A case of perfect procedural justice arises when there is independent knowledge of the outcome and it is possible to devise procedures that will reliably, or perfectly, lead to that outcome whenever it is applied. In short, perfect procedural justice arises when the procedure ensures no unjust outcomes. An example of perfect procedural justice is the solution of a conflict about the fair distribution of pie among dinner guests, in which the person slicing the pie is the last to select his or her piece. This will ensure that not only the pie is as equally divided as possible but also the distribution among the guests is fair. It would be irrational for the pie slicer to assume that a larger piece would be left for him or her after the other guests had taken theirs, assuming that more pie is better than less pie. This example notwithstanding, perfectly just procedures are difficult to construct for all cases in which they would be useful.

Imperfect procedural justice is similar to perfect procedural justice in that the just outcome is known independently but it is not possible to devise procedures that will reliably lead to it. In imperfect procedural justice, it is recognized that even the best possible procedure may result in the occasional unjust outcome. An example of imperfect procedural justice is contest applied to a case of employment, which only reveals the most meritorious candidate on the day of the contest and is not a general predictor of similar or constantly high-quality performance over the term of the employment contract. A candidate for an office position may be interviewed on a day when he or she has a cold, though it is not obvious to observers, and is slower to respond than usual. This may create the impression that the candidate is dull or disinterested in the job. Alternately, a candidate may do exceptionally well when the assigned task is one he or she has done repeatedly and for which he or she has developed an impressive expertise. However, the candidate may be the least qualified to do the other related tasks of the job, which would only become apparent after he or she is hired. The procedure in question only imperfectly results in just outcomes. In such a case, it is wise to combine this procedure with another, which may also only imperfectly result in justice but when combined with the first procedure improves the likelihood that justice will be achieved, or at least that injustice will be avoided. It may be that the best that can be achieved in any case is an imperfect procedure that reliably, but not always and not perfectly, results in a just outcome.

Disagreement as to the possibility of identifying perfectly just procedures is deep and is reflected in the choice of commonly used examples: Jury trials, democratic elections, collective contract bargaining, and mediated arbitration are all taken as examples of either perfect or imperfect procedural justice. This is a strange phenomenon, since if a procedure is perfect, it should never result in injustice. But if the same procedure is used by some scholars as an example of perfect procedural justice and by others as an example of imperfect procedural justice, then which is really the case? Are jury trials perfect, in which case at least they do not result in injustice? Or are they imperfect and result most of the time in just outcomes but some of the time not? The answer is important since it shapes collective expectations of what the results of the procedure should be, when the procedure should be applied, what counts as evidence of success or failure, and how to respond to incidences of failure in the process.

Pure procedural justice is a third variation of the concept of procedural justice. Pure procedural justice obtains in circumstances in which we do not have independently verifiable knowledge of what the just outcome is. In such cases, the procedure itself determines what justice is. In this way, the procedure guarantees the justice of the resulting outcome. The challenge in cases of pure procedural justice is determining the justice of the procedures in advance of their application. At this juncture, the justificatory role of associated values—such as fairness, equality, or desert—is crucial. John Rawls devised a theory of justice on the basis of pure procedural justice. His account of justice includes a decision-making procedure for arriving at the requirements of justice for the basic structure of society. Unlike instances of perfect or imperfect procedural justice, we do not have any independent means of identifying the requirements of justice for the basic structure of society, yet it is imperative that we do so if what we want is a just social order. In Rawls's formulation, justice requires that any result from this procedure be fair among the parties, that each party be treated as an equal, and that the procedure be rational, or at least reasonable. If these conditions are met, then the resulting procedure would itself result in justice for all parties. In this way, the procedure itself verifies the justice of the outcome.

These ways of conceiving of procedural justice help resolve the final philosophical issue: Why would justice require following procedures at all?

By way of an answer, in normative ethics, it is clear that a moral outcome may be attained by any variety of means. Among the principal problems in ethics is establishing which of the available means *ought* to be used. A dialysis patient in terminal renal failure may be saved by a variety of means, including the abduction of and forced removal of a healthy kidney from a child. This means of securing a morally desirable end would rightly be ruled out as immoral on almost every account of ethics. The concern with procedural justice is similar. Though we may know what the just outcome is, following the specified procedure is important to ensure that the expected outcome really is just and that no related values are violated in the process.

Consider the jury trial scenario. The police, the prosecutors, the judge, and even the defense lawyer may all know by independent means that the accused is the guilty party. The defense lawyer may know this from the accused's sincere confession at their first meeting. The arresting officer may know this because he witnessed the accused do what is charged, and so forth. Barring for a moment the very important philosophical problems of knowledge by observation, testimony, and confession, each of these individuals knows what the just outcome is: The accused deserves punishment, and a guilty verdict should be issued by the jury.

The importance of following established criminal law procedures, however, ensures not only that the outcome is just (i.e., that the one who deserves punishment is punished) but that the accused has every opportunity available to dissuade the jury from believing that he or she is guilty. This includes the opportunity to challenge what is asserted as true or known by those claiming to know. Sending the accused to prison, circumventing a trial, may be more efficient but may not be just in the fullest sense of the term—that is, when justice is understood in conjunction with the related moral values of fairness, equality, and desert.

Alternatively, in the case where it is not possible to establish independently what the just outcome is, pure procedural justice prompts us to consider the possibility of advancing procedures that satisfy the related values and that, thereby, can ensure a just (or not unjust) outcome, whatever it may be.

Procedures are also important for the very simple requirement that like cases be treated alike. The most effective means of achieving this basic tenet of common-law legal systems is to establish a set of procedures that apply to all cases of dispute or conflict of a certain sort. For example, all cases in which the conflict revolves around a dispute over criminal violations where life or liberty is at risk will be decided by jury trial combining discussion of merit and voting. Other conflicts with less severe penalties may be decided by a presiding judge according to established minimum sentencing guidelines and limited discretion. Consistency in decision making, and thereby satisfaction of the values of equality and fairness, is facilitated by consistently applied procedures.

Procedural Justice: Social Science Perspectives

Procedural justice refers to the fairness of the procedures used in decision making. In contrast to distributive justice, which concerns the fair allocation of benefits and burdens (e.g., pay, workload), procedural justice addresses individuals' evaluations of and reactions to the fairness of the procedures used to distribute those outcomes. For example, in a business situation, the concept of procedural justice might be used to analyze the fairness of the process used to make hiring decisions, to evaluate performance, or to decide who will be laid off in a corporate downsizing. This entry examines procedural justice as an element in dispute resolution, allocation of outcomes, and organizational contexts. It also examines the concepts of interactional justice, relational justice, fairness theory, fairness heuristic theory, and uncertainty management theory.

Procedural justice theory in organizational behavior goes back to work in the 1970s that studied how those involved with dispute resolution in legal settings evaluated the fairness of the procedures used for resolving disputes and making decisions. Key to procedural justice at that time was voice, or the amount of input that participants had in the decision-making process.

Research indicates that procedural justice is associated with positive attitudinal and behavioral effects. However, violations of procedural justice can lead to negative consequences such as sabotage and lawsuits against the organization. Leadership training in justice principles not only emphasizes the importance of ethics but also contributes to the development of fair human resource procedures.

Dispute Resolution

John W. Thibaut and Laurens Walker were the first to develop the concept of procedural justice. Their research showed that disputants' attitudes were more positive to the extent that disputants were given "voice," or the opportunity to express their views, and they used the term *process control* to refer to voice in this sense. Although they focused on the application of the theory in legal settings, it is relevant in nonlegal settings as well. Thibaut and Walker contrasted the legal procedures used in an adversarial system, in which the court functions as an impartial referee between opposing parties, with those used in an inquisitorial system, in which the court participates in the process of gathering information. They found that their research participants preferred the adversarial system, which allows the decision maker only minimal control over the process of evidence gathering and presentation and gives more control to the disputants with respect to the process of evidence gathering and presentation. Thibaut and Walker found that disputants who have an opportunity to provide input into the decision-making process are more likely to perceive it as fair. Numerous studies supported their finding that there is a positive relationship between process control and perceived fairness.

Allocation

Gerald S. Leventhal developed a broader model of procedural justice, in which he identified six characteristics that individuals consider when deciding whether a process is fair: consistency, bias suppression, accuracy, correctability, representativeness, and ethicality. Turning from the dispute resolution context to the allocation of benefits and resources, Leventhal and his colleagues argued that procedural justice is an important consideration in allocation decisions. They developed the allocation preference theory, which holds that allocators will favor procedures by which their goals can be achieved, including the achievement of distributive justice. The authors of the allocation preference theory indicate that justice in allocation can be attained through seven components of allocative procedure:

1. The selection of decision makers
2. The establishment of ground rules to evaluate the prospective recipients of rewards
3. Information gathering with respect to prospective reward recipients
4. The definition of the decision process structure
5. The establishment of safeguards to monitor the behavior of both the allocator and the prospective reward/resource recipients
6. The establishment of procedures to seek redress on the part of the complainants
7. The establishment of mechanisms to change possibly unfair allocative procedures

Research has upheld the significance of these criteria, which have also been applied in other contexts.

Procedural Justice in Organizational Contexts

Jerald Greenberg and Robert Folger applied the concept of procedural justice to organizations. They found that employees in organizations who are given the opportunity to provide input in decision making react with greater satisfaction. They described this result as the "fair process effect," which refers to the positive effects of perceived procedural justice on people's reactions. Since this initial demonstration of the fair process effect, it has also been found in many later studies in a variety of contexts. Studies indicate that employees who perceive their treatment as fair react positively, as evidenced by better job performance, higher organizational commitment, and greater acceptance of organizational policies. On the other hand, employees' perceptions of unfair treatment lead to negative effects such as higher turnover rate, greater work stress, and lawsuits.

Folger and Greenberg advocated giving employees a chance to contribute to evaluation of their own job performance and an opportunity to choose from different benefits options. They also suggested that employees be given information on the criteria attached to each pay level. According to Folger and Greenberg, employees' participation in these human resource functions related to evaluation and compensation promotes procedural justice.

Interactional Justice

First introduced as an independent variable, interactional justice is viewed by various scholars as a component of procedural justice, although some have treated it as a separate construct. Research indicates that interactional justice consists of interpersonal and informational components. The interpersonal justice component involves treating people with respect, dignity, and propriety. The informational justice component refers to authorities' truthfulness in implementing procedures and explaining decision outcomes. Interactional justice may arise from the actions of a system or an agent. To clarify the constructs of procedural and interactional justice, a line of research crosses justice source (e.g., system, agent) and justice content (e.g., consistency of procedures, treatment with respect) to examine the effects of procedural and interactional justice.

Relational Models of Procedural Justice

In their "group value" or relational model, E. Allan Lind and Tom R. Tyler argued that individuals in organizations are concerned about fair procedures because procedures tell them something about how the organization treats people—essentially, how it values members of the group. They developed the self-interest and group value models of procedural justice. With the self-interest model, or "instrumental perspective," individuals seek decision control to maximize their own outcomes. However, according to the informed self-interest model, individuals can gain more favorable outcomes from group cooperation than from individual efforts in the long run. Therefore, the fairness of procedures in making decisions overrides the individuals' preferences for certain self-interested outcomes.

Evidence indicates that procedural justice, independent of outcomes, is enhanced by voice—the opportunity for affected parties to provide input into the decision-making process (or process control, as defined by Thibaut and Walker). The informed self-interest model does not explain process control's noninstrumental value-expressive effects, which are explained in Lind and Tyler's group-value model. Lind and Tyler asserted that the functioning of groups is governed by group identity and group procedures. Fair procedures allow group members to express their views. Value-expressive effects occur when individuals value their membership in a group, regardless of whether their decision-making input will result in a favorable outcome for them, because the consideration of their views confirms their status in the group and their rights as members to participate in group processes. Therefore, voice enhances perceived procedural justice even if it does not produce a favorable outcome.

The group-value model was later revised and labeled a relational model of authority in groups. The latter model indicates that procedural justice judgments are affected by three relational concerns with authority: trust, neutrality, and standing. The authority who considers fairly the views of an individual can be trusted. Decision making that is unbiased indicates the authority's neutrality. The authority who treats an individual with dignity and respect provides status recognition for the latter. The authority's relational concerns of trust, neutrality, and standing as evidenced in the procedures used affect individuals' procedural justice judgments.

According to the relational model of justice, employees who experience fair procedures in an organization feel that they are valued members of the organization. The group engagement model extends this idea by asserting that procedural justice strengthens employees' sense of identity as members of the work group. The group engagement model incorporates three identity judgments: pride, respect, and identification. Pride refers to perceived group status, respect refers to one's perceived status in the group, and identification refers to the extent to which one affiliates oneself as a member of the group. When employees are treated with procedural justice, they perceive their organization to be of high status, their standing in the organization to be high, and their identification with the organization to be strong. These identity judgments resulting from procedural justice lead to high levels of employee cooperation. Conversely, a lack of procedural justice erodes pride in the group, respect for it, and identification with it; these weak identity judgments lead to lower employee cooperation.

Fairness Theory

Robert Folger's referent cognitions theory (RCT) and Folger and Russell Cropanzano's fairness theory, a successor to RCT, involve counterfactual thinking. RCT involves conscious mental simulations of counterfactual alternatives. With fairness theory, counterfactual alternatives can be brought to mind spontaneously. Fairness theory attempts to hold an authority accountable for injustice, with three types of accountability judgments: *would* judgments, *should* judgments, and *could* judgments. With the *would* counterfactual, one's actual state of being is contrasted with whether one would have been better off with another procedure or outcome. With the *should* counterfactual, what was carried out is contrasted with what should have been done according to moral standards. With the *could* counterfactual, a contrast is made between what one has done and what one could have done in terms of feasible options. An experience will be evaluated as unjust if an authority who has inflicted injury on an individual (i.e., the individual *would* have been better off with a different process or outcome) *could* have chosen another feasible option and *should* have acted differently so as not to violate some moral standard. With RCT, the *would* counterfactual is linked to the *should* counterfactual. What would have occurred is conceptualized to be linked to what should have been done. With fairness theory, the *could* counterfactual is connected to the *would* and *should* counterfactuals separately. In other words, fairness theory contends that in addition to the *should* aspect, there are contextual factors that promulgate various feasible options, as denoted by the *could* aspect, which RCT does not take into consideration.

Fairness Heuristic Theory

Fairness heuristic theory is based on the argument that people use a "fairness heuristic" to determine whether to accept an authority's directives. The earliest relevant information, as opposed to information made available later in time, exerts the greatest influence in the formation of fairness judgments. Therefore, for an authority to receive support from subordinates, the latter should be treated with procedural justice the moment they join the organization. Also, where there is no available information pertaining to the trustworthiness of an authority, perceptions of fair treatment serve as the key in determining whether or not to accept the authority's decision. In other words, trust in the authority can be instilled by fair procedures. When information is available with respect to an authority's trustworthiness, then procedural justice information will have a lesser impact on people's reactions. Social interdependence in groups, teams, and organizations is associated with problems such as exploitation and exclusion. Therefore, fairness judgments are needed to assess the trustworthiness of the authority, especially when information pertaining to it is not available, and to determine whether to respond positively to the demands of that authority.

Uncertainty Management Theory and Distributive Justice

Uncertainty management theory also relies on the fairness heuristics. However, while perceived fairness is used in fairness heuristics theory as a surrogate for trust, a source of uncertainty, it is used in uncertainty management theory to deal with not only trust but also other uncertainty sources. Research indicates that people react to perceived fairness more strongly when they have to cope with various sources of uncertainty, such as procedural and distributive issues.

Despite their significant intercorrelation, empirical tests of the theoretical relationship between distributive and procedural justice show them to be distinct constructs and to differentially influence employee attitudes and behaviors. Furthermore, a number of researchers have demonstrated that perceptions of distributive and procedural justice interact to influence outcomes. For example, reactions to negative outcomes are found to be less negative when the procedure is thought to be fair. Nevertheless, discussion is continuing in the organizational behavior literature about the usefulness of the distinction between distributive and procedural justice. Some are concerned that justice researchers have sliced justice into such narrow slivers that it may be less useful or descriptive of how individuals really think about justice in organizations, and they are now discussing the importance of employees' more holistic perceptions of justice and injustice and their use of a more general justice heuristic in their evaluations and reactions.

Productive Efficiency

Productive efficiency, measured by the ratio between output and input, improves when the same input yields more, or better, output and is maximal when the output cannot be increased without increasing input. When the input is monetized and the output is not, the measurement can be called cost-effectiveness, cost utility, or cost efficacy. Productive efficiency is contrasted with allocative efficiency, which describes societywide allocation of resources and the resulting increase in general welfare.

Information about productive efficiency is often highly useful. Furthermore, its basic concepts add a useful clarity to many discussions; for instance, "cost cutting" is not synonymous with improved efficiency, since the result of cost cutting can be less or poorer output. On the other hand, productive efficiency is an inherently comparative and evaluative term and can be easily misunderstood as simple and objective.

To say that a process or system is "efficient" or "productively efficient" is to compare it favorably with some other process or system, or some other period of time, where the same kind of input is used for the same kind of output. When input and output are simple to define and easy to measure, productive efficiency is similarly easy to measure. Other things being equal, efficiency is ethically desirable; inefficiency leads to the unnecessary and therefore wasteful use of scarce resources. Nevertheless, efficiency cannot reasonably be seen as an ultimate goal; instead, it is a desirable quality in pursuing further goals. Allen Buchanan, in *Ethics, Efficiency, and the Market*, discusses the extent to which efficiency is ethically desirable. Janice Stein, in *The Cult of Efficiency*, dissects the contemporary tendency to value efficiency as an end in itself.

Ordinarily, both input and output refer to complex sets of diverse factors. In the transformation of steel into paper clips, for instance, the input includes not only the quantity of steel used but also the labor, the time taken, the machinery used, and other factors. The output could be defined as the quantity of paper clips, their quality, the price they bring, the improvement they bring to the handling of paperwork, and other things. Therefore, in measuring productivity, one must specify what ratio is being examined: the number of paper clips per pound of steel, per hour, or per factory; the market value of paper clips produced per any or all of these units; and so on. What counts as waste under one description (e.g., "unnecessary time" used in manufacture) can alternatively be described as an increase in leisure or as a contribution to better labor-management relations. Furthermore, what counts as "input" under one description (e.g., labor) can also be seen as an output (the satisfaction and self-esteem built into many kinds of work).

For ease of comparison, it can be useful to translate inputs and outputs into a single unit of measurement, often either money or utility (here meaning preference satisfaction). But doing so can also obscure ethically significant differences in kind—for example, the extinction of a species, the harshness of a tired parent, 3 months' greater life expectancy. Such translations, in other words, can be useful but always risk offering precision at the cost of losing sight of important differences.

Some argue that resources used throughout the life cycle of a product (not just during its manufacture) should count as a cost. As an example, vinyl siding, discarded after its useful life, produces toxic waste. The damage to air and water (an externality, i.e., an effect on parties who were not part of the initial exchange) can also be considered an "input" from a societal point of view. In addition, since factors of production are always in limited supply, their use in one project carries an opportunity cost.

Product Liability

Product liability refers to the responsibility of manufacturers to compensate for injuries brought about through the use of their products. Legal and moral accounts of product liability seek to determine the conditions under which businesses can be held responsible for such harms. Since the risk of injury in the use of consumer products can never be completely eliminated, the notion of product liability raises important legal and philosophical questions about who should bear the burden of costs for such injuries. Determining the answer to these questions raises deontological issues of fairness and justice as well as utilitarian considerations as to how society can best prevent and recompense such harms. The wide publicity of famous cases of product liability, such as those involving McDonald's coffee, the Ford Pinto, Dow Corning breast implants, Firestone tires, and asbestos products, has particularly amplified such legal and moral questions.

Historical Background

The Anglo-American law of liability until the end of the 19th century was largely governed by the doctrine of privity. Under the law of privity, injured persons could not legally collect compensation from parties with whom they did not have an explicit contractual relationship. Thus, since manufacturers who sold their products through retailers did not have a direct contractual relation with the final purchaser of those products, they were effectively immune from lawsuits for injuries to consumers brought about by those products. As such, the privity barrier essentially made it impossible for most victims of product-related injuries to recover damages from a manufacturer of a defective product unless they had purchased the product directly from the manufacturer. While the law of privity may have made sense when most products were bought directly from the persons who made them, its legitimacy began to come into question as retail distribution was becoming a hallmark of the modern economy.

In the United States, the landmark 1916 case of *MacPherson v. Buick Motor Car* more or less abolished the barrier of privity. In that case, a New York court rejected Buick's argument that it could not be held responsible for an accident due to a defective wheel that it had used in the production of its automobile simply because it had no direct contractual relationship with the person injured. The court ruled that Buick should have detected the wheel defect while the automobile was being assembled and that Buick had a reasonable duty to provide consumers with safe and reliable products.

The *MacPherson* ruling was soon adopted in most U.S. jurisdictions, and it ushered in a new theory of "due care" in product liability law. Under the due care theory, companies are held responsible for taking reasonable precautions to produce products that are free from potentially harmful defects. Generally speaking, under the theory of due care, a person could recover damages for an injury if it could be proved both that the product that caused those injuries was defective and that the defect in question was the result of negligence on the part of the manufacturer of the product. Demonstrating negligence involved showing that the manufacturer was at fault for the defect in failing to adopt reasonable standards in the design or production of the defective product.

While the doctrine of due care in liability provided injured consumers with a greater ability to recover for damages caused by defective products, the burden was still on the injured party to prove negligence on the part of the manufacturer. A series of court decisions in the mid-20th century, including *Escola v. Coca Cola Bottling*, *Henningson v. Bloomfield Motors*, and *Greenman v. Yurba Power Products*, eventually eroded even this requirement. In each of these cases, the courts awarded damages to consumers without requiring proof of negligence on the part of the manufacturers, ushering in the era of strict liability in torts. Under the rule of strict liability, manufacturers can be held legally liable for injuries caused by the defective nature of a product even if they were not negligent in producing that product. In certain contexts, distributors, assemblers, retailers, and any other party involved in placing a defective product on the market can also be held strictly liable for injuries caused by that product. Although injured parties can still bring legal action under negligence, the doctrine of strict liability is presently recognized, to some degree, in nearly all U.S. jurisdictions.

Forms of Defect and Compensation

While the theory of strict liability does not require proving negligence, it still requires that the injury in question be caused by the defective nature of the product. Thus, under both negligence and strict liability, proving liability involves demonstrating the defective nature of the product. Since there is some risk associated with the use of any product, this issue is of moral and legal significance as well. In general, products may be defective in manufacturing, design, or warning. Manufacturing defects occur when a product does not conform to the manufacturer's own specifications, as when a food product becomes contaminated during processing or a tool leaves the production line missing a screw. Defects in design occur when a product line is designed in a manner that is deemed to be unreasonably dangerous, as when the design of a ladder makes it likely to fail under anticipated weights. Finally, defects in warning occur when consumers fail to receive proper instructions as to the safe use of a product, as when a pharmaceutical company fails to inform consumers of a drug of possible dangerous interactions with other common medications.

Since no manufacturer can anticipate or prevent every possible risk involved in the use of a product, the determination that a product is defective in any form concerns judgments as to the reasonableness of the risk presented. To constitute a defect, most theories accept that the condition must constitute an unreasonable danger to the consumer. In this regard, the reasonable person standard is often appealed to in determining the existence of a defect. The reasonable person standard holds that a product is sold in a defective condition when it presents dangers to ordinary consumers in its expected use that would not be reasonably foreseen by them. However, some courts have lowered the standard for determining defectiveness by holding that manufacturers should also anticipate the unreasonable ways in which people might put their products to use in producing them. It should be noted that some products—for instance, many pharmaceuticals—have inherent dangers associated with them. In cases of such unavoidably unsafe products, a standard of social risk/utility is often used to adjudicate questions of manufacturers' responsibility. A social risk/utility standard holds that if the dangers inherent in the use of the product are outweighed by the potential benefits of its use, and there is no other means of obtaining those benefits or making the product safer given current technology, then the product should not be considered unreasonably dangerous as long as information concerning the risks is provided to consumers.

In seeking restitution for injuries caused by defective products, plaintiffs can request both compensatory and punitive awards. Since product liability cases generally fall under civil law, and not criminal law, such awards are usually measured in monetary terms. Compensatory awards are meant to compensate injured parties for the losses they incur as a result of their injuries. These losses can include medical expenses incurred as a result of the injury as well as lost earnings, both past and future, due to the injury. They can also include awards for the pain and suffering and other intangible harms associated with the injury. Finally, juries can award punitive damages to victims for the purpose of punishing the defendant, though this is more usually restricted to cases of negligence. The last two forms of compensation have been made particularly contentious because of the well-reported examples of extremely large jury awards to victims, as in the case of the nearly $3 million award originally issued by the jury to the woman burned in the McDonald's hot coffee case. As a result, tort reform in some jurisdictions has involved placing monetary limits on awards for noneconomic and punitive damages.

Social and Ethical Issues

There is a good deal of debate surrounding product liability law, particularly with regard to the rule of strict liability. These moral concerns are generally divided into questions of fairness and justice and those of social and economic utility. Both proponents and opponents of the theory of strict liability appeal to such concerns in making their cases. For instance, many critics of the rule of strict liability hold that it is inherently unfair to manufacturers, since it holds them responsible for defects even when they have fully exercised reasonable precautions in producing the defective products. As such, they claim that it is unjust to hold manufacturers responsible for harms if they were not at fault in bringing about such harms. Such critics are often particularly opposed to what they see as the unfairness of much mass tort litigation, such as asbestos and tobacco suits, since this litigation often involves holding a current business responsible for harms that originated long ago and under the control of different persons. For all these reasons, many opponents of the rule of strict liability argue for a return to standards of negligence or comparative negligence in liability cases.

Proponents of strict liability also appeal to considerations of justice and fairness, though. They argue that if companies are not held responsible for harms caused by defective products, then injured persons will go uncompensated. Since the injured person is not at fault for an injury caused by a defective product, it is just as unfair, they maintain, to deny that person the ability to seek recourse for the damages caused by such defective products. Indeed, they argue that since someone has to bear the costs involved in injuries caused by defective products, it is most fair that the party that profits from their production should do so. In this vein, some proponents of strict liability have even argued that since businesses can only profitably operate within a specific underlying social and economic system, they should also help bear the cost of the harms produced with that system, even when they are not directly at fault.

Both proponents and opponents of strict liability also appeal to utilitarian considerations in their arguments. Proponents of strict liability maintain that the doctrine of strict liability provides businesses with the incentive to be as careful as possible in producing safe and reliable products. They also argue that businesses can build the costs of such liability back into their products and thus efficiently spread the cost to all consumers of those products. Opponents of strict liability, on the other hand, argue that the litigation and insurance costs associated with strict liability place an increasingly unbearable cost on businesses that is stifling to the economy and hurts the competitiveness of businesses in the United States with their international competition. Critics of strict liability have also argued that the doctrine discourages companies from introducing new or innovative products, particularly those, such as pharmaceuticals, that are unavoidably unsafe. As the utilitarian arguments, both for and against strict liability, appeal to long-term social and economic benefits and costs that are difficult to measure precisely, determining the overall utility of the strict liability approach is likely to remain a contentious matter in the foreseeable future.

Professional Ethics

Professional ethics is a branch of applied philosophy and can be understood as the application of ethical concepts and principles to professional practice. Questions relating to the justification of these theories and concepts are also part of professional ethics.

A key element in ethics is the identification and justification of rules or standards that can be used to distinguish right and wrong behavior and identify what ought to be done. These rules and standards can be used by people to identify what they ought to do in various circumstances and to evaluate particular behavior. Likewise, professional ethics is concerned with rules and standards that distinguish right from wrong. These rules and standards constitute the principles of professional conduct and are the foundation for professional ethics. They are used by practitioners to identify what they ought to do in particular situations, and they can be used to evaluate professional behavior.

Professional ethics is grounded in the belief that professional roles require particular norms and principles to guide behavior. The focus is on the special relationships between practitioner and client or patient and what that relationship entails. Professional ethics does not encompass all the norms and principles that apply to everyone but only those that pertain to individuals in their professional roles. Professional ethics, then, is concerned with the moral principles and values relevant to the roles and conduct of professionals in society and can therefore be thought of as a system of norms that can be used to justify and inform beliefs and behaviors.

Professional ethics is a recognized field of study with an established academic literature. Since the 1970s, there has been increasing attention paid to applied ethics, and subdisciplines have developed in a wide range of areas, such as accounting ethics, banking ethics, engineering ethics, teaching ethics, real estate ethics, and so on, in addition to the more established areas of bioethics or medical ethics and legal ethics. The study of professional ethics can take various forms. The most common approaches are concerned with one or more of the following dimensions: the ideal norms that a particular professional should aspire to, the common norms that are actually accepted by most professionals, the elements contained in the codes of professional associations, or the contractual relationship between the profession and society.

The Professions in Society

Until the mid-19th century, the professions were limited to the church, law, and medicine, with the army and navy sometimes included. Today, an increasing number of occupations are regarded as professions, and many more aspire to be recognized as professions. There is constant pressure both on and from within particular nonprofessional and quasi-professional occupations to become more professional and to claim public recognition as a profession, giving rise to the phenomenon of the emerging profession.

The professions occupy an important position in society because their roles have an impact on the lives of many people. Because societies have evolved and become more complex, individuals increasingly seek professional advice concerning various aspects of their lives. As the role of professions expands, existing professions mature and new professions are created. At the same time, the behavior of professionals, especially those based on private practice, have increasingly come under close scrutiny. For example, advances in health care technologies have drawn attention to bioethics, and the fiascoes surrounding Enron and WorldCom, for example, have focused attention on accounting ethics. Recent research has demonstrated that public perceptions of accountants' professional ethics and honesty have declined in recent years, while the professional ethics and honesty of doctors, teachers, and the police are perceived to have increased.

What Is a Profession?

A profession has been described as a community of people circumscribed by the activities they perform. These activities are grounded in a common theoretical background that is acquired through formal education. There is no single definition of a profession, and various commentators have provided checklists of attributes that are claimed to distinguish the professional from the nonprofessional. It is implicit in this approach that the professions possess unique characteristics that set them apart from other occupations. The core features included in such lists are as follows: (1) There is a systematic body of theory that must be mastered through tertiary education, professional development activities, and experience; (2) there is a dependent relationship between the client and the professional; (3) the professional exercises autonomy in performing his or her work; (4) there is a tradition of service and values that promote the public interest rather than self-interest; (5) there is a certification or licensing process for practitioners; and (6) there is a representative body that develops and enforces a code of professional conduct.

Others claim that professionalization is a matter of degree and what is important is developing skills and strategies for improving performance rather than acquiring the characteristics of a profession. Nonetheless, there seems to be a core of three features common to all professions, with other characteristics varying depending on the profession: First, extensive training is required; second, this training has a significant intellectual component; and third, the skills and expertise of the practitioner provide an important service in society.

It has been argued that the primary quality that sets professionals apart from nonprofessionals is the reliance that clients or patients place in professionals due to their superior knowledge and expertise. There is a resulting power differential between the professional and the client. In many instances, the client has no option but to rely on the judgment and expertise of the professional. The clients must trust that the professional is competent and committed to helping them because the ordinary person, in many cases, is unable to make a judgment about the capability of the professional. Only ethical conduct on the part of professionals can ensure that their power is not abused and the trust of the client is warranted.

While professionals have enjoyed prestige and privileges within society, this has been because they are thought to bear more responsibility and have a heavier moral obligation than others. The status of any profession rests on social consent, and in return the profession accepts a responsibility to subordinate self-interest to the public interest. When a profession is recognized, it is granted an exclusive franchise as only those who are licensed can practice. The justification for licensing is that the public good would be threatened if unqualified people were permitted to practice. The benefits that attach to a profession include social status, respect, and wealth.

Almost all well-established professions are located to some extent in universities. The professional schools within universities have as one of their basic functions the transmission of both the generalized and the systematic knowledge that forms the basis of professional practice. Another role of the university-based professional schools is research aimed at creating new and better knowledge. In relation to normative standards or ethics, universities provide ethical training of students. Some ethics training is explicit, and some is combined with the learning of substantive knowledge. The behavior of the teaching staff also provides a model for ethical behavior.

Codes of Professional Conduct

The most visible aspect of professional ethics is the code of professional conduct adopted by each profession, and much of the professional ethics literature takes as its focus codes of professional ethics. Although some writers distinguish between terms such as codes of ethics, codes of conduct, and codes of practice on the basis of their content, in practice, professional codes tend to include elements of all three. A code of professional conduct provides a set of rules that promote a professional attitude and behavior consistent with the ethical expectations of the public.

A profession's code of conduct serves both its own interests and the public interest. The code serves as a public relations tool by fostering a positive image of the profession that contributes to building and retaining public confidence. Codes also reassure the public that the profession is monitoring itself by establishing high standards of conduct and implementing disciplinary procedures to deal with violations. Codes protect potentially vulnerable clients from incompetent and unscrupulous practitioners and also protect the qualified practitioner from unfair competition. They establish minimum standards of behavior that provide a reference point for decision making and a benchmark for assessing the ethics of members' conduct. Any behavior that is inconsistent with the code of professional conduct is judged unethical.

Professional ethics, however, involves much more than a code of conduct. Practitioners are required to do more than simply act in accordance with the identified norms and regulations of the profession. This is because the norms and regulations must be interpreted and applied in different contexts. Moreover, no set of rules or regulations can cover every possible situation, and indeed, they are not meant to. One characteristic of a profession is that practitioners are required to act autonomously; they must exercise judgment, which involves identifying and choosing between alternatives.

Some of the "big issues" in professional ethics include the question of whether deception is ever permissible on the part of the professional in either a paternalistic sense (e.g., if a doctor believes that it is in the best interests of the patient not to be told the truth about his or her medical condition) or a nonpaternalistic sense (such as a researcher not fully informing the research subjects of the aims of the research). The issue of informed consent is central to medical ethics, and the question of what information a client needs to be given in order to make an informed decision (e.g., before entering into a contract) is common to most professions. Client privacy and confidentiality raise important ethical issues for all professionals. The issue of distributive justice also arises with respect to the allocation of scarce resources by professionals. When professionals are employed in businesses or by the state, other issues arise concerning the potential for a conflict of interests between the employer and the patient or client.

Critical Inquiry

Although professionals have undoubtedly enjoyed prestige and privileges, there are several challenges to professional legitimacy and authority. Three relevant features of the role of the professions in Western society during the past 50 years or so have been claimed to lie at the heart of the problem of their position in a liberal society: First, the professions provide an important service that people depend on; second, they serve basic values and have a monopoly over the provision of services; and third, despite occupying monopolistic positions, the professions have not been subject to much public control.

Some commentators have claimed that the professions are simply offering commercial services. Despite the claim that the professions operate for the public good, they are really just another form of business, albeit a well-entrenched and well-organized form of business. These critics question the privileged position occupied by the professions. Others have pointed out that the ideal notion of a professional—an autonomous, self-employed person whose actions are determined by the client's needs and interests and who is a member of a professional organization that regulates its members through a code of ethics—is no longer widely applicable. More and more professionals are employed in large firms or by the state, which complicates the ethical issues faced by professionals because they have ethical commitments to both their clients and their employer. In this situation, the question of who should determine the needs of the client—the client, the professional, the employer, or the state—becomes a key ethical issue, and a professional code of conduct is of little assistance.

Other commentators question the normative claims made by professionals. The problem is that professionals see themselves as being ruled by ethical norms or standards that permit, and in some cases oblige, them to do things not permitted by general ethical norms. This situation has been questioned, and many philosophers conclude that to be legitimate, professional ethics must be derived from or be identical with or focus on specific aspects of ordinary morality. These critics question the content and application of professional ethics.

Profit Maximization, Corporate Social Responsibility as

The claim that the social responsibility of business is to increase its profits is associated with the late Milton Friedman and is the title of a famous article he published in 1970. The article is a devastating critique of the popular idea that corporations have social responsibilities that trump profit maximization. It has proved to be prophetic. The article was written, as it states, against a background of "widespread aversion to 'capitalism,' 'profits,' [and] the 'soulless corporation.'" At the time, Friedman further noted, managers would often disguise actions that were really intended to increase profits in the cloak of corporate social responsibility (CSR). But today, in a remarkable reversal, Friedman's doctrine of shareholder value is triumphant, and managers often use the rhetoric of profit maximization as a cloak for actions that are, in part at least, really driven by considerations of CSR.

The doctrine of CSR teaches that corporations have responsibilities to promote certain social goals, even at the expense of their own profitability. CSR requires more than simply playing by the rules—that is, engaging in free and open competition without deception or fraud. It imposes on corporations affirmative obligations to play their part in solving social problems and righting social wrongs. At the time the article was written, corporations were exhorted to help fight inflation and high unemployment among inner-city youth. Today, corporations are urged to combat global warming, help solve the AIDS crisis, alleviate poverty at home and abroad, and much more.

The argument of Friedman's article is actually less a case for profit maximization than it is a demolition of the case for CSR. And Friedman's position is more complex and nuanced than is suggested by the polemical title of his article. The critical passage in his article is as follows:

> In a free-enterprise, private-property system, a corporate executive is an employee of the owners of the business. He has direct responsibility to his employers. That responsibility is to conduct the business in accordance with their desires, which generally will be to make as much money as possible while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom.

It is apparent that Friedman's objection to CSR is not that it leads to spending money on social goals but that it does so *without the consent of a corporation's owners.* Managers have accepted a fiduciary obligation to manage the corporation in accordance with the desires of its owners, and CSR would permit or require them to violate that obligation. As Friedman notes, things would be quite different if the managers had promised something else. If a group of people established a corporation for a charitable purpose, such as building a hospital or a school, then the manager of that corporation would have a fiduciary duty to carry out that objective.

It is also an entirely different matter, Friedman says, if the manager chooses to devote some of his *own* money or time or energy to help achieve a social objective, because in that case "he is acting as a principal, not an agent; he is spending his own money or time or energy, not the money of his employers or the time or energy he has contracted to devote to their purposes." If managers disagree with a corporation's priorities, then of course they are free to "refuse to work for particular corporations."

There are other objections to CSR. First, it empowers managers to spend other people's money for a general social interest. That is objectionable because it usurps a function of government: It means that managers are in effect "imposing taxes, on the one hand, and deciding how the tax proceeds shall be spent, on the other." It places public decision making in private hands and bypasses the traditional checks and balances of our political system. Second, nothing in the training or experience of managers qualifies them to make public policy—they are "experts at making money, not social policy." Third, CSR harms the foundations of our free society by reinforcing the idea that profits are wicked and so must be controlled. From that idea, it is a short step to the detailed regulation of the economy by "the iron fist of Government bureaucrats."

Friedman makes a final point that has passed relatively unnoticed: Not only is CSR undesirable, but it is probably *unworkable* too. That is because the manager who strays too far from minding the bottom line will likely be fired by the shareholders—"either the present ones or those who take over when his actions in the name of social responsibility have reduced the corporation's profits and the price of its stock." The market for corporate control strictly limits the scope for managers to engage in CSR (unless of course it is profitable).

Friedman's *positive* case for seeing profit maximization as business's social responsibility is really the subject of two other classic works—*Capitalism and Freedom* (1961) and *Free to Choose* (1980). There, Friedman lays out the case that individual freedom can thrive only where markets are substantially free. This is because the freedom to determine one's own economic choices (including whether or not to seek to make a profit) is both an important element of individual freedom in itself *and* a necessary condition for political freedom. Economic freedom and political freedom are linked because political freedom is illusory if one's livelihood is under the control of the government. History attests that there have been no free societies without free markets. (Unfortunately, the reverse does not hold: Relatively free economies have coexisted with tyrannies.)

Friedman's thesis has scandalized many critics, particularly because it appears to celebrate the profit motive at the expense of the common weal. Many of these criticisms are wide off the mark or simply based on misreadings of Friedman's article. Space limitations permit only a superficial review. First, it is wrong to say that Friedman celebrates self-interest. As we have seen, he doesn't object to managers contributing to worthy public purposes; he just wants them to contribute their own money, time, or effort. Second, Friedman's case for profit maximization does not rest on the supposed greater efficiency of market economies. The goal of efficiency is a distant second to Friedman's concern to secure our freedom. Third, it is false to claim that Friedman's position privileges shareholders at the expense of "stakeholders." The corporation's stakeholders all voluntarily acquiesce in this arrangement or the corporation could not exist. Employees freely choose to work for corporations because they offer favorable wages and conditions. Consumers purchase from them because they offer better products, and so on. Fourth, the frequent charge that corporations don't "give back" to society is mystifying. Corporations pay market prices for their inputs, and they pay taxes. In fact, as is well known, the owners of corporations—the shareholders—are subject to double taxation on their shares of corporate profits. The corporation's shareholders make numberless other contributions to society. Advocates of CSR have failed to offer a convincing explanation for why shareholders should be expected to give back yet again, this time under the rubric of CSR.

There are, however, some more damaging criticisms of Friedman's thesis. One can best be suggested by an example. What should a manager do if he or she discovers that one of the corporation's plants is emitting a dangerous chemical into the atmosphere but that a loophole in the law would permit it to go on doing so? For the British economics writer Samuel Brittan, the answer is obvious: "The absence of effective legislation should not excuse a chemical company for polluting the air." However, it is not clear what Friedman's position would be. He might take a hard line and argue, as he does elsewhere in the article, that the manager should not make "expenditures on reducing pollution beyond the amount that is in the best interests of the corporation or that is required by law in order to contribute to the social objective of improving the environment." (Assuming that the government is unaware of the loophole, would the manager have a duty to bring it to the government's attention?) Or he might invoke the passage quoted earlier, which requires the manager to conform to the basic rules of society, both legal and *ethical.* That is to say, Friedman might argue that the manager has an ethical responsibility to stop the pollution. Neither answer is satisfactory. The first is blind to the fact that there are always gaps in the laws that may have to be filled by business's sense of responsibility. The second won't do because the clause about ethical custom should probably be disregarded as an embarrassing loose end in an otherwise tightly constructed argument. On many issues, there simply is no canonical "ethical custom," and Friedman points us to no source for one. Critics have predictably seized on the clause to argue that CSR is part of society's ethical custom, thus negating Friedman's thesis. The first answer—that the manager has no duty to do more than the law requires—is probably more consistent with the position Friedman has staked out in the article and elsewhere.

A final criticism is that much of the debate over CSR versus profit maximization is moot. One reason is that, as Friedman himself has explained, the market for corporate control severely limits the scope for managers to exercise social responsibility. However, that assumes that there is (and will continue to be) a functioning market for corporate control. To the extent that, say, state antitakeover statutes weaken the market, the legitimacy of CSR may become a live issue once again. Another reason why the debate over CSR may be moot is that virtually all shareholders today had notice of corporations' CSR policies when they purchased stock in them. Arguably, by purchasing the stock, they consented to at least the existing level of CSR. That removes Friedman's main objection to much of contemporary CSR.

Profits

One of the most important functions of business is to sell goods and services for profit. In the economic view of the firm, business decision makers are assumed to desire as large a profit as possible for their organization, and a good society develops conditions for businesses to produce and sell valuable products and services as efficiently as possible in order to improve the quality of human life. In this economic view, opportunities to make profits are signals that society's resources can be used more efficiently.

For a business, profit refers to the amount of revenue it receives from customers in excess of the costs it incurs over a defined period of time. This profit is a form of wealth that belongs to the owners of the business. Business owners can reinvest their profit to produce more goods and services that people value, or they may exercise their liberty to use their profits to further their own personal satisfaction. Government may tax profit to use for other social purposes and public goods.

A business by definition is an organization that intends to make a profit by selling goods and services that its customers value. When it conducts its activities with trustworthy integrity, then its profit after its cost of capital is a monetary measure of the increase in social wealth that the business created by transforming a portion of society's supplies into more valuable goods and services. Thus, many view profit as a moral good when it is generated within the bounds of economic efficiency and good moral character. Adam Smith, for example, argued in the 19th century that self-interested exchange brings about welfare by maximizing the output of scarce goods and services subject to the constraints of costs when it is bounded by a competitive marketplace operating with principles of honesty, trust, social contract, and protection of private property. Milton Friedman, Nobel Prize–winning economist of the 20th century, followed this perspective when he famously wrote that the ethical responsibility of business is to generate as much profit as is legally and honestly possible.

Most people agree, however, that profit can be unacceptably excessive. The great religions of the world, for example, have guidelines for principled profit in commerce—that it reflect fair value for buyer and seller, that it not be an outcome of hoarding that unfairly limits the availability of products, and that it not be an obstacle to broad distribution of essential goods throughout society. Similarly, most governments have commercial laws to prevent businesses from taking advantage of short-term circumstances, such as natural disasters or wars, that may create opportunities for excessive, or windfall, profits. Many businesses voluntarily adopt codes of conduct that call for fair negotiations with customers and suppliers so that all parties are satisfied with the value and reasonable profit created.

Despite these guidelines to constrain excessive profits, many argue that business naturally tends toward excessive profits whenever it does not directly pay for all the costs of its effects on environment and community. For example, a business's profit might be considered excessive if the business does not directly bear all the costs of rectifying pollution it generates in its operations or of unemployment it causes when it lays off workers. These perspectives focus attention on the deficiencies of fairness in profit making whenever business is granted liberty to shift cost away from itself and onto society.

Profit and Law

In the legal framework of the United States, *Dodge v. Ford* of 1919 is a commonly cited precedent that establishes that the primary responsibility of business management is to make profits for owners according to the charter of the corporation. Beyond the requirements of this precedent, the government also requires businesses to comply with Generally Accepted Accounting Principles (GAAP) regarding the recording and reporting of costs, revenues, and profit. Furthermore, publicly owned firms must report their profits annually to shareholders. All businesses must report revenues, costs, and profits to the government for purposes of taxation.

These legal obligations, however, often leave room for judgment and aggressive accounting practices that may violate law and the norms of financial integrity. One of the most successful corporations in the United States, Enron, declared bankruptcy in 2001 because of illegal and aggressive accounting practices. Although Enron's financial practices had been audited by public accountants, conflicts of interest prevented the auditors from stating a truly independent opinion regarding the financial integrity of Enron. Other serious business scandals made the lack of financial integrity appear to be a widespread and fundamental threat to the profit-based system of market capitalism. In response, the U.S. Congress passed the Sarbanes-Oxley Act of 2002 to compel publicly owned businesses to implement ethics management programs and for top management to certify by signature the financial integrity underlying the reporting of business profits. This has placed a significant burden of accountability on chief financial officers and chief executive officers.

Profit and Care for Stakeholders

The market context in which a business makes and allocates its profit depends on the decisions and actions of many interdependent parties or stakeholders—customers, suppliers, managers, employees, owners, and government. The quality of a business's relationships with these stakeholders can help or hinder its efforts to sustain itself as a profitable entity. Accordingly, it is critically important that a business operate in a manner that fosters trust and cooperation in these relationships. This is a challenging task because satisfying their preferences may conflict with the profit-making goal of business. For example, customers may demand low prices and costly features that together reduce profit. Employees may demand benefits that require financial resources to be allocated to their needs instead of going to profit. Owners may prefer that profit be distributed to them as dividends rather than reinvested in the business to pursue opportunities for future profit. Government regulatory regimes may increase business costs and limit the scope of permissible profit-making activities.

Business owners are primary stakeholders entitled to business profits to use as they see fit, subject to taxation. Thus, profit contributes to the liberty of business owners by giving them the economic means to realize their own preferences. For this reason, some consider taxation of profits distributed to owners as a reduction in shareholders' liberty for some other social purpose. Participatory government, such as democracy, provides a public policy mechanism for shareholders to participate in holding government accountable for the justice of such transfers of property. Citizenship, personal virtue, and self-interest are weighty principles to balance individual rights, utilitarian benefits, and universal rules of distributive justice.

Often, business owners employ professional managers as their agents to generate profit from the assets of the business. When owners cannot observe the actions of their managerial agents, however, the owners bear a moral hazard that managers might act in their own self-interest rather than in the best interest of the owners. Owners can reduce this risk by monitoring managers, but monitoring has costs. Thus, the good virtue of reliable professional managers increases profits both by putting owners' assets to their best use and also by reducing the costs of monitoring.

An economic view of profit-seeking businesses suggests that they are likely to charge as high a price as possible given their understanding of the conditions of competition and demand. Economic demand, however, is a quantitative expression of the needs and desires of real people, some of whom may not have the means to pay market prices. As Dr. Martin Luther King noted, it is an injustice to pursue profit without concern for the poor people of the earth, and excessive profit taking in a world where the necessities for human dignity are not fairly distributed may cause revolutionary and repressive cycles of violence. This concern for distributive justice is also found in Article 25 of the Universal Declaration of Human Rights adopted by the General Assembly of the United Nations in 1948. Thus, profit-seeking businesses show care for stakeholders by balancing their need for profit with the needs of customers and potential customers in economically disadvantaged communities. Broadening the scope of affordable products may be one way to achieve this balance. Recent efforts of major pharmaceutical companies to price drugs differently in developed and less developed countries is one example of such broadening. Government control of allowable rent that landlords can charge tenants for housing is another example.

Corporate social responsibility considers business performance for a broader set of stakeholders than just owners. For example, a triple bottom line (including financial, environmental, and social performance) values "reasonable profit" instead of maximum profit in order to address the ethics of a scope of duty beyond the creation of profit for owners. In the United States, legal support for a triple-bottom-line perspective is embedded in many laws governing business care for the environment and the conduct of due diligence in mergers and acquisitions.

Triple-bottom-line governance of profit has been criticized by some because it is dependent on the judgment of managerial agents constrained by the owners of capital who may be self-interested and remote from the needs of workers and communities. To respond to these criticisms, alternative mechanisms to generate and allocate profit include worker collectives, employee stock ownership plans, democratic capitalism, and market socialism.

Ethics and Types of Profit

The amount of revenue a business receives is determined by the price its customers pay for a quantity of its products and services and the costs it incurs to acquire factors of production (land, labor, and capital), knowledge and capabilities, and inputs of supplies and to operate processes that create its finished products and services. There are several different types of business profit that are identified by subtracting different categories of costs from revenue. These types include gross profit, operating profit, retained profit, and economic value added. Each type of profit highlights interesting ethical issues and dilemmas for further discussion.

Gross profit is calculated by subtracting the cost of sales from revenue. This cost includes the cost of supplies and materials that go into making the products, and so it reflects the business relationship with its suppliers. This relationship may be a function of several factors, including their relative market power and the degree of mutual trust and cooperation. For example, costs of goods may be reduced and profit increased for a business that uses its power legally to pursue efficient production and economies of scale. Furthermore, suppliers may be more accommodating and flexible in their contractual terms for trustworthy businesses that pose less of a moral hazard. Flexibility in contracting reduces transaction costs and thus increases profit.

Cost of sales also includes direct labor costs. Business may increase its profit by reducing its direct labor costs. There are several alternative approaches to reduce labor costs, including increasing the productivity of workers, locating labor-intensive operations in low-wage countries, and outsourcing operations to shift labor costs to other independent businesses. Recent trends toward globalism and free trade have encouraged business to source labor from low-wage areas of the world. As a result, many labor organizations and public policy makers in high-wage countries have argued for fairness and justice in helping workers make the transition to new employment opportunities. They point out the potential for social disruption if workers' prospects for a good quality of life are disadvantaged in a world order geared to enabling global opportunities for business profit.

Production costs also are subtracted from revenue to calculate gross profit. As discussed earlier, businesses reduce their production costs when they do not directly pay for all the costs of their effects on environment and community. Many advocacy groups prefer business to directly take on more of these costs and to accept responsibility for them. Unscrupulous businesses may also attempt to improve their profits by pricing their products to reflect high-quality production and materials while secretly substituting inferior processes and supplies. Government regulation and inspection often attempts to prevent such fraudulent profit-seeking practices.

Operating profits are calculated by subtracting selling, general, and administrative expenses from gross profit. The bulk of these expenses come from marketing expenses such as advertising and promotions, travel and entertainment, executive salaries, and sales agents' salaries and commissions. Recent discussion has focused attention on the fairness of these expenses in relation to business integrity and value-creating activities for society. For example, marketing practices in the U.S. pharmaceutical industry create demand by directly advertising pharmaceuticals to consumers or by rewarding doctors rather than by the merits of objective scientific research. In other industries, some unethical businesses may falsely advertise a scarce and valuable item at a low price as bait to lure customers but then switch them to a higher-priced and more profitable item from among the only ones available. Such bait-and-switch tactics are illegal in the United States.

The administrative expense category also raises issues of properly accounting for CEO pay and its relationship to business profitability. When CEO pay is tightly linked to business profitability, however, the executive has an incentive to be aggressive, perhaps inappropriately so, in the reporting of profits. This is one important reason why independent outside auditors without conflict of interest are necessary to ensure financial integrity in the reporting of business profit.

Taxes paid to the government are subtracted from operating profits, leaving profit after tax. Some view taxes on business profit as a confiscation of private property and an infringement of individual liberty by government for social purposes. This argument may have some weight in societies that tax business profit twice—once levied on the business and again when the profits are distributed to owners in the form of dividends. Others, however, note that business has similar responsibilities as does any citizen to support society by paying taxes. Because this civic duty can be a significant burden on profit, businesses often participate through lobbying activities in the public policy process that sets taxes. There are many discussions of the fairness, integrity, and legality of these lobbying activities and relationships businesses may use to reduce the impact of taxation on their profits. Interestingly, a libertarian business ethic argues that honest and full tax payments satisfy business responsibility to society. Unfortunately, some unprincipled businesses may resort to dishonest accounting or to black market operations to avoid paying taxes. This is another important reason for independent outside auditors without conflicts of interest to ensure financial integrity in the reporting of business profit.

Profit and the Ethics of Innovation

Profit seekers often strive for the first mover advantage that comes from introducing innovations to the marketplace. While there are potential rewards of profitability for successful innovation, there also are risks of failure that typically are borne by the owners of capital, their managerial agents, and their immediate stakeholders. For some innovative businesses, however, the risk of failure may have some small possibility of catastrophic failure. Current discussion focuses on such significant consequences in genomic commerce and nanotechnology. For example, profit seekers may create human-animal hybrids that enable animal diseases to leap the species divide and proliferate in human populations that have no immunity. Similarly, an existential threat may be posed should nanoparticles unexpectedly become embedded in human organs with no way to remove them. A precautionary principle to defer profit-seeking action until consequences and contingencies are better known has been more accepted outside the United States, as evidenced by the 1992 Rio Declaration on Environment and Development and the European Commission's Communication on the Precautionary Principle.

Conclusion

Smoothly functioning markets that maximize profits signal that welfare, defined as subjective self-interests of individuals, is maximized. To ensure smooth functioning, government must enforce contracts, protect private property, and tax to fund public goods. Discussion regarding business profit will continue to address the balance of incentives for wealth creation with rules and enforcement to protect stakeholders and the broader society against self-interest and opportunism.

Promises

Promises are utterances or statements expressing an intention, resolution, or commitment to the promisee (one to whom the promise is made), thereby creating a new obligation to carry out the content of the utterance or statement. When a promise is made, the promisor (the one who is making the promise) understands that if the promise is not kept, then a moral obligation will have been breached. Keeping promises is critical to ethical business practice and is frequently viewed in relation to the obligation to be honest. Promises are the key to trust; thus, breaking a promise is generally a breach of trust. Furthermore, since many contracts are based on promises, a full understanding of promises is central to both moral and legal issues in the practice of business. This entry will examine the following issues: How is a promise different from other kinds of utterances or statements such as intention, resolution, or vow, which do not carry the same obligation? How does saying "I promise" create an obligation? Why is that obligation binding? Under what circumstances is it moral to break a promise? How is promise keeping important to the ethical practice of business?

Making Promises

One usually engages in economic transactions with a view to reciprocal advantage, but there are circumstances in which one cannot be certain that the other party will hold up its end of the bargain. In fact, from a standpoint of pure self-interest, it would seem advantageous *not* to perform on the promise if one has already received a benefit. Without promises, self-interested agents would not be willing to assume the risk involved in transactions requiring trust or future performance; this would limit economic efficiency, and one would miss out on many beneficial transactions. To overcome these problems, to cope with the uncertainty in such exchanges, one makes a promise—a form of words that affirm the performance of future acts to those outside one's normal sphere of interest and trust. To say or write "I promise" is not just to *say* or *write* something. It is also to *do* something—namely, to put oneself under an obligation and to make oneself responsible to potential sanction if the promise is not kept.

A basic issue with promises is how they differ from other types of language, such as statements of intention, vows, and commitments. Some argue that the difference is only a matter of degree, not of type. A promise, in this view, is a stronger level of commitment than an intention (where one could still change one's mind) and needs to be communicated in a social context (where intentions and vows do not necessarily need to be). In another view, promising is a species of consent. It is an expression of one's consent to restrict future behavior or liberty (to not change one's mind, to carry out a particular action) in exchange for present or future benefit.

Critics of these views argue that a promise is a fundamentally unique type of utterance or statement. They insist that it produces particular expectations and creates a right on the part of the promisee, who can choose whether or not to exercise this right, as well as a new obligation on the part of the promisor. Consequently, a promise is different because it creates confidence, reliance, and trust between the two parties in a way that statements of intentions, commitments, or vows do not.

Another important debate is whether making promises gives rise to the rules and practices that govern promise making or whether it is these social conventions that make a promise possible and meaningful. One line of thought is that the concept of a promise only makes sense against a background of these rules and practices—promise-making procedures, which delineate what it means to make a promise. In contrast, some believe that promises come first as an informal practice, and the more formal social conventions arise later to solve problems and regularize the practice.

One final issue in making promises is the false promise. If one is in difficult circumstances, can one make a promise that one knows one cannot keep? Self-interest and prudence might argue that it would be advantageous (especially in the short term) to make a promise, even if one has to renege on it later. On more careful examination, the long-term consequences of a false promise may be hard to accurately foresee, and the lie may cause more resultant inconveniences than keeping the promise. This line of thought is based on the fear of adverse consequences, but that may not be sufficient grounding for a moral obligation. When examining a false promise from the standpoint of duty, one must ask whether the maxim of the action (making a false promise to extricate oneself from difficulty) can be willed as a universal law. However, this would ultimately prove self-defeating. If that maxim were universal law, then any future promises would not be believed and accepted, or they would be retaliated against by making false promises in return. Therefore, one ought not, that is, one has a *moral* obligation not to, make false promises.

From the perspective of U.S. law (rooted in English common law), promises are binding and legally obligatory if (1) the promisor receives benefit from the promise, (2) the promisee acted to his or her detriment, and (3) there was a mutual exchange of promises. This suggests that the difference with promises is that one party gives something up and the other party gains a benefit, with the understanding that at some future point the roles would be reversed. A failure in this regard is viewed as a violation of justice in the sense of fairness.

Obligation to Keep Promises

Central to understanding the obligation to keep promises is the question of what it is about promises that creates a new obligation. How does one get from the utterance or statement to a moral obligation?

The first suggestion is that there is a basic, self-evident (via reason or moral intuition) moral principle that moral persons ought to keep their promises. Promise keeping is a basic duty that must be observed, although this duty must be considered in the larger context of other moral duties. In this view, there are competing moral duties, and one must make decisions about their relative weight and import.

The second suggestion is that the performance of promises, along with rules and conventions about private property, forms the foundation of justice. Promising is not natural; it is a product of social conventions. The concept of a promise would have no meaning or force without these conventions. One version of this argument has it that promises are founded on the interests and necessities of society. At first, the obligation to perform on a promise is due to self-interest, since not doing so will result in sanctions and adverse consequences. As the conventions governing promise making and promise keeping become a matter of public interest and convenience (as legal systems and economic transactions based on promises develop), a new obligation to keep promises is produced.

A different version of this argument says that since promises are based on social convention, there is no moral obligation to keep one's promises apart from the sanctions and penalties imposed by the law or the government. One keeps promises, in this view, *only* out of fear of sanction and punishment and self-interest; there never develops any mechanism for extended trust other than external sanctions from the law or state. Without sanctions and punishment, promises would be meaningless words.

Reputation

Reputation plays a crucial role in the discussion of promises, regarding both why one makes promises and what happens if one fails to keep them. One tends to receive promises from those people who do not habitually renege on their promises. When one makes a promise, one hands over one's reputation as a security deposit or collateral, which will be forfeited (or at least damaged) if the promise is not kept. It subjects the promisor to the sanction of being viewed as untrustworthy, and this will usually impair the promisor's ability to participate in such transactions in the future.

Reputation is a kind of commodity that one has an interest in preserving, like property. One perspective suggests that credit bureaus function as a kind of reporting agency on persons' reputations for keeping promises. One's credit score, reflecting the extent to which one keeps financial promises, can be traded on for financial gain and is increasingly used in job application processes or background checks to gauge how responsible and reliable an applicant is. In an analogous way, reputation is arguably a company's strongest asset; it helps the company acquire and keep customers, build business relationships, and attract employees and leads to higher stock valuation, which, in turn, makes it cheaper to raise capital. This concern for reputation may also broaden one's concerns from simple self-regarding interest to a concern for what others think. Many argue that this initiates the bonds of trust needed for both society and the efficient practice of business.

Trust

Some view promise keeping not as a universalizable rule but as a mechanism that builds relationships of trust. Keeping promises helps to build the bonds of trust in society, and failing to keep promises is a violation of trust. The concept of trust is closely connected to promising but includes more than just promising; there are aspects of trust related to other forms of commitment that are much less explicit than promising.

Trust, in this view, is an open-ended set of activities and practices. It is a flexible relationship that is not self-interested, not merely rule following, and not just a feeling. "Authentic" trust is self-aware, cognizant of its own conditions and limitations, open to new ideas, and based on choice and responsibility. It is not simply mechanical reliance or a prediction of what someone will do. One trusts a person and regards that person as trustworthy when he or she does what one justifiably expects. Trust is gained, therefore, by keeping promises, doing one's duty, discharging obligations, respecting others, and being honest. Consequently, trust is seen as a bond of society and a core value for the practice of business. To have authentic promise making and the social practices and benefits that come from it, one needs this phenomenon of reliance, of taking one at one's word, of committing to promises in a consistent way.

Breaking Promises

If there is such a strong obligation to keep promises, one might wonder if it is an absolute obligation. Are there ever circumstances under which it is either permitted or even ethical to break a promise? In general, breaking (or failing to keep) a promise is seen as either dishonesty—especially in the case where one made a promise that one had no intention of carrying out, simply to gain an advantage—or analogous to lying.

However, promises are not always binding. Where a promise is made by a child, by fraud or under coercion, or by misunderstanding or by mistake or in the case of an impossible or illegal or immoral promise, most commentators insist that one cannot be morally or legally bound to keep it. In these cases, there is either no obligation at all or there is an obligation, but the promisee has an obligation to release the promisor from that obligation.

There may also be appropriate reasons to break a promise. The circumstances may have been significantly altered via unforeseen events, bad luck, or intervention of fate, or the other party may have failed to keep its promises. Although a regular habit of promise breaking can breach trust or prevent it from getting off the ground in the first place, not every instance of breaking a promise is necessarily a breach of trust. The promise may not be performable because circumstances have changed, or the promise might even be renegotiated if the promisor comes clean that he or she has bitten off more than he or she can chew. In the latter case, one commentator argues that this is a confirmation of trust, not a violation of it.

Furthermore, it is possible to make an argument that breaking a promise in certain circumstances might promote the greater good or social utility and, therefore, can actually be the moral course of action. If keeping the promise would produce undue hardship on either of the parties, or if it would cause damage to the relationship, impair trust, or make future cooperation less likely by producing resentment or conflict, one might argue that it would be ethical to *not* require performance of the promise *in this case*. Those who take this line of thought are quick to point out that keeping promises on a regular basis is still important for social utility and that reputation is necessary as a measure of reliability and essential in forging bonds of trust.

In the case of hostile takeovers, there are two important issues related to promises. First, there is the charge that the practice of takeovers transfers wealth to the shareholders by violating implicit contracts or promises with the other stakeholders. Second, one might ask, Does the new management have to keep the promises made by the prior regime? Both these issues focus on the fact that making promises produces expectations; not meeting these expectations can produce adverse consequences for the company's reputation and its ability to maintain trust. If the expectations were contractual or actually promised, it would be unethical to break a promise, even if the new regime was not the one that made it. This is especially true if there were legitimate expectations, which most commentators insist need to be honored to preserve reputation and maintain trust.

Business Relationships

Business is a group activity, and at the core of successful business relationships is trustworthiness and promise keeping. Without these, the economic and social costs of doing business increase considerably. Many argue that promises and promise keeping enable markets and facilitate economic transactions with few or no legal strictures. As a social norm, promise keeping facilitates economic production by encouraging cooperation and accountability and discouraging predation. It helps promote fairness and economic prosperity (without which unfairness and inefficiency would reign), and it produces a kind of social capital in the form of reputation and trust that can be traded on as an intangible currency.

For some commentators, the idea of a social contract provides a significant source of norms in business, and promises form the foundation of the social contract. Businesses ought to keep promises in ad claims (avoid deceptive brand promises in marketing), return calls on time, keep personal promises (whether related to the business or other matters), meet financial commitments, and keep commitments to employees (time off, financial compensation, due recognition). Business also should not encourage inappropriate expectations. Trust is so important that legitimate expectations should be kept regardless of what form they take.

One area where this may seem to go against conventional business strategies is in marketing. Traditionally, marketing attributes desirable qualities—sexiness, wealth, beauty, power, coolness, or physical prowess—to the consumption of a product, the implied promise being that if one consumes the product, then these qualities will or may also be acquired. Many ads promise intangible benefits (status, well-being, the good life) from their products, on which it is very difficult or impossible to deliver. Other ads promise that their product is the "best," "freshest," "fastest," or some other superlative on which the company cannot possibly deliver, since multiple competing products claim the same qualities. One line of thought holds that these practices must change because (1) buyers want vendors who keep promises; (2) products are too complicated; and (3) repeat negotiations to find a new supplier are too costly, in terms of both time and money. Rather, businesses should see marketing in terms of developing a relationship of trust with the consumer, a relationship that must be maintained by the making and keeping of "authentic" promises.

Another concern is how one might measure the extent to which companies *are* keeping their promises. Clearly, various kinds of financial ratings can be a useful way to see how a business keeps certain kinds of promises, and reputation is seen as a key indicator, particularly in the long term. Social audits are also seen as a useful way to see if companies are keeping their promises about social, ethical, and environmental performance claims, since they allow for a process of self-reflection and intentional improvement in areas that are found to be weak.

Conclusion

The concept of making and keeping promises forms a basic and essential building block in the practice of ethical business because making a promise carries with it a special kind of ethical obligation to carry out that promise. If the promise is not kept, the promisor understands that he or she is failing in a central moral duty, as well as risking his or her reputation, violating trust, and impairing future relationships. In business, promise keeping is seen as a core value and basic obligation since it directly affects a company's reputation, while failing to keep or breaking promises can undermine trust and will ultimately raise the social and economic costs of doing business.

Property and Property Rights

To have a right of property or to own property is to have, with regard to some resource or thing, a relation to other people that establishes a rightful claim as to how one may use, enjoy, or deploy that resource. Although we often think of property in terms of some material good or resource (e.g., "This land is my property"), the assertion of property, property ownership, or a property right is, in fact, a statement that one's relation to that thing is defined in terms of rules that establish what one may do with that thing and what others may or may not do. If one owns one's bicycle, then one has the right to drive it on a municipal street, to paint it blue rather than red, or to loan it for a fee. If one owns one's house and the land on which it sits, then one may plant a flower garden on the south side, paint the shutters, attach a porch, or sell the house and land to someone else. However, ownership may not include a right to build a bonfire on one's front lawn or to raise swine or chickens in the backyard.

The concept of property has played a pivotal role in political and social philosophies throughout the ages, and since ancient Greece, property has been regarded as a fundamental institution of society. In what follows, the major focus is on the nature of property rights, specifically, the rights of private ownership or private property. What is the importance of private property? What goods in society should be privately rather than publicly held? As a first approximation, one may note that private property is an institution essential to business. Market exchange involves a transfer of property from one person (or organization) to another. Private property has other important functions in market societies. Private property ensures that current owners take into account future income, thus ensuring that the owners consider the long-run effects of their decisions. Since private property is necessary for exchange and since it encourages prudential decision making, it is an institution essential to business competition. Thus, private property provides the foundation for the complex or spontaneous order that characterizes markets.

Conceptual Issues

The concept of property refers less to the material resource than to ways of relating to that resource. Property is often understood in terms of a set or bundle of rights. The rights in question may be considered—at least typically or for the most part—as *claims*: A person's right to X entails a claim that others either act or forbear to act in certain ways. If these other persons fail to act or forbear to act in the appropriate way, then they may be compelled to do so. A right (or rights) to property may be further specified in terms of who holds the right, who must honor the right through an action or forbearance, and what sort of acts or forbearances are required. A complete discussion would also include an account of when the right is violated and how such a violation may be remedied and by what means.

Early in the 20th century, Wesley Hohfeld analyzed the concept of a right into a set of four categories: a claim, a liberty, an immunity, or a power (or privilege). Liberties and claims share entailments to one another, as do immunities and powers. The first pair of categories is most relevant to an analysis of a property right. For example, if a person P possesses a liberty to do some act, then another person Q has no claim against P that P either perform or not perform that action. For example, if I am at liberty, with respect to all others, to buy a car, then no one has a claim that I buy the car or that I not buy it. However, let us suppose that there is but one car and that I am at liberty to buy it. That I am at liberty to buy the car does not entail, however, that no one else is at liberty to do so. For other individuals may have the same liberty and another person may succeed in purchasing the car before I can do so! Other rights do involve claims. Person P has a claim right that another person Q not perform some action if and only if Q has a duty *not* to do that act. And if Q has a duty not to perform that action, then Q is not at liberty to carry it out. If we apply this analysis to property, then, as we will see below, within John Locke's state of nature, each person is at liberty to mix his labor with an unowned resource. Thus, once I mix my labor with an unowned resource, I have a claim right to that property such that you may not justifiably interfere with my possession. Thus, my claim right limits your liberty. Such a right may also be understood to be a *negative* rather than a *positive* right in the sense that it requires that you refrain from doing an action (interfering with my property), not that you perform some specific action. If I own property, then I possess a liberty to act toward that property in certain ways, but others do not. (The other pair of Hohfeldian categories may be understood as follows: A *power* entails that one can alter or change another's liberties, claims, or duties; the party subject to such change has a *liability.* Regulatory agencies or Congress, for example, have certain powers with respect to business firms. If a person has an *immunity,* on the other hand, then another has a disability to alter that individual's rights.)

Turning to property rights or ownership, A. M. Honoré describes 11 features of the concept of "full" ownership. These attributes constitute a complete and unrestricted notion of ownership. Although all these attributes need not be present to assert that one owns something, some of them are necessary in any instance of ownership. The attributes include the right to *possession* (the right to exclude others, which holds *in rem*, against persons in general, rather than *in personam*, against particular individuals); the right to *use* the resource for one's personal enjoyment or benefit; the right to *manage* the thing, to decide how it is to be used; the right to the *income* derived from the object or thing; the right to the *capital* (specifically, the right to alienate, consume, modify, or destroy); the right to *security* from expropriation; the right to *transmit*; and four additional attributes, including indeterminate length of ownership; a duty not to use the thing in ways harmful to others; the fact of liability (so that the resource may be taken as payment for debt); and the residual nature of the object, such that if a right lapses it returns to the original owner. These 11 attributes, constituting a variety of claims, powers, and liberties, are necessary for *full* ownership, even though we often speak of "ownership" when some of these attributes are absent. Each attribute may be subject to varying applications and interpretations. The first five seem to be the most significant, with possession (the right to exclude), use, and capital as particularly crucial. In the case of owning a home, one may have the full complement of the 11 attributes, but in the case of owning, say, a mutual fund, one has a right to the income, but one does not have a right to manage the fund.

Kinds of Property

The conceptual accounts just delineated are compatible with distinct kinds of property: private, collective, and communal. Private property is that form of property for which an individual (or a small set of named persons) has rights of management and exclusion, among others. Communal property, however, may be understood in terms of a resource that may be used freely by all members of a group (excluding nonmembers) but whose general use is determined by custom, tradition, government, or even individual users. Examples of communal property might include common grazing lands (as in the medieval commons) or public parks. Although the family home is a quintessential case of private property, the structures of ownership *within* the house are typically communal rather than private: The sofas and chairs in the living room or den are open to the use of family members and are not owned by particular members of the family. Thus, communal ownership need not entail government ownership. Collective property refers to some thing or resource whose use has a specific purpose (as defined by the government or the group as a whole) that purports to satisfy some general interest of a group or whole. For example, a government building is collective property, as is a government-owned industrial concern or housing project.

Honoré's bundle of rights may apply as much to collective or communal ownership as to private. For example, a collectively owned property may be a resource in which nonmembers are excluded and that is managed by some group appointed by the collective, and so on. In the United States, approximately 30% of the land is owned by the government, and much of this land is more communal (such as parks or range land) than collective. Robert Ellickson has pointed out that different types of property have distinct incentives and diverging costs and advantages. Private property, for example, may be preferable for small and medium enterprises. The recognition that property may be of distinct kinds is an important consideration, but the remainder of this discussion focuses on private property.

What sort of things may one have property over? Property is often considered in terms of tangible or real property in land, resources, or specific goods. Other forms of property are intangible or abstract and include all sorts of financial instruments, such as stocks and bonds, as well as forms of intellectual property. For example, copyright law expresses the common assumption that ideas originate with a person or persons and that those who have discovered or elaborated an idea should have the opportunity to reap the benefits of their efforts.

Among tangible goods, one of the first if not the most fundamental of property rights is that over one's person or body. (John Locke takes this to be the principal form of property, a natural right.) Many of Honoré's rights of ownership seem to establish exactly the ownership of self. A right to use, to manage, or to exclude the interference or actions of others would seem to hold of the self (or body), implying thereby that each person has an ownership right in the self. However, it is not obvious that the right to one's physical body (part of, if not identical to, the self) would be the same type of ownership as a right to own furniture. If one owns a chair, then one may destroy the chair, remove its legs, or sell it to another person. It is not obvious that the ownership of one's body would allow one to destroy oneself, to amputate one's healthy legs, or to sell oneself into slavery. Some might contend that differences such as these suggest that we do not really own the body or self. In such a view, it is argued, one must distinguish between having ownership of self and enjoying rules that protect one's interests or exclude others from certain sorts of actions.

A corollary question is the extent to which human beings may claim ownership of other living species. There are commonsense cases in which we easily accept ownership, as in the case of owning a goldfish, a hamster, or a dog. Yet in these instances the ownership is distinct from other types of ownership, in particular in the kinds of rights that one may claim. Some have argued that ownership should be extended to endangered species. Those who defend this argument point out that a significant reason that some species are endangered is because the animals are treated as a commons in which no single individual has any incentive to care for the animals or to take into consideration the long-run survival of that species. Rather, in these circumstances, each individual has an incentive to kill or hunt as many of the animals as he or she can before someone else does the same.

