same rules.

At the same time, Carnegie attempted to break the Steel Workers union, which represented employees at his Homestead, Pennsylvania, steel mill, in 1892. Management had unilaterally cut wages and locked out the union. Guards from the Pinkerton Detective Agency were hired to protect the plant against union demonstrators. The union rioted and occupied the town. The governor called in the militia to restore order. In the ensuing battle, 14 people were killed and 163 wounded. Carnegie reopened the plant as a nonunion facility.

In the late 1800s and early 1900s, union leaders more readily identified themselves with the anarchists, socialists, and communists who believed that capitalism was inherently unethical and cruel toward laborers. In response to inhumane working conditions and union strikes, Congress created the Department of Labor in 1913. William B. Wilson, the first secretary of labor, began working in the coal mines at the age of 9 and had been both an officer of the United Mine Workers and a congressman.

At the onset of the Great Depression, 7% of all employees were union members. Union membership grew in response to these economic hardships, forcing political leaders and President Franklin Roosevelt to develop a new set of laws governing labor relations. The passage of the National Labor Relations Act of 1935 legally obligated employers to negotiate with duly elected unions. Workers now had a legal right to collective bargaining.

The Taft-Hartley Act of 1947 was passed in response to the rise of dictatorial communism as a worldwide threat to democratic capitalism. Fearing that politically motivated strikes could ruin the economy, the legislation prohibited Communist Party members from holding union offices and established limitations on strikes and picketing. In 1955, the AFL merged with the Congress of Industrial Organizations (CIO), which organized employees according to industrial interests and had previously pursued more militant tactics. The Landrum-Griffin Act of 1959 was enacted in response to concerns about union corruption; it required democratic reforms within unions, such as regular open elections and the filing of membership and financial reports with the Department of Labor.

By 1960, approximately one third of all wage earners were union members. In 1962, federal clerical and technical employees gained the right to unionize, though not the right to strike. The union movement also spread to the service sector, farmworkers, and academia. Beginning in the late 1960s, unions began organizing higher education professors for the purposes of collective bargaining. By the early 1970s, the American Association of University Professors (AAUP), the American Federation of Teachers, and the National Education Association represented faculty at community colleges and public and private 4-year institutions throughout the nation. Currently, approximately 31% of the faculty teaching at 4-year institutions and 63% of full-time faculty at 2-year institutions are members of collective bargaining units.

Despite these new areas of recruitment, union membership steadily declined as the United States began to shift away from its manufacturing base, the most heavily unionized sector in the economy, due to foreign competition. Currently, more than 50 unions operate under the AFL-CIO banner. The AFL-CIO advocates for union interests at the local, state, and federal government levels and partners with unions from other nations on global trade issues.

More important, labor unions evolved differently in other nations. In Great Britain, union leaders formed their own political party, the Labour Party, and obtained legal recognition sooner than unions in the United States. Some European nations had rival Christian and Socialist trade unions. In the Soviet Union and other Communist nations, unions became tools of politicians to obtain economic goals, until the collapse of dictatorial communism, which began in 1989. In Germany, codetermination laws require medium and large employers to allocate up to half the seats on their boards of directors to union members.

Union Violence and Corruption: The Teamsters

Historically, the union movement has been hampered by the stigma of violence and corruption. In the late 1800s, employers bribed police, militia, and criminals to harass and physically attack union organizers and their families. Some union members responded to violence with violence. In addition, unions organized migrants who traveled from one hard labor job to another. Some of these migrants used union membership as an opportunity to exercise their bitterness and resentment against those who had either been born with, or accumulated, more social privileges.

One such person was the union hero Joe Hill. Hill arrived in New York City from Sweden in 1902 and became a journeyman laborer, traveling from state to state looking for work. He joined the Industrial Workers of the World (IWW), a militant union based on the Marxist critique of capitalism. Hill composed prounion folk songs to inspire union organizers and strikers in their fight against abusive business owners and scabs who crossed the picket line. He was jailed for sabotaging an employer, which made him more militant. Hill obtained work in a Utah mine, but ill health and a bad economy led to unemployment. He was later accused of killing a Utah grocer, found guilty by a jury, and executed in 1915. Most scholars believe Hill was indeed guilty, but the IWW supporters claimed he was framed and declared him a martyr. Songs written by him, and about him, continue to be sung at union gatherings.

Most unions have high ethical standards, but not all. The International Brotherhood of Teamsters is allegedly the most notoriously corrupt union in the United States. The Teamsters were chartered by the AFL in 1899 to organize the transportation industry and quickly became the nation's largest union. Teamster leaders represented working-class laborers who worked 70 hours a week driving teams of horses to deliver products. Membership was expanded to laborers loading and unloading products at shipping docks, railroad depots, and warehouses. Within 6 years, the union won higher wages and a 52-hour workweek.

Unfortunately, people with criminal histories rose to leadership positions and formed alliances with well-organized criminal gangs. Teamster leaders, aware that employee wage demands and strikes could destroy a business, extorted money from business owners. Teamsters solicited payments either to not go on strike against a company or to conduct a strike against a competitor. The Teamsters intimidated nonunion employees to force them to join the union, using threats of physical violence. They also refused to transport products to or from businesses unless union members were employed or an extortion fee paid. Organized crime gangs, like Al Capone's group in Chicago and the Mafia in New York City, took control of local Teamsters unions when Prohibition ended and raided their pension funds.

During the 1950s, the Teamsters, still the nation's largest union, were led by Dave Beck and Jimmy Hoffa, both of whom had strong ties to organized crime. Their threat to interstate commerce transactions led to Senate committee hearings on union corruption. The public learned about unfair elections, extortion, embezzlement, kickbacks, money stolen from member benefit plans, no-show workers, and bribery, which led to some of the union reforms codified by the Landrum-Griffin Act of 1959. The Teamsters were expelled from the AFL-CIO in 1957 for their involvement in illegal activities; they were readmitted 30 years later but voluntarily withdrew from the AFL-CIO in 2005.

Profile of a Union Organizer: Cesar Chavez

Cesar Chavez represents a typical profile of a union organizer. Chavez, inspired by Gandhi's message of nonviolence and by Catholic social justice teaching, unionized immigrant farmworkers in California and led a 10-year nationwide boycott against nonunion grapes, until his death in 1993.

Chavez was born in Arizona in 1927, the son of illiterate Mexican immigrant parents. His father lost the family farm during the Depression and migrated to California. The poverty-stricken family lived in a tent and traveled throughout the state picking grapes, strawberries, tomatoes, and cotton. Chavez enlisted in the United States Navy following World War II and returned to California when his service ended. There he was recruited as a community organizer by Saul Alinsky's Community Service Organization and led a voter registration campaign for Chicanos.

In addition to receiving below-poverty wages, farmworkers were charged for ice water and had no bathroom facilities. Some supervisors charged for transportation to the fields and collected social security payments that were never recorded. Chavez started an underground newspaper, held secret meetings, and eventually founded the National Farm Workers Association in 1962, later renamed the United Farm Workers, to represent the rights of farmworkers.

Filipino grape workers went out on strike in 1965 for better wages and unemployment insurance. Chavez persuaded Mexican and Latino workers, fearful of being deported for immigration violations, to join the strike. Landowners accused Chavez of being a communist and imported Mexicans to work the fields. Local police sided with the landowners, threatened strikers with attack dogs and deportation, beat them up, and sprayed the strikers with pesticides. Some union members were illegally arrested for saying the word *strike* in public.

Chavez raised public awareness about these events by speaking at churches and universities. He called for a nationwide boycott of Schenley Industries, which purchased the farmworker-picked grapes for its liquor products. In the spirit of Gandhi and Martin Luther King Jr., Chavez led a 300-mile march to Sacramento, the state's capital, demanding political action. In 1966, Schenley Industries capitulated and recognized the union as the farmworkers' bargaining agent. Chavez spent the rest of his life expanding the union, participating in collective bargaining negotiations, and conducting strikes and boycotts.

The Ethics of Union Management Tactics: The University of Bridgeport Faculty Strike

Managing in a union environment can be extremely difficult. Most union contracts restrict managerial discretion. Strikes are very emotion-laden events that contain a plethora of ethical dilemmas. The behavior of the University of Bridgeport's administration and faculty union exemplifies some of these issues. The longest faculty strike in U.S. higher education history began in 1990 at the University of Bridgeport and lasted 2 years. The university administration locked out striking faculty and hired permanent replacement faculty. With the school on the verge of bankruptcy, the union was decertified.