Apart from the particular kinds of things that we might have property over, there is another way of understanding property rights. Are these rights conventional or legal, human rights, or natural rights? A legal right is a right recognized within some actual legal system; a human right is a right that pertains only to human beings; a natural right is a right that is grounded in some feature of nature and is considered to hold regardless of what convention or legal systems allow. A human right may be understood to be either a natural right or a legal right. Taking this into account, a *moral* justification of property is a justification in which it is argued that property is a human or a natural right. There are a variety of such justifications.

Justifications of Private Property

A justification of property may take one of several forms. One basic justification purports to show why there should be some rules of property (private, communal, or collective) rather than no such rules. A second sort of justification seeks to show that one kind of property is justifiable (or preferable to another set)—for example, that the institution of private property is justified (or that private ownership of land is preferable to communal). A third sort of justification seeks to show why some particular person (or group) ought to have a right to this particular thing. The accounts that follow focus largely on the second sort of justification.

The philosophers of ancient Greece discussed the institution of private property in relation to its effect on virtue and the good life. However, Plato, in the *Republic,* argued that those who are to serve as rulers (or as warriors) should live in communal conditions to preserve unity and to guard against the emergence of private interests that would draw these rulers away from the public good. In contrast, Aristotle suggested that property was essential to moral goodness. In his *Politics* (Book II), Aristotle notes that those resources or goods that are held in common will receive less attention and care than those held by individuals. For Aristotle, in contrast to Plato, common property may generate discord, for it will encourage the lazy to reap rewards commensurate with those who work hard. Private property, on the other hand, not only encourages responsibility but is also essential for other virtues, including friendship, generosity, and self-control.

Instrumentalist Justifications

The concerns of the ancient Greeks point to a more general kind of argument for private property—that it is a means or instrument to some other good(s). Such instrumentalist justifications are consequentialist but not utilitarian. For example, property may be taken as an essential means to secure liberty. Private property secures a sphere in which one may act freely, and it also ensures that, against the power of the state, there will exist several and dispersed sources of material wealth. Property-owning individuals, and those contracting with them, will have the independence to oppose social pressures of conformity, whether coming from the majority culture or the government. This was certainly the argument of Thomas Jefferson, as well as defenders of the agrarian ideal, who found in the landowning farmer the independence and responsible virtue necessary for a free society. More recently, Milton Friedman has argued (*Capitalism and Freedom*) that political freedoms, such as those of speech and the press, depend on private property and that such property ensures political liberty more generally. A different kind of instrumentalist argument for private property rights has been forwarded by Friedrich Hayek, who contends (*The Constitution of Liberty*) that several (or private) property allows for the generation of a spontaneous order. Not discounting the argument for liberty, Hayek contends that dispersed property provides the conditions for voluntary cooperation and productive innovation, thereby bringing about a vibrant and wealthy society, a spontaneous order that is more complex than could have been designed by collective decision making. There are, in fact, correlations between standards of living and the protection of property rights: Nations that have secure protection of such rights (as well as other rights) generally have more wealth (and freedom) than nations that have tenuous protection of property rights. Hayek's account of spontaneous order, not to mention Adam Smith's system of "natural liberty," provides evidence of how the institutionalization of secure property rights may generate an unintended social order of great complexity.

Property as Freedom

Somewhat distinct from the instrumentalist argument that property is a means to freedom or social benefits is the argument that *identifies* property and freedom. As articulated by some contemporary libertarians, this argument maintains that since freedom involves acting without interference from others, property alone effectively defines that sphere within which one may act freely. Within the confines of one's own property, one is free to do what one wants and to choose with whom one wants to contract. Even if one argues that the private property rights of one person also *limit* (as do all rights) the liberties of others, who are no longer free to use that property, the guarantees of property also ensure transmissions of rights. Thus, if I own some land, then I may also transfer that land to you, by a rental agreement, thereby ensuring for you a right of use that is secure from interference from me and from the state.

The identification of property and liberty is not, however, so obvious. Among contemporary philosophical theories, John Rawls's theory of justice is notable for how it does not discuss the issue of property. In his *Theory of Justice* and his *Political Liberalism*, he leaves open the question of whether the principles of justice, especially the first principle of liberty, require that productive property be privately owned. Rawls declares that one of the basic liberties is personal property, but this sort of property does not entail that the basic economic arrangements of society must include private ownership of productive property or that freedom of contract may include all market exchanges. Rawls's account suggests, therefore, that private ownership is not essential to liberty and, as he affirms more explicitly, that forms of market socialism are compatible with principles of justice.

Occupancy, Labor, and Natural Rights

Apart from these general arguments for private property, there are significant arguments based on occupancy and labor, of which the most notable is Locke's labor theory of natural property rights. Before turning to Locke's theory, it is best to note how one might seek to justify the property of a particular person by appealing to some notion of first occupancy: Given some unowned resource, whoever manages to occupy it first has a justifiable claim to it. In the *Metaphysics of Morals*, Immanuel Kant contends that the actual possession of the first occupant must be legitimated within a civil society in which everyone's will and interests are respected. A contemporary argument is that of Carol Rose, who suggests that so long as some institution of property is legitimate, then a prima facie rule of first occupancy is the most efficient. The contemporary Austrian economist Israel Kirzner has also suggested that we might consider, in relation to profits and property, an application of the general intuition of "finders keepers": Insofar as one creates, discovers, or notices that which others have not, then it is one's own to keep.

John Locke's labor theory of property is a notable argument that extends the idea of first occupation and, in so doing, attempts to establish both the legitimacy of private property and an account of why a particular person may justifiably hold an ownership right over a previously unowned resource. In his *Second Treatise of Government,* Locke begins by describing a state of nature in which the land is held as a commons and individuals, each bearing natural rights to life and liberty, live together freely. What actions would generate a right of private ownership? Locke begins with the assertion of self-ownership. Since the individual owns himself or herself (to include one's body, acts, thoughts, and beliefs), the individual owns his or her labor. When one "mixes" one's labor with some unowned resource, then one's property in the self is extended to that material resource and one acquires, thereby, a property in that resource that excludes any other person.

Locke places a significant proviso on this account: One may acquire property only so long as one leaves "enough and as good" for others. If one interprets this clause as making an assertion about the appropriation of finite resources, then it is never possible to take some plot of land and to leave enough and as good for others: If at any point the property of one person is disallowed by this proviso, then so is everyone's property acquisition. However, if the proviso is understood to refer to the *value* of things, then appropriation is not only justified but is perhaps preferable to all other options. For it is precisely Locke's point that private appropriation also creates value (benefits) where none had previously existed. In this sense, the very act of private appropriation may increase resources rather than diminish them, thereby generating benefits and enlarging the options available to all. If the alternative to private appropriation is that of leaving the goods in the commons, then there will be little incentive for any individual to cultivate land if the cultivated land may then be appropriated by anyone regardless of effort or contribution. To leave resources in a commons is, as David Schmidtz has argued, to leave everyone worse off than if the land were privately appropriated.

Utilitarian Justifications

Locke's argument is a natural rights argument that is accompanied by an account of the benefits of the institution of property ownership. The idea that property has such benefits was developed in the 18th century by, among others, David Hume. In his *Treatise of Human Nature,* Hume contends that property is not so much a natural right, as Locke suggested, as a rule or convention that arises gradually, if not unintentionally, over time. Given a scarcity of resources, limited benevolence, and conflicting ends, social cooperation will not be possible unless we agree to ensure the security or stability of our possessions (and their secure transfer via contract). As rules of property emerge, perhaps taking on diverse forms across societies and social groups, social cooperation is made possible, as well as ongoing commerce and industry. Emerging against universal circumstances and a uniform human nature, these conventions are, in Hume's account, laws of nature whose presence also assumes moral legitimacy as we recognize the general benefits that they generate.

One may, however, generate a more explicit utilitarian doctrine according to which private property is the preferred institution for maximizing utility, whether utility is understood in terms of wealth, preferences, or happiness. Clearly, it is argued, some institution for assigning goods is necessary, and the institution selected should provide security and liberty for creation and experimentation, as well as an incentive to use one's resources and labor as efficiently as possible. In general, the best institution for doing so is that of private property. That said, for the utilitarian, the actual constellation or mix of private, collective, or communal property is determined by a consideration of the type of resource in question. Thus, utilitarian arguments need not conclude that *all* property must be private: The mix of private and public property may differ depending on particular circumstances and traditions as well as the types of resources to be owned.

Property and Personality

Alongside the instrumentalist, the Lockean, and the utilitarian justifications of property, there is that of the 19th-century German philosopher G.W. F. Hegel. In his *Philosophy of Right*, Hegel contends that property should be understood as the expression or embodiment of one's will. An individual's free personality must find an external embodiment, and property constitutes the actualization of one's freedom. Out of one's subjective actions and decisions, one develops a material and external embodiment of oneself. This objective embodiment, unlike mere possession, also requires the recognition of others. For Hegel, then, property has an inescapably social component. This sort of argument that links property to personality would, unlike the Lockean or the utilitarian account, seem to entail that each person should have property.

Criticisms of Property Rights

Apart from criticisms of particular aspects of specific justifications of property, there are general criticisms of private property. Some have argued that property ownership entails that owners have power over others. Morris R. Cohen notably asserted that "the essence of private property is always the right to exclude others." It may be admitted, for example, that a property right may limit the liberty of another person to use one's property, but it is not obvious that a system of property rights or an individual's particular ownership of property entails power over others, including those who do not own property. Institutions of private property may, in fact, increase options rather than decrease them. Private property provides incentives to innovate and to produce new goods and services, the net effect of which is to generate more rather than fewer choices. Nonetheless, a property owner, such as a factory owner, may direct the activities of those who are employed by him or her. This sort of direction need not be objectionable insofar as the employee is free to go elsewhere for work. Further protection of workers may be sought through government regulation of working hours, working conditions, wages, and benefits.

It was Karl Marx who argued, more generally, that private property allows one class to exploit the productivity of another class. Property owners have the purchasing power to secure the labor of others who do not own property but must labor to survive. As the propertied class or bourgeoisie accumulates wealth, the means to exploit the laboring classes increase, alienating the workers from their very actions and from one another. Under common ownership, Marx contends, the worker is no longer alienated from his or her labor because the work is no longer a means to an end but an end in itself. However, the Marxist analysis has been subject to withering criticism. Both Ludwig von Mises and Hayek argued that a fully functioning socialist economy could not achieve any sort of efficient operation without the incentives that operate in a private property economy. How will the governing directors of the economy know what to produce, how to produce it, and by what means unless freely determined prices emerge out of the competitive interaction of privately run firms? Such prices provide signals as to what people desire and how these desires might be efficiently met.

Nonetheless, critics also charge that a market economy of private firms and corporations will create or perpetuate great inequalities of wealth and income. Even if there is movement among or between social classes, that does not help the person or groups who have little or no property: Those who do not possess property will be at the mercy of those who do. If one holds, however, that property ownership need not be absolute, a market economy is compatible with taxation policies that seek redistribution of wealth or that attempt to ensure some economic threshold below which no one will fall.

Applications and Considerations

Property is a relevant consideration for a variety of topics and controversies in business ethics. It is worth recalling that the practice of business is, in fact, the exchange of property for profit. Property includes a right of management or use, and the question of what constitutes legitimate management or use arises in a variety of areas.

Some of the questions at the intersection of business ethics and property rights are also questions of constitutional import. As the fundamental law of the land, a constitution has significant effects on the legal status of property. John Locke, for example, had a great influence on the outlook of those who devised the U.S. Constitution. Many of the signatories to the Constitution maintained that its very purpose was to protect property and that doing so would preserve life and liberty. James Madison, following the ideas of Locke, maintained that the primary function of the government was to protect property, to include one's life and estate. Even so, the Constitution makes scant reference to "property," a fact that does not gainsay its importance, for the founders regarded the right to acquire and hold property as part of the common-law inheritance, scarcely in need of written constitution. Article IV of the Constitution includes the "Property Clause," which specifies that Congress shall have power to make rules and regulations on property belonging to the United States. More notably, the Fifth Amendment includes the "Takings Clause," which specifies that property shall not be "taken for public use, without just compensation." This clause attempts to ensure that no single property owner must bear the burden of a public use that should be borne by all. The phrasing also suggests a distinction, not always clear, between the *use* of property and the *devaluation* of that property for the owner. For example, regulations that serve to inhibit or prohibit an economic activity on one's property may devalue that property. The Supreme Court has invoked the Takings Clause to invalidate some laws or regulations that effectively deprive an owner of an economic use for the property. Most recently, however, in *Kelo v. City of New London* in 2005, the Court ruled that eminent domain is permissible if the taking of the property will generate "public benefits." This suggests a broader notion of "public use" than the traditional and would seem to allow for private property to be taken and allocated to another party if only that party will generate greater tax revenue for the state.

Constitutional and moral questions have surfaced with regard to questions of employment and working conditions. For example, whether the right to use and to manage one's property includes a right to discriminate is relevant to discussions of affirmative action. Similar questions of use and management affect the status of contracts and working conditions. If an owner should be free to dispose of his property as he sees fit, then this might permit exchanges otherwise prohibited by minimum-wage laws or allow the disposal of hazardous materials on one's own property. Similar considerations of management and use arise in discussions concerning regulations that place constraints on the sort or degree of risk an employer or owner may require of an employee.

The value of property rights also arises with regard to corporate governance. Should the corporation be managed for the benefit of its owners, the stockholders, or for those stakeholders who have a significant interest in the success of the corporation? One may argue that a stockholder or shareholder *owns* stock and that managers therefore have a fiduciary duty to these owners, a duty that trumps any obligations to stakeholders. The stockholder, for example, has succeeded in buying the ownership shares precisely because he or she has consumed less than he or she earns. It is to society's benefit that resources be put to the most productive uses; the management of corporations in the interest of the owners (stockholders) should ensure this better than the stakeholding alternative. Others argue, however, that the sort of property relation that exists between stockholders and shares in a corporation is distinct from the ownership relation of, say, a homeowner to his or her home. The homeowner is responsible and liable in a way that a stockholder is not, and the property of the stockholder is held solely for profit. The call for the corporation to be managed with an eye to stakeholders, as well as stockholders, also rests on an appeal to a moral principle of respect for those affected by the decisions of the corporation.

Although we often think of ownership as referring to land or material resources, there is also intellectual property in ideas, discoveries, or inventions. Originally invoked for written documents, a copyright grants to the originating party an exclusive right to copy or sell a product; a patent provides, for a specified interval, protection for inventions, discoveries, or innovations. The arguments for copyright are both nonconsequentialist and consequentialist. The consequentialist arguments center on how copying will generate a decline in the prices of the good and reduce the incentives for its production. The nonconsequentialist argument stipulates that copying the work of another, including computer software, is theft. In this view, for example, the author or programmer has a property right in the work, and copying violates that right. Setting aside the consequentialist argument, the nonconsequentialist claims are not so obvious as they first appear—especially if one takes property rights to be important. A copyright law has the effect of prohibiting others from using their own property, including their own minds as well as their own material resources. For example, if an author writes a novel and then sells that novel to another person, why should that person be prohibited from copying that novel and selling it himself (preserving the name of the original author rather than passing himself or herself off as the author, which would be fraudulent)? Of course, if the author of the novel (rather like the manufacturers of computer software) sells the book on condition that no one else replicate it, then any replication on the part of the buyer is a violation of the contractual agreement. In the case of patents, if one person discovers a new use for some chemical agent and patents that invention, then anyone else who, independently, discovers the same thing is prohibited from using that discovery, even though the discovery was wrought through that individual's own effort and resources. These brief considerations would suggest that the nonconsequentialist arguments for intellectual property rights are, by their very appeal to property, quite controversial.

It is often assumed that private property and market transactions generate negative externalities such as pollution and environmental damage (not to mention the depletion of natural resources). Yet it is not obvious that this should be taken for granted. In the ideal case, property law should ensure that all negative externalities, and presumably all benefits, would accrue only to those engaged in production or in the exchange. As an illustration, if property rights are enforced, then the factory down the street cannot spew smoke that will affect others living nearby on their property. If this occurs, the third party is bearing some of the costs of an exchange between the factory owners and the consumers of the factory's products. In a real sense, then, many environmental problems result not from private property but from its absence or its nonenforcement. Property enthusiasts have maintained that the enforcement of clear property rules may do a better job of altering incentives and internalizing costs than do regulations, pollution taxes, or tradable permits.

Considerations of property and the institutions of property also have significant relevance to issues of privatization and globalization. If the legal enforcement of property rights is essential to the growth of wealth, then one of the most important elements for economic development will be the institutionalization of a rule of law. The rule of law not only allows for the recognition and enforcement of property but also serves to discourage the use of bribery. The importance of the rule of law in maintaining legitimate property rights has come to the fore as formerly Communist nations have attempted to privatize industries that had been collectively owned and managed by state officials. One clear lesson is that genuine privatization must include the recognition and enforcement of property rights and contracts, along with the institutionalization of the rule of law and the staffing of regulatory agencies by persons who are committed to an impartial administration of rules of property and contract. Even these reforms do not, however, answer the question of who is the proper owner of the companies to be privatized. It is not at all obvious that the owners are those who had formerly managed or worked in these organizations, as has been assumed in many countries, for many of those who managed state firms may have done so only because of their affiliation with the Communist Party.

Finally, business ethicists often appeal to the principle and value of autonomy. Property offers one means of ensuring autonomy, for it grants to the owner the rights of decision, use, and control. Whether the link between autonomy and property entails a classical liberal approach to business and society or one that favors a more egalitarian distribution of property is a question of some importance. It also serves as a reminder of how the consideration of a fundamental institution such as property is relevant to the very issue of choice and moral decision.

PROTESTANT WORK ETHIC

We are a culture whose history is steeped in the hard work and accomplishments of our pioneering forebears. Our most ingrained cultural constant and our enduring national myth is what Max Weber dubbed the Protestant Work Ethic. At its core, the Protestant Work Ethic is the conviction that all work, any work, is good, noble, and a demonstration of diligence and duty. It is also an active demonstration of religious devotion and piety, as well as commitment to the perfectibility of the "human condition" at both the material and the spiritual level.

Most historians attribute the origin of the work ethic to Martin Luther. According to Luther, one was summoned by God to a secular "calling," which today we would call a job, profession, or career. Before Luther, most work was looked on as a curse more than a calling. To the ancient Greeks, whose physical labor was in large part done by slaves, work brutalized the mind and made workers unfit for the practice of humanizing virtues. The Greeks regarded work as drudgery, an activity to be conducted with a heavy heart. Work enslaved the workers to the task, corrupted the soul, and impeded the worker's pursuit of "the good life."

Luther stressed that all work, all callings were necessary to life. No calling was to be recognized as more necessary or blessed than another, and therefore, all callings were of equal worth in the sight of God. For Luther, work was a form of serving God. Thus, the only way to live acceptably before God was through devotion to one's calling.

With John Calvin in the 16th century, we find Luther's ideas extended, systematized, and institutionalized. Work was the will of God, and even ceaseless dumb toil sufficed to please him. Calvin preached the predestination of the elect. He believed that the elect could be recognized by certain outward signs, which included self-denial and devotion to duty, and that God caused the elect to prosper. "To prosper" or "to succeed" meant to enjoy not only wealth and happiness on earth but also eternal salvation. Success was the symbol of selective salvation. Calvin managed, no matter how indirectly, to provide a rationale that linked work and the divine with material success and comfort.

In *The Protestant Ethic and the Spirit of Capitalism,* Max Weber observed that the rise of Protestantism and the rise of capitalism generally coincided in England and throughout most European countries. Weber's explanation was that many basic Protestant ideas encouraged capitalistic activities. For example, Protestantism taught that each person would be individually judged by God and that judgment would be based on one's whole life's work or "calling." Protestantism also taught that the fruit of one's calling—money—should not be spent frivolously or unnecessarily. According to Weber, these ideas led to a life of hard work, self-discipline, asceticism, and concern with achievement. This ethic helped advance the rise of the private entrepreneur in that it led to the accumulation of money that would not be spent on luxuries but that could and should be put into one's own business.

The direct theological descendants of the Protestant Reformation, and of John Calvin in particular, were the Puritans who migrated to New England. Citing the biblical parable of the talents in Chapter 25 of the book of Matthew, Calvin urged the Puritans to prosper. The gospel of work in America was also preached from many other pulpits. William Penn constantly reminded the Quakers that diligence and frugality were virtues.

Perhaps the final solidification of the work ethic in America occurred with its practical translation and secularization by Benjamin Franklin. In his various publications, Franklin taught that wealth was the result of virtue and the proper display of character. In his *Autobiography,* he defines the ethic of work in his list of ideal traits. With Franklin, the work ethic shifted from a direct form of worshipping God to an indirect way of rendering service to God by developing one's character and doing good to others. Unlike the Puritans, Franklin's craftsman no longer worked for God's glory but for himself. Franklin maintained that God helped those who helped themselves. Nevertheless, hard work remained the primary standard for private success and social usefulness.

By the 19th century, the Protestant ethic in America had changed its name at least three times, but its essential focus had not changed at all. Whether it was called the Protestant ethic, the Puritan ethic, the work ethic, or the immigrant ethic, hard work was seen as good in and of itself—the only ticket to survival and the possibility of success.

According to the noted labor historian Daniel Rodgers, the central premise of the work ethic is that work forms the core of the moral life. Work, said Rodgers, made men useful in a world of economic scarcity. It staved off the doubts and temptations that preyed on idleness; it opened the way to deserved wealth and status; it allowed one to put the impress of mind and skill on the material world. In many ways, the work ethic posited one's very right to existence. One achieved worth through work. Work is the means by which we achieve status, stuff, and success.

PRUDENCE

Prudence is good judgment in the pursuit of one's interests. A prudent person characteristically acts in a rationally self-interested way, with long-term considerations in mind. An imprudent person might pursue short-term pleasures and later deal with bad consequences that outweigh the pleasures. Prudence is therefore not just a matter of desire satisfaction; in fact, prudence often involves deferring gratification in aid of maximizing it. Prudence is a virtue in a manager or a professional person, particularly one who is another person's agent. Imprudence in one's own case is foolish; imprudence on another's behalf is morally irresponsible.

A prudent investor takes rational risks. One's risk curve depends on how one evaluates certain possible states, particularly gains or losses. Your risk curve may differ from mine without either of us being imprudent. You are imprudent if you invest in ways that ignore your evaluations or if your evaluations turn out to be mistaken—if, for example, it turns out that you mind losing $1,000 much more than you thought you would.

In popular usage, the notion of prudence carries the connotation of undue caution. This is not how moral philosophers have historically understood prudence. Aristotle argues that prudence is the virtue that entails all others. So courage, for example, is of a piece with prudence. A courageous person knows when to stand and fight and when to run; he or she habitually makes that sort of distinction rationally, even when in danger.

Prudence is of particular interest to virtue ethicists, who follow Aristotle in believing that ethics is primarily about being a certain sort of person rather than acting according to certain principles. So a courageous person, a species of prudent person, fears what is in fact worth fearing and acts accordingly. This does not involve weighing the personal rewards and costs in (say) a utilitarian way but instead has to do with acting on well-habituated moral intuition supported by emotion. In particular, it would not be characteristic of a courageous person to run because others are probably going to run; the courageous person might stand and fight futilely. An agent who looks for utilitarian grounds for not exercising a certain virtue is in danger of losing that virtue. That would be bad for the agent in the long run.

In some ways, prudent people and well-managed companies are similar. They have an agenda that is based on certain values that stand them in good stead in the long term. But creating that sort of organization and the strategic capacity that it requires is difficult, and most firms are not that good. Similarly, if you are a prudent person with coherent and sustainable values that regularly inform your desires and drive your actions, you are a rare bird. For contrary to what many economists presuppose, people do not always act in a self-interested way. They may be ignorant of probable consequences or they may have incoherent values. Sometimes they consciously act against their values.

Aristotle calls prudence (*phronesis*) a virtue, a component of character that is part of a good life—in fact, a sufficient condition of all the virtues. A prudent person is a self-interested one, but that raises a problem. One might wonder whether prudence is an ethical virtue, for ethics is surely about the interests of others, and selfishness is a vice. Kant is one of many philosophers who distinguish the prudential from the ethical: The dear self is the beneficiary of the former and interferes with the latter.

Aristotle differs from most modern moral philosophers in that he does not presuppose that morality is necessarily about the interests of people other than oneself. Ethics is about the good life, primarily a life of personal fulfillment. Philosophers have often asked why one should be ethical—that is, what self-interested reason one has for being ethical. Arguing that one should be prudent in Aristotle's sense would not answer the question, for one would still have to show that his form of prudence qualifies as a genuinely ethical trait.

Aristotle does not claim that doing the right thing will make one happy. His claim is rather that being the sort of person who characteristically does the right (courageous, benevolent, honest) thing will make one a happy person. The argument begins by denying that the difference between a good person and a bad one is that the bad person does what is enjoyable while the good person is willing to set aside enjoyment and instead do the right thing. This suggests that prudence is antithetical to morality. On the contrary, Aristotle claims, the person of good character, the prudent person, is one who enjoys doing the right thing. Enjoying doing the wrong thing is a sign of bad character. The claim is compelling. Surely it is not preferable to be the sort of person who does the right thing reluctantly.

We must not assume that what is in one's interests is independent of one's character and values. It is true that things such as food and shelter are in anyone's interests. Beyond such essentials, however, interests, and therefore what is prudent, may differ from one person to another, depending in part on what people consider the features of a good life to be. It is difficult to determine the limits of what could be regarded as a good life, but there is some leeway, and a plurality of conceptions of the good life may all be equally good.

The crucial question is whether a good life has to be a moral life. Here is a reason to think so. Suppose that an individual could exercise a kind of higher-order prudence and decide what he or she would consider a good life—that is, decide what he or she would most value and accordingly desire. What would the criteria be for choosing well? Self-interest will not be one of them, for the person is deciding what will count as self-interest. One criterion surely would be sustainability: Other things being equal, it makes little sense to take the good life to be one of uninterrupted success and pleasure, for one will surely experience frequent disappointment. Coherence is another: One should not aspire to enjoy fitness without exercise or be offensive and have many friends. Few could rationally aspire to a life of vanquishing all others, or even of being altogether independent of others.

The good life from the agent's viewpoint can be a moral life if what the agent most enjoys is the life of a good character in a good community, in which trust, mutual respect, honesty, and similar virtues are the norm. If Aristotle is right in claiming that human beings are rational and communal creatures—capable of intending, acting on values, and creating their lives subject to the constraints of their interdependence with others—then one must live in harmony with one's fellow citizens but cannot do so if one treats them dishonestly, disrespectfully, and so on. If that is the case—that is, if Aristotle's analysis is correct—then the standard virtues will normally be necessary for happiness, at least in a good community.

A good community will encourage the virtues that help build and sustain it. For example, it will require its citizens to be honest without calculating whether their fellow citizens are likely to be honest. Children will be taught that it is good to be honest. Those who grow up to be liars will be despised and likely punished by their fellow citizens. In such a community, desiring to be and being an honest person stand one in good stead. Widespread honesty will create social capital that will enhance life in the community. There may be some communities, however, in which there is so little support and reward for honesty that it is futile to be honest, for the dishonest people will take advantage of the honest ones. So in the wrong kind of community, it will be difficult for prudence to include self-interestedness and attentiveness to the interests of others.

An organization may encourage the virtues that sustain it—trust and trustworthiness, for example. But suppose it rewards an extreme form of independence and aggressiveness among its employees. Those traits may lead to internal competition and uncooperativeness, hence organizational ineffectiveness. A dysfunctional organization characteristically has a culture that wars with its mission in just that way. In such an organization, cooperativeness and other virtues may not serve the agent's interests.

Arguably, what makes business ethics a difficult matter is that success in business requires competitive ruthlessness rather than benevolence. It does require competitiveness, but whether it requires ruthlessness depends on whether the environment of business is such that an honest person with decent sensibilities can be successful in it. There are some markets and some organizations in which an honest person cannot succeed. In such environments, good ethics is not good business, and prudence splits into two antithetical traits.

Even in a good community or organization, not everyone will enjoy being prudent in the appropriate sense. Some prefer competition and the exquisite pleasure of crushing others, by fair means or sneaky. The risk in this sort of life is part of the fun. People with the requisite skills and inclinations can often maintain such a life for a good long time and find it to be satisfying on the whole, even taking into account a short stay at a minimum security facility.

Even for such people, however, a higher-order prudence may link self-interest to ethics. If we ask the typical MBA candidate, "What sort of life do you want?" we might get a Darth Vader answer. But the more interesting question is this: "What sort of life do you want to want?" Most people like ice cream better than broccoli, and given a choice would take the ice cream. But at least some of these people wish they liked broccoli more than ice cream because broccoli is healthier. Similarly, given the choice between adopting Nietzschean values and adopting Aristotelian ones, a prudent person might well choose the latter, along with the desires it entails.

Not everyone can choose to have certain values and desires, but some people can do something much like it. Social psychologists argue that character is overrated as an independent variable explaining behavior: The features of one's environment are more influential. Few people are prudent. We are more vulnerable than we think, and we should be conscious of environmental influences and careful in avoiding situations that can influence us in wrong directions. That is, we should prefer to be in a good community. Prudence is therefore extremely important when one is choosing a career or an employer.

An MBA student may believe, correctly, that he or she is the sort of person who will enjoy working for (say) McKinsey. But it is also true that an MBA who goes to McKinsey will likely soon begin to adopt the values that the culture encourages. People who say that the travel takes them away from their families and that the internal competition is dysfunctional will be considered losers. Meanwhile, a student who goes to work at Johnson & Johnson will probably not spend years wishing he or she were with McKinsey. In a strong culture, you become a certain sort of person.

The most prudent possible agent is one who can decide what values and desires to have and then arrange to satisfy them to the greatest extent possible. So a highly prudent MBA candidate will understand that the choice of McKinsey or Johnson & Johnson will in due course create certain desires and values. He or she can then consider which set of values will be sufficiently coherent and sustainable to create a satisfying life in the long run. Such a person will likely be ethical.

Prudent Investor Rule

The Prudent Investor Rule generally provides that a fiduciary shall invest and manage property held in a trust as a prudent investor would, by considering the purposes, terms, and other circumstances of the trust and by pursuing an overall investment strategy reasonably suited to the trust. A person who holds property for the benefit of another is said to hold that property in trust and is known as a fiduciary. The terms *prudent* and *discretion and intelligence* were first applied to trustee decisions in an 1830 Massachusetts court case, in which the court first established a "Prudent Man Rule" by determining that trustees must take their investment cues from "men of prudence, discretion and intelligence."

State statutes setting forth prudent investor rules have varied in their application of the general rules of trust management. The concepts originally established by the Prudent Man Rule became limited over the years as states began enacting "legal list" statutes specifying the types of investments in which trustees were permitted to invest. The Restatement of Trusts (Second) codified the principles of the Prudent Man Rule and broadened the permissible investment strategies but still prohibited any "speculative" or innovative investments. In addition, the application of the Prudent Man Rule was extended beyond the rule's origins in income trusts to a greater variety of situations involving charitable trusts, public funds, and pensions. Each situation bears its own particular complexities with respect to trustee obligations. For example, pension fund management's additional conflict lies in the reconciliation of the trustee's duties to the employer and employees when the effect of the decisions made may differ dramatically depending on whether the employees are current or retired. Likewise, remainder trusts pay income to the initial beneficiary for a period of time and ultimately pay out the remainder or residue of the trust property to a second party. Given the tension inherent in such competing ownership interests of successive beneficiaries, the investor must maintain a balance between all relevant interests in arriving at the best course of action, requiring greater flexibility in trust investment principles.

The criticisms of the Prudent Man Rule were addressed in the revision of trust legal principles set forth in the Restatement of Trusts (Third) in 1992, which attempted to reconcile trust investment law with ongoing investment practices. The revised principles of the Restatement of Trusts (Third) then gave rise to the promulgation of the Uniform Prudent Investor Act (UPIA) in 1994. UPIA has been adopted by a significant majority of states.

In contrast to traditional trust management principles, the Prudent Investor Rule as stated in the Restatement of Trusts (Third) and UPIA adopts the revised principles of trust law, requiring the trustee to justify the reasonableness of each investment rather than demonstrating avoidance of all speculation, and serves to provide consistent application of a more process-oriented trust investment law. The Prudent Investor Rule and UPIA incorporate Markowitz's modern portfolio theory, which provides that trust management must reduce risk by mathematically diversifying assets across a spectrum of classes of assets as well as within each individual asset class to reduce risk and maximize reward.

The Prudent Investor Rule had historically advocated that investors build investment portfolios from securities that each individually had low-risk and high-reward characteristics. Modern portfolio theory finds fault with the traditional approach for yielding a portfolio with assets selected using the same criteria, potentially resulting in an overall decrease in value of the assets chosen using the same criteria and assumptions as the one that initially decreases in value. The Prudent Investor Rule of the Restatement of Trusts (Third) uses the broader asset selection methods of modern portfolio theory to allow trustees greater flexibility in managing each trust's respective assets to minimize risk and reap maximum rewards.

Public Choice Theory

Public choice theory is the application of economic principles to politics. It is most often considered to be an area of study lying between market exchange "economics" and "political science" ideologies, although some scholars consider it to be more a branch of economics. Public choice theory's main tenet is that voters, politicians, and government officials are motivated by the same basic economic factors as market actors and as a result do not always operate in the public's best general interest. Legislators are considered to make decisions with tax payers' money to advance predominantly (if not exclusively) their own self-interests and are primarily interested in their own power, prestige, advancement, reputation, status, income, and perquisites. Public choice theory offers a critical examination of the decisions made and roles played by voters, legislators, regulators, lobbyists, and various special interest groups, and the subsequent positive and negative impact of these decisions on the general public interest. It is predominantly a skeptical, cynical, and less naive view of democratic government and also offers suggestions for the improvement of modern political governance systems. The view applies purely positive economics (how people behave) and eschews normative economics (what should be).

History of Public Choice Theory

The application of economic principles to political processes began in the 1940s and 1950s. The approach grew out of an awareness of the deficiencies (or inefficiencies and injustices) of current governments in "curing" existing social ills and in addressing effectively the concerns of the "general public." Government had been perceived as the panacea for addressing market failures, market inefficiencies, and social inequities and was considered to be an infallible controller of the public interest, with noble ideologies and perfect information. In addition to a reaction against this widely held perception, public choice theory also grew out of both the public's and scholars' increased awareness of the growing size of the federal government (through expanding taxation and expenditures), which began to equal or surpass the size of the private market sector.

Public choice theorists indicate that they simply attempted to provide a coherent understanding and interpretation of what everyone could allegedly readily observe about governments at the time—most notably that

- collectivist schemes (governments) were failing,
- little correction of social ills was occurring, and
- governments were growing and making things worse.

Public choice theory applied the economic concepts of self-interest, market exchange, and methodological individualism to the main players involved in and responsible for the public interest, including voters, legislators, regulators and other bureaucrats, special interest groups, lobbyists, public action committees, trade associations, and more recently the media. Public choice theory states that it takes common economic principles of behavior in the marketplace and assumes that these self-interest motives are the same motives operating in the political arena for the above organized constituents.

Rational Ignorance of Voters

A fundamental premise of public choice theory is that efficient, effective, and "just" government policies and activities in democracies are an underprovided public good. An important reason for this "failure of government" is the "rational ignorance" of voters. Voters understand that an individual vote has negligible impact on the result of an election, while the personal cost of becoming knowledgeable and well-informed on political issues and candidates consumes enormous time and energy. As a result, it is rational for voters to abstain from voting, or at least to remain ignorant and uninformed. This behavior is evident historically in the low turnout of voters in U.S. elections.

Interest Groups

While individual voters have little incentive to influence elections and the legislative process, a plethora of special interest groups exist that have a very strong incentive to lobby and influence the government to enact and implement specific policies that would benefit their special interests at the expense of the general public. The classic example given by James M. Buchanan and Gordon Tullock is the success of local farmers (in need of getting their roads repaired) in lobbying for special legislation to pay for the improvement of their individual roads. The road repairs are funded by the general public, who receive no such benefit. Similar examples are sugar manufacturers, who receive special subsidies, either directly or through protectionist measures. The benefits of these activities are received by a small special interest, with the costs being dispersed over all citizens in an almost imperceptible and unnoticeable manner.

Public choice advocates criticize the pervasiveness of benefits received by special interest groups and the resulting inefficiencies and injustices of government as these interest groups, legislators, and government bureaucrats take care of their own self-interests at the public's expense. Special interest groups contribute to politicians through legitimate financial contributions, lobbying, and perquisites and potentially through illegal bribes and kickbacks. These exchanges and the resulting inefficiencies and injustices are what public choice theorists refer to as "government failure."

Majority Rule and the Public Interest

An important concept in public choice theory and democratic forms of rule is "majority rule": The elected ruling political party makes decisions favoring established party platform issues and supportive constituents. Kenneth Arrow, a major forerunner of public choice theory, stated that majority rule could not work to promote the general interest in democracies. Arrow's "impossibility theorem" states that a majoritarian democracy would be inherently unstable as it fosters discrimination against outvoted minorities. Pure majority rule would then contribute to inefficiencies and injustices in democracies as special interests receive benefits at the expense of the general public.

For a society or a political form of government to be just, all groups must benefit from its activities and resource allocation decisions. A solution to the problem of majority rule was addressed by public choice theorists through the concept of "unanimity": All members of a voting group must first agree on policy decisions, for subsequent collective action to be taken. All persons would secure a net gain as a result. Public choice theorists recognized that unanimity was impractical and unrealistic and, as a result, developed the concept of supermajority rule. Based on early work by Knut Wicksell, supermajority rule would require, for example, that five sixths of a voting block agree for any collective action to be taken by an existing government or collective body.

Constitutional Economics and Rent Seeking

The most prominent scholars associated with public choice theory are James Buchanan and Gordon Tullock. Buchanan won the 1986 Nobel Prize in Economics. Buchanan and Tullock's 1962 book, *The Calculus of Consent,* addressed the potential unjust and inefficient issues allegedly associated with majority rule. The central contribution of their book was to identify two structures of "collective decision making" by governments. "Ordinary politics" involves the decisions made in legislative gatherings or sessions. "Constitutional politics" concerns the "rules" of how ordinary politics are conducted. The rules of congressional decision making are based on the Constitution, allowing for unfettered majority rule to the exclusion of unanimity and supermajorities and to the benefit of special interests. Constitutional economics explains the underlying rules specifying how self-interest is promoted by legislatures, special interest groups, voters, government officials, and bureaucrats.

An associated term coined by Anne Krueger in 1974 and discussed conceptually by Tullock in 1967 is "rent seeking." This idea emphasizes that there is value to be gained (rents) through politics and that special interests will try to gain favor (seek rents) by lobbying and donating funds to candidates who will promote their constituents' interests in "exchange" (e.g., roads for local farmers, subsidies, tariffs, quotas, tax breaks). To the extent that other groups likewise expend resources to gain such rents but are unsuccessful, interest competition results in waste and inefficiencies for the general public.

Legislators, Vote Trading, Logrolling, and Capture Theory

Public choice economists closely examine the action of legislators. In a "just" society, legislators are expected to pursue the "public interest." Legislators, however, use other people's money raised through taxes, and legislators have little incentive to spend money wisely or fairly as a result. Efficient or fair expenditure of taxpayer resources by legislators does not save any of their own money nor reward them for any saving in expenditures. As a result, there is no economic incentive for government officials to be efficient or fair to the general public.

Legislators have the power to tax, extract, and spend resources in inefficient and unjust ways because voters poorly monitor their behavior. One technique used by politicians is "logrolling," or "vote trading," in which politicians trade their votes to support each other's bills or initiatives to benefit each legislator's individual constituent group (to the detriment of the general public). Local uninformed voters only know that their local representative got something for them and are unaware of the larger inefficiencies for both themselves and the general public.

Public choice theorists have also addressed the role of regulators in government under the label of "capture theory," introduced by George Stigler, a Nobel laureate in economics (1982). Regulatory agencies rely on Congress and legislators for their budgets. Lobbyists can influence legislators to provide funds for regulatory bodies, and in this sense, the regulatory agencies (and legislators) are "captured" by the lobbying interest groups.

Suggestions to Correct "Government Failures"

Public choice theorists have offered solutions for "government failures." One suggestion is to introduce "rules" that would limit government legislation that caters to special interests and to curtail the expanding expenditures of the federal government. One attempt was made in the 1980s by James C. Miller, a public choice theorist who headed the Office of Management and Budget. Miller was instrumental in passing the Gramm-Rudman-Hollings (Balanced Budget and Emergency Deficit Control) Act of 1985, which set a limit on annual government spending and required automatic cuts if the overall limits were not met. Additional rules have been offered to limit logrolling and the power of special interest groups.

Another suggestion by public choice theorists is to initiate responses on the local government level through referenda and initiatives for voting by the public before any legislative action is taken. To streamline federal bureaucracies, some public choice theorists suggest that private enterprises take on the responsibilities currently allocated to federal bureaucratic organizations. The idea is to use market exchange activities to implement and control procedures more efficiently and effectively.

Critics and Opponents of Public Choice Theory

Critics and opponents of public choice theory emphasize that human actors respond for many reasons and that self-interest and economic benefits are not the be-all and end-all of every human action. Public choice theory has been criticized as being "immoral" or lacking any moral component in its analysis of human behavior in the political arena. It has been criticized as the simple transference of economics to politics, when in reality, voters and legislators do not behave in the same manner as individuals and markets do in purely financial exchange relations. This criticism argues that individuals behave differently for the public than they do for themselves.

Public choice theorists agree that individual actors respond in many ways for many reasons and that economics is one of many factors but an important one. They assert that self-interest does not simply go away in politics. It may be mitigated by social and political roles in the consideration of public interests, but ordinary incentives and their impact and motivating value do not simply vanish.

Impact of Public Choice Theory

Public choice theorists do not claim any new insight or discovery but rather a rediscovery of wisdom and common sense in bringing the perspective and implications of economics into democratic politics. The approach purports to offer insights into political activities such as tax exemptions, loopholes, tariffs, quotas, growth in governmental bureaucracies, and various other "rent-seeking" behaviors of legislators and regulatory agencies. Public choice theorists claim to have had an impact on critical thinking and on new public attitudes about government and collective decision making. They claim to have made the public more critical of politicians and regulators, more cynical about the motives of government officials, and less naive about the success of ideological democracies and socialistic approaches to solving the social ills of society.

Public Company Accounting Oversight Board

The Public Company Accounting Oversight Board (PCAOB) is a private, tax-exempt regulatory entity that Congress created through the Sarbanes-Oxley Act of 2002 (SOX), principally to promulgate and enforce rules regarding the auditing and governance of publicly held corporations and the practice of public accounting.

Structure of the Public Company Accounting Oversight Board

Title I of the SOX sets out the responsibilities of the PCAOB "to oversee the audit of public companies . . . subject to the securities laws . . . to protect the interests of investors and further the public interest in . . . informative, accurate, and independent audit reports." Despite the PCAOB's federal charter, Congress created it as a private entity, a tax-exempt organization, under the proximate authority of the Securities and Exchange Commission (SEC), and provided that board members would not be federal officers.

The SOX assigns the SEC, in consultation with the chair of the Federal Reserve Bank and the secretary of the treasury, authority to appoint five board members to the PCAOB, consisting of "prominent individuals of integrity and reputation who have a demonstrated commitment to the interests of investors and the public, and an understanding of the responsibilities for and nature of . . . financial disclosures . . . and the obligations of accountants with respect to . . . audit reports."

These are full-time, exclusive positions with 5-year terms, except for the first group, whose terms will end on a staggered basis on each anniversary of the first appointment; the chair serves for 5 years. Two members must be, or must have been, certified public accountants (CPAs), while the others should not have been CPAs. Members can serve only two terms, consecutively or nonconsecutively, and are subject to removal for a good cause. The board maintains an ample staff of attorneys, subject-matter experts, and administrators.

The PCAOB's duties include registering public accounting firms (hereafter, firms) that audit issuers of securities in public capital markets (hereafter, issuers); setting professional standards for auditing, quality control, ethics, independence, and other matters; inspecting, investigating, and sanctioning firms and their members; and enforcing SOX provisions, PCAOB rules, professional standards, and securities laws regarding audits. Firms must submit activity reports to the PCAOB at least annually. These reports, and the original registrations, are available for public inspection, except for proprietary information. To finance its operations, the PCAOB assesses registration and annual fees on firms that practice before it.

With regard to standards for auditing, quality control, and independence, the SOX provides for a *discretionary* zone of cooperation between the PCAOB and private sector advisory bodies, including the authority to adopt professional standards from such groups. However, subsequent provisions signal the significant reemergence of direct oversight of the accounting profession by laying out stiff *minimal* requirements for firms regarding auditing standards and quality control standards for audit reports. The PCAOB may recognize, but also can overrule, private authorities, including the Financial Accounting Standards Board (FASB), regarding such requirements. Although the PCAOB may solicit recommendations from private sector "expert advisory groups" within the profession and from others, it retains "full authority to modify, supplement, revise, or subsequently amend, modify, or repeal" the resulting standards. In other words, what for decades had been the SEC's largely rule-based deferential delegation to the private sector standard-setting process had become in the SOX a potentially more case-based, even issue-based, exercise of regulatory oversight.

As indicated below, this statutory oversight authority had remained with the SEC since its creation in 1934 (and under the SOX, it continues to do so). With the SOX, though, the proximate *exercise* of this authority shifted perceptibly, and the federal government reclaimed much of what it had delegated, though ostensibly through an *alternative* private entity. Yet in the future, the PCAOB's private status may turn out to be not significant, since the SEC's "oversight and enforcement authority" over the body remains quite wide-ranging.

Title II of the SOX changes the legal guidelines to promote formal, arm's-length relationships between firms and issuers. Among other things, these provisions affirm the fiduciary duty of the issuer's audit committee to preapprove audit engagements and the obligation of auditors to make timely reports of the issuer's critical accounting policies and practices, alternative presentations of financial information, and other material in written communications between the parties. In addition, to sustain the arm's-length nature of the relationship, the SOX requires the audit partner for each engagement to rotate at least once every 5 years, and it prohibits a firm from performing an audit for an issuer whose chief executive officer or senior financial officer had worked for the firm and "participated in any capacity" in the audit of the company during the year preceding the beginning of the audit.

Title II also enumerates a long list of services that firms may not offer to issuer audit clients, including bookkeeping, financial information systems, appraisal, internal audit, human resources, investment, and legal services. The previous proliferation of these parallel services, while plausibly complementary to effective and efficient audits, became excessive, distracted CPAs financially and operationally from their original central concern as auditors, and in some cases compromised their independent professional judgment—for example, when audits came to involve review of their own work. However, the SOX empowers the PCAOB to grant exemptions from these restrictions on a case-by-case basis—for example, for firms to calculate compensation packages for the chief executive officers of issuers.

The SOX applies as well to foreign firms that prepare or provide audit reports for issuers in the United States, and it subjects them to the rules of the PCAOB and the SEC as though they were American firms, with the exception that registration by itself will not subject them to the jurisdiction of federal or state courts, other than for controversies between the firms and the PCAOB. Even for foreign firms that do not issue audit reports, the SOX empowers the PCAOB to use its rule-making authority to assert jurisdiction when it determines that "it is necessary or appropriate" to do so, in light of the purposes of the SOX and in the public interest or for the protection of investors.

Historical Context for the Public Company Accounting Oversight Board

Numerous scandals and other ethically problematic behaviors involving financial markets marked the final decades of the 20th century, including the savings and loan crisis, conflicts of interest and social disruptions from leveraged buyouts, insider trading, and the blatant disregard of proscriptions against auditor investments in clients. However, with the beginning of the 21st century, fraudulent corporate financial reporting and the complicity of the accounting profession elicited outrage on a new scale from the public and regulators. In part, this was due to the ineffectiveness of public and private sector regulatory responses to previous scandals. The unsympathetic demeanors and extravagant behaviors of some of the miscreants undoubtedly aggravated public reaction, particularly since reports of these frauds and the bankruptcies associated with their personal enrichment came in the context of a declining economy with diminishing jobs and retirement savings. With greater direct and indirect popular participation in capital markets in the 1980s and 1990s, and the robust returns of the second half of the latter decade, there had been growing public confidence in the prospects for economic opportunity. However, the combination of an economic downturn and major scandals disillusioned many and led them to believe that capitalism and some of its key figures—including corporate leaders and CPAs—had betrayed this confidence.

The United States has long had a robust and formidable apparatus for regulating its capital markets, the accounting profession, and corporate governance practices, with many of the elements of this framework originating in the rigorous intellectual discourse and principled leadership of the accounting profession in the 19th century—that is, prior to and apart from federal, state, and other private regulatory initiatives. When Congress passed the Securities Act of 1933, it assigned the responsibility for regulating the issuance of securities across state borders to the Federal Trade Commission. It was only in the Securities Exchange Act of 1934 that Congress created the SEC and invested it with the authority to regulate public securities markets and to set and enforce standards for the practice and the profession of accounting. However, in recognition of the aforementioned long-standing expertise and leadership of the profession in developing a theoretical and practical apparatus for these standards, the SEC voted in 1938 to delegate this statutory authority to the profession itself. Although the entities through which the profession did this varied, from the Committee on Accounting Procedure (1936–1959) to the Accounting Principles Board (1959–1973) and, eventually, to the FASB (1973 to the present), this public-private partnership prevailed essentially without interruption until the early 2000s.

This experimental arrangement toward a regulatory framework was uneven in its effectiveness, as the recurring scandals in the 20th century demonstrated. Sometimes the regulatory hand of government made incremental adjustments in this framework, particularly in securities regulation. Depending on the ethos of the time, this stiffened disclosure and other requirements, as with the Williams Act of 1968, or loosened them, as with the Private Securities Litigation Reform Act of 1995. Often the mere threat of legislative tinkering with the regulatory framework was sufficient to motivate the accounting profession to take preemptive regulatory action to stave off the blunt instrument and loss of control that legislation portended. However, the profession itself was not of one mind on many issues, as even the threat of government regulation failed to quash internecine arguments between the FASB and practitioners over accounting for stock options and other issues.

The combination of market failure of the self-regulatory initiatives of the profession and the influence of the profession and its allies on legislators and regulators led to a weakening of this framework, just as opportunists in the corporate world sought to manipulate their investors, their accountants, and the public. The scandals at the beginning of the new millennium revealed that this public-private regime was insufficiently resilient or responsive to prevent and detect widespread and massive fraud in corporate reporting and audit practices. It became clear that some modifications to this regime would be necessary. From the perspective of the accounting profession, the form these would take ideally would remain mindful of the beneficial contributions of the profession as well as its latter-day missteps.

There had been prescient and diligent efforts at reform years before the major scandals broke out, but they were largely ineffective. In the 1990s, SEC Chair Arthur Levitt Jr. repeatedly tried to limit the ability of accounting firms to provide consulting and other nonaudit services for their audit clients, but he faced chronic resistance from Congress and President Bill Clinton. After reports of accounting irregularities at Enron and other companies in late 2001 and early 2002, many members of Congress, including some who had accepted campaign contributions from interest groups associated with these companies and the accounting profession and who had blocked Levitt, expressed outrage in at least 11 investigations. During one such hearing, a previous critic, Senator Robert Torricelli (from New Jersey), addressed Levitt directly and offered a rare admission in Washington: "We were wrong. You were right."

At the same time, the accounting profession tried to influence public perceptions of the scandals and accountants' complicity, but the scale and scope of the irregularities and the damages they caused, the public familiarity with the firms' names, and the stories of executive hubris and greed created an impetus that limited the profession's ability to deflect criticism by the public, commentators, and Congress. As the U.S. Department of Justice prosecuted the American unit of Arthur Andersen, the once venerable global firm whose audit practice had been the focus of much of the controversy at Enron and other companies, the other major firms eventually abandoned their lobbying alliance with and support for the firm as they worked to influence the path of reform. After its conviction, Andersen followed through on the humiliating necessity to terminate its audit practice and resign from the SEC Practice Section of the American Institute of Certified Public Accountants (AICPA). The U.S. Supreme Court later overturned the conviction, but the reputational and economic damage was complete—and catastrophic—for the firm.

Scandals at WorldCom and other companies in 2002 inflamed public outrage and led President George W. Bush to condemn corporate misconduct, though in muted language. Despite his initial reticence in providing a dramatic regulatory response, he eventually signed the SOX into law on July 30, 2002. In addition to heralding profound changes for corporate governance, this legislation significantly altered the regulatory framework for the accounting profession, and in reasserting federal regulation of the profession's audit function through the agency of the PCAOB, it marked a dramatic change from the policies that had prevailed for the preceding 64 years.

Establishment of the Public Company Accounting Oversight Board

As formidable as this statutory response to rehabilitating corporate America and the accounting profession seemed abstractly, the moral frailties of those who implemented it in 2002 quickly aggravated the problems that had occasioned it, and this tested the credibility of the PCAOB before it even began to operate. Doubts among observers about the competence and the independence of the then SEC chair Harvey L. Pitt only deepened with the perception that his lukewarm response to the scandals and financial crisis was due to his lingering sympathies for his former CPA firm clients. He compounded this image with his stealthy and awkward attempt to install the retired federal judge William H. Webster, former director of Central Intelligence and the Federal Bureau of Investigation, as the first PCAOB chair, instead of John H. Biggs, the former chair of TIAA-CREF, who likely would have been firmer with the profession.

The controversy deepened after disclosures that Webster had chaired the audit committee of U.S. Technologies, which some had suspected of financial fraud. Pitt had kept this information from the other SEC commissioners prior to the vote. The resulting uncertainty generated global concern about the integrity of American capital markets, and this even affected the stability of currency markets. After their positions became untenable in the eyes of the public, Pitt and Webster resigned a few weeks later, and the former New York Stock Exchange chair William H. Donaldson and William J. McDonough, president of the Federal Reserve Bank of New York, assumed their respective positions. In 2005, they stepped down, and California congressman Christopher Cox assumed leadership of the SEC, while Willis Gradison, a board member of the PCAOB, became acting chair.

Analysis of the Work of the PCAOB

Once Congress, the SEC, and the PCAOB largely resolved the difficulties in implementing the provisions of the SOX, including the establishment of the PCAOB, corporate leaders, investors, financial analysts, attorneys, accountants, regulators, scholars, and other observers and participants in capital markets began to assess the meaningfulness and effectiveness of the putative reforms and the likely direction they would take, including influences on sectors about which the SOX is silent. While many hailed the promulgation of the SOX and the appearance of the PCAOB as necessary correctives, there were concerns among these constituencies as well about risk management and the need to balance the enormous costs of compliance with the costs of errors or irregularities in financial reporting and auditing.

The accounting profession largely accepted the new regime, although controversy erupted again when, during January 2003, Pitt, who was in his last weeks in office, oversaw the most prodigious promulgation of SEC rules since the founding of the commission. Many observers, including some in Congress, perceived the episode as a last attempt by an advocate for the profession to weaken the regulatory implementation of the SOX. Some critics, especially among scholars, expressed concern about the legalistic focus of the SOX provisions, an emphasis that some compared unfavorably with the nearly contemporaneous revised federal organizational sentencing guidelines for white-collar crime, which reflected a broader managerial approach that encompassed factors of organizational culture and ethics rather than mere compliance.

Moreover, while the costs of complying with the provisions of the SOX raised the risk profile for senior corporate executives, corporate directors, and the attorneys, accountants, and financial professionals who worked with them, there was little doubt or disagreement about the significant and lucrative business opportunities this occasioned for those who were willing to continue such a service. Accountants in particular complained about the SOX and the PCAOB, including the flight from the profession that the concomitant burdens occasioned, but the reality was that their services were in unprecedented demand because of these requirements.

In ongoing assessments of the scope of the SOX and the work of the PCAOB, one must keep in mind what the board does not do, at least according to the letter of the law: namely, promulgate standards for the vast majority of firms that provide auditing and nonauditing services for clients that do not meet the statutory definition of "issuer." The regulation of most of these firms falls outside the scope of federal securities statutes and regulations and PCAOB rules, yet the size of this practice area abundantly confirms the necessity for multilevel, integrated, and institutionally pluralistic oversight as well. In practical terms, this means a continuing prominent role for the state boards of accountancy that license firms and, of course, for private entities such as the AICPA and parallel state CPA societies, for example, through promulgating and enforcing substantive codes of conduct and performing regular peer review. Regardless of whether a sector or firm falls under the jurisdiction of the SOX, an effective regulatory framework also requires correlative vigilance on the part of other observers and participants in capital markets, including the media, stock exchange managers, and the investors themselves.

At the same time, in light of federal experience, the provisions of the SOX and the rules and example of the PCAOB have set de facto standards of best practices for organizational governance and professional due diligence, and this, along with similar legislative initiatives at the state level, has begun to extend the influence of the new regulatory framework far beyond the ranks of "issuers" and "firms" that the SOX cites.

A salient example is the exempt organization sector in the United States, which, as of 2003, managed approximately $1.76 trillion in assets, making it one of the largest discretely identifiable economies in the world. While exempt organizations presently must follow a strict regulatory regime under the Internal Revenue Code, treasury regulations, state laws, and other public and private guidelines, they need not comply with the provisions of the SOX. However, due to scandals and the negative public perceptions of some prominent exempt organizations, including the United Way, the Nature Conservancy, the American Red Cross, and American University, there have been calls from Congress and elsewhere to extend these or similar requirements to this sector. Many of these organizations voluntarily have followed guidelines analogous to the practice requirements of the SOX as best practices—for example, assigning audit and tax services to two or more accounting firms. In many instances, the impetus for these practices comes from board members of exempt organizations, many of whom are familiar with SOX requirements because they must comply with them in their own companies.

The SOX represents a 21st-century attunement to a 20th-century regulatory framework that presumed *19th-century* standards of proficiency, professionalism, and restraint on the part of accountants. Its comprehensive provisions, particularly the establishment of the PCAOB, proportionately responded to the most notorious practices, including financial statement irregularities; compromises of auditor independence; bias in securities analysis in investment banking firms; and breaches in fiduciary duty, corporate accountability, and principled governance. The early reaction from most practitioners and scholars has been that the SOX represented a necessary modification to the regulatory framework for corporate governance and the accounting profession. However, more experience with this regime will inform this ongoing process of attunement and help guide the virtually certain broadening of the scope for its application to other sectors and contexts.

Public Domain

The public domain comprises the body of community resources, including knowledge and innovation, in which no person or other legal entity can establish or maintain proprietary interests. This includes creative works such as writing, art, music, software, and other inventions. The public domain also includes the physical domain, including land, oceans, and the atmosphere.

The Environmental Commons

One important element of the public domain is the idea of the "commons." In particular, there is an ideological tension between advocates of the public domain, who support the promulgation of collective rights, public goods, and other shared resources, and those who advocate the establishment and ownership of private property. This tension often arises out of concerns about the "tragedy of the commons," as posited by Garret Hardin and others, when the interests of private property owners impinge on the commons. The absence of specified, enforceable property rights encourages overuse of the commons by private interests. Examples include overfishing of unregulated public fishing grounds or building of private condominiums that restrict access and views of a public beach.

Environmental nongovernmental organizations (NGOs) operating in civil society tend to regard themselves as advocates for "public rights" to protect the commons, in the belief that these groups "speak" for species who lack voice and legal standing. In contrast, libertarians argue that the commons should be privatized so that property rights can be enforced to save community resources. They point to the work of Ducks Unlimited in buying up threatened wetlands to set aside habitat for waterfowl (and hunters). Disputes over government policies that provide extractive industries, such as timber and mining, with partial access to public lands suggest that privatizing the commons will remain a controversial public policy issue.

Creative Works

In the United States, certain works do not qualify for copyright protection, and therefore exist in the public domain. These include creative works that consist entirely of common knowledge, facts, or symbols, such as tables, lists, and measurement standards. Works that have been performed or presented but that have not been recorded or otherwise "fixed in a tangible form of expression" also exist in the public domain.

Creative works that are owned or produced by the federal government automatically exist in the public domain and may not be copyrighted. Artistic interpretations of these works may be copyrighted. For example, a painting based on an astronaut's photograph of a manned space mission may be copyrighted, but the original photograph exists in the public domain.

The various laws and rulings of the U.S. government also exist in the public domain. Various publishers of legal databases and manuals have successfully asserted copyright control over their indexed and annotated versions of federal legislation and jurisprudence.

When a publisher or rights holder fails to renew the copyright on a work, the work lapses into the public domain. These are commonly referred to as "orphaned" works.

Slogans, trade dress, and other marks may be protected through trademarks and service marks but may not be copyrighted.

The proposed WIPO (World Intellectual Property Organization) Treaty on the Protection of Broadcasting Organizations would allow broadcasters to copyright their transmissions for 50 years. This includes the transmission of public domain works. One criticism of this treaty is that it effectively creates an endless copyright, allowing broadcasters to remove works from the public domain through systematic retransmission. The proposed treaty also applies to Webcasting or narrowcasting, which is the transmission of materials to a self-selected audience over the Internet.

The Knowledge Commons

Creative works may be considered as part of a vast "knowledge commons," in which users store, analyze, and share intellectual property. In some countries, cultural biases tend to favor the rights of users over publishers. For example, South Korean manufacturers often appropriated the brand names and trade dress of popular Western products, until the United States and European countries prevailed on the South Korean government to enforce international agreements on intellectual property ownership. Howard Rheingold and others have examined the self-organizing capabilities of stakeholders, who use mobile phones and computers to find each other and establish communities in the real and virtual worlds. Paul David refers to the "overfencing" of intellectual property by rights holders, which may serve as a countering force to suppress or stifle innovation and creative thought. The delicate balancing act between users and owners has become more challenging as the Internet and telecommunication technologies have tipped the balance of power and allowed the rapid creation, acquisition, and distribution of creative works on a global scale.

The Internet and the Public Domain

It is a common misconception that material that is freely available on the Internet is also in the public domain. Authors and creators can claim copyright over any works they create and post to the Internet, just as they might when they publish in another medium. However, it is illegal to post or distribute a copyrighted work on a computer network without the express permission of the publisher or rights holder.

Open-Source Software

Various types of public domain licensing schemes allow software developers to distribute their works to the public while maintaining control over how the software is maintained, developed, or extended. These licenses collectively form the open-source software (OSS) movement, which derives its name from the right of users to examine the underlying source code of these software works.

One example of OSS is the GNU General Public License (GPL), which was first developed in 1989 by Richard Stallman as the legal foundation for his GNU (GNU's Not UNIX) software project.

The GPL provides four freedoms to software users:

1. The freedom to run the program for any purpose
2. The freedom to study how the program works and modify it
3. The freedom to redistribute copies
4. The freedom to improve the program and release the improvements to the public

Access to the actual source code is a precondition of Items 2 and 4.

The GPL differs from other schemes by employing the principle of copyleft. Anyone who distributes a modified version of a GPL-licensed work must do so under the GPL license. Thus, GPL works and their derivatives exist in the public domain and cannot be sold or licensed as proprietary works. In 2005, approximately 70% of the free and OSS projects hosted by the two largest OSS sites were licensed through the GPL.

The GPL has been challenged in various courts as an overly restrictive licensing scheme. At least one legal challenge has portrayed the GPL as a price-fixing scheme, with a target price of 0.

Many other OSS licensing schemes exist, including the Berkeley Software Distribution license. In general, these licenses provide limited forms of protection to software creators and rights holders when compared with the absolute protection of the GPL.

The Creative Commons license is an alternative licensing scheme that allows users to create works that may or may not remain in the public domain, based on a list of permissions selected by the creator or rights holder. Creative Commons works carry the legend "Some rights reserved." While this legend may also describe other licensing schemes, it stands in deliberate contrast to the copyright legend, "All rights reserved."

The Creative Commons scheme is an attempt to reconcile traditional copyright law with digital and network distribution and use. Creative Commons licenses are based on national and international copyright laws and are also expressed as machine-readable license agreements that may be attached or linked to a creative work. Creators may sanction the creation, distribution, and licensing of proprietary derivative works. Eleven different licenses are available, in logical combinations of four core principles: attribution, noncommercial use, derivation, and "share alike."

Public Goods

Economics distinguishes between private goods and public goods. By definition, any pure public good lacks two key technical attributes that any pure private good possesses. While largely theoretical, the distinction is very important for understanding actual markets and governments. In practical terms, private goods are basically those that markets can produce and sell. Public goods are basically those for which markets will fail or at best perform below social requirements. Given such conditions of "market failure," either governments or private clubs must act if there is to be production and distribution of the good. Real markets often require government activities of some type. Enforcement of private contracts in courts is an example. Many private goods are therefore not strictly speaking "pure."

Pure private goods exhibit the two attributes that economists term rivalness of consumption and price exclusion. There is a buyer and a seller (i.e., an owner of the good for sale). If one consumer purchases a loaf of bread, another person cannot consume that particular loaf; a person who cannot afford to purchase does not consume bread. When higher demand for ethanol in gasoline caused the world price of corn to increase, low-income consumers in Mexico relying on corn for tortillas as a staple food had serious problems. The result in Mexico was political protests calling on the government to enact price ceilings.

Pure public goods lack both of the attributes possessed by pure private goods. National defense involves nonrival (i.e., joint) consumption and impossibility of price exclusion. A pure public good is not reduced by individual consumption, does not involve transferable property rights, and does not assign full costs to individual consumers through the price mechanism. Once a pure public good is available, multiple consumers can freely make use of the good. The behavioral prediction is that a rational consumer will "free ride" in the sense of not paying for this free use and indeed will conceal preference (i.e., demand) for the good. If so, compulsory taxation by government will be necessary (and justified).

Pure public goods such as national defense are in fact relatively rare. The broad concept of public goods is therefore further subdivided into three categories. In addition to pure public goods, such as national defense, there are club goods and common pool resources (or common goods). The concept of public goods thus includes what economists term mixed (or ambiguous) goods, which combine private and public attributes, as happens with club goods and common pool resources. (As already noted, many private goods are not strictly "pure" either.) Club goods, such as a movie theater or a toll facility, involve joint consumption but price exclusion. When one goes to a movie theater, one buys a ticket for access but sees the movie with an audience. Common pool resources, such as air, occur freely in nature. Common goods such as fish swimming freely in the ocean involve rival consumption (i.e., individual harvesting) but no price exclusion.

Pure public goods are very difficult if not impossible to produce for private profit. A business typically cannot recoup the full costs of trying to provide national defense. Businesses are unlikely to supply unprofitable public goods except in strictly limited quantities out of motives of corporate social responsibility. Some club goods (e.g., movie theaters) are suitable for business, while other club goods may require nonprofit organizations (e.g., symphonies or operas) or governments (e.g., toll bridges and roads) to produce them. There is consumer demand for the various types of public goods, but such demand is collective or social in the sense that anyone obtaining access to the good with or without payment can consume it equally and jointly. The result is often market failure or, at best, suboptimal market supply. Some form of collective (i.e., nonmarket) action through the government or nonprofit organizations typically will be needed to satisfy consumer demand for a public good that does not occur freely in nature. In the case of a common pool resource occurring in nature, collective action regulating free consumption may be needed. Unless there is effective regulation by private clubs or government, there may be increasing air pollution or progressive depletion of the common pool resource (as is happening with global fish stocks).

Public Interest and Collective Choice

Public goods typically require collective (i.e., nonmarket) choice concerning the public interest in government or nonprofit provision or government regulation. In economics, a "good" is technically a physical item such as a loaf of bread (a type of consumption good) or a machine tool (a type of capital good). A "service" is an activity such as a dental examination or a pipeline inspection. The word *good* is often used broadly to include both goods and services, as a form of shorthand. A "public good" is not "the public good" or "the common good"—terms referring to "the public interest." Provision means funding rather than production. Much of the production for the public sector occurs, outsourced, in the private sector.

Public goods are widespread phenomena. The term *public goods*, also known as social goods or collective-consumption goods, covers three related conditions in which goods (or services) are consumed jointly rather than individually. Common pool resources (or common goods) such as air occur naturally for free use by any consumer. In some circumstances, free consumption results in overgrazing. A classic or pure public good, which is a relatively rare occurrence, reflects market failure or suboptimal market supply due to an extreme instance of beneficial (i.e., positive) externalities. National defense, public order, and justice are the standard examples. There are private security services and volunteer fire departments. Generally, government must act to provide such goods in sufficient quantity to satisfy consumers. Club goods are consumed collectively or jointly but by only a subset of society. Examples are golf courses or toll bridges and roads. Either the government or private entities might provide club goods, depending on the conditions.

Related to public goods is the notion of merit goods. A merit good is underconsumed because individual consumers ignore positive externalities. A merit bad (or a demerit good) is overconsumed because individual consumers ignore negative externalities. A merit good, while provided in some quantity for profit by the market economy, ought in someone's judgment to be provided in a greater quantity, requiring collective action. Examples are education and health. There are for-profit schools and hospitals, but there are arguably broad social benefits (i.e., positive externalities) from wider consumption. Analogously, a merit bad, while provided in a satisfactory quantity for profit by the market economy, ought in someone's judgment to be provided in a lesser quantity, requiring collective action. Examples are tobacco and illegal drug consumption, which arguably ought to be reduced.

Public goods, with related notions of merit and demerit goods, are a key concept in the theory of welfare (or normative) economics. The concept generates a prescriptive theory of public and nonprofit expenditures. Prescriptively, the government should provide goods and services strictly in the public interest, defined as maximizing net national wealth. Provision by governments and nonprofit organizations should be complementary to business production rather than substitutes. What the government actually should provide, and how, is a matter of considerable controversy. For example, lighthouses involve an interesting range of options: Some lighthouses may be provided through general taxation and some through port fees on users.

The correspondence between government activity and this prescriptive theory of public goods is very rough for several reasons. First, a government may in practice provide private as well as public goods (including regulation services), subsidies of private activities, and transfers of wealth among citizens. The theory of public goods is a normative framework for prescribing what the government ought to do rather than describing what a particular government actually does for whatever reasons. Second, there are very few "pure" public goods other than perhaps national defense and human rights enforcement. Third, there are very few "pure" private goods. For example, a private good is often transported to market on a public roadway. Most goods are impure or ambiguous in the sense of having mixed public and private characteristics in various degrees. Fourth, the private sector includes both businesses selling private goods in markets and nonprofit organizations. Some nonprofits operate like businesses, some operate as clubs or voluntary associations providing collective benefits to their members, and others are dependent on government subsidies and private donations.

Private Good

The best way of defining a public good is by contrast to a private good. Pure public goods and pure private goods have polar-opposite characteristics. A private good is one traded in markets by buyers and sellers, whose interactions determine prices and volumes. Buyer and/or seller may be a business, household, government, or nonprofit organization. It is the attributes of the good itself that matter for definition purposes. What a private good possesses by way of two key attributes, a public good lacks by definition. The two polar-opposite conceptions define a continuum along which in reality lie various mixed goods and services.

The two key attributes of a pure private good are price excludability and rivalness of consumption. If the buyer and seller cannot agree on a price, then a transfer does not occur. On eBay, Internet trading is basically an auction often conducted with a time limit and minimum bid requirement. The buyer offering the highest price wins, and all other buyers are excluded. This attribute generates a demand function. At the same time, and inherently, private goods have clearly identified owners, and consumption of the good is rival or individual. Ownership generates a supply function. If a buyer purchases a loaf of bread from a seller, that loaf once consumed cannot be shared by others; and in a reasonably functioning market system, there is no reason why others should demand a share of the loaf. Excludability is the inherent purpose of the price mechanism. The qualities of excludability by price and rivalness of consumption are preconditions for market exchange and business activity.

Public Choice Theory

A pure public good lacks both the essential qualities of price excludability and rivalness of consumption. Collective (i.e., nonmarket) action through government or nonprofit organizations will be necessary for provision or regulation. By definition, a pure public good is one that for technical reasons involves nonrival consumption and that once produced cannot be denied to any particular consumer through the price mechanism. Economists say that the marginal cost of production (i.e., the cost of producing one more unit) is 0 and, thus, price should be 0 (i.e., free). Such goods can occur naturally, as in the case of air. The classic example of market failure is national defense. If the government defends the country by the provision of a daily air force patrol authorized in the extreme case to shoot down hijacked commercial aircraft being directed by terrorists against targets, then that provision covers everyone in the spatial coverage of the air patrol. No one can be readily excluded by pricing. Consumption of this air protection service is nonrival or joint. Everyone consumes the service simultaneously. There is demand and willingness to pay for public goods: Consumers do want such goods. No business will undertake the provision of such a public good, because it cannot collect any revenues. Rational consumers can free ride by concealing their true willingness to pay for the good. Compulsory taxation or charging by government and regulation of free consumption of the natural environment will be necessary.

Pareto Efficiency

Even a reasonably competitive market economy cannot achieve Pareto efficiency if there are significant unmet needs for public goods. Pareto efficiency means that resources are allocated such that no voluntary trade can improve the welfare of one individual without reducing the welfare of another individual. The failure of market transactions to achieve Pareto efficiency unaided is the justification for provision of public goods by governments and nonprofit organizations. This failure also justifies corporate social responsibility by businesses, including broadly the defense of human rights proclaimed in the Universal Declaration of Human Rights adopted in 1948 by the UN General Assembly.

The Tragedy of the Commons

A common good, also called a common property or common pool resource, is a good for which price exclusion is not feasible but rivalness of consumption occurs in the sense that individual consumption does diminish availability of supply. Such goods or resources occur typically in the natural environment. There are many instances of common pool resources—leading to “the tragedy of the commons.” The technical situation of diminishing supply and nonexcludability will lead inevitably to overgrazing of the common resource. Some ownership device or regulatory scheme will be needed to avoid such destruction.

Nonprofit Organizations

Nonprofit organizations typically provide what are called club goods. A club good is one characterized by nonrival (joint) consumption but with price excludability feasible. A club good reflects the provision of collective (group) benefits. A club good benefits only a subset of society. Where the government provides such a club good, a subsidy or transfer to the subset of society is involved. Nongovernmental organizations functioning as activist pressure groups provide club goods to their members. A voluntary association or a country club, for example, provides collective consumption benefits to the members, but membership depends on payment. A near instance is a privately owned movie theater (or a commercial air flight). Businesses can generate profit in such conditions. Price excludability is feasible. No consumer can get into the theater lawfully without purchasing a ticket—sold on a seat-by-seat basis. Once in the theater, however, consumption is nonrival, in the sense that a number of consumers can see the same movie at the same time in the same place. It costs the theater the same to show a movie to one person or the theater capacity, because the cost of running the movie is fixed rather than variable. Availability of supply does diminish with individual consumption in the limited sense that one's precise location within the theater can matter. Consumers who care about seating location will arrive earlier. Once all tickets for a showing are sold, then consumers must queue by availability of showings. An alternative is to wait until the movie is available on video (through purchase or rental) or on television (through cable purchase or general broadcast).

In principle, a commercial firm might build and operate a toll bridge or road, but if so, it must hold an effective monopoly to profit sufficiently. Where a business owns the toll facility, the bridge operates like the movie theater—and for the same reasons. There is typically no economic reason for the government to operate movie theaters (although it may on military facilities, for instance). A government may provide and operate a toll facility because the fixed cost of investment to construct the facility is too large or too risky for a private entity. Government operation creates, however, a pricing issue for consideration. Until facility capacity is reached (i.e., cars are bumper-to-bumper), the marginal cost of allowing any additional consumer is effectively 0. The toll collection itself imposes operating expenses and slowdowns. Construction and maintenance costs might be recovered by a general levy on gasoline sales. The user charge approach focuses cost distribution on the beneficiaries.