The AAUP collective bargaining agent was certified in 1973, when a combination of declining enrollments, inflation, high capital expenditures, and large deficits suppressed wage increases. When administrators refused to negotiate with a faculty wage committee, the faculty authorized the AAUP as its bargaining agent. During the next 17 years, contract negotiation disputes focused on shared governance issues, managing faculty reductions during a time of declining enrollments, and determining fair wages. These deliberations resulted in a 3-day faculty strike in 1975, a 16-day strike in 1978, and a 2-day strike in 1987.

The faculty union never fully recognized the depth of the university's precarious financial situation. Union leaders, predominantly from lower-paying liberal arts departments that were threatened with the greatest position reductions, were convinced that the university had substantial financial resources. In January 1990, banks that had extended loans of more than $10 million demanded immediate cost reductions. The university president declared financial exigency in March 1990 and unilaterally eliminated 50 faculty positions, representing 27% of the faculty, without 1-year prenotification or severance pay. The union sued for failure to abide by its contract's legally binding due process clause. The president agreed to honor the contract until it expired in May 1990.

The university president hired a well-known union buster. During summer negotiations, the administration proposed a new contract that included a draconian 30% pay cut, a reduction in prenotification to 30 days, and no severance pay. This translated into a reduction in average salaries from $46,000 to $33,000 and a one-in-five chance of being laid off in 30 days without any severance benefits. By the time school began in September, a contract agreement had not been reached and 125 of the 175 full-time faculty went out on strike. Most of the 50 faculty who crossed the picket lines were from the professional schools. The union offered to return to work under the terms of the previous contract. The administration rejected the offer because it could not afford to pay faculty salaries under a temporary continuation of the previous collective bargaining agreement. Doing so would have put the university in default of its bank loans.

Students began withdrawing their tuition payments, which worsened the university's cash flow crisis. The administration declared a back-to-work deadline, and 40 of the original 125 striking faculty returned to work. For all intents and purposes their crossing the picket line broke the strike. The administration hired 20 permanent replacement faculty where needed. By mid-September, the university had 110 professors on its payroll. The administration achieved a labor reduction of 65 faculty by locking out the striking faculty.

Returning faculty crossing the picket line provided several justifications for doing so: They could not financially afford to lose their jobs to permanent replacements; the union was asking for too much given the university's financial distress; a continuation of the strike would destroy the university; and they wanted to help students enrolled in their programs complete the semester. The remaining locked-out strikers tended to be older faculty with a strong commitment to academic freedom and faculty whose positions would have been eliminated in March, though there were several exceptions.

The now jobless striking faculty, having worked at the university for an average of 25 years, were outraged at being permanently replaced. This had never happened before in academia. The striking faculty lobbied students to withdraw from the university, picketed the board of trustees, requested that local high school guidance counselors not recommend the university to graduating students, and disrupted graduation ceremonies.

When the Fall 1991 semester began, enrollment was down 25% from the start of the strike. The university, technically in default on its bank loans, was on the verge of losing its accreditation and bankruptcy. The university president was forced to resign by the board of trustees. The university avoided bankruptcy when the Professors World Peace Academy, an organization funded by a controversial Korean religious leader, supplied $50 million in exchange for majority control on the board of trustees. The university lost 75% of its enrollment during the 2-year strike. The inability of both union and administrative leaders to engage in cooperative trust-based negotiations ruined the careers of many faculty and administrators and nearly destroyed the university.

Current Status of Unions

Union membership totals differ from nation to nation. According to the 1997 to 1998 World Labour Report, the percentage of wage earners who are union members has declined worldwide since the 1980s due to economic, political, and cultural factors.

In the United States, union membership steadily declined from 35% in 1955 to 20% in 1980, and to just 12.5% in 2004. The highest unionization rates were in the public sector, namely employees in government, education, and protective services, such as firefighters and police officers, all at around 36%. Unions claimed only 8% of private sector employees. On the high end are transportation and utility companies at 25%. At the low end is the financial service industry at 2%.

Union decline in the United States is attributable to a host of factors, including the following:

- A job shift from manufacturing with high employee density to a service economy with low employee density
- Relocation of facilities to overseas regions that lack unions
- Employee satisfaction with existing work conditions being enhanced because of the adoption of participative management techniques and profit sharing
- A strengthening of antiunion labor laws
- Damage caused by corruption within unions
- Inadequate union leadership

According to the 1997 to 1998 World Labour Report, Western European union membership was highest in Sweden (77%), Iceland (71%), and Denmark (68%), and lowest in France (6%) and Spain (11%). Germany had 30% union membership and the United Kingdom had 26%. Most Western European nations had experienced declines from a decade earlier.

Former Eastern European communist nations tended to have higher rates of union membership than their Western counterparts, with Belarus at 96%. But Eastern European nations also experienced significant declines. After being liberated from Russian domination, trade union membership in Poland dropped from 47% in 1989 to 27% in 1995.

In Africa, Egypt had the highest level of union membership at 30%, but this was down from 39% a decade earlier. South Africa had 22% and Kenya had 17%. Mauritania, Guinea, and Gabon each had rates less than 3%.

In Asia, democratic capitalist Taiwan had 28% union membership compared with 55% for dictatorial communist Republic of China. Japan had 18% and India just 5%. In Latin America union membership ranged from 32% in Brazil and 31% in Mexico, down to 4% in Guatemala. Elsewhere, Russia had 75% union membership.

A union's ultimate weapon against a recalcitrant owner is a strike, the collective refusal to work. An owner's ultimate weapon against a recalcitrant union is a lockout, the refusal to allow employees to work. The 1997 to 1998 World Labour Report collected statistics that combined the number of strikes and lockouts in each nation. Leading the list were Russia (8,856), France (1,671), India (1,062), Spain (883), Australia (643), and Italy (545). The United States had just 31 strikes and lockouts.

The Future of Unions

Union membership is historically low. Dissension within the AFL-CIO regarding appropriate recruiting and political strategies threatens the federation. In 2005, four unions boycotted the 50th anniversary convention of the AFL-CIO merger to protest its current leadership. Then the Service Employees International Union and the Teamsters—the two largest AFL-CIO unions, representing one fourth of the federation's membership and accounting for one sixth of its budget—withdrew from the coalition, leaving it with 54 unions and 10 million members.

Nonetheless, the issues relevant to unions remain salient. According to the Economic Policy Institute, 24% of working Americans have incomes below the federal poverty level. Wages have been stagnant for 30 years. During the 1960s, scholars predicted that by the year 2000, technological advancements would reduce the average workweek to just 20 hours. Instead, between 1973 and 2000, the average annual hours spent working increased by 199 hours. Labor-saving technologies continue to create anxiety over job loss. Downsizing has caused the survivors to do the work of two people, while those dismissed work two jobs to achieve an equivalent prior income.

Research has shown that long working hours have negative impacts on employee productivity, employee health, family issues, and the natural environment:

- *Employee productivity impacts:* increases error rates and reduces productivity
- *Employee health impacts:* increases stress, fatigue, depression, high blood pressure, heart attacks, obesity, diabetes
- *Family impacts:* decreases the time available for family meals and increases job-escape drinking
- *Environmental impacts:* increases consumption and greater use of disposable items

The modern union agenda shares many similarities with the original union agenda. Employees continue to need better wages, benefits, and working conditions, and shorter working hours. Immigrants need more protection from abusive owners and managers. Other future items on the AFL-CIO agenda include universal health care, elimination of discrimination, and wage and income equality.

Conclusion

Unions can be agents of social change and workplace justice. They can also be corrupt and destructive. One thing is clear: For the past 50 years they have been steadily losing more members than they have gained.

Labor unions perform an essential equalizing function, leveling the playing field between powerful business owners and organizational managers, who seek to minimize employee wages and benefits and dictate workplace rules, and individual employees who lack the power to adequately represent their own interests. Unions typically arise in circumstances where employees are continually dissatisfied with wages, benefits, and working conditions. They counteract managerial power by providing a unified employee voice.