Free Riders

Free riders are individuals who benefit without paying. Free riding involves important ethical and social issues. Public goods of all types can be viewed as extreme examples of positive externalities, whose economic value (i.e., consumers' willingness to pay) cannot be captured by the provider. Given the conditions of nonexcludability and nonrivalry, a rational consumer can use a public good without paying for it. This phenomenon is called the free rider problem: The consumer rides freely without paying. (A softer version is the easy rider problem: The consumer contributes something.) Free riding reflects the relatively low benefit and relatively high cost to the individual of paying. In the case of a private good, a consumer purchases where benefit of consumption equals or exceeds cost of purchase. The free rider problem undermines collective action in a wide variety of circumstances. One person or group may be willing voluntarily to provide a public good, because benefits exceed costs, and thus be willing to tolerate free riders. Adam Smith, in *The Theory of Moral Sentiments* (1759), defined citizenship as legal compliance and good citizenship as concern for the welfare of others. Good citizenship is the offset to free-riding behavior.

Merit Goods and Merit Bads

A merit good can be distinguished from a merit bad. A good—collective or merit—is something most consumers want but rationally will not pay for voluntarily unless compelled to do so by price excludability or compulsory taxation. Typically, a social good reflects positive externalities (i.e., benefits). Some form of collective action, whether provision or regulation, becomes necessary. This collective action may occur through the decision of an individual donor who tolerates free riding, the formation of a voluntary association or club that can restrict benefit access, or government provision or regulation.

A merit bad (or demerit good) is something most consumers do not want but wind up paying for anyway. Typically, a merit bad reflects negative externalities (i.e., costs). Prime examples are air and water pollution, secondhand smoke, noise pollution, street crime, drug abuse, and so forth. Government regulation (a governmentally provided service) may be warranted to protect common pool resources from destruction (i.e., overgrazing).

Regulation

Related to public goods is the problem of regulating a natural monopoly. Nature has a natural monopoly of air production. Some forms of natural monopoly must be operated or regulated by government. Natural monopoly may be distinguished from coercive monopoly. In the latter, artificial barriers to entry erected by some method prevent competition and leave market control with a single company or cartel of companies—such as the Organization of Petroleum Exporting Countries. Patents, copyrights, and trademarks are a form of public interest coercive monopoly, intended to stimulate innovation through economic rent protection. A patent permits a pharmaceutical company, for example, to obtain an economic rent, defined as charging price in excess of average cost of production. In the United States, cable television service is typically provided through a private local monopoly licensed by the local government.

Pricing of private goods depends on market (or industry) structure. Under perfect (or workable) competition, price equals marginal cost equals average cost—at the lowest feasible minimum average cost. The notion of cost here includes a competitive return (i.e., just enough profit to stay in business). Under monopoly, price exceeds marginal cost (thus generating a return or profit margin greater than the competitive), and typically, average cost is above the competitive minimum. Government regulation shifting a monopoly to workable competition might improve Pareto efficiency, depending on the cost of regulation.

A natural monopoly is a cost situation that results irresistibly in control of supply of a product or service by a single company. The cost situation is one in which a large fixed investment (i.e., capital cost) is required to begin operation, and the result is what economists call economies of scale (or increasing returns to scale). As volume of production increases, the long-run average cost falls steadily without reaching a turning point. (Typically, returns to scale first increase and then decrease, so that the average cost curve of the firm has a U-shaped function.) The large fixed investment creates a significant barrier to entry by competition. The offsetting factor tending to limit expansion involves the increasing costs of organizational control. If the optimal size of the firm—where scale economies intersect with organizational control costs—is as large as the whole market, then the situation is one of natural monopoly. The government can either operate or regulate such a natural monopoly. This situation is common in electricity generation and water supply. Some municipalities operate local public enterprises in these industries; other municipalities (or their states) regulate private enterprises typically granted a local or regional monopoly.

Spatially Limited Benefits and Fiscal Federalism

Local and regional public goods are defined by spatial limitation of benefits. For example, police and fire services are often provided by municipalities. Their authority and service provision typically terminate—by law—at the boundary of the municipality. If one dials (in the United States) the 911 emergency number, the call should go to the appropriate local authority. State police and highway patrol operate on a larger regional basis. The U.S. National Guard is operated on a state-by-state basis and reports to the state governor for civil emergencies. Once called up by the president, National Guard units move into federal service. It is possible for some services to spill over local or state boundaries into another jurisdiction. These spillovers are a type of externality from the point of view of the jurisdictions involved. Spatial limitation of benefits and jurisdictional spillover of benefits and costs are the economic basis for fiscal federalism. The U.S. government should supply national goods and municipalities local goods, with states handling regional goods. Spatial variations involve intergovernmental cooperation problems.

International, Regional, and Global Public Goods

Spatial variations of international public goods define regional and global ethical and social issues. An international public good is shared by two or more countries. Restriction of benefits to a set of collocated countries—such the European Union or the North American Free Trade Area—constitutes regional public goods. A global public good is one with global effect. This global effect notion has a broad reach: Certain benefits may reach across population groups and generations as well as across boundaries. For example, the eradication of dangerous diseases such as smallpox or polio has benefits globally and temporally. Once these diseases are eradicated, no one needs to be vaccinated. There are important international policy regimes for civil aviation, passports, postal services, telecommunications, and so forth. International cooperation and bargaining are often involved. The notion of global public goods becomes bundled with the problem of distribution of public goods across income levels and, thus, issues of distributive justice. Vaccinations and other medications are desperately needed by low-income developing countries and populations. The issue is who will finance such medical care and similar public goods.

Public Interest

Although the concept of the public interest has a long history, it remains one of the most often used yet ill-defined concepts in public discourse. The difficulty in specifying the public interest parallels the similar problems the literature has had in clearly distinguishing public from private organizations. The following review of the concept will include applications of the concept both to economic activity and to general contexts of the evaluation of public action.

The Public Interest and Economic Activity

In the context of economic activity, the precursors of the modern notion of the public interest included, in Roman and medieval times, the concept of a "just price" controlled to protect consumers against exploitation. Such a price contrasted with the "natural price" produced by the unfettered market. Later, special expectations began to be assigned to certain areas of commerce. The guilds of medieval towns received a monopoly in their trade in return for their willingness to hold themselves out in service to anyone who came to them for assistance. This norm of universal service is echoed, of course, in the requirements for such service placed on modern-day public utilities. Royal charters or franchises during the age of mercantilism presumed a governmental purpose in the enterprises. And the common-law designation of some occupations as "common callings" that were said to be "affected with a public interest" gave rise to expectations that service would not be denied and that it would be provided at a reasonable price.

Over time, the rights and duties of such businesses were expanded and became a recognized set of expectations that applied to an emerging business class, the "public utility." Such enterprises had obligations to serve all who requested service, to be certain such service was both safe and adequate, to not engage in unjust discrimination among customers, and to charge only "just and reasonable" prices. In return, the state had to protect private property, defend the right to receive a reasonable level of payment for the service, allow reasonable restrictions on the provision of services, provide the right of eminent domain as long as the property was taken for "public use," with just compensation, and so on.

A long line of court cases have attempted to determine the boundaries of what was "affected with a public interest" and hence potentially subject to special expectations or controls under common law or black letter regulation. Perhaps the most memorable was the U.S. Supreme Court case of *Munn v. Illinois*, 94 U.S. 113 (1877), in which Chief Justice Waite wrote, "Property does become clothed with a public interest when used in a manner to make it of public consequence, and affect the community at large. When, therefore, one devotes his property to a use in which the public has an interest, he, in effect, grants to the public an interest in that use, and must submit to be controlled by the public for the common good, to the extent of the interest he has thus created." The difficulty of decoding such language, making it more operational than hortatory, is evident.

Eventually, the Court decreed, in *Nebbia v. New York*, 291 U.S. 502 (1934), that "the phrase 'affected with a public interest' can, in the nature of things, mean no more than that an industry, for adequate reason, is subject to control for the public good. . . . There can be no doubt that upon proper occasion and by appropriate measures the state may regulate a business in any of its aspects, including the prices to be charged for the products or commodities it sells." In essence, the state, giving reasons, can regulate just about any aspect of business in the name of the public interest.

Debates of this sort are not by any means settled issues, even today. Recent cases over the ability of municipalities to condemn property under eminent domain for public purposes that involve the support of private business have been highly controversial. Indeed, they have led to proposals to change some state and local laws to enhance protection of private property against such public takings. Thus, what is covered by the "public interest" remains a prominent issue for practical analysis.

The Public Interest in Political Philosophy

There is no settled view of the concept in political philosophy, much less in the sphere of its practical application to economic activity. The literature contains a host of typologies—systematic sortings by dimensions claimed to extract important aspects of the concept—that purport to distinguish key alternative meanings of the concept. The types distinguished are sometimes little more than lists, and the labels given to the types can seem arcane and somewhat distant from practical application. Here are some prominent examples:

In 1955, Edward Banfield found "unitary" meanings (distinguishing "organismic" from "communalist") and "individualistic" approaches (distinguishing "utilitarian," "quasi-utilitarian," and "qualified individualistic"). In 1957, Frank Sorauf distinguished alternative meanings: as commonly held value, as wise or superior interest, as moral imperative, as balance of interests, or as vague, essentially undefined value. In 1959, W. A. R. Leys and C. M. Perry found both formal meanings (simple or pluralistic) and substantive meanings (utilitarian, procedural, or normative). In 1960, Glendon Schubert identified "rationalist," "idealist," and "realist" types. In her 1970 book, Virginia Held divided the theories of the public interest into "preponderance" theories, "common interest" theories, and "unitary" theories. In 1974, Clarke Cochran listed "normative," "abolitionist," "process," and "consensualist" types.

These typologies seem bewildering in number, and though in their authors' discussion they provide numerous, valuable insights concerning subtleties in the meanings of the public interest, they are often not very systematic in construction. The Sorauf, Schubert, and Cochran typologies are lists with no structure; the others sort the concept with varying, often incomplete logics.

Barry Mitnick provides a sorting that offers a systematic logic to array the various meanings of the public interest. The distinctions made by the scholars above, in addition to analysis in other works in the literature, are disaggregated and sorted. The dimensions that seem to generate the definitions of the public interest that appear in the literature are the following: whether or not a holder of the public interest is required; the level of the holder (no holder—ideational or holder—individual/group-organizational vs. systemic); whether participation by the polity is required—that is, some set of acts or procedures is necessary to determine the public interest; whether or not the public interest is rule determined—that is, whether or not those who determine the public interest must follow formal or informal rules; and, finally, the number of sets of preferences that are used to determine the public interest—whether only one (unitary) or whether a number must be combined in some way (combinatorial, whether from multiple same or multiple different preferences).

This generates a large typology that subsumes those definitions that are specified clearly enough in the literature. For example, the public interest is a type of "pluralistic aggregation" when a holder is required, the determination occurs at the individual or group level, a rule applies, and multiple, different sets of preferences are combined—we get the public interest via, to take one case among many possible ones, an election. On the other hand, the public interest is described as "consensual" when a holder is required and multiple-same preferences are combined. Examples include unanimity, a Paretian process, or "consensual majoritarianism."

The typology allows us to classify conceptions of the public interest but may draw criticism from those who require a kind of contentful instruction: Don't tell me *how* to construct it; tell me *what* it is in the case I am worrying about. But the concept of the public interest is inherently vague; we can only set up the conditions for its determination or appearance. In this respect, the concept of the public interest is similar to the concept of Pareto optimality in economics. The latter occurs when no further trade in the market is possible that makes at least one actor better off without making any other actor worse off. Its desirability stems from the presumed consumer satisfaction that occurs from having traded until no further trades are possible. But nothing is said about exactly what circumstances would be supposedly better than others; Pareto optimality, like the public interest, merely establishes the conditions under which the desirable state can occur, not what that state actually is. Thus, the public interest remains elusive in content although understood in construction.

Public Relations

Public relations is a business function that can have any number of names—namely, corporate communications, corporate affairs, public affairs, or external affairs. The senior public relations officer usually reports to the chief executive officer, although sometimes the function reports to a second-level senior officer (e.g., chief administrative officer or, occasionally, the general counsel).

No matter what the name, the function will have a core mission of ensuring good relations with important constituencies, particularly the media. In many instances, the function will include a government relations component, manage corporate charitable contributions, handle relationships with the local community (and sometimes plant communities), and maintain relationships with important activist and interest groups involved with issues affecting the company's business. The same function is also likely to manage internal communications with employees and may have an important role in communications to the financial community—for example, it may produce annual reports and organize annual meetings.

Evolution of the Function: The First Decades

Public relations has grown and evolved as a business function from its earliest days at the beginning of the 20th century. Ivy Lee is often credited with being the "founder" of the field when he began to advise John D. Rockefeller about ways to improve his public image, through philanthropy, policies toward workers, selection of plant sites, and so on.

While the press agency aspect of public relations was—and remains—a core activity, Ivy Lee's determination to go beyond simply issuing press releases laid the groundwork for a much broader business function that would provide input to basic business decisions. Rockefeller at first resisted the advice but eventually gave in to the notion that public reaction had to be a factor in his business decisions.

Later, when Edward Bernays, another "founder" of the public relations profession, wrote the first book on the profession, titled *Crystallizing Public Opinion*, he too went beyond press relations. A student of Freud, he discussed the critical roles that events, third-party opinions, and social trends played in forming public opinion. He argued that public relations professionals had to be able to manipulate these elements if they were to be truly successful.

The early founders of the public relations function focused on image making. Given the historical period in which they were operating, which included the influence of F. W. Taylor's scientific management and the development of sophisticated mass marketing, Bernays and others worked to develop a scientific patina for public relations that ultimately came close to being a glorification of propaganda. Indeed, Bernays's second book was titled *Propaganda.* In it, he argued that in a complex democratic society, propaganda provided the means through which consensus could be reached, and he posited that those who knew how to manipulate public opinion were, in essence, the true ruling power in society.

While public relations professionals learned to shy away from promoting themselves in such terms during the 1930s, 1940s, and 1950s, the focus remained on image making. The corporate public relations function was grounded in press relations activity—sending out press releases, maintaining good contacts with reporters, holding press conferences—but also included speech writing and the development of corporate brochures and films and, occasionally, systematic "speaker's bureaus" that would send out representatives to make speeches and presentations to schools and community groups. Ronald Reagan, for example, spent many years doing the speech circuit for General Electric.

Companies such as AT&T (then a national telephone monopoly), DuPont ("Better Things for Better Living Through Chemistry"), and General Motors were practitioners of very sophisticated image efforts, as were many smaller companies and some industries. Several also worked with the emerging field of public opinion research to develop public opinion tracking surveys to monitor their image and report back to management on how they were doing.

Evolution of the Function: Into the Maelstrom

Rachel Carson's *Silent Spring* and Ralph Nader's *Unsafe at Any Speed* ushered in a new era for public relations. Suddenly, the companies and industries that had felt confident about their image-making abilities found their reputations collapsing under a barrage of new questions about corporate behavior—environmental impacts, workplace discrimination, safety, operations in South Africa, and so on. The age of issue management had begun.

The term *issue management* is credited to Howard Chase, who coined it in 1976, describing a process of how issues emerge through a mixture of events, media, and activist groups: how issues grow and how they eventually lead to regulation—as they did in the early 1970s, in a panoply of new federal regulatory agencies, including the Occupational Safety and Health Administration, the Environmental Protection Agency, the Consumer Product Safety Commission, the Equal Employment Opportunity Commission, and so on. Like Bernays and Ivy, Chase argued that smart business management disciplines could be applied to the world of public opinion if a company or industry acted quickly during the early stages of issue development to reduce the underlying problem, to show that the perceived problem was not really a problem, or to offer other solutions besides regulation.

The public relations function—both within companies and in the agency world—expanded exponentially to deal with the new issue-laden environment, becoming more focused on public affairs activities. New lobbying offices were opened, not just in Washington but also in state capitals and in many European nations (and ultimately in Brussels). Public affairs experts emerged to offer new services, such as ally development (i.e., finding or creating third parties to communicate points of view), constituency mobilizations (e.g., letter-writing campaigns), and issue advertising (a technique pioneered by Mobil Oil during the energy crisis of the 1970s because of what it viewed as biased media coverage of energy issues).

Drawing on the evolving techniques used in political campaigns, public relations practitioners began to target their audiences through psychographic profiling, becoming more sophisticated at identifying and then mobilizing political forces. No longer was public relations concerned about a generalized public opinion;

now the question was who were the opinion leaders on particular issues and who were the mobilizable publics who needed to be reached through direct mail, telemarketing, or targeted media campaigns.

The field of marketing offered other new possibilities, such as focus group message testing to determine the right mobilizing messages. One of the most visible and successful issue-driven campaigns was probably that launched by insurance companies, pharmaceutical companies, and others to stymie President Bill Clinton's health care reform in the early 1990s. The message was crafted around protecting the right of health care consumers to choose their own providers. Through television and print advertising, targeted mobilization of letter writing, ally development, and other techniques, the Clinton plan was stopped in its tracks.

Parallel to these developments was the emergence of television as the dominant medium both in the United States and elsewhere. Until the 1960s, the public relations function had been mostly focused on print media—the leading local newspapers, the wire services that fed them, and major national magazines. Following the Kennedy assassination, television stations and the three nationally dominant networks (NBC, CBS, and ABC) vastly expanded news coverage and created new programs that covered issues of the day (e.g., *60 Minutes*, the morning news and talk shows). Then came CNN, followed in later decades by CNBC, MSNBC, Fox News, and so on.

Television became—as it continues to be—the most powerful force in defining and prioritizing public concerns. And it changed the timetable of the news cycle, which used to define the day in terms of the deadlines for going to press or the nightly news shows. Now there was no cycle—only endless news coverage.

Public relations professionals developed new skills and techniques to respond, taking advantage of the technological changes. An early innovation was media training for executives appearing on television, a medium where physicality is often as important as the words spoken and where message delivery strategies can differ depending on whether an interview is live or on tape.

In the 1980s, public relations agencies invented the video news release (VNR) and Radio Actualities, which were electronic versions of the traditional press release. They also developed "B-roll," which is a collection of video snippets with or without audio components that TV producers can use in developing a news segment. They learned how to create press conference environments that played first and foremost to television and only secondarily to the print media.

As satellite technology developed, both VNRs and B-roll could be distributed electronically and instantaneously. Equally important, companies and agencies discovered that they could have their own broadcast studios on the premises, offering a business executive live for an interview with a TV news host thousands of miles away. By the 1990s, "satellite media tours" allowed a spokesperson to sit in a small studio for a few hours and make sequential appearances on multiple local TV shows, answering local reporters. Then, with the advent of the Internet, "sound bite" sequences could be stored centrally for any reporter to pull down on demand.

These technological innovations became particularly useful for crisis communications, yet another emerging specialty in public relations. Starting with the nuclear accident at Three Mile Island in 1979, the Tylenol cyanide poisonings in 1982, and the chemical plant disaster in Bhopal, India, in 1984, companies began to realize that rapid and appropriate communications were critical in a fast-moving crisis environment. Various crisis communications experts began to outline procedures for managing communications in a crisis, and companies developed crisis communications manuals. Crisis preparedness planning became part of normal business practice. Companies in industries susceptible to large accidents (oil, chemicals, airlines) established technology-laden crisis communications centers on their premises, and many companies began to engage in crisis simulation exercises, in which press inquiries and press management were critical factors.

Another new field that developed was litigation communications. More and more companies under legal fire began to realize that battles were fought in the court of public opinion long before they were engaged in the court of law. With the investment community concerned about the potential costs of litigation and customers and employees worried about corporate or product reputation, no company could afford to be silent while plaintiff lawyers leaked documents and information to television and print reporters. So more experts emerged in the public relations profession—many of them trained as lawyers—to develop communications strategies that would precede courtroom activity and then carry the company through a trial and/or to a settlement.

Public Relations Today

The globalization of the media and the development of the Web have offered even more challenges and opportunities. Public relations functions are now the owners and operators of the company's Web site and, often, the company's Web communications strategy. Public relations professionals design and proactively manage large corporate Web sites containing massive amounts of information that once had to be printed in brochures and sent out in press kits. Reporters—once only reachable by phone, mail, or fax—now became available by e-mail, and conversely, reporters can now have quick access to in-depth and constantly updated information, statements, visuals, and video snippets any time of the day or night.

Today, the field of public relations involves activities, techniques, and subspecialties that parallel the social and technological complexities of the age. But the focus remains constant. Now it is called "reputation management," a reformulated statement of "image making." And while companies are more successful at managing political issues, the reputation of business in general and of most companies remains at an all-time low—as it was even before a series of corporate scandals (Enron, Tyco, WorldCom) raised new questions about corporate ethics and integrity.

Ironically, approaching its 100th year of existence, the public relations field also retains its own image problem. Phrases such as "flack" hang over the field, left over from movies and novels (e.g., *The Sweet Smell of Success* of 1957) in which the press agent is portrayed as amoral and scheming. There are more ominous phrases, such as "spin doctor," not unrelated to the profession's once lauded relationship to propaganda. Even the acronym *PR* continues to carry negative connotations, the reason why so many corporate departments now bear names such as Corporate Communications, Corporate Affairs, or External Relations. Countless professional confabulations have discussed the dilemma of the bad image of the public relations profession, but the experts in image making cannot seem to solve their own image problem.

Beyond Message Delivery to Dialogue

During the 1990s, the newly emerging ideology and methodology of corporate responsibility (sometimes corporate social responsibility) offered a new approach to the field of public relations. The underlying assumption of corporate responsibility—once articulated by Ivy Lee to John D. Rockefeller—is that a business cannot survive and be sustainable in the long term without the support of key constituencies. Those constituencies are not limited to those with economic ties (investors, employees, customers, suppliers) but include other critical social groups (the media, the government, communities, and what is now termed "civil society" and was once called interest groups).

The theory of corporate responsibility does not focus on the image of the company with these groups, however. It focuses on the concept of stakeholder engagement and the need to carefully listen to constituency groups as part of the decision-making process, attempting to address concerns as part of business development. It is a model where the company becomes a more transparent and open-minded entity, discussing issues and even business ideas with others so that social groups become involved actors in what is decided, while not, in any way, controlling the decision. The goal is not image or reputation but rather decision making that is compatible with the social and ethical concerns of communities that could be affected by it.

While the "managing reputation/image" model of public relations has always included the notion of "listening," this activity has been largely left to opinion research and to the intuition and accumulated experience of the public relations professional. More important, listening has been merely a step in the process of developing the message that then gets delivered by the most effective voices and techniques to get the particular perceptual outcome—for example, an issue belief, favorability for the company, and so on.

Now, according to the theory of corporate responsibility, listening has to be redefined as a serious kind of dialogue—a two-way conversation—where views are shared, common ground defined, and disagreements respected. The quality of the relationship is paramount, not the perception of the company.

This approach creates new challenges for the public relations field, which as of 2005, only some companies and industries have embraced—and only in some narrow issue areas. It changes the job of the public relations function to not just carry messages to the outside but also bring the outside in. In this way, business management is more likely to make decisions that are compatible with societal expectations and values.

This redefinition of the function requires that public relations professionals become more adept at give-and-take exchanges and at finding common ground, not in a context of a negotiation but in a context of dialogue and respectful sharing. This is a different skill set from that which has generally guided the profession—namely, the ability to develop influential messages (in print and in visual and aural forms) and deliver them creatively to intended audiences.

Becoming More Businesslike

While public relations functions learn to operate within the new corporate responsibility paradigms, it is unlikely that they will stop doing what they have long existed to do. Companies will continue to need core public relations activities—media relations, internal communications, Web site management, corporate identity and positioning, financial communications, issue monitoring and management, government affairs, contributions, and community relations—all being performed at the leading edge of technology and of communications theory and practice.

These public relations activities are increasingly managed in ways that parallel other core business functions. Long-term and short-term plans are developed as part of the business-planning process. Desired outcomes are agreed on and often expressed in perceptual terms—that is, a particular audience will hold a particular belief—or in terms of an action that an audience will take as a result of a belief: for example, purchase shares in the company. As in any business plan, the situation analysis is laid out, and strategies are outlined along with tactics (messages, messengers, and media).

Measurement can occur at several levels. *Output* is a measurement of the activity of the function: issuing press releases, making contacts with government officials, writing speeches, or improving the Web site.

Impact is a measurement of target audience exposure to the messages. This measurement parallels the field of advertising where reach, frequency, and gross rating points can be used as readings of how often an intended audience target is exposed to the message. Impact in public relations can be measured in terms of both message accuracy (described through word counts and subjective analyses of whether media coverage accurately delivered the desired message) and the number of people exposed to the media that carried the information.

The most elusive measurement is *outcome*—that is, whether all the public relations activity (the output) reached the audience the right way (the impact) to actually create or sustain the desired belief. Opinion research can be used to measure outcome (e.g., Did the percentage of believers increase?), but often public relations professionals are not eager to have their work judged on their ability to move public opinion. This reluctance then raises the question of whether the public relations profession will allow itself to be measured on its core mission, which is to influence opinion.

The movement of public relations into more of the business mainstream, including the use of business tools such as planning, objective setting, strategy articulation, and measurement, has not yet closed the gap that most public relations professionals—all the way back to Ivy Lee—would like to have closed. That is the gap that keeps them somewhat to the side in critical decision making. Public relations professionals yearn to have a "seat at the table" earlier in the decision-making process. They know that the adage "Actions speak louder than words" is valid, and that no "spin doctor" or "message delivery strategy" can turn a bad corporate behavior into an acceptable one. In the end, good public relations can help a company, but it can never replace—or cover up—bad decisions.

—Jim Lindheim

Public Relations Ethics

The ethical issues of public relations arise because public relations is not just a set of techniques to disseminate information. There is always a perceptual objective to be achieved, and ethical dilemmas abound in how that objective is achieved.

Codes of ethics exist within the public relations profession at various levels—in trade associations (The Public Relations Society of America, The Council of Public Relations Firms, the International Association of Business Communicators, etc.), in public relations agencies, and within the public relations departments of companies. Except in the specialized area of government relations, there are few laws that govern how public relations professionals go about their objective of persuasion. Enforcement of codes is sporadic, and sanctions are few. The codes that exist cover a variety of issues (protecting confidentiality, avoiding cultural offense, financial management), but three areas remain ethically ambiguous: (a) truthfulness of information, (b) relations with the media, and (c) motivation of third-party support.

Truthfulness of Information

The public relations industry makes a variety of statements about a commitment to supply information that is accurate and honest and known not to be false. Some of these statements go further to require that public relations professionals make an effort to confirm the accuracy of the information they are communicating and to correct any misinformation that is transmitted.

The ethical gray areas include what might be termed "lying by omission" or "being factually correct while leading to a misimpression." In both cases, there may be a commitment to "telling the truth" but perhaps not the whole truth. Indeed, only a slice of the truth might be presented, and this might be done in a fashion that knowingly leads the audience to a conclusion that they might not have reached if they had the "full story."

Such activities are very common in public relations (as they are in marketing), since public relations can involve "spin"—that is, finding the best thing to say and avoiding discussing the negatives. In some cases of regulated communications, such as FDA regulation of pharmaceutical information, there are both guidelines and a watchdog over this parsing of the truth. But even with regulation, the line between acceptable and unacceptable can be muddy.

Relations With the Media

The public relations profession has a symbiotic relationship with the media. Public relations people want their messages and stories in the press, and journalists need information and access.

In some parts of the world, direct payments to journalists for press coverage are a matter of course. In most countries, however, such "pay-for-play" practices are forbidden by the ethical codes of the media. However, there are some subtle distinctions in what *pay* may mean. Many—but not all—media outlets forbid reporters from accepting any travel reimbursement or entertainment from a company or an agency. But reporters can be invited to speak at conferences, sometimes for honoraria; and moonlighting reporters have been known to accept writing or video-editing jobs through companies that they own.

Most media also create an institutional barrier between their desire to sell advertising to a company and the company's desire for good media coverage. Nonetheless, many public relations professionals know when purchasing of ads will help with favorable coverage, and many media are now offering advertising in "special issue sections" (e.g., a report on environmental issues) where advertisers also will get coverage.

In early 2005, a major industry scandal erupted when a syndicated "columnist/commentator" received a government contract for his advertising firm to help explain a government program. The work also included speaking well of the program as a commentator. While the controversy led to apologies and the discussion of new rules for government public relations contracts, the practice is not rare. Various experts who widely comment through their own columns or TV appearances as specialized reporters (e.g., "our travel reporter") have contracts with companies to provide favorable comment. No disclosure of these relationships is required by public relations codes of practice.

The 2005 scandal also led to a focus on video news releases (VNRs) issued by government agencies. A VNR is designed to be a fully produced news segment that a TV news show can simply slip into its news program. It includes a "reporter," who may or may or may not appear on camera, and some government VNRs may include an "interview" with a senior government official that is actually a scripted appearance. In the 2005 controversy, reform proposals ranged from forbidding government-produced VNRs altogether (even for important public information programs) to requiring a visual disclosure on the entire tape. Government has no ability to require such disclosure on VNRs produced by the private sector.

Third-Party Spokespeople

Many public relations efforts involve motivating third parties (e.g., respected experts, happy consumers, celebrities, or interest groups) to carry a message to the media or directly to the intended audience. This may involve simply finding such people and encouraging them to make their views known. At the other end of the ethical spectrum is the paying of spokespeople, preparing and training them, writing their words, and "pitching" them to the media, all without disclosure of who is providing this support.

Strategies can also include the support of "coalitions," which are essentially front groups that will buy advertising, serve as spokespeople, and sometimes lobby a particular issue. Such support can include the re-creation of such groups or providing special grants to existing nonprofit groups to support specified activities on behalf of the company. Sometimes these relationships are publicly disclosed, sometimes not.

Disclosure is usually the ethical remedy suggested for these third-party practices, since it seems to be acceptable to pay a spokesperson or provide a VNR or even have a financial relationship with a business owned by a journalist if these relationships are fully disclosed. To date, however, the public relations industry—and some in the media industry—have resisted such a "sunshine" approach since the effectiveness of numerous public relations tactics would be greatly reduced if the mechanisms behind them were revealed.

Public Utilities and Their Regulation

Public utilities are economic entities "vested with the public interest," also known as "common calling enterprises." "Vested with the public interest" is a centuries-old concept based on the common-law notion of "status," a complex set of rights and responsibilities associated with the provision of services of public necessity. Those who engage in common calling enterprises are bound by status to provide goods and services in accord with the needs of the broader community.

Public utilities are defined by the necessity of the goods and services they provide and the inherent market power they possess. Public utility services are essential because of both what is provided, such as water or electricity, and the network system of delivery. Many public utilities are infrastructure organizations, entities that maintain the fabric of social and economic institutions by providing network connectivity for individuals and continuous interconnections among buyers and sellers. The demand for public utility services is time critical; even relatively brief service interruptions can result in significant economic loss and social disruption. Due to the necessity of utility services, consumer demand is highly price inelastic, and governments assert oversight responsibility.

Historically, grist mills, granaries, docks, wharfs, toll roads, intra-urban transport systems, and railways were considered to be public utility entities vested with the public interest. Currently, electric power, natural gas, telecommunications, and water and sewerage are considered to be the core public utilities, although not all aspects of their supply are public utility in nature. For example, natural gas transmission and distribution are public utility services, though natural gas production is not.

Most utility markets will not sustain numerous independent suppliers. Instead, utility markets are served by a very limited number of entities, most often by a single firm. Public utilities firms are often referred to as "natural" monopolies because their control of utility markets is rooted in technologies of production rather than artificial constraints such as anticompetitive practices or governmental grants of exclusivity.

Public utility technologies are capital intensive and manifest extensive economies. Public utilities typically require 5 to 10 times as much investment per dollar of revenue as do economic enterprises in general. Many factors lead to the capital-intensive nature of utilities. Utility services often require permanent physical connections between suppliers and consumers. Utility supply systems, such as electricity, natural gas, or telecommunications, are tightly coupled, highly interdependent, and subject to significant reliability externalities; changes in the level of use by one customer can affect the reliability of service for others. Unlike airplanes or parking garages, when public utility demand exceeds the available supply, system failure can ensue, resulting in a loss of service for all customers. Because there tends to be little or no storage, high levels of service reliability can only be maintained by building system capacity significantly in excess of expected peak demand.

There are various types of public utility economies. Transmission systems, for example, exhibit economies of scale; when fully utilized, the larger the capacity of a natural gas pipeline or electric transmission line, the lower the average cost of delivery. Local distribution systems exhibit economies of density; the cost per customer served decreases as service area density increases. Utilities have economies of diversity; the cost of having a single firm serve a number of different types of customers is less than the costs of having different firms serve different types of customers. The combination of the various types of economies leads to market "cost-subadditivity"; it is less expensive for one firm, or at most a very small number of firms, to provide service to an entire market than it would be to divide market service among many firms.

High levels of capital intensity result in substantial barriers to entry. Extensive economies preclude the market sustainability of many independent providers. The result is that necessary public utility services are provided by organizations with substantial market power.

Industries vested with the public interest bear a responsibility to provide service at just prices, without discrimination, and on a reliable basis. Just prices are based on the costs of service rather than the relative bargaining power of buyers and sellers. Nondiscrimination means that all must have access to the service and that similar customers must be treated similarly. Reliability pertains to the continuous provision of utility service of acceptable quality. These common-law responsibilities emanate from a system of social ethics attuned to concerns with protection, fairness, and attainment of the social good.

Open markets cannot be relied on to ensure the attainment of common calling responsibilities. Unlike firms in competitive markets, monopoly utilities have the capacity to set prices in excess of costs, engage in price discrimination, limit access to the service, and maintain reliability levels below that which would best serve the public interest. Some form of governmental intervention is necessary if public interest objectives are to be attained. The two primary approaches for governmental intervention are (1) extensive regulation of privately owned utilities and (2) government provision of public utility services. While there are several governmentally owned utilities in the United States, the predominant means of oversight has been through extensively regulating privately owned utility companies.

The common-law basis of public utility regulation in America was affirmed by the U.S. Supreme Court in *Munn v. Illinois*, 94 U.S. 113 (1876). In its seminal decision, the Supreme Court held that the state of Illinois could regulate grain elevator storage prices because grain elevator storage was an undertaking vested with the public interest—storage was necessary for effective supplier participation in grain markets—and storage was provided by a shared monopoly. Although subsequent Supreme Court decisions broadened the bases for establishing a state's constitutional authority to regulate business, American public utility regulation developed in accord with the *Munn v. Illinois* standards.

Utilities in the United States are regulated at both the state and federal levels. In 1907, New York and Wisconsin became the first states to establish public utility regulatory commissions. By the late 1920s, over two thirds of the states had regulatory agencies. Today, all states have public utility commissions.

Federal public utility regulation, particularly with respect to price control, arose primarily in the 1930s. The Communications Act of 1934 placed telecommunication regulatory authority in the Federal Communications Commission (FCC). The Federal Power Act of 1935 and the Natural Gas Act of 1938 placed energy utility regulatory authority in the Federal Power Commission (now named the Federal Energy Regulatory Commission, FERC). Other important federal public utility regulatory statutes include the Telecommunications Act of 1996, the Public Utility Regulatory Policy Act of 1978, the Natural Gas Policy Act of 1978, and the Energy Policy Acts (1992, 2005).

The primary responsibility of public utility commissions has been to regulate utility prices. Commissions have a wide range of other regulatory powers, including control over market entry, service requirements, construction, issuance of securities, ownership, affiliate relationships, product standards, accounting, information and reporting systems, operating standards, and so forth. While significant in their own right, these additional regulatory powers primarily serve to enable effective regulation of utility prices.

State commissions regulate retail prices and utility construction. The FERC regulates electricity and natural gas wholesale prices and transmission rates. The FERC also has regulatory authority over natural gas pipeline construction. The FCC regulates interstate telecommunication prices and controls the provision of wireless telecommunication licenses.

Federal and state public utility commissions are almost always required by statute to set "just and reasonable" utility prices. Historically, prices were considered to be just and reasonable if they were based on the costs of service. Traditionally, commissions determined just and reasonable prices through company-specific litigated rate cases. Commissions evaluated revenue requirements through assessment of service costs—a utility's jurisdictional specific operating expenses, taxes, depreciation, and necessary returns on investment—and established prices accordingly. Utility prices were established on a forward-looking rather than a retroactive basis. While previous deficient or excess earnings provide a reason for changing utility prices, the utility is neither allowed to recover lost earnings nor required to return excess profits.

In various jurisdictions, commissions augmented traditional rate-making methods by automatic adjustment clauses and performance-based rate mechanisms. Automatic adjustment clauses give a utility the ability to periodically adjust its prices based on changes in only some of its costs, such as the cost of fuel or purchased gas supplies. Performance-based rates incorporate profit incentives and rewards into the pricing mechanisms. The incentives or rewards may be based on a number of factors, such as utility productivity, service quality, plant availability, and consumer energy use efficiency.

In recent years, several commissions have moved away from company-specific cost-based pricing. These commissions have adopted formulaic price-capping mechanisms or have established other standards for determining just and reasonable prices. Price caps "decouple" a utility's prices from its cost of service. Price caps establish an upper boundary on the annual rate of change of a utility's average prices based on economywide inflation indices adjusted for assumed rates of productivity improvement. Alternatively, some utility commissions now accept negotiated or market-based rates as just and reasonable if there is buyer access to alternative providers.

Public utility regulatory commissions, particularly those at the state level, require a utility to obtain a "certificate of public convenience and necessity" prior to the construction of a new plant and equipment. The reason for licensing construction is to avoid the adverse consequences of overbuilding, such as threats to utility solvency or the need to impose substantial increases in customer prices. Traditionally, construction projects were evaluated on a project-specific, case-by-case basis. From the 1970s into the 1990s, many state commissions moved from a case-by-case evaluation of electric utility projects to a comprehensive planning framework. Commissions assessed future demand requirements; evaluated the private, environmental, and other social costs of a range of alternative construction and energy use efficiency options; and established a least-cost plan to ensure ongoing system reliability. Commissions then decided whether to grant construction approvals based on a specific project's conformity with the least-cost plan. This planning approach constituted a major shift in regulatory function; commissions moved from focusing primarily on price control to engaging in systemwide planning. While various consumer and environmental groups embraced regulatory planning efforts, most utilities saw commission planning as an inappropriate infringement on managerial prerogatives. In the latter part of the 1990s, commissions moved away from system planning as the FERC opened wholesale electric power markets and "non-utility" electricity suppliers entered the market.

For the greater part of the century, regulators viewed their primary responsibilities as being the direct control of utility prices and the assurance of service reliability. In recent years, however, regulatory policy has turned to opening utility markets. By the early 1980s, the FERC no longer regulated natural gas wellhead prices. In the mid-1980s, the FERC opened wellhead supply markets to local distribution companies and end-use consumers. In its Order 636, the FERC required natural gas pipelines to provide transmission service for the delivery of natural gas supplies purchased by local distribution companies and consumers directly from producers or through market brokers. As the direct purchase of natural gas supplies increased, interstate pipeline companies were transformed from natural gas merchants into the equivalent of common carriers. The FERC began to open wholesale electricity markets in the late 1990s. In its Order 888, the FERC required open access to transmission services. The FERC has also promoted the formation of regional transmission organizations to handle the operation of transmission systems and oversee emerging open wholesale markets.

As the FERC was opening up wholesale markets, some states opened retail markets to alternative providers. Natural gas retail consumers, particularly industrial customers, were allowed to purchase supplies directly from producers and brokers. Electric retail consumers were allowed to designate who would provide the kilowatts they consumed. Although the natural gas and electricity commodity markets were opened up, the transmission and distribution systems have remained under more traditional forms of regulatory control.

In the telecommunications industry, public utility regulatory control has been substantially eliminated. Prior to the 1980s, AT&T controlled 85% of local telecommunications markets and virtually all the long-distance market; long-distance rates were regulated by the FCC and local rates by state commissions. Several factors have altered the industry since then, including AT&T's divestiture of its local operations pursuant to a 1984 antitrust consent decree, the growth of the Internet, the development of broadband services and alternative means of broadband access, the rapid expansion of wireless telecommunications, and the passage of the 1996 Telecommunications Act. In the 1990s, the FCC ended its regulation of long-distance rates. Most state commissions have now relaxed rate regulation by adopting price cap mechanisms or by accepting negotiated prices as just and reasonable rates. Wireless and broadband services have developed outside public utility regulatory controls.

Various reasons have been given for the substantial shift in public utility regulation policies. Some believe that technological changes have obviated the need for substantial regulatory oversight. Transmission advances enabled the opening up of regionwide wholesale markets. Technological advances fostered cost-effective, small-scale, independently owned power systems. Technological advances have reduced the cost of telecommunications operations and fostered the development of alternative types of services and different means of delivery—such as broadband services that can be provided through existing telephone facilities, by cable, by wireless, by satellite, and over power lines. Some believe that the movement toward deregulation was prompted by claims that regulatory deficiencies hampered technological development and induced significant inefficiencies in the provision of utility service. Some suggest that a partial opening of some portions of utility markets led to the cascading inability of commissions to maintain effective or reasonable regulatory controls in general. Some argue that those seeking increased profits and reduced regulatory interference successfully influenced politicians through campaign contributions and effective lobbying. Some argued that regulatory systems were dismantled for ideological reasons when conservatives and free market advocates gained control of the various branches of state and federal governments.

Some of the results of opening utility markets have been beneficial. Long-distance phone rates have declined. The development and adoption of new technologies have brought forth a range of new telecommunication services for consumers. Utility companies have become more attuned to customer needs. Various investors have gained substantial profits as utility systems were deregulated and sold.

However, many results of deregulation have been less than favorable. Wireless and broadband services lag behind those in other industrial countries. Wireless and broadband access is not being made available to all; there is a persistent digital access divide between urban and rural areas and between low-income consumers and others. Telecommunication companies have indicated their intention to alter Internet service accessibility by ending network neutrality on their broadband systems. Utility markets have become more concentrated as major mergers have swept through the telecommunications and energy utility industries. Local phone rates have increased substantially. Natural gas and electric power wholesale prices have become much more volatile. Retail electric and natural gas prices are now much higher than had been previously predicted. Discouraged by the results of deregulation, many states reversed it or put further deregulatory efforts on hold. Previous proponents of deregulation, including associations of large industrial energy users, now argue that various efforts at deregulation have failed and that a return to traditional systems of regulatory control should be seriously considered.

Public utilities are not static. As technologies and needs change, so do the goods and services that bear public utility attributes. People living two centuries ago could not have imagined today's public utilities—they had yet to be invented. Likewise, public utility regulation is not static. As social and economic institutions change, so do the forms of governmental oversight. Administrative regulation, today's predominant institutional mechanism for public utility oversight, did not evolve until after the late 1800s. What remains constant, however, is the premise that there are goods and services that are public utility necessities and the conclusion that the public interest requires their regulation.

Punitive Damages

What Are Punitive Damages?

They Are Additional to Other Damages

Punitive damages are additional to the compensatory damages a judge or a jury may grant a plaintiff. Special damages are designed to replace "out-of-pocket" costs to the plaintiff. General damages are designed to compensate for the more ephemeral losses—such as pain and suffering; loss of consortium; or loss of care, love, and affection—to the plaintiff. Punitive damages are awarded to punish and make an example of the defendant.

Punitive Damages Cannot Be Insured

Generally, compensatory damages are paid for by an insurance company. Common law and many state laws or regulations prohibited insurance companies from insuring or paying punitive damages. Punitive damages must be paid for by the party against whom they are assessed.

Punitive Damages Are Quasi-Criminal Assessments

Punitive damages serve a similar purpose as criminal penalties—they punish the defendant and serve to make an example of the defendant. However, because civil defendants are not afforded the same due process and procedural protections as their criminal counterparts, the imposition of punitive damages inherently includes the danger of arbitrary and excessive deprivation of property. This problem is exacerbated when the decision maker, usually a jury, has also been presented with the inflammatory evidence necessary to merit the imposition of punitive damages. For an example of bad behavior that can lead to the imposition of punitive damages, read the facts in *State Farm v. Campbell et al.*, 538 U.S. 416 (2003).

Because of their quasi-criminal nature and the potential for abuse or mistake, the threat of punitive damages touches a red hot button for many people, especially the business community. This entry will look at the type of claims that cause courts and juries to award punitive damages, the Supreme Court's theory of ratio of punitive damages to compensatory damages, and some open issues.

One Legislature's Definition

California's Civil Codes § 3294 is an example of how a state's legislature codifies punitive damages. It states, in salient part, the following:

> In an action for the breach of an obligation not arising from contract, where it is proven by clear and convincing evidence that the defendant has been guilty of oppression, fraud, or malice, the plaintiff, in addition to the actual damages, may recover damages for the sake of example and by way of punishing the defendant.

Punitive Damages Generally Require a Tortious Act

The statute requires the alleged offensive act to arise from a tort, not a contract. These are two very different theories of law. A tort is an offense against an individual. A breach of contract is where a party is alleged to have broken its contractual obligation. This definitional difference can be dangerously simplistic and tricky.

One area of law where these two legal theories blend involves the duty of parties to exercise "good faith and fair dealing" in a contract. If one of the parties had larceny in his or her heart when entering into a contract and used some device to take advantage of the other party (or parties) to the contract, the aggrieved party could claim that the offensive party lacked the requisite "good faith." In a lawsuit, the aggrieved party would allege a "breach of the covenant to deal fairly and in good faith." Although this breach arises in a *contract* setting, the breach of this duty has been routinely defined as a *tort*. Therefore, in the case of California's statute on punitive damages, while there can be no punitive damages for the breach of the *contract*, there can be punitive damages for the *tort*. So the aggrieved party can claim punitive damages for the breach of the duty to deal fairly and in good faith but not for the breach of the contract.

The Standard of Proof for Punitive Damages Is Higher

Constitutional Standard: Probable Cause

The lowest level of proof is "probable cause." This is the level referred to by the Constitution in the Fifth Amendment, which allows the state to get a warrant. It is the level by which a law enforcement officer can stop a citizen and then instigate an investigation or interrogation. Probable cause has a very low evidentiary threshold.

Civil Standard: Preponderance

The next highest level of proof is a "preponderance," which is the standard of proof in a civil action. The simile often used to demonstrate this level of proof is to imagine the Lady of Justice's scales. If they should tilt ever so slightly one way or the other, the heavier side has been said to have the preponderance of the evidence.

Criminal Standard: Beyond a Reasonable Doubt

The highest level of proof is "beyond a reasonable doubt." This is the level reserved for criminal cases. The burden is on the state to prove that the accused is guilty "beyond a reasonable doubt." The higher burden is an attempt to offset the extraordinary range of resources the state has to prosecute the accused.

Punitive Damages Standard: Clear and Convincing

Between preponderance and beyond a reasonable doubt lies a level of burden of proof called "clear and convincing." It is beyond the 51/49% of preponderance and below the "beyond a reasonable doubt" standard. Clear and convincing is a compromise that considers the quasi-criminal nature of punitive damages. Courts have historically upheld this standard as reflecting society's and the court's disfavor of punitive damages.

Clear and convincing is the *legal* barrier a plaintiff must cross to prove his or her case. However, in the courtroom, even when a plaintiff meets his or her burden of proving the claim for punitive damages by clear and convincing evidence, juries find it hard to award punitive damages in all but the most egregious cases. Furthermore, appellate courts uphold punitive damages in only the most serious circumstances.

The Purpose of Punitive Damages

As California's statute states, punitive damages are used to make an example and punish the alleged offender. As mentioned above, the imposition of punitive damages assumes the mantle of quasi-criminal punishment. One of the questions plaguing the imposition of punitive damages is, "What does punishment, *sufficient* punishment, look like?"

Suppose a person of modest means chooses a certain behavior, such as using marijuana. What kind of punishment would cause such a person to change his or her behavior? Would a "warning" cause him or her to stop using marijuana? Probably not. How about a $25 fine? Again, probably not. A $250 fine? It might get his or her attention, especially if it were imposed regularly, every time he or she used the drug. Now, how about seizure of all his or her property, a 10-year sentence in a federal jail, and a $250,000 fine? Chances are high this draconian step would cause the miscreant to change his or her behavior.

This is the principle behind punitive damages. Punitive damages should be sufficient to punish and make an example of the defendant, in consideration of the defendant's wealth and ability to pay the damages. The elusive issue is what is just enough but not too much.

Suppose a manufacturer creates a product, develops the product, tests the prototypes, markets the product, and sells the product. Before the product has been placed into the stream of commerce but after the manufacturer has spent hundreds of millions of dollars on the initial development and testing, the manufacturer discovers that the product is defective. Management determines to near certainty that in a common-use scenario, the product uniformly fails catastrophically, with predictable results of serious injury or death to the user. Rather than pulling the product, as Johnson & Johnson did during the Tylenol problem of the 1980s, this manufacturer makes a simple cost-benefit analysis to determine how to proceed.

To a statistical certainty, the catastrophic failure will result in 180 deaths by burning, 180 serious injuries attributed to burning, and 2,100 burned vehicles. The unit cost is $200,000 per death, which was a published U.S. government figure for the value of human life at the time, $67,000 per injury, and $700 property damage per vehicle. The total benefit of doing nothing can be computed by the formula $180 \times (\$200{,}000) + 180 \times (\$67{,}000) + 2{,}100 \times (\$700)$ for a result of $49,500,000. This figure assumes that all persons sue and recover.

Then, the risk management section crunches the numbers and further analyses the cost. They find that 12,500,000 vehicles were sold. The unit repair cost is $11.00. The total cost formula is $12{,}500{,}000 \times \$11.00$ for a result of $137,000,000. The manufacturer decides that it is cheaper to deal with the deaths, injuries, and property damage than to make the repairs. It is decided not to recall the product and to deal with the cases as they appear. The figures used in this hypothetical problem were actual numbers taken from the Ford Motor Company interoffice memo titled "Fatalities Associated With Crash Induced Fuel Leakage and Fires" by E. S. Grush and C. S. Saunby, which was used in conjunction with the Ford Pinto litigation in the 1960s and 1970s.

After a series of configurations resulting in the predicted deaths and injuries, how should society get the company's attention? The company has made a clear decision to sell a product it knew to be defective. It chose to put people at risk after doing its own risk-benefit study. This is a scenario that might merit the imposition of punitive damages. Assuming that a plaintiff can show, by clear and convincing evidence, that the manufacturer knew of the problem, it might be very appropriate to award punitive damages to punish and make an example of the errant manufacturer.

In *Time* magazine, March 10, 2006, there was an article that discussed the *Exxon Valdez* oil disaster. Sixteen years after the accident, Exxon is still disputing the punitive damages award. The attorney of one of the victims was quoted as saying, "Only punitive damages will give Exxon the incentive to prevent future oil spills. The industry's perception is that all they have to worry about is the immediate out-of-pocket costs and they can just pollute and pay."

Some Unresolved Issues

Multiple Plaintiffs and Class Action Cases

One of the unresolved issues involves multiple plaintiffs, such as in a class action case. If one plaintiff were to recover a large punitive damage award, what about the other plaintiffs? If the behavior was considered reprehensible in the first case to trial, what mitigates the behavior in the subsequent cases? On the other hand, if the punitive damage award was sufficient enough to punish and make an example of the manufacturer in the first case, then other punitive damages would be definitionally unfair because the original imposition was supposed to be sufficient to "punish and make an example of" the defendant. On the other hand, is it not unfair to give a large award, seemingly a windfall, to only one of a number of injured plaintiffs?

The "Ratio"

The issue of the ratio of punitive damages to compensatory damages has been before the U.S. Supreme

Court twice in the last decade. The first case was *BMW of North America, Inc. v. Gore*, 517 U.S. 559 (1996), and the second was *State Farm Mutual Automobile Insurance Co. v. Campbell et al.*, 538 U.S. 416 (2003). In *Gore*, the Supreme Court overturned a $2,000,000 punitive damages award that accompanied a $4,000 compensatory award. In *Campbell*, the Court reversed a $145,000,000 punitive damages award where the compensatory damages were $1,000,000.

The Supreme Court, in *Gore* and *Campbell,* refused to give a specific formula or ratio. However, in both cases, the Court said, "In practice, few awards exceeding a single digit ratio between punitive and compensatory damages will satisfy due process." The Court found that single-digit multipliers satisfied both the due process issues presented by the Fourteenth Amendment to the Constitution and the state's need for punishment and deterrence. In *Gore*, the ratio was 500 to 1, and in *Campbell*, the ratio was 145 to 1.

However, to a company such as BMW or State Farm, if the aberrant behavior was very profitable, would the imposition of insignificant punitive damages really be a deterrence? For example, in *BMW*, the company was punished for failing to disclose that they were selling vehicles damaged in the manufacturing process as new vehicles. If the Court's guidance for a ratio was 9 to 1 and the damage was $4,000, the maximum punitive damage would be $36,000. Considering that the vehicle sale price was more than double the maximum amount that could be awarded for punitive damages, would the 9-to-1 ratio be enough to cause the defendant to refrain from the practice of selling vehicles damaged at the factory as new cars?

Popular Prejudices

Over a decade ago, an article in the June 17, 1996, *Wall Street Journal* discussed punitive damages from a business perspective. The authors addressed some of the commonly held misunderstandings regarding punitive damages. They said,

> Here is the latest stunning development about runaway punitive-damage awards: They may not be as common as you think. . . . Punitive awards are generally modest, and meted out in only the most extreme circumstances. . . . According to the study, most punitive awards aren't random, as critics have argued, but instead are closely tailored to the amount of compensatory damages, such as medical expenses and lost wages. Punitive damages are designed to punish and deter bad conduct. . . . The study found a much closer relationship between punitive and compensatory damages in most cases. Where compensatory damages were $10,000, punitives averaged around $10,860. Where compensatory damages were $100,000, punitives averaged around $65,720. And where compensatory damages were $1 million, punitives averaged $397,810.

This is just one example of the public's common misunderstanding of the nature and purpose of punitive damages. More important, it also gives an indication of the depth of passions around the subject. Is this prejudice a function of excellent manipulation of the media by savvy manufacturers or artificial hype brought to the public by the media?

What seems to be accurate is that in most cases, when the public hears the real facts of a case where punitive damages are awarded, they usually have no problem. Once the public hears why a jury gave punitive damages, the reasons predicated on the evidence proven in the trial, the average citizen is supportive. However, when only partial facts are given, many people look at these awards askance.

An example is *Liebeck v. McDonald's Corp*, the (in)famous "hot coffee" case. Many people have a very strong feeling that this case was just ridiculous. However, when they are quizzed to give the facts, invariably they give the wrong facts. When they are told the facts the jury heard, even the most obstinate persons usually feel that they have been duped by the media. Perhaps the more important question is who gave the "story" to the media and why they omitted the essential facts.

Conclusion

The issue of punitive damages touches social and legal hot buttons. However, such damages serve a valid social purpose. Punitive damages are designed to be punitive, to punish and make an example of a wrongdoer. Without punitive damages, society has no other viable means of holding large corporate entities accountable for intentional wrongdoing. One of the current important questions is what constitutes enough punishment. What is enough money to "punish and make an example" yet not so much as to violate an entity's right to due process under the law? The intertwining of civil and criminal law is what makes punitive damages so volatile and yet so effective. As long as punitive damages remain an alternative, they may serve a greater purpose, that of deterring despicable behavior.

Racial Discrimination

Racial discrimination in the United States is discrimination on the basis of an individual's race, generally manifested in blacks not receiving jobs, housing, education, and so on, of the same caliber as whites. Due to the unique racial history of the United States, racial discrimination often refers to the relationship between blacks and whites. Other groups that have been subjected to discrimination historically include Native Americans, Jews, Hispanics, the Japanese, and Muslims. However, these categories are generally considered to be discriminated on the basis of national origin or religion rather than race and are discussed in other entries.

To understand racial discrimination in the United States, it must be put in its proper historical perspective. Racial discrimination has deep roots in American history. Being founded by immigrants and well known for embracing immigrants from all over the world, the United States has a unique relationship with blacks. Africans make up the only group in what was to become America that did not voluntarily immigrate here. Rather, they were captured in Africa by Europeans and brought to the colonies to be used as a means of cheap labor to supply the ever-growing need of the colonists forging a new country from uncharted (for Europeans) territory. The choice to enslave Africans and the results of that system form the basis for much of the racial discrimination against African Americans still present in the United States today.

The first Africans in an American colony, who arrived aboard a Dutch ship in 1619, were actually not intended as slaves for the colony. The Dutch ran low on provisions and offered several of their African cargo, bound elsewhere, in exchange for provisions. Afterward, Africans brought to America were not enslaved but, as was the case with many Europeans, were indentured servants for a fixed period of generally 7 years. For the Africans, this arrangement lasted for only about 40 years. As the need for cheap labor grew, more restrictions were put on the indentured servitude of Africans, until finally they were enslaved for life and totally owned by their purchaser. Throughout slavery, there were a small number of free blacks and blacks who did manage to achieve a measure of success in business, the arts, and commerce, regardless of their circumstances, often with the help of sympathetic whites, but the system was overwhelmingly one of black enslavement and subjugation.

As the need for cheap labor increased, growing numbers of Africans were imported. Slaves were also bred by owners as a cheap way to increase an owner's slaveholdings, particularly after importation of slaves was outlawed in the early 19th century. Eventually, in some places the slave population rivaled or outstripped the white population. As such, slave uprisings were a primary concern. Each slave could not be watched at all times, so means were needed to prevent the possibility of such an occurrence. Ultimately, the consensus was that the most efficient means of control was a combination of self-monitoring mechanisms to keep slaves in line coupled with strict enforcement of rules by owners.

To create the self-monitoring mechanism, owners ensured that each minute of every day, in every way possible, a slave be reminded of his or her position in society so that the thought of changing the status quo would not even arise. This was accomplished in varied ways, from formal laws to violent punishment; from not being allowed to use their own languages to owners' unrestricted sexual access to female slaves; from using rough "Negro cloth" for slave clothing to making it a crime to teach slaves to read and write. Slave codes and ironclad social customs outlined the role of slaves and owners in minute and careful detail.

Though they varied from state to state, generally, the codes gave owners absolute power over the life, and even death, of slaves. Slaves were permitted little, if any, control over any aspect of their lives. Their children were not their own, they were not allowed to marry without the owner's permission, to read, write, travel outside their owner's property without written permission, gather in groups of three or more, enter into contracts, or raise their voices to whites, and they generally had no rights or status as human beings. Slaves were taught that they belonged to the owner and must obey whites without question. Whites were taught that slaves were inferior to them in every way and were to be treated as little more than errant children. Each learned his or her place from birth and generally maintained it. Transgressions resulted in swift and fierce retribution. To maintain the status quo and prevent uprisings, it was important that slaves understood that violations of law or custom, no matter how small, were not to be tolerated. *Dred Scott v. Sanford*, 19 Howard 393, of 1857 held that a slave who had lived in a free state for 7 years was, in fact, still a slave. Despite many slave revolts, for the most part, to survive, slaves learned to be subservient and respectful to whites and to think they were incapable of being responsible for themselves.

This system was in place from the 1600s until after the Civil War (1861–1865) ended nearly 250 years later. Blacks had virtually never been free in this country, so there was little experience as to how the race of 4 million free blacks would fit into American society. For about 5 years after the Civil War ended, the Freedmen's Bureau (The Bureau of Refugees, Freedmen, and Abandoned Lands) attempted to try to help newly freed slaves, but it suffered from chronic underfunding and stiff white resistance. Blacks were thus released from slavery and, for the most part, simply left to fend for themselves with no education, little support, and much resentment by whites. Promises made to give them land were revoked by Andrew Johnson, the U.S. president who took office after President Lincoln's assassination.

After Southern Reconstruction (1865–1877), when federal troops were stationed in the South to keep it from reverting to pre–Civil War slavery, there was little to keep resentful southerners from doing what they could to return to their previous way of life. Slave codes were replaced with black codes, and for the next 99 years, until the Civil Rights Act of 1964, the era known as Jim Crow existed. Emanating from an 1830s minstrel show act by a white performer in blackface makeup singing and dancing to a song called *Jim Crow* to the delight of white audiences, *Jim Crow* is the term used for the set of laws and social mores that arose after Reconstruction to keep blacks and whites strictly segregated and blacks subservient. *Plessy v. Ferguson*, 163 U.S. 537, of 1896 had held that racial segregation was constitutional and gave judicial affirmation to states' "separate but equal" Jim Crow approach to race.

Jim Crow meant that blacks and whites could not attend the same public or private schools, universities, theaters, parks, municipal swimming pools, libraries, churches, stores, hospitals, doctor's offices, beauty or barbershops or restaurants, or even drink from the same water fountains or use the same toilet facilities, and they could not marry or sit together while riding public transportation. Discrimination in housing, education, and employment was widely permitted. Newspaper classified sections were divided into jobs for whites and those for "coloreds."

For the next 99 years after the Civil War ended in 1865, blacks in the South, where the vast majority of them lived, were in much the same position they had been in under slavery. Jim Crow segregation excluded blacks from most of mainstream life. Unfair sharecropping and convict lease laws kept blacks working for whites at low or no wages. The Ku Klux Klan was a white supremacist organization that used violence and intimidation to keep blacks subjugated. The lynching of blacks, particularly of black men, as a means of social control was widespread, with 3,446 lynched between 1882, when reliable statistics were first collected, and 1968, when most lynching had subsided. Lynchings were often social affairs, complete with families, children, picnics, and photos taken with the hanging corpse. Appeals to the federal government to intervene received no quarter—something for which Congress apologized in 2005, though there were dissenters.

Picking cotton engaged the vast majority of black workers in the South. This task was mechanized soon after the end of World War II. No longer needed for this labor-intensive role and trying to escape the racial oppression of the South, for the first time blacks began leaving the South in significant numbers. They found jobs in cities, filling in for those who left for military service during World War II, and left for military service themselves. Thus began the Great Migration, the largest peacetime domestic exodus that the world had ever seen. From the early 20th century until the 1960s, millions of blacks left farms in the South and migrated to cities. In 1910, 89% of blacks still lived in the South, and 80% of that number lived in rural areas. By 1960, 40% of blacks lived outside the South, and 75% of these lived in cities.

Rural blacks moving to urban areas created many challenges, not the least of which were demands for decent employment, housing, and education as well as other social issues. Jim Crow continued to be a way of life, for both social and economic reasons, even more so since the cities to which blacks migrated had never had so many blacks living in them, and, for the most part, blacks coming from the farms had little or no education that would permit them to move into anything other than menial jobs. Vibrant communities of blacks thrived in some ways under segregation, having their own doctors, lawyers, and so on, but for the most part, blacks were primarily consigned to poorer neighborhoods and jobs as domestics, caretakers, cooks, and laborers.

Under Jim Crow, blacks were also denied the right to vote in elections, with the imposition of poll taxes, literacy tests, and other measures aimed at keeping them from the ballot box. Real estate contracts routinely contained restrictive covenants that prohibited a buyer from conveying the property to blacks. The armed services were segregated, with blacks generally being allowed to perform only manual labor. Though slavery had ended nearly 100 years earlier, blacks were in no way considered equal citizens in the United States.

In 1954, in *Brown v. Board of Education*, 348 U.S. 886, the U.S. Supreme Court struck down segregation in public education and paved the way for dismantling the system of racial segregation in the United States. In response, whites rioted and some public school systems, for instance in Virginia and Arkansas, closed the entire school system rather than allow white and black children to attend school together. Ten thousand federalized National Guard troops were called in by President Dwight Eisenhower, and 1,000 paratroopers were dispatched to handle the crowd of 1,000 angry whites when nine high school students ("the Little Rock Nine") integrated Little Rock's Central High School in Arkansas. Two people were killed and more than 150 federal marshals injured when the University of Mississippi admitted its first black students in 1962. Schools would not be integrated until well into the 1970s, during which time whites began moving from cities to suburbs to avoid the issue. In the years following the integration of Central High School in Little Rock, the civil rights movement, always simmering at a low level, heated up and became more pressing.

In 1963, the largest march ever to take place was held in Washington, D.C., at which the Rev. Dr. Martin Luther King Jr. gave his famous "I Have a Dream" speech. Blacks, whites, Jews, and others came from all around the world to protest the unequal treatment of blacks. The next year, President Lyndon B. Johnson signed into law the Civil Rights Act of 1964, which had been introduced by President John F. Kennedy. The law, which became effective in 1965, prohibited discrimination on the basis of race, color, gender, religion, and national origin in employment, education, public accommodations, and the receipt of federal funds. Though there had been a few pieces of legislation passed after the Civil War (called the post–Civil War statutes) to give blacks the right to enter into contracts like whites, to prevent citizens from being deprived of their rights under the pretense of following state law, and to prohibit Ku Klux Klan–type actions, none were as comprehensive and far-reaching as the Civil Rights Act of 1964. Even though the Civil Rights Act of 1964 relates to a broad set of groups against which discrimination is prohibited, race discrimination has consistently been the most frequent type of claim filed with the Equal Employment Opportunity Commission (EEOC), the agency created by the act to enforce claims arising under it. In 1965, the Voting Rights Act was passed, nullifying the onerous restrictions states had put on blacks registering to vote.

The Civil Rights Act has been in existence for 40 years and significant changes have resulted, but three centuries of exclusion of blacks from virtually all aspects of mainstream society ensured that passage of the law would not immediately result in their equality. Extensive and varied research demonstrates time and again that race discrimination is still very much a part of the American landscape and still greatly affects the everyday life of blacks. Blacks still lag behind whites in the ability to access virtually every significant facet of life, from education to medical assistance; from the criminal justice system to home ownership; and from employment to receipt of bank loans.

For instance, a recent congressionally commissioned study by the Institute of Medicine found that "bias, prejudice, and stereotyping on the part of health care providers" contributes to blacks being less likely than whites to receive appropriate heart medication, coronary artery bypass surgery, and kidney transplants, as well as being more likely to receive a lower quality of basic clinical services such as intensive care. In November 2004, Alabama voters voted to keep this language in their constitution: "Separate schools shall be provided for white and colored children, and no child of either race shall be permitted to attend a school of the other race."

According to U.S. Census data, a black man with a college degree makes 30% less than a similarly situated white man, but more blacks attend college, and hold jobs, than ever before. The average black male with a master's degree earns 20% less than a white man with a master's degree, and blacks with master's degrees have a higher unemployment rate than whites with bachelor's degrees. The median income for whites is $47,800, but for blacks, $29,600. The average net worth of blacks is $6,000, compared, for whites, with an average net worth upward of $88,000. A black male with a high school diploma earns 25% less than a white male with a high school diploma. Research shows employers would rather hire a white man who had served time in prison than a black man who had not, and when given identical résumés with the only difference being the names of the applicants, employers gave 50% fewer callbacks to those with "ethnic" names such as Jamal or Lakiesha than those with traditionally white names such as Megan or Brad. In addition to visual racial profiling by law enforcement and others, researchers have found that there is also linguistic profiling, with blacks who leave messages in response to real estate ads often never receiving return calls, while whites almost always do.

A 5-year, seven-volume study from Harvard by the Russell Sage Foundation in 1999 found that "racial stereotypes and attitudes heavily influenced the labor market, with blacks landing at the very bottom." A comprehensive, 24-year Ford Foundation–funded study, results of which were published in 2002 by Alfred W. Blumrosen and Ruth G. Blumrosen, explored the public sense of reality about job discrimination and found that most people assume that intentional job discrimination either no longer exists or is the act of a few willful individuals, but this is not the case. Rather, they found that "thousands of employers have continued systematic restriction of qualified minority and female workers" (p. 1), resulting in the workers losing opportunities to develop and exercise skills and abilities that would result in better pay, with blacks still being the victims of most of the discrimination. Nearly half of white Bostonians surveyed said that blacks are less intelligent than whites and that they are harder to get along with than other ethnic groups. A 2004 Gallup poll found that 76% of whites, including 9 out of 10 less than 30 years of age, thought blacks were now being treated fairly or somewhat fairly, compared with only 38% of blacks who thought so.

The types of discrimination claims have changed over the years, with the more obvious types of racial discrimination declining, for the most part, but they still exist and tend to be more subtle. Just recently, race discrimination claims have cost several employers millions of dollars. For example, Abercrombie & Fitch settled an EEOC claim by paying $50 million for its discriminatory practice of avoiding hiring blacks and other minorities as sales staff in its stores. Supercuts settled a claim for $3.5 million for failing to hire and promote blacks and for unlawfully terminating them. Home Depot settled for $5.5 million for allowing a hostile work environment based on race, gender, and national origin. Consolidated Freightways entered into a settlement for $2.75 million for permitting a racially hostile environment, including the placement of nooses in the workplace, assaults, threats of physical violence, and racial graffiti at its workplace. Carl Buddig agreed to pay $2.5 million for excluding blacks from working at some of its plants in Illinois, and Milgard Windows agreed to pay $3.37 million for engaging in racially discriminatory hiring practices and then retaliating against the human resources employee who complained about them doing so.

Despite the intensity of the country's racial divide, race has often been a rather ambivalent issue for Americans. One of Jim Crow's staunchest supporters was the erstwhile segregationist, South Carolina Senator Strom Thurmond, who died in June 2003 at the age of 100. Six months after his death, a mixed-race woman came forward and announced that she was his daughter, the union of then 22-year-old Thurmond and her then 16-year-old mother, who worked as a maid in the Thurmond household. Thurmond had acknowledged, supported, and kept in contact with her during her life, while still fighting to protect the institution of racial segregation up to, and including, 1948, when he ran for president of the United States on a "Dixiecrat" ticket composed of Southern Democrats who opposed the softening of racial segregation laws. On the other hand, in the early

1970s, Thurmond was one of the first legislators to hire a black in his congressional office.

Rand, Ayn (1905–1982)

Ayn Rand was born Alissa Zinovievna Rosenbaum in St. Petersburg, Russia. Attracted by the United States' ideals of freedom and individualism, Rand fled from the Communist U.S.S.R. in 1926. Shocked to find much of the American public unappreciative of their freedom and their country's founding values, Rand set about writing philosophical novels intended to inform and inspire a broad readership about the wonders of individualism and capitalism and the dangers of collectivism and central planning.

Her early Broadway play *Night of January 16th* and her two earlier novels *We the Living* and *Anthem* paved the way for Rand's two enormously influential works of fiction. *The Fountainhead* recounts innovative architect Howard Roark's struggle and ultimate success maintaining his individualism and integrity in a world predominantly peopled by imitators and manipulators. Rand considered her penultimate novel *Atlas Shrugged* to be the complete statement of her Objectivist philosophy. In it, the hero John Galt and other brilliant American capitalists withdraw from a crumbling, increasingly regulated economy. Without their creative force, the economy teeters on disaster. Of the more than 25 million copies of Rand's fiction and nonfiction works purchased to date, *Atlas Shrugged* accounts for more than 5 million.

Rand holds that ethics must be conceived as a logical component of a philosophical worldview. Thus, before explaining her ethical theory, she argues for metaphysical realism and for reason as humans' only epistemology. Only then does she enter the realm of ethics or how humans should conduct themselves. Following Aristotle, she believes that ethics relate to the appropriateness or goodness of humans' behavior *as humans.* Because our epistemology shows us that living things pursue life and that humans' fundamental means of survival is reason, people *should* behave rationally and develop themselves to their fullest potential. The only political system that allows humans the freedom to live and to engage one another rationally is free market capitalism. Rand, thus, offers the field of business ethics one of the strongest available arguments for free markets.

While Rand has strong opinions on the subject of rights, she is not a "rights theorist." Unlike theorists like Robert Nozick, she does not see rights as the foundation of ethics, but ethics as the foundation of rights. Ethical people will strive to build their own characters whether alone or dealing with other people; thus, they will have no rational incentive to engage in force or fraud. Only when dealing with the irrational do people need the protection of rights.

This distinction formed the basis of Rand's disagreement with Libertarianism. She saw this political position as founded on floating rights, ungrounded in broader philosophy. This divergence ultimately precipitated a rift among Rand's adherents that both broadened and deepened ongoing Objectivist research. Dr. David Kelley, by engaging in dialogue with the Libertarians, sanctioned their untenable position, according to Rand's intellectual heir, Dr. Leonard Peikoff. Therefore, Kelley was expelled from what was then the solitary Randian association, the Ayn Rand Institute, which strove to protect, promulgate, and promote Rand's original ideas. Kelley's response was to open in 1989 what is now the Objectivist Center, in Washington, D.C., a think tank working to develop, refine, and apply Objectivism. Many Libertarians now ground their political positions in Rand's Objectivist philosophy.

Rational Choice Theory

Rational choice theory (RCT) is a method of formally describing decision-making situations to explain, predict, or prescribe a course of action. (Rational choice theorists disagree among themselves over whether the theory is properly seen as descriptive and predictive or instead prescriptive.) The theory seeks to explain choice in terms of agents' beliefs and desires, assuming that agents do their best to choose courses of action that they believe will satisfy their desires. RCT is an attempt to understand people's actions as calculated reactions to the situations they face. It holds that through observing actions, we can infer people's preferences; alternatively, if we understand people's options and their preferences, we can predict or prescribe their actions.

Some Examples

A simple example will help. Imagine that the management team at ABC Corp., a publicly traded manufacturer of cell phones, faces a decision whether to license a new, patented technology (say, a novel memory chip) from XYZ Inc. or instead to develop its own memory chip using similar methods, despite the fact that doing so could arguably infringe on XYZ's patent. This is a complex decision.

In its explanatory capacity, RCT might explain ABC Corp.'s decision *not* to risk infringing XYZ's patent as a rational response to the anticipated costs and benefits of doing so. Clearly, if ABC Corp. chooses not to risk infringing the patent, it must be because managers there believe that the benefits and costs of not doing so jointly outweigh the benefits and costs of infringement. Perhaps, they see patent infringement as a very risky behavior (very likely to result in legal action by XYZ) or the likely legal penalty for patent infringement as being very important to avoid—and so they rationally choose to license the technology from XYZ Inc. instead.

In its predictive capacity, RCT might lead us to predict, prior to ABC Corp.'s choice, what managers there will in fact choose to do. The prediction made will depend on some assumptions about what the managers predict to be the costs and benefits of patent infringement. (In practice, a rational choice theorist might not make a prediction about what a specific company such as ABC Corp. will do but rather about what managers at companies facing a choice like the one faced by ABC Corp. are likely to do, on average. That would be typical of the use of RCT in modern economics.)

In its prescriptive (or normative) capacity, RCT might tell managers at ABC Corp. (or managers facing a choice like the one faced by ABC Corp.) what they *ought* to do in such a situation. So (depending on what is known about, or what assumptions are made about, the relevant costs and benefits of copyright infringement and about the company's own mission, vision, and values), the rational choice theorist might tell managers at ABC Corp. that given how much they value avoiding serious legal penalties and given how little it would cost simply to license the technology from XYZ Inc., it would be irrational to risk infringing XYZ's patent.

Rationality

Central to RCT, of course, is the idea of rationality itself. The term *rationality* is a contested one—it is used in different ways by different theories in different fields. As used by rational choice theorists, rationality simply means the capacity to evaluate options and to choose among them according to some set of criteria (normally, the agent's own values or preferences). To say that an agent is rational is simply to say that the agent has the capacity to evaluate options and to choose among them to achieve goals. The standard of rationality assumed by RCT has little, if anything, to say about the quality of agents' goals. Rationality is a property that applies to agents (an agent is called *rational* to the extent to which she or he is effective at choosing actions conducive to the achievement of her or his goals) or to agents' choices (an agent's choice is called rational if it is conducive to securing the agent's ends); but for RCT, *rationality* is not a concept that applies to an agent's preferences or goals themselves. Thus, RCT leaves it to agents to determine what their goals are; there are no irrational preferences. RCT merely assumes that agents choose according to their own goals. This leaves open whether the agent's goals and preferences are narrowly selfish, nepotistic, sympathetic, or altruistic, or aim at promoting the well-being of all humankind, and so on. So contrary to the claims of some critics of RCT, calling an agent rational does not necessarily imply either a "cold," emotionless demeanor or a narrow focus on the agent's own interests.

While RCT does not criticize agents' preferences, it does stipulate that a rational agent's *set* of preferences must have certain characteristics. These axioms are quite technical. But key ones may be stated briefly as follows. A rational agent's preferences must be

- complete (a rational agent is able to rank order any options she or he is offered: preferring one to the other, or vice versa, or being indifferent between them);
- transitive (if a rational agent likes oranges better than apples, and apples better than bananas, then she must like oranges better than bananas); and
- independent (if a rational agent is indifferent between two options, she will still be indifferent between those two options if we add some same third ingredient to each of them).

The reasons for stipulating each of these requirements are too complicated to explore here. It is enough to note that any agent whose preferences do not satisfy these axioms is simply not a *rational* agent *in the sense in which RCT is interested.*

What types of agents does RCT apply to? Traditionally, individual human agents have been the primary subject matter of RCT. Indeed, RCT is in part motivated by the idea that more complex social phenomena can be explained in terms of the net effect of the rational choices of various individual people. RCT is *reductionist* in this sense. (So, for example, upward and downward trends in financial markets can be explained by the rational responses of individuals to things such as changes in income and the price and supply of various goods.) But the application of RCT is not limited to individual human agents. In principle, the RCT framework applies to any entity that is capable of choosing from among a set of options in light of its own desires or preferences. Thus, RCT may apply to the decision-making situations faced by corporations and other organizations as well as by nation-states.

Two Main Branches of RCT

There are two main branches of RCT. One (known as "expected utility theory") deals with decisions in which a single agent chooses in response to a fixed (though not necessarily predictable) environment. Expected utility theory deals with how agents do (or should) evaluate various options, in light of available information. A simple example of such parametric decision making might involve an executive (call her Lori) deciding whether to use the final half hour prior to an important meeting to (a) go for a walk to try to clear her head or (b) prepare for the meeting (by rereading the agenda for the meeting, going over her own notes, etc.). Both activities are valuable, but she cannot do both. Let us assume that going for a walk is only 70% likely actually to clear her head. An RCT perspective on such a situation would have us calculate (at least roughly) the net value of each alternative (in terms of Lori's own objectives). An estimate of the net value of each alternative would be achieved by multiplying the chance of an outcome's occurrence by its value to Lori. So in the case at issue, it is calculated as follows:

Value of going for a walk = (value of getting to the meeting ill prepared with an unclear head × .3) + (value of getting to the meeting ill prepared but with a clear head × .7)

compared with

Value of not going for a walk = (value of being well-prepared but with an unclear head × .3) + (value of being well-prepared but with unclear head × .7).

Whichever calculation produces the highest total is the "preferred" option. Of course, we cannot complete the calculation without knowing how much Lori would value or disvalue each of the four possible outcomes (e.g., we need to know how much Lori values having a clear head at such a meeting and how important it is that she arrive prepared). But if this information were available, this procedure does in principle allow comparison of the value of each alternative.

The second branch of RCT, known as "game theory," deals with *strategic* decision making. That is, game theory is the study of rational decision making in contexts in which the eventual outcome depends on the interaction of several agents' choices. For example, imagine driving a car in a foreign country. Which side of the road should you drive on? Clearly, that depends very much on what you expect other people to do. Without some idea of what others will do, you cannot calculate the expected utility of your options. If you expect other drivers to drive on the right, you should too. If you expect others to drive on the left, then *that* is what you should do. There is no "best" answer, here, independent of our prediction of other people's behavior. (In a business context, such decisions are common: All marketing decisions, for example, are made in light of expectations of what one's competitors are likely to do.) Modern game theory has focused largely on characterizing and analyzing a number of common "games" (situations calling for strategic choice) and devising best (i.e., utility maximizing) strategies for agents to adopt in these games. The best known of these games is the famous prisoner's dilemma, a game in which individually rational choice leads to bad outcomes for all involved and which has been seen as providing a model for many modern ethical issues.

History of RCT

RCT originated as a 17th-century reaction to the skepticism of the 16th century. Notwithstanding the fact that certain belief was thought largely impossible, it was argued rational to hold beliefs, and act on those beliefs, if a relatively intelligent person would have been persuaded to do the same based on the same evidence. This claim was aimed primarily, but not exclusively, at games of chance. This school of thought was pushed toward formalism by the Enlightenment's fancy that a calculus of right reasoning could be constructed.

Earlier examinations of what constitutes "a just gamble" facilitated this focus on games of chance. Church prohibitions on gambling and usury seemed at odds with the civil law, which allowed usury, insurance, and annuities. This sparked debate about what a "just" compensation for risk taking amounted to. There was agreement that a just gamble was one where the price of playing was (roughly) equal to the expectation of reward, but the way to determine this was contested. This debate, framed in terms of expectation, made it natural for the early probability theorists examining mostly games of chance, many taken from a legal context, to talk in terms of people's expectations (a subjective measure) instead of taking a frequency interpretation of probability (an objective measure).

In the early to mid-20th century, RCT received its modern cast. Theorists focused on producing a mathematical system that would mimic the decisions of an ideal practically rational agent by relying on a precise measure of preference, namely utility. Game theory received formal treatments during this same period, being used primarily to analyze strategic (military) situations during World War II. While RCT, in general, typically treated probability as dependent on the agent's beliefs, game theory treated probability as dependent on objective facts about the world. Neither treatment is universally followed today.

Criticisms of RCT

Critics of RCT have pointed out serious problems with each of its descriptive, predictive, and prescriptive ambitions. To begin, people do not always make decisions rationally. Sometimes we choose whether to walk or take the bus based on habit, for example. The consequences of following habit look, to the outside observer, just like the consequences of deliberate choice. It would, therefore, be questionable to describe someone's walking to school as a *choice* they made based on the expected benefits of the various outcomes. One might respond that this only means that RCT should be cautious regarding what it tries to explain—it should only attempt to explain *purposeful* behavior. But even our purposeful behavior is known to not always be based on rational calculation. We often appeal to general *rules of thumb* when making decisions or only analyze *some* of the relevant costs and benefits when making decisions (e.g., ABC Corp. might not take into account the effects of patent infringement on public perceptions of the firm). Since this is sometimes the case, the ability of RCT to explain behavior is at least questionable. The degree to which people are supposed to act rationally when making important life choices is in some dispute—some theorists suppose people (and organizations) more rational than do others.

RCT has also been accused of producing few nontrivial predictions. This will not surprise those who accept that RCT is not adequate as a descriptive methodology. If RCT cannot accurately describe how we *do* make decisions, then it is reasonable to infer that it cannot predict how we will make *future* decisions.

Finally, as a prescriptive device, RCT falls prey to two distinct types of objections. If RCT is seen as making *moral* prescriptions (telling us which course of action is the ethically correct course of action), it is commonly argued that maximizing your satisfaction is hardly an appropriate basis for morality—indeed, "doing the right thing" seems to consist largely of constraining the maximal satisfaction of your preferences. If RCT is seen instead as making economic prescriptions (deciding which course of action will maximize the satisfaction of my interests), it might be thought that RCT is on solid ground. It has been argued, however, that it would be inefficient to appeal to RCT for such advice. If you think about all the possible choices and costs and benefits associated with something as simple as figuring out where to take an important client to eat tonight, you can imagine that doing that calculation itself would take you well past the dinner hour! It seems that, rationally speaking, it can be argued that a rule of thumb (such as "We always take important clients to *da Maurizio*") would be more efficient than appealing to a full rational choice theoretic analysis.

Rationality

Many things have been called rational, or irrational as the case may be, including beliefs, actions, desires, and persons. Of these, perhaps the two that have received the most attention are belief and action. Discussions about the rationality of belief fall under the domain of theoretical rationality; those concerning the rationality of action fall under practical rationality.

Theoretical Rationality

Theoretical rationality is often called "epistemic" rationality, since it is concerned with the question of obtaining knowledge. An agent can be said to know that *p* only if, apart from believing that *p* and *p* being true, he or she is able to give reasons for his or her belief that *p.* Theoretical rationality, hence, can be understood as that capacity of cognitive agents that allows them to adopt beliefs about the world on the basis of reasons. This raises at least two problems. First, what are the grounds on which a rational agent may adopt such beliefs? Second, what are the rational procedures or rules that allow her to invoke those grounds to support her belief?

The first question concerns the notion of evidence. If Jane has evidence for a belief that *p,* then this serves as a reason for her both to adopt and to defend that belief. Maybe the most obvious candidate for evidence is perceptual information—information that the agent receives about the world by means of her sensory faculties. Furthermore, in some cases Jane will be able to justify her belief that *p* long after she has obtained immediate perceptual information about *p.* In this case, she is no longer relying directly on perceptual information but on her memory thereof. The capacity to store information and access it later is of prime importance for an agent's ability to adopt and justify beliefs. Last, Jane may come to adopt a belief because she has been told that *p:* In this case, she is relying on testimonial evidence.

Perception, memory, and testimony all constitute *defeasible* grounds of evidence: The correctness of information received from any of these sources depends on the adequacy of the agent's sensory faculties, her cognitive capacities, and the external circumstances under which the information is acquired. Awareness of the contestability of evidence based on such information and the capacity to assess its quality are important aspects of an agent's rationality.

Not all evidence is concerned with the outside world, however, and evidence that is not external in this sense may not always be falsifiable. For example, rational agents can have information about their own inner states, such as being in pain, that is not subject to reasonable doubt. And some writers believe that intuitive, noninferential knowledge may be available about abstract objects, such as numbers and concepts forming the basis of mathematics and logic, which is not defeasible.

The second question—the question of the rules or rational procedures that allow a rational agent to adopt a belief on the grounds of information obtained via the above-mentioned channels—falls into the domain of logic and concerns the nature of arguments. Any logical argument consists of two or more statements, at least one of which serves as a premise that supports (or, we may also say, offers evidence for) a conclusion. There are two ways in which a conclusion can follow from a premise. If the conclusion follows with a degree of probability from the premise, then the argument is *inductive.* If the conclusion follows necessarily from the premise, it is a *deductive* argument. Most arguments, including scientific ones, rely on inductive inference. On the other hand, according to the traditional view, logic and mathematics proceed deductively. The foundationalist would argue about mathematics that mathematical reasoning is based on intuitively obvious axioms from which theorems can be deduced that are true once and for all. This conception has come under threat in the 20th century from an argument by Kurt Gödel. In his famous incompleteness theorems, he shows that for a large class of important axiomatic theories, such as number theory, mathematical reasoning cannot deduce all mathematical statements that are true relative to that system and cannot even show that the system is internally consistent. Furthermore, according to the "quasi empiricism" of Hilary Putnam and Imre Lakatos, mathematical knowledge is similar to empirical knowledge in possessing a hypothetical status. Mathematical theories are then fallible, and they are arrived at not by means of formal proofs but in accordance with inductive methods of inquiry similar to those employed in the empirical sciences.

In his *Enquiry Concerning Human Understanding*, David Hume pointed out a problem with inductive knowledge. He argued that any inductive inference from true premises to a general conclusion relies on a further hidden premise—namely, that the world in the future will be relevantly similar to the world as it is when the inference is made (that nature is uniform). But the uniformity of nature cannot be presupposed and hence must be justified. The problem is that any such justification can only proceed inductively itself. Hence, Hume concluded that inductive inferences are circular. It follows that one cannot inductively obtain knowledge of those parts of the external world about which one does not have perceptual information.

The problem does not end here. Hume argued that since the idea of necessity cannot be derived from the observation of individual sequences of events, it turns out not to be possible to justify causal necessity on empirical grounds. Yet it is not possible to justify causal judgments a priori (i.e., prior to any experience) either, for it is impossible to tell how objects have behaved prior to having observed them. Hence, causal necessity can only be explained reductively in terms of constant conjunction—a relation between two events in which one invariably accompanies the other.

Immanuel Kant thought that Hume's argument, if sound, undermined not only natural science (and thus a core domain of theoretical reason) but also metaphysics, the philosophical discipline that investigates the general structure of reality. He responded by trying to show that there is a class of judgments that can be made a priori but that are nevertheless "synthetic" (i.e., revealing genuinely new information). Examples of such judgments can be found, for example, in geometry: "The angles of a triangle always add up to 180 degrees" is a judgment that is known a priori yet cannot be deduced from an analysis of the concept of triangle (judgments that can be deduced from the analysis of a concept are called "analytic"). Kant's project in the *Critique of Pure Reason* is to explain the possibility of this kind of judgment. He approaches it by arguing that there are features of experience that the mind bestows on objects and these are hence not supplied by the external world. Since metaphysics is concerned with the question of what these features are, it cannot proceed on the basis of empirical evidence, that is, inductively. The question whether Kant's response to Hume's empiricism is viable has been raised forcefully in the 20th century by W. V. O. Quine's argument that no distinction between analytic and synthetic judgments can be drawn.

Practical Rationality

Practical rationality is concerned with an agent's capacity to choose from among different courses of action. It does not attempt to give an account of our knowledge of the world, but focuses on the reasons and ways of thinking that lead us to choose to do some actions and not others. Thus, a main task for theorists of practical rationality is to give an account of the exact role reason plays in action. There have been many such accounts, but for purposes of this entry we will divide them into two rough categories: those that maintain that reason's role is entirely or almost entirely confined to devising the means necessary to achieve the goals or ends of action and those that argue that the role of reason in action is much larger than simply devising the means to ends.

Writers who argue that reason is confined to working out means to ends typically endorse or have been heavily influenced by David Hume's understanding of practical rationality. According to Hume, the job of reason in action is to choose means to ends that are themselves neither discovered nor sanctioned by reason, but given by desires or passions, as he put it. Reason can devise means to satisfy desires, but since desires are neither true nor false, they are not subject to rational assessment. Furthermore, reason can assess neither which of our desires we should pursue nor the order in which we should pursue them. Consequently, Hume claimed, it is not contrary to reason to pursue goals that we realize are not in our best interests, and may even be detrimental to our interests. For Hume, reason is a mere instrument used to serve ends that are set by desire and only by desire.

Many contemporary theorists of practical rationality accept Hume's idea that our desires and goals are not subject to rational assessment but argue that reason has a role to play in selecting the order in which we ought to pursue them. This approach contends that the basic task of practical reason is to discover means that optimally advance an agent's ends, whatever they might be, and that an agent acts rationally to the extent that he or she undertakes such optimizing actions. The procedure for this, as developed with considerable mathematical precision in decision theory and the theory of rational choice, is first to propose a measure for agents to rank their goals from most to least desirable. This measure gives the "utility" of each goal. The utility of each goal is then multiplied by the agent's estimate of the probability that the goal will be achieved given the means contemplated to attain the goal, and the products are added together to get the expected utility of each action. The rational thing to do, then, is to select the action that has the highest expected utility. Thus, agents can use reason to determine which available actions maximize the satisfaction of desire and, hence, how desires can be pursued efficiently. Note that if the proposed measure of the utility of desires applies to all agents, it may be possible to discover which social policies have the highest expected utility and so guide social as well as individual choice.

Opposed to the Humean view are writers who argue that reason is not a mere instrument in the service of desire but has a much more complicated role in choosing action. There are two main strands of the non-Humean understanding of reason's role in action. The first is that reason is not purely instrumental since it has the dual role of identifying the objective ends of human life and guiding action to achieve those ends. For example, Aristotle argued that there is a good for man that is both knowable by reason and the proper goal of human action. Thus, for Aristotle, and for many writers since Aristotle, reason is not the servant of desire but is an instrument for achieving ends that are to a large extent revealed and endorsed by reason itself.

The second non-Humean strand of practical rationality claims that what makes an action rational is at least in part that it conforms to rules for action that are independent of the agent's ends and do not necessarily advance those ends. According to this position, a rational agent is one who, in circumstances in which the rules are applicable, chooses to act by the rules. There are different accounts of this rule-based conception of rational action depending on what one takes to be the source of the rules. One is that the rules are widely accepted social norms about what is or is not a socially acceptable action. For example, most of us stop at a red light even when the road is clear and no police are in sight because of the social norm that prohibits running the light, regardless of the immediate benefits of doing so. This sort of norm-based reasoning is a familiar part of ordinary life. However, there is a major controversy about how far it can be extended and, in particular, whether it can be extended to cover ethical reasoning.

Those who argue that it does apply to ethical reasoning often accept some type of ethical relativism.

In its simplest form, ethical relativism is the view that what is good to do, or what is ethically proper or right to do, is regulated by socially accepted ethical norms. For example, in societies where there is a social norm against having multiple spouses, it is ethically wrong to have more than one spouse. In societies where there is no such norm, it is not ethically wrong. That is all there is to it, and, at its core, reasoning using social norms to guide action is all there is to ethics.

On the other hand, many writers who reject ethical relativism maintain that ethical reasoning is based on norms that are in principle available to all agents. The most influential version of this position was developed by Immanuel Kant. Kant argued that practical reason should not be based on social norms that arise in different societies from arbitrary historical processes but on rational principles known by rational means, and thus in principle accessible to all rational agents regardless of their cultural affiliations. Kant claimed to have found such a principle, which he called the "categorical imperative." The basic idea here is that unless you can suppose that everyone in similar circumstances could wish to do what you now propose to do, you should not do it. This, Kant believed, is a requirement of reason itself, and reason dictates that it be followed by all rational beings regardless of the consequences.

It is a matter of continuing debate whether Kant's defense of the categorical imperative as a principle of pure practical reason is successful. However, Kant's views about practical reason have inspired contemporary philosophers and social theorists, such as John Rawls and Jürgen Habermas, to propose theories that make essential use of the notion that rational agreement can be based on principles that everyone can accept.

Practical Reason and Social Responsibility

It is not self-evident how the various conceptions of rationality introduced here bear on real-life ethical questions, in business environments or elsewhere. One reason is that it is not clear whether there exists a necessary connection between rationality and ethics. On Kant's account of practical rationality, it is rationally required to act morally and, thus, always irrational to act immorally. This is a consequence of his view that moral requirements flow from the universalizable principles of reason itself. However, on Hume's account, it is entirely possible to be completely rational in accomplishing goals that are immoral. For Hume, reason is confined to devising means to satisfy our desires, and there is no assurance that our desires match up with what is morally acceptable.

But even if we take it that the employment of one's rational faculties leads to morally worthy actions, it does not follow that a rational agent will always be in a position to resolve real-life ethical problems. The complexity of such problems, in business and other contexts, typically defies standardized solutions. The most that can be hoped for is that an agent's familiarity with theories of practical rationality might enable him to better understand the nature and scope of the problems at stake. Unfortunately, perhaps the most obvious difficulty here is that sometimes business interests and ethical concerns follow different such theories and may hence not always be compatible.

Empirical Issues Concerning Theoretical and Practical Reasoning

In recent times, the human capacity for both theoretical and practical reasoning has come under intense scrutiny from the natural and the social sciences. Psychologists have pointed out that intelligent agents frequently commit significant errors when making intuitive judgments about physics, arithmetic, and probabilities. Cognitive scientists have produced evidence that poses problems for the classical philosophical view of rationality as radically disjoint from an agent's emotive faculties. The ideally rational agent, according to this view, bases his or her actions on conclusions that are obtained through rational inferences alone. Any emotive interference makes the agent less than fully rational. It has been observed, however, that an impairment of an agent's emotive skills (through a brain injury, say) can result in a diminished capacity for theoretical and practical reasoning. How exactly philosophers might respond to these challenges is not currently obvious.

RATIONALITY AND ETHICS

The word *logos* was used in Greek philosophy to refer to rationality. *Logos* was adopted by the Romans as *ratio*, which became *rationality* in English. Rationality, like ethics, is considered a uniquely human characteristic, a characteristic that distinguishes humans from other life-forms. Aristotle used *logos* to describe humans as rational animals, animals that are capable of knowing in the cognitive and moral sense. This Aristotelean notion of the interdependency between rationality and ethics is a characteristic broadly accepted in classical Greek philosophy.

In Roman and medieval times, rationality was associated with religious thought and belief. This association was severed during the Renaissance and the Enlightenment, when the relationship between ethics and religion was questioned. As a consequence, rationality became the characteristic of autonomous persons who possessed the capacity to develop their own morality because of their capacity to be rational and were in no need of external authority or imposed values.

In addition to the focus on the individual during the Enlightenment, rationality became associated with scientific method and gave birth to the rationalist school of thought. This school of thought claims that knowledge and truth are based on reason, not on external sources or value judgments. Rationality then became associated with utility in value-free science. This development led to scientific rationality, which is based on positivism, the perspective that perceives value judgments as incapable of being rational, and rational judgments as those that relate to utility.

Rationality underwent radical transformations in its journey through history. From the coexistence of rationality and ethics during the classical Greek period, rationality became the source of morality during the Enlightenment. More recently, rationality is generally associated with utility and efficiency rather than ethics.

Types of Rationality

Rationality is generally distinguished as being theoretical or practical. Theoretical rationality is associated with beliefs and knowledge, while practical rationality is associated with intentions and behavior about what is the good thing to do. Practical rationality provides the explanation and justification for behavior.

Alastair MacIntyre explains three main positions on practical rationality. The first is based on acting for one's self-interest. Action in this perspective is based on the calculation of costs and benefits of different alternatives. The second position of rationality is based on the capacity to act impartially toward your own interests but in accordance with the constraints accepted by any rational person. This view makes rationality a standard that can provide a benchmark for human behavior. The third view sees rationality as the capacity to act in ways that bring out the inherent goodness of human beings.

Ethical Theories and Rationality

The three main schools of thought of ethics are deontological or duty based, teleological or consequence based, and virtue ethics. Deontological and teleological ethics contend that ethics is a function of rationality. Virtue ethics, without eradicating the importance of rationality, contends that ethics is primarily concerned with the cultivation of character, and it emphasizes individual virtue and integrity. The character disposes the person to act ethically, so what is important is to develop a strong character. The cultivation of character is important, according to virtue ethics, and happens before the rationalization of actions and the formulation of principles.

Teleological ethics is based on the notion that moral behavior is not intrinsically valuable. The value of moral behavior is determined by its consequences, which can be ascertained through rationality. Rationality provides the ability to know what is good by assessing possible consequences and selecting the one that provides the greatest net benefit. The ability to know what one should do, therefore, depends on rationality.

Immanuel Kant, the most influential representative of deontology, is considered the founding father of the ethics of rationality and the modern conception of rationality. Kant wanted to separate ethics from religion and developed ethics as a consequence of human rational ability. For Kant, rationality and autonomy are related since persons are rational when they follow the laws they are able to make for themselves. Rationality makes persons autonomous because it places the authority for moral decisions on the person and not on any external authority such as the law, religion, or society's traditions. Autonomous rational agents are, according to Kant, ends in themselves and not means because they can author the laws they are bound by, deserving respect and having dignity.

Rationality, for Kant, provides the categorical imperative of morality, the fundamental principle of ethics that prescribes the duties required for moral behavior. The fundamental principle of ethics, which is provided by rationality, requires that what counts as a reason for one person also counts as a reason for everyone else in the same situation. When applied to practice, reason provides the ground of morality in the first formulation of the categorical imperative: So act on that maxim that it can be willed to be a universal law. Thus morality is founded on rational laws rather than emotions, desires, or even religion. The categorical imperative, like the principles of mathematics, is discovered a priori through thinking and not through experience or emotion.

Since the rules of morality are rational, they are the same for all rational beings. In addition, since rational human beings discover the rules of morality autonomously, they are bound by these rules of morality because they are self-legislated, are discovered through thinking, and are not imposed from an external authority.

Kant developed a morality based on rationality. Only an autonomous being can determine its actions in accordance with its reasons for acting, and only such a being can be a moral agent. Autonomous moral agents develop ethical values and standards and are responsible for their behavior.

Other Perspectives of Rationality and Ethics

The Enlightenment relied on rationality to resolve ethical issues. Hume and Rousseau, unlike Kant, sought to oppose the notion that rationality is able to guide human life. For Hume, a rational man is a man who is suffering from a psychological disorder. Hume sees moral judgments as an outcome of moral sentiments rather than rationality. Reason, according to Hume, is a slave to passion, not the other way around, because reason cannot move one to act, while passion can.

Rational self-interest is used by David Gauthier to justify morality. Gauthier adopts a contractarian approach to morality and justifies morality in terms of instrumental rationality. He argues that the justification for morality must be independent from it, that is, morality needs to offer reasons for action, not merely an explanation of action. Rationality provides constraints on individuals' self-interest, and these constraints are the moral principles.

There is another view that positions ethics as prior to rationality, not a consequence of rationality. Emmanuel Levinas, a postmodern philosopher, sees ethics as an outcome of responsibility. This responsibility is born not of the capacity of people to be rational but rather from the existence of other people. The encounter with other people creates the demand for responsibility, thus making responsibility and ethics the outcomes of the existence of persons. Similarly, Bauman, after Levinas, argues that morality does not have a purpose and it is nonrational. Morality, according to Bauman, is an impulse, unpredictable and unregulated.

Business, Ethics, and Rationality

Rational today is a term that has diverse meanings. Generally, rationality requires consciousness, competence, consistency, and awareness. Rational is also the effective and efficient or widely accepted and shared. In economics, rational is associated with optimal. It is related to goal achievement in a value-free context without examining the ethics of the means and the ends of the goal achievement process.

Rationality occupies a central position in management theory and practice. Management and organizational theory relies on rationality to achieve not only effectiveness and efficiency but also morality. Instrumental rationality, for example, the rationality most often employed in business, is the process of finding the means to achieve predetermined ends, without concern for the ethics of such goals.

Business adopted the notion of instrumental rationality as an adequate measure of human nature from other social sciences, especially economics. This understanding of rationality has been used in business to develop theories and models of human behavior. More specifically, the "rational economic man" has been imported from economics to develop human nature in management. The rational economic man has been criticized because the assumptions of its construction are immoral and do not reflect the reality of human existence. Work on heuristics and biases bounded rationality, and satisficing emphasized the inadequacy of the assumption of rationality in business.

Ethics and rationality are examined in business ethics at the individual and organizational levels of analysis. At the individual level, rationality and ethics are examined in terms of personal ethical values, ethical decision making, and ethical behavior at work. Rationality and ethics at the organizational level are also receiving increased attention through the corporate social responsibility and stakeholder theories. The view that ethical behavior is reduced to economic rationality is the classical perspective of corporate social responsibility. More contemporary perspectives of ethics in business see business activity as including responsibilities not only economic and legal but also ethical.

The issue of organizational rationality is also connected with the issue of the ontology of the organization. An ongoing debate sees the organization as a person, a property, and as a partial moral person. This debate has implications for the ethical behavior of both persons and organizations.

People's rationality in the business realm is affected by specialization and the division of labor, the establishment of standard practices, objectives, communication channels, and training, and the indoctrination of members with knowledge, skill, and loyalties. The organization also affects the locus of choice on decision making and shapes what a person perceives as rational at any given moment.

Rawls, John (1921–2002)

John Rawls, an American philosopher who held the position of Professor of Philosophy at Harvard University, is widely considered to be the most important political philosopher of the latter part of the 20th century. His highly influential writings have contributed greatly to the shaping of contemporary political thought. He began his philosophic career in the context of a cultural climate permeated by the assumptions of utilitarianism with its understanding of individuals as merely means to a goal of general social well-being. A strong advocate of the liberal political tradition, he argued for a political philosophy that, unlike utilitarianism, stresses issues of justice and individual rights.

In his most important work, *A Theory of Justice,* published in 1971, Rawls sought procedures that embodied the moral ideal of justice and put forth his fundamental insight that every individual has an inviolability rooted in justice that cannot be overridden even for the welfare of society as a whole. Basing his political theory on the idea of justice as fairness, he postulated a hypothetical or original position, in which free, equal, and rational individuals devoid of any social attributes, particular ends, or attachments might agree on principles of social cooperation. These individuals deliberate from a basis of self-interested rationality and do so within a veil of ignorance that shields them from morally irrelevant knowledge such as social status or wealth. By insuring impartiality, Rawls concludes that all parties involved would place a high priority on basic liberties, for they would not want to risk a loss of freedom in whatever segment of society they may find themselves. Second, they would choose distribution of fundamental goods that allowed for inequalities only when such inequalities would raise the level of the least well-off. The principles for this social contract result from rational insights, and what results is a temporal, rationally constructed frame or social contract imposed on the contingencies of real-life existence. Social structure is in some sense postulated in abstract principles, and social reasoning is by and large the application of the rule to the particular case.

In *Political Liberalism,* Rawls keeps the key tenets of *A Theory of Justice* but emphasizes that all modern societies have diverse views on basic issues of value, the significance of life, and the relation of these to belief in God. Thus, he concludes that liberal political principles must be acceptable to a wide range of viewpoints. In *Justice as Fairness: A Restatement,* Rawls again holds fast to his core ideas, but formation of the fundamental principles through intuitions is modified to the position that there is a certain ideal implied—that of Western liberal democracies—and the basic values of the agent, now called citizen, are not derived from fundamental intuitions but from an overlapping consensus, thus allowing for more pluralism. Whether one agrees or disagrees with Rawls's position, his work has been, and will continue to be, a powerful impetus for political, social, and philosophical debates, and its scope is unmatched in recent times.

Rawls's Theory of Justice

A Theory of Justice

In *A Theory of Justice* Rawls argues that the primary task of social and political institutions is the preservation and enhancement of social justice, which he understands to include both principles of individual liberty and principles of well-being or welfare. Rawls tries to develop a procedure called the original position that would yield principles of justice. These principles of justice would then serve as guides in the construction and evaluation of social and political institutions.

Rawls does not view people as naive moralists searching for a utopian ideal. Rather, they are sufficiently self-interested to wish to pursue their own individual interests or those of their families and loved ones. Given inevitably competing interests and conflicts, Rawls attempts to provide a procedure that will enable the members of the society to adopt principles for resolving conflicts and for adopting just practices and institutions.

Rawls appeals to a procedural process in the social contract tradition. Rawls's contract is not an actual contract made in history but rather a thought experiment or hypothetical state called the original position.

Persons in the original position are governed by certain constraints both moral and psychological.

One of the key constraints is the adoption of the veil of ignorance, or the ignorance principle. The ignorance principle states that the contract makers are to act as if they did not know their place in society. Such ignorance guarantees impartiality and prevents us from arguing on selfish rather than general grounds. The veil of ignorance would exclude knowledge of one's class position or social status (including the probability of occupying any position or having any specific degree of status), one's fortune in the distribution of natural assets and abilities, one's intelligence, one's physical strength, the nature of one's society, and one's individual conception of good and other values. Operating in this way, none of the contract makers would have any special interests to defend, nor would they have any reasons to form alliances to adopt principles that work to the disadvantage of a minority of other contract makers.

For example, suppose the issue were the distribution of income. Since the veil of ignorance prevents you from knowing how wealthy you are or will be, and it prevents you from knowing your occupation and talents, what strategy would be rational for you to adopt? Surely, Rawls argues, you would want to protect the position of the least well-off. Since the contract makers are rational egoists operating from behind a veil of ignorance, they would adopt the general principle of seeking to minimize their losses. Since they are ignorant of the probability of any specific outcome, they would guard against the worst possible outcomes by making the people in the worst-off position as well-off as possible.

We can now see how unanimous agreement on the principles of justice is possible. Since everyone agrees that it is rational to reduce one's losses and since no one knows what position he or she holds in society, the following two principles would be adopted unanimously: (1) Each person is to have an equal right to the most extensive total system of equal basic liberties compatible with a similar system of liberty for all; and (2) social and economic inequalities are to be arranged so that they are both (a) to the greatest benefit of the least advantaged and (b) attached to offices and positions that are open to all under conditions of fair equality of opportunity.

Some elaboration on these two principles is required. What are the constituent liberties that make up the total system of liberty? Rawls answers this question by providing a list of basic liberties. The list includes political liberty (the right to vote and to be eligible for public office) together with freedom of speech and assembly; liberty of conscience and freedom of thought; freedom of the person along with the right to hold (personal) property; and freedom from arbitrary arrest and seizure as defined by the concept of the rule of law. These are the traditional liberties found in liberal democracies.

The second principle is concerned with the primary goods of opportunities and power, income and wealth. What Rawls does is consider his principle in contrast to several competing ones and then ask which principle would be chosen by self-interested persons constrained by the veil of ignorance. Rawls first considers the principle of natural liberty. In the system of natural liberty, positions are open to those able and willing to strive for them. This is the liberty found in competitive markets.

Rawls argues that this principle of natural liberty would be rejected. If after the initial distribution, someone had vastly more wealth than others, nothing could be done to correct the situation. Moreover, the distribution of wealth at any given time has been strongly influenced by the cumulative effect of the natural and social contingencies of past distributions. Accident, past injustice, and good fortune play an important role in determining who is wealthy at any given time. Since the veil of ignorance prevents us from knowing our own fortune, rational contractors would seek to avoid the risk of turning out to be at the bottom in a society governed by natural liberty.

Rawls has more positive reactions to the principle of equal opportunity. This principle asserts that people with the same abilities, talents, and expenditures of effort should have roughly the same prospects for success in given fields of endeavor. One's family background, race, religion, sex, or social background should not act as an impediment to success. To assure equality of opportunity, society should impose heavy inheritance taxes, offer a broad public education, and pass antidiscrimination legislation. To the extent that such social measures are successful, the distribution of goods and services depends on ability, talent, and effort.

However, in Rawls's view, the principle of equal opportunity is still not sufficient as an adequate principle of justice. He argues that the distribution of talent, ability, and capacity for effort is just as arbitrary from the moral point of view as the distribution of sex, family wealth, and social class. A person has no greater right to more wealth because he is smart than because he is of a certain religion.

In part, Rawls seems to be claiming that behind the veil of ignorance, it would be no more rational to gamble on being smart, talented, or dedicated than on being a member of a dominant group, so we would reason conservatively and try to protect ourselves against bad outcomes. However, he also seems to appeal to our considered ideas about fairness. Distribution is fair, in Rawls's view, only if assets are treated as collective social goods. After all, none of us deserves to have been born into favorable circumstances or with personal traits such as a disposition to work hard. These are gifts distributed at birth as if by a natural lottery and are not earned by us as individuals. Moreover, the distribution of goods and services is a cooperative effort on the part of all. Given the cooperative effort and the morally arbitrary distribution of natural assets and favorable family circumstances, the fairest principle is the one that accepts inequalities only if the inequalities work to the advantage of the least well-off.

When fully spelled out, the Rawlsian argument is that the two principles of justice are justified because they alone would emerge from a fair procedure of rational choice. The procedure itself is warranted because of its coherence with our most firmly held considered judgments about justice and fairness. Finally, Rawls maintains that a society in which the political, social, and economic institutions were constructed in conformity with the principles of justice would be a highly stable one. The citizens of such a society would recognize that the society is basically just and, thus, would desire to act as the principles of justice require. These citizens would also be inclined to support society's basic institutions. In this way, such a society would be well-ordered and stable.

Criticism

Critical reaction to *A Theory of Justice* came from those on the political right and the political left. Libertarians and others who supported capitalist economic institutions thought that Rawls's theory sacrificed liberty for greater equality. Those on the left thought that Rawls conceded too much to the self-interested side of human nature. Those on the left thought that Rawls overemphasized the inequalities that were necessary to provide incentives to the more talented. Moreover, even if such incentives were required, that did not make them just.

The criticism of Rawls that has had the most impact is that it is biased in favor of liberal individualistic Western values and so cannot succeed as a universal theory for all. In part, this criticism is directed to Rawls's theory of the good. In the original position, Rawls rules out any knowledge of what each of us considers to be the good life. Rather, our knowledge of our desires is limited to what Rawls calls primary goods. Primary goods are goods such as rights and liberties, powers and opportunities, wealth and income that every rational person should want since these goods are necessary for achieving any other goods. By limiting our knowledge of the good in this way, Rawls can argue that no one would choose a society where the pursuit of one nonprimary good prevailed at the expense of all the others. For example, no one would choose a society where religious persecution was practiced since behind the veil one does not know if one is in the majority religion or not.

But critics point out that this stipulation is biased against individuals who hold alternative theories of justice in which one value, such as the predominance of a religion, or a limited set of values is given preeminence. Rawls's refusal to rank particular perceptions of the good implies a very marked tolerance for individual inclination.

Another way of putting this point is to say that Rawls has not shown that being neutral with respect to various theories of the good is itself a neutral decision. Thus, Rawls's theory reflects a built-in liberal individualistic assumption that is undefended in the theory.

Political Liberalism

Over a 20-year period, Rawls reflected on criticisms like these and published a response, *Political Liberalism.* In this book, Rawls agrees with his critics that his theory applies only to liberal democratic societies. Toleration and stability are central themes of *Political Liberalism.* In it, Rawls holds fast to his belief that modern liberal democracies are characterized by intense competition among different, often conflicting, theories of the good. How can people who hold these competing conceptions get along? This is a profound question in the first decade of the 21st century.

To answer this question, Rawls distinguishes between a *modus vivendi* and an *overlapping consensus.* A modus vivendi occurs when people agree to grudgingly accept one another rather than fight. A tense stalemate is better than the Hobbesian war of all against all. However, a modus vivendi is inherently unstable since it will tend to break down.

An overlapping consensus exists where there is agreement on certain principles for carrying on a debate and for making decisions in the political realm. True to his procedural inclinations, Rawls believes that people with competing conceptions of the good can nonetheless accept certain common political ground rules. In that way, we have an overlapping consensus on these ground rules rather than an unstable agreement of convenience.

To achieve this consensus on ground rules, there must be some kind of limit on conceptions of the good that can be tolerated, such as allowing for the exclusion of those who have no wish to get along with others and actively seek to eliminate those with different religious beliefs. Imposition of a conception of the good through coercion is not just. Rawls believes that such people do not have reasonable conceptions of the good.

To develop this concept of a reasonable account of the good, Rawls provides a normative characterization of citizenship in a democratic society. Citizens in a democratic society are committed to the use of evidence and to procedural rules for settling debates rather than, say, divine revelation, not available to other citizens or confirmable by public tests. In addition, a citizen should respect the reasonable conceptions of the good that other citizens might have, even when these conceptions are inconsistent with his or her own comprehensive view of the good. Citizens in a just democracy are appropriately tolerant of the reasonable positions of others.

Rawls's account of the reasonable imposes additional requirements on the citizens in a just democracy. Citizens must be willing to let political values have priority over other values in public life. Political values are those that govern the basic structure of social life and are constituted largely by the principles that Rawls developed in *A Theory of Justice:* equal political liberty, fair equality of opportunity, economic reciprocity presumably implemented through the difference principle, and the social bases of mutual respect among citizens. To these principles, Rawls adds the value of public reason as explained above. Rawls believes that any person with a reasonable conception of the good will accept these political values and their priority.

But why should these political values and principles be given priority? Because only in this way is an overlapping consensus possible. And it is the overlapping consensus that makes a liberal democracy and social justice possible. Rawls's theory is a theory of reasonable pluralism.

To a large extent, citizens in the United States have accepted something like Rawls's reasonable pluralism. Thus, when authorities in Afghanistan threatened to execute a citizen who had converted to Christianity from the Muslim faith, there were cries of outrage. To prevent a citizen from changing his or her religion on pain of death is a violation of liberal justice.

The Law of Peoples

In his last book, *The Law of Peoples,* Rawls extends the theory of justice developed in *Political Liberalism* to "the principles and norms of international law and practice." This was an important move since a number of Rawlsians had done this on their own and, in fact, had not captured what would turn out to be Rawls's view. Rawls deliberately avoids providing principles for the just state because he wants his law of the peoples to act as a constraint on some of the traditional prerogatives of nation-states. Moreover, just peoples treat other just peoples who have different comprehensive doctrines of the good as equals and worthy of respect. Nation-states do not adopt this attitude.

Rawls distinguishes among five kinds of people, two of whom, the peoples of liberal democracies and decent governments, can be subject to the law of the peoples. Decent people differ from the people in a liberal democracy because there is a hierarchy in the society and, thus, not all citizens are equal. However, to qualify as decent, these people must meet a number of moral conditions, including the acceptance of human rights.

The law of the people will result from a second original position that has many, but not all, characteristics of the original position in *A Theory of Justice.* Part of the law of the people is constituted by eight traditional principles of justice. These principles include, but are not limited to, principles to honor human rights, to observe treaties, to accept restrictions in the conduct of war, and to assist people who live in situations that prevent them from having a just or decent political regime. These principles constitute the basic charter of the law of the peoples. Rawls believes that his law of the peoples represents a realistic utopia and that liberal and decent societies would accept the law of the peoples. Thus, there would be a reasonable pluralism rather than a modus vivendi among liberal and decent peoples.

These peoples have the right to defend themselves against outlaw states—against states that support terrorism, for example. To what extent outlaw states should be tolerated is a central issue of the foreign policy of liberal states. As the international community grapples with terrorism, outlaw states, and indeed any state that denies basic human rights and thus would not qualify as decent peoples, Rawls's theory of justice faces a practical challenge. What should liberal and decent peoples do in such circumstances?

The Influence of Rawls on Political Economy and Business Ethics

On the publication of *A Theory of Justice,* Rawls was invited to address the American Economic Association. Several economists have tried to show how Rawls's theory was consistent with certain utilitarian theories of maximization in economics. In his discussion of the "Institutions of Distributive Justice," Rawls was heavily indebted to public finance theory, especially that of Musgrave. *A Theory of Justice* is considered a classic of political economy as well as a classic of political philosophy.

There is no major work in business ethics that can be called exclusively Rawlsian. Nonetheless, many business ethicists working from the contract, Kantian, or stakeholder perspective include Rawlsian elements in their theorizing and practical applications of ethical theory to business ethics dilemmas.

Reasonable Person Standard

The reasonable person standard is a test used to define the legal duty to protect one's own interest and that of others. The standard requires one to act with the same degree of care, knowledge, experience, fair-mindedness, and awareness of the law that the community would expect of a hypothetical reasonable person. The standard is objective in that it compares one's behavior with that expected of a "reasonable person," without regard to one's intention or state of mind. The reasonable person standard plays a key role in negligence law, where behavior falling below the standard triggers liability. The reasonable person standard also appears in contract law, criminal law, civil rights law, and elsewhere.

The reasonable person standard has roots in the development of the concept of negligence in common law. The purpose behind the reasonable person standard is the public good. The legal use of the standard clarifies behavioral expectations that allow people to work, plan, and get along together. Similar terms include *reasonable man*, *reasonably prudent person*, and *ordinarily prudent man*. Related terms include *standard of care*, *reasonable care*, *due care*, and *ordinary care*, as well as *reasonable bystander* and *reasonable third party*. In the United States, the "prudent person rule" or the "Prudent Investor Act" operates in fiduciary relationships.

Although the reasonable person standard is well-established, the meaning of "reasonable" is a topic of legal and philosophical debate. In recent years, the standard has been criticized as tainted by the biases of dominant groups.

How the Reasonable Person Standard Works

The degree of caution and prudence used by a reasonable person when doing an activity that could foreseeably harm others is called the "standard of care." The standard of care varies with different actors and circumstances, allowing courts to apply the reasonable person standard flexibly to a wide assortment of cases.

Special Groups

Professionals and tradespersons are judged by the standard of care for their profession or trade. For example, if someone goes bankrupt as a result of following the advice of an accountant, a court of law would ask whether an accountant facing the same circumstances, with the knowledge available at the time the advice was given, would have considered the advice reasonable. Professional licensing requirements, industry safety standards, and similar benchmarks help define the standards of care for trades and professions. However, some circumstances require going beyond the usual requirements to meet the reasonable person standard. Expert testimony is often used to define reasonable behavior for tradespersons and professionals.

People with disabilities are judged according to the behavior expected of a reasonable person with similar disabilities, and the disability is considered as one of the circumstances in the case. For example, if a person with impaired vision drove a car and caused an accident, a court would ask whether a reasonable person with a similar impairment would drive a car. Mental deficiencies are excluded from the circumstances for the purposes of applying the reasonable person standard. Mental deficiencies are considered too easily faked, and their impact on one's duty is considered too difficult to determine.

Minors are judged according to what a reasonable minor of the same age, intelligence, and experience would do in similar circumstances. Rules involving negligence on the part of minors vary from one jurisdiction to another. Case law has determined that a minor engaging in an adult activity, such as driving a car, should be held to an adult standard of care.

People who lack experience in an everyday activity are held to the same standard of care as those with more experience. For example, a teenager who has just earned a driver's license is held to the same standard of care as an experienced driver.

The Role of Circumstances

The reasonable person standard uses different standards of care for different circumstances. For example, a trucker hauling bottled water would be held to a lower standard of care than would a trucker hauling toxic chemicals, since a spill of toxic chemicals would create more danger of harm. People facing emergencies might reasonably behave differently than people in ordinary circumstances. Accordingly, the reasonable person standard asks how a reasonable person would handle an emergency similar to the case in question.

Relationship to Customs and Laws

Following the customs of one's community or occupational group can serve as evidence in favor of one's having met the reasonable person standard. Typically, courts hesitate to label customs as negligence and, thereby, require a large group of people to change their behavior. However, special circumstances can require going beyond custom. For example, it might be customary in a quiet neighborhood to let children ride their bikes in the street. But if a strange dog were loose in that neighborhood, reasonably careful babysitters would be expected to call the children in and perhaps phone the local animal control agency. Conversely, acting contrary to community or occupational group customs could serve as evidence of failing to use an appropriate standard of care.

Compliance with or a failure to comply with federal, state, or local laws may count as evidence in determining whether one has met the reasonable person standard. Meeting the minimum requirements of a law could still constitute negligence if the reasonable person in similar circumstances would have exercised greater care than the law required.

The Reasonable Person Standard in Civil Rights Law

The reasonable person standard operates in civil rights law to help define workplace harassment. In 1986, sexual harassment came to be considered a violation of Title VII of the U.S. Civil Rights Act of 1964. Under Equal Employment Opportunity Commission guidelines, a civil rights violation called "hostile workplace environment" harassment occurs when an employee is regularly subjected to sexually offensive speech, behavior, or materials. An ongoing pattern of offensive conduct is generally necessary to show that a hostile workplace environment exists.

In the 1993 case of *Harris v. Forklift Systems,* U.S. Supreme Court Justice Sandra Day O'Connor developed a twofold test for hostile workplace environment harassment: (1) Is the conduct so severe that a reasonable person would find the environment objectively threatening or abusive? and (2) Does the employee perceive the environment as threatening or abusive?

In the context of hostile workplace environment law, some legal theorists and several courts came to view the reasonable person standard as enshrining the biases of white males. These critics replaced the reasonable person standard with a "reasonable woman" or "reasonable victim" standard. These alternative standards encouraged juries to consider experiences that could lead to a perception of harassment that might not be obvious from a white or male perspective. The alternatives themselves were then criticized as impractical or unfair. Most courts that tried the alternative standards have returned to consistently using the reasonable person standard.

Related Terms

The Reasonable Bystander

In common-law contract theory, a standard called the "reasonable bystander" or "reasonable third party" is used when one party denies having entered a legally binding agreement. If a reasonable bystander observing the parties' outward conduct would have inferred a serious intention to form an agreement, the contract is considered binding. Also, when the terms of a contract are misstated, the erring party can void the contract if the mistake is clear to a reasonable bystander.

The Prudent Person Rule

In a few states, a standard called the Prudent Person Rule requires fiduciaries to invest trusted assets as a prudent person would invest their own assets. The prudent person is expected to take into account factors such as the needs of beneficiaries, the need to preserve the estate, and the desired income. The Prudent Person Rule rests on common law stemming from the 1830 Massachusetts case of *Harvard College v. Armory.* Most states have replaced the Prudent Person Rule with all or part of the Uniform Prudent Investor Act (UPIA). The American Law Institute adopted the UPIA in 1990 in the Third Restatement of the Law of Trusts. The UPIA reflects modern portfolio theory. For example, diversification is required, and individual investments are evaluated in light of the portfolio as a whole. Both the Prudent Person Rule and the UPIA seek to protect clients from shady investments and undue risk taking.

Defining "Reasonable"

What kind of behavior qualifies a person as "reasonable"? Legal experts give a variety of answers, including

- doing cost-benefit analysis and taking care that benefits justify their costs;
- treating others with respect (this interpretation roughly resembles the moral theory of Immanuel Kant: The reasonable person treats others as ends in themselves and not only as means; the principles underlying the reasonable person's actions could be willed as universal laws); and
- acting in accordance with moral and intellectual virtues, such as temperance and wisdom (this interpretation draws on Aristotle's moral theory).

Questions about the meaning of "reasonable person" lack easy answers. Which definition best fits the way the reasonable person standard is actually used? Which meaning best fits commonly accepted ideas from sociology, psychology, and moral philosophy? Does—and should—"reasonable person" have the same meaning across different areas of law? And if the standard requires economic cost-benefit analysis, how can anyone rightly calculate the cost of negligent loss of life?

Recalls, Voluntary

Consumer product recalls occur frequently. In 2000, there were at least 2,523 voluntary recalls. Recalls publicize product dangers and request that consumers return the defective product for repair or replacement. In fact, the recall is a specific type of communication campaign full of ethical considerations. Federal regulatory agencies involved with recalls include the Food and Drug Administration, with 1,915 recalls in 2000, and the National Highway Traffic Safety Administration and Consumer Product Safety Commission, with similar totals of 227 and 207 recalls in 2000, respectively. There were 76 U.S. Department of Agriculture recalls in 2000, 32 at the Environmental Protection Agency and 23 at the U.S. Coast Guard.

Ethical Issues in Recalls

Recalls raise a number of ethical questions. There are about a dozen specific recall ethics issues. Ethics must be considered a primary factor in recall campaigns and the ad hoc American recall system.

The Decision to Recall

An initial ethics issue involves the corporate decision to recall a product. Are such decisions made out of a sense of corporate social responsibility or out of fear of facing a recall order from a regulatory agency? Most recalls are probably motivated not by ethical values and beliefs but by fear of the consequences of not recalling.

Recalls were originally intended as remedies only when public safety was at stake. However, there have been recent cases of recalls of tabloid magazines because they contained illegally taken photographs of Jennifer Aniston and Brad Pitt at a nude beach and a recall of T-shirts because they were considered obscene.

Silent Recalls

Silent recalls, as the title implies, are not generally publicized. In some cases, there is no communication at all. This seemingly incongruous situation results from corporate fear of strongly worded recall warning communication. Manufacturers sometimes convince regulators to avoid publicity in lieu of relying on "internal" communication between manufacturers, distributors, and retailers.

Silent recalls are not uncommon. Between 1995 and 1997, 15 of 51 U.S. Department of Agriculture recalls were not publicized. Instead, the Department accepted a recall plan relying exclusively on intercorporate communication. The ethical adequacy of recalls without any public communication is questionable.

The Duty to Recall

Court decisions have consistently recognized a corporate duty to recall, but that duty has always been quite limited. Recalls are a corporate duty only when there is a widespread severe public safety threat. Does limited legal duty imply a limited ethical responsibility? In the late 1980s and throughout the 1990s, there was a trend away from court-ordered recalls. However, failure to voluntarily recall or comply with regulatory recall requests might result in product liability litigation exposure.

Are Voluntary Recalls Really Voluntary?

The American recall system appears to be one thing but is actually another, in a sense. According to recall legislation, virtually all recalls are called voluntary, unless a court order is required. However, these voluntary recalls only occur after significant regulatory pressure. Is it unethical to refer to recalls as being voluntary when in fact they are not?

Political Interference With Recalls

The recalling regulatory agencies are subject to political influence. They are part of the executive branch of the government and respond to political pressure. There has been typically less recall activity during Republican administrations.

Politics plays another role in the recall system. For instance, child product manufacturer Graco donated substantial sums to 15 political candidates after the recall of its Converta-Cradle in 1972. The result was legislation limiting corporate recall liability.

Product Registration

There is an ethical irony about corporate resistance to product registration legislation. Such laws would make recalls much easier, but manufacturers and retailers argue that this data collection would be time-consuming and costly. They also express concerns over consumer privacy rights.

These reservations, nevertheless, do not stop much corporate information gathering now. These data are used by corporations to cross-market other products to consumers. In addition, these customer lists are frequently sold to other marketers.

Indirect Recall Costs

In addition to the direct costs of a recall, recalling firms suffer other consequences, as well. These indirect costs include reduced sales for the recaller and its competition, stock devaluation, gross national product reduction, and reduced public confidence in the recaller's industry.

Recalls can drive firms out of business. In light of these terrible effects, recalls appear to be ethically justified only in extreme cases.

Antirecall Lobbying

A substantial amount of antirecall lobbying is conducted by trade associations representing manufacturers or retailers. Proposals for corporate product registration at the 1999 Consumer Product Safety Commission Forum on Improving Recalls drew criticism from manufacturers, retailers, and trade associations. Is it ethical for firms to try to minimize their social responsibility by lobbying?

The U.S. Department of Agriculture sought recall powers through the Food Safety Enforcement Enhancement Act of 1990. In opposition were the National Meat Association, the National Food Processors Association, the Beef Industry Food Safety Council, the American Meat Institute, and the National Broiler Council, among others.

Corporations Mislead Government Regulators

Lying is generally considered unethical. Yet that is what happens sometimes in recall situations. It is believed that the Food and Drug Administration has been repeatedly intentionally misled by medical product manufacturers.

Corporations Resist Recalls

Despite legal and ethical obligations, firms frequently resist regulatory recall recommendations. In the 1970s, Firestone refused to recall its "Firestone 500" tires and tried to block the National Highway Traffic Safety Administration investigation. Similarly, General Motors declined to recall 1.1 million cars with brake problems in the 1970s and 1980s. The American distributor of Royal Line Salmon wouldn't participate in a recall of *listeria*-infected product in the 1990s.

We can quantify the result of Firestone's resistance to recall. Thirty-four people died, and there were 14,000 consumer reports of defective tires, which caused hundreds of accidents.

Cost-Benefit Analysis

Recalls can be a matter of life and death to consumers. The use of cost-benefit analysis to make recall decisions is ethically questionable, especially when the tacit corporate calculation of the value of human life is so low.

At least 500 consumers, and as many as 900, were killed in the Ford Pinto in the 1960s and 1970s. The part needed to avert the danger cost $11 per vehicle. General Motors sold 9 million pickup trucks and made $10 billion in profit during the 1990s. A gas tank defect resulted in 1,600 deaths, yet an expenditure of merely $8.59 per vehicle would have made the trucks safe.

Corporations Fail to Report Product Dangers

Despite laws requiring immediate notification, some firms fail to inform regulatory agencies of recall situations. The Food and Drug Administration is often kept in the dark.

The National Highway Traffic Safety Administration receives much recall information, but the largest recalls are typically not reported to the agency by auto manufacturers. Similarly, many manufacturers failed to mention product defects to the Consumer Product Safety Commission, necessitating 1990 amendments to the original Consumer Product Safety Commission Act.

Reciprocal Altruism

Rooted in evolutionary biology and multi-iteration game theory, reciprocal altruism is a cooperative strategy in which someone chooses to perform an act that incurs an immediate net personal cost to benefit another individual in the hope of reaping a future gain. In biological terms, it represents a willingness to forego one's own reproductive chances in favor of another's chances for the overall benefit of the group. This goes beyond a form of altruism dictated by kin selection in that the short-term selfless behavior is extended to organisms that do not necessarily share a common ancestry. In an evolutionary sense, it seems as though a behavior that imposes a greater net cost on one individual for the sake of an unrelated person would be selected out. On the contrary, natural selection—the mechanism of evolution—will favor this kind of self-denying behavior under certain conditions. Reciprocal altruism is hardwired in our psyches and is responsible for encouraging a range of cooperative social interactions, including business exchanges.

In an economic sense, the evolution of the willingness to cooperate with others was critical to the formation of market transactions in modern society. Thus, the fact that reciprocally altruistic behavior has evolved to include members outside one's own clan has enabled social contracts to form among strangers in business contexts. Humans have developed the ability to share tasks with members of other groups in response to adaptive challenges to perform tasks that could be accomplished neither alone nor by members of a single familial group. The concept of reciprocal altruism is important for business because it is a necessary antecedent to our social institutions and division of labor within organizations. Economic relationships in our global marketplace today are facilitated by the biological and psychological propensity to engage in mutually trusting relationships with unfamiliar others.

These intergroup relationships are highly dependent on the existence of trust. Without trust as a bond for exchanges between strangers, a market system could never develop. While trust between partners can be cultivated over repeated just and fair transactions, various social institutions serve to solidify this bond. For groups to form spontaneously, a degree of reciprocal moral obligation must be present. In some cultures, this impulse still occurs primarily among kin. But in other cultures, this sense of moral duty to reciprocate does spread to nonkin. High-trust societies, such as the United States and Japan, are characteristically open to mutually beneficial relationships among strangers. There is a general moral obligation in Japan for workers employed by a particular firm not to seek higher wages and better employment elsewhere. In return, the employer provides lifetime job security.

Reciprocal altruism assumes that humans are social beings, not governed entirely by rational self-interest. For kin, one-time altruistic behaviors that jeopardize the survival of the provider without the hope of reciprocity make sense because the genes are passed down the lineage. For nonkin, these isolated acts of altruism make little sense in the short term. For reciprocal altruism to evolve as a trait in humans, certain conditions must be present. Only if there is a probability of repeated encounters between the altruist and the beneficiary, resulting in a chance that the altruistic behavior will be reciprocated in some way, would natural selection favor the trait. Social beings establish cooperative relationships with other nonkin individuals out of expectation of future gain.

The biologist Robert Trivers is widely considered the authority on the theory of reciprocal altruism. His work described conditions under which reciprocally altruistic behavior evolved and indicated the design features of the human mind that are necessary for this type of altruism to become advantageous in an evolutionary context. Trivers cites an example involving a drowning man who has a 50% chance of drowning. A stranger has the opportunity to rescue the man with a 50% likelihood that both will die in the attempt. If this were a one-time encounter between the two men, it certainly would not pay for the rescuer to attempt to save the drowning man. Trivers posits that if there is a chance the rescued man will reciprocate that behavior at a later time, then both parties have a chance to benefit from the altruistic act.

To regulate altruistic behavior, Trivers identifies certain characteristics that must have evolved in the brain. In social exchange, individuals must be able to detect and punish cheaters who accept a benefit without reciprocating. Psychological mechanisms have evolved that help people determine which contracting partners do not pay a cost in return for the altruistic behavior. For altruism to evolve, Trivers postulated that the cost must be comparatively small to the bearer and that contact between recipient and provider should be frequent. Otherwise, the fitness costs to the altruist would have been too great for the trait to proliferate in the population. Individuals are less likely to contract with a person who does not reciprocate at least an equal later survival benefit.

Norms of justice and fairness may have formed out of the need to regulate altruism. When benefits are taken by an individual in a social contract relationship but no benefit is bestowed in return, an injustice has occurred for the altruistic party. Human brains have developed the ability to regulate unfair behavior by eliminating future contact with the cheating individual. Throughout evolutionary history, our ancestors found it desirable to foster friendships based on trust with nonkin individuals and to avoid opportunistic relationships. Sentiments that draw people toward altruistic individuals tend to influence the monitoring of social exchange relationships.

Evolutionary game theorists devised a mathematical model to illustrate how cooperative behavior may have evolved in our species. A widely cited game in economics and evolutionary biology is the prisoner's dilemma (PD), in which individuals are assumed to behave in a rationally self-interested manner. The PD tests what strategies people use to distribute particular costs and benefits. It demonstrates that people generally do not choose a strategy of selfishness.

In a single-iteration game, people would rarely have the motivation to cooperate with one another. Cheating on others in exchanges would always benefit a selfish person when players do not have an opportunity to interact in future exchanges. Only in multiple-iterative games does a cooperative social contract evolve over time. In repeated exchanges, cheaters are punished by not having the opportunity to form alliances with others in the future, since no one will contract with them again.

Kinship is not responsible for cooperation in this type of situation. Rather, a contracting party's *history of cooperative behavior* is paramount. Robert Axelrod, who proposed the prisoner's dilemma, coined the phrase *the shadow of the future* to describe this phenomenon—the probability of future interactions with a contracting partner. If a contracting individual has a history of cooperating in past exchanges, then the likelihood of future engagements with that individual increases. Thus, the reputation for trustworthy behavior of individuals in multi-iteration games is critical for determining cooperative encounters down the road. As is often seen in business, reputation spreads through various communication channels. Feedback about adherence to social contracts between parties will affect the reputation of individuals and organizations alike. For business organizations, reputation affects share value. Once the scandals at Enron were exposed to the public, a sharp and perilous drop in the share price of the company followed.

Computer modelers have attempted to devise strategies for participants in multiround games. The most famous strategy, tit for tat, describes the process of reciprocity in nature and provides insight into how cooperative behavior among selfish beings could have evolved through time. Tit for tat mimics the behavior of the other player in the two-person, multiround game. If one person cooperated, the partner would cooperate, but the partner would cheat if he or she observed the other person cheating. The evolutionarily stable strategy is the one that spreads through the population and dominates behavior. In the computer models, tit for tat—the strategy that resembles Trivers's reciprocal altruism—was the only approach that grew in the population. This suggests that proper management of stakeholder relationships in organizations through honoring cooperative, fair agreements will reinforce the norm of reciprocal altruism, thereby enhancing prospects for gain in both economic and social welfare.

RECIPROCITY

Reciprocity is a pattern of mutually contingent exchange of gratifications, or tit for tat. Reciprocity can be shown to be one of the universal aspects of moral codes all around the world and has been argued to be the key for social stability. Reciprocal social mores range from mutual gift exchange to rules of hospitality. As a normative concept, reciprocity typically focuses on an individual's or an organization's return of fitting and proportional benefits for benefits bestowed by others. The return of harm for harm (which we usually call "retribution") tends to be a more controversial aspect of reciprocity. In addition, it is important to note that, because its core element is an exchange, reciprocity is not synonymous with the Golden Rule: Do unto others as you would have them do unto you.

Sociologists, game theorists, and evolutionary psychologists have provided evidence of the evolutionary advantages of tit-for-tat strategies in difficult-to-resolve situations, such as the prisoner's dilemma. Norms of reciprocity, grounded in enlightened self-interest, do not require the invocation of benevolence, or an active concern for the welfare of others, to justify virtues such as truth telling or cooperation. What is more controversial than the cultural universality of the norm of reciprocity and its importance for the evolution of cooperation is the moral question of whether one owes favors in return for involuntary prior favors. For this reason and a few other problems (e.g., the concrete meaning of "fitting," "proportional," or "equivalent" returns of favors), reciprocity has been endorsed a bit more warily by ethicists than by social scientists.

As for organizational behavior and theory, Bowie's and a few other ethicists' formulations of corporate social responsibility have shown it to be grounded in norms of reciprocity as well. According to this conceptualization, a company is a moral community in which stakeholders both create and are bound by the rules that govern their social relations. In turn, these relationships are reciprocal; that is, when one party in business dealings infuses the relationship with moral capital, it creates reciprocal duties on the other stakeholders. The definition of corporate responsibility would be too narrow if it focused only on the obligations of the firm. Other stakeholders also have rights and duties. For example, a company may owe its employees loyalty and fair employment practices, but a similar obligation (of loyalty) falls on employees in return. Similarly, we cannot stop environmental pollution by focusing on the emissions reduction of companies exclusively; customers must also do their part to create a demand for environmentally safe or conscious products. According to Bowie, what is needed is a comprehensive theory for determining the appropriate reciprocal duties that exist among corporate stakeholders. Because of the fact of moral pluralism, such a theory will most likely have to be quite complex and sophisticated.

RECYCLING

Recycling is a three-part series of activities, to recover, reprocess, and reuse materials that are considered "waste," thus reducing their burden on the environment. These materials come from household use, industrial processes, commerce, and agriculture; they typically include glass, paper, wood, aluminum cans, metal scrap, some plastics, and various organic materials. Through a variety of processes, waste materials are recovered and reprocessed to become substitutes for raw materials obtained from natural resources (such as petroleum, minerals, trees, and soil).

Besides economizing on the use of natural resources, recycling can help reduce quantities of solid waste sent to landfills and can reduce pollution caused by waste disposal: Incineration consumes energy and creates air pollution; landfills contaminate water and also create air contamination. These financial and environmental benefits also translate into social benefits: improved quality of life and a means for achieving sustainability (ensuring that future generations have access to comparable air, water, and natural resources that we enjoy presently).

Recovering value from so-called waste requires *motivation, innovation,* and *marketing. Motivation* often begins with the necessity to save money by not discarding used materials or by substituting reprocessed materials for expensive natural resources. Education and refinement of consumer values also contribute to motivation, as do government-sponsored financial rebates or requirements.

For example, in 1998, an executive order from the president of the United States required that all federal agencies use paper composed of 30% postconsumer fiber. This practice later resulted in a 13% reduction of solid waste material requiring disposal. The California Redemption Value (CRV) for aluminum cans increased from 2 to 4 cents in January 2004, resulting in the collection of an additional 680 million cans. Part of motivation is to provide information, so that consumers and businesses understand what products can be recycled, how to prepare them, and how to transport them to processing stations.

Innovation requires rethinking of procedures (such as instituting curbside pickup of used consumer materials) and manufacturing processes (such as reprocessing newspaper and paper waste to create new paper products or reclaiming wastewater from raising flowers and using it to irrigate another flower crop). Two major areas of recycling operations are internal and external. Internal recycling is the reuse in a manufacturing process of materials that become a waste product of that process. Throughout the life cycle of a product—the extraction of its raw materials, transportation, processing, and manufacturing—waste is generated. But this waste can be salvaged. External recycling is the reclaiming of materials from a product that has been used, such as the widespread use today of refurbished ink cartridges for printers or the transformation of used tires into safer playground equipment, groundcover, and park benches and tables.

Once materials have been reprocessed, *marketing* enables businesses and consumers to know that the recycled content materials are available for use. Marketing can help build commitment to purchase these recycled products. Only then, with purchase and use of these reprocessed materials, can the process of recycling be considered complete. "Green marketing" had a rough start in the early 1970s, primarily because some products advertised as good for the environment performed poorly or because some advertising was deceptive. But as time passed, "green" products improved, and with the U.S. Environmental Protection Agency (EPA) giving consumers new confidence through its Energy Star label, consumers began to respond to marketing of products that are good for the environment, including recycled goods. As Roper's "Green Gauge" Report of 2002 notes, 56% of Americans would do more for the environment if they only knew how. Marketing can help consumers understand which products are recycled or recyclable and why buying them helps the environment.

The United States, as of 2004, attained 28% recycling of consumer goods—a rate that had almost doubled since 1990. Much of this progress has resulted from increasingly stringent environmental rules from federal and local government that have restricted solid waste incineration and landfill options. Success rates for recycling are further improved when coupled with behavioral adjustments that result in reducing needs and reusing products before they enter the recycling process (hence the slogan "Reduce. Reuse. Recycle.").

While Americans are recycling more, they are also generating more waste than any other nation. According to the U.S. EPA, during the past 35 years (from 1970 to 2005), each American has nearly doubled the waste generated every day: from 2.7 to 4.4 pounds per day. The most effective way to halt this trend is through preventing waste. Waste prevention is also known as "source reduction": any change in the design, manufacture, purchase, or use of materials to reduce their amount or toxicity before becoming part of municipal solid waste.

Here is where business can make a vital contribution, because it is in the design, manufacture, and distribution of products that so much waste is created. More large corporations seek increased efficiency in the use of petroleum products and natural resources; cost savings from reduced use have motivated further innovation. Businesses of all sizes have recognized the marketing value in reducing waste and use of materials; consumers increasingly make buying decisions based on perceived corporate social responsibility, so businesses find value in publicizing their proenvironmental practices such as recycling.

The European Union (EU) has demonstrated an even stronger commitment to recycling than the United States. In the 1990s, the EU required that all member states meet a target of 25% to 45% for recycling waste in 1998. The target for 2008 is to recover 60% to 75% of waste. In 2002, the EU created a directive for treating waste electrical and electronic equipment (WEEE) that encourages and sets criteria for the collection, treatment, recycling, and recovery of electrical and electronic waste; it affects any business that manufactures, brands, imports, sells, stores, treats, or dismantles electrical or electronic products within the EU. Since August 2005, a new and important component of this directive is "producer responsibility" to take back used electronic products after consumer use.

The value of recycling has been challenged by antigovernmental, procapitalist critics—most notably Bjorn Lomborg, author of *The Skeptical Environmentalist.* He notes that some resources, such as metals, cannot be completely recovered due to losses through corrosion. Also, some products are unable to be reconstructed, so all the constituents cannot be recycled. Initial efforts in the United States, sometimes, were quite costly and inefficient—collection costs of materials to recycle were often two to four times the costs of simply dumping those materials into a landfill.

However, verifiable economic and environmental improvements resulting from more efficient recycling indicate that these practices will be continued. According to the Bureau of International Recycling, use of secondary materials results in major savings of energy and reduced pollution. For example, use of recycled paper provides a 64% energy savings when compared with use of primary ("raw") materials, 35% less water pollution, and 74% less air pollution. In October 1995, the Chicago Board of Trade began its Recyclables Exchange for the trading of used materials such as glass, polyethylene, and used paper products. This effort marked recognition of recycled materials as legitimate commodities and helped combat large price fluctuations in the recycling industry. In addition, as an industry, recycling produces jobs and promotes technical innovation.

Redistribution of Wealth

The phrase *redistribution of wealth* commonly refers to government policies that are intended to increase the income or benefits of poor people using money raised by general taxation of the rich, the prosperous, and the middle classes. Sometimes the debate is limited only to the redistribution of income, but generally any policy intended to benefit the poor, whether in the form of income or services, can be considered an attempt to redistribute the wealth. The ethical debate about redistribution is usually framed as a conflict between egalitarian proponents of redistribution, who claim that society has a collective moral responsibility to look after the poor, and libertarian critics, who see such transfers as an unethical violation of the property rights of those who pay the taxes.

Social classes vary greatly in different countries. This affects the redistribution debate as the current distribution determines the extent and type of poverty and wealth. The debate is sometimes framed in terms of the origin of people's incomes such that the rich are those with substantial investment income, the middle class are those with sufficient salary or wage income to be above the poverty line, and the poor have insufficient income of any sort or depend on government or charity. However, much of the debate, especially with respect to developed countries, uses deciles and quintiles (dividing the population by income into 10 or 5 groups, respectively) for convenience. Generally, the rich are the top 10%, the prosperous the rest of the top 20%, the middle class is the middle 60%, and the poor are the bottom 20% (or sometimes the bottom 10%).

Although the redistribution debate is primarily about government programs that intend to benefit the poor, there are many other government programs that redistribute wealth to the middle class and even to the rich. For example, those prosperous enough to have investments benefit most directly from government subsidies, bailouts (especially of hedge funds), and corporate tax exemptions. Old-age security, government support for postsecondary education, and even road budgets greatly benefit middle-class people.

Government programs that are targeted specifically toward the poor, often referred to as "social welfare programs," are specifically meant to have a redistributive effect. It is the ethics of these programs that are usually addressed in discussions of redistributing wealth. The key ethical positions in this debate are libertarianism, egalitarianism, objections against the extremes of poverty or wealth, and efficiency.

The libertarian argument is that social welfare programs are unethical because they involve taxing some people solely for the purpose of giving the money to others. This violates taxpayers' rights to their property and income. The libertarian position can also be defended on the grounds that it promotes freedom, minimizes government power, supports the morality of free markets, and rewards virtues such as hard work, ambition, skills, and risk taking (at least in those societies in which wealth does not come from crime and corruption).

Libertarianism can be criticized for its assumption that current property ownership and income are morally just. Libertarians morally privilege the current distribution of wealth, often without giving adequate justification. Furthermore, libertarianism assumes that all income should be private and that there should be no social income from community ownership of natural resources, taxes on social capital, or other sources. In defense of libertarians, they are often consistent in that they oppose not only social welfare programs but also all other government programs except security and defense.

The word *egalitarian* is used both for those who believe there should be equal or near equal distribution of wealth or income and for those who believe that the extremes of great wealth and poverty should be avoided. Egalitarians who advocate complete equality of wealth or income usually base their argument on the fundamental moral assumption that economic equality is inherently just and that it is unethical for some people to have a lot more private property than others. The defenders of this position place more ethical value on equality than they do on property rights, and they believe that redistributing the wealth is the only way to achieve a just society. Arguments against egalitarianism are that economic equality kills incentives and destroys productivity; that it is unfair to those who produce more through hard work, skills, and risk taking; and that it requires a totalitarian state to constantly redistribute the wealth.

Some egalitarian arguments in favor of redistribution concern only the extremes—the very poor and the very rich. Humanitarians argue that allowing preventable poverty and destitution is inherently unethical and a violation of basic human rights. The government ought to provide a safety net below which no one is allowed to fall. At the other extreme, some argue that there should be limits on great concentrations of wealth. If people are too wealthy, they can disrupt free markets, such as the Hunt brothers disrupting the world silver market. Large concentrations of wealth can also corrupt democratic political processes.

Extremes of great wealth, especially if it is inherited, raise the ethical problem of a leisure class which makes no contribution to society but which lives in luxury. This is especially an ethical problem if the wealthy class originally obtained its wealth by means now thought immoral, such as British landowners whose family wealth originates from enclosures, clearances, or the slave trade.

Ethically, the efficiency models of wealth redistribution are forms of utilitarianism; they rest on the belief that if redistribution helps society overall, then redistribution is morally justified. One efficiency argument rests on the claim that economic growth (as well as other desirable social characteristics, such as democracy, rule of law, and stability) is mostly driven by the middle class and that the government should therefore redistribute the wealth to achieve a large and thriving middle class. The middle class, it is argued, drives domestic investment, innovation, and anti-corruption campaigns, while the poor are a drag on the economy, and the rich support corruption, special interests, and capital flight. The economic growth argument for redistribution seems to be mainly applicable to developing countries; in developed countries that already have a large middle class, the argument mainly concerns the preservation of that class.

Another efficiency argument concerns security and social stability. Poverty causes crime (especially violent crime), so social welfare programs may be cheaper than police, courts, prisons, private security, and the losses from crime. However, this assumes that social welfare programs are an efficient way to cure poverty, a claim which some people question. Similarly, poverty causes ill health, and ill health is expensive and increases taxes even if public health care extends only to the very ill and seniors.