Laissez-Faire

It is said that the 17th-century French finance minister Colbert once asked a group of businessmen what he could do for them. One of them, Legendre, is supposed to have replied, "Laissez nous faire" ("leave us alone!"). The reply became a slogan, serving ever since as a tag for the policy of keeping government direction of the economy to a minimum. (Some argue that the minimum should be *none.*)

The theory of laissez-faire stems from the fact that what we call an *economy* is a vast array of interactions among individuals, each of whom is concerned with making his or her living by organizing and exerting skills and energies to that end. In the process, the agent will frequently find it advantageous to benefit from the productive energies of other agents by making trades. There are two hallmarks of these trades. First, each party is motivated by his or her *own* interests—not "advancing the general good" or some other theoretically questionable motive, but by his or her own interests, *whatever* they are. Second, each individual participating is free to take or leave any particular proposal made by the other party. The two are linked together in that when parties freely exchange, we infer that each sees the choice as being to his or her own benefit—otherwise why would they do it? But given that it is to one's benefit, why would not one do it? Having an actual interest in something is an intelligible explanation of why someone did something, and having an interest in oneself, whatever else, is something we're generally safe in presuming for anyone.

The case for "leaving them alone" derives from this presumption. Each participant is inherently motivated to seek out trades and to take the best options available. It is not obvious why any direction or regulation would be required to accomplish this end. Why might it be?

Here are several familiar answers.

1. Countering Force and Fraud. One answer is that while people are indeed motivated to promote their respective advantages, they are not necessarily motivated to do so in a way that respects the freedom of others. Besides trading, another way of getting something from someone is simply by taking it, by stealth or force. Still another is by fraud—claiming to be offering one kind of good or service when in fact what will be delivered is not as described, or perhaps not delivered at all: "Take the money and run" is, in short, a temptation. The need for intervention of some kind is inferred from this possibility. We may need to set up mechanisms either for preventing fraud and violence in the first place, or at least for detecting, apprehending, and punishing those who engage in it. In this respect, of course, the need for intervention in exchanges is the same as in the case of any interpersonal actions.

2. Limited Knowledge. The other answer is rather different. According to it, trades take place on the basis of knowledge on the part of each participant. But what if the individual's knowledge is insufficient? That party may then be unable to pursue advantage as intended. The proposal, then, is to see to it that all operate within an environment of relevant knowledge. The state is then called on to provide it, on a basis of equal provision for all.

3. Providing the Framework for the Market. A variant of this second idea is that trade takes place within a framework provided by the law. Law and regulation establish the forms for trade and thus encourage it, smoothing the way and providing paths, as it were. In one version of this reply, we need law to make trade possible at all: Trade, it is claimed, cannot proceed without a framework of law. Specific ways in which government is said to be needed in this respect would include the provision of forms of currency or money and laws and regulations governing exchange. In the other version, government is needed for the provision of infrastructure, such as roads, bridges, canals, and communication facilities, and economic policy to prevent inflation, deflation, and other economic ills that are thought to have bedeviled economies over the past few centuries.

Advocates of laissez-faire have replies to all of these. They point out that there is no obvious reason why people cannot make exchanges among themselves without any external overseers, and that trades occur all the time among people without police standing over them. Trade has occurred among very primitive peoples as well and between people from distant tribes or communities with no common state to oversee the activity. They also note that infrastructure can be and has often been provided by privately acting parties. This includes even the provision of monetary facilities such as coinage and banking procedures and forms. Economists explore the potential for nongovernmentally based facilities of these kinds, and it seems fairly clear that the case for the literal necessity of the state as the provider of them has been by no means established.

In any case, an advocate of laissez-faire need not be a philosophical anarchist. The free market proponent can simply suggest that the minimum amount of governance needed to make exchange function is very tiny and that substantial control over the terms of trade, whom we may trade with, and control of prices is inimical to the securing of the benefits to which trade can lead.

The Model of "Perfect Competition"

Economic theorists in the late 19th century developed a theory of a "perfectly competitive" economy, proposing that such an economy would indeed maximize the utility of all parties—if certain conditions were met. The following are required: first, perfect *information*, so that each participant knows everything about what is offered, and about all alternatives; second, *many producers*—so many that no single one or small number of them can influence prices by unilateral actions; third, no *transaction costs,* so that the only relevant costs and benefits are those sought from the exchanges themselves; and finally, no *externalities,* these being effects on "external" persons, that is, people not participating in the exchange in question, and such that the effects of the exchange on these parties is either not wanted by the parties or not wanted by the exchangers themselves, but nonetheless they affect the pattern of benefits and costs. In fully "internalized" trade relations, each party to the trade would bear the cost if and only if that party also received the relevant benefits, and vice versa. If any of these conditions is lacking, so it is argued, there will be departures from perfect efficiency. And it is also argued that rectifying these deficiencies, again, justifies the intervention of government.

Again, supporters of laissez-faire have replies. First, they point out that the "ideal" of a perfectly competitive economy is idealized in the sense that it would be impossible for any of its conditions to obtain. It is commonly said that a completely free or a so-called perfect market could not exist. That is obviously true: "Perfect information" makes little sense, as well as being obviously impossible; transaction costs are inevitable; and the category of externalities is so broad that it is again unclear even what the condition is supposed to exclude, other than violence and fraud. This makes it dubious to use the model for the purpose of describing economic reality. Information simply does have costs, and others do not automatically have a right to it. So the laissez-faire advocates propose that the right thing to do is to have those who discover it sell it to those who do not have it but want it. Transaction costs simply do happen, and people can make fortunes by discovering and marketing ways to lower them: Banks, for example, are in that business. Negative externalities too can be managed by firms protecting people from them and via arbitration services to sort out disputes regarding them. Violence is avoidable—easily so among reasonably civilized people—and it is possible to take measures to reduce or eliminate it in cases where it is a problem without resorting to centralized authority. Defenders of laissez-faire also argue that state intervention as a cure for these supposed shortcomings is worse than the disease. (And "anarcho-capitalists" argue that it *always* is and thus that government as such is not justifiable.)

Laissez-faire supporters propose that the correct model of the *ideal* market is not the so-called perfectly competitive market but simply the market in which there is no authoritative intervention by persons external to exchanges and not themselves affected by them. This would be the situation where the relevant factors were simply the resources of the various parties, which are recognized by the others as belonging to their owners, and their interactions, which are with a view to securing the best outcome that can be achieved by each participant.

If a "perfectly competitive" economy is unrealizable, the more relevant idea of a market in which no agent is coerced by further agents is quite realizable and often is, in limited ways, realized. When we go to the supermarket, no one prevents us from choosing whatever we want from what is available, unless it turns out that we cannot pay for it. There is typically a lot of competition, no store being in a position to charge whatever it likes, but never so much competition that prices absolutely do not vary from one to another. In any case, no one can charge "whatever he or she likes," since at some point their hoped-for customers simply will not buy. The condition of perfect competition is in fact impossible to define, since everyone competes in one way or another with everyone else, and price adjustments, great or small, are continually being made.

Monopoly

An instructive application here concerns monopoly. Critics of laissez-faire contend that monopoly is an evil that clearly justifies state intervention to prevent it—a point of view that has led to antitrust legislation in many countries. Upholders of laissez-faire argue that the claim that free markets tend toward monopoly is not obviously true and, if anything, the reverse. The purpose of monopoly would be to be able to charge above-market prices; yet if firm X charges above-market prices, it would mean, by definition, that others could make money by charging less than that. Why would they not do so? As long as entry into the market is not artificially impeded, most notably by government, it seems that they would indeed do so.

Reflection on this point leads to the need to distinguish between two kinds of monopoly: one in which the monopolist enjoys government support, *compelling* potential competitors to stay out, and the other in which even though competitors are not prevented by law from entering the market, no one else is in fact able to make a go of it—the monopolist is so because of superior efficiency, organization, quality, and price. In this latter case, supporters of the free market point out, it's hard to see why the public should be motivated to break up what is apparently a good thing. But in the former case, monopoly is not a problem for the laissez-faire theorist but rather a manifestation of its absence. If monopoly is bad, then the state shouldn't be creating it. In the unlikely case that it's good, why should government suppress it?