Objections to efficiency arguments include claims that promoting the general social good can never justify injustices to individuals, including violations of their property rights; that governments do not have the knowledge, wisdom, or impartiality to promote economic efficiency through redistribution; and that the negative effect of redistribution on incentives to work, save, and invest outweigh any efficiency gains from greater equality. Many people also argue that government programs intended to help the poor do not always have the intended result.

Although a government's policy on redistribution is likely to affect business, it is difficult to determine in the abstract what that impact is likely to be. If a government avoids redistribution policies, the impact would depend on the current distribution. If the current distribution has extremes of poverty and great wealth, business may have to deal with violence, crime, and social instability on one side, and capital flight on the other. If current distribution is more even, a favorable climate for business may exist. The impact of redistribution from the well-off to the poor may have various effects on business. Consumer markets may expand as poor people are able to increase their consumption. Savings may decline. Investment may decline with savings or increase with consumption—it is hard to say. It is equally hard to say how labor availability and incentives would be affected. Any disincentive for the poor to work may be offset by the poor being able to afford day care, transportation, work clothes, training, and (in developing countries) enough calories to have the energy to work more. The poor may become more capable of work.

Businesses may also be affected if they have to pay higher taxes for the government to finance redistribution. The impact would depend on whether their competitive situation allows businesses to pass on the tax cost in higher prices or lower costs or whether they are faced with declining retained earnings or profits. Governments need to consider the impact on business carefully, since business is a vital part of the economic system that generates the wealth that is redistributed.

A person's opinion on the ethics of redistributing wealth mostly depends on his or her basic values. Those who highly value property rights and freedom from government interference will take a libertarian stand against redistribution. Egalitarians who think social justice requires economic equality favor redistribution. Humanitarians will object to preventable poverty and destitution but may not favor redistribution beyond a social safety net. People who live in countries with an extremely wealthy inherited upper class may question its moral acceptability. Utilitarians will give weight to efficiency arguments, but the conclusions they draw will depend on their views on the effect of redistribution on economic growth, and on economic data on the relative costs of health care, security, and welfare.

—John Douglas Bishop

Reductionism

Reductionism is the endeavor of understanding any object of inquiry, such as physical objects, situations, phenomena, explanations, theories, concepts, language, and so forth, by specifying the elements that constitute it. Whenever one level or domain or whole is analyzed as nothing more than another, it is said to be reduced to that other. The whole does not impart meaning to its parts, but rather, the parts are the meaning of the whole. The study of anything must be the study of its parts.

Reductionism can be said to trace back to the Middle Ages with the development of nominalism, which was committed to the reduction of collectives to their constituent elements. However, the full strength and significance of the method of reductionism developed along with the development of Newtonian physics, which incorporated the process of understanding the object of inquiry by analyzing its constituent elements. Newtonian physics depicts the universe as composed of discrete particles operating mechanistically and deterministically according to the universal laws of motion, gravity, and so forth.

But while science takes no position concerning the status of the object that it analyzes, the term *reductionism* implies a philosophical outlook that finds the ultimate meaning of any object to lie not in its inherent qualities as a whole but in the parts that compose it. This position identifies knowledge in general with the findings of science and mathematics and the method of gaining knowledge in general with the procedures of rational analysis used in Newtonian physics. The implicit assumption of this worldview is that physics is the metaphysics of nature. What mathematical physics and physiology find is what, and only what, is truly real and truly knowable, and what we experience is reducible to the procedures and contents of math and science.

This reductionist point of view has implications for the understanding of the scientific method itself, leading to a strong antitheoretical bent. According to this view, scientific investigation does not penetrate nature in a way the senses cannot, but rather, scientific investigation is the rigorous, economical organization of what is given to us in experience. And since, at its extreme, it is held that what we have in experience are not objects "out there" but sensations, the goal of scientific investigation becomes that of discovering relations between sensations. The construction of theoretical entities is useful in science, but these are not getting at some transphenomenal realities. Rather, they are learning devices or models, psychological aids for organizing our sensations.

As theoretical concepts lost their significance, the focus on theoretical entities was replaced by a focus on the structure of empirical concepts and their logical ordering. Science becomes understood as a hypothetico-deductive system, and scientific theory is understood as an axiomatic structure, similar to a logical or geometrical ordering. On this view, a theory is nothing but a logical ordering of the relations between observed phenomena. The question as to why or how theories could have predictive power concerning future experiences is ignored or considered irrelevant. The reductionist framework is not concerned with the dynamics of science, with theory formation and theory growth, or with predictive power, but with the logical formalization of accepted theory, which is, ultimately, the formalization of experienced phenomena and their relations. Within science, the term *reductionism* is sometimes used to refer to the view that all special sciences, such as biology, psychology, chemistry, and so forth, are reducible ultimately to the fundamental laws of physics, a claim which is also termed the unity of science.

Reductionism virtually destroys the meaningful wholes associated with our traditional understanding of humans and the world in which they live. For example, religion is reducible to some nonreligious origin, such as the human psyche, human drives, or brain constitution. Human action as purposive or goal-oriented activity by which we relate to the meaningful world in which we live is reduced to neurophysiological behavior, with humans becoming nothing more than the object as studied by various disciplines such as physiology, neurology, anatomy, behavioral psychology, and so forth. Human values that direct action and the course of cultural development become identified with physiological or psychological drives and needs. Mental activity is reduced to biological or computational functions; mental phenomena are nothing more than neurophysiological functions. Human freedom is but a myth, with human actions governed by the laws of physiology, and with enough information, human actions could be predicted. At its extreme, physical objects themselves become nothing more than experienced sensations in our brain. In sum, the concrete fullness of humans and the qualitatively rich, value-laden, goal-oriented contexts in which they have their being are all ultimately identical with, or reducible to, the systems of mathematical physics and physiology, a position which, in its various forms, falls under the generic label of scientific reductionism. Such reductionism embodies a fact/value distinction in which values are ultimately reducible to facts.

The application of the model of Newtonian physics to the social sciences, in particular, has led to some of the worst abuses of reductionist thinking. Reductionism has been used by modern social science in elaborating the frameworks of new fields of study and academic disciplines and has been highly influential in the manner in which the social sciences and business ethics have developed. In business ethics, reductionism has led away from a normative value-laden approach to an empirical explanatory, descriptive, and/or predictive approach concerned with empirical facts. The empirical approach focuses on identifying definable and measurable factors within the individual psyches and social contexts that influence individual and organizational ethical behavior.

The opposite of reductionism is relational holism, an approach to the phenomenon being described that views the whole as having a significance that is on a different level than, is irreducible to, and is not explainable in terms of parts. Instead it views the whole as an emergent relational complex. This position is sometimes called emergentism, the view that the properties of the more complex level are unique emergents that are lost when reduced back to parts whose interactions give rise to them. For example, for the reductionist, water is nothing but hydrogen and oxygen, while the emergentist holds that the unique qualities of wetness, thirst-quenching ability, bouyancy, and so forth, are emergent relational properties of the whole that are as real as, but on a different level from, the hydrogen and oxygen whose interaction gives rise to them, and these real emergent properties are lost when water is reduced to nothing more than the sum of its parts.

The concept of emergent relational complexes gains support from the "new science" of quantum physics and systems thinking, which illustrates the role of emergent properties within the context of relational systems. This view has important implications for business ethics, for it undercuts the fact-value distinction in favor of empirical situations that are concretely rich, value-laden relational complexes. Such an approach does not reduce values to facts but rather understands empirical and normative business ethics as inquiries that focus on different dimensions of a concrete unified situation based on the two fields' differing contextual interests. In this way, each area of business ethics can recognize that its particular perspective and approach not only cannot substitute for those of the other, but that, in fact, each approach gains its full significance only within the context of the other. In addition to accounting for interdependent, shared problem domains, the concept of relational webs also provides the context for the shared construction of meaning and for a general openness to others. It also provides the basis for a relational view of corporate citizenship within the complexes of community life and responsibilities and for stakeholder theory as providing an understanding of one type of commitment within these relational webs.

Regressive Tax

A tax is regressive if it requires those with lower income or wealth to pay a higher fraction of their income in tax. A sales tax, which can be levied either at the point of purchase or at various points in the product or sales process, is generally regressive. Sales taxes are also sometimes called commodity or excise taxes.

Taxes can be classified as regressive, proportionate, and progressive. A proportionate tax takes the same portion of each individual's income. Sales taxes are a fixed percentage tax on the cost of goods purchased. Yet such taxes are in practice regressive, because those with lower incomes use a larger portion of their income for necessities, such as food and clothing. A sales tax that exempts food can result in a more proportionate tax. Taxes on cigarettes and alcohol are regressive sales taxes imposed to achieve a social good (to reduce smoking and excessive use of alcohol).

A progressive tax requires those with higher income to pay a larger fraction of their income in tax. A graduated progressive income tax increases that fraction as income increases. Estate and inheritance taxes are progressive taxes, since those with greater wealth pay a higher portion of their wealth in taxes. Most governments use an "ability to pay" principle and, accordingly, seek to make their income taxes progressive. This is considered more just and equitable.

A progressive tax reduces inequality of income, while a regressive tax increases inequality. Horizontal equity in taxes (equal treatment of equals) requires that people earning the same amount and having the same expenses pay the same tax. If horizontal equity does not exist, people often protest. Because of the many tax deductions and "loopholes" in the U.S. tax code, which are often deemed to be unjust, some advocate a proportionate (or a flat) tax—the same tax rate for all incomes.

Most philosophers (including Aquinas, Rousseau, and Rawls) hold that in justice people should be taxed according to their means—that is, the wealthy should pay a greater portion of their income in tax. Social justice calls for a sufficient income to feed, house, clothe, and educate a family. And those with larger incomes have a greater obligation to help provide necessary government services. Thus, a regressive tax is unjust; it is not a fair distribution of the tax burden. John Locke maintained that private property was a natural right; however, he also acknowledged that an individual does not have as firm a right to wealth beyond what he or she can use. On the other hand, conservatives argue from consequences that it is ethical to impose less tax on the wealthy. When the rich have greater income it benefits all, since their income supplies new investment and purchases goods and services which in turn provides many with jobs and family income.

The ethics of taxation has been described as an uneasy truce between good citizenship and personal greed. Supreme Court Justice Oliver Wendell Holmes said that "taxes are the price we pay for civilization." On the other hand, the U.S. tax code has been interpreted by courts as not requiring an individual to pay more taxes than are absolutely required. Hence, taxpayers self-assess their own tax returns, and they seek to pay as little tax as possible.

The U.S. federal income tax provides examples of various tax strategies. Income tax is a direct tax as it is levied on the individual person. A consensus grew in the United States in the 1930s that the government had an obligation to help those citizens who had lost their jobs and those who were spending their old age in poverty. This consensus shifted in the 1980s with the middle class tax revolt. The middle class, who bore a major portion of those costs, judged that they were not receiving proportionate services in return for their taxes. So many Americans demanded tax cuts, and one effect of this tax revolt is that it has required federal and local governments to reduce services. Corporations and wealthy individuals pay federal and local taxes, but they generally hire tax advisers (all the major accounting firms have tax consulting divisions). These tax advisers interpret the tax code so that their clients pay as little tax as possible. Thus, many firms and wealthy individuals pay little federal income tax. Recently, numerous tax advisers and accounting firms have been indicted for advising fraudulent reports.

In addition to generating revenue for government operations, another goal of tax legislation is to influence citizen behavior. So there are many tax incentives for various activities that legislators deem to be for the long-term public good. Hence, it may be difficult for the taxpayer to decide whether she is engaging in the behavior that is encouraged by the tax code or merely exploiting a tax loophole.

Historically, increases in taxes were made in times of war, because of the need for more resources to pursue the war. In democracies, initially income tax was levied only on the rich, but income tax now is generally levied on all but the very poor. Taxes are higher in European Union countries. But governments of these countries provide many more services, such as universal health care.

Regulation and Regulatory Agencies

Regulation has been defined broadly as the intentional restriction of a subject's choice of activity by an entity not directly party to or involved in that activity. In its most familiar form, regulation concerns restrictions placed by government on activities in the private sector (although government may also regulate itself). Normally, government acts as an agent for its citizens and, as such, is obligated to give account of its actions. Hence, regulation, as well as other government actions, is normally accompanied by a formal rationale, though the content of the rationale may range from substantive to purely symbolic in character. There are many possible forms for this rationale, but it is generally given the label of "the public interest." Hence, regulation can be defined more narrowly as *the public administrative policing of a private activity with respect to a rule prescribed in the public interest.*

As discussed later in this entry, regulation that is formally rationalized as in the public interest may in fact be the result of a societal group obtaining government protection that steers benefits to the members of the group. Thus, the existence of a public interest rationale for regulation does not necessarily mean that the primary actual purpose of the regulation is to provide general public benefit. Government regulation can be a valuable prize that reduces competition, guarantees enhanced incomes, discriminates against open participation in activities, and so on. Indeed, one of the classic reasons for the existence of government is to provide a legitimate mechanism for the coercive resolution of disputes. Whoever can harness that coercion to serve particular economic and social ends can reap enormous windfalls.

Regulation is traditionally divided into economic and social regulation. *Economic regulation* includes the regulation of market transactions, restrictions on the behaviors of firms and on the behaviors of individuals within firms and markets, regulations on financial and trade practices in particular industries and in commerce at all levels, including international trade, and so on. *Social regulation* is concerned with the impacts of economic and social practices on people and on the natural environment; it is sometimes labeled "protective" regulation. Such regulation can be aimed at reducing pollution, protecting consumers from physical harm from the use of consumer products, ensuring the safety of drugs, keeping the workplace safe, assuring safety in the performance of motor vehicles, eliminating discrimination in employment on such grounds as gender, race, age, or disability, and so on.

There are several standard rationales for regulation in the political economy literature. For economic regulation, these include, among others, the control of cutthroat competition (selling below cost) and other forms of "unfair competition;" the control of monopoly power, especially that arising from so-called "natural monopolies;" the existence of unequal bargaining power and of excessive transaction costs in markets; and the control of economic rents, in which firms possess cost advantages over what prevails in the market by being able to exploit their control of local supply due to technological, legal, situational, or other factors. For social regulation, these rationales include the control of externalities, the unintended by-products of market activities, such as pollution; information, incentive, or public goods problems that are judged to require rebalancing interventions by government; and other public policy concerns where the market works but produces outcomes that are socially unacceptable.

Regulation is a function of governments at all levels, from local to national (and even international). This entry will focus on regulation in the United States, with an emphasis on the federal level.

Origins of Regulation

Quite apart from regulation that is sought to benefit narrow private interests, more broadly based regulation is rarely enacted with deliberative foresight. At least with respect to the development of regulation in the United States, policy makers tend not to act in a precautionary manner, reviewing the economic and social hazards that plague society, and developing government interventions that aim to forestall or ameliorate the detected present or anticipated future hazards. Instead, a number of factors work against such rational, calculative regulatory initiation, that is, rationalized policy formulation and implementation of new regulation. Indeed, the most important precursor to regulation has been a real or perceived crisis in the issue area. Advocacy from a variety of pressure groups has influenced the origin and character of the regulation, taking advantage of or creating the perception of crisis. The resulting pattern of regulatory origin in the United States featured most economic regulation arriving decades before extensive social regulation.

Factors Affecting the Initiation and Implementation of Regulation

Factors that work against systematic planning in the initiation and early implementation of regulation include, among others:

- The extent and character of current economic and social hazards, much less the course of future events, may be poorly understood and initially unpredictable.
- Political consensus supporting regulation may be lacking, especially in the case in which those who would pay the costs of regulatory compliance, such as industry, are aware of the potential future economic impacts, are well represented, and oppose the regulation effectively, and those who would benefit are spread diffusely through the population and lack effective political agents to secure regulatory protection (see the work of James Q. Wilson).
- There may be a technical incapacity to resolve the hazards, for example, the knowledge to produce nonpolluting engines.
- The prospective costs of regulation may deter adoption of the regulation. Regulation may be perceived as costly to administer as well as costly to those who must comply with it, so that resource availability issues may slow adoption, as well as engender opposition from both those who must pay for compliance and those who must absorb the tax burden of administering the regulatory state. The Weidenbaum Center (Washington University) and the Mercatus Center (George Mason University) jointly prepare an annual report of federal spending on regulatory activities by agency and in aggregate. Although the report is perhaps overly inclusive about which federal programs are regulatory and is based in center research programs that tend to be critical of government regulation, the extensiveness and significant cost of regulatory programs in the federal government is apparent.
- Whether or not regulation is approved and the particular design of regulation and locus for its administration can depend on the process of regulatory approval, the distribution of political power, and the design of the institutions that manage such approval. For example, conflict in the legislature may lead it to delegate the locus for choice of specific features of the regulation to the regulatory body, where the mix of pressures from interests concerned about the regulation might be different. And the legislature may wish to shift the burden for design of the regulation, as well as the potential blame for the costs or other negative impacts from the regulation, to the regulatory body. The gatekeeping role of legislative committee process can block or advance regulatory legislation. There is now a growing literature on delegation, the creation of regulatory agents, and the design of regulation, beginning with Barry Mitnick's work and including such scholars as Morris Fiorina; the trio of Mathew McCubbins, Roger Noll, and Barry Weingast; Jonathan Macey; David Epstein and Sharyn O'Halloran; and others.
- The design of regulatory tools remains relatively poorly understood so that the choice of regulatory instrument can be far from systematic. The choice of regulatory means is often based on the availability of traditional tools, such as directive standards, or the influence of political directives to reduce regulatory impacts or serve special interests. Political mandates can filter societal expressions of need for government intervention. Thus, issues with the design and choice of regulation, as well as the design of the administrative process, can present challenges in ensuring that controls are adopted and that they are effective and efficiently administered, as well as provide due process opportunities for public participation. The

treatment of regulatory means as a matter of choice, rather than as predetermined in the form of traditional standards regulation, was introduced largely by Allen Kneese and Charles Schulze with the comparison of incentive to directive means. This evolved into the "tools" approach to the study of regulation, as developed by Lester Salamon, Mel Dubnick, Christopher Hood, John Scholz, Barry Mitnick, Stephen H. Linder and B. Guy Peters, Michael Howlett, and a number of others.

- There can be significant hurdles in implementation, that is, in creating the regulatory system, and in administering that system as an operating regulatory organization. These administrative problems are made even more formidable by the need to operate regulatory controls across a federal system in the United States, that is, to operate across federal, state, and local government settings. The study of implementation as almost a subfield of political science has expanded since the 1970s. The early work of Jeffrey Pressman and Aaron Wildavsky was soon joined by that of a number of scholars, including Daniel Mazmanian, Paul Sabatier, Laurence O'Toole, Kenneth Meier, Keith Provan, Brint Milward, and many others. Implementation was treated as potentially a highly problematic and often critical aspect of the initiation of any new public program, including regulation.
- Finally, regulation can be opposed on normative or ideological grounds as a restriction on private choice and on the uses of private property, no matter the distribution of costs and benefits. In general, scholars such as Paul Quirk and Joseph Kalt and Mark Zupan have studied the influences of ideology on changes in regulatory policy.

Crisis as the Precursor to Regulation

Thus, although industries may actively secure and defend regulation that benefits them, much regulation does not occur unless there is widespread public pressure as the result of a perceived crisis. Such perceived crises may have a real basis generated by an attention-grabbing, catastrophic, and often tragic event. One such case was the sulfanilamide elixir poisonings in 1937, in which many of those who died were children. That incident led to the Food, Drug, and Cosmetic Act of 1938, which required the U.S. Food and Drug Administration (FDA) to determine that drugs are both safe and effective before being allowed on the market.

The circumstances preceding regulation can be manipulated or brokered so that they are perceived as a crisis, though there may be no single precipitating event. Thus, pressure from the labor movement led to the creation of the Occupational Safety and Health Administration (OSHA) in 1970. There were indeed serious issues regarding the level of safety in the American workplace as well as advocacy to ameliorate them for years, but there had been no single, galvanizing event.

Although a crisis may be perceived, there may be no real basis for one. Or, if real, the purported solution to the crisis may in actuality be a subsidy or protection for a particular interest or company. Typically, firms seeking regulatory protection invent rationales claiming great public need for the intervention, even though the public action that is proposed may actually raise costs to the public or divert resources better used elsewhere. Firms may manage to define the public's perception of the crisis in such a way that the solution provides significant benefits to the company. Via adroit use of political influence strategies, such firms can ensure implementation of regulatory interventions that are superficially designed to resolve the crisis but may produce little general benefit other than enriching the firms. Thus, tax incentives to produce ethanol, plus the seasonal mandate to use gasoline mixed with ethanol, were great benefits to Archer Daniels Midland, which had sought the regulation. Some critics argued that there were better ways of achieving essentially the same public ends.

Widespread, severe human harm, such as the sulfanilamide elixir poisonings, tends to be the most effective generator of crisis. The crisis levels political divisions and makes legislative action mandatory. But such crisis is not predictable, of course, and, besides producing such reactions as outrage or widespread horror, it acts as a kind of social surprise. Hence, reform with the creation of new or more stringent regulation staggers forward unpredictably after recurrent crises rather than after rational steps to prevent harm.

Role of Pressure Groups in Regulatory Origin

By generating widespread social and political support for public action, the social perception of crisis provides the opportunity for groups to push policy agendas featuring regulation. In general, regulation can be created in response to pressures from a variety of sources, including consumers desiring protection, industry desiring competitive protection and special advantages, the bureaucrats themselves as a means to extend or defend the bureaucracy or to rationalize existing regulation, and legislative or bureaucratic actors as a good faith effort undertaken in a particular, but authentically held, view of the public interest.

As an example of "public interest" regulation, consider Ann Friedlander's arguments regarding value-of-service pricing regulation by the Interstate Commerce Commission (ICC). Beginning in the ICC's early years, value-of-service pricing appeared originally to be aimed at subsidizing the development of the American West, and, hence, promoting economic development in the United States. Under value-of-service pricing, so-called higher-valued goods, such as manufactures, were subject to higher shipping rates than lower-valued goods, such as bulk commodities. Because the developing West produced lower-valued goods, this form of discriminatory pricing in effect subsidized development in that region. But value-of-service pricing lingered as official regulatory policy long after western development ceased to be a national goal and was for decades supported in Congress and the ICC by those whom it benefited. Indeed, scholars have found strong evidence that regional differences, including regional competition reflecting differential potential impacts of regulation, frequently shape regulatory designs and implementation (see, e.g., historical studies by Thomas W. Gilligan, William J. Marshall, and Barry R. Weingast; Richard Bensel; and Elizabeth Sanders). Thus, whether or not the initiation of the regulatory policy had an authentic public interest basis, history suggests that groups, including those with a regional basis, have interpreted the regulation in light of their self-interest and pursued and defended it chiefly on those grounds.

Historical Pattern of Regulatory Origin

Most economic regulation predated social regulation in the United States. With a few exceptions (e.g., antitrust regulation in the 1903 Antitrust Division of what became the Department of Justice), the model of the ICC (see below) was replicated in other regulatory contexts: the Federal Reserve Board in 1913, the Federal Trade Commission (FTC) in 1914, the Shipping Board (later the Federal Maritime Commission) in 1916, the Tariff Commission in 1916 (becoming the International Trade Commission in 1975), the Federal Water Power Commission in 1920 (becoming the Federal Power Commission [FPC] in 1930 and the Federal Energy Regulatory Commission [FERC] in 1977), the Federal Radio Commission in 1927 (becoming the Federal Communications Commission [FCC] in 1934), the Securities and Exchange Commission (SEC) in 1934, the National Labor Relations Board (NLRB) in 1935, the Civil Aeronautics Board (CAB) in 1938 (beginning as the Civil Aeronautics Authority), and the Atomic Energy Commission in 1946 (becoming the Nuclear Regulatory Commission [NRC] in 1975).

Federal regulation was relentlessly mimetic, replicating earlier models. As noted below, the rationale for those models was created largely post hoc but found widespread support and defense among the legal practitioners who populated the agencies. Regulation was seen as an enterprise in the law, guided and defended by those schooled in the same tradition as those who practiced in the courts. In essence, despite being a delegation from the legislature, regulation in the United States was perceived as an appendage of the legal system and its practitioners. A few social regulatory agencies, mostly in the single-headed agency rather than multi-headed commission structure, were established, including the FDA in 1931 (developing from regulation going back to the Pure Food and Drug Act of 1906) and the Federal Aviation Agency (later, Administration, or FAA) in 1948.

Beginning in the mid-1960s, new regulations were overwhelmingly social in character. Some used the old independent commission form, but many were established as single-headed agencies. The commission model was under increasing attack, and the new regulation was sometimes seen as an urgent matter for executive branch policy making and implementation rather than as something to be investigated and adjudicated in an independent body. In other words, social regulation was sometimes perceived as an enterprise directed at solving pressing social problems, under the execution of the chief executive, rather than as the arbiter of disputes and protections among industries that needed to be governed so as to approximate markets. The new agencies were thus a mix of the old independent commission form and the single-headed executive branch agency. For example, the Equal Employment Opportunity Commission (EEOC) was established in 1964; the Environmental Protection Agency (EPA) in 1970; the Consumer Product Safety Commission (CPSC) in 1972; OSHA in 1970; the Mine Enforcement and Safety Administration in 1973, becoming the Mine Safety and Health Administration (MSHA) in 1977; the National Transportation Safety Board (NTSB) in 1975; and the Office of Surface Mining Reclamation and Enforcement (often referred to more simply as OSM) in 1977. The Commodity Futures Trading Commission (CFTC) saw light in 1974 in a structure parallel to the 1934 SEC, evolving from earlier economic regulation located in the executive branch.

Performance of Regulation

The performance of federal regulation has been criticized almost from its beginning, with the ICC in 1887. Many regulatory performance issues have been rooted in the design of the agencies and their administrative practices, with the original model being the ICC.

Model of the ICC

The ICC took on the modern form of the independent regulatory commission, an entity outside the hierarchical direction of executive branch agencies, in 1889. Early that year, a lame-duck Congress and President Grover Cleveland sought to put the ICC beyond the direct control of incoming President Benjamin Harrison, who was perceived as a "railroad lawyer" likely to weaken the new agency's authority. They passed legislation taking the agency outside the Department of the Interior and making it an independent body. Subsequent legal scholarship sought to reify the value of independence, which is supposed to keep agencies free of political meddling and ensure that they develop and maintain the specialized expertise necessary to regulate effectively. Many critics have observed that independence may have caused more problems with developing consistent public policies than avoided partisan manipulations.

The ICC's procedures were developed by its first chair, Judge Thomas Cooley, who installed an adversarial, judicial-like system in the new agency. These procedures were intended to give the new agency legitimacy, but in practice they led to long delays and significant costs for those who sought to participate in the process. Sometimes those costs actually protected regulated companies from challenges by acting as an entry barrier to companies seeking to enter the industry. Because new entrants often brought cost-saving innovations to the industry, the classic administrative process tended to act as a drag on innovation and efficiency in the regulated industry. Later, the Administrative Procedure Act of 1946 and its amendments attempted to standardize the process across agencies and succeeded in bringing some, though not complete, uniformity across the federal government. But as the Cooley model spread across federal regulatory bodies, so did its problematic characteristics.

Reliance in the United States on an adversarial administrative process mimics the practice of the larger legal system derived from the English model. Such adversarialism stands in marked contrast to the greater use of administrative tribunals in many other countries around the world, including many in the European Union. In an administrative tribunal, a greater burden is placed on the administrative judges to investigate and assemble the case, rather than sit back as arbiters between the advocates representing the parties in the dispute or administrative judgment. One consequence of the U.S. system is that the cases that are assembled via adversarial contest do not necessarily reflect all interests relevant to a case, nor do they necessarily assemble all relevant evidence. What is assembled is what is in the self-interest of the parties to the case to present, not what should be reviewed in the wider aim of serving the public interest in regulation. There is a nominal instruction in U.S. administrative procedure that encourages administrative judges to play a more active role, but the common historical practice has been to allow the record to assemble itself.

Regulatory agencies were set up as government in miniature. The agencies performed all the functions of the larger government but without the checks and balances of separation of powers. Thus, regulatory agencies were administered by an executive (sometimes plural, as in the independent commission), who conducted the legislative function of rule making under delegation from Congress, investigated infractions of those rules, adjudicated whether infractions occurred and how rules should be applied to individuals and firms, conducted enforcement activities, set general policies, and collected data and statistics on the industry. Critics charged that agencies that functioned in this manner could not be truly impartial and could not police themselves effectively by competition among their functional areas.

Rigidity and Capture in a Regulatory Life Cycle

Critics of regulation noted that, over time, many regulatory agencies reached accommodations with the regulated industries. The agencies appeared to become supportive and protective of the industries rather than of the consumer and general public. In a classic analysis, Marver Bernstein argued that independent regulatory commissions tended to follow a life cycle: The regulatory commission emerges from a crisis that, in a compromise, resolves a group struggle that may have lasted for decades. In its youth, the agency is crusading and is opposed by a well-organized industry. The agency lacks experience in the area and has vague objectives and untested legal powers. Its political supporters fade away, convinced the battle was won. In maturity, the agency adjusts to the conflict it faces and begins to act as a manager or umpire for the industry rather than as a policeman. It relies on precedent, maintains good relations with the industry, and soon develops a backlog of slow-moving cases. Bernstein notes that the agency "becomes a captive of the regulated groups." In its old age, the procedures of the agency become sanctified and resistant to change. It acts as if it has a "working agreement" with the industry to maintain the status quo. The agency's staff declines in quality and the agency suffers from poor management. It fails to keep up with societal change and is generally recognized as a protector of the industry. Congress becomes reluctant to fund what is perceived to be a poorly performing agency. Should crisis recur in the industry, however, whether due to technological, competitive, or other changes, new legislation, supported again by activist groups, can return the agency to its youth. The cycle repeats. The life cycle model provides an attractive explanation for some very recognizable behaviors in federal regulation, though a number of scholars, including Barry Mitnick, Robert Chatov, Kenneth Meier and John Plumlee, and others, have analyzed Bernstein's arguments and found them more heuristic than descriptive.

Iron Triangles Protect Industry

Critics of federal regulation observed that the close relationship that developed between agency and industry was often embedded in a network of relationships among industry, the agency, congressional committees, and, later, citizen groups, the federal courts, and the president. Because the public policy that emerged from the interaction of industry, agency, and Congress tended to reliably favor the regulated industry, the trio was often referred to as the *iron triangle.*

The iron triangle is built on a system of incentives operating among the particular institutions of the federal government. To serve their districts and earn reelection, legislators in the House and Senate seek to be members of committees of oversight for industries important in their home districts. To encourage legislators to protect the industries via helpful legislation (and obstruction of threatening bills), the industries take actions that generate flows of campaign contributions as well as organize support and votes from those employed in or dependent on the industry.

In return, legislators produce laws consistent with the interests of the industry and attempt to influence the regulatory agency to bias its discretionary decisions toward the industry. Legislators control agency budgets; the Senate passes on top-level agency appointments. Uncooperative agency administrators can be publicly embarrassed at oversight hearings. Agency heads are political appointees who, according to historical data, tend not to stay in their positions for even the full term of their appointments. Looking ahead in their careers, these administrators do not want their service in the agencies held up to public ridicule. In their jobs, they are dependent on information from the regulated industry. Because the industry depends on receiving favorable regulation, it treats regulators with the respect and attention that these officials can get from nowhere else. Through repeated interaction, the regulators see industry managers as reasonable folks trying to do their jobs rather than as subjects of federal regulation whose compliance must be ensured. Thus, the industry can shape the perceptions of regulators via information and interaction. Finally, when they leave their positions, agency heads often find employment either in the regulated industry or in jobs dealing with the industry, for example, in law firms or lobbying groups specializing in the industry. This rotation of jobs among the actors in the regulatory system is sometimes called the *revolving door.*

Because of this perverse distribution of incentives, mediated by legislators or received directly, regulators tend to be responsive to the industry. In the extreme case, the incentive system leads to regulatory capture. Public policy making in such regulatory systems thus displays the stable outcomes of an iron triangle.

Although regulatory outcomes in some issue areas appear to benefit the regulated industry, and there is abundant anecdotal evidence of many of the behaviors described above that appear to lead to such outcomes, the behavioral and motivational logic of the iron triangle is relatively simplistic. Many practicing regulators would claim that the logic either does not fully apply or is incomplete as it applies to their industry contexts. For example, the classic logic ignores the emergence of professionalism in the staffs of the regulatory agencies and how such professionalism would modify agency outcomes (see, e.g., work by Ted Greenwood, John Mendeloff). Thus, one area for future academic research is whether iron triangles really emerge in the fashion described (as influences on bureaucratic decision making—see, e.g., the recent work by George Krause; Marc Eisner, Jeff Worsham, and Evan Ringquist; B. Dan Wood and Richard W. Waterman; and Richard W. Waterman, Amelia A. Rouse, and Robert L. Wright).

Beginning in the late 1960s, increases in judicial activism along with the appearance of citizen group activism on an organized scale never seen in Washington posed challenges to the old iron triangles of regulation. Even the White House took occasional action to repair regulatory failures. The networks of federal policy making in a number of areas of regulation became more flexible, with outcomes that were no longer so consistently supportive of industry interests. With six significant influential actors rather than three, regulatory policy making looked more like a jelly hexagon than an iron triangle.

The study of the creation and change of policy agendas (see, e.g., the work of Roger W. Cobb and Charles D. Elder; John Kingdon; and Frank R. Baumgartner and Bryan D. Jones; among others), the study of networks of policy making, often labeled *policy subgovernments* or *policy networks* (see, e.g., the work of Hugh Heclo; Edward O. Laumann and David Knoke; among others), as well as the study of networks of policy implementation (see, e.g., the work of Keith Provan; Brint Milward; and others), have been expanding. These approaches suggest that, quite apart from the rational choice or interest-based arguments that seek to explain regulatory origin and regulatory design, path and institutional structure models can offer a powerful descriptive theoretic alternative. Thus, such factors as the particular pattern of decision control in the administrative process in the issue area; approval paths; government-level crossing effects, featuring control loss, policy redefinitions, control delays, and so on; and arena effects as competition occurs among a limited set of elite groups within a particular set of institutions can individually or collectively shape regulatory origin, regulatory designs both formal and in practice, and, of course, regulatory performance (on the extreme case of regulation as a random walk, see the work of David McCaffrey).

Recent Performance of Regulation and the Coming of Reform

A large number of studies in the 1970s and later, both by economists and by public interest activists, established that federal regulation had performed poorly in a number of regulated contexts. Agencies such as the CAB and the ICC had tended to protect regulated companies from competition while raising costs for consumers and retarding innovation. In other cases, protections for consumers, those exposed to environmental pollution, vehicle owners, patients treated with new drugs, and others, were criticized as poorly designed, ineffective, or insufficient. These streams of criticism, together with the acceptance of new ways of thinking about the design and performance of government, led to both efforts to deregulate, chiefly in economic regulation, and efforts to increase or modify social regulation. The rise of public interest activism spurred by the efforts of Ralph Nader, beginning in the late 1960s, led to support for new social regulation. Agencies such as the EPA, OSHA, and the CPSC were established in the early 1970s. For the first time, major regulatory agencies were terminated or replaced with much smaller entities (the CAB in 1978 and the ICC at the end of 1995). Beginning with the Carter administration, there were experiments with new methods of regulation in some agencies.

Despite the problems noted above, social regulation has yielded very significant benefits in the United States in the just over 30 years in which the major statutes have been in effect. Social regulation has resulted in markedly cleaner air and water. Despite some early, conflicting empirical studies, regulation appears to have had some effect in making the workplace safer. It has caused firms to establish significant offices dealing with environment, health, and safety. In many firms, this has translated to a serious and ongoing attention to compliance, with measurable reductions in pollution and increases in employee safety. The development of professional compliance bureaucracies with both a vested interest in the regulation and a high level of professional expertise in designing and performing compliance led many firms to resist the deemphasis on regulatory compliance that characterized regulatory policy during the administrations of Reagan and George H. W. Bush (on response bureaucracies in the financial services industry and elsewhere, see the work of David McCaffrey and his coauthors).

Indeed, some large firms (e.g., PPG in Pittsburgh, Pennsylvania) participated in the development of new regulation. Their expertise in regulatory design, and their knowledge of how regulation affects their costs, permits them to help design regulation that may be less costly for them in compliance than for their smaller competitors. Large, multinational firms have participated in negotiations leading to the establishment of voluntary international standards that make it easier for such firms to do business overseas. Having a uniform standard across international boundaries, even a fairly stringent one, is far less costly for business than adapting products to the multiple standards of different national regulatory regimes. Meeting such international standards can thus be a critical element in the ability to compete. And there can be significant differences across international regulatory regimes. For example, regulation in the European Union is more likely than in the United States to be based on the *precautionary principle,* which places the burden of proof of safety on those introducing a new technology. In the absence of such proof, the technology is tightly restricted. Thus, sensitivity to and the ability to adapt to as well as shape international standards can be essential in being able to compete in many markets around the world. Today's patterns of corporate compliance tend to acknowledge such international differences.

Some Business Complaints Under Regulation

Among the most important factors shaping public agenda discussion over the creation, design, and performance of regulation have been business complaints about the impacts of regulation. Offered sometimes with guile as part of a contest over the definition of regulatory issues and the design or implementation of pending regulation or regulatory reform, at other times they have reflected frustration with inappropriate, counterproductive, costly, and ineffective regulatory tools and administration. There is a huge anecdotal literature on regulatory failures, spanning decades (see, e.g., the historical reporting and fascinating anecdotes in works by Louis M. Kohlmeier Jr. and Cindy Skrzycki; there are many articles in the *National Journal* and in *Regulation* that describe regulatory behavior). Some of the typical complaints include the following:

Stifled Innovation

Regulation tends to freeze industries, protecting the existing competitors against new entrants and slowing the introduction of new technologies. For example, in 1961, the Southern Railway attempted to introduce its new aluminum "Big John" hopper cars, which were capable of competing with barges in transporting grain. The barge lines and a number of other businesses that depended on barge traffic or grain storage complained to the ICC, tying up the regulatory approval process in the ICC and in the federal courts for years, forcing Southern Railway to pay high legal fees and preventing it from earning a swift reward for its innovation. Studies at the time showed that just switching grain transport to the cheaper rates of the Big John cars was sufficient to reduce the prices of many commodities that even indirectly depended on grain, such as milk, beef, and poultry.

Inconsistency in Application; Unresponsiveness to Error

One of the classic cases of regulatory failure concerned the Marlin Toy Company, whose popular transparent plastic children's play balls, the "Birdie Ball" and "Flutter Ball," began breaking unexpectedly. A supplier had substituted an inferior grade of plastic. The balls were taken off the market under the Hazardous Substances Act, then administered by the FDA. The new CPSC took over responsibility for this act in 1973. Under agreement with the CPSC, Marlin had replaced the plastic in its balls by then, but the CPSC inaccurately listed the new balls as the banned ones. The commission was unable to issue a timely correction in its public listing of banned products. As a result, the company was unable to sell its toys and laid off most of its workforce. It required the passage of a private bill by Congress permitting Marlin to sue the government for the company to recover a portion of its damages.

Mindless Proceduralism

A common complaint about regulation is that it can feature procedural requirements that are imposed in a rote way, without effective linkage to any substantive rationales. Such proceduralism is often characterized as *red tape,* or termed *bureaucratic.* Sometimes the proceduralism does have an unstated rationale, such as creating an entry barrier that protects regulated firms from new entrants.

In a classic historical case of regulation from 1965, Tom Hilt, a young employee at his father's trucking company, Hilt Truck Line, became frustrated at having to type and retype tariff schedules—lists of shipping rates between various locations—for submission to the ICC. All new rates as well as rates proposed for change had to be approved by the ICC. After Hilt submitted a lower tariff on frozen potatoes, meat, and grain, railroads had challenged the reductions, claiming that Hilt's rates were lower than its costs. Under ICC regulations, cutthroat competition—selling below cost—was illegal, and had been since the original Interstate Commerce Act of 1887. The railroads mounted such challenges routinely for rate reduction submissions from competing transportation modes to protect their competitive position, and the protest was not based on real knowledge of Hilt's costs. The Hilt Line had decided not to fight the challenge. So, after finishing typing tariffs that raised the rates back up, a disgusted Tom Hilt inserted a new item at the end of one such list, "Yak Fat, Omaha to Chicago. Rate: 45 cents per hundred pounds . . . to be shipped in minimum quantities of eighty thousand pounds . . . Hilt Truck Line would accept yak fat in glass or metal containers, in barrels, boxes, pails or tubs." The ICC clocked in the new tariff, filed it, and "tariff watchers" for the railroads noticed the filing. The railroads filed a formal complaint, complete with supportive data and comparing the shipment to an earlier case dealing with paper articles, arguing that Hilt Line's rate was patently below cost. The ICC reviewed the submissions and suspended the yak fat rate, responding routinely, as it normally did, to such a complaint. The railroads notified the ICC that they had formed a yak fat arguing committee, on which sat representatives of a number of midwestern railroads. Hilt Line never responded, and, after a while, the ICC closed the case, warning Tom Hilt that it had been "afforded ample opportunity" to counter the railroads' case. Of course, the yak fat rate was entirely bogus, borne of impatience with a regulatory system that used procedures originally intended to provide due process to protect a regulated industry from competition.

Excessive Delays

The administrative process often permits intervenors to participate, realizing norms of due process and protecting regulatory decision makers when appeals courts look to see if the required substantial evidence on the record was compiled. The procedures themselves are often time-consuming, with many layers of review. The result is delay. It can take an agency a year or more to issue a single regulation, and challenges to regulations can span years, as they did in the Big John case.

Inappropriate Levels of Standard Specificity

Regulation has operated with vague standards in some cases (e.g., many areas of economic regulation) and overly specific standards in other cases (e.g., some areas of social regulation). Thus a standard such as forbidding "unfair competition" under economic regulation (e.g., by the old ICC) tells us by itself little about what is forbidden. This delegates effective regulatory policy making from legislators to the regulators, who have sometimes implemented their discretion by offering inconsistent, case-by-case interpretations. The other side to such vague controls is directive regulation that entails highly descriptive "design standards" that detail the specific acceptable means of compliance, admitting no adaptations. Examples include the original design standards implemented by OSHA as it got under way in the early 1970s. Thus, the exit sign standard specified every aspect of an exit sign, without regard to the room or setting in which the sign was situated. Many OSHA standards were originally adopted from boilerplate language designed for procurement contracts, not safety regulations, simply to get OSHA implemented quickly. Such standards were pruned from OSHA's rulebook in the late 1970s. In general, standards can be ineffective when they require compliance that is inappropriate to their contexts as well as unnecessarily costly.

Excessive Costs; Costs Exceed Benefits

It is not surprising that so much criticism has been leveled by business at the costs of regulation. Many of the regulatory problems noted in this entry generate questionable costs, whether due to delay, proceduralism, inability to recover savings from innovation, protection of the profits of special interests, or other factors.

Protection of Special Interests

Private interests have sometimes been able to shape regulations in ways that protect them from competition or that provide them with direct, tangible benefits denied others. The iron triangles functioned in this way, of course. The ICC operated for decades in a way that protected each mode of transportation against competition from the other modes. Marketing orders administered under the U.S. Department of Agriculture kept the prices of navel oranges high by restricting the supply of "whole fruit" allowed to go to market, while keeping the price low on excess oranges treated as juice for Sunkist and other juice producers.

Regulatory Paternalism

Too often, regulators assumed that the locus for the design of regulatory standards lay completely in government. The industry was treated as suspect, not to be trusted. This led to unrealistic, overly costly, and often ineffective standards. For example, the original bicycle standard issued by the CPSC was developed in-house and widely criticized by industry as likely to be ineffective and needlessly costly. In recent years, a whole subfield of administrative practice and research has grown under the heading of "reg-neg," *regulatory negotiation,* which aims to involve industry representatives together with consumer and other stakeholder representatives, along with government regulators as facilitators, early in the process of regulation development (see the work of such scholar-practitioners as Philip J. Harter and Daniel Fiorino). Such collaborative development of regulations tries to avoid paternalism, while yielding more effective regulation with a wider base of support from those affected by the regulation.

Conflict Among Regulations

The development of any regulation tends to proceed independently of related or existing regulations. This can lead to the government effectively prescribing opposing mandates. For example, OSHA noise protection rules have required ear protectors for users of noisy machinery, such as drills, and also required backup beepers on workplace vehicles as a warning to pedestrians. How to avoid what may happen when a work vehicle backs up toward an ear-protected worker using a drill is not considered.

Inability to Focus on Cases Where Needed and to Avoid Cases Where Inapplicable; Poor Targetability

Government tends to regulate what can be measured and controlled rather than what is dangerous and can be made safer. Indeed, government too often regulates appearances when it cannot or will not control outcomes. Thus, regulations attempt to control conflicts of interest by requiring reporting of stock ownership by top officials, effectively regulating the appearance of conflict of interest. But they permit lobbyists to flow campaign contributions to legislators who are key to creating or blocking new regulatory legislation. The only conceivable reason such contributions are made, of course, is to influence such actions—the issue is not appearances, but active biasing of outcomes.

Feasibility of Regulating in Some Areas

Just as perfect agency—perfect performance by agents for principals—is only rarely, if ever, attained, so are there limits to what can be controlled by regulation. Regulation of jaywalking is common in American cities, yet, apart from a very few central city locations, is impossible to implement universally and, indeed, is enforced only sporadically. The regulation appears to exist primarily for educational or emergency uses.

Regulatory Agencies in the United States

Unlike some national systems of regulation around the world in which the central government reserves to itself all significant regulatory controls, including direct inspections, regulation in the United States has been adapted for our federal system. U.S. regulation also displays characteristic institutional structures and administrative processes, including the process of judicial review of its decisions.

Regulatory Federalism: The Granting of Primacy to the States

In the United States, regulation is performed by governments at all levels, federal, state, and local. Major new regulatory initiatives usually, though not always, begin at the federal level, but are often implemented via federal to state handoffs. Thus, a new piece of social regulation might create a new federal agency or a new program within a federal agency. Under federal rules set in the legislation, if states pass legislation similar though not necessarily identical to the federal act, provide state funding, and adopt regulations consistent with the federal ones, the federal government can grant states *primacy.* This permits the state to be the regulator of first contact and, of course, primary effect. State inspectors, not federal regulators, are likely to be the ones to visit regulated workplaces. Federal inspectors fall back to support positions, though they may intervene. Some, such as those at OSHA, may concentrate on the most dangerous enterprises. Primacy has usually functioned well and has been pulled back only infrequently. During the Reagan administration, severe cutbacks in federal agency staffing and budgets were implemented in response to White House policy favoring loosened enforcement. When failures in state regulation of mine safety emerged in a few states in the absence of federal assertion of authority, in some cases involving corruption, federal regulators were forced to cancel primacy and reassert full federal control in those states.

Institutional Structures and Practices in Federal Regulation

Federal regulation in the United States is implemented via a mix of institutional structures that do not reflect a consistent design practice or rationale. In addition, although there have been sporadic efforts to combine sector or industry controls in the same agency setting, such controls can still be found split in different locations. Thus, antitrust and competition regulation is split between the FTC and the Department of Justice. Consumer protection in transactions is in the FTC, while consumer safety is in the CPSC. The FDA regulates some aspects of food safety, as do parts of the Department of Agriculture. The stringency of controls is also inconsistent. The CPSC can issue mandatory product recalls; the Department of Agriculture's Food Safety and Inspection Service can ask meatpackers to recall adulterated meat but does not issue mandatory recalls (though it can seize adulterated product from the marketplace).

Institutional forms include the independent regulatory commission, dating to the ICC, which as noted above became independent in 1889, and the executive branch administrative agency. The independent commission has been structured as partly independent of presidential policy, but even this status varies. Presidents can designate a commissioner as chair, but cannot always remove a chair. In the independent commission, commissioners are nominated by the president and confirmed by the Senate but cannot be removed by the president, unlike top-level department appointees. There has been a trend to place new or reorganized independent commissions inside government departments for administrative reasons, while retaining most of their previous independence. Thus the FPC, when reorganized as the FERC, was placed inside the Department of Energy rather than, as before, floating freely in government space. The Surface Transportation Board, successor to the ICC, was placed inside the Department of Transportation. But, apart from the occasional requirement to consider policy initiatives from the department secretary and other relatively minor stipulations, such agencies still function as they did before.

In contrast, regulation by executive branch agencies functions as does the rest of the federal government. The head of the FDA has the title of commissioner, is nominated by the president and confirmed by the Senate, but serves like other executive appointees at the pleasure of the president. The particular regulatory tools used, such as design standards, can be exactly the same whether in a commission or an executive branch agency. The U.S. EPA is unusual in that it is an independent agency, not inside a department, but functions as an executive branch agency. Its top post, the EPA "administrator," serves at the pleasure of the president, like other top executive appointees.

Today, the number of commissioners on an independent regulatory commission varies from 3 to 5; in decades past, the number ranged as high as 11. Most economic and social regulatory agencies in the 20th century were small relative to agencies in the executive branch, with a few hundred to a few thousand employees and budgets in the seven- to eight-digit range. The expansion of federal authority now subsumes many government functions not previously thought of as regulatory. Thus, the annual compilation of regulatory budgets by the Weidenbaum and Mercatus Centers shows a Fiscal Year 2007 total budget for regulatory activities of $44.2 billion and a staffing level at 245,361 full-time equivalent people. The comparable numbers were $43 billion and 241,029 in 2006. Adjusted for inflation, the budget total is actually slightly less. But these totals include many functions that would in the past have been considered as related to defense, such as homeland security, as well as to other functional areas. In 2003, the Transportation Security Administration alone hired more than 50,000 airport screening agents, greatly inflating the apparent size of regulatory staffing.

As illustrations, the estimated outlays by the CPSC for 2006 are $65 million with a staff of 440; for the FDA, $1.875 billion with a staff of 10,164; for OSHA, $484 million with a staff of 2,173; for the EPA, $5.395 billion with a staff of 17,302; for the FCC, $365 million with a staff of 1,886; and for the FTC, $220 million with a staff of 1,080. The SEC budget jumped from $357 million with a staff of 2,841 in the year 2000 to $867 million with a staff of 3,765 in 2006 largely due to extra resources given it after the corporate scandals, with the passage of the Sarbanes-Oxley Act in 2002. It should be noted that some regulatory agencies are funded at least partly by fees or penalties, rather than by outlays from the federal budget, reducing their actual central budget cost.

Political party balance on a regulatory commission is often required by statute. Thus, no more than three members of the five-member FTC can belong to the same political party. In one historical case, the appointment of Joseph Eastman to the ICC in the early years of the 20th century briefly became an issue. With his typical honesty, Eastman notified congressional leaders that he was an independent, not registered to either major party, and so, in his own view, there was an issue as to whether he could be appointed to a seat that would normally go to a member of a party to ensure statutory balance on the ICC. Eastman did this on principle—he did not believe regulatory officials should be partisans. Senator Henry Cabot Lodge is said to have deliberately ignored the observation of his constituent, and Eastman's famous career as an ICC commissioner began.

Statutes also often set up the terms of commissioners to be overlapping to maintain policy uniformity and institutional memory. Thus, on some commissions, one commissioner's term ends each year, though even this is not consistent across all commissions. For example, terms on the five-member FTC are 7 years, not 5. Thus, the five FTC commissioner terms expire in 5 straight years, followed by a gap of 3 years, then five more expirations and a gap of 3 years, and so on. This pattern has existed since 1914. The FCC and the SEC each have five members who serve overlapping 5-year terms, so that one member's term expires each year. But the expiration date of those terms is not the same for each agency. The reasons for the differences among the agencies are historical, not based in some intrinsic agency characteristics.

Judicial Review of Regulation

In general, decisions by the federal regulatory agencies may be challenged in the federal appeals courts, with the possibility of review by the U.S. Supreme Court. A string of federal cases has narrowed the qualifications that any party must have to bring suit against agency decisions, that is, to have "standing to sue." In most cases, that party must at least show that he or she is individually "aggrieved" in a manner covered explicitly by the enabling statute. Review courts look to see if the agency has compiled "substantial evidence on the record," that is, collected evidence on all the decision criteria specified in the enabling statute and in its own rules. There is no requirement that the review court determine that the agency actually weighed all that evidence so as to produce a decision consistent with the content and balance of the evidence. All that is required is that the evidence be there. This decision rule can create an interesting and potentially mindless dynamic, as agencies routinely assure that the evidence covered at rule-making hearings and in adjudications—indeed, in any reviewable context—touches on all criteria mentioned in the enabling statute and in agency regulations. Such procedure is also potentially a recipe both for delay and for manipulation over the content of the record.

Some Tools of Regulation

In recent decades, the tool set of regulation has expanded from the traditional directive standard to include a variety of innovative and sometimes incentive- or market-based alternatives.

Traditional Standards

The traditional tool of U.S. regulation is the standard. The agency promulgates a rule that either incorporates standards specified in the enabling legislation or creates such a standard under authority created by the legislation. The standards amount to mandatory directives for behavior. As noted above, the standards can vary greatly in specificity. In the context of social regulation, standards are sometimes called *design standards* because they fully specify the compliance required, whether it is use of hay bales to control mine runoff under the regulations of the Office of Surface Mining Reclamation and Enforcement or the height of fire extinguishers above the ground under old, now deregulated OSHA rules. Penalties are attached to noncompliance with the directives. The use of standards assumes that the activities that standards specify will produce the outcomes desired under the regulation, such as a cleaner environment or a safer workplace. But the social science on many such regulations that would establish whether the standards actually produce their intended outcomes has often never been done. In fact, some critics argue that such standards often have the opposite effect—by locking in certain compliance technologies, they inhibit the development of innovative, efficient, and more effective means of compliance. On the other hand, when regulated actors strongly oppose the regulations or are likely to game or manipulate regulations that allow discretion in compliance, the standard provides an easier-to-measure and more certain control.

New Regulatory Tools Featuring Incentive Effects and Discretionary Compliance

Beginning in the 1970s during the Carter administration, largely in the context of social regulation, a number of innovative means of regulation were developed that aimed to produce outcomes better than those from old-style directive regulation. The use of tax incentives in the form of tax credits was a familiar and widely criticized tool, and, until that era, incentive regulation had rarely been employed elsewhere. Tax incentives were useful only on those who paid taxes and amounted to an implicit subsidy from the Treasury. In contrast, incentives such as effluent charges, which put a price or fee on each unit of pollution emitted from a plant, tried to create direct incentives for polluters to reduce emissions. A company's total costs for pollution would go down as it reduced emissions.

Other methods sought to make use of a company's own knowledge of costs of compliance to produce both more effective and more efficient compliance. For example, the regulatory bubble placed an imaginary bubble over a plant that had multiple air pollution sources. Old-style standards would have required each smokestack to reduce emissions to a set level, per a standard. With a bubble, the company was able to use its own discretion to decide which sources on the site to reduce, as long as the total emissions met the EPA bubble standard for the site. The company had to worry only about total emissions from the site, combining all the sources. Some sources, in newer facilities, were typically much cheaper to control than those from older plants. Emissions from the bubble could be adjusted by the regulator to ratchet down total site emissions below the total level that would have resulted from regulating individual stacks, leaving both the company, which could do the reductions in the cheapest manner, and the public, which would get, overall, cleaner air, better off.

A similar logic created regional or urban permit auctions. An imaginary bubble was placed over a region and pollution permits issued to all polluters in the region. If any company wished to expand, it would have to purchase permits from other polluters. Such permits might become available (and, indeed, be sold for profit) when plants were closed or equipment upgraded to more efficient, cleaner technologies. Any trade in permits resulted in an automatic reduction in the permitted levels by a certain percentage, for example, 15%. Thus, pollution would ratchet down as permit trades occurred and the total pollution "value" of permits in the regions moved downward. The problem with such markets is that they ignored localized effects. Companies could build very dirty sites, polluting nearby communities, if they could purchase the permits elsewhere in the air shed.

One solution to the problem of design standards was to use *performance standards.* These standards set the outcome levels directly and allowed industry to figure out the best way to reach those outcomes. Like the bubble, the performance standard took advantage of industry expertise and used the discretion it permitted industry to make all concerned better off. One problem with performance standards is simply that it is often difficult to measure outcomes directly in many regulated areas. Unless outcomes can be measured consistently and with high certainty, there may be opportunity for manipulation. But in such contexts as environmental pollution or workplace safety, it is sometimes possible to directly measure such performance success, and so performance standards can be a significant advance. It is likely that future regulatory tools will take advantage of incentive and marketlike effects to reach outcomes above those achieved in the past via traditional standards.

The newer regulatory tools have also tried to shape the decision setting for the respondent. Thus, transparency or information provision has been used to take advantage of consumer choice and reputational factors in encouraging companies to modify their behaviors. And, as discussed above, the administrative process itself has been modified in some agencies to try to involve all regulatory stakeholders early in the rule-making process. If a "reg-neg" process results in a quality regulation supported by both industry and consumers, lengthy court challenges will be avoided and the regulation itself is likely to be more effective.

Strategic Use of Regulation

Despite the development of new, more effective regulatory tools, business may continue as it has done for decades and take strategic advantage of regulation. Indeed, though public discussion might suggest that regulation is a continual burden for business, more often than not the opposite is true: Regulation protects and gives competitive advantages to companies able to exploit its impacts. In general, large firms gain advantages over smaller competitors under regulation. They are better able to handle the demands of compliance. Under newer forms of regulation, such as performance standards, they can afford to employ expert central staffs that can design compliance activities that are most efficient for the firm; smaller firms must contract this out and thus have higher costs and less of an opportunity to develop adapted, customized responses to the regulation.

Of course, a view that treats regulation as a strategic opportunity rather than as a citizen obligation raises serious ethical issues. To the extent to which newer means of regulation achieve both public and private ends, yielding better as well as cheaper compliance, the ethical stress is reduced. But in a society that operates under both the rule of law and a representative democracy in which the choices to impose costs and achieve common benefits are made legitimately, business must act as a citizen and not just a player. Thus, the description below of strategies under regulation is offered descriptively, rather than as a kind of normative guide to what should be done under regulation. When such strategies run counter to public policy, regulators must find innovative means to counter them, much as they developed replacements for traditional regulation. As of 2006, government was widely exploited for private gain by American business, making use of sophisticated lobbying, carefully targeted campaign contributions, relationships with friendly legislators who use the earmarking capability in legislation to divert public benefits to narrow private interests, and other means. Most such mechanisms were not anticipated by the Constitutional designers, and so the work of academics and public policy advocates alike remains to design practical means to ensure that business no longer gets the best government money can buy in the United States.

Many strategies are available to firms that seek to manipulate regulation and gain competitive advantage. The explicit literature on strategic use of regulation is now extensive and goes back at least to the 1970s, but similar arguments have populated the literature on regulatory capture for decades. Early work in the area was done by such scholars as Bruce M. Owen and Ronald Braeutigam, Robert Leone, Barry Mitnick, John Mahon, Alfred Marcus, Richard Harris, Donna Wood, David Baron, and George Stigler, among others. These strategies include the following:

Strategic Use of Information

Firms know their costs and their compliance status better than regulators and can shape information responses, withhold information, or flood agencies with information to gain advantage in compliance.

Strategic Use of Litigation

Larger firms tend to have deeper pockets available to support expensive litigation before regulatory agencies and to challenge regulation in the courts. Just the threat of litigation can be enough to deter small firms seeking to be new market entrants in a regulated industry.

Strategic Use of Innovation

Innovation can be used both to lower the costs of compliance to regulation and to gain competitive advantage over other firms subject to the regulation. U.S. auto manufacturers told Congress that there was no technology to reduce emissions as the original Clean Air Act would require. At the same time, each manufacturer was secretly developing the technology. When a Japanese company introduced cars with such technology, Detroit's car companies were quick to follow, apparently pulling the technology out of thin air.

Exploitation of Cross-Subsidies

Under regulation, firms use funds from a more profitable—"creamy"—part of their business to subsidize an unprofitable segment. Prices in the unprofitable segment are deliberately set low, either for competitive reasons or to build support from the group or groups receiving the subsidized prices. Thus, transportation companies set rates low for senior citizens. If threatened with undesired regulation, these companies can warn that the new regulation will make it impossible for them to keep the low rates for seniors. Lobbies for senior citizens then file briefs supporting the transportation companies. The choice of seniors is no accident—a much higher proportion of seniors vote.

Co-optation of Coalition Partners

Besides cross-subsidizing politically powerful customers to defend against undesirable regulation, firms can provide benefits to their stakeholders to build political coalitions for or against regulation, as desired. For example, in Pittsburgh, Pennsylvania, the city's elected leadership has been hostile to billboards for years, viewing them as urban blight. The city's dominant billboard company has donated empty billboard space to nonprofit organizations for limited periods of time for the cost of the sign and a fee for placing it. Whenever a proposal comes before the Planning Commission for restriction of billboards, a host of the city's largest nonprofits show up to testify against the regulation.

Use of the Agency as a Cartel Manager

By setting prices and policing trade practices in an industry, an economic regulator can act as a cartel manager who stabilizes the industry and protects it from new market entrants. The ICC acted in this role by protecting each regulated mode, railroads, trucks, and barges, against new competition from other modes or new entrants. As in the Big John and Yak Fat cases, the modes gain strategic protections by challenging the actions of transportation competitors, using the ICC to defend and enforce their protected activities.

Effective Lobbying

Effective strategic behavior in regulation often includes the adroit use of lobbying. Legislators depend on industry lobbyists for information on issues, and the literature tells us that lobbyists can perform as extensions of the legislator's staff, helping to write speeches, draft legislation, conduct liaison with groups supportive of issues the legislator supports, and so on. Lobbyists are as important in their roles as shapers of issues, defining the public agenda, as they are in providing tangible electoral support in the form of steering campaign contributions and organizing group support. By developing long-term relationships with key legislators, guaranteeing access whenever major regulatory issues need to be advanced or resisted, lobbyists can play a central role in making policy in regulation.

Co-optation of the Experts

Because the administrative process depends on the building of substantial information on the record, and regulated areas tend to cover issues that are technical to the industry, the use of specialists can be essential to effective participation both in that process and in the judicial appeal process. Larger firms with deeper pockets can afford to have a field's top experts on retainer, denying their availability to competitors. Before deregulation, AT&T provided support to many of the country's top experts on communications regulation, potentially making them unavailable to challengers such as MCI.

Trading Off the Agencies/ Choosing Regimes

Firms can sometimes choose their regulators. State regulatory regimes can differ appreciably, so that location decisions can be influenced by state regulations. Federal law in some areas of regulation allows states to have regulations more stringent than federal ones. In essence, firms can choose federal over state regulations by locating in a state that achieved primacy by closely following federal rules. In addition, the granting of primacy by a federal agency does not generally require that a state's regulations be identical to the federal regulations in every respect. Thus firms can track such differences. Finally, some areas of regulation allow a choice between a federal or a state regulator, for example, between establishment as a state mutual savings bank or a federal savings and loan.

Blowing the Whistle

Firms complain to regulators that competitors are in violation of regulatory standards. For example, there are two competing technologies in solid waste disposal: incineration and burial. The companies that specialize in each regularly complain to regulators that their competitors in technology violate air pollution standards on the one hand and effluent or ground water contamination standards on the other.

Regulatory Pork Barrel

Just as firms benefit from building pork barrel projects steered to their districts by legislators, so can firms obtain benefits in the form of regulations tailored to benefit them against their competitors. Thus, tariffs can be designed to raise the costs of imports from competitors. Standards can reflect bias for domestic or district products over international suppliers or competitors elsewhere in the United States.

Conclusion

Although its performance has been questioned, and though it has sometimes been used to divert public resources to private ends, regulation remains a central and essential function of government. It remains a work in progress, and the tasks of both scholars and policy makers in the future will be to devise increasingly efficient, effective, and just social and economic controls worthy of the democracy in which they are embedded.

Regulatory Flexibility Act of 1980

The Regulatory Flexibility Act of 1980 (referred to here as the Act), Public Law No. 96-354, was signed by President Carter on September 19, 1980. The Act had a major impact on the rule-making activities of government agencies as it attempted to minimize any disproportionate effect of federal regulations on small entities. This Act was part of a stream of legislation and executive acts, beginning in the 1970s, that sought to increase the flexibility and effectiveness of federal regulation. A number of new regulatory tools were implemented, sometimes across regulatory issue areas. The Act reflected a newly proposed regulatory design often referred to as "tiering," in which the burdens of regulation were adjusted for the size of the complying organization, so that the burdens faced by smaller organizations would be reduced. Through tiering, compliance would improve because it would become more feasible for small organizations to comply. This design was also viewed as a more equitable way to regulate, because it removed what some viewed as unjust, unreasonable burdens from small organizations. Tiering was sometimes incorporated into regulation via specific size guidelines, for example, being triggered by a specific number of employees such as 25 or 50. In the case of the Act, this size limit was left undetermined, leaving the agencies required to do regulatory flexibility analyses to indicate the appropriate reach of the regulation in question. The Act required all independent federal regulatory agencies and executive agencies to perform various analyses, calculate cost impacts, and evaluate alternatives with regard to the impact of their proposed regulation on small entities. Enforcement of the Act is performed by the Small Business Administration (SBA).

Passage of the Act resulted from complaints from small businesses that were going broke and drowning in federal forms as a result of federal regulations. Prior to 1980, small entities experienced the same burdens of regulations as their larger competitors, but with fewer resources. The Act recognized that the size of a small entity frequently has a bearing on its ability to abide with federal regulations. Compared with larger entities, a small entity may not be able to absorb the costs of complying with a particular regulation. These costs include staff time, direct compliance costs, record keeping, outside expertise, and others. The burden of these extra costs, which may be manageable for larger businesses, may not allow small businesses to set competitive prices, expend funds on development activities, or even remain in business.

The Act had three main goals. The first goal was to improve governmental agencies' understanding and awareness of the impact of their regulations on small entities defined as small business, small not-for-profit organizations, and small government jurisdictions. The second goal was to require agencies to communicate to the public by explaining their findings through various reports. Finally, the Act encouraged agencies to be flexible and provide regulatory relief by attempting to find an easier, less burdensome way for these small entities to comply with the regulations.

When proposing a new regulation, the Act requires governmental regulatory and executive agencies to publish a general notice, then prepare and make available to the public an initial regulatory flexibility analysis (RFA). The RFA was developed to place the burden on governmental agencies to review all proposed regulations to ensure that they do not unduly inhibit the ability of small entities to invent, produce, and compete while accomplishing their intended purpose. The initial RFA contains the objective and legal basis of the proposed rules and describes the agencies it applies to and the requirements for reporting and record keeping. In addition, it contains significant alternative proposals that could satisfy the objectives of the proposed rule at a cheaper cost to small entities and states any duplicative, overlapping, or conflicting federal rules. An RFA analysis is not required if the agency head certifies that their proposed rule will not have a significant economic impact on a substantial number of small entities.

Small entities are encouraged to participate in the development of new regulations and suggest alternatives by responding to the initial RFA. The Act required all regulatory agencies to solicit input from small entities through various means, such as publishing a semiannual regulatory agenda, publishing proposed rules in the Federal Register public forums and notices in industry trade publications, and making direct notifications. After the comment period for the initial RFA, a final RFA must also be made and published along with the final rule. Federal agencies are allowed to establish different compliance or reporting requirements for small entities, including giving them exemptions to the rule and allowing them different timetables for implementations. The final RFA needs to include a summary of public comments received and the action the agency has taken as a result of the comments. In addition, it must include a description of alternative proposals that were considered and rejected by the agencies with an explanation of why they were rejected.

Finally, the Act requires agencies to publish and implement a plan for reviewing existing rules. On a 10-year cycle, all agencies must examine their rules and make appropriate changes to minimize any economic impact these rules have on small entities.

Despite the passage of the Act, the small business community still complained that federal regulations were too numerous, complex, and expensive to implement. The failure of the Act to produce its intended results was partially attributed to the lack of a provision allowing small entities to directly challenge federal agencies' compliance in court. Without any enforcement provision, several agencies chose to not comply with the intent of the Act by certifying that their regulation did not have a significant impact on a substantial number of small entities. Others chose to do as little as they thought necessary to meet compliance, such as trying to satisfy the advance notification requirement by publishing completed actions in the federal regulatory agenda.

As a result of these concerns, Congress passed the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). The SBREFA gave small businesses a voice in the development of new regulations and provided them with assistance in understanding and complying with them. Under the SBREFA, federal agencies were required to produce small entity compliance guides and be responsive to small business inquiries concerning compliance issues. The SBA established the Office of the National Ombudsman and Regional Fairness Boards to investigate small business complaints about federal agency enforcement actions. The SBREFA also allowed small businesses that were unhappy with administrative decisions regarding the effects of regulations to seek judicial review of those decisions and recover attorney's fees and costs when a federal agency was found to have acted excessively in enforcing the regulations.

Rehabilitation Act of 1973

The Rehabilitation Act of 1973 applies to any program that receives financial support from the federal government. As the act states, "disability is a natural part of human experience and in no way diminishes the right of individuals to live independently, enjoy self-determination, make choices, contribute to society, pursue meaningful careers, and enjoy full inclusion and integration in the economic, political, social, cultural, and educational mainstream of American society" (Section 2(a)(3) of the Rehabilitation Act). To that end, the act's purpose is to provide "comprehensive and coordinated state-of-the-art programs of vocational rehabilitation, independent living centers and services, research, training, and demonstration projects" (Section 2(b)). The U.S. Department of Education's Rehabilitation Services Administration (RSA) is responsible for administering the act. The RSA develops and issues program regulations as well as the policy guidelines that support those regulations. The act is enforced at the federal level.

The Rehabilitation Act of 1973 represented a new approach toward providing individuals with disabilities with greater access to the workplace. One major change in policy was the act's requirement that vocational rehabilitation programs make individuals with the most severe disabilities their first priority. In addition, the act promoted consumer empowerment with the requirement that the consumer be involved in the development of the Individualized Written Rehabilitation Program (IWRP) and sign the final plan as an indication that he or she understood it and agreed with it. The act also supported rehabilitation research and independent living centers. Finally, the act mandated that the RSA conduct regular evaluations of programs that fall under the act.

Title V of the act focused on the civil rights of individuals with disabilities. Section 501 requires executive branches of the federal government to develop affirmative action plans for the employment of individuals with disabilities. Section 502 established the

Architectural and Transportation Barriers and Compliance Board. Section 503 prohibits federal contractors and subcontractors receiving $2,500 or more from engaging in employment discrimination against individuals with disabilities. Those with 50 or more employees or a federal contract of $50,000 or more were required to write an affirmative action plan. Section 504 prohibits any federally supported program (e.g., hospitals, school districts, state offices, colleges, and universities) from discriminating against qualified individuals with disabilities.

Since 1973, the act has been amended several times. The Rehabilitation Act Amendments of 1978 further strengthened the call for consumer involvement with an added focus on peer counseling (from peers with the same as well as different disabilities). The Rehabilitation Act Amendments of 1986 enhanced the support for rehabilitation engineering and provided support for special projects and demonstrations, all of which promote new advancements in rehabilitation. The Rehabilitation Act Amendments of 1992 made it clear that the person with a disability should be able to exercise choice and that competitive employment is the ultimate goal. In 1998, Section 508 was added to make information technology accessible to people with disabilities. The Americans with Disabilities Act of 1990 (ADA) built on the Rehabilitation Act's foundation by expanding protections to employers with 15 or more employees, including private, nonprofit, and government entities.

RELATIVISM, CULTURAL

Cultural relativism has been given at least two distinct definitions. On the one hand, "cultural relativism" is the view that an individual's beliefs and attitudes are largely shaped by the culture in which he or she lives. Put another way, a culture is the primary source of an individual's views. On the other hand, "cultural relativism" is the view that different societies accept different moral standards, have different moral beliefs, and thus frequently disagree on how to act morally. Both versions of cultural relativism are descriptive claims about the state of the world. Cultural relativism as a descriptive thesis must be kept distinct from ethical relativism. Ethical relativism is a normative thesis that states that one ought to follow the cultural norms of the society in which one lives. Clearly, a person can be a cultural relativist without being an ethical relativist.

Cultural relativism has a long history. The earliest exponent in the West was the Greek Herodotus, who pointed out that the Callatians ate the bodies of their dead fathers while the Greeks burned the bodies of their dead fathers. Both the Callatians and the Greeks were horrified at the practices of the other. Cultural relativism seemed to get a foothold in social science when the discipline of anthropology was born near the beginning of the 20th century. Anthropologists such as Ruth Benedict, Margaret Mead, and William Graham Sumner, among others, documented the widespread differences in ethical practice that existed throughout the world. In the late 20th century, a number of ethicists criticized the reigning ethical theories of utilitarianism and Kantian deontology for ignoring the influence of culture on our ethical beliefs. As a result of such criticism, John Rawls withdrew his claim for a universal theory of justice and announced that his theory was designed for liberal democracies. Assorted feminists and communitarian moral philosophers seemed to subscribe to both versions of cultural relativism defined above. Alasdair MacIntyre's approach based on communitarian virtue ethics was framed from within a cultural relativist standpoint. This emphasis on the role of culture was also a prominent feature of the advocates of postmodernism—a group of thinkers that went well beyond philosophers. In business ethics, Patricia Werhane, in expanding on the importance of moral imagination in ethical decision making, noted that one of the impediments to moral imagination was the tendency to think that we Americans had discovered the correct version of capitalism and that our form of capitalism could be exported to all other countries around the world. The failure of some prominent American professors to recognize the cultural parameters of American capitalism led them to give the Russians rather bad advice as they transitioned from communism to capitalism. In the context of Russian culture at that time, American capitalism became, in Russia, a lawless kind of capitalism often referred to as "Cowboy Capitalism."

At first glance, the descriptive claims of cultural relativism seem to be true. Even in today's "global society," there are widely different moral beliefs regarding what is right and what is wrong. Terrorists think the killing of civilians is morally justified. "Civilized" societies think that such practice is morally heinous.

But are the claims of descriptive cultural relativism true? There are plausible reasons to doubt the truth of cultural relativism. First, the underlying disagreement may not be a disagreement about ethical beliefs but may rather result from a disagreement about the facts on which the ethical beliefs are based. For example, those who think that the development of nuclear power plants is morally permissible and those who think their development is not morally permissible may disagree on the likelihood of a catastrophic accident at one or more of these nuclear power plants.

Second, the disagreement could be about conceptual issues rather than about moral judgments. For example, both sides in a dispute could agree that it is morally wrong to kill an innocent person but disagree as to what constitutes a person. At least some of the debate surrounding abortion, certain forms of birth control, and certain types of stem cell research are debates about what counts as a person.

The greatest challenge to the truth of cultural relativism is the possibility that there may be underlying principles behind the divergent moral practices and beliefs that might be held in common. If that were true, there would be universal agreement on the fundamental underlying ethical principles even though these universal principles might legitimately be applied differently in different cultural circumstances. This point can be illustrated by taking two of the basic principles from the two dominant ethical theories. Suppose we take the key principle of utilitarianism—that we should adopt the social practices and institutions that create the most good—as the underlying principle. It does not take much imagination to see how that principle could be applied very differently in different cultural circumstances.