The "Invisible Hand" Thesis

A famous thesis from Adam Smith's *The Wealth of Nations* introduced the expression "the invisible hand" in support of laissez-faire. All individuals direct their industry so as to produce what is of greatest value, even though they aim at only their own gain, and so, as if "led by an invisible hand," they promote a good public end that was quite unintended. Smith's claim is that the wealth of the *nation* is promoted by the individual's promotion of his *own* interest, without any aim of advancing the wealth of the whole. Why would this be plausible? The answer is that when the market is a socially supported institution, there is a general recognition of the rights of property. People own various things and are entitled to them just because they have either created those things by their work or gotten them by freely trading with others: Theft, violence, and fraud are not permitted. So long as those restrictions are observed, the market works for the public good in that the only ways in which it can work for the reverse are blocked. So, all trades will work to some people's good and no one's harm. Moreover, when person A gains something valuable to her by an exchange with B, who in turn has something more valuable from his exchange with A, the stage is set for further, still more beneficial exchanges with yet other people. Trade generates *positive* externalities in that sense. This is most clearly illustrated in the case where A acquires from B capital goods enabling A to produce consumer goods more efficiently than A would otherwise have been able to do. The benefits of this exchange to A's later customers continue indefinitely at a level higher than they otherwise would have been. In general, freely acquired gains tend to generate still further gains, and only interferences with those free activities will make for the worse. Smith's thesis, then, looks promising.

Equity and Equality

An area in which opponents of the free market have been vocal is equality. Their thesis is that the free market pays no attention to equality and indeed creates inequality. Given a free market, we will expect some people to do better than others—probably, much better. First, some people are much more productive than others, and so will be able to make trades more profitable to themselves. This may be because they are more clever, more hardworking, or more skillful. Or, second, it could easily be that some people just happen to be "in the right place at the right time" as, for example, in stock market purchases or because their particular talents are just what people need at that time and place. Even the ingenious inventor needs to be born in the right age so that his or her talents can generate the goods that people in that age and place will be able and willing to buy. In short, luck is also likely to cause some to prosper more than others.

This argument raises a deep question of social philosophy: Are people indeed entitled to the sort of "equality" that consists in having similar levels of income? The most forthright response of the free market theorist is to deny that they are. The free market philosophy certainly treats everyone as equals in other basic respects. No one is entitled to use force against *anyone* else for *any* reason other than for protection of person or property, and this applies whether the victim is black or white, male or female, religious or irreligious, and so on. Moreover, the market cares, as it were, only about "the color of your money." People may select trading partners on any basis they like, but if they are hiring people to help them produce, or to appeal to customers, the market works strongly against what we usually consider "discrimination." One has but to witness the success of black athletes in professional sports, where once legally imposed color barriers were broken down, to see the powerful forces of the market at work in eliminating irrelevant distinctions—much to the improvement of those sports, as well, in the view of virtually all enthusiasts.

The market does indeed "discriminate" against those who lack productive skills or savvy, and certainly luck will often play a part. But why would these be objections? The former effect works greatly to society's benefit, by encouraging what is more to social advantage. As for luck, a main point about it is that it is unforeseeable, by definition, and attempts to eliminate its effects are sure to be counterproductive. Moreover, the rules of the market ensure that those effects will be good rather than bad, though not, of course, equally good for all.

In countries such as the United States, where the free market flourished, probably more effectively than anywhere else for a long time, prosperity has been their reward. A major effect of this prosperity is that it has been very widespread: Poverty in the United States is rare, and what is called "poverty" there would be considered great good fortune in most of the world. If the concern about equality is that some people will be, not just less well off than others, but actually suffering, starving, or in desperate want, then the free market supporter can plausibly reply that the market will do far better than any other kind of social system in reducing or eliminating those evils. Apart from that, it surely should be doubted if it is a good thing when people with amazing talents or extraordinary business acumen get no more than the untalented and incompetent. Given the enormous benefits to most people from the fact that people *can* become wealthy performing socially useful services, it is arguable that the egalitarian has no real case. It must be remembered that the only way to make a lot of money on the market is to sell a lot of things that people want to a lot of people. How can we complain about *that?* So asks the supporter of laissez-faire.

Complaints About the Market: Cultural

One often-heard complaint is that a market economy leads to a market *society* and that this would be a bad thing. The market society, it is claimed, would be full of extremely competitive people—a sort of "dog-eat-dog society." People would be fixated on owning as much as they could and would turn into greedy people with shallow values, and so on. Defenders of the market respond that this familiar and fashionable criticism is almost impossible to evaluate. We all live in a society in which such behavior is possible, but most of the people we know are not like that. Even highly competitive businesspeople are often civilized, interesting, intelligent, outgoing, and warmhearted in their social lives. Clearly, any tendencies in that direction are resistible by individuals and have apparently been resisted by most of them. Where do we go from there?