The same type of analysis would work for someone who adopts a deontological point of view. Suppose one adopts as a fundamental moral principle the respect for person principle; that principle may indeed be accepted in all cultures, although what counts as respecting persons differs in different cultures. This point can be illustrated by the earlier example concerning the Callatians and the Greeks. Both demonstrated respect for their dead fathers but in radically different ways.

In addition to this theoretical consideration, international organizations have agreed, or are meeting to agree, on international standards. Perhaps the most familiar set of international standards is the United Nations Universal Declaration of Human Rights. Every member of the United Nations has accepted these standards as a condition of membership, and most of the countries in the world are members of the United Nations. Having said this, the member countries of the United Nations often disagree as to how to honor these human rights, and they disagree as to whether a given country has violated those rights. For example, the United States and China often accuse one another of violating one or more of the UN's stated human rights. For example, the United States has accused China of violating Article 5, which stipulates that no one should be subjected to torture or to cruel, inhuman, or degrading treatment or punishment. The basis of this charge is the allegation that China harvests the organs of executed criminals. (It should be noted that many accuse the United States of being in violation of Article 5 because it permits capital punishment.) On the other hand, China takes the existence of the large population of homeless people in the United States as showing that the United States is in violation of Article 25, which provides that everyone is entitled to a standard of living that includes food, clothing, housing, and health care. Whether these disagreements are fundamental or are differences in applying human rights in different circumstances is a matter of controversy.

The United Nations Declaration of Human Rights is not the only example of an attempt to develop universal standards. The International Labour Organization sets international standards regarding the treatment of labor. Other examples include the Rio Declaration of Development and the Environment and the United Nations Convention Against Corruption. These international agreements provide the basis for the 10 principles of the United Nations Global Compact. The UN Global Compact asks companies to embrace, support, and enact a set of core values in the areas of human rights, labor standards, the environment, and anticorruption. There are also a number of international agreements that govern business conduct in certain industries, such as the Fair Labor Association, which sets standards for the apparel industry as members of that industry outsource to "sweatshops." How extensive these international agreements turn out to be remains in doubt. However, it is significant to note that in this era of global capitalism, there is a growing recognition of the need for international standards governing business conduct.

The tendency to develop international standards is not the only challenge to cultural relativism. The very notion of cultural relativism suffers from certain conceptual ambiguities. First, what constitutes a culture? Some might argue that a common language is indicative of a culture. However, consider the United States. Suppose one were asked to identify the characteristics of American culture. What could be said? The United States is considered to be a highly pluralistic culture. This means that there are many cultures within the United States, and perhaps this means that there is no one identifiable culture of the United States. The country is even becoming bilingual or multilingual. For many Americans, Spanish is the language of choice, and in an increasing number of places, public instructions in airports, subways, and so on, are given in both English and Spanish. One of the first items on the menu when you try to conduct business on the phone is whether you wish to speak in English or Spanish. On the other hand, English is becoming the universal language—or at least the universal language of business—worldwide. Thus, identifying a culture is an increasingly problematic activity.

But to the extent that one can identify a culture, it is the existence of a certain minimal morality that makes such an identification possible. Suppose an anthropologist arrives on a heavily populated island and wants to know how many tribes are on the island. One key to answering that question is to ask whether the people on the northern part of the island are permitted to kill, steal, and commit violence against those on the southern part of the island. If they are, then there are at least two tribes. If they are not, you have evidence that there is only one tribe. Thus, what constitutes a culture, at least in part, is that the members of the culture practice a certain minimal morality with respect to one another. Killing, stealing, and wanton acts of violence are not permitted among members of the culture. Thus, rather than simply saying that different cultures have different moral customs, we also need to say that for any culture to be a culture there is a certain morality that must be practiced by members of the culture.

All these considerations indicate that the simple descriptive claim that different cultures have different moral practices is much more complex than it appears.

Despite these criticisms of the simple descriptive claim of cultural relativism, the continued existence of different ethical standards among people reminds us to be cautious in asserting the correctness of our own moral standards in all circumstances. We must also remember that differences in geography, population density, and economic development, among other factors, require that any universal standards need to be applied taking such factors into account. An appreciation of cultural diversity here reminds us that when circumstances such as the global conduct of business seem to require universal standards, then these standards need to be negotiated among the relevantly affected parties. Universal standards are more likely to be created than to be discovered.

Relativism, Moral

Definitional Issues

Moral relativism is a theory that can be applied to individuals, to cultures, or to moral theories themselves. At the individual level, individual moral relativism would argue that whatever an individual thinks is right or wrong really is right or wrong for that individual. A popular expression of this view is, "What's right for me is right for me and what's right for you is right for you." In philosophical discussions of ethical theory, this view is either identical with or closely allied to the doctrine of ethical subjectivism. Since most philosophers think that ethical subjectivism results in the very denial of the possibility of ethics as the term is normally understood, it will not be discussed further here. At the level of moral theory itself, moral relativism would argue that there is no ethical theory that is really objective. An ethical theory is objective when there are independent reasons that provide for its truth of adequacy. The key here is justification by reason rather than authority, be it personal charisma or cultural norm. Moral relativism at this level is an example of metaethical moral relativism since it denies the possibility of this form of rational justification. One needs to ask whether metaethical moral relativism is a moral theory (it seems that it is) and, thus, whether it is put forth as an objective moral claim. If so, it seems that metaethical moral relativism would contradict itself. If it is not put forward as an objective moral claim, why should any moralist pay attention to it?

Most moral philosophers discuss moral relativism at the level of cultures, and that is the focus of this discussion. At the cultural level, moral relativism is the normative ethical theory that says that what is really right or wrong is what the culture says is right or wrong. In other words, it is culture that determines the criteria for right and wrong. Thus, if the culture of Sweden has a norm that accepts the moral permissibility of abortion, then abortion really is morally justified in Sweden. If Ireland has a norm that abortion is wrong, then abortion really is wrong in Ireland, and it cannot be morally justified. In matters of right and wrong, culture is the ultimate judge but it is only the judge for that culture.

Moral relativism must be distinguished from cultural relativism, with which it is sometimes confused. Moral relativism is a normative ethical theory that is meant to instruct as to what is really right or wrong. Cultural relativism is a descriptive thesis that says that moral practices differ among cultures. Cultural relativism is a factual claim about the world.

Reasons for Adopting Moral Relativism

In the late 1800s and early 1900s, American politics was dominated by the doctrine of manifest destiny—namely, that America's destiny was to spread democracy, capitalism, and Christianity throughout the world. At about the same time, the discipline of anthropology was born. Early anthropologists included William Graham Sumner, Ruth Benedict, and Margaret Mead. These pioneers and others discovered a great variety of customs regarding morality throughout the world. What was considered moral in one place was almost always considered amoral or immoral in another. As an antidote to the cultural imperialism of manifest destiny, these social scientists and others urged a greater toleration of the moral customs of others. Thus, one reason for adopting moral relativism, some would argue, is that it encourages a healthy toleration of diverse moral customs—a toleration that is pragmatically necessary in a pluralistic world and cosmopolitan business environment.

Another reason for adopting moral relativism is to use it as a counterweight to cultural imperialism. There is a natural human tendency to think that one's culture has the correct morality and that other cultures are either backward or irrational in some way. Ethical relativism is an antidote to this tendency to think that one's culture has all the moral answers and that other countries are mistaken or misguided on matters of ethics. Some would argue that this counterweight is especially required in the United States in the early years of the 21st century. Many believe that when Americans speak of universal standards or universal human rights, they often identify these universal standards or universal human rights with American standards. The adoption of cultural relativism would be a corrective to this tendency. After all, if moral relativism is correct, there is no standard for right or wrong beyond the culture itself, and, thus, there is no basis for Americans to claim that their moral customs are the correct ones for cultures with different views.

Yet another reason for adopting moral relativism is the vast disagreement among moral philosophers and other thinkers about ethics as to which ethical theory is the correct one. Although all the major theories have their partisan defenders, it is easy for one to argue that all this disagreement simply shows that one cannot do better than one's culture as a source of ethical justification. Since the major ethical theories allegedly give different answers as to what is wrong, what is more reasonable than using culture as the default position?

Difficulties With Moral Relativism

Despite the reasons that have been given for adopting moral relativism, nearly all ethical theorists in philosophy reject it. Some defenders of cultural relativism have been tempted to use the alleged fact of cultural relativism to justify moral relativism. Those who attempt this approach argue that since it is true that moral practices differ among cultures, then what is really right or wrong depends on the culture. But the mere existence of cultural difference does not establish the truth of ethical relativism. After all, it is possible for a culture to be wrong about a matter of ethics, and if so, then it would not be the case that what is really right or wrong in that culture is what the culture says is right or wrong. Another way of showing the error involved is that one cannot derive an ought (what is really right or wrong is what the culture says is right or wrong) from a fact (there are differences among cultures with respect to what is right or wrong).

Moral relativism also is inconsistent with how we actually discuss ethical issues. First, if moral relativism is correct, there is no way to settle or even to rationally argue about conflicting moral practices in different cultures. If what is really right or wrong is what the culture says is right or wrong, then that seems to be the end of the discussion. Yet in the many debates among countries regarding matters of ethics, public policy, and business, people talk like objectivists in ethics and not like ethical relativists. If a country practices torture of criminals, the citizens of other countries that have a moral norm against torture do not say, "well, if torture is considered right in that culture, it really is right in that culture although it is surely wrong in our culture." Rather they say that torture is really wrong everywhere, even in countries where it is morally permitted. In other words, moral relativism is inconsistent with how we talk.

The moral relativist might reply that one certainly could criticize another culture. Indeed one might even persuade another culture to change its moral practice in some regard. In other words, there is a place for argument and even a place for moral reform. But notice how strange a discussion of reform would look if one is an ethical relativist. So long as the culture subscribes to the moral norm that the critic is challenging, that norm still really determines what is right or wrong in that culture. The plausibility of the critic's argument does not count until the cultural norm changes. If the critic is successful and moral practice changes, then what was right (wrong) in the culture becomes wrong (right). But this is surely a strange way of talking. Consider the practice of slavery in the Southern United States. If moral relativism is correct, then slavery was morally right in the South until the moral norm changed. But wouldn't we say that slavery was always wrong; it was never right even if it was accepted in the Southern United States.

There are also difficulties with the claim that the adoption of moral relativism would promote tolerance. First, the extent to which we should be tolerant and to which cultures we should be tolerant is controversial. (We should not tolerate cultures that endorse terrorism, for example.) Second, note that appealing to tolerance is to appeal to a cross-cultural moral concept. Not all cultures believe that one should be tolerant, and if ethical relativism were the correct moral theory, then they would be right. Thus, those who defend the value of tolerance and urge that nontolerant cultures be more tolerant are appealing to a moral norm that cannot be defeated by the fact that some cultures are not tolerant.

Moral Relativism and International Business

The leaders of multinational enterprises face genuine business issues when they wrestle with cultural relativism. The variables they must consider include the culture in their home country—the place where they are headquartered, their corporate culture, and all the cultures in the countries where they do business. Should they adopt moral relativism, or, as it is often expressed in business, "When in Rome, should they do as the Romans do?"

One might think that the obvious position to adopt is that of moral relativism. In this way, businesses can adapt to local custom and not be seen as cultural imperialists. In this way, they could be more competitive. But the issue is more complicated than that.

Many multinationals believe that a strong brand gives them a competitive advantage. What makes a strong brand? Obviously the quality of the product is a major contributing factor. But a strong brand depends on more than that. The reputation of the company is important as well. A well-defined set of corporate values, a specific mission statement, and an ethical corporate culture are components of a corporation's reputation, and these in turn contribute to a strong brand. Nike provides an excellent example.

Multinational corporations try to avoid the following dilemma: doing business abroad in a way that opens them up to moral criticism at home. Many of the sportswear and apparel wear corporations such as Nike found themselves in just this dilemma when they were criticized in their home countries because of the labor practices of their suppliers. The suppliers were accused of mistreating their workers and of paying wages that would not provide a minimum standard of living. In other words, these multinationals were using sweatshop suppliers. Companies such as Nike did not respond to their moral critics at home by invoking cultural relativism. They were not content to simply reply that they were merely following the norms of cultures that happened to differ from the home culture. Rather, to protect their brands and to keep a level competitive playing field, they worked together and with their critics to establish a set of ethical standards that would apply to all their suppliers wherever these suppliers might be located. In other words, an industry standard was developed that transcended the norms of the suppliers' cultures.

In the European Union, the guiding principle, if not universal practice, is that corporations should practice sustainability. A corporation's business practices are sustainable if they are financially sound, environmentally friendly, and socially responsible. These are the three pillars of sustainability. For most Europeans, the key element in social responsibility is to be in conformity with and supportive of human rights. Reference here is usually to the United Nations Declaration of Human Rights.

The challenge is especially great when multinationals do business in countries that systematically violate human rights. Certainly, companies themselves should not violate human rights. But many would go further. They would argue that multinationals should not do business in countries that violate human rights. This demand is not new. Many companies left South Africa when that country practiced the form of racial discrimination known as apartheid. Lately, many multinationals will not do business in Myanmar (Burma) because the government of that country systematically violates human rights.

Thus, most multinational corporations do not practice moral relativism. They will not subscribe to cultural norms in host countries when those norms are inconsistent with the fundamental values of their own company. They are also cognizant of critics in their home countries who would condemn business practices that violate home country norms or universal norms as found in the United Nations Declaration of Human Rights.

Nonetheless, multinationals are well aware that they cannot practice ethical imperialism. Multinationals need not insist that business be done in every respect the way the multinational or the home country of the multinational would do it. As two prominent business ethicists have argued, there is a certain amount of moral free space where practices are not in violation of any universal norms even if the practices violate the norms of the home country or the company. Gift giving (as opposed to bribery) in many Asian countries, especially Japan, is a good example of a practice that is morally permissible there even if it is frowned on in the United States. In Japan, it is morally permissible and good practice to participate in the culture of gift giving.

The struggles of multinationals to deal with the "When in Rome, should you do as the Romans do?" problem illustrates the strengths and weaknesses of moral relativism. On some occasions, a multinational should not follow the moral norms of the host country but rather should follow the moral norms of the corporate culture or should follow norms that are considered universal. For these reasons, ethical relativism cannot be the sole guide. On the other hand, multinationals should not be moral absolutists. They should not think that there is one and only one morally correct way to practice the moral life. There is an important place for the universal value of toleration and for moral free space where different moral norms in different cultures are all morally permissible.

Religious Discrimination

Discrimination, in its etymological sense, means the action and effect of making a distinction, or differentiating one person or thing from another. Discrimination itself is not morally wrong. When a company selects personnel, discrimination occurs in accordance with the profile required for the job, and this is not necessarily incorrect in ethical terms. However, in talking about discrimination, this word generally has a negative connotation, meaning “invidious discrimination.” In this sense, the common meaning of “discrimination” includes a judgment based on unacceptable ethical or legal motives, one of which involves religion.

Religious discrimination takes place when one person is treated less favorably than another is, has been, or would be treated in a comparable situation on the grounds of religion. The prohibition of religious discrimination covers most social activities, including business.

Three forms of religious discrimination can be distinguished: (a) *direct,* where this less favorable treatment occurs unmasked, (b) *indirect discrimination,* where an apparent neutral provision, criterion, or practice would put persons having a particular religion or belief at a particular disadvantage compared with other persons, unless such is objectively justified by a legitimate aim and the means of achieving that aim are appropriate and necessary, and (c) *religious harassment,* which occurs when unwanted conduct related to any of the grounds of religion takes place with the purpose or effect of violating the dignity of a person and of creating an intimidating, hostile, degrading, humiliating, or offensive environment.

Many international human rights doctrines have articulated the freedom from religious discrimination as a human right. However, people in many theocratic countries deny the importance of such a right and maintain the criteria of adherence to the official religion as essential in filling leadership roles in society and business. This commitment is founded on a belief in the fundamental rightness of their faith, which overrides the standards of rational ethics, as defined by Western philosophers and political theorists. Freedom from religious discrimination is closely related to another even more fundamental right: religious freedom. Religious freedom is seen as necessary for carrying out the moral duty to search for the truth, especially with reference to God, religion, and a meaningful sense of life. It also provides protection for those who do not believe in God to adhere to their own beliefs.

Religious freedom requires immunity from coercion for individuals and social groups, including businesses, governments, and any other human power, which can be forced to act in a manner contrary to their own beliefs. Religious discrimination impedes or even prevents religious freedom and frequently entails the disdaining of people and lack of respect for individual freedom.

Significant International Texts and Legislation on Religious Discrimination

There are significant international declarations against religious discrimination. In 1948, the General Assembly of the United Nations adopted and proclaimed the Universal Declaration of Human Rights, in which Article 2 states that everyone is entitled to all the rights and freedoms set forth in the Declaration, without distinction of race, color, sex, language, religion, or political or other opinion. Article 16 adds that everyone has the right to freedom of thought, conscience, and religion. In 1981, in a more specific way, the General Assembly adopted the Declaration on the Elimination of All Forms of Intolerance and of Discrimination Based on Religion or Belief.

Prohibitions against discrimination on grounds of religion are also present in the legislation of the United States and other countries. Title VII of the U.S. Civil Rights Act of 1964 makes it unlawful for employers to discriminate against any individual on the grounds of religion. With the Equal Employment Act of 1972, the U.S. Congress amended Title VII requiring that employers reasonably accommodate the religious preferences of employees when this can be done without undue hardship when the employees are conducting the employer's business. In addition, it clarified that the term *religion* includes all aspects of religious observance and practice as well as belief. The Workplace Religious Freedom Act of 2003 also amended Title VII of the Civil Rights Act of 1964 to establish provisions with respect to religious accommodation in employment. In Europe, the Council Directive 2000/78/EC establishes a general framework for equal treatment in employment and occupation prohibiting, among other things, discrimination on grounds of religion or belief. Its prohibitions included the types mentioned above: direct and indirect discrimination and religious harassment. Since 2003, national legislation in European Union member states has been used to develop the implementation of this directive.

From both legal and ethical perspectives in the Western tradition, it can be stated that freedom from religious discrimination is an important right, which should be respected and fostered, but it is not an absolute right and, in certain circumstances, another right may have priority when a conflict arises.

Freedom From Religious Discrimination in the Workplace

The problem is that religious discrimination is a constraint to employers' freedom in hiring, promotion, dismissal, and work conditions within a company, and conflicts can arise. Nondiscrimination on religious grounds requires the employer to provide reasonable accommodation to an employee's sincere religious beliefs, unless this accommodation would cause an undue hardship to the company. From a legal perspective, at least in the United States and in the European Union, this is also mandatory. However, not only the employer but also the employee should make an effort to arrive at a reasonable solution to avoid religious discrimination.

In practice, it is difficult to establish clear rules about what a "reasonable accommodation" and an "undue hardship" are. Determining them requires common sense and practical wisdom to explore imaginative and fair alternatives. Legal cases and empirical information can help to find an appropriate solution in each situation, which is compatible with the employee's religious beliefs without compromising the employment entitlements of other employees and with minimal costs to the enterprise.

Undue hardship is generally evaluated by considering the damage that religious discrimination would cause. It is assumed that avoiding religious discrimination could have a cost, but this cost has to be reasonable. This is not because profits are intrinsically more important than people, but profits are related to other people's interests and rights and perhaps to the competitive continuity of a business, which obviously affects people's well-being. The Workplace Religious Freedom Act of 2003 clarifies that, for legal purposes, the term *undue hardship* means an accommodation requiring significant difficulty or expense, including (a) the costs of loss of productivity and of retraining or hiring employees or transferring employees from one facility to another; (b) the overall financial resources and size of the employer involved, relative to the number of its employees; and (c) for an employer with multiple facilities, the geographic separateness or administrative or fiscal relationship of the facilities. From an ethical perspective, these criteria could also be valid. These legal criteria provide an insight to aid sound ethical judgments in specific situations.

There are some kinds of businesses or organizations in which a certain religious belief could be necessary because a religious orientation is an essential part of the organization's mission. This is the case, for instance, with religious institutions, which require appropriate people to carry out their mission properly. Similar reasoning could be extended to some key positions in educational or medical centers that define themselves as organizations with a religious mission. U.S. legislation explicitly allows religious discrimination for religious institutions. In Europe, this is not so explicit, but it can also be justified.

Some Specific Issues

Religious Feasts, Worship, and Prayers

Most religions have feast days in reverence to divinity, during which adherents pray, worship, and enjoy the day in particular ways. Jews celebrate the Sabbath, as the weekly Lord's day, remembering the seventh day of Creation, on which, according to the Bible, God rested. According to Jewish tradition, Jews shouldn't work on Saturday, and some Jews do not work past sundown on Friday afternoon. Christians consider Sunday as the fulfillment of the Sabbath, because this is the day of Christ's Resurrection. They participate in the Eucharist or other religious services and abstain from working. For Muslims, Friday is the day they meet to pray in mosques.

Apart from this, most religions have special festivals or periods of time with special religious significance. In addition, Muslims generally have to make a pilgrimage to Mecca once in their lifetime. In many companies, it has been not so difficult to accommodate business schedules to holy days or to religious duties on these days, through a sense of comprehension and flexibility and a good rotation system.

However, some managers think that praying five times a day, which is required in Islam, could be more difficult to harmonize with production needs. It could even be disruptive and cause resentment among other employees, especially in societies in which Muslims are a minority. In spite of this difficulty, some companies have found solutions based on goodwill of both employer and employee.

Dress and Grooming Policies

Certain business policies, compulsory for every employee, can pose dilemmas of religious discrimination. Thus, dress requirements in some companies, such as those for people in transportation, security guards, fast-food workers, and so on, can conflict with the practices of Sikh employees who wear headscarves or turbans for religious motives. A successful solution has been to permit wearing headscarves or turbans, while maintaining the rest of the required uniform.

Another conflict could appear when the workplace requires certain clothing and an appearance that may conflict with certain religious beliefs (e.g., that women should keep their legs and head covered at all times). Sometimes, as long as no damage is done to the business, companies admit a certain degree of flexibility in clothing requirements to avoid religious discrimination, but this is not always possible. In such cases, management generally prefers making this point clear when contract conditions are discussed.

Handling Food

Some religious practices, such as wearing a beard or having long hair can conflict with health and safety requirements. Some clear regulations on this point help us to find solutions. Those who handle food need to keep long hair tied back or otherwise restrained. A hygienic head cover for long hair and a net for long beards are generally accepted as a reasonable accommodation.

Training Programs

Some specific training programs, for instance, those based on New Age spirituality, can pose a problem. These programs employ a variety of techniques (meditation, self-hypnosis, altered states of consciousness, and guided visualization) that can conflict with the employees' religious beliefs. These kinds of training programs, which are not too common, have been declared noncompulsory by courts on grounds of religious discrimination.

Religious Symbols

Forbidding discreet religious symbols is generally understood as religious discrimination. A more complex case arises when certain symbols might seriously annoy or offend other employees or customers. In this latter situation, some people suggest employing common sense and flexibility to arrive at the best solution for both sides, and, in practice, it is not too difficult to find solutions that work for all.

Free Speech and Proselytism

Free speech on one's own religion and even respectfully trying to persuade others about religious matters without neglecting business obligations is normally allowed. However, proselytizing using harassment, especially if it comes from a supervisor, is a different matter. Harassment is a form of religious discrimination, as has been mentioned above.

Being aware of situations of religious discrimination, such as those described here, means respecting human freedom. This helps avoid expensive trials, negative corporate image, and loss of reputation.

Religiously Motivated Investing

Religiously Motivated Investing and the Socially Responsible Investment Community

Religiously motivated investing (RMI) is a rapidly evolving core component of the larger socially responsible investment community. Understanding the contextual nuances of RMI and its placement within this community requires a brief overview of socially responsible investing itself. The term *socially responsible investing* (SRI) encompasses an investment strategy whereby financial contributions are placed into investment vehicles designed to combine the traditional investment philosophy favoring profit maximization with values-based component-seeking nonfinancial benefits. Such nonfinancial benefits are often referred to as social returns. These social returns vary in scope but may be broadly defined as corporate policies and actions that enhance a socially responsible investor's specific environmental, religious, or social values. It is important to note that such enhancements may or may not have any impact on the profit-maximization component of the socially responsible investment. Therefore, a successful socially responsible investment portfolio will appreciate in value over a specific time period (when compared with an appropriate financial benchmark or to returns from a traditional and similarly situated investment portfolio) while also significantly advancing an investor's specific social values. A quasi-successful SRI portfolio may earn substandard financial returns but successfully advance an investor's specific social values—a result acceptable to many socially responsible investors. Although *socially responsible investing* is the most common term for this practice in the United States, the concept is also referred to as ethical investing (primarily in the United Kingdom and Australia), moral investing, or values-based investing.

Today, major institutional investment groups such as corporations, hedge funds, insurance companies, mutual funds, pension funds, religious institutions, and universities, along with the environmentally/religiously/socially motivated individual investor, are becoming increasingly involved in SRI. Similar to the traditional investment community, religiously motivated investors take advantage of three distinct investment strategies to advance their investment goals: (1) social screening—the affirmative investment in (or divestment of) companies meeting (or failing to meet) predetermined social investment objectives; (2) shareholder advocacy—a process by which investors choose to initiate discussions with company management, sponsor or cosponsor shareholder resolutions, or boycott company products or services in an effort to induce company management to modify policies in accordance with specific social objectives; and (3) community investment—where investment funds are channeled directly to communities where such resources have been historically scarce with the intention of fostering regional economic development.

At the dawn of the 21st century, the SRI industry claims that more than $2.16 trillion is invested in professionally managed portfolios implementing at least one of the three SRI investment strategies mentioned previously. This figure, touted as representing one out of every nine dollars invested professionally in the United States, grew from $1.19 trillion in 1997 and from $40 billion in 1984. It is important to note that many scholars remain skeptical of the accuracy of these figures and toward the effectiveness and widespread use of SRI. While many peer-reviewed academic studies demonstrate that SRI earns substandard returns and is merely growing in pace with the traditional investment strategies, other studies demonstrate that SRI is becoming more prominent and that socially responsible investors are increasingly able to achieve desired social objectives while also earning competitive returns as compared with traditional investment philosophies.

Three Core Classes of SRI Investors

SRI is an umbrella concept covering three core areas of socially responsible investment: (1) environmentally motivated investing (EMI), (2) RMI, and (3) socially motivated investing (SMI). While investors from all three core groups seek social returns along with capital appreciation, the major difference between these investors stems from the motivations behind their investment practices. Environmentally motivated investors generally seek to invest in companies where corporate policies and actions either benefit, or do no significant harm to, the global or local environment. Issues such as global warming and deforestation often top the agenda of EMI. Religiously motivated investors are generally guided by issues central to their particular religious traditions. Historically, core RMI issues revolved around alcohol, gambling, and tobacco and have recently encompassed human dignity and antifamily entertainment as well. Socially motivated investors, not specifically motivated by environmental or religious issues, generally invest in companies whose policies and practices adequately address key contemporary social issues such as diversity, discrimination, and corporate governance. Although these distinctions make for a clean categorization of investment motivations, they are not perfect representations of the SRI community overall. For instance, the investment strategies of many religiously motivated investors may focus on issues more commonly found in the environmentally or socially motivated investment communities. In fact, at any time, a socially responsible investor may be interested and invested in companies dealing with issues important to all three core SRI groups. While such issue crossovers commonly occur, at any given time the majority of socially responsible investors can be classified as primarily pursuing EMI, RMI, or SMI.

Religiously Motivated Investing: In-Focus

Members of the RMI community hail from diverse religious philosophies; for instance, the Catholic Sisters of Charity of Cincinnati have emerged as effective shareholder advocates, while managers of the Amana Mutual Funds are expanding the practice of investing according to Islamic investment principles. Although various world religions can stake a claim to investing according to their religious practices, the most prominent RMI investors come from the Christian, Islamic, and Jewish religious traditions. Historically, a less sophisticated form of RMI emerged in America during the early 20th century as certain religious groups—specifically the Methodists and the Quakers—expressly avoided investing in companies dealing in alcohol, gambling, or tobacco, also known as the "sin stocks." The contemporary history of RMI began in the 1960s as certain groups of religiously motivated investors, opposed to the Vietnam War, screened from their portfolios companies involved in the production of weapons or military-related products. In the 1980s, religiously motivated investors joined forces with many other socially responsible investors urging divestment from companies involved in supplying products or services to or within the apartheid regime in South Africa. The tobacco-related litigation of the 1990s shed light on this key RMI issue as religiously motivated investors lobbied for additional restrictions on the production, distribution, and selling of tobacco and tobacco-related products. At the turn of the 21st century, areas such as human dignity (sweatshop and child labor) and antifamily entertainment (graphically sexual or violent programming in television, movies, or video games) are beginning to garner the attention of the religiously motivated investment community, while the traditional avoidance of sin stocks remains prominent.

RMI emerged as a specific investment philosophy as religious adherents began to realize that companies included within their investment portfolios were not operating in accordance with their religious beliefs. While continually striving to incorporate specific religious philosophies into their everyday activities, friendships, relationships, and careers, these investors were either unconcerned or unsure what products and services their investment dollars were promoting. To remedy this contradiction, these investors began to incorporate their religious beliefs into their investment philosophies. Today, to make their investment strategies compliant with their religious tradition, religiously motivated investors look to their religious philosophies, sacred texts, and community religious leaders for guidance in determining the issues on which they will focus their investment energies. Once these core issues are selected, religiously motivated investors commonly undertake a combination of the key SRI strategies of social screening, shareholder advocacy, and community investment.

RMI and Social Screening

Similar to contemporary EMI and SMI groups, religiously motivated investors use social-screening techniques to develop their investment portfolios to meet predetermined religiously motivated objectives. While this practice involves a small amount of screening specific companies into portfolios (positive screening), the majority of RMI groups screen from their portfolios companies not meeting their social standards (negative screening). Such negative social screening results in an investment portfolio free from companies whose policies contradict moral principles of the particular investor's religious tradition. Today, issues such as human dignity and antifamily entertainment combine with companies' dealings in alcohol, gambling, and tobacco as the most common negative screens for religiously motivated investors.

RMI and Shareholder Advocacy

Religiously motivated investors also use common shareholder advocacy tactics, including discussions with management, shareholder resolutions, and boycotts attempting to move corporate policies closer to specific religious investment objectives. While alcohol, gambling, and tobacco remain potent issues for RMI shareholder advocacy, the same emerging issues found in the screening process are often subjected to advocacy practices as well. For example, major religiously motivated investors, led by a Catholic group, recently cosponsored a shareholder resolution at the Walt Disney Company urging company executives to analyze and report how the prominent placement of smoking in television commercials and movies negatively influences society—particularly teenagers. Another Catholic investment group recently urged a major Fortune 500 company to report on the economic effects—both foreign and domestic—of its foreign weapons and weapons-related sales.

In addition to the predominantly RMI issues, religiously motivated investors are also concerned with mainstream EMI and SMI issues. A recent example of this cross-interest emerged out of the recession of 2001 and the renewed focus on corporate governance. During 2005, Baptist, Catholic, and Methodist investment groups cosponsored shareholder resolutions alongside socially motivated investment groups advocating for the separation of the chief executive officer and board chairperson roles and an analysis of excessive executive compensation. In addition, allying with environmentally motivated investment groups such as the As You Sow Foundation, the Adrian Dominican Sisters advocated against genetically modified organisms that may allow dangerous substances into the world's agricultural environment. These groups cosponsored a shareholder resolution asking the DuPont Company's board of directors to review the company's internal controls and report to shareholders concerning the potential impact on the worldwide seed market and risk management.

RMI and Community Investment

Religiously motivated investors are increasingly joining the community investment movement by providing financial assistance in communities traditionally underserved by financial institutions in an attempt to stimulate economic development. RMI groups are among the many SRI community groups allocating funds into Community Development Financial Institutions (CDFIs) to provide affordable housing, entrepreneurial microloans, and job opportunities where such opportunities have been historically scarce. In 2001, the Social Investment Forum—a national nonprofit SRI trade association—issued the 1% Mark challenge. This challenge urged the entire SRI community to invest at least 1% of their assets into community investment programs. In 2002, The Mennonite Mutual Aid Praxis Mutual Funds became the first religiously motivated investment group to achieve the 1% Mark challenge goal.

RENT CONTROL

Rent control refers to laws or ordinances that regulate how much landlords can legally charge for their property. In its simplest form, there are two approaches to rent control. The first approach is that a "fair rent" is fixed for every unit and that an enforcement mechanism is established to ensure that these rents are in fact charged. The second form of rent control is a "control on rent increases," regardless of the current rent level. Rent control was established to protect renters from excessive rent increases, especially if such an increase could lead to renters being forced out of the premises. As such, rent control was intended to help renters, especially indigent ones, by allowing them to continue living in areas which otherwise would be too expensive for them to afford since rents would be too high for their level of income. In fact, rent control is often enacted in times of severe housing shortages and steep rent increases, for example, due to war or hyperinflation. Rent control is an international phenomenon and exists in both developed and developing countries.

In a free market, rent is the result of supply and demand for a rental property. However, rent control fixes this outcome at an artificial level, thus creating an imbalance between supply and demand. Even so-called second-generation rent control, which is when landlords are allowed to escalate rent in certain situations, will lead to such an imbalance. For rent control to achieve its desired outcome of creating more affordable housing for lower-income renters, the market rent in equilibrium would have to be higher in the absence of rent control than it is in its presence.

Factors of supply and demand along with the lack of income constraints often limit the effective matching of lower-income families with restricted income properties. Because of the reduced prices landlords must accept for their investment, new investment in rental properties is discouraged. This resistance to investing in rental property creates a shortage of these properties. Since there are fewer rental properties than the market demands, the landlord has more renters from which to choose.

On the other hand, rent control can create an excess demand for rental properties. This excess demand comes from two groups of renters. The first group consists of those renters who prefer renting over buying since rents are kept artificially low. In some situations, these renters have been known to use their financial resources to buy other property while continuing to live in rent-controlled apartments. The individuals then rent out the purchased property, generating personal income, while maintaining residence in the rent-controlled apartment.

The second group consists of those renters who are attracted to the area with the low rent-controlled prices and are willing to commute. Even with the added expense of commuting, it could be more cost-effective to live in the rent-controlled area. Together, these two groups create an artificial shortage, as shown in Figure 1.

Social and Ethical Implications

However well-intended the concept of rent control may be, empirical studies indicate that it seems to have failed its intended objectives. While some lower-income tenants have enjoyed the intended benefits of rent control, much benefit has gone to those less in need. Instead of creating a fair and equitable opportunity for lower-income renters, there are data that show that rent control has created greater hardships and inequities for all involved. In many cases, it is not the low-income renter who occupies the rental property but someone in a more financially secure position who is profiting from the situation. Since rent control in general does not place constraints on the income levels of prospective renters from which landlords may choose their tenants, they will be drawn to choose those tenants

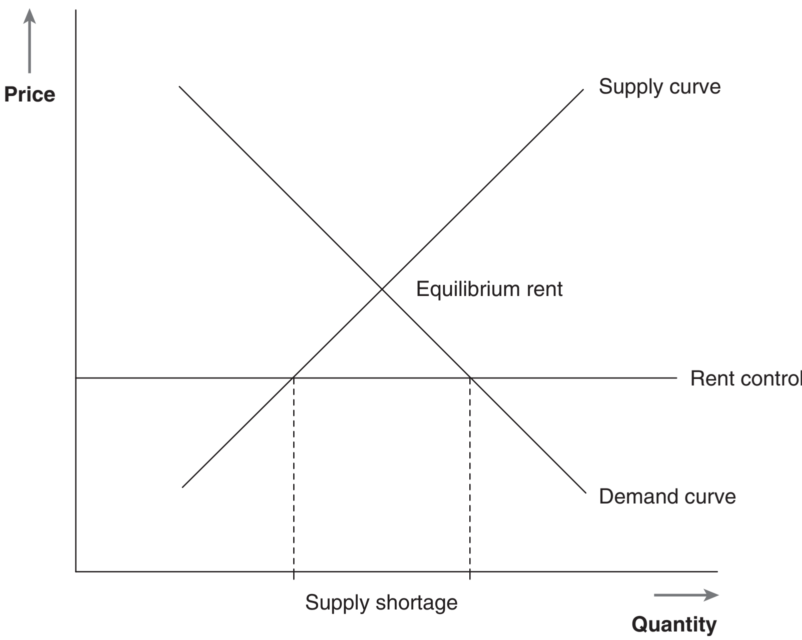

Figure 1 Supply and Demand Graph

who are more likely able to meet their rent payments on a consistent and timely basis. These renters tend to be those in the higher-income brackets.

This often leads to renters occupying too much space for their needs. For example, an elderly couple, whose children have left their home, keep a large apartment, seeing that their costs are low and could go up if they were to move to a smaller apartment. On the other hand, a young couple with children is unable to find a bigger apartment because people enjoying rent control benefits are occupying them. This can lead to another unintended outcome of rent control—namely, it limits the exchange opportunity to the one who values the property rights the most. By definition, the use of a resource is economically efficient when the property rights associated with the resource are held by the one who values them the most.

In addition, rent control may lead to reduced maintenance. Landlords of rent-controlled apartments often delay or even completely avoid maintenance in an attempt to reduce costs and increase their returns to compensate for lost rental income. While the landlord may attempt to withhold maintenance on all rent-controlled properties, those occupied by higher-income individuals will be in a better position to fight this lack of services. They may be able to hire an attorney to sue the landlord to force him or her to do the required maintenance, or they may have the financial ability to make the necessary repairs themselves. However, lower-income individuals will often be at the mercy of the landlord, unable to take the legal action often necessary to force the landlord to comply and make necessary repairs.

Rents, Economic

Rents have a specific meaning in economic theory. They are equal to any excess payment made to a resource over and above the amount necessary to keep that resource under current employment. This necessary amount is equal to the opportunity cost of the resource; that is, the payment it could receive in its most desired alternative employment. Consider, for example, a famous movie actor who receives a very high salary due to the large revenues generated for movie producers. Of course, if the film industry did not exist, this actor would not be famous and could not, therefore, generate such large revenues. As such, the salary he or she could secure as an actor would be a lot less. The amount he or she would accept to remain an actor is the salary floor on which any excess payment is considered an economic rent. It is obvious, then, that actors earning multimillions of dollars per year are earning a salary that is mostly economic rent. And this rent is paid to them because of their fame that arises from a unique talent that is suited to their current occupation.

The concept of economic rent was originally applied by 18th-century economists, notably David Ricardo, to the agriculture sector. If land is homogeneous and in abundance, it has an opportunity cost of zero; that is, it will either be gainfully used or remain idle and intact. Thus, any payments made to landowners for the use of their land become economic rent in their entirety; in fact, economists refer to it as Ricardian rent. If the land is limited in availability, then any payment above its most gainful use would be the economic rent in that case. But suppose, on the other hand, that land is made up of tracts of different qualities within a market area. Each tract is, therefore, usable for the different activities which are best suited to the qualities concerned. Since the opportunity cost of each tract is different, if a single price were paid to use any of these tracts for some common activity, it would result in what are known as differential rents.

What a tract of land and a famous movie actor have in common is that they both remain available in the long run to be employed in a fashion commensurate with their potential. Their availability for use is independent of any payment offered which is above their opportunity cost. Sometimes, however, rents could be limited to the short run only. In this case they are known as quasi rents (a term first used by the 19th-century economist Alfred Marshall). Quasi rents occur when an economic profit is earned on a resource or activity whose supply is fixed in the short run. In the long run these quasi rents disappear. As an example, consider a business that uses a patented technology and, as such, produces a unique product. This patent gives the business a monopoly situation whereby it can set a price above the economic cost of production so as to earn a profit equal to the quasi rent. When the patent expires, and other businesses are allowed to use the technology, these quasi rents will disappear as the business now faces competition. Unless the producer benefits from long-run barriers to entry, such as economies of scale, its monopoly rents can be competed away by new entrants to the market.

Quasi rents could also become a long-run cost of doing business. As an example, consider a manufacturer who has leased (rather than own) a factory in a particular city. If the city grows in population, the manufacturer's sales may rise and quasi rents could be earned as a result. This analysis assumes that revenues are rising faster than costs (of which the fixed lease payment is but one component). In the long run, when the lease comes up for renewal, the factory owner could raise the required lease payment by the amount of the quasi rents expected to be earned by the manufacturer over the lease period. To the manufacturer, the quasi rent now becomes an opportunity cost of doing business using that factory.

In another setting, the manufacturer could enjoy a government-issued license, which limits the competition faced in the marketplace. When the license comes up for renewal, however, the government could raise the cost of the license by the amount of quasi rents expected to be earned by the manufacturer. On the other hand, the government could make the license available to any business wishing to spend the time and money required to successfully lobby for it. The collective amount of money spent in this rent-seeking situation could dissipate some or all of the quasi rents, with all this wealth being transferred to the government, to lobbyists, to lawyers, and so on.

Economic rents, when they exist in the long run, are not a source of economic waste or inefficiency. It is meaningless to say that a multimillionaire movie actor is "overpaid." While it is true that the actor is being paid multiple times more than the opportunity cost of remaining an actor, the fact is that the employer is willing and able to afford the salary due to the actor's revenue-generating ability. Paying ever-higher amounts for fixed tracts of land is also not wasteful because the rents are a signal that the users of the land expect to generate enough revenue from their production to validate the rent being paid. Thinking about economic rent in this way prevents one from making the error of assuming that high rents lead to high costs of finished goods. It is the demand for the finished goods themselves, and the higher price signals received, that filter down into the costs of employing productive resources such as land.

Quasi rents, on the other hand, do indicate inefficiency because the market has not been able to adjust fully the level of competition necessary to prevent a monopolist from earning them. Quasi rents earned by monopolists generate a deadweight loss in the market. By eliminating barriers to entry, the government eliminates the quasi rents; by instituting barriers to entry, the government creates the environment necessary for quasi rents to be earned. Rent seeking is a phenomenon propagated first and foremost by the governing authority.

The socially optimal situation is one in which there is sufficient competition to prevent quasi rents. The government may need to eliminate barriers to entry to promote competition. Quasi rents signal persistence of inefficient monopoly. Long-run economic rent is in contrast not a signal of persistent inefficient monopoly. The government would, therefore, make a policy error in erecting barriers to entry.

Reputation Management

Reputation management is a term that has recently gained broad recognition, referring to methodical efforts by business managers to influence perceptions about their businesses. However, the notion that reputation can and should be managed has been around since ancient times. Reputation, which can apply to institutions or to individuals, is analogous to perceptions of character—and while it sometimes is assumed that having a reputation is a good thing in and of itself, an institution can have a good or bad reputation just as a person can have a good or bad character, and reputation measures are as multifaceted as are the purported elements of character. Socrates said that the way to earn a good reputation was "to endeavor to be what you desire to appear," optimistically suggesting a confluence of reality and perception. Although Socrates emphasizes the importance of good moral character to reputation, his remark on its face is not inconsistent with Machiavelli's concession that sometimes political and economic success require a reputation for being heavy-handed and conniving while nonetheless being well respected.

It is clear from these historical views that there is an element of reputation management that is concerned with public relations but that that is not all there is to reputation management. As managers grow more sophisticated about performance management and markets grow more transparent about performance measurement, reputation has become one of those so-called soft characteristics of a business that are believed to have a material impact on market value. Therefore, as analysts, the media, and other stakeholders express interest in corporate reputations, business managers seek ways in which to influence them.

Reputation Indices

What companies have the "best" reputations? Not only is there never full consensus on an answer to this question among the many reputation indices that have been released by the media and other parties, but also, there is no full congruence on what it means to measure reputation. However, there are generally some companies, brands, and individuals that tend to perform well (or poorly) across indices, whether they purport to measure reputation, respect, admiration, brand, or some other variation on a theme. So while reputation indices differ substantially in approach and outcomes, they share the goal of measuring stakeholders' perceptions of business entities.

Most business reputation indices focus on company reputations, although clearly brand reputation influences company reputation and vice versa, while the reputations of individual executives can reflect or less often clash with the reputation of the enterprise. One aspect of reputation measurement methodologies that leads to important differences in results concerns the survey population. Perceptions of the general public tend to differ from perceptions of, for example, chief executives, stock analysts, the business media, or other specific expert populations, while perceptions also vary as a result of other factors, including respondent nationality, economic class, and other demographic indicators. These indices do not always measure a company's internal reputation (among its employees), which may be as important as its external reputation but may be the result of significantly different factors.

These differences among survey populations and methodologies lead to different attitudes about what matters to corporate reputation. Reputation generally is sometimes mistakenly equated with a reputation specifically for corporate responsibility, which in some studies is merely one factor among many that constitutes overall reputation. While the rise of socially responsible investing has increased the potential impact of corporate social performance on corporate financial performance, not all investors (or reputation indices) place equal weight on the importance of social responsibility to corporate reputation. In general, the factors that constitute various reputation indices vary significantly enough from study to study and there is no general agreement even on a typology of factors. Certain factors focus primarily on financial success and efficiency, others on strategy and governance, corporate social responsibility and trustworthiness, product innovation and quality, brand and name recognition, and even on how well the company does with regard to managing its reputation (e.g., through communications and public relations, marketing, or political maneuvering). While a good reputation may be seen as inherently valuable, often these studies seek to make a descriptive connection between a good reputation (however defined) and good financial performance.

As a general rule, the reputation studies that generate wide publicity generally concern companies that have well-established, often global, reputations (such as automobile manufacturers or life insurers). Companies that serve niche markets may have established reputations with their stakeholders but may remain relatively unknown to the broader investing public (such as auto parts manufacturers or reinsurers). Conversely, companies that sell consumer products to a cross section of society tend to be reputation sensitive because they rely on name recognition with consumers who are often also investors. Sometimes, entire industries can be swept up in a wave of excitement or criticism because of their association with external events that may not be entirely within their control: For example, the dot-com boom of the late 1990s led to irrational overvaluation of many Internet start-ups, while energy companies may suffer reputation loss when the price of crude oil leads to a rise in gas prices.

Perception Versus Reality

The debate about the meaningfulness and importance of reputation—and by implication the meaningfulness and importance of managing reputation—links back to an ancient tradition that has often distinguished between perception and reality. From Plato's divided line that helped to explain his theory of forms and form-sense distinction, to Bishop Berkeley's antimaterialist claim that "to be is to be perceived," to Descartes' mind-body division, philosophical epistemology and related psychology have suggested that human beings (and other animals) engage with and respond to the world they perceive, not necessarily the world that is actually out there. Kant's synthesis in a critical philosophy that said that the version we see of reality is inescapably colored by our cognitive hardwiring, and more recently Wittgensteinian and postmodern thinking, to some extent say that the only world that matters is the one we think we are in—that is, the world of perception.

It may be argued that all investment and trading decisions made in the financial markets depend on perception, and the quality of these decisions is a function of the extent to which these perceptions match reality. Recent corporate governance reforms that focus on more comprehensive financial disclosure—in the aftermath of corporate conduct scandals that, not incidentally, adversely affected corporate reputation—are essentially an effort, accepting the traditional perception-versus-reality distinction, to bring perception closer to reality by giving investors more reliable real information on which to base their opinions and decisions.

Even more than other financial market perceptions, however, perceptions of reputation are perceived to be particularly ripe for distortion. That is to say that to the extent that reputation is seen to be important, reputation management has been criticized for being intentionally manipulative of stakeholders' perceptions. Unlike financial statements, which can be reasonably assured through the financial audit process applying generally accepted accounting principles, reputation measures are often more difficult to quantify, sometimes relying on emotional associations with products, brands, and companies. When WorldCom was disgraced by an accounting scandal, one reputation-enhancing step that the company took was to change its name to MCI, the name of one of its legacy acquisitions that had less unfavorable associations for stakeholders (later, the MCI name went away in an acquisition). Johnson & Johnson, a company that has long performed well in many reputation indices, evades the general disrepute of the pharmaceutical industry sector, in part because its most recognizable brand-name products, baby powders and shampoos, have historically sentimental associations for many stakeholders.

These examples suggest simple reputation management techniques from which business managers can learn, but they reinforce the perception-versus-reality distinction and several associated concerns of reputation management, such as the potentially important difference between being a good company (having quality products and services, reliable financial performance, etc.) and being a known (prominent) company. Furthermore, to the extent that a good company is one with a favorable ethical reputation, there is alleged to be an important difference between good ethics (being socially responsible because it is morally right) and good business (which sometimes includes being socially responsible because it is perceived to be strategically advantageous).

Managing Reputation

Another complicating factor in reputation management is the question of what causes what. Does a good reputation enhance financial performance, or does good financial performance enhance reputation? Or is the relationship overstated? In the final analysis, reputation management comes down to giving deliberate attention to the perceptions of stakeholders in making business management decisions, something good managers should be doing anyway. Managing reputation well rarely involves giving equal weight to each stakeholder, but it does require prioritizing, understanding, and then acting to influence the ways in which key stakeholders' perceptions can affect such important business drivers as attracting and retaining human capital, increasing brand distinctiveness and market share, lowering the cost of capital, stimulating favorable analyst and media coverage, and so on.

The business case for reputation management has been said to be a market premium that attaches to a good reputation. Since the market value of a business is not simply a matter of what that business is today but also what investors expect from it in the future, a gap in reputation can distinguish otherwise similar companies' future prospects in the minds of investors. This perspective on reputation management may categorize reputation as an intangible or "shadow" asset, but an asset nonetheless. Reputation has been credited by risk managers as constituting a "reservoir of goodwill" when something goes wrong. However, the value of reputation as an asset is impermanent, and the reservoir is not bottomless. Market perceptions can be fickle, and a single event can transform a reputation, for better or worse. The downside of a prominent reputation is that while it may help in an up market, it can magnify liability in a down market, emphasizing the extent to which a company is vulnerable to events beyond its control—external events, competitor failures, or supply chain mismanagement. All these factors might challenge the perceived value of reputation management, whereas they led to Warren Buffett's famous remark in support of taking steps to manage reputation, "It takes twenty years to build a reputation and five minutes to ruin it."

Machiavelli's pragmatic approach to reputation notwithstanding, Buffett's folk wisdom emphasizes the importance of ethical reputation, because even if certain stakeholders (e.g., shareholders) want management to be aggressive in its bargaining position with other stakeholders (e.g., employees and customers), each influential stakeholder's perception of the business depends on assurances that it will be treated fairly. If management has a reputation for dealing dishonestly with regulators, the negative consequences will extend beyond direct fines and penalties, potentially draining the reservoir of trust the management may once have had with shareholders and the communities in which the company operates. Thus, reputation management experts tend to coalesce around the importance of business ethics and social responsibility to reputation, even if there is no broad consensus on the exact meaning of these concepts in practice. On a related point, they also commonly advise transparency in communications with stakeholders, reasoning that a sound business should have little to hide along with conventional wisdom that when there is something worth hiding, the cover-up usually causes more trouble than the problem itself.

Just as stakeholders' knowledge of the business is important to a fair evaluation of reputation, management's knowledge of who its stakeholders are and what matters to them is critical to effective management of reputation. The benefits of sound reputation management are not separate from sound business performance but rather integral to management's ability to deliver what many stakeholders want—increasing shareholder value, worthwhile products and services, good jobs, social and environmental benefits, and so on. Stakeholder dialogue and monitoring of stakeholders' interests contributes to management's knowledge and ability to balance and, where necessary, prioritize these interests to the extent they cannot equally be satisfied. When there are tradeoffs between product quality and price, cost of production and environmental degradation, local community benefits and low-cost-country sourcing, and other conflicting stakeholder interests, it can be as important for management to have a credible story to tell as it is for management to make an informed decision.

Stakeholder engagement, a term that is often associated with maintaining a dialogue between a corporation and its moral critics, is in fact just a variation on investor relations that recognizes that Wall Street analysts are not the only stakeholders with the media power to express an opinion about corporate management. Stakeholder engagement is a form of reputation risk management that seeks to exert greater management control over the perceptions of others, and managers who view reputation as an opportunity and a risk employ other reputation management techniques that are modeled on risk management techniques, such as identification of key reputation drivers, scenario planning, reputation measurement and monitoring, and the installation of early warning systems.

Finally, in determining how to approach reputation management, it is important for management to ask what kind of reputation it makes sense for the business to have, and how prominent a reputation it needs to have. It is rarely possible to have a reputation for being the highest quality, lowest cost seller of a given product or service, so it makes sense to target reputation to the market the company is best positioned to serve. And given that reputation poses potentially as much risk as reward, it is reasonable to seek that reputation among those that matter to the business while seeking to stay out of the broader limelight lest that bring unwanted attention.

Together, these techniques are valuable reminders that reputation is manageable to the extent that it is based on substantive behaviors but never wholly within any one individual's or company's control. It may be practically useful to distinguish between perception and reality to call attention to the importance of attending to stakeholders' interests, but it is at least as important to recognize that a lasting corporate reputation also requires a grounded sense of corporate purpose that is not buffeted by sometimes ephemeral stakeholder demands and that helps sort out those demands. The notion of reputation management emphasizes the interdependence and potential inseparability of companies from the industries, communities, and markets in which they operate. While this interdependence has led some corporate critics to demand a stakeholder-driven conception of strategic management, it also demonstrates the extent to which capitalist societies rely on business for production and distribution of basic goods. It further suggests that as much as the financial markets are driven by perception, the real exchange of goods and services in the marketplace is evidence that business is integral to social well-being and not just an institution whose reputation is on exhibition for social scrutiny.

Resource Allocation

A resource is any supply or technology input to a productive process to create value or wealth. Resource allocation involves the physical movement or transfer of supply from a point of origin to a destination. Resource allocations may be directed by private owners or by government. Private owners may be motivated by self-interest or by social responsibility. Typically, government requirements regulate these transfers to put social or political goals into practice. For example, government subsidies may direct resource allocations, regulations may govern them, and taxes may raise funds for them. The integrity of procedural justice in legal institutions and judicial systems is critical for the protection of property rights, an important component of the allocation process.

Competition among sellers in a free market tends over time to allocate scarce resources toward the satisfaction of buyers' needs in a process that seemed to Adam Smith as if an invisible hand were guiding the allocation of productive resources for social progress. The for-profit marketplace, however, tends to underallocate resources toward social needs where there is insufficient opportunity for profit. These sectors, such as military defense and public safety services, must be provided by government if they are to be provided at all.

The dynamics of global competition compel businesses today to locate in geographic areas where scarce resources can be acquired and deployed most advantageously. Calls for government regulation on business may become more frequent if their global allocation of resources disrupts traditional lifestyles and sustainability of communities.

Neoclassical economists argue that once the productive possibilities from resource allocations have been maximized, then there will be more wealth to distribute to achieve social goals. For example, some wealth may be taxed by government to reallocate resources toward rectifying the disadvantages of poor segments in society. Many economists recognize the disincentives of such government transfers—the wealthy may work less because their marginal income from additional work is taxed, while the poor may work less because they receive the transfer without needing to work. At the same time, however, economists often compare such government transfers to a leaky bucket—inefficient but still useful.

Owners of private property often contract with managers to act as owners' agents to allocate resources. The resource perspective of management in market-based competitive economies focuses attention on the relationship between resource allocations and financial performance in industries and businesses. Cost-benefit analysis attempts to estimate all the consequences, both adverse (costs) and advantageous (benefits), of a proposed resource allocation and places a money value on the outcomes to allocate as much of the resource as possible to the most beneficial uses. Not all ethical considerations, however, can be monetized, and the costs and benefits may not be fairly allocated.

Competitive marketplaces may not result in resource allocations that satisfy all definitions of justice and social welfare. Competition as a process to allocate scarce resources has been praised for its efficiency but criticized for its amoral focus on short-term self-interest. For this reason, many socialist alternatives to private property governance of resource allocations in competitive markets have been suggested.

Teleological theories of distributive justice focus attention on consequences of resource allocation for individuals and society. The consequential perspective requires comparative measures of well-being and reliable mechanisms to transfer resources from better-off individuals to those less well-off. A sufficiency perspective on resource allocation suggests that all individuals below a certain threshold should receive additional resource allocations. If all individuals' social positions are rank ordered, however, then the transfer from the highest position to the lowest has the greatest impact on equality.

Criteria for justice at the individual level may place the highest priority on resource allocations to those individuals with the least valuable resource stock *ex ante*. Pareto-efficient allocation, for example, is a decision rule that demonstrates fairness by improving the position of at least one individual, while under no circumstance causing any individual to be worse off. When allocation participants view value subjectively, then Pareto efficiency has the practical effect of giving every individual a veto over the allocation scheme.

Some applications of justice theories focus attention on aggregate measures of resource allocation throughout society. Utilitarianism, for example, seeks to maximize the total allocation of valuable resources distributed to the majority. If this social state can be measured, then an equivalent allocation may be found that does not change the total value of resources in society, but does allocate them more fairly or equitably across all members of the community. If such a measure is an additive function, then small amounts of valuable resources allocated to a large population may be calculated to be a greater social good than larger amounts of value allocated to a small population. In the latter situation, the average individual allocation may have higher value, but the total sum of value in the group is smaller.

Whether calculating the social sum or individual average allocation, resources need not be allocated equally for the allocation to be fair. Indeed, one potential criticism of a Pareto-efficient approach to allocation is that there are multiple solutions and not all necessarily have equal resource distributions. There may be variety in tastes and needs that lead to acceptable asymmetric allocations, so that each individual perceives his or her allocation to be a fair response to his or her subjective preferences.

Restraint of Trade

Restraint of trade, defined broadly, is a contractual limitation on business dealings or professional or gainful occupations, and is legal or illegal, ethical or unethical depending on its effect. If the restraint is in the best interests of both the parties and the public, then it is not illegal. Otherwise, if it is an agreement between or combination of businesses intended to eliminate competition, create a monopoly, artificially raise prices, or otherwise adversely affect the free market, then the restraint of trade agreement violates antitrust laws and is probably illegal. A horizontal restraint of trade is one imposed by agreement between competitors at the same level of distribution, such as a cartel in which rivals agree to restrict output and raise prices. A vertical restraint of trade is one imposed by agreement between firms at different levels of distribution, as between manufacturer and retailer.

Antitrust laws are the United States' embodiment of the British common law's restraint of trade principles and are grounded in the ethics of free market values. Under this theory, technology improves human life because it makes such things as antibiotics available, but it requires constant innovation. For example, as microbes become resistant to penicillin, new antibiotics must be created. Free market economies maximize competition and therefore encourage innovation: They both encourage the creation of new antibiotics and decrease their prices so that they become more readily available to a larger proportion of the population. In contrast, in a planned economy, a monopoly where one company or concern controls the manufacture or sales of antibiotics would provide no incentive for innovation, would raise prices artificially, and therefore would be antithetical to the fundamental values of widespread availability and innovation.

An exception to the principle that a monopoly discourages trade and innovation is the limited monopoly created by patent and other intellectual property laws. Under patent law, the developer of a new antibiotic is granted a monopoly over that product for a limited amount of time, to allow innovators a certain period during which they can recoup the costs of research and development and make a profit. Patents, therefore, are thought to provide an additional positive incentive for innovation.

Development of Restraint of Trade Law

In feudal England, a complex system of guilds regulated relations among master, journeyman, and apprentice. In the first known restraint of trade case, in 1414, a court refused to find the defendant liable for breaching his agreement not to practice his dyer's craft in town for 6 months, finding that the agreement was unfair. Today, this type of noncompetition clause might be found acceptable depending on whether the time and place limitations are found to be reasonable under the circumstances. Thus, the common law of trade restraints originated not so much with notions of competition and protection of the free market but rather in support of fair commercial activity and crumbling guild customs.

Later cases were not so quick to invalidate such agreements, and reflected a respect for freedom of contract principles, until gradually courts decided to uphold such agreements so long as their primary purpose was not to limit competition. The concept was further developed in the U.S. common law such that one line of decisions banned price-fixing agreements and other anticompetitive arrangements when the challenged restraint affected basic necessities. As the 19th century came to a close, however, U.S. courts became more sensitive to unreasonable restraints on competition, positing that where the sole object of both parties to the contract is to restrain competition and enhance or maintain prices, the restraint is unjustified and therefore void.

U.S. courts became more sensitive to unreasonable restraints on competition after the Civil War because rapid industrialization had led to the perceived accumulation of power in the hands of a few robber barons. Public opinion in the United States had always opposed monopolies, because under the original definition, they were despotic powers created by the government. But after the Civil War, large-scale corporate concentration became the norm, and the fiscal power shown by these new trusts led to a widespread perception that so-called private institutions were acquiring coercive power that had formerly been reserved for governments. The result was the passing of the Sherman Antitrust Act in 1890, which made trust agreements in restraint of trade both illegal and criminal. However, this act covered only some abuses of trade. Two other acts were subsequently passed to address other types of anticompetitive behavior. The Clayton Act of 1914 made price discrimination, exclusive dealing contracts, some corporate mergers, and interlocking directorates illegal. The Federal Trade Commission Act created the Federal Trade Commission (the FTC) and made "unfair methods of competition" such as dumping and subsidies illegal. Although they made certain behavior illegal, neither the FTC Act nor the Clayton Act made those behaviors criminal, in contrast with the Sherman Act. The FTC, in addition to investigating unfair trade claims, also prosecutes Sherman Act cases, along with the U.S. Justice Department.

Restraint of Trade as Defined by the Sherman Act

The Sherman Act declares that "every contract, combination, in the form of a trust or otherwise, or conspiracy, in restraint of trade . . . is declared to be illegal." As the Supreme Court describes it, the Sherman Act was designed to be a comprehensive charter of economic liberty and was intended to preserve free and unfettered competition as the rule of trade in the belief that the unrestrained interaction of competitive forces yields the best allocation of economic resources, the lowest prices, the highest quality, and the greatest progress. Violation of the Sherman Act can lead to civil penalties, including injunctive relief and treble damages as well as criminal penalties, including fines of up to $10 million and sanctions for corporations or fines and jail terms up to 3 years for individuals.

The Rule of Reason

Because every agreement concerning trade can be seen as restraining, Section 1 of the Sherman Act prohibits only restraints that *unreasonably* restrict competition. The fundamental test of reasonability is whether the restraint imposed merely regulates competition (thereby possibly enhancing it) or whether it is designed to suppress competition. In determining whether a restraint is reasonable, the court examines all the facts and circumstances peculiar to the business to which the restraint is applied: conditions before and after the restraint was imposed; the nature and effect of the restraint; and the reason why it was adopted. For example, in the seminal "reasonableness" case that allegedly involved price-fixing, the Supreme Court found that a grain exchange rule requiring members to adhere to their closing bid was reasonable because the rule applied only to a small part of traded grain, had no appreciable effect on market prices or conditions, and actually broke up a monopoly previously held by a few warehouses.

Although it is still used in other types of antitrust cases, in more recent price-fixing cases, the Supreme Court has left behind the reasonable test, stating that any agreement whose purpose is to raise, depress, fix, peg, or stabilize the price of a commodity is presumptively illegal (illegal per se) because it discourages competition. Thus, the Supreme Court struck down an agreement among physicians setting the maximum fees they would charge for their purposes. Although the doctors argued that the agreement reduced prices to consumers by lowering information search costs, the Court believed that similar ends could be achieved without maximum price-fixing, which would discourage competition, and, therefore, condemned the agreement per se.

Monopoly Power

The Sherman Act prohibits monopolization, attempted monopolization, and conspiracy to monopolize.

However, the act does not condemn the mere possession of monopoly power, but instead prohibits conduct that excludes others from competition. Thus, a court first determines whether a firm has monopoly power and then determines whether it has exerted exclusionary conduct to prevent vigorous competition.

Because the Sherman Act does not define when a firm is a monopolist for antitrust purposes, three different approaches can be used to measure whether market power has become monopolist power: performance, rivalry, and structure. The performance approach identifies how much a firm's actual performance deviates from the competitive norm. This may involve determining how much a firm's prices depart from its marginal cost, or the amount by which a firm's net profit exceeds the industry average. If the net profit far exceeds the industry average, then it exerts monopoly power. The rivalry test measures how sensitive the firm's sales level or output is to adjustments in buyer behavior. If the firm can ignore buyers' needs without losing a substantial amount of sales, then the firm has monopoly power. The third, most widely used method is the structural approach, which involves counting the number of firms in a market and comparing each firm's share of market activity. An overly large market share indicates monopoly power. Each of the three methods has its advantages and disadvantages.

Exclusionary Conduct and Microsoft

For a firm to be found guilty of illegal conduct under Section 2 of the Sherman Act, it not only must have dominant power but must also have abused that power through unreasonably exclusionary conduct. Competitive measures are not an abuse, but unreasonably exclusionary ones are. In the case of Microsoft in 2001, the Justice Department and 20 states filed a lawsuit against Microsoft alleging that the company had (1) illegally tied Windows to its Internet Explorer, which was per se unreasonably exclusionary against other navigators, (2) attempted to monopolize the browser market, and (3) wrongly maintained its monopoly power in the operating system market in response to a perceived threat by Netscape Navigator. While the trial court found for the Justice Department, the appellate court reversed two of the three findings of violations, upholding only the last.

In reaching its decision, the appellate court gave four ways to distinguish between exclusionary and competitive conduct: (1) The monopolist's act must harm the competitive process and, thereby, harm consumers; (2) the plaintiff must demonstrate that the act had the requisite anticompetitive effect; (3) once the plaintiff establishes a basic Section 2 case, then the defendant may offer a procompetitive justification for its conduct in rebuttal; and (4) if the plaintiff fails to rebut the defendant's justification, then the plaintiff must demonstrate that the anticompetitive harm of the conduct outweighs the procompetitive benefit. Although ultimately the plaintiffs were not able to force Microsoft to divest itself of its browser, after the D.C. circuit court's opinion, the Justice Department and most of the states negotiated a consent order.

International Law and the Long Arm of the Sherman Act

Although some authorities feel it would be helpful, currently there is no international antitrust or "restraint of trade" law, the closest being the WTO rules against dumping and subsidies. Thus, there is no international body that could try Microsoft. The Sherman Act covers restraints that are in the flow of interstate commerce as well as local restraints affecting interstate commerce, which means that it is focused on effects felt or potentially felt in the United States and, necessarily, in more than one state. Where a restraint has purely local effects, it is not in interstate commerce. For example, a board of supervisors' disqualification of an employee from running for the position of county supervisor did not violate antitrust laws, because it had only local effects. Suit would have to be brought under state antitrust law instead.

However, although the Sherman Act is limited to effects or potential effects in the United States, due to a 1982 amendment, it covers acts of firms in foreign countries that have a direct, substantial, and reasonably foreseeable effect on U.S. domestic commerce, U.S. import trade, or the export commerce of a person engaged in such commerce in the United States. Thus, a Mexican sisal monopoly was found to have restricted or adversely affected imports into the United States. In these cases, to have the power to sue a foreign firm in the United States under the Sherman Act, the firm must have intentionally done business in the United States or own assets within the court's jurisdiction.

The lack of an international antitrust law, however, does not mean that a multinational firm won't face substantial antitrust suits elsewhere in the world. While Microsoft did fairly well in its U.S. litigation, it fared much less well in the European Union, which found that Microsoft had abused its near monopoly in operating systems by leveraging that power into markets for media players and for work group server operating systems. The European Union imposed a record-setting $613 million fine, ordered Microsoft to disclose to competitors the interfaces required to permit their products to interact with Windows, and ordered the company to offer a version of Windows without the Media Player. South Korea similarly found that Microsoft violated its antitrust laws.

Revealed Preference

Revealed preference theory holds that consumers' preferences can be revealed by what they purchase under different circumstances, particularly under different income and price circumstances. The concept argues that if a consumer purchases a specific bundle of goods, then that bundle is "revealed preferred," given constant income and prices, to any other bundle that the consumer could afford. By varying income and/or prices, an observer can infer a representative model of the consumer's preferences.

Much of the explanation for consumer behavior, particularly consumer choice, is rooted in Jeremy Bentham's concept of utility. Utility represents want-satisfaction, which implies that it is subjective, individualized, and difficult to quantify. By the early 20th century, substantial problems with the use of utility had been identified, and many of the theoretical replacements of the concept either struggled with the same critiques (often because they retained too much of the heritage of utility) or suffered from being essentially unmeasurable and untestable. In 1938, Paul Samuelson noted that there seemed little reason to believe in the dominant theories of the time other than the fact that the concepts led "to the type of demand functions in the market which seem plausible." As a result, Samuelson offered what became known as revealed preference theory in an attempt to build a theory of consumer behavior that was not based on utility. He argued that his new approach was based on precepts that were observable and relied on a very minimal number of assumptions that many would argue were relatively uncontroversial.

As revealed preference theory has developed, three primary axioms have been developed: the weak, strong, and generalized axioms of revealed preference. The weak axiom indicates that at given prices and incomes, if one good is purchased rather than another, then the consumer will always make that same choice. Less abstractly, the weak axiom argues that if a consumer purchases one particular type of good, then the consumer would never purchase a different brand or good unless it provides more benefit, by being less expensive, having better quality, or providing increased convenience. Even more directly, the weak axiom indicates that consumers will purchase what they prefer and will make consistent choices.

Although relatively simple, the weak axiom provides strong rationality properties that economics requires, including downward sloping demand curves and the dependence of consumption on relative prices. These properties can be developed without resorting to the types of strong assumptions required by utility-based or indifference curve analysis, such as diminishing marginal rates of substitution.

The strong axiom essentially generalizes the weak axiom to cover multiple goods and rules out certain inconsistent chains of choices. In a two-dimensional world (a world with only two goods between which consumers choose), the weak and strong axioms can be shown to be equivalent. Later research built on the revealed preference framework and demonstrated that indifference curves and utility functions can be developed from observations of behavior, even though revealed preference theory explicitly rejects these precepts as a starting point for explaining behavior. As a result, a number of the analytical tools and concepts regarding consumer choice could be preserved, albeit with a stronger theoretical base.

While the strong axiom characterizes the implications of utility maximization, it does not address all the implications—namely, there may not be a unique maximum. The generalized axiom covers the case when, for a given price level and income, more than one consumption bundle satisfies the same level of benefit. Expressed in utility terms, the generalized axiom accounts for circumstances where there is no unique bundle that maximizes utility. This extension is important because it allows for multivalued demand functions and, in the structure of indifference curve analysis, for "flat" indifference curves. Both these implications are important for empirical research.

The two most distinguishing characteristics of revealed preference theory are as follows: (1) It offers a theoretical framework for explaining consumer behavior predicated on little more than the assumption that consumers are rational—that they will make choices which advance their own purposes most efficiently, and (2) it provides necessary and sufficient conditions, which can be empirically tested, for observed choices to be consistent with utility maximization.

Currently, revealed preference theory has been applied to economic theory. However, because the theory is so general and depends on such a small set of basic axioms, as data sets regarding human behavior expand, the contributions to empirical economics, and perhaps other fields, are likely to increase. While more attuned to addressing primarily economic considerations in the formulation of consumer choices, the nonparametric nature of the theory, its flexibility at accommodating a wide range of consumer choices, and its ease at generating testable constructions may allow it to make even broader contributions in other areas, such as ethics or other fields of study.

Reverse Discrimination

For decades, women and various minorities were barred from some of the most desirable institutions and positions in North America. Discrimination persisted in many quarters even after it was declared unconstitutional. Continuing discrimination led to a widespread demand for effective policies of preferential treatment or affirmative action to provide justice for those individuals or groups previously (and often presently) discriminated against. The effect of policies that advantage women and minorities in admission and employment is to decrease opportunities for nonminority males. The direction of discrimination is reversed: The properties of race and sex once used to discriminate against members of groups are now used to discriminate in their favor and against the interest of those not of the right race, sex, nationality, and the like.

Preferential policies that establish goals, timetables, target numbers, and the like have provoked impassioned criticism to the effect that, rather than leveling the playing field, these policies are simply instruments of reverse discrimination. One classic case, known as the "McAleer case," centered on a service representative who handled orders for telephone service in AT&T's Washington, D.C., office. In 1974, he asked for a promotion that he did not receive. Instead, a staff assistant named Sharon Hulvey received the promotion. Although less qualified than McAleer, Hulvey was basically qualified. She received the promotion because of an affirmative action program at AT&T. McAleer claimed that he had been discriminated against on the basis of sex. He then brought a lawsuit against AT&T to ask for the promotion, differential back pay, and $100,000 in damages.

A judge held on June 9, 1976, that McAleer was a faultless employee who became an innocent victim through an *unfortunate but justifiable* use of the affirmative action process. In other words, reverse discrimination was justifiable even though McAleer was a victim of it. The judge ruled that McAleer was entitled to monetary compensation (as damages) but was not entitled to the promotion because the very discrimination that the affirmative action policy had been designed to eliminate would be perpetuated if Hulvey were not given the promotion. The central thrust of the ruling was that AT&T had engaged in sex discrimination, setting back the interest of employees such as Hulvey, who had not been properly trained and promoted. AT&T's prior sex discrimination was judged the root of the problem. Since McAleer had no responsibility for this sex discrimination, AT&T rather than McAleer should bear the financial burden of rectifying the company's previous failure to comply with the Civil Rights Act of 1964. The judge held that an affirmative award of some damages on a "rough justice" basis was therefore required and would constitute an added cost that the stockholders of AT&T should bear.

Over the years, many preferential policies have been backward looking, in the sense that they aim to redress past wrongs. However, proponents need not use only arguments that compensation is owed for *past* wrongs. They can, and often do, argue that preferential policies are required to eliminate or alleviate *present* discriminatory practices that affect whole classes of persons (especially practices of minority exclusion). From this perspective, policies are needed to reach the end of alleviating or eliminating ongoing discrimination that negatively affects groups. Reverse discrimination is judged, by those who believe it is justifiable, to be an unfortunate, but not unjust outcome of the policies. It is said to be justified by a compelling social (or governmental) interest in eradicating pervasive, systematic, and obstinate discriminatory exclusion of minorities or other groups so affected. In other words, reverse discrimination is justified when it is essential to overcome long-term, open, and pervasive discrimination.

Opponents of this position argue that reverse discrimination violates fundamental, overriding principles of justice and cannot be justified. There exist a variety of arguments in opposition to several kinds of preferential policies that have the effect of reverse discrimination. Arguments that have received widespread attention include the following: (1) Some persons who are not responsible for the past discrimination (e.g., qualified young white males) pay the price; preferential treatment is invidiously discriminatory because innocent persons are penalized solely on the basis of their race or sex. (2) Male members of minority groups such as Polish, Irish, Arabic, Chinese, and Italian members of society who were previously discriminated against inevitably will bear a heavy and unfair burden of compensating women and other minority groups. (3) Many individual members of any class selected for preferential treatment never have been unjustly treated and, therefore, do not deserve preferential policies. (4) Compensation can be provided to individuals who were previously treated unfairly without resorting to reverse discrimination.

Few deny that reverse discrimination is sometimes caused by preferential policies, and most agree that cases of reverse discrimination exist in which a white male has unjustifiably been excluded from consideration and has a right to compensation. Unwarranted reverse discrimination is no better than any other form of unwarranted discrimination. But those who believe that it is justifiable to permit reverse discrimination argue that the following should also be considered: Reverse discrimination should be distinguished from what merely appears to be reverse discrimination. Sometimes persons will be hired or promoted who appear to be displacing better applicants, but the appearance is the result of another person's discriminatory perceptions of the person's qualifications. If discrimination against black men, say, is sufficiently entrenched in society, then the effects of this discrimination may simply offset the effects of policies that eventuate in reverse discrimination. That is, black men may be neither better nor worse off even if some are hired or promoted under preferential policies.

Those who tolerate some measure of reverse discrimination argue that many setbacks to the interests of white males negatively affected by a policy may be no more objectionable than a variety of burdens produced by social policies that advantage some members of society and disadvantage others. Inheritance laws, for example, favor certain members of society over others, whereas policies of eminent domain disadvantage persons who wish to retain what is legitimately their property to advance the public good. Such laws and outcomes are warranted by a larger public benefit and by justice-based considerations that conflict with the interests of the disadvantaged parties. The point is that disadvantages to majorities produced by affirmative action may be warranted by the promotion of social ideals of equal treatment for members of groups who were severely mistreated in the past.

Some parties who are either advantaged or disadvantaged by preferential policies are not the parties who, ideally, should be advantaged or disadvantaged. For example, just as young white males may pay the penalty for wrongs committed by older white males (who will likely never be penalized), so the older members of minority groups and older women who have been most disadvantaged in the past are the least likely to gain an advantage from affirmative action policies. Paradoxically, the younger minority members and women who have suffered least (if at all) from discrimination stand to gain the most from preferential policies. It seems much harder to justify reverse discrimination in these cases.

Preferential policies have been alleged to have other shortcomings as well. For example, they may confer economic advantages on some who do not deserve them, lower admission and work standards, heighten racial hostility, and cause continued suspicion that well-placed women and minority group members received their positions purely on the basis of their group affiliation, thereby damaging their self-respect and the respect of their colleagues.

Although reverse discrimination does involve real discrimination, the reasons behind this form of discrimination are notably different from the kind of racial and sexual discrimination that spring from a sense of superiority. Preferential policies seek, ideally, to restore status to a class of persons who have been stigmatized and unjustifiably denied access to employment or advancement. However, there has been and will continue to be considerable disagreement about the best means to rectify the evils of discrimination.

Revolving Door

The revolving door refers to the practice of individuals rotating between working in the private sector and working for the government, often in regulatory capacities, and vice versa. While the government needs individuals with expertise in specific areas, this practice may blur the distinction between the public good and business interests.

There are various types of revolving doors: industry to government, government to industry, law to government and then back to law or working as a lobbyist. Business executives sometimes take positions in government regulating industries in which they were recently employed. The experience the business executive brings to the job could be vital to the government, but it is fraught with potential for conflict of interest. A person who has made a career in a mining company and then takes a mining regulatory position in the U.S. Department of the Interior may appear to be compromised. It is not uncommon for officials to leave government and take lucrative positions in firms that they once regulated or to whom they have awarded contracts. In this case, any interaction the individual had with the company before joining it is suspect, and the integrity of government decisions is called into question. Senior regulators often hold law degrees. When they rotate out of government, they may resume work in a law firm that represents clients in the industry they once regulated. This raises obvious questions of conflict of interest even if the said regulator is not the counsel of record since the former government employee could easily coach his or her colleagues. Government regulators and legislators also frequently leave their positions and work as lobbyists for private business interests. Here concern is raised as to whether they might exercise inappropriate influence over their former colleagues.

The federal government began implementing conflict of interest and ethics laws in the 1950s. The two most important laws enacted are the Ethics Reform Act passed in 1989 and the Procurement Act passed in 1996. Under the current laws, "senior" and "very senior" government officials who make contracting decisions must wait a year before joining a military contractor. A 1-year, and sometimes 2-year, cooling-off period is also imposed on individuals making representational contacts with their former agency or with any high-level executive branch official. The Procurement Integrity Act's two main purposes are to limit contacts related to future employment between current government officials and government contractors and to prohibit high-level government officials who act on contracts worth more than $10,000,000 from accepting compensation, including future employment from the said contractor. The laws are broad, complicated, and overlapping; rules differ by the level of involvement of the government employee as well as by the employee's rank. The laws also allow many exceptions. Many in Congress have called for additional legislation to tighten the laws limiting post–government employment. Also, 29 states currently have their own distinct revolving door policies. California and New Mexico impose a permanent ban on working on identical contracts that the government officer was personally involved in while in public service.

The revolving door has become ubiquitous in both state and federal government from defense contracts to health care to the environment. The practice of rotating work in government and the private sector is not illegal unless unfair advantage is given to certain businesses or individuals, which is what the laws attempt to regulate. Unfair advantage is difficult to prove, but even the perception of it can undermine public faith in the government.

RIGHTS, THEORIES OF

In general, the term *right* is used to describe a person's entitlement. For example, people claiming an entitlement to say what they think express a right of freedom of speech.

In modern-day societies, it appears that claims to entitlements are proliferating; matters as diverse as liberty, abortion, health care, privacy, human welfare, euthanasia, capital punishment, and suicide are all steeped in claims to certain rights. Indeed, the term *rights* is used extensively in relation to a vast array of contentious matters; debates concerning politics, morality, justice, and fairness are especially peppered with claims to rights. The notion of rights is now also commonly used in relation to claims concerning inanimate objects, plants, and nonhuman animals. It becomes important therefore to consider exactly what we mean by "rights."

The language employed in relation to rights is, however, problematic. Some rights are, on occasion, described as "fundamental." This suggests a hierarchy of rights, some of which are of greater importance, in terms of morality or otherwise, while others are simply rights. It may be that in more developed societies the rights that are seen to be fundamental to civil society have been enshrined in their constitutions. But "fundamental rights" could also refer to those rights that are the minimum entitlement of every person no matter their society's stage of development. The term *natural rights* is sometimes employed in this regard. Life, liberty, property, and equality are often cited as "fundamental natural rights" for the reason that they underlie or are a necessary condition for the enjoyment of all other rights. It is also claimed that natural rights are implicit in human nature.

On other occasions, some rights are described as "inalienable." For example, an individual's freedom, dignity, and choice are commonly described as inalienable rights. These particular rights are also sometimes described as "moral rights." But it is sometimes difficult to determine whether fundamental is one and the same as inalienable or moral or otherwise.

The term *right* is also sometimes used in a more general sense to mean treatment that is just or fair. For example, in relation to being employed, a claim to equal pay for equal work is made in respect of being treated in a just and fair manner. Other times the term *right* is used when some other term may be a more accurate description. For example, the Universal Declaration of Human Rights specifies a right to work (Article 23[1]) and to rest and leisure (Article 24). But whether these are truly rights in the sense of entitlements, as distinct from social/political ideals, is another question that gives rise to debate.

To claim that something is "a right" gives rise to myriad questions that extend from understanding the nature of rights and identifying legitimate claims to a right to concern for their universal acceptance. These questions have in turn generated a literature, grounded in a wide spectrum of philosophical discourse, which is rich in character and long in debate. There is now an abundance of theories endeavoring to answer, or at least clarify, some of the questions posed in relation to claiming an entitlement or a right.

Kinds of Rights

A review of some of the rights commonly upheld in modern-day societies suggests that rights may differ in kind. There are certainly differing ways of expressing rights. Some rights are phrased in terms of the person claiming the right, for example, the rights of a child or the rights of a human being. Other rights are more concerned with certain behavior, for example, claims to the right of freedom of speech. But this distinction may not be of any real importance because a closer review reveals that whether the claim to a right focuses on a person or on behavior, the claims also entail involvement on the part of other persons. That a child has a right to a childhood free from abuse entails those persons who interact with children not abusing them. Similarly, a right of freedom of speech entails that those persons hearing a speech will not censor or silence the speaker.

Certain kinds of rights, thereby, appear to involve a correlative duty, or duties, on the part of other persons. In the examples cited above, the correlative duty is negative in the sense that it requires forbearance from action; a right to a childhood free from abuse requires that other persons will not abuse children. A right of freedom of speech requires that other persons will not censor or silence speakers. In other cases, a right may entail a positive involvement on the part of other persons. For example, a right to work may entail that society ensure job opportunities.

But claiming entitlements as rights, and the imposition of correlative duties, raises questions concerning their legitimacy and enforcement. A person may claim falsely and those persons who are obligated may not act according to the required duty.

A review of some of the rights commonly upheld in modern-day societies reveals that some rights are specified by law, and so we claim them as a matter of legal right, whereas other rights are claimed as a matter of moral right. But while law and morality are both concerned, to some degree, with rights and correlative duties, and employ much the same terminology, there is a considerable amount of philosophical debate concerning the relationship between "legal rights" and "moral rights." It becomes necessary, therefore, to first distinguish what these terms mean.

Legal Rights

Legal rights are recognized and enforced as part of each society's legal system. Such rights will therefore vary depending on the society in which an individual lives; they are created or granted by government, and their being upheld depends on the particular legal system in question. Legal rights may be, but are not necessarily, consistent with moral rights.

Greek societies, for example, developed laws and thereby created legal rights within their city-states. Their laws did not, however, extend to benefit all members of their societies; if you were a public slave, you did not have rights.

In modern societies, legal rights exist for the benefit of all members. They are typically embodied in a written constitution, which also allows for the creation of further rights. Thus, the essential rights affecting U.S. citizens are set down in the U.S. Constitution, while Congress and state legislatures are given powers to a create laws and so to create further rights. A single written document is not, however, a requirement; Britain, for example, has no such constitutional document. Rights determined exclusively by society's legislators and legal system are sometimes described as positive laws.

Moral Rights

Moral rights concern moral standards independent of any legal system. They are rights that, from a moral perspective, we ought to have. Moral rights are often claimed on the basis of their being conventional societal practices. But the nature of moral rights, and the basis for claiming such rights, is problematic. There are also debates as to whether moral rights are culturally specific, and influenced by the society's stage of economic development, or whether they are applicable to all persons everywhere and, thereby, serve as a universal set of moral rules.

In modern societies, moral rights are often enshrined in laws as a means of ensuring their observation and a common standard of enforcement. For example, the rights of owners of private property are protected by laws that, at least in part, reflect the rights that society acknowledges as belonging to such property owners.

Some moral rights are also upheld by the notion of "natural laws." Advocates of natural laws generally argue that the general precepts of natural law are self-evident and discernable by anyone, provided only that their natural reasoning is neither deficient nor degenerate and that natural laws respecting life, liberty, and property are possessed by all persons, simply because they are human beings. Some philosophers advocating natural law argue that such laws have been formulated by human beings because man, by human nature, needs to coexist with others. Natural laws have also been associated with a belief in some form of divine lawgiver, but the discourse concerning natural laws in modern-day societies does not generally rely on such belief.

Other philosophers advocating natural law argue that if there were no governments, human beings would find themselves in a "state of nature" governed by natural laws obliging everyone to respect life, liberty, and property. They also claim that such natural laws are superior to a society's constitution and laws and serve as a standard for evaluating all constitutional and legal endeavors.

Other philosophers deny the existence of such natural laws. Alasdair MacIntyre, for example, asserts that there are no natural laws or human rights on the grounds that there are no good reasons for believing there are such rights. He likens the situation to not believing in witches and unicorns, that every attempt for believing there are such has failed. But he proceeds to discuss natural laws and human rights on the basis that they are a fiction.

Whether natural laws are self-evident and discernable by anyone, whether they have some other basis, or even if they are a fiction, it appears that natural laws are limited in their sphere to matters of "life, liberty, and property" and to what is needed to preserve such matters. Whether a particular claim to an entitlement falls within these bounds will always be a subject for debate. If a claim clearly falls outside these bounds, then arguably some other justification will be needed if the claim to the entitlement concerned is to be regarded as a right.

In modern-day societies, claimants to entitlements that are not duplicated in either legal rights or natural laws argue that such entitlements are imperative. This argument relies on the notion that such entitlements derive their force from the ethical rules, principles, and practices prevailing in a given society. This claim can be likened to the deontological notion of duty and concern for how a person should behave. Immanuel Kant posed that if a rational person's maxim, meaning the reason for carrying out the action, could be willed to become a universal law, the action is morally right. Thus, given a person in a particular situation, if the reason for acting in a certain way is a reason that every person, in any similar situation, would be willing to act on, the action is supported as a moral right.

History of Rights

Whether rights have been claimed as entitlements, and granted as such, since man's existence on earth or whether the notion of fundamental rights is the invention of modern-day societies is a question that remains a subject for debate.

Part of the difficulty in determining the history of claims to rights lies in language. In relation to natural or human rights, Alasdair MacIntyre explains that there is no expression in any ancient or medieval language that correctly translates to what we understand as "a right" until near the close of the Middle Ages; the concept lacks any means of expression in Hebrew, Greek, Latin, or Arabic, classical or medieval, before the year 1400.

However, theories relating to the existence of natural laws, upholding certain fundamental rights, have a long history, reaching back to the ancient

Greek philosophers, including Socrates, Plato, and Aristotle.

It was, however, the Stoics who first stressed the universality of human nature and the brotherhood of man. Their doctrines placed emphasis on man's ability to reason, and they argued that a universal law of nature is ascertainable by reason. At much the same time, the Romans developed laws not only for Roman citizens but also for "foreigners" within the state of Rome and, thereby, recognized the idea of a common law applicable to everyone. The Stoics then had a model on which to develop their concept of universal laws claiming moral superiority over local and conventional rules.

It was in the 17th and 18th centuries that the concept of natural rights became a more prominent issue. This period of so-called Enlightenment is a time when the foundations of the Church, and the Renaissance and the notion of divine, "God-given," law began to be questioned and the order of the so-called natural world began to be seen as a matter relating to society and to justice. The rights of individuals, in relation to sovereigns and governments, came to the forefront in efforts to understand and organize modern-day society.

Hugo Grotius was one of the first scholars to separate the study of rights from theology. He argued that natural law would still apply if God did not exist. He believed that humans have the ability to reason and a social nature and theorized on the basis that mankind desires an orderly and peaceful society. A "right" in his view is a moral quality making it possible to have or to do something lawfully, and he regarded justice as a matter of respecting and exercising individual rights. He, thereby, recognized what are termed *subjective rights*.

Grotius also argued that governments should be understood as compacts among men. However, he rejected the notion of an ideal political state or form of government because in his view there is no single best type of life for all individuals to lead. Thus, while advocating natural laws governing the lives of individuals in society, he introduced the notion of differing forms of government and the recognition of differing social values.

Thomas Hobbes, in contrast, denied man's natural sociability and argued that life without government would be "solitary, poor, nasty, brutish and short." But he developed Grotius's notion of government as a compact among men. In relation to rights, he argued that the inhabitants of the state of nature had the right to do whatever they judged to be necessary for their survival. But given that the world has limited resources, conflicts regarding rights are inescapable unless people agree to surrender their rights to a sovereign Leviathan, the Leviathan being some form of state. In Hobbes's view, having surrendered rights to the state, the individual retains only the natural right to resist being killed or confined.

The Development of Rights in Modern-Day Societies

John Locke is generally credited with developing the doctrine we rely on today when we claim that all individuals have certain natural rights, independent of any human compact or convention. He expressed disagreement with Hobbes's view of man's natural unsociability and, in the absence of submitting to the state, resulting hostility. Locke regarded the state of nature as a state of reciprocal liberty; that each individual has a natural right to preserve himself but not to harm others in doing so (except in self-defense against a violent attacker).

In Locke's view, people ought not to be interfered with in pursuit of life and liberty. These, he said, were the natural rights of man. He also argued that everyone has natural rights to private property that must be respected by others, to compensation for injuries, and to punish anyone who violates the law of nature. In relation to the authority of government, he argued that by the terms of a social contract, the power of government is conceded only on trust by the people to the rulers and that any infringement by the rulers of the fundamental natural rights of the people put an end to that trust and entitled the people to reassume their authority.

Locke's views arguably extended the notion of natural laws to being a source of fundamental democratic rights restricting the freedom of rulers. This view was fully explained in his work *Two Treatises on Civil Government,* which was highly influential in formulating both the American Declaration of Independence in 1776 and the Declaration of Rights made by the French National Assembly in 1791.

The opening statements of the Declaration of Rights made by the French National Assembly claim that the end view of every political association is the preservation of the natural and imprescriptible rights of man to liberty, property, security, and resistance to oppression, and these clearly reflect Locke's views. But there was opposition to such views.

In particular, Jeremy Bentham, a proponent of utilitarianism, was highly critical of these claims. In

Bentham's opinion, there are no such things as natural rights, and he proceeds to describe such rights as "mischievous nonsense" and "nonsense upon stilts." He opined that there can be no rights anterior to the establishment of government and no rights that contradict the laws made by government. He argued that to talk about rights made sense only within a legal framework and that legal rights correlate to legal duties, thereby rendering the notion of legal rights redundant.

While political developments following the French and U.S. declarations caused the notion of natural laws and government as perceived by Locke to be questioned, his legacy remains very much intact.

The Nature of Rights

The philosophical discourse that examines the nature of rights is an attempt to determine what rights are and how they are composed. These are conceptual questions that have given rise to divergent theories and, to varying degrees, invariably unsatisfactory answers.

Arguably, the task of defining what is meant by "rights" is thwarted by the fact that the various claims being examined are too divergent; it may be that the nature of legal rights is dissimilar to the nature of moral rights or the rights created by a particular institution, such as a school or hospital.

Clarity as to the conceptual nature of legal rights emerged in the late 19th century and is generally attributed to the American jurist Wesley N. Hohfeld. He built on earlier juristic work and provided a more rigorous analysis for the proposition that rights comprise four basic components. He described these, the "Hohfeldian incidents," as the privilege, the claim, the power, and the immunity.

Hohfeld maintained that a privilege (which some writers prefer to call a liberty) is a right that does not depend on another person having a correlative duty but requires that other persons have no claim that you either do, or do not, act in a certain way. Thus, you have the liberty to voice your opinion to A only if A has no valid claim requiring you either to voice your opinion or to remain silent. In the context of law, you have a legal liberty in fact of A to perform some action if and only if you have no legal duty to A to refrain from doing that action. Based on Hohfeld's work, but using slightly different language, a liberty right can be explained in terms that B has a liberty (relative to A) to do X, if and only if A has a "no-claim right" that B should do, or not do, X.

A claim, in contrast, is a positive claim right that has a corresponding duty; that duty may be to do or to forbear doing some action. Thus, you have a legal claim against A with respect to some action if and only if A has a legal duty to you to perform that action. For example, a claim right to education has a corresponding duty to provide a system of schools.

Neither a no-claim right associated with a liberty nor a duty associated with a claim right need fall to a particular person or body. For example, a claim to freedom of speech has a corresponding duty not to silence or censor and applies to everyone hearing the speech in question. Similarly, a child has a claim right to a childhood free from abuse, and everyone concerned with that child has a duty not to abuse that child. Such claim rights are also described as general rights because they involve claims against everyone, or humanity in general.

Claim rights can, however, also concern claims against a specific person. For example, the seller of goods has a claim right to payment, and the buyer has a corresponding duty to pay for the goods. Similarly, an employee has a claim right to wages and the employer has the corresponding duty to pay the wages. In both these cases, the claim and corresponding duty can be a matter for the parties themselves and, therefore, be entirely voluntary. In other cases, the law may prescribe certain minimum claim rights. For example, it may stipulate a minimum wage. Such claim rights are also described as specific rights because identifiable persons are involved.

Critics admit that this distinction between A's claim right, which has as its correlative B's duty, and A's liberty, which is A's freedom from duty and has as its correlative the absence or negation of a claim right that B would otherwise have, does provide a clear aid to thinking about rights. But they also take the view that it is problematic.

Hohfeld's other two components of rights, power and immunity, are rather different; they are more about rights involving the ability to change rules. A person has a power right if and only if he or she has the power within a set of rules to alter either his or her own or another person's privileges or claims. For example, a manager has a power right if he or she can alter his or her employee's claim right to wages. The component that Hohfeld describes as an immunity right is essentially the corollary of a power right; if a person does not have a power right to alter another person's privilege or claim right, that other person is said to have an immunity right. H. L. A. Hart defines such rights as "secondary rights," while privileges and claims are in his view primary rights.

Other discussions concerning the nature of rights focus more on the notion of choice and the equal right of all men to be free. Rights are then determined on the basis of a moral justification for one or more persons interfering with and limiting another person's freedom. Hart, an English jurist, and Carl Wellman, an American philosopher, are the principal modern-day exponents of what is commonly termed *the choice theory*.

According to the choice theory, the unifying characteristic of rules that entail or create rights is that such rules specifically recognize and respect a person's choice either negatively by not obstructing it or affirmatively by giving legal or moral effect to it. This theory proposes that no person has an absolute or unconditional right to do or not to do any particular thing or be treated in any particular way.

This right to choose, Hart explains, is more accurately described as "an equal right of all to be free." Every adult human capable of choice, first, is at liberty to do any action that is not coercing, restraining, or designed to injure others and, second, has the right of forbearance on the part of others from the use of coercion or restraint against them. These notions of choice and freedom can also be expressed as a liberty or as an obligation not to do a particular act (*X*): thus A's liberty to do/not having any obligation to do *X* is A's right given B's duty not to interfere.

More recent theories concerning rights have also focused on the notions of liberty and noninterference. Libertarian philosophers maintain that every person is the absolute owner of his or her own life and should not be constrained by others but subject to every person respecting the liberty of others. Robert Nozick, an American philosopher, claims that the only basic right that every person possesses is the negative right to be free from coercion by other human beings. He explains that, in other words, rights are to be thought of as side constraints that limit the actions that are otherwise morally available to everyone. Nozick relies on Immanuel Kant's notion of not treating persons solely as "a means" as the basis for his theories.

Joseph Raz offers a different conception of rights; he argues that people may be said to have a right if and only if some aspect of their well-being (some interest of theirs) is sufficiently important in itself to justify holding some other person or persons to be under a duty. This is commonly termed *the interest theory*. For example, A can be said to have a right to free speech if some interest of A is sufficiently important from a moral point of view to justify some other person(s) to have a duty not to restrict A in speaking freely. The duty in this case rests primarily with the government, but in other cases, the duty may be imposed on some other person or persons.

This theory of rights singles out a certain interest on the basis of its moral importance, but it may be that an interest has sufficient moral importance to justify holding other individuals to be under more than one duty. The interest in question may morally justify endless duties. Thus, if A's interest in speaking freely is sufficiently important from a moral point of view to justify the government to be under a duty not to impose censorship, then others may be under further duties to ensure that A is given the opportunity to speak out, that A has some platform for communication, and even that A has protection as a means to ensure that persons with opposing views do not prevent or disturb A's right of free speech.

In recent times, theories concerned with the proper conception of rights have focused more on the nature of moral rights and claims to rights, as distinct from legal rights. But many of the theories employ, at least in part, the concepts identified in relation to legal rights; whether these conceptions are generally relevant to both legal rights and moral rights, in a like manner, is a question that continues to be explored.

Declaration of Human Rights

Today, it is more usual to employ the term *human rights*, as opposed to natural rights or natural laws, when confronted by apparent abuses of human life. The United Nations Universal Declaration of Human Rights, which was proclaimed following the end of World War II in 1948, was enacted in the hope that an ostensibly universal standard would serve to discourage the sort of barbarous acts witnessed in the first half of the 20th century. The preamble to the declaration explains that such actions had outraged the conscience of mankind.

The Declaration, which is in the form of a charter, generally uses the term *rights*. But the preamble describes the foundation of freedom, justice, and peace in the world as inalienable rights of all members of the human family. It also talks of fundamental human rights, in the context of promoting social progress, in terms of the dignity and worth of the human person and the equal rights of men and women. The use of the terms *inalienable* and *fundamental* does suggest that certain rights may be of greater significance or importance.

The charter also appears to promulgate rights of differing nature. In the first 20 articles, which include the rights of life, liberty and security, free speech, and freedom of worship, the right not to be tortured, the right to a fair trial, and the right to own property, the rights are arguably more concerned with individuals and with the notions of freedom and liberty. The articles thereafter are more communal and concern socioeconomic rights, such as the right to work, the right to just and favorable remuneration, the right to rest and leisure, and the right to periodic holidays with pay.

The first 20 articles of the charter are sometimes described as first-generation rights, whereas the rights that are more concerned with communal rights are said to be second-generation rights. Rights concerning the solidarity of communities are said to be third-generation rights. There is an abundance of modern philosophical and political discourse concerning the relationship between these first-generation rights and the so-called second- or third-generation rights.

The first-generation rights are generally expressed as freedoms. In relation to the people of the United Nations, they are rights to which each and every person is entitled. In Hohfeldian terms, they are privileges (freedoms) because their correlative is a "no-claim right."

Such rights are, however, problematic in that, arguably, a fair degree of material security is required if they are to be exercised. Thus, economic and social well-being, which is addressed in the later articles of the charter, are important in determining whether the freedoms expressed in the earlier articles are actually worth having. It is argued that first-generation rights are predicated on some notion of respect for human dignity and that the neglect of an individual's social or economic predicament is not consonant with that respect. Thus, economic security is necessary if first-generation rights are to be taken seriously. This line of argument ultimately leads to claims concerning welfare and for economic support and assistance.

Modern-Day Issues Concerning Rights

Claiming an entitlement as a "moral right" has become commonplace, and as Waldron explains, the language of rights now appears to be used to refer to any demand that an individual interest should be protected or promoted that is made from the individual's own point of view.

In recent debates, it has been suggested that we need some way of expressing that not all individual interests have sufficient importance to form the basis of rights. Given that rights may also generate more than one duty, we also need to understand whether the duties generated by a right have differing degrees of importance.

To categorize rights based on their moral importance is clearly problematic. John Rawls developed the idea of lexical priority in relation to his first principles of justice. But identifying certain rights as of higher priority and needing attention before others, as Rawls has pointed out, seems ill-suited to principles or moral considerations that are in many cases open-ended. Priority becomes even more problematic if we determine that a certain right is correlated with more than one duty. Such a priority may also result in an overly rigid approach to claiming an entitlement or a right.

Waldron poses a qualitative weighting as a means to determine the importance of different duties expressed as a fraction of the importance of the right from which they flow. But he ultimately dismisses this idea as unsustainable because it also requires prioritizing rights.

There remains a need to clarify exactly what is meant when we claim to have "a right." Theories abound, but they lack a consensus, or at least explanation in language that can be commonly understood by persons claiming entitlements or rights. The basis for making such claims, in many cases, is a "moral right" or a "human right," but modern-day societies have yet to determine what such rights actually comprise.

Right to Work

According to some accounts, the right to work denotes a basic human right; to others, it aims to remove the limitations to employment imposed by unions or, alternatively, takes away employment protections that unions have fought to attain. More recently, the right to work has been invoked as part of efforts to ensure a just and equitable workplace free from discrimination or hazards. In different ways, each of these interpretations is grounded in an understanding of work as a necessary component of human dignity and human flourishing.

A right is a claim that an individual or group may make against a society or state. The claim is limited by what is morally correct or upholds standards of justice. For every right, there is a corresponding responsibility both on the part of the right-holder and on the part of a second party who either enables or provides for that to which the claimant is entitled (positive rights) or does not infringe in areas of the claimant's life that are protected (negative rights).

Two broad-based categories of rights are civil or legal rights and moral rights. Civil or legal rights are rights that are guaranteed by law; they are created by a state to ensure the proper functioning of that state and the protection of the individuals who reside under the state's jurisdiction. Any given legal right may or may not be informed by a specifically perceived moral right but must be made explicit by the state through legislative or judicial decision making. Moral rights are construed more broadly to be universally applicable but may be divided into categories based on the identity of the rights-holders. A human right is a moral right that pertains to all human beings regardless of their political state or society. Human rights are determined according to widely accepted basic requirements for human dignity.

The Right to Work as a Human Right

Since work allows the individual to strive to achieve his or her fullest potential while also emphasizing a sense of social responsibility, it must be considered one of the requirements for human dignity. Within moral theory, then, the right to work is a positive moral right, thereby necessitating the assistance of others, and is generally understood to be one of the basic human rights.

Broadly construed, work is the exercise of a service, or a skill in the creation of a product, that is valuable to society. Work tends to be thought of as providing a service or skill in exchange for a wage; however, "work" might also include labor that does not receive a traditional wage but is nonetheless valued. Examples include traditionally uncompensated household tasks that are necessary for the running and maintenance of a family as well as other creative or valued tasks that may not always receive a wage, such as tutoring needy students or organizing a community garden. Human rights principles require that individuals have some social support in the form of wages or financial assistance from the state.

In 1948, the United Nations General Assembly adopted the statement of human rights called the Universal Declaration of Human Rights. The UN Declaration is not based on any particular political or religious system but is rather a general statement to which the signing countries can agree. It is an assertion of what the participating nations take to be the basic minimum standards of human dignity, that is, the basic standards by which an individual may not only survive but also thrive. This document is the most comprehensive and widely accepted statement of human rights to date. Article 23 (in four parts) and Article 24 of the UN Declaration assert a universal right to work as well as some of the necessary provisions included in that right.

The first paragraph of Article 23 of the UN Universal Declaration of Human Rights asserts the right to work. The work must be freely chosen rather than coerced or enslaved labor. In addition, the conditions and environment within which a person works must not be harmful to the person's health or dignity.

The second paragraph of Article 23 emphasizes the equality of all persons in work upheld through providing equal pay for equal work. Such a policy would in part mean that it violates basic rights to assign the most degrading or difficult forms of work to those individuals perceived to be already degraded or socially inferior, for whatever reason.

The third paragraph states that workers also have a right to a just wage. The just wage is determined according to the amount necessary to guarantee a family existence worthy of human dignity. Human dignity entails such basic needs as clean drinking water, adequate health care, proper shelter and clothing, a substantial diet, and basic education. If the wage is inadequate to provide such needs, then it is the responsibility of the state or the community to provide supplemental means of social protection.

The fourth paragraph in Article 23 ensures a worker's right to join a trade union or to form collective bargaining bodies. The UN specifies that this right is designed to protect the interests of the individual worker.

Article 24 asserts the importance of limiting work so that individuals may have time to develop other aspects of their human personality as well as spend time with family and friends. Thus, the UN includes a statement about the need for leisure time so as to ensure that while we validate the right to work we in no way validate or legitimate the exploitation of the worker.

Not all work supports or upholds the dignity of the individual; such labor would not satisfy the criteria for the human right to work. Some work may be demeaning or degrading or otherwise detract from a person's sense of self-esteem, autonomy, or responsibility. Additional aspects of assessing forms of work in fulfillment of the human right include the extent to which employees are incorporated into decision-making procedures that affect their work activity, the variety of tasks they perform, the degree of worker input into modifications of work load or production alterations, and the avoidance of hierarchies that dehumanize types of work.

While civil or legal rights generally mean the holder has a claim against another agent or state, as a moral right, the right to work operates somewhat differently. There is no single governmental office and no single person or group of people responsible for finding dignified, nonexploitative work for each and every human being. However, as a matter of public policy the state may be held responsible for unemployment. The right to work may function also to limit other rights and inform other obligations, as when the right to work conflicts with the right to private property.

Most rights also carry a corresponding obligation. In the case of work, there is both an obligation to oneself and to one's community. First of all, work fulfills a personal obligation in that it encourages or even requires that the individual determine certain aims or goals for himself or herself. These aims generally make use of one's unique talents or gifts. Our uniqueness helps determine our obligation to work. We are obligated to develop our talents to actualize our own potential.

In addition, our obligation to work extends to the community. The community provides certain social goods ranging from simple support to more detailed structures of exchange. Membership in a community entails reciprocal relations, whereby one gives of oneself in the form of time, talent, and goods while also receiving from others similar forms of support. These reciprocal relations allow individuals to pursue more specialized tasks precisely because they are ensured that those tasks related to daily living will be reciprocally exchanged for the specialized tasks some other individuals perform. In addition, the communal obligations of the right to work mandate mutual protection of that right. Thus, the right to work at times has been construed as a negative right insofar as individuals ought not to have their right to work infringed.

Right-to-Work Laws

Within civil society, the right to work frequently has been construed to mean a public policy of full employment. In the United States, this took the weakened form of the Employment Act of 1946, which stopped short of advocating full employment, and the Full Employment and Balanced Growth Act of 1974, which aimed at 3% unemployment. The Keynesian model of full employment in the United States contrasts with the predominant model in Western Europe that was influenced by trade unions and socialism. Sweden, for example, crafted an economic policy that recognized the right to work as a human right and emphasized economic security guaranteed by society.

Since the mid-19th century, trade unions have been instrumental in pushing public policy toward the goal of full employment. Ironically, labor politics in the United States during the latter part of the 20th century centered on a different conception of the right to work. Right-to-work laws are state constitutional amendments or legislative statutes that challenge union security or proscribe compulsory participation in a union. They specifically make the closed shop and the union shop illegal, but they also target the preferential shop and maintenance of membership programs. In a closed shop, only union members may be hired; in a union shop, employers may hire anyone, but employees must join the union within a specified time of employment. The preferential shop mandates priority hiring of union members and maintenance of membership requires union members to sustain their membership for the entire time of their employment contract. In contrast, the open shop allows the employer to hire employees regardless of union membership.

Right-to-work laws are based on Section 14(b) of the Labor-Management Relations Act of 1947, better known as the Taft-Hartley Act, and protect an individual's right to refuse membership in a labor organization. Individuals have a right not to join a union and ought not to be forced to pay dues to a labor union as a condition of their employment. The Taft-Hartley Act bans the closed shop, and Section 14(b) permits states to outlaw the union shop through state law.

The first right-to-work law was passed in Florida in 1944. Since that time, 21 other states have passed right-to-work laws, and Congress occasionally discusses a federal right-to-work law. Of course, numerous bills have also been introduced into Congress calling for the repeal of Section 14(b).

In contrast to the human rights account of the right to work, right-to-work laws are negative legal rights because they prohibit the infringement of a person's liberty. Nonetheless, defenders of the right to work demonstrate the link to human rights by emphasizing the individual employee's right to work regardless of union membership. Proponents of right-to-work laws further claim that they protect individual freedom and are neither pro- nor antiunion. Unions, they argue, often use member dues to support political candidates or causes that individual employees would not or may not choose to support. Forcing employees to join a union, then, forces them to contribute to causes they may find morally problematic or politically unsound.

Opponents argue that right-to-work laws or "right-to-work-for-less" laws are part of a systematic attempt to destroy collective bargaining and merely enhance the ability of employers to underpay their workers. Moreover, because unions also negotiate hours and working conditions, opponents argue that right-to-work laws invite unfair or even abusive treatment. Right-to-work laws, they argue, open the door for free riders to reap the benefits of union negotiation without contributing to the costs. Moreover, by appealing to the 1951 Supreme Court ruling in *Railway Employees v. Hanson*, supporters argue that unions protect and strengthen an individual's right to work, and those who benefit from the collective bargaining of unionism ought to contribute dues.

The right to work continues to take on new meanings as traditional workplaces adapt to the changing workforce. Affirmative action policies aim to remove barriers that limited the right to work for women and minorities. Dual-career families challenge traditional conceptions of work rights by demanding flexible schedules, family leaves, on-site child care, and family health provisions. Laws that protect against sexual harassment, gender discrimination, and hostile environment add further layers of complexity and increased importance to ever expanding social conceptions of the right to work.

RISK RETENTION ACT OF 1981

The Product Liability Risk Retention Act of 1981 sought to improve the availability and cost of product liability insurance to businessmen and municipalities across the United States by allowing similar businesses to form risk retention groups (RRGs) who could self-insure to cover product liability exposures. The Risk Retention Act reflects social organization and a decision that continues to evolve as to who bears the risks in society.

In 1986, the Product Liability Risk Retention Act was revised, expanded, and renamed the Risk Retention Act. The revised act established a new entity by which insurance buyers could purchase liability insurance: purchasing groups (PGs). A PG can be any group of persons with similar or related liability risks who form an organization to purchase liability insurance on a group basis. Unlike a RRG, a PG is not an insurance company. PGs are much easier to form and are not required to raise capital to file feasibility studies or to reinsure, as are RRGs.

For the RRGs and PGs to operate cost-effectively and efficiently across state lines, Congress inserted two types of federal preemption provisions. The first prohibits discrimination against RRGs and PGs by the states. On a practical level, once a RRG has obtained a license from its chartering state and has raised its capital, it can begin operations in other states almost immediately. The second prohibits a state from requiring any insurance policy issued to a RRG or any member of the group to be countersigned by an insurance agent or broker who resides in that state. This addresses the issue of states requiring every insurance policy issued in the state to be countersigned by an agent who is a resident of that state and who would be paid a percentage of the commission. RRGs, by definition, provide insurance to persons in the same type of business or industry, not to the general public. Therefore, the state requirement for a resident agent to sell insurance seems to add nothing but cost. Although the Liability Risk Retention Act is a federal law, it has no enforcement mechanism of its own. RRGs are regulated by the state in which they are registered. Regulation of PGs entails not only the domiciliary state of the PG but also the regulation of the PG's insurer.

RRGs benefit from the act because it allows members to control their own program, obtain rate stability over the long term, and implement effective loss control programs. They may obtain dividends for good loss experience and have access to reinsurance markets, all of which improves their ability to maintain a stable source of liability coverage at affordable rates. The major benefit for PGs is the ability to negotiate tailor-made coverage at favorable rates with insurers.

The natural catastrophes of the 1990s drove up the price of commercial property insurance and increased discussion about the need to broaden the act to allow RRGs to cover property risks. Although such legislation would be welcomed by RRGs, the National Association of Insurance Commissioners (NAIC) opposes expansion of the 1986 act on the grounds that a lack of any guaranty fund protection could lead to a disproportionate number of bankruptcies of RRGs. The NAIC also argues that although premiums may be high, there is no actual shortage of property insurance that is not addressed by state-based solutions that are mindful of insurer bankruptcy. At the time of this writing, legislation to expand the 1986 act is being reviewed by a congressional committee.

Rocky Flats

Rocky Flats Nuclear Weapons Plant (Rocky Flats) in Jefferson County, Colorado, was a nuclear weapons production site. From 1952 to 1989, Rockwell International produced plutonium triggers for the U.S. Department of Energy (DOE) for nuclear weapons. After its cleanup in 2006 (scheduled), the site will be designated a National Wildlife Refuge. Rocky Flats has been controversial regarding issues such as regulation, government oversight, community involvement, use of risk-based analyses, cleanup standards, and disposal of radioactive waste.

Operations were on a 384-acre portion of the 10-square-mile site, 10 miles northwest of Denver. Community groups expressed concerns over contamination and lack of oversight by the DOE. Major sources of contamination on- and off-site were two fires (1957, 1969), an accidental release of plutonium into the air in 1974, leakage of metal-laden oil from barrels stored outside since 1958, and a chromic acid spill in 1989. The use of corrosive and radioactive materials, storage of hazardous and radioactive wastes, and spraying wastewater resulted in contamination on- and off-site. Additional problems included safety issues, decreased staffing, breakdown of controls in the radiation compliance programs, and organizational independence.

Following an FBI raid in 1989, Rockwell settled out of court in 1992 admitting to environmental crimes and paid an $18.5 million fine, the largest environmental penalty ever imposed at that time. In 1989, EG&G Technical Services became the prime contractor for the site. EG&G planned to resume production but stopped due to performance problems. In 1993, the DOE revealed that the site had at least 14 tons of plutonium, 7 tons of enriched uranium, 281 tons of depleted uranium, 65 tons of beryllium, and large amounts of other toxic chemicals. Surface soils had high concentrations of plutonium-239, estimated at almost 380 times the background concentration, or level naturally or previously occurring, and a significant inhalation hazard. Although conclusive evidence of health problems in the community due to exposure is not available, community groups and health studies emphasize the potential risks from accidental releases and continual operations. Studies of the workers' health continue; to date elevated risk of disease and chromosome damage related to radiation exposure has been seen in some plant workers.

The DOE initially estimated that the cleanup would take 70 years and $36.6 billion. A joint venture of Kaiser Engineers and CH2M Hill (environmental and engineering firms), Kaiser-Hill proposed a cleanup that would take 7 years costing $6 billion. Citizen groups called the latter plan a "dirty closure" as it would leave elevated levels of plutonium in the soil and groundwater, and the contaminated building would be buried. When Kaiser-Hill and DOE agreed to a 7-year plan costing $7 billion, community groups were angered over the lack of citizens' input. Debate involved several stakeholders, including DOE-sponsored organizations and grassroots organizations.

By designating the end use of Rocky Flats as a National Wildlife Refuge, the DOE tailored remediation goals to meet less stringent legal requirements, since the risk standard is based on the "maximally exposed individual" on the future site—a wildlife refuge worker. By using a risk-based end state, costs were lower than if the land was to be cleaned up to background concentrations.

Role Model

According to philosophers, the relationship between ethics and role modeling extends back to Aristotle, who said that the spirit of morality was awakened in an individual through the witness and conduct of a moral person. Social scientists bear this out, finding that the modeling process is a common means of observational learning and of transmitting values, attitudes, and behaviors. People learn much of what they know, not through direct experience but by observing the behavior and experiences of others. Thus, much learning, of behavior generally and ethical behavior more specifically, occurs in an anticipatory manner as individuals are informed about the benefits of the modeled (ethical) behavior and the costs of inappropriate behavior.

When an individual becomes a role model for others, she or he becomes a target of identification and emulation. Theoretically, anyone (e.g., a coworker) can act as a role model for another, but leaders are likely role models in organizations because of their status, success, and power to affect the outcomes of others. In the organizational literature, role modeling is viewed as essential to leadership and, in particular, to the transformational leadership style.

Empirical research suggests that individuals can become ethical role models by engaging in behaviors that are thought to be altruistically motivated and normatively appropriate (e.g., honesty, fairness, caring). Such behaviors increase the model's attractiveness, credibility, and legitimacy, all requirements for effective role modeling. In an interview study, MBA students at three universities were asked to identify the characteristics of individuals they think of as ethical role models. They identified a number of interpersonal behaviors displayed by their ethical role models, such as care and concern, integrity, trustworthiness, humility, respectful treatment even in difficult times, explanations for negative outcomes, and openness to input and criticism. The interviewees also described ethical role models as taking responsibility for their own ethical failings and accepting the mistakes of others. Ethical role models were described as coaches who focus on improvement and also as having a consistent ethical vision and behavior that play out in all areas of the role model's life. They communicate high standards to others and hold themselves and others accountable to those standards. Ethical role models put ethics above other personal or company interests, sacrifice their own needs for the needs of others, and have a long-term multistakeholder perspective. The researchers found that thinking of someone as a role model requires a close working relationship and, somewhat surprisingly, does not require business success. Rarely were senior executives identified as ethical role models. Rather, interviewees thought of someone with whom they worked closely whose integrity they admired. It remains an open question whether ethical role models can be developed.

Roles and Role Morality

The notion of role morality is based on the belief that individuals and groups have certain duties and virtues as a result of the specific roles they occupy within society. A conceptual framework for understanding these specific moral obligations can be found in Greek virtue ethics. Within the thought of Aristotle, virtues were carefully cultivated character traits that were teleologically related to the good life or happiness of the community as a whole. For a community to be happy, or prosper, each individual had to cultivate the virtues specific to his or her role in society. If you were a soldier within the Greek city-state, you had to cultivate the virtue of bravery; if you were a worker, you had to be diligent; and as a ruler, you had to be wise. The communitarian philosopher, Alisdair MacIntyre, argues that duties and virtues are cultivated within certain practices in society and that we cannot understand our moral obligations without reference to such a social context.

A contemporary application of role-specific virtues and duties can be found within professional ethics. As a society, we expect professionals to fulfill their role properly by displaying certain virtues and responding to specific moral obligations. We trust professionals to be custodians of certain specific public goods: Legal professionals serve justice and, therefore, have to be fair; medical professionals protect and nurture our physical well-being and have to display the virtue of care; and accountants vouch for the veracity of financial statements and have to be honest. If professionals fail to protect these basic goods or neglect these virtues, society can no longer allow them to fulfill their specific roles. Arthur Andersen, the auditors in the Enron scandal, exemplifies how a lack of honesty and failure to protect the public can result in the loss of an auditing practice.

Role morality is sometimes contrasted with personal morality. Virtues and duties required in a specific role may conflict with one's personal sense of what is morally appropriate. It was Max Weber's contention that individual morality is subjugated to the functionally specific rules and roles of the bureaucratic organization. The danger that this subjugation presents is that of the compartmentalization of an individual life. Alisdair MacIntyre points out that individuals lose a sense of overriding concern for what it means to be human and stop asking moral questions apart from those required by specific roles. For example, executives may have two radically different opinions when asked about the need for environmental protections in two different capacities. When confronted with this issue in their capacity as parents, executives will typically support environmental protection, but in terms of their fiduciary duties within the corporation, they will often not feel responsible for implementing environmentally friendly business practices.

The phenomenon of amoralization, or the inability or unwillingness to recognize something as a moral issue, has also been linked to the limitations that role morality imposes on one's sense of moral imagination. This problem is exacerbated by the fact that society tends to assign legal responsibility for the avoidance of harm only to those within a specific role and not to human beings in general. For instance, within most jurisdictions, failure to assist a drowning person is not technically illegal, but a mother's allowing her child to die of neglect is. In the business environment, this is manifested in the fact that legal concepts such as the "business judgment rule" assign executives certain rights and liberties to take risks to maximize shareholder value. The flip side of this coin is that legislation like the Sarbanes-Oxley Act of 2002 increases the risk of individual liability of CEOs and CFOs by requiring sign-offs verifying the accuracy of financial statements.

ROUSSEAU, JEAN-JACQUES (1712–1778)

Jean-Jacques Rousseau, who lived most of his life in France but sometimes identified himself as "a citizen of Geneva," was a philosopher who wrote novels, letters, autobiographical reflections, and essays that advanced positions that were at once provocative and paradoxical. He is remembered most for his political thought, which is both a critique of existing monarchies and a reaction against the Enlightenment and the then revolutionary individualism of Thomas Hobbes and John Locke. His writing first gave impetus to the French Revolution, later lent weight to the Romantic movement, and continues to be studied for its attempt to confront, define, and solve the problem that political societies are inescapably made up of naturally asocial creatures. His several solutions to this problem join in offering a powerful moral critique of the "bourgeois," the sort of person Rousseau sees as being fostered by large, democratic nation-states founded on the rights of the individual to pursue property.

Rousseau accepts Hobbes's view that human beings are not "political animals" but are asocial by nature. The challenge of politics is hence to design institutions that are legitimate and function well with creatures whose primary natural concerns are themselves, not the common good or unselfish virtue. But Rousseau's view of human asociality is much more radical than Hobbes's. Rousseau denies that one can discover human nature simply by observing what happens when enforced law is removed, as Hobbes implied, for the people who live in civil society have been deeply shaped by this experience. Their conduct, with or without enforced law, is a reflection on socialized man, not on natural man. To discover natural man, one must go back much further in the history of the species, and this leads to a much different set of standards by which to guide and assess political life. Indeed, for Rousseau, natural man is scarcely human at all. He lacks language, reason, imagination, and the inflated desires that these nurture.

Because Rousseau's natural man is without pride, religious opinions, or exaggerated desires, he is also free from many of the motives that drive human beings into conflict. True, he is an uncivilized brute, but he is a peaceful brute, a "noble savage," capable of enjoying "the sweet sentiment of existence." Whereas Hobbes used the horrors of the state of nature to underscore the blessings brought by stable government, Rousseau uses natural man's freedom, self-sufficiency, equality, wholeness, goodness, and tranquility to argue that life in civil society has made human beings weaker, less happy, more artificial, and deeply corrupt. For Rousseau, the political problem is not mainly one of keeping the peace and increasing material prosperity; more important, he argues, are political principles that look to human happiness, wholeness, and virtue.

It is a modern political idea to affirm and stress a natural right of individuals to pursue property. Even before this idea takes hold, Rousseau expresses powerful reservations against it. He does so partly on the ground that the inequality between rich and poor is hardly natural or based on natural rights (Locke's argument that labor constitutes a title to ownership to the contrary notwithstanding), but he also stresses the moral changes that accompany this inequality: Avarice and ambition come to be dominant passions, and unhappiness is added to injustice. Rousseau is thus a critic of the sort of human being who is devoted to the pursuit of self-interest, and he sees this sort of person as justified and encouraged by modern liberal institutions. Adam Smith would later show that, under capitalism, it is not from "the benevolence of the butcher, brewer, or baker that we expect our dinner, but from their regard to their own interest." Rousseau would grant this but would be quick to add that if it is not in their interest to feed us, modern principles and institutions will incline others to let us starve. More fundamentally, what if true happiness requires that one be benevolent or good, not merely well fed? Modern liberalism may succeed in producing "the wealth of nations," but only, if Rousseau is correct, by impoverishing the individuals who seek their daily bread within these wealthy nations.

Rousseau openly admitted to writing "paradoxes." Through these, he lent support to the forces that would overthrow the French monarchy, but at the same time he laid a foundation for opposing any liberal regime that might replace it. Rousseau's diagnosis of the problem of natural man in unnatural society went so deep that it could not be followed by a simple solution. He did present "solutions" both for civil society (*On the Social Contract*) and for the individual (*Emile*), but both are so complex and demanding that neither serves as a pattern for easy imitation. In Rousseau, one finds no easy solutions but rather stimuli for romantic longings that cannot be satisfied by getting and spending; for outrage at the callous mistreatment of the poor by the rich; and for the urge to go "back to nature" to live a simpler but happier, more honest existence. Above all, one leaves Rousseau with the sense that the pursuit of luxury and superfluity may bring tangible benefits while yet also coming at an enormously high social and human cost.

Royal Ahold Company

A Dutch-listed company, Royal Ahold NV, was first established by Albert Heijn as a small grocery store in 1887 in Zandaam, the Netherlands. By 2005, it was one of the world's leading food providers with more than 240,000 employees, a customer base of more than 300,000 independent and chain businesses, and sales of more than 44 billion euros in 2005. In 2003, however, Royal Ahold was rocked by a financial scandal resulting in the firm restating its earnings by $1 billion for 3 years ending 2002 and paying $1 billion in December 2005 to settle a class-action lawsuit with shareholders. The former CFO who was fired in 2003, Michiel Meurs, was singled out by a Dutch enterprise court in 2006 as bearing most of the blame for the accounting scandal. The former CEO, Cees van der Hoeven, who resigned when the fraud was uncovered, was also found complicit. The accounting scandal involved overlooking weak internal controls because Royal Ahold emphasized achieving double-digit growth within its recently acquired subsidiary, U.S. Foodservice.

Starting in 1995, Royal Ahold achieved rapid growth by purchasing subsidiaries around the globe. It spent approximately $19 billion in acquisitions over a 6-year period. The Dutch enterprise court in 2006 stated that Royal Ahold knew about the weak internal controls within the U.S. Foodservice subsidiary before it was acquired in 2000 and accused Royal Ahold of failing to act even after warnings of continued accounting weaknesses.

The February 2003 discovery of accounting fraud due to overstatements of income nearly bankrupted the entire firm. Characterized as "Europe's Enron," Royal Ahold has made significant changes in its financial and operating controls as well as increasing transparency with investors. Financial statements for the fiscal years 2000, 2001, and 2002 were restated with significantly lower net earnings and earnings per share.

The U.S. Securities and Exchange Commission (SEC) also investigated Royal Ahold and its various operating companies, including its U.S. Foodservice subsidiary. A final settlement with the SEC was reached in October 2004. Under the agreement, Royal Ahold was not required to pay any fines or admit to any wrongdoing for its actions, which caused it to restate earnings by $1.2 billion over 3 years.

The SEC didn't fine the company because Royal Ahold cooperated with investigators. Royal Ahold reported the misconduct itself and conducted an extensive internal investigation that went beyond U.S. Foodservice. According to the SEC, Royal Ahold also gave up attorney-client privilege, made personnel available for interviews, and fired employees responsible for the irregularities.

After the fraud crisis in 2003, stronger financial controls, direct oversight, better governance mechanisms, and tighter controls on vendor contracts provided additional accountability and transparency of the firm to many government agencies in the Netherlands and the United States, investors, and employees. As part of Royal Ahold's "road to recovery," numerous steps were undertaken to increase trust. Among the steps was the appointment of a chief corporate governance counsel who is a member of the executive board.

One in a continuing line of accounting fraud discoveries, Royal Ahold joined the ranks of Enron, WorldCom/MCI, Tyco, and Adelphia Communications as lightening rods depicting managerial exuberance and accounting fraud. Unlike Enron, WorldCom, and Adelphia Communications, however, Royal Ahold did not declare bankruptcy and emerged 2 years later in stronger financial shape with better operational controls. Today, Royal Ahold continues to operate through subsidiaries and joint ventures of food retail and food service activities predominantly in the European Union (EU) (e.g., operating supermarkets, hypermarkets, and convenience stores, including Albert Heijn, Gall & Gall, Etos, and Albert Zakelijk) and the United States (e.g., owning food service stores, including Stop & Shop, Giant, and Tops and its e-commerce grocery retail delivery service, Peapod).

Rural Electrification Administration

The Rural Electrification Administration (REA) was created during the Depression era to provide electricity to rural areas. President Franklin D. Roosevelt established the REA through Executive Order 7037 on May 11, 1935. In 1939, the REA became part of the Department of Agriculture (USDA). Subsequently, the agency's role was expanded by Congress to include directing a rural telephone program in 1949 and the delivery of rural Internet-based broadband telecommunications programs in 2002. In 1994, the Department of Agriculture was restructured under the Federal Crop Insurance Reform and Department of Agriculture Reorganization Act. This restructuring ended the REA but created the Rural Utility Service (RUS), which was charged with administering rural utility programs, rural housing programs, community facilities programs, rural water and waste disposal programs, and select rural business programs.

The vision of the Rural Development unit (which runs the RUS programs) of the USDA is "a rural America that is a healthy, safe, and prosperous place in which to live and work." Its mission is "to increase economic opportunity and improve the quality of life for all rural Americans." To serve its mission, the agency provides direct loans, loan guarantees, and modest levels of grant assistance in public-private partnerships. The RUS offers its services to rural cooperatives, nonprofit associations, public bodies, and for-profit utilities. The agency estimates that it supports the development of economic opportunity for more than 60 million Americans living in the 80% of the country classified as rural.

The Electric Program is the largest of the infrastructure programs of the RUS, accounting for approximately $28.5 billion of its fiscal-year 2006 loan portfolio. Water and telecommunications projects account for the remaining $12.5 billion of the agency's loan portfolio.

The agency has identified two key strategic initiatives: broadband service access in rural areas to provide for equal economic development opportunity and a grant program for high home energy cost areas. The RUS views affordable broadband as an "essential business tool." The agency is committed to the provision of such technology that will improve distance learning opportunities and telemedicine care for sparsely populated areas. The energy grant program is targeted to pockets of homes in nine states with energy costs exceeding 275% of the national average. This program seeks to improve generation, transmission, and distribution facilities for those communities.

The provision of electrical service to rural America by the government through the REA was not without its detractors; for example, the bituminous coal industry objected to the federal government's entry into the power business through subsidies using taxpayers' money. Although large private power companies may have been capable of generating and delivering electrical power to rural customers during the Depression, few actually provided such service, citing prohibitive costs and customer payment risks. Similar arguments are made regarding current RUS initiatives. However, the RUS essentially serves as a financing agency for infrastructure needs, providing 25-year loans to private companies, cooperatives, and public agencies at interest rates approximating the prevailing rate for government obligations.

S

Sarbanes-Oxley Act of 2002

In response to major corporate accounting scandals at large U.S. companies such as Adelphia, Computer Associates, Enron, and WorldCom, to name a few, the United States Congress passed a sweeping legislation in July 2002 aimed at improving the integrity of financial statements and related audits and mandating certain corporate governance practices within publicly traded U.S. companies. This legislation, called the Sarbanes-Oxley Act of 2002 (referred to here as Sarbanes-Oxley or the Act), has been considered by many to be the most significant new law since the passage of the Securities and Exchange Acts of 1933 and 1934.

The Act is most commonly referred to by its section numbers. Each section has specific requirements, affecting either the external auditor or a company or both, or in some instances, creating additional government oversight of companies and their auditors.

Some of the most important sections of the Act and their related requirements are discussed in the following sections, grouped into related categories.

Enforcement and Penalties

The Act has created new mechanisms to monitor the quality of audits performed by public accounting firms that audit publicly traded companies, establishes accounting standards, and includes penalties to punish officers of companies that attempt to profit from fraudulent activities.

Section 101

It established a newly created and separate nonprofit corporation, the Public Company Accounting Oversight Board (PCAOB; referred to here as the Board) to "oversee the audit of public companies that are subject to the securities laws . . . in order to protect the interests of investors and further the public interest in the preparation of informative, accurate, and independent audit reports for companies the securities of which are sold to, and held by and for, public investors." The Board shall be operated under the auspices of a five-member commission, appointed by the Securities and Exchange Commission (SEC; referred to here as the Commission). The Board may have only two members who have been or are Certified Public Accountants (CPAs). Each member of the board is expected to serve on a full-time basis and may not engage in any other business or professional activity during their term of appointment. Board members are appointed for a 5-year term and may only serve for two terms.

Section 102

Any public accounting firm that desires to be appointed as the auditor for a publicly traded U.S. company (i.e., an issuer or a registrant) must register with the PCAOB to perform such audits. In addition, the firms must pay an annual registration fee and provide periodic reports to the Board. The firms are also subject to an inspection process as defined by the Board (see Section 104).

Section 103

This gives the Board the authority to establish, as it deems appropriate, auditing standards to be used by registered public accounting firms in their conduct of financial statement audits of issuers and in the preparation and issuance of their audit reports. The Board issued PCAOB Auditing Standard No. 1 (AS1), which adopted all the previously issued and existing *Statements of Auditing Standards* of the Auditing Standards Board of the American Institute of Certified Public Accountants (AICPA) in effect as of April 16, 2003. AS1 also provided the standard report format for registered public accounting firms to use when issuing their auditor's report on an audit of an issuer's financial statements. Section 103 also set standards for the retention of the registered firm's audit documentation, requiring firms to maintain their documentation for 7 years from the auditor's report release date, unless a longer period of time is required by law.

Sections 104 and 105

The PCAOB was charged with conducting "a continuing program of inspections to assess the degree of compliance of each registered public accounting . . . with this Act" as well as with any standards or rules issued by the Board or the SEC related to the performance of audits or issuance of audit reports. The inspection program replaced the previous peer review process conducted by member firms of the SEC Practice Section of the AICPA, considered by some to be ineffective at detecting financial statements lacking adherence to auditing standards. These inspections are to be performed annually for all registered firms that audit 100 or more issuers and at least once every 3 years for firms that audit 100 or fewer issuers. A report of the results of the inspection shall be issued, the registered firm shall have the right to respond to the findings of the report, and the information shall be provided to the public, absent any confidential or proprietary information related to the firm. The PCAOB has accomplished this by making the reports resulting from their inspection process available on the Board's Web site (www.pcaobus.org). The Board was also granted the power to investigate and discipline registered firms, including requiring and obtaining testimony, producing documents, and requesting other forms of cooperation. Failure to comply with the Board's requests or provisions of the Act can result in sanctions, temporary or permanent revocation of registration, limitations on activities, and monetary penalties.

Section 107

The SEC shall have oversight and enforcement authority over the Board as specified in the Act. Sarbanes-Oxley requires that the PCAOB submit their proposed rules for registered firms or issuers to the Commission for their approval.

Section 108

The Act allows the SEC to recognize, as generally accepted for purposes of the securities laws, accounting standards that have been issued by a private standard-setting body that has a board of trustees committed to serving the public interest and will be responsive to emerging accounting issues, business practices, and changes in the business environment. This was de facto confirmation of what has already been occurring in practice for many years. The Commission, which was granted the authority to promulgate accounting standards by the Securities and Exchange Act of 1934, has relied almost exclusively on the Financial Accounting Standards Board (FASB) and its predecessor organizations for standard setting.

Section 109

This section of the Act establishes a funding mechanism to provide for the activities of the Board and the standard-setting body discussed in Section 108, in the form of annual accounting support fees paid by issuers. The Board and the accounting standard-setting body establish their annual operating expense budgets, and these amounts are allocated to issuers by a formula based on an issuer's average monthly market capitalization during the preceding year as a percentage of the total average monthly market capitalization for the preceding year.

Section 304

If an issuer is required to restate its financial statements as a result of misconduct with any financial reporting requirement under the securities laws, the chief executive officer and the chief financial officer of the issuer shall be required to reimburse the issuer in the amount of any bonus, incentive-based compensation, or equity-based compensation that the person received during the 12 months following the issuance of the misstated financial statements, and to reimburse the issuer for any gains that they may have realized from sale of the issuer's securities during the same 12-month period.

Section 408

The Act requires that the SEC shall review the periodic filings of issuers (e.g., Form 10-K) no less often than once every 3 years.

Section 906

This section of the Act is part of the "White-Collar Crime Penalty Enhancement Act of 2000" and provides for the imposition of criminal fines and penalties on chief executive officers and/or chief financial officers who knowingly certify that their financial statement filings are accurate when they are not (see the discussion of Section 302 below). The fines and penalties can amount to as much as $5,000,000 and imprisonment of up to 20 years.

Reporting Requirements

The Securities and Exchange Acts of 1933 and 1934 require issuers of publicly traded securities to provide certain periodic filings with the SEC, such as quarterly reports (Form 10-Q), annual reports (Form 10-K), and current reports (Form 8-K). In response to significant misstatements of financial statements by some companies, the Act includes provisions requiring executive officers to certify their company's financial statements and assess the effectiveness of their systems of internal control.

Section 302

The principal executive officer or officers of an issuer were always required to sign a company's periodic reports being filed with the Commission. The Act goes further, requiring the principal executive officer(s) and principal financial officer(s) to certify in each annual or quarterly report filed with the Commission that (1) they have reviewed the report; (2) to the best of their knowledge, the report "does not contain any untrue statement of a material fact or omit to state a material fact necessary in order to make the statements made, in light of the circumstances under which such statements were made, not misleading"; (3) to the best of their knowledge, the financial statements included in the filing present fairly in all material respects the financial position and results of operations for the issuer for the period(s) presented; (4) the signing officers are responsible for disclosure controls and internal controls over financial reporting, have evaluated the effectiveness of the issuer's internal controls as of a date within 90 days prior to the report date, and have presented their conclusions in the report about the effectiveness of internal controls; (5) the signing officers have disclosed to the issuer's auditor and audit committee any significant deficiencies in design or operation of internal controls, any material weaknesses in internal controls, or any fraud (whether or not it is material) involving management or employees who play a significant role in the system of internal control; and (6) the signing officers must indicate whether or not there have been any significant changes in internal controls or other factors that could affect internal controls subsequent to their evaluation date. The wording of the management certification included in Section 302 must be used *verbatim*; issuers are not permitted to adjust the language, and it must be included within the periodic report.

Section 404

The Act requires that the SEC develop requirements that each annual report filed (Form 10-K) by an issuer must include a report on internal control that shall "1) state management's responsibility for establishing an adequate system of internal control and procedures for financial reporting and 2) include an assessment, as of the end of the issuer's most recent fiscal year, of the effectiveness of the issuer's internal control structure and procedures for financial reporting." If management determines that it has one or more material weaknesses in its internal control system, then they cannot conclude that they have an effective system of internal control. In addition, Section 404 requires that the issuer's registered public accounting firm "shall attest to, and report on, the assessment (i.e., of internal control) made by the management of the issuer." The auditor's report on management's assessment of internal control shall be made in accordance with guidelines issued by the PCAOB and shall not be an engagement separate from the audit of the issuer's financial statements. This is referred to as an integrated audit, incorporating the financial statement and attest report on management's assessment of internal controls.

This three-paragraph section of the Act has been the subject of much discussion, criticism, and complaint, and there have been outright calls for its reversal. Many business executives have complained that the costs of Section 404 have far exceeded the possible benefits. Proponents claim that this is the only way to ensure that issuers will devote the appropriate resources to ensure that adequate internal control systems are in place to produce accurate financial statements. Others claim that this section has also rewarded the public accounting firms with additional fees when they were implicit in some of the accounting scandals that have occurred. The first year that companies were required to report under Section 404 was the year ending after December 15, 2004. Moody's, the rating agency, estimates that approximately 6% of companies reported material weaknesses in their internal controls and procedures for financial reporting. While Section 404 of the Act has received the most criticism, a previous law, the Foreign Corrupt Practices Act, which was passed in 1977, already required public companies to maintain an adequate system of internal control. It is unclear how vigorously this law was enforced.

Section 409

This section of the Act requires that the SEC issue new rules requiring companies to disclose additional information regarding material changes in their financial condition or operations on a rapid and current basis. The SEC subsequently amended its rules for the filing of Form 8-K, requiring that it be provided within four business days of the occurrence of the event.

Auditors

Prior to the passage of the Act, it was not uncommon for the auditors of publicly traded companies to provide additional services to their audit clients. These services typically involved various types of business consulting, and in many instances, the fees for these services exceeded the fees charged for the financial statement audit. Many observers believe that this created an inherent conflict of interest for the auditor and that the auditor could not carry out a thorough audit of an issuer's financial statements if the auditor was also concerned with whether or not significant consulting work would be retained. The Act provides specific rules on what services the auditor of an issuer may provide and also addresses the issue of a registered firm's employees becoming employed by an issuer.

Section 201

Registered public accounting firms that perform an audit of an issuer's financial statements are specifically prohibited from performing any nonaudit service, including "a) bookkeeping or services related to accounting records or financial statements of the audit client; b) financial information system design and implementation; c) appraisal or valuation services; d) actuarial services; e) internal audit outsourcing activities; f) management functions or human resources; g) broker or dealer, investment adviser or investment banking services; h) legal services and expert services unrelated to the audit; i) any other services that the Board determines, by regulation, is impermissible." The effect of Section 201 has been to limit the registered public accounting firm who performs an issuer's audit to performing the audit and preparing the company's income tax returns. In addition, the issuer's audit committee must now approve any nonaudit services performed by the registered public accounting firm in advance (Section 202).

Section 203

The Act requires that the lead audit partner of the registered public accounting firm having primary responsibility for the audit and the audit partner responsible for the reviewing of the audit (i.e., the concurring partner) be changed or rotated from the audit every 5 years.

Section 206

Historically, many employees and even partners of public accounting firms accepted employment opportunities with client companies when they decided to make a career change from public accounting. The act makes it more difficult to do this because an employee of a public accounting firm must wait for at least 1 year before he or she accepts a position in a financial reporting oversight role with a client company.

Corporate Governance

Many of the financial statement scandals occurring in the late 1990s and early 2000s have been attributed to lack of proper oversight by corporate boards of directors and, specifically, their audit committees. The Act includes specific rules expanding and clarifying the composition and responsibilities of audit committees. In addition, it provides rules for corporate officers related to transactions that they might engage in related to an issuer's securities as well as other transactions with the company.

Section 301

This section of the Act provides specific guidance on the composition and duties of an issuer's audit committee. The audit committee must consist of members of the issuer's board of directors, and the members must be independent. Independence of the audit committee member means that he or she cannot be a member of management, cannot accept any consulting or compensatory arrangement with the issuer, and must not be affiliated with the issuer in any other way. At least one of the committee's members must be considered a *financial expert* having thorough education and (1) an understanding of generally accepted accounting principles (GAAP) and financial statements, (2) experience in financial statement preparation or auditing, (3) experience with internal controls, and (4) an understanding of the functioning of an audit committee. Audit committees without a financial expert must disclose the reasons why they do not have such a person on their committee.

The audit committee is now directly responsible for the appointment, compensation, and oversight of the registered public accounting firm. In addition, the committee has the right to engage its own advisers to carry out its duties and responsibilities, and the issuer must provide the necessary funding. Furthermore, the committee must establish procedures to receive and address complaints received by the issuer regarding accounting, internal accounting controls, or auditing matters, and it must provide for confidential submission of employee concerns regarding questionable accounting or auditing matters. Many audit committees have established anonymous hotlines to accept these types of complaints and concerns.

Section 204

Traditionally, public accounting firms have met with the audit committees of their clients at the conclusion of a financial statement audit. This section of the Act mandates that certain communications take place between the auditor of the issuer and its audit committee. Specifically, it requires that the auditor report to the committee on all critical accounting policies and practices of the issuer, any alternative treatments of accounting matters discussed with management of the issuer, and any other material written communications between the registered public accounting firm and the issuer's management, such as a letter of recommendations on internal controls or a list of accounting adjustments that were detected during the audit but not recorded (referred to as passed adjustments).

The Sarbanes-Oxley Act has mandated that companies make significant changes in corporate governance, requiring more proactive audit committees and holding senior management more responsible for the information presented in a company's financial statements. The Act has changed the role of the registered public accounting firm as well. Firms now report directly to the audit committees of their clients and are subject to the expectations of their new government regulator, the PCAOB. Many critics of the Act contend that the U.S. Congress has attempted to legislate ethics into the corporate workplace. In addition, there are concerns that implementation of the Act gives U.S. public companies inherent disadvantage in raising capital in international markets, as no other country has such significant laws and regulations regarding financial reporting and corporate governance. Will the changes brought on by the Act improve the integrity of financial reporting, the quality of audits of financial statements, and the behavior of corporate management and directors? Will U.S. public companies experience difficulty in their attempts to raise capital? Only the passage of time will permit a determination of the effectiveness of this far-reaching legislation.

SATISFICING

Satisficing takes place when an individual arrives at a decision that is good enough according to the information at hand. When a person satisfices, he or she is not necessarily arriving at the best decision but at one that is considered adequate for the achievement of the current goals. Satisficing is not a process in which the first-fitting solution is chosen but, instead, is a consideration of what has worked well in the past. It is often used during cognitive tasks such as problem solving where the best solution is difficult to establish. An obstacle to satisficing, however, is that individuals do not usually have access to all the alternatives available because they are simply too numerous to contemplate. As a result of these cognitive restrictions, it is sometimes rational to choose an option that may not necessarily be viewed as optimal. In contrast to satisficing, optimizing behavior attempts to determine the best possible way for an individual to attain his or her most desirable goal. Although optimizing can provide the paramount solution for long-term goals, most of everyday decision making is based on the need to satisfice. In business situations, satisficing is frequently seen as cheaper than optimizing because looking for other alternatives would be time consuming and unnecessary when a viable solution already exists.

The term *satisficing* was introduced in the work of Herbert Simon (winner of the Nobel Prize in economics in 1978). Simon believed that human wisdom is bounded or limited by incomplete knowledge and an inability to predict all the consequences of decisions. Since these cognitive boundaries do not allow the processing of all possible information, individuals are forced to pick the most satisfactory solution from those they can envision.

Selling an item (such as a car or home) provides an example of satisficing in a dynamic decision-making environment. Possible options are explored in the form of offers made on the item being sold, and the seller is forced to eventually stop taking offers and finalize the sale. In essence, the seller must arrive at the offer deemed good enough when considering all the offers on the table.

Satisficing also has moral implications that must be considered. Situations that take into account a multitude of people or decisions such as shareholder wealth maximization or stakeholder analysis may pit optimization against satisficing. As a result, it is possible that managers seen as satisficing will be criticized for their lack of insight or ability to see the "big picture," including their duties or obligations to all business constituents. In terms of moral theories, satisficing may be viewed as a form of consequentialist decision making. Satisficing utilitarianism is very similar to classic views of utilitarianism except that it does not necessitate the maximization of total well-being and, instead, believes that coming up slightly short of total well-being is acceptable.

Several criticisms of satisficing exist. Of significance is the theory's elimination of an individual's ability to make impulsive decisions. In addition, there are protests that the constant evaluation of the utility of consequences may be detrimental to a person's capacity to make the best decision.

Savings and Loan Scandal

During the 1980s, a large number of savings and loan depository institutions in the United States failed or suffered severe financial distress because of changing financial regulations, widespread financial mismanagement, and a surge of financial crimes perpetrated by, in many instances, officers of the affected institutions. This wave of financial failures, unprecedented since the difficult economic years of the Great Depression, came to be known as the savings and loan scandal. Ironically, the earlier success of the savings and loan institutions in fulfilling their intended mission laid the groundwork for this descent into financial ruin.

The origins of the savings and loan scandal in the United States lay in the changing economic and political environment of the 1970s. Savings and loans institutions, also called thrift institutions, existed since the banking reforms of the 1930s (under Franklin D. Roosevelt's "New Deal" administration) as a major source of residential mortgages for single-family homes. During the housing boom in the United States following World War II, these institutions provided low-interest, fixed-rate, long-term loans to a growing consumer base of home buyers. The thrifts in turn funded these long-term loans by attracting deposits that, because they could be withdrawn at any time, were short term in nature. This financial framework succeeded in driving the growth of the post–World War II residential building and home-owning boom, especially in the expanding suburban communities surrounding major American cities.

Savings and loans attempted to balance this difference between their short-term deposits and long-term loan obligations by matching the interest rates of their mortgage lendings to the interest rates offered for savings. Throughout the postwar years and into the 1970s, they accomplished this through three incentives: savings interest rates at levels slightly higher than those available to depositors from commercial banks, customer convenience services and savings bonuses, and the protective umbrella of federal deposit insurance for savings.

During the 1970s, however, the conditions underpinning the thrifts' activities changed drastically. Consumer price inflation caused federally set interest rates to rise dramatically, increasing the cost of funds to all savings institutions and forcing thrifts to increase their savings interest rates to continue attracting deposits. Meanwhile, the assets held by savings and loans in the form of mortgage loans remained at fixed rates of interest that were much lower than the cost for new deposits. This trend created economic pressures that had an adverse impact on the financial profitability of the thrift industry.

Accompanying these economic changes were growing political pressures from free market advocates for reduced government intervention in the marketplace. These advocates cited the financial imbalances faced by thrifts and the growing emergence of market-based alternatives to thrifts (such as commercial banks with expanded powers, mutual funds, and even government-chartered mortgage institutions such as Fannie Mae and Freddie Mac) as proof that the savings and loan industry needed deregulation to compete more effectively. With the United States facing both inflationary pressures (from a combination of economic recession and supplier-created oil scarcity) and increasing mistrust of government (in the aftermath of the Vietnam conflict and the Watergate scandal), the sentiment for change was strong within most sectors of the economy.

Whereas many thrifts lost money during this period of economic and political uncertainty, the regulatory changes of this time also brought expanded opportunities. Governmental actions in the late 1970s and early 1980s succeeded in removing many of the regulations that previously restricted the range of deposit and lending options available to thrift institutions. These actions attempted to offer the thrift industry a degree of flexibility for diversifying their mix of deposit (liability) and lending (asset) offerings. On the liability side, federal legislation approved the expansion of deposit offerings by savings and loans beyond simple savings accounts to include more lucrative, but also higher risk, products such as interest-bearing checking accounts and large-denomination, nationally sold certificates of deposit. These new products also received the protection of guaranteed federal deposit insurance, which was increased from $40,000 to $100,000 per account. Meanwhile, on the asset side of the business, thrifts began to offer both fixed-rate and adjustable-rate mortgages, expanded into a wider range of investments beyond residential real estate, and extended their lending activities beyond their traditional regional locales to a nationwide marketplace. However, even with these structural changes, thrift institutions' primary expertise remained rooted in locally based residential lending, creating the potential for large-scale mismanagement.