As regards the marketplace for culture in a more literal sense, proponents of the market can point to the enormous support of museums, operas, symphony, and the like in 19th- and early-20th-century America prior to substantial public financing of those things. They argue that capitalism can and does support the arts. Artists, musicians, and other creators have always faced the question of how to make a living by their talents, and they appear to do so very well in fairly free market societies.

Complaints About the Market: Economic and Technical

Somewhat more technical criticisms of the market are widespread. It is widely claimed that the market is subject to "market breakdown," which requires government action to counteract it. And it has long been held that market economies are subject to "business cycles"—namely, "booms and busts," as classically exemplified by the Great Depression in America. This general issue is the subject of much controversy in the economic literature, but supporters of the market have strong arguments on their side as well. They point to the fact that downturns have been of much more modest proportions in the past 60 years and cite extensive research that has shown that bad monetary and fiscal policies by governments are the main cause of depressions, rather than anything internal to the market.

Land Ethic

The Land Ethic is a perspective within environmental ethics that grants ethical priority to ecosystems and other ecological entities. Although the Land Ethic is sometimes used to refer to any ecocentric environmental ethic, the phrase originated in the writings of the American ecologist and writer Aldo Leopold (1887–1948) and is most commonly identified with Leopold's views.

"Ecocentric" ethics integrates ethics and ecology by bringing such ecological wholes as species, populations, habitat, and ecosystems to the center of ethical consideration. Thus, an ecocentric approach is distinguished from biocentric ("life-centered") approaches by its emphasis on ecological concepts rather than on individual living animals and plants. Ecocentric ethics also gives ethical consideration to nonliving natural objects, such as rivers, wetlands, and mountain ranges, in ways that a life-centered biocentric ethics does not.

The science of ecology developed during Leopold's lifetime, and he was the first person to call for a radical rethinking of ethics in light of this new holistic science. Leopold's thinking was presented in the posthumously published *A Sand County Almanac* (1949), and the definitive section of that book, an essay titled "The Land Ethic," is the first systematic presentation of an ecocentric ethics.

Leopold began that essay by retelling the story of Odysseus, who, on returning from the Trojan War, hanged a dozen of his women slaves for misbehavior. Because slaves were understood as property, Odysseus's action was not seen as unethical or inappropriate. Since that time, ethics has evolved so that moral standing now is extended to all human beings. "The Land Ethic" is Leopold's call to continue this extension of ethics to include land, plants, and animals. Leopold appears to defend a version of biocentric ethics by extending moral consideration, what he termed "biotic rights," to birds, soils, waters, plants, and animals.

Yet throughout his life, Leopold remained an active hunter and fisherman, and an advocate of other activities that treat natural objects as resources for human use. The apparent inconsistency between advocating biotic rights for natural objects and supporting hunting, fishing, and timber harvesting was resolved by Leopold's insistence that we view the land ethic holistically. It is the "land community" that is granted moral standing. Individual members of that community can still be treated as resources as long as the community itself is respected. The "ecological conscience" teaches that humans are but members of the biotic community—"biotic citizens," rather than conquerors of nature. Ecology shifts the focus of moral consideration away from the individuals emphasized by biocentric approaches and onto biotic wholes.

Accordingly, the extensionism that is at work in the Land Ethic does not ask that we simply extend moral consideration to other living beings and make room in our moral deliberations for yet another type of individual moral subject. Leopold asks that we make a category shift away from individuals and grant moral standing to communities, symbolically represented as the land. This shift to an ecocentric approach is central to the Land Ethic.

This aspect of the Land Ethic is concisely summarized in Leopold's most celebrated and controversial statement that "a thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise" (from *A Sand County Almanac*). When combined with some basic ecological observations, this principle can be used to generate the specific normative conclusions of the Land Ethic.

The Land Ethic uses the image of a "biotic pyramid" or "land pyramid" to help us understand the nature of the biotic community. The land pyramid represents the structure of biotic and abiotic elements through which solar energy flows. This structure can be understood as a pyramid, with soil on the bottom, followed by a plant layer, an insect layer, a bird and rodent layer, and so on up through the larger carnivores. As long as the structure and function of this pyramid is maintained, individual components of that structure can be used as food and resources for humans. Indeed, this fact simply acknowledges that all living beings use both other living beings and the abiotic components of their environment as resources.