As savings and loans moved to expand their lending (asset) and deposit-attracting (liability) activities while returning to profitability, the free market–based philosophy of deregulation proposed that those institutions unable to balance their assets and liabilities under free market competition would fail or be absorbed by more viable competitors. The result would be a stronger, more effective, and more profitable industry sector for both consumers and industry participants. However, this proved not to be the case because of two significant intervening factors: institutional regulatory failures and expanded risk-inducing incentives.

When the U.S. federal government moved to relax regulations for the savings and loan industry, it likewise lessened regulatory oversight of the implementation and consequences of these changes. As thrift institutions lost money and moved toward (or reached) financial insolvency, this reduced level of regulatory oversight allowed many declining thrifts to avoid disciplinary penalties and remain open. Once this process of regulatory failure had occurred, the postderegulation expansion of deposit-attracting opportunities for thrifts provided a perverse incentive for these businesses to engage in increasingly risky lending activities.

All savings and loan deposits were insured by the federal government in full up to $100,000, without regard for the underlying risks or the creditworthiness of the insured savings and loan institution. Thus, once a thrift fell into financial insolvency (where its liabilities exceeded its assets), it could choose to raise additional deposit funds for speculative investments knowing that its liability in the event of failure would be assumed by the federal government. These risky investments, if successful, would then return the business to financial solvency. If these risky investments failed though, the depositors whose money had been put at risk would not lose their funds, because the federal insurance guarantee would presumably protect the full return of their principal.

This combination of potential high return for thrift industry participants with relatively small risk proved very attractive to both experienced managers and new entrepreneurs. From 1983 to 1985, the savings and loan industry grew by more than 50%, just as the underlying real estate values supporting the industry's lending-based growth declined. The result was a tidal wave of financial insolvency throughout the 1980s and the early 1990s among savings and loan institutions, which, because of political pressures raised by depositors and their legislators to ensure federal deposit protection for the entire value of consumer deposits, was ultimately assumed by the federal government. By the end of the 1990s, the taxpayer cost for resolving the problems of failed savings and loans had exceeded $120 billion.

The movement toward financial deregulation in the 1970s that engulfed the savings and loan industry intended to address one growing issue facing the industry: the problem of economic imbalances and inefficiencies in a changing global marketplace. However, by ignoring the critical public service component underlying the creation and success of the savings and loan industry, the reduced levels of governmental oversight occasioned by deregulation invited unscrupulous financial risk takers to exercise unprecedented control over assets previously considered inviolate—the savings and homes of individuals. This deregulation-driven emphasis on financial criteria as the sole justification for the savings and loan industry highlighted a critical trend of political policy making in the late 20th century: a reliance on the economic forces of growth and globalization (Adam Smith's "invisible hand") as the preferred course for ensuring financial well-being and individual security.

Scandals, Corporate

Scandals have been a part of the commercial landscape at least since the inception of the corporation. Corporations are created to generate wealth by concentrating economic power and directing it to achieve corporate purposes. Corporate scandals emerge when individuals attempt to seize this power for personal purposes and from their abuse and misuse of it. The form of scandal is shaped by the economic nature of the modern corporation.

The British economist Ronald Coase observed that modern economies are dominated by large corporations run by managers rather than by traditional systems of individuals and small organizations selling goods and services primarily to each other. These managers seek to control their firm's transaction costs (i.e., to manage the costs incurred in acquiring resources and in coordinating processes such as marketing and manufacturing). In *The Modern Corporation and Private Property*, Adolph Berle and Gardiner Means argued that the essence of a corporation is the fragmentation of accountability among its various managers and other related actors. In the modern corporation, professional managers are not necessarily the owners; stockholders and other investors are not generally in charge or even legally liable; and the boards of directors are rarely sufficiently informed or adequately empowered to control their firms. This fragmentation and lack of control tend to encourage an open grab for corporate power as individuals who are involved with these organizations seek to acquire for themselves some of the available resources connected with corporate transactions. There are both morally acceptable and morally unacceptable ways of doing this. In Western societies we tend to praise those who acquire power and wealth by ethical means. But actions that are born out of greed, hubris, narcissism, or arrogance and that abuse corporate power are morally unacceptable. They offend many people's sensibilities.

A scandal materializes when untoward actions are alleged and publicized whether they ultimately prove to be valid or not. The publicity harms some people, if not many. Meanwhile almost everybody is tainted, bringing about general public disgrace. Comparing scandal to robbery, Lord Chesterfield once observed that the victim is generally thought as bad as the thief. Accordingly, it is the very fact that some untoward incident is made public that makes it a scandal. Social systems tend to agree with Molière, the French dramatist who claimed that to sin in secret is no sin at all but to be accused of sin made a scandal.

Corporate power can be abused scandalously in many different ways: using corporate resources for personal gain, excessively hyping an unsound business deal to an uninformed investing public, using false and deceptive advertising or selling methods, indulging in insider trading, paying bribes, making use of influence peddling, paying early investors out of later investors' contributions rather than from income (pyramid or *Ponzi scheme*), selling a phony or nonexistent product, manipulating or colluding on prices, overcharging for products or services delivered, and failing to respond adequately to an accident or natural disaster. Organizational forms that have been used to concentrate power unduly include trusts—units for which the real control of a company is transferred to an individual or small group by an exchange of shares of stock for trust certificates, which are issued by the individuals seeking control—and cartels—organizations formed by producers whose purpose is to allocate market shares, control production, and regulate prices.

In a capitalist economy, the public depends on accounting statements and financial and other information to make its business decisions. In recent years, accounting fraud has been a source of considerable scandal. Among the many shams that have been used recently to pretty up some ugly underlying financial conditions and to deceive investors are channel stuffing (Sunbeam), treating expenses as capital investment (WorldCom), unsubstantiated lengthening of the lives of assets (such as a fleet of trucks) to reduce depreciation charges (Waste Management), and the shams that Enron used par excellence—namely, front-end loading of revenues by using unduly optimistic "mark-to-market" (actually, "mark-to-model") estimates and transferring assets off the books to specially contrived paper organizations such as "special-purpose entities."

Brief History of Corporate Scandals

The modern history of corporate scandals begins with the South Sea Bubble of 1720. In 1711, the British Parliament gave the South Sea Company permission to form a monopoly for trade in the South Seas and South America, including the right to import slaves from Africa. The deal's promotion spawned a frenzy of public speculation. As a result, the South Sea Company share prices soared from about £1 to as high as £1,050. Trading in slaves, however, proved to be unprofitable, and the monopoly in British trade with Spanish America never achieved its original high expectations. In possession of insider information about the forthcoming shortfall, in January 1720, the chairman and some company directors sold their holdings. Widespread financial losses were experienced, and thousands of investors were ruined when the bubble burst and the stock price collapsed. The public, having lost confidence in the entire economic system, demanded explanations and restitution. A parliamentary investigation revealed complicity by several company officials. Two members in the royal court of George I were also implicated in the scandal. Early in 1721, Britain's Chancellor of the Exchequer was imprisoned in the Tower of London on charges of fraud in connection with the South Sea Bubble. A new prime minister and Chancellor of the Exchequer were appointed. Reforms were initiated averting an even greater financial panic.

The South Sea Bubble case illustrates a general pattern for corporate scandal. First, there is a climate of general optimism creating an environment in which significant business opportunities arise or appear to arise. Executives, managers, and others in positions of power succumb to greed and narcissism and embark on grandiose schemes to avail themselves of the opportunities. Some of these schemes are initially legitimate, whereas others are scams from the beginning. Playing on the public's infectious greed (as Alan Greenspan subsequently called it), hype, exaggeration, and clever new instruments (creative financing) are used to secure funds and other resources. The ballyhoo creates a bubble. But the underlying business model proves to be flawed and fails. The executives then conjure up deceptions, illusions, deflections, frauds, and other schemes to hide the shortfalls. Meanwhile, they take action to protect their personal interests. Eventually, however, an investigative reporter uncovers a clue, a whistleblower releases information, or the march of events simply overtakes the firm, and the public learns of the misdeeds. The press runs scathing stories. People learn that the executives' self-aggrandizing actions have deceived investors and other stakeholders and, ultimately, inflicted substantial harm on many other parties. The harm is often widespread. Investors lose savings and retirement funds. Suppliers no longer have customers. Consultants are ousted. Trading partnerships are terminated. Customers and communities are disrupted. Notably, employees lose their jobs. Usually, some of the key parties would have been privileged to inside information and would have cashed out their stock or otherwise protected their interests before the burst. As a result, the public is incensed, disgraced, and morally offended; trust in the economic system erodes; and the public calls for redress and reparation. Allegations are made. Investigations are launched. Culprits are sought out and charged. Two types of social control are implemented. External controls such as laws, sanctions, and imprisonment are put into practice. Internal controls of socialization including programs to promote ethics and more acceptable behavioral norms are propagated. All this is intended to prevent future abuses. The next scheme, consequently, must be created outside the purview of these new controls.

The *Black Friday* incident of 1869 in which the great railroad and telegraph baron, Jay Gould, and another financial speculator, Jim Fisk, attempted to corner the U.S. gold market follows the pattern of corporate scandal. It occurred during a period of optimism following the U.S. Civil War. On September 20, Gould and Fisk began purchasing gold in New York City. The public was led to believe that government officials condoned the purchases. Soon Gould and Fisk controlled enough of the available gold supply to bid the price up from about 140 to 163, thus creating turmoil and confusion at the exchanges. A general panic ensued and the prices of other commodities began to fluctuate wildly. The run on gold was halted when U.S. Secretary of the Treasury George Sewall Boutwell announced that the federal government was making $4 million of its gold reserves available for trading. Many businesspeople were ruined by the panic whereas Fisk and Gould reportedly made a profit of about $11 million. As events unfolded, the press portrayed Gould as a malicious, amoral, unstoppable financial wunderkind, pasting him forever with an unsavory reputation. The incident outraged the public, prompting the U.S. House of Representatives Banking Committee to launch an investigation focusing largely on President Grant's administration. While implicated members of the administration were eventually exonerated—not all scandals end with convictions—the Congress and Wall Street changed their policies and procedures to further protect financial markets from flagrant market cornering by conniving individuals.

As the 19th century morphed into the 20th, opportunities in steel, oil, railroads, finance, and other emerging industries attracted a new group of innovators—men who would not only create great industrial organizations but would also secure massive fortunes for themselves. Today, the names J. P. Morgan, Andrew Carnegie, John D. Rockefeller, and Cornelius Vanderbilt join Gould's as archetypical scandal makers and power magnates of the era. The mere mention of their names conjures up images of the excesses and skullduggery of the time. Their ethical standards for doing business during the heated post–Civil War decades of innovation, capital accumulation, and consolidation shocked almost everyone. In 1902, the muckraking writer, Ida Tarbell, published an exposé of Rockefeller and Standard Oil, concluding that the spectacular growth of the companies had been accomplished by means of fraud, deceit, special privilege, gross illegality, bribery, coercion, corruption, intimidation, espionage, or outright terror. In 1934, the journalist Matthew Josephson appropriately dubbed these people *robber barons.* President Theodore Roosevelt launched a successful antitrust suit against Standard Oil and pursued other robber barons as well, which earned him the title of *trust buster.* Public outrage gave rise to reforms, including the passage of the

Sherman Antitrust Act of 1890 and the Clayton Antitrust Act of 1914.

The 1920s were called the roaring twenties because of the affluence and optimism of the times. Early in the decade, a flamboyant Italian American financial wizard named Charles Ponzi bilked thousands of unsuspecting people out of their savings by claiming that his company had agents buying Spanish reply coupons for 1 cent that could be redeemed at any U.S. post office for a 6-cent stamp. Investors flocked to participate. Early investors were paid off at rates of 50% to 100% with funds raised from later investors, thereby giving the illusion that the deal was financially sound. The pyramid scheme eventually collapsed, at least $8 million were never accounted for, six banks failed, and Ponzi went to jail. The phrase *Ponzi scheme* became a standard part of the corporate scandal lexicon.

Another enduring symbol of scandal occurred in 1929 when a former U.S. secretary of the interior, Albert Fall, was convicted of accepting a bribe of $100,000 for secretly leasing the U.S. Navy's *Teapot Dome* oil reserves to Harry Sinclair's petroleum company. In 1932, Chicago Edison, Commonwealth Edison, Peoples Gas Light and Coke, and several other utilities companies, all controlled by Chicago magnate Samuel Insull, went into receivership. More than 600,000 shareholders and 500,000 bondholders lost most of their investments. Insull, who had emerged from an impoverished childhood to become Thomas Edison's private secretary and then to play a pivotal role in the creation of General Electric (GE) before taking control of the companies, was indicted for fraud and embezzlement. Pyramided holding companies and interlocking directorates were his key deceitful tactics. President Franklin Delano Roosevelt publicly denounced him and his practices and called for regulatory reform leading eventually to the Public Utility Holding Company Act of 1935, one of the most important federal consumer protection laws ever passed.

The Depression and World War II diverted corporate efforts, but by the 1960s, corporate power was on the rise and more scandals were in the making. The climate of the 1960s in the United States was one of social unrest. Civil rights issues emerged, concerns about the war in Vietnam arose, drug use escalated, employees formed more adversarial relationships with management as old values were cast aside, and loyalty shifted from faithfulness to one's employer to belief in personal ideals. In this milieu, several executives in the electrical equipment industry, led by executives from GE and Westinghouse, entered into agreements to fix prices and to allocate market share by a phases of the moon formula that determined which company would make the low bid on a particular job. Learning of this, the public was incensed. In December 1961, the Justice Department sought a court order to make GE subject to unlimited fines if it ever again tried to fix prices or violated any antitrust laws. Several senior GE executives went to jail. The 1960s also witnessed the conviction of the colorful financier Billie Sol Estes from Pecos, Texas, for selling finance companies $24 million worth of mortgages on fertilizer tanks that did not exist. Texas Gulf Sulfur was indicted for issuing misleading press releases about copper deposits supposedly discovered in Canada. A few cases of insider trading led to case law efforts to protect innocent investors. As part of the reformation efforts toward the end of the decade, firms began to establish codes of conduct and publish vision and values statements. This was also the period of the birth of the corporate social responsibility movement. For the most part, corporate legal and human resources departments took the lead in these efforts.

The decade of the 1970s was characterized by recession, oil embargo, unemployment, productivity lag, and heightened concerns about the environment. Its moral tone was set by the Watergate affair. In June 1972, burglary and wiretapping of the Democratic Party's campaign headquarters led to a scandal involving abuse of power by public officials, violation of public trust, bribery, contempt of Congress, and attempted obstruction of justice. President Richard M. Nixon and many of his associates were implicated. The affair culminated in the first resignation of a U.S. president. The Love Canal incident, in which scores of residents were evacuated from houses built over an abandoned excavation site used to dump toxic chemical waste, raised questions of corporate responsibility for environmental safety and disclosure. Defense contractor overcharging, the Lockheed overseas bribery case, and Equity Funding were notable corporate scandals. In February 1976, a Lockheed executive told the U.S. Senate Foreign Relations Committee that the company had paid bribes to Japanese government officials to sell aircraft to the country. The incident led to the arrest of former Prime Minister Kakuei Tanaka on charges of accepting bribes. The scandal was heightened when it was revealed that Lockheed had paid a total of $22 million to Japanese and other foreign government officials shortly after it received a $250 million emergency loan guarantee from the U.S.

government. Senator William Proxmire spearheaded the passage of the *Foreign Corrupt Practices Act*, which President Carter signed into law in December 1977. A company called Equity Funding overstated its revenues by making up phony insurance policy sales supported by fictitious records in their files. The result was a billion-dollar fraud based on thousands of fabricated transactions that outside auditors never caught. An insurance analyst, Raymond Dirks, warned his clients about the massive fraud and encouraged them to sell short. Regulators investigated and uncovered the scandal; but they then rewarded Dirks by prosecuting him for using insider information to tip off his clients who had shorted Equity Funding stock based on his advice. Dirks was convicted but later exonerated by the U.S. Supreme Court. Nevertheless, the case served to warn investors about the impropriety of trading based on an insider's tip. The Ethics Resource Center was established in Washington, D.C., to provide aid to companies on issues of ethics. During this period, the "values" movement in business ethics began. Its mission was to encourage corporate ethics efforts to move beyond legal compliance and become values centered. Nevertheless, compliance with laws still dominated.

During the 1980s, the social contract between employers and employees was redefined. As companies became less loyal to their employees, employees became less loyal to their employers. Additional cases of bribes were uncovered, deceptive advertising methods exposed, and influence peddling revealed. The Swiss company Nestlé Corporation was accused of marketing powdered infant formula, whose safe use required a literate consumer who had access to a clean supply of water, to illiterate mothers in undeveloped countries. Many of their babies died, raising questions of misleading and irresponsible selling practices. Union Carbide's plant in Bhopal, India, exploded emitting poisonous gases that killed more than 3,000 people and injured more than 200,000 others due to a failure to comply with safety practices. The incident raised questions about a multinational corporation's obligations when operating in less developed countries. Dow Corning was accused of covering up evidence linking its silicone breast implants to female patient illnesses, immune system problems, and other disorders, raising additional questions about corporate responsibility for safety and disclosure. Four other scandals stand out: defense contract cost cover-up, the savings and loan debacle, Wall Street insider trading, and the *Exxon Valdez* oil spill. The public was outraged to learn that numerous defense contractors had substantially overcharged the government for minor items—for example, the $1,000 toilet seat—and were submitting misleading, if not false, information. As reports of procurement irregularities increased, investigations into the activities of major contractors began. In July 1985, President Reagan asked David Packard, chairman of Hewlett-Packard Corporation and a former deputy secretary of defense, to chair a specially appointed, independent Blue Ribbon Commission on Defense Management (the Packard Commission). In late spring of 1986, the Packard Commission delivered a report that many companies signed, pledging to implement several reforms: codes of ethics, ethics training programs, internal reporting systems for allegations of misconduct, compliance monitoring systems, Best Practice Forums, and accountability to the public programs. Deregulation of the U.S. savings and loan industry and an increase on the limits on deposit insurance (from $40,000 to $100,000 per account)—actions intended to make savings and loans more competitive with commercial banks—led to a wave of failures that foreshadowed a more general financial crisis. About $150 billion was lost, more than 80% of which was borne directly by the U.S. government and hence the public. Although mismanagement, rising interest rates, fluctuation in real estate values, and failed speculation were contributing factors, the Federal Home Loan Bank Board concluded that fraud and insider abuse were the primary causes. Charles Keating, head of Lincoln Savings in Irvine, California, was convicted of fraud, racketeering, and conspiracy and spent 4½ years in prison until his convictions were overturned and he pleaded to a lesser charge. Also, during the 1980s, financial crime became commonplace on Wall Street as greedy traders struck shady deals, bribed influential people to leak confidential business information, illegally manipulated prices, and secretly accumulated portfolios of prized securities. Drexel Burnham Lambert, Inc., was most infamously implicated. Among the key parties in these insider trading scandals were Ivan Boesky, Michael Milkin, Dennis Levine, and Martin Siegel, all of whom served prison terms but avoided full public trials by pleading guilty to reduced charges. In 1989, a drunken captain ran the *Exxon Valdez* aground, spilling 11 million gallons of oil into Alaska's Prince William Sound and producing a world-class environmental disaster. The public was incensed by the seemingly insensitive demeanor and slow response of Exxon executives.

The 1990s was a period, as described by Federal Reserve Chairman Alan Greenspan, of global expansion and irrational exuberance. The decade ended with the blooming of the dot-com bubble. More global issues emerged as scandals included the Bank of Credit and Commerce (BCCI), foreign sweatshops, financial mismanagement, false reporting, fraud, and a renewed emphasis on board of directors' corporate liability.

The Pakistan-based BCCI built an empire that operated in 73 counties and controlled at least $30 billion in deposits. Portrayed as the first global Third World bank by founder Agha Hasan Abedi, BCCI was based on fraudulent practices from the start, being designed to steal billions of dollars and buy political influence in the United States and around the world. The company devised an array of schemes to rob innocent depositors of their savings, assist government officials in looting their countries' treasures, and finance the activities of terrorists and drug lords. Its major mission was to influence U.S. policy in the Middle East. The BCCI affair highlighted a laxness in international control of banks and raised questions about the morality of governments and individuals that used outlets like BCCI to conduct their own covert activities.

The sweatshop issue came to the public's attention when it was revealed that popular talk-show host Kathie Lee Gifford's line of clothing at Wal-Mart had been manufactured by women laborers in Guatemalan shops under near-slavery conditions. Around the same time, CBS ran a report on the poor working conditions in Nike factories in Indonesia and Vietnam. Whereas the Asian workers, mostly women between the ages of 17 and 25, worked 60 to 90 hours a week and were paid 15 to 25 cents an hour, celebrities such as basketball star Michael Jordan and golfer Tiger Woods were paid handsomely ($45 million and $28 million, respectively) for merely associating with the companies' products.

Beginning on February 23, 1995, the venerable 200-year-old Barings Bank was plunged into bankruptcy within just 3 weeks by the unapproved speculative trading of a 28-year-old named Nicholas Leeson. Leeson's short-term trading losses exceeded $1.4 billion, more than the capital of the bank. He was sentenced to serve 6 years in a Singapore prison for his fraudulent scheme, which included phony hedges, doubling up on speculative investments, and submitting false profit reports to the bank.

Social control responses included the recasting of a set of principles for conducting international business that were originally propagated by Reverend Leon Sullivan in 1977 and known as the Global Sullivan Principles for Corporate Social Responsibility. Representatives of 34 nations under the auspices of the Organisation of Economic Co-operation and Development signed a new Convention on Combating Bribery of foreign public officials conducting international business transactions. New emphasis was placed on the United Nations' Code of Conduct on Transnational Corporations, which among other things, required multinational corporations to engage in arm's length pricing. Corporate executive and board member responsibilities and liabilities were clarified. On November 1, 1991, sentencing guidelines of the U.S. Sentencing Commission for all public or privately held organizations were put into effect. They were intended to ensure just punishment and deterrence and to encourage the installation of effective compliance and ethics programs. In 1996, Chancellor Allen of the Delaware Chancery Court, responding to a plea agreement, decreed in the *Caremark* case that the company's directors still bore personal responsibility for the harm the company had caused by alleged mail fraud and kickbacks to physicians for patient referrals, even though no senior company officials were implicated. The following year, the U.S. Supreme Court decided the O'Hagan case, specifying that a person who trades in securities on the basis of insider information may be held criminally liable even if he is not an insider of the company whose securities he trades. On the corporate front, a few companies that had earlier been implicated in scandals, like Royal Dutch Shell, began issuing annual reports on their companies' ethical performance. During the decade, a collection of start-up companies selling products and services offered on or otherwise related to the Internet proliferated, giving rise to a speculative frenzy of investment in technology-related stocks and enterprises. The questionable business models of these companies typically relied on network effects to justify their losing considerable amounts of money to build market, mind, or eyeball share. As a consequence of hype, accounting artifacts, and investor exuberance, a bubble developed that sent dot-com stock prices soaring to dizzying heights making the founders extraordinarily rich, but mostly just on paper.

The economic growth of the 1990s was followed by some dramatic financial failures at the outset of the 2000s. This decade, during which numerous cases of severe financial mismanagement were uncovered, is also characterized by extended international corruption, exorbitant executive pay packages, cyber crime, intellectual property issues, and privacy issues stemming from the collection and selling of personally identifiable information. The dot-com bubble was blown up to the point of bursting on March 10, 2000, when the technology intense NASDAQ composite index peaked at 5048.62, more than double its value the previous year. Soon thereafter, as the flawed, and in many cases deceitful, business models were exposed, investor confidence plummeted. By year's end, the NASDAQ fell to below 2000, wiping out many fortunes. On December 1, 2001, Enron filed for bankruptcy, launching a period of revelation of numerous scandals. A partial list of companies is startling in its scope: Adelphia Communications Corp. A.I.G., AOL Time Warner, Bristol Myers, Cendant Corp., Computer Associates, Credit Suisse First Boston, Disney, Dollar General, Global Crossing, HealthSouth, ImClone Systems, Hollinger International, Merck, Quest Communications, Rite-Aid, Parmalat, Sunbeam, Tyco, Waste Management, WorldCom, and Xerox.

Enron is the poster child and prototypical case. CEO/Chairman Kenneth Lay, COO/CEO Jeffery Skilling, and CFO Andrew Fastow were the lead executives responsible. By using shams and questionable accounting techniques, executives made it appear that the company was earning money that it really wasn't. For example, Enron allegedly generated 96% of its 2000 reported income of $979 million deceptively. The company also reported having a debt load of $10.2 billion in 2000, when it was really $22.1 billion. One of Enron's largest shams was a $111 million deal with Blockbuster video for video-on-demand that never went through but was recorded as profitable on its books. Although it was once the largest energy trader in the United States, on December 1, 2001, Enron collapsed into the largest bankruptcy in the United States at the time (Worldcom's eventually exceeded it). At least seven former Enron executives faced criminal charges. Three British bankers were also indicted for Enron-related wire fraud in late June 2002, and several Morgan-Stanley executives were convicted of illegally parking investments in barges for Fastow. Fastow's co-conspirator, Michael Kopper, returned $4 million after he pleaded guilty to fraud and money laundering. Fastow was arrested on numerous fraud and conspiracy charges (which could have landed him up to 140 years in jail). On October 2, 2002, he was indicted. Eventually, the grand jury lodged 98 counts against him. Among other things, he was accused of obstruction of justice for his part in the destruction of a laptop on which he and Michael Kopper kept secret records of their illicit deals. Then, on January 14, 2004, Fastow entered a guilty plea as part of a plea bargain, admitting to two counts of conspiracy involving wire fraud and securities fraud and agreeing to testify against Lay and Skilling. He also explained his role in several Enron frauds and in a billion dollar hedging scheme that failed. Fastow's wife, Lea, completed a yearlong sentence in July 2005 on a misdemeanor tax charge for having failed to report the kickbacks Fastow received to the IRS. Former senior Enron energy trader Tim Belden pleaded guilty to conspiring with others to create the California power crisis, a major scandal within the Enron scandal. Former Enron treasurer Ben Glisan was sentenced to 5 years in prison for his role in the scandals. Lay and Skilling stood trial early in 2006. Enron's accounting firm, Arthur Andersen, was indicted for obstruction of justice and went out of business. David Duncan, Andersen's lead partner at Enron, pleaded guilty to obstruction for shredding pertinent documents. In response to Enron and other scandals, on July 30, 2002, Congress passed the Sarbanes-Oxley Act, the most far-reaching overhaul of securities law since the Depression. Subsequently, the Federal Sentencing Guidelines for Organizations were extended.

In Enron, WorldCom, and other early 21st-century scandals, once again a familiar pattern of corporate scandals was played out. New technology and business practices and a favorable climate presented opportunities for unscrupulous individuals to contrive deceitful and self-aggrandizing deals. The deceit was exposed and published. As a result of the scandal, reputations were tainted and investments lost. An incensed public called for more forceful external and internal social controls, some of which were implemented.

Securities and Exchange Commission (SEC)

The U.S. Securities and Exchange Commission (SEC) is the primary federal government regulator of securities markets in the United States. The SEC was created to administer the Securities Act of 1933 and the Securities Exchange Act of 1934. Since its creation, the SEC has been assigned responsibility for administering other laws and amendments to those laws, including the Public Utility Holding Company Act of 1935, the Trust Indenture Act of 1939, the Investment Advisors Act of 1940, and the Investment Company Act of 1940. The SEC also has responsibility for administering large parts of the Sarbanes-Oxley Act of 2002. These laws were enacted by Congress to achieve the broad policy goals of protecting investors and promoting efficiency and competition in the capital formation process. The SEC's mission is to help achieve these statutory goals. The SEC carries out its mission by issuing rules and regulations based on the authority of the laws it administers. These rules and regulations serve to interpret and implement the laws enacted by Congress. The SEC also carries out its mission by enforcing the nation's securities laws, including the rules and regulations promulgated under the authority of laws enacted by Congress.

To achieve the statutory goal of investor protection, the SEC relies on several regulatory tools. Chief among these tools are rules and regulations promoting the public disclosure of information about key variables influencing investor decisions. Nearly every securities market participant faces some form of SEC mandated information disclosure requirements. For example, securities exchanges, such as the New York Stock Exchange, face SEC mandated transparency requirements promoting the real-time publication of information about market quotations and transactions. Publicly traded firms, like IBM, face SEC mandated disclosure requirements concerning the information contained in the firm's prospectus ahead of its initial public offering. In addition, publicly traded firms are required by the SEC to disclose, through regular reports to investors, information about the firm's financial condition along with any other information that may be important in influencing investor decisions. Brokers and dealers face SEC mandated disclosure requirements related to the handling of investor funds, sources of potential conflicts of interest, and matters related to fees and trade execution. Mutual funds face SEC disclosure requirements concerning investment risk and performance as well as information concerning advisory relationships, investment objectives, and fund governance. The SEC has continued its policy of mandating more frequent and comprehensive information disclosure requirements over the objections of critics who argue that such policies often have unintended consequences and foreclose an otherwise important dimension of competition among market participants.

To facilitate the SEC's information disclosure policy for public companies, the commission maintains the Electronic Data Gathering and Retrieval system (EDGAR). All companies, foreign and domestic, are required to file registration statements, periodic reports, and other forms electronically through EDGAR. Any member of the public can access and download this information for free over the Internet.

To achieve the statutory goal of promoting efficiency and competition in the capital formation process, the SEC adopts rules and regulations prohibiting trading practices that distort prices and degrade the performance of the securities markets. The SEC regulates aspects of market microstructure to promote competition in securities trading. In addition, the SEC regulates important dimensions of exchange competition as part of its administration of the National Market System amendments to the Securities and Exchange Act of 1934.

Sometimes the SEC must choose to sacrifice the promotion of one goal to promote another. For example, rules that prohibit insider trading to protect investors may degrade the quality of securities prices. In other cases, protecting one class of investors, for example, individual small investors, may harm another, for example, mutual fund participants. When facing conflicting goals, the SEC must determine the trade-off that is consistent with the public interest, broadly defined.

In addition to rules and regulations, the SEC imposes self-regulatory duties on market participants who interact with public customers. In other words, market participants themselves must perform a regulatory role. The SEC oversees the entire regulatory structure to make sure that market participants perform their self-regulatory duties. It has the authority to approve the rules of self-regulatory organizations to ensure that investors are protected and that the capital formation process is efficient and competitive.

The SEC maintains an active program to enforce securities laws under its jurisdiction. Each year it brings hundreds of enforcement actions against individuals and companies that violate the securities laws. Typical infractions include insider trading, accounting fraud, and providing false or misleading disclosures about the financial condition of public companies.

The SEC is not the only governmental organization regulating securities trading in the United States. Individual states have their own antifraud laws related to securities issuance and trading, and the Federal Reserve Board sets minimum margin levels for stocks and stock options through its Regulation T. The SEC also works closely with other financial market regulators, such as the Commodity Futures Trading Commission, to define responsibility for products that have economically similar characteristics to security products.

The SEC consists of five commissioners appointed by the president and confirmed by the Senate. Each commissioner is appointed to a 5-year term. The commissioners' terms are staggered, so that each year one commissioner's term expires. No more than three commissioners may belong to the same political party. The president designates one of the commissioners as chairman, the SEC's top executive. The commissioners are supported by a large permanent staff of approximately 3,100 lawyers, accountants, and economists. The SEC is headquartered in Washington, D.C., and has 11 regional and district offices across the country. The SEC's meetings are open to the public unless confidential subjects, such as settlement negotiations related to an enforcement proceeding, are discussed.

The SEC is organized into four operating divisions: the Division of Enforcement, the Division of Investment Management, the Division of Corporate Finance, and the Division of Market Regulation. These divisions carry out the day-to-day regulatory and oversight operations of the SEC. The SEC also has several independent offices that support the operating divisions as well as the commission itself.

The Division of Enforcement investigates alleged violations of securities laws. On completion of an investigation, the Division will recommend Commission action when appropriate, either in a federal court or before an SEC administrative law judge. Often, the Division will negotiate settlements on behalf of the commission. Although the SEC has civil enforcement authority only, it works closely with various criminal law enforcement authorities, such as the U.S. Department of Justice, to develop and bring criminal cases when warranted.

The Division of Investment Management is responsible for administering the Investment Company Act of 1940 and the Investment Advisor Act of 1940. The Division also exercises oversight of utility holding companies under the Public Utility Holding Company Act of 1935. It is responsible for formulating policy proposals governing investment companies and investment advisers. It is also responsible for registering investment companies and advisers and for ensuring that registrants comply with securities laws.

The Division of Corporation Finance forms the SEC's disclosure regulations related to publicly held corporations and ensures that corporations comply with these regulations. This Division determines the types of public disclosures that must be made when a stock is initially sold. It also determines the types of disclosures that must be made to investors on a continuing and periodic basis. Its staff routinely review the disclosure documents filed by companies and provide companies with assistance in interpreting the commission's rules.

The Division of Market Regulation is responsible for regulating the major securities market participants such as broker-dealers, securities exchanges, clearing facilities, and securities information processors. Among other things, it sets regulations governing minimum capital levels for broker-dealers, reviews and recommends SEC approval or disapproval of rules adopted by securities exchanges and other self-regulatory organizations, inspects clearing facilities, and regulates the price of real-time market information charged by exchanges to information vendors such as Bloomberg. It also oversees the Securities Investor Protection Corporation, which is a private, nonprofit corporation that insures the securities and cash in the customer accounts of member brokerage firms against the failure of those firms.

In addition to the SEC's operating divisions, the commission's supporting offices include the Office of Economic Analysis, the Office of the Chief Accountant, and the Office of General Counsel. The SEC's Office of Economic Analysis advises the commission on policy and regulatory issues. The office analyzes the potential costs and benefits of proposed rules and regulations. It also develops economic evidence for use by the SEC's Division of Enforcement. Another mission of the office is to conduct empirical research on issues of interest to the commission. The office works on a consulting basis with the SEC's operating divisions and with other SEC offices.

The SEC's Office of the Chief Accountant advises the commission on accounting and auditing matters. It also works with accounting standards–setting bodies, such as the Financial Accounting Standards Board (FASB), the International Accounting Standards Board, the American Institute of Certified Public Accountants, and the Public Company Accounting Oversight Board. It advises the commission regarding the application of accounting standards and financial disclosure requirements and helps develop evidence for use in enforcement proceedings related to accounting fraud.

The primary duty of the Office of General Counsel is to serve as the commission's legal representative in appellate proceedings or other litigation involving the commission. The office also works on legislative matters and provides legal advice to the commission.

The securities market is changing rapidly, and the rate of change often outpaces securities laws and regulations. New technology for trading and disseminating information, the growing importance of institutional investors, the proliferation of innovative financial products, the restructuring of financial exchanges, increased linkages between markets, financial scandals, and the globalization of markets are all examples of recent developments that are forcing the SEC to reevaluate how it regulates securities markets. The SEC's response to these developments will have important implications for the cost of raising capital in the United States and, more broadly, for the international competitiveness of U.S. firms.

Securities Industry Association

The Securities Industry Association (SIA) is a professional trade organization that represents organizations that are licensed to participate in the securities industry. The association's membership is vast and includes securities entities such as brokers, dealers, exchanges, investments firms, investment counselors, mutual funds, and many others that are involved in securities transactions. The SIA was established in 1972 through the merger of the Association of Stock Exchange Firms (1913) and the Investment Banker's Association (1912), and the SIA recently merged with the Bond Market Association as well. The SIA is a trade association of nearly 800 securities firms. SIA members—including most NYSE member organizations, major firms, Canadian exchanges, the OTC market, investment banks, broker-dealers, and mutual fund companies—are active in all U.S. and foreign markets and engaged in all aspects of corporate and public finance. Membership is open to all qualifying entities on a nondiscriminatory basis. In the United States, SIA members collectively account for approximately 90%, or $100 billion, of securities firms' revenues and employ about 350,000 individuals. They manage the accounts of more than 50 million investors directly and tens of millions of investors indirectly through corporate, thrift, and pension plans. In 2005, the industry generated an estimated $322.4 billion in domestic revenue and an estimated $474 billion in global revenues.

U.S. securities markets are the most transparent, liquid, and dynamic in the world. New forms of competition, technological advances, globalization, and broader investor participation have driven phenomenal changes in the capital markets and the securities industry over the past three decades. U.S. securities markets are grounded on the foundation of a structural framework. Self-regulation—and the historical level of member cooperation in particular—has been a key ingredient in the longevity of this framework. For example, the extensive expertise of members and their involvement in the rule-making process has undoubtedly led to more effective, less costly self-regulatory rules. Members of the regulatory community have noted that self-regulation has been viewed as having certain advantages over direct governmental regulation because industry participants bring to bear expertise and intimate knowledge of the complexities of the securities industry.

SIA provides much of the leadership for Wall Street firms in Washington, D.C., as a representative of the industry on securities and financial services issues. It actively engages in testifying on Capitol Hill before various committees on issues that affect the securities industry. It prepares position papers and presents them at conferences to crystallize issues that will affect the capital markets and plays a significant role in contributing to the development of proactive policies that help perpetuate the longevity and integrity of the securities markets.

Also, SIA takes a progressive role in other related issues affecting the financial services industry. It provides policy guidance to both federal and state policy makers in the following areas. The association has provided specific policy guidance on issues pertaining to savings and retirement, financial services, tax, securities, international transactions, treaties, and privacy. It regularly issues press releases on various actions that the executive, legislative, and administrative agencies take that affect the financial services industry. For example, on May 11, 2006, SIA issued a press release praising the U.S. Senate for extending capital gains and dividend tax rates. SIA is an active voice for its members on issues that affect the long-term interest of financial services in the United States and abroad. Last, SIA-PAC is a federally registered political action committee for the SIA. Its primary focus is to participate financially in the election of candidates to the U.S. Congress who are committed to preserving the sound economic policies on which the securities industry is built.

SECURITY INDUSTRY ASSOCIATION

The Security Industry Association (SIA) is a full-service, international trade association. The security industry was a $130 billion industry in 2005. It is a broad one that offers protective measures to communities, organizations, and people to alleviate risk, danger, doubt, anxiety, or fear. Security is the condition of being protected against danger or loss.

The security industry is concerned with safety, continuity, and reliability. Safety means the condition of being safe and free from danger, risk, or injury. Safety devices include those designed to prevent accidents, such as a lock on a firearm preventing accidental firing. Continuity means an uninterrupted succession or flow. Systems that provide continuity include disaster recovery systems and backups, for example, generators. Reliability refers to the probability that a system will satisfactorily perform its intended function and behave as we expect it to behave.

Many threats to security stem from external forces; so the industry takes into account the actions of active malicious agents attempting to cause destruction. The security industry includes tangible things that give or assure safety, such as security guards, controlled access systems, and alarm systems, as well as intangible things, such as measures adopted by a government to prevent espionage, sabotage, or attack. A secure system is one that behaves exactly as it is expected to even when external forces try to make it behave differently. The security industry is concerned with risk (the possibility that an event that could cause a loss will occur), threat (the method of triggering risk), countermeasures (ways to stop a threat from triggering risk), and assurance (guarantees that a secured system will behave as expected).

Security measures are generally taken around physical security, building and asset security, information security, and computer systems. Recent security efforts include those enacted by transportation systems, such as at airports and seaports, and the food industry (to prevent contamination). A general principle is that one should never rely on one single security measure alone. Often multiple means of security are built in.

Member companies of the SIA deal with numerous ethical issues. The most compelling are those around privacy and surveillance. For example, the technology of radio frequency identification has raised questions about unauthorized reading of one's personal information—although one should keep in mind its beneficial uses, such as law enforcement using it to locate 911 callers. Other ethical issues include the reliance on biometrics. Some biometric identification methods, such as retina scans, are relatively intrusive and could create a loss of a person's sense of privacy and dignity. Also, the public sentiment toward the use of biometrics like fingerprints may have a negative perception—that is, fingerprinting may be associated with criminal behavior. People feel embarrassed when rejected by a public sensor. Some methods (e.g., face recognition in public places) could be used to track someone's movements without their knowledge or consent.

Ethical questions also arise about how data are stored and used. Safeguards and ethics policies are needed regarding limiting how electronic information is moved and duplicated, who has access to this information, and the proper uses of the information.

The SIA's mission is to promote growth, expansion, and professionalism within the security industry. It provides educational opportunities, performs research, participates in setting technical standards, and represents member's interests.

The SIA was formed in 1969. As of 2005, the SIA counted manufacturers, distributors, service providers, integrators, and other companies among its 417-member base. Members represent a variety of market segments, including closed-circuit television (a type of television that does not involve broadcasting for public viewing but rather limits the content to be seen only on specified receivers connected to the television camera); access control (which includes policies and permissions regarding entrance to a property or system and may be implemented via a human agent such as a security guard, mechanical means, such as locks and keys, or through technological means, such as identification card readers); biometrics (the measurement of physical characteristics, such as fingerprints, DNA, or retinal patterns, for use in verifying the identity of individuals); computer security (the authorization of access to hardware, software, and information on a computer or within a computer network; typically, users are assigned ID numbers and passwords that allow them access to information and programs within their authority); fire/burglar alarms (devices that announce the outbreak of a fire or unauthorized access); and building automation (such as lighting controls, intercoms, energy savings, and security).

The SIA serves several purposes. Its first core purpose is education. The SIA issues a certificate in security project management. It works with other organizations to offer certificates in burglar and fire alarm technologies and video security systems. The SIA has also established multilevel apprenticeship programs in low-voltage systems installations with other groups.

The SIA's second core purpose is to provide its members with market trends and intelligence, so they can increase business effectiveness and achieve greater potential within the market for security services. New technologies that have an impact on the security industry include biometrics and Voice over Internet Protocol. Current topics of interest include workplace violence and threat mitigation and technology-enabled terrorism.

The third core purpose is to develop and implement integration and performance-oriented standards. SIA's current standards activities focus on architectural graphics, control panels, security communications, digital video, and sensors.

The fourth core purpose involves government relations and lobbying. SIA is an active proponent of tax-expensing legislation for security and life safety equipment products and services. Members have testified at U.S. congressional hearings about issues such as homeland security, dual-line monitoring, and wireless technologies and are influential in introducing legislation that codifies theft and licensing in the security field.

Self-Consciousness

Self-consciousness refers to a person's tendency to focus attention on his or her own thoughts and feelings that results in awareness, control, intention, and self-reflection. Because personal actions and choices are based on what one sees, feels, and believes, self-consciousness is essential to understanding human action and moral development.

The state of self-consciousness, therefore, has fundamental personal, social, and cultural consequences. Its related aspects include self-awareness and self-knowledge—terms more frequently applied in management theories. Integral to understanding self-consciousness are definitions of self and self-concept.

Defining Self and Self-Concept

Broadly defined, the self is an array of self-relevant knowledge acquired through thinking, feeling, and motivation. A unique quality of the self is the reflexive capacity for one to be the object of his or her own attention, likened to looking at oneself in a mirror. The self includes a physical body and a social identity and is the active agent in decision making. In the early history of psychology (the late 19th and early 20th centuries), research focused solely on the individual aspects of the self. In the 1920s, the self was primarily studied from a sociological perspective. This shift indicates that the self derives from the interaction with one's culture and society.

One's self can be categorized as material (tangible objects, people, places designated as my or mine); social (social roles and the way we are recognized and regarded by others); and spiritual (inner psychological self, includes perceived traits, abilities, emotions, and beliefs). Contemporary researchers expanded the concept to include a collective self (social categories in which we belong, including racial, religious, and ethnic identities) and a relational self (family, friends, and coworkers).

A person's self-concept derives from how he or she integrates these categories. One's self-concept performs several functions. As an interpersonal tool, self-concept informs one's identity—a prerequisite for social life and human interaction. A person must be able to understand "you" and "I" to sustain relationships over time. Second, one's self-concept is a collection of values and preferences that influence decision making. Choice is integral to self-definition. Because individuals are diverse and complex, the way to keep order when values and preference conflict is through self-regulation—a third function. Finally, one's self-concept serves as a reference point. The storing and organizing of information that relates to and has an impact on one's personal life is processed and remembered more thoroughly through self-reference.

Thus, a person's self-concept guides and directs action and future-oriented goals. It serves as a fundamental tool of mental and social development. Questions of "Who am I?" "Where do I belong?" and " How do I fit in?" are social in nature. Others' views of us are vital to how we conceive of ourselves.

The social construction of one's self depends on one's immediate environment and on larger sociocultural and historical factors. Our *selves* are created within social contexts that take into account the values, norms, and mores of others in that same environment. Self-concept is the result of what Mead calls social commerce—that which propels the type of social action that sustains societies and ourselves. Therefore, the context of the social environment is central to self-understanding.

For example, in Western culture, the emphasis is on personal identity and how people are different from others. In Eastern cultures, the emphasis is on collective and relational identities and how people are similar. Societies that emphasize individualism value individual rights over the duties or social obligations that define a collectivist society. Individualism places value on personal autonomy and self-fulfillment in contrast to collectivist societies, which place value on group memberships.

Therefore, one's self-concept is tied to cultural influences. For example, a person who came of age in the United States in the 1950s, an era of relative conformity, would tend to define self differently than one who entered adulthood in the 1960s, a time of counterculture and peace movements, or the 1970s with the advent of the women's movement. Today, what is often identified as the modern obsession with selfhood is linked to the desire to find meaning in life, with individual and societal values placed on community building and awareness, volunteerism, and philanthropy. This is also evidenced in business practices such as social venture partnering, social entrepreneurs, and strategic corporate philanthropy.

The field of social psychology continues to expand on how culture influences social interactions. Businesses are social institutions; organizations establish legitimacy through ethical interactions with other social actors. The resulting corporate culture functions as part of and within a larger demographic culture. The process of self-consciousness brings these influences into awareness.

Self-Consciousness Defined

Consciousness as a general state is defined as being awake, alert, or aroused—characteristics aligned with motivation. Consciousness encompasses the processes of awareness and attention. Awareness involves the continual monitoring of the inner and outer environments. Attention involves applying conscious awareness to an event or situation that produces greater understanding.

Self-consciousness is the ability to think, reason, and reflect on one's self. Self-consciousness is difficult to study because it is layered, multifaceted, complex, and not generalizable. It is unique and distinct to the degree to which a person becomes conscious through reflection on his or her life experiences. Therefore, self-consciousness is related to one's unique and particular identity as a person. The concept of person is laden with assumptions of duties and rights, both moral and legal. For example, how would one distinguish between a person versus an individual? Are human rights distinct from individual rights? A corporation is defined as a legal person; how does this affect one's view of self?

The process of being self-conscious is the distinguishing feature that separates humans from other mental beings in answering these questions. For example, I have the capacity to make plans for the future. In doing this, I can pursue questions such as "What sort of person am I?" " Am I the sort of person I want to be? Ought to be?" The state of self-consciousness yields this form of moral reflection and evaluation that is tied to moral self-development.

Kohlberg identified three levels of moral development that enhance this discussion. Right behavior, or morally correct action, differs across the three levels. At Level 1, right action is initiated to avoid punishment and to serve one's own needs. At Level 2, right action is to gain approval from others and to abide by legal authority. At Level 3, right action is the result of respecting individual rights and social contracts based on principles of justice, fairness, and universal human rights. According to Kohlberg's research, people appear to develop sequentially through these levels. As one matures, right behavior moves from being motivated by external standards and rules to taking guidance that results from internal recognition and control. The rationale behind this model is that people move from a self-centered to a principle-centered approach to decision making. Being at a higher stage does not ensure that more ethical decisions will be made. The processes of awareness and self-reflection that lead to self-consciousness allows a person to identify the level he or she is in, which in turn, results in intentional decision making.

The process of self-consciousness is what allows one to distinguish himself or herself from the larger environment in which he or she interacts. From this, self-consciousness gets categorized as public and private. Public self-consciousness is the tendency to be concerned about one's self as perceived by others. Self-monitoring, self-awareness, and paying attention to one's relationships with others are components of public self-consciousness. Components of private self-consciousness are self-reflectiveness and internal awareness. A related construct used to describe private self-consciousness is mindfulness.

Mindfulness has its roots in contemplative traditions where conscious attention and awareness are actively cultivated because consciousness is related to sustaining quality of life and well-being. In management theory, mindfulness is most closely aligned with emotional intelligence—the array of noncognitive skills, capabilities, and competencies that influence one's ability to succeed in managing environmental demands and pressures. Emotional intelligence is becoming a considered and measured factor to include in leadership capability and change management. As an aspect of self-consciousness, mindfulness is important in disengaging individuals from automatic thoughts, habits, and unhealthy behavior patterns. Therefore, mindfulness plays a role in fostering self-regulation and guiding personal understanding of one's own ethics and subsequent response to social issues. A fundamental aspect of mindfulness is the capacity for self-awareness and heightened self-knowledge.

Self-Awareness

Self-awareness is the extent to which an individual monitors and reflects on his or her own behaviors, traits, and accomplishments. The more self-aware one is, the more likely the attempt to match behavior to his or her beliefs and internal standards. For example, if people have norms against stealing and cheating, those who are self-aware are much less likely to engage in these behaviors. Some evidence suggests that self-aware individuals are more likely to assume responsibility for a given action. Research and practice in systems theory cites self-awareness as an integral component to effecting systemic organizational change. Self-awareness can be anything from broad, abstract, and far-reaching (i.e., "How do I uniquely contribute to bettering society?") to narrow, concrete, and short term (i.e., "Do I tell a white lie to get ahead?"). The process of self-awareness requires a person to examine his or her potential actions in light of moral standards.

Self-awareness also has public and private aspects. Public self-awareness is associated with moral approbation, defined as a person's desire to gain moral approval from others. According to this theory, the desire to be viewed as a morally good person influences one's ethical course of action and decision making. Moral approbation characterizes the internal need for approval, and public self-awareness is part of monitoring this process.

Private self-awareness is prominent in theories on self-regulation—how individuals choose and accomplish their goals. It involves an inward focus of one's behavior. Therefore, a person's thoughts and feelings about himself or herself affect goal-directed behavior and motivation.

Psychological theories that suggest that self-awareness is an inherently positive quality are referring to self-awareness as self-knowledge—the mix of roles, traits, values, and relationships and past experiences acquired through social interaction. Individuals come to know themselves through social comparison, observing their own behaviors, and through awareness of how others react to them. Therefore, social interaction and communication play an important role in shaping one's self-knowledge.

At one time, self-knowledge was seen as the most complete and perfect form of knowledge available.

Today, however, the accuracy of self-knowledge is challenged through the construct of self-deception: Are people fooling themselves into believing that they are different and/or better than they really are?

Two distinguishing areas associated with self-knowledge are identity crisis and identity conflict. Identity crisis deals with the difficulties of defining oneself because one's environment and experiences change over time. Identify conflict is often linked to this crisis and occurs when multiple definitions of one's self come into conflict and dictate competing, incompatible courses of action. It is particularly relevant in an organizational setting where a person's values and identity conflict with organizational goals. Unlike cognitive dissonance theory, which says that the inconsistency needs to be resolved, identity conflict suggests inconsistency can be tolerated until one encounters a situation that makes it impossible to sustain both definitions of self.

Identity conflict typically produces passivity, guilt, and feelings of being a traitor. It also precipitates whistle-blowing in an organization—the disclosing of misdeeds of superiors and/or colleagues to preserve ethical or morally acceptable behavior and to prevent and correct wasteful, harmful, and/or illegal acts. The act of whistle-blowing shows an individual is no longer willing to violate a personal code of ethics for the sake of the organization.

The Impact of Self-Consciousness on Society and Ethics

There are four areas that outline the impact of self-consciousness on society and ethics. First, the maxim "Know thyself," as articulated by the Greek thinker Solon, comes through understanding one's culture and sociohistorical context. The reflective and reflexive capacities that are the hallmarks of self-consciousness have an impact on the private and public aspects of one's personal life and significantly influence social actions. It is through the vehicle of social action that one's individual's life and total societies are created and sustained.

Second, the by-products of self-consciousness (i.e., awareness, control, intention, and self-reflection) influence behavior and/or intent to behave. Most notable are studies on conformity, which have found that the more self-conscious/self-aware an individual is, the less apt she or he is to be swayed by group or social norms. This may support either ethical or unethical behavior. The key is that the ethics of business is the ethics of those individuals who make business decisions. The process of self-consciousness shapes individual decision making.

Third, the role of self-consciousness influences the question of workplace distributive justice, defined as reward allocation in situations where more than one person has contributed to the outcome. People whose disposition focused on private self-consciousness tended to allocate rewards on the basis of the privately held principle of equity. That is, people are rewarded as a direct function of their contribution. People with a predisposed focus on public aspects of self-consciousness, which uses a social standard, allocate rewards according to the principle of equality. Specifically, people share evenly in rewards without regard to their relative contributions. The point is not to label one disposition, public or private self-consciousness, as better or to associate self-consciousness necessarily with concrete behaviors. What is worthy of note is how self-consciousness directly influences workplace issues of import, such as determining a just allocation of rewards.

Finally, an Aristotelian approach to business ethics is often applied with its focus on individual character, and not only on impersonal policies and abstract principles and theories. Implicit in this approach is the role of an expanded self that is part of and identifies with the larger community or society. The act of becoming self-conscious creates this enhanced awareness and connection. This integration of one's self with society is a component of integrity—a defining characteristic of ethical leadership.

Conclusion

In *Man's Search for Meaning*, Viktor Frankl says being human means being conscious and being responsible. The concept of self-consciousness has not, to date, been integral when discussing the ethical dimensions involved in the relationship of business to society. However, it is an endeavor worthy of further research.

Individual, organizational, and societal factors affect ethical decision making. Frequently, these factors interact, influencing a business's course of action. Focusing on the role of self-consciousness gives deeper insight to understanding not only one's self but others, all within a social environment of which business is a part. Consciousness is informed by values, worldviews, and ideologies, each of which translate and affect day-to-day business operations. How we define work, the role of corporations, and the responsibility of business to society are examples of changes noted in management theories as requiring paradigmatic shifts in consciousness. Future study and attention to self-consciousness inform this discussion at a deep and sustaining level.

Self-Deception

Self-deception is the act of leading oneself to believe something is false, and this can occur with varying degrees of self-awareness about the process. The other face of self-deception is denying or ignoring the relevance or importance of evidence and argument that is contrary to our preferred vision of ourselves and our world. A common example would be ignoring chest pains and convincing oneself that all is well even with all the classic symptoms of heart problems. Because self-deception is seen as a barrier to living an authentic and ethical life, from the earliest of times, philosophers have encouraged us to be aware of ourselves and our surroundings—or in the words of the ancient Greek aphorism "Know thyself."

Sources of the Self

In searching to the root of self-deception, the first question becomes determining the source of the self that we are to know. For all philosophers, the essence of being human is to exercise free will—to choose how to live. Whether that choice is to follow an ideal or become fully aware of one's existential self, the central choice we have as humans is whether to be true to ourselves or to live a life of deception.

For much of Western philosophical history, humans had a "self" that existed at birth. That self was a complex being with contradictory motives and actions, elements of human nature that were measured against ideals (Plato), or the exercise of virtues necessary to fulfill one's role in society (Aquinas). People who adopt this notion of self tend to have a transcendental vision of the soul, which is grounded in religious or philosophical commitments. In this tradition, self-deception occurs if one does not ruthlessly measure one's motives and actions against the ideals as one navigates through life.

Another understanding of self emerged with the existentialists and the notion of a constructed self. As individuals are placed in history, they come to understand who they are as they interpret the events of their lives. As meaning is given to the events, people determine their identity in relationship to the rest of the community. For Albert Camus or the early Jean-Paul Sartre, the self constructs itself by free acts of will. For other theorists, the sense of self is constructed as individuals accept or reject information that is given to them about their place in society. For example, for much of history, women "knew" that they were supposed to create households and raise children because that was the role given to them by society. Men "knew" that they were to be the breadwinner and were measured by how well they supported the family. In this tradition, self-deception emerges as one does not accurately evaluate one's position in the social matrix.

Finally, a third school of thought asserts that self-deception is a natural progression of evolution. To survive, all species adopt camouflage to protect them from the enemy. Thus, if a person wishes to succeed in business or marry well, that person must exaggerate personal strengths and minimize weaknesses to be positioned for survival. If one actually believes the rhetoric, one is more convincing and, thus, more likely to succeed. This school of thought asserts that the quest to minimize self-deception may in fact be counterproductive because people will not position themselves appropriately in the marketplace to succeed. However, to the degree that telling the truth will maximize the opportunity for survival, self-deception should be avoided.

In practical ethics, for individuals seeking to fulfill their obligations and have a good life, all three theories about the source of self-identity and the role of self-deception in shaping that identity have the same implication: To be a mature ethical actor and survive in the community, one must be ruthlessly aware of one's self, motives, and place in the community. In the first two traditions, self-deception means that we are avoiding responsibility for ourselves. In the third, self-deception may hinder our ability to survive.

Sources of Self-Deception

While the following list is not exhaustive, eight different sources of self-deception provide insight into the patterns that keep people from seeing themselves clearly.

1. One source of self-deception may be undesirable thoughts or actions that are influenced by the subconscious or the unconsious. Self-interest, including the very basic will to survive, is often raised as a barrier to truth telling. Prejudice, desire, insecurity, and other psychological factors are cited as affecting people's ability to accurately assess a situation and respond authentically. Much of psychology is dedicated to helping people explore and understand their subconscious with the goal of making explict hidden motives and drives. With understanding, the seeker can use his or her will to break habits and make more ethical choices.

Example: A person promotes himself as an "expert" and "star" even though his performance is mediocre. As he does not get the promotions he believes are deserved, in therapy he discovers that his parents always told him that he was wonderful, even when he knew that he wasn't.

2. Social pressure is another source of self-deception. For example, society has very deep commitments to how the genders are to relate to each other. Women who wished to pursue certain male-dominated careers were told that those desires were not "normal" and were counselled out of them. The conversation about essentialism, whether certain traits or qualities were "essential" to one's racial or gender identity, served to underscore societal expectations for the self. Thus, one had to carefully evaluate one's desires and choices against the social fabric of acceptability.

Example: A woman finishing law school has the skills to be an excellent litigator. However, her grandfather, who is also a lawyer, strongly asserts that fighting in the courtroom is unseemly for a woman. That lawyer then settles for another, lesser paid and esteemed branch of the law, convincing herself that she would rather be a "lady," and wouldn't be that good anyway, than follow her talent and passion.

3. Another source of self-deception comes with unthinkingly embracing social roles to achieve calculated rewards. Thus, people climbing a professional ladder will routinely overestimate their abilities to reach a goal or maintain market strength. Those who understate their abilities do not get promoted. Others may not examine whether the roles they have taken on are congruent with their own desires. Thus, people choose careers based on how much money they will make or power they will amass rather than according to ability or desire.

Further, identification with a role may excuse examination of a larger social problem. One who is a "company man" may not believe that he can critique the overreaching of a corporation. As one takes on the identity of a profession, one may be blinded to the cost to the self in terms of authenticity. Thus, lawyers who professes a commitment to justice may balk at seeing themselves as technicians who manipulate the law. Their very identity as public servants would be compromised by clearly seeing the trajectory of their career. Thus, self-deceit can be a function of our wanting to think of ourselves as honest persons.

Example: A son is in line to inherit the family business. Even though he does not like business, he follows the career chosen by his parents and grandparents. As he struggles to perform well, he finds that he is miserable. Telling the truth about his skills and choosing to change professions require a great deal of courage.

4. Humans may be deluded by suggestive propaganda or even a neighbor's back-fence rhetoric. Much advertising is designed to manipulate our understanding of ourselves—strong not weak, rich not poor, right not wrong. Whether it is a question of notions of racial or national superiority or an accurate assessment of

one's own or children's abilities, humans tend to hear what they want to believe. Studies of people find that we routinely overestimate our abilities and our place in the community. Most of us believe that we are more talented, more attractive, or more successful than the average. Clearly, by definition, we cannot all be above average.

Example: Many college graduates who attended a middle-of-the-road school and received middling grades are surprised when they do not command top dollar at prestigious organizations. These students have been told forever that they were "special" and "talented." Whatever niggling fear they might have that they are not "the brightest and the best" is dismissed. Their failure to achieve a highly placed position is someone else's responsibility for failing to recognize their talent.

5. Humans may be misled into addicted behavior where they are unable to see the truth, because their habits are so deeply ingrained that they form virtual blinders. Those who wish to cast off the behavior of alcoholism must begin by acknowledging that they are in fact addicted. As society has identified a whole series of addictions from food to work, recognition and naming of the addiction must precede mastery.

Example: An executive is convinced that she is the only one who can effectively lead the company. That executive works 7 days a week, resisting taking vacations. When forced to leave, the cell phone and computer are constant companions. That executive exhibits all the classic symptoms of addiction to work. However, because diligence is valued, that executive will have to face a personal crisis, such as a divorce, a problem with a child, or physical illness, before admitting the truth: No one is indispensable.

6. Many people surrender their autonomy to create an intimacy that will offset the pains and perils of loneliness. Many who are in abusive relationships, whether personal or in the business world, justify the behavior of the abuser by asserting that the abuse was deserved. Others define abuse as love to avoid the possibility of being alone or rejected. People will also surrender their autonomy to be accepted by a group. The fear of being excluded has kept many people from carefully examining both what was being taught and the behavior that was then expected of the members.

Example: A personal assistant to an explosive executive will put up with the abusive behavior, convincing herself that the stress of the job is what causes the angry outbursts. If another coworker suggests that she should not put up with the behavior, the suggestion will be dismissed.

7. One of the most enticing forms of self-deception is attachment to a closely held belief about the world. Rather than being proved wrong about a situation, we refuse to either accept data that contradict our beliefs or engage in experiences that might enlarge our sense of ourselves or the world. From our perspective at present, white men being terrified by integration of African American children into a school seems irrational. At the time, however, the attachment to the notion of racial superiority transcended evidence to the contrary.

Example: Many Americans believe that our health care system is the very best in the world, even though it is the most expensive and many people do not get good care. Evidence of other health care systems, such as those in Canada, giving excellent care is minimized or dismissed. Then, when someone goes to India for surgery and spends a fraction of the cost for the same service that is provided in the United States, many refuse to believe that those physicians are as well trained and qualified as those in the United States. By definition, any item made or service provided in the United States is better than an equivalent anywhere else in the world.

8. Finally, we can get caught in a frenzy of antireason and be persuaded, by our emotional identification with a certain mood or movement, that we are somehow more important to all other people than we really are. Each person has a seemingly primal need to be included and important. Thus, we misinterpret motives, actions, and events to give ourselves a larger place in the stream of history than we would otherwise deserve.

Example: A talented athlete believes that he is somehow exempt from all the rules of the organization. He believes that his value to the team is such that his "bad-boy" behavior and image will be tolerated. When benched or dismissed from the team, he is surprised that he is dispensable.

Antidotes to Self-Deception

Self-deception has been classified into three types. Cognitive self-deception occurs when one does not interpret data correctly. Learning rules of analysis will often be an antidote to that form of deception. Emotional self-deception happens when one does not accurately name and respond to emotional states. Moral self-deception occurs when one fails to tell the truth about oneself or one's world. This failure can result in either not being true to oneself or not being an ethical member of the community. All three forms of self-deception begin with a failure to pay attention.

A central task of being human is to understand one's self and one's place in the world. If we don't pay attention to what is happening around us and how we interpret that activity, we fall prey to self-deception. We have the capacity to see, evaluate, and ultimately accept or reject the identity given to us by ourselves or others. Thus, the primary source of self-deception is a failure to "notice" the thing that threatens our identity and then not notice that we are blind. We may see economic injustice a thousand times, but if we have not noticed it, that injustice cannot be said to have entered our experience.

According to William James, our consciousness—or sense of meaning, our sense of self—must be constructed out of what we have seen. If we have not seen ourselves as an oppressor, we may be distressed by another accusing us of misusing our power. If we rationalize that experience or deny it, we move into self-deception rather than facing the possibility of changing our sense of self. Thus, the first step to overcoming self-deception is to practice seeing that which we don't expect to see.

Some who practice self-deception have never been taught to see compassionately and accurately. If families do not teach children to accurately assess themselves or their situation, the skill of reflection and truth telling is not learned. Others are not motivated to overcome patterns of self-deception. Telling the truth requires anticipation of possible outcomes, concentration, and effort. If truth telling is not valued, apathy or disinterest will dampen our desire for the hard work required to not succumb to self-deception.

As we learn to see more clearly, we must be careful not to misperceive random data and see patterns where there are none. We must carefully evaluate the data around us, looking both for data that confirm our beliefs and those that do not support our worldview.

Finally, as we learn to see clearly, we will be able to carefully judge ourselves. In the process of evaluating our actions in the community and accurately attributing cause to the results, we can learn to be responsible for ourselves rather than be at the mercy of our community. In the process, we can evaluate ourselves against the standards or goals—whether an ideal or set of virtues—that we believe are essential for us. Countering the entropy that leads to self-deception requires an act of will; but the prize will be an authentic life—one lived according to one's own definition of the good life.

Self-Interest

Self-interest is the desire to act in ways that promote what is good for one's self. Whether or not human behavior is, or perhaps more importantly should be, motivated by self-interest has been a central theme throughout the history of Western philosophy. The term *egoism* is used to describe a variety of philosophical schools of thought on the pursuit of self-interest. Some Eastern philosophies, notably Taoism and Zen Buddhism, also discuss a form of egoism—solipsism—that argues that one's own existence or at the least the experiences of one's own existence are the only things one can truly verify.

Most religions have codes of conduct that promote regard for others, fearing an inherent danger that self-interest will be pursued excessively. The dividing line between self-interest and selfishness is thin at best. The line is arguably crossed by pursuing one's own interests in ways that knowingly cause harm to others or with disregard for potentially harmful (even if unintended) side effects.

Beyond the realms of philosophical inquiry, the belief that self-interest explains human behavior has had a profound influence on the development of classical and modern political and economic thinking. The idea that pursuing self-interest can simultaneously serve the public interest underpins classical economic theories favoring free markets in production, exchange, and consumption. A belief in the positive power of self-interest is strongly linked to the emergence of individualism as a political force and the enforcement of private property rights under capitalism.

The assumption of self-interested behavior can be extended to the analysis of business and organizations. First, people in organizations may pursue what is good for them rather than what is good for the organization (the principal-agent problem). Second, organizations may pursue interests that conflict with the interests of others (stakeholder theory) and the interests of wider society (corporate social responsibility). This makes understanding self-interest crucial to the analysis of business, ethics, and society.

Egoism

Egoism is the term used to describe the philosophical doctrine that what ultimately matters to a person is his or her own self-interest. The term egoism derives from the Latin word *ego,* meaning *I*. It is important to note that what is in one's self-interest may incidentally be detrimental to others, beneficial to others, or neutral in its effect: Self-interested behavior is, therefore, not inherently immoral, because serving one's own interests does not necessarily imply intentions to harm others or indifference to any incidental harm. Egoism must be clearly distinguished from *egotism*—an excessive or exaggerated sense of self-importance that can manifest as selfishness and narcissism.

A variety of egoisms have been proposed, which can be grouped under two headings: descriptive or psychological egoism and normative egoism.

Psychological Egoism

Psychological, or descriptive, egoism suggests that self-interest fundamentally describes human nature—in effect, people pursue only that which is in their self-interest. In the extreme, accepting psychological egoism implies that even when a person acts in an altruistic way, or with regard for others, the reason is self-interest. According to this reasoning, acts which might appear to be or which some people might interpret as being done out of regard for others, such as helping a stranger, inherently have a self-interested component.

Thus, the belief in psychological egoism is non-falsifiable if truly altruistic behavior is by definition impossible. Critics also argue against psychological egoism on empirical grounds, stating that much psychological research into motivation suggests that it is too extreme to believe that all behavior is motivated by self-interest.

Questions about motivation are crucial to understanding the debate over self-interest as a description of human behavior. The chief question is, of course, whether or not self-interest is the only thing that motivates people; or does self-interest coexist with other motivations? A related question is, even allowing that self-interest is an important motivation, is it the most important motivation? Further, what constitutes self-interest—is it always something one can know? For example, one could argue that there could be a short-term self-interest that may conflict with a long-term self-interest. And assuming we know our self-interest, do we always pursue it to our maximum advantage, or would we moderate our goal of self-interest in any way?

Normative Egoism

Normative egoism suggests that people ought to act in their own interests, either because it is rational to do so (rational egoism) or because it is moral to do so (ethical egoism). In the strongest version of rational egoism, pursuing one's own interests is not only rational, but it is also irrational not to pursue them. In a weaker version, the latter condition is relaxed, and therefore, not pursuing self-interest is not necessarily irrational.

A strong version of ethical egoism holds that it is always moral to promote one's own good and it is never moral not to promote it. A weaker version states that while it may always be moral to promote one's own good, not pursuing one's self-interest could also be moral.

Normative egoism avoids the criticism noted above about psychological egoism because one's motivations are not important. Rather, one should act to serve one's own best interests in the name of logic and/or morality.

Self-Interest in Economic and Political Thought

The belief that self-interest is a fundamental aspect of human nature has had a profound impact on the development of classical liberal economic and political thought. The writing of the renowned Scottish moral philosopher and political economist Adam Smith has been used to support the primacy of self-interest in economic affairs. First, he argued that we should not think that it is because other people are benevolent that they supply goods that meet our tastes, but rather they are driven by their interest in profiting from our demand.

Wicksteed, in *The Common Sense of Political Economy, Including a Study of the Human Basis of Economic Law*, also suggests that people entering economic relationships do not intend to further the interests of the other party in the exchange, although the outcome of the exchange may in fact serve the interests of all parties. This idea is called non-*tuism* to contrast it with *tuism*, interest in the "other" (*tu* in Latin means *you*). However, even though non-*tuism* suggests neutrality about the interests of the "other" in the economic transaction, it is compatible with broader altruistic behavior as well as self-interest, such as a person driving the hardest possible bargain to secure the most food possible to feed the starving in Africa.

Smith argued further that national economic policy should promote competition because, then, the sum of individual self-interested economic decisions can lead to a socially desirable state of affairs—his famous invisible hand metaphor. Smith was asserting a form of consequentialism, sometimes called conditional egoism: Self-interest is morally acceptable if it leads to morally acceptable ends.

Nonetheless, Smith should not be considered an unequivocal advocate of self-interest, having in his philosophical writing extensively discussed what he called sympathy as fundamental to human nature. In his *The Theory of Moral Sentiments,* people exhibit sympathy and listen to their *impartial spectators.* Whereas people may act opportunistically and self-interestedly, they do so within limits dictated by their sympathy, which may compel them to stop short of crossing the line between self-interest and selfishness. Smith also placed great emphasis on the virtues of benevolence and justice.

In his economic writings, Smith warns of the tendency for businessmen to collude against the common interest if allowed, thereby reinforcing his idea that self-interest can easily give way to greed unless competition holds it in check. *An Inquiry Into the Causes and Consequences of the Wealth of Nations* was written to persuade politicians to restrain their desires to hand out governmental favors and create monopolies at the expense of consumers; competition is achieved through a *laissez-faire* policy.

The Wealth of Nations was published in 1776, the same year in which the U.S. Declaration of Independence was signed. Arguably, this was more than a coincidence as there was a symbiotic relationship between emerging classical economic theories and political theories of individualism. Individualism describes a political and social philosophy that promotes the primacy of the individual and his or her right to the maximum degree of liberty consistent with the maximum liberty of others. The American colonies equated their struggle for political and economic freedom with values of "individualism": self-reliance and independence.

Self-interest and individualism became axiomatic assumptions in the neoclassical school of economics that has come to dominate economic thinking during the 20th century. *Methodological individualism* is invoked to reduce economic analysis to the level of the individual person or firm. Economic writers have expressed views consistent with both psychological and normative egoism, but rational egoism is the variant of self-interested behavior that is most commonly used to explain people's economic decision making—people are acting rationally when they seek their own interests. Models of behavior based on self-interested individualism have been applied to wider social settings under the title *rational choice theory*, purporting to explain behaviors such as marriage, divorce, and family formation. A variant called public choice theory examines political settings, such as the irrationality of an individual becoming an informed voter, and the rationality of "pork-barrel politics," where politicians ignore wider public interest to serve their own interests or those of their immediate constituency.

In the late 20th century, neoliberals developed a political movement based on the pursuit of self-interest, bolstered by individual ownership of property and freedom to make (economic) decisions with minimal interference from the state. The concept of a "Nightwatchman" state is equally applicable to economic and political affairs—the state's role is to provide national security, enforce individual rights through a police force and judiciary, and enforce contracts and private property. This analysis of the role of the State vis-à-vis the individual led the neoliberal movement to critique increased intervention by the state in economic and social decisions, championing the cause of the individual for knowing where his or her best interests lie. Individualism is invoked as a virtue, while effectively ignoring the fact that individuals live and operate in societies and, thus, are influenced knowingly and unknowingly by societal norms, expectations, and constraints. The former British prime minister and neoliberal Margaret Thatcher was nearing the end of her reign when she famously declared that there was no such thing as society, only individuals and their families.

The idea that people are egoists is not just an abstract debate among philosophers, economists, and political theorists. The assumption of self-interest is widely held among the general population. The established folklore about self-interest is problematic for two reasons. First, there is evidence that people are more likely to agree that others are driven by self-interest the more they are told that this is the case. For example, studies have found that completing a course in economics is likely to lead to an increase in the likelihood that a student will believe that self-interest is a fundamental description of human behavior, compared with the same student prior to the course and to another student who has completed a course unrelated to economics or business. Second, there is a tendency among the general population to conflate egoism with selfishness; thus, it is unclear whether self-interest in folklore is effectively egotism rather than egoism.

Self-Interest and Outcomes

Belief that self-interest lies at the heart of economic decisions is argued to be justified by empirical observation of aggregate economic behavior. Economists argue that no one has to be explicitly driven by egoism; yet the evidence of economic statistics is interpreted as showing that, on average, people act as if they are self-interested. Thus, while one might never actually bump into *homo economicus* (economic man) on the street, the outcome of economic decisions is consistent with the assumption that people may be motivated by egoism. However, the principle of revealed preference is subject to a nonfalsification critique. If it is rational to only do things in one's self-interest, then everything we observe people doing must be the thing that was in their best interest; otherwise they would not be doing it. We do not need to know motivations in advance because these will be revealed through actions: The desire to maximize self-interest leads people to make the best choice for themselves.

Two situations argue that pursuing self-interest may not always be rational. The first, called the tragedy of the commons, starts from an empirical observation. The second, the prisoner's dilemma, uses a thought experiment to explain the tragedy of the commons.

The tragedy of the commons refers to the fact that in commonly held resource stocks, every person pursuing his or her own self-interest will lead to the over-exploitation of the common pool. In grazing cattle on common land, for example, each individual owner of cattle is trying to capture an increase in value to his or her herd through grazing, whereas any cost in terms of degradation of the land is spread across all grazers. The outcome of each person pursuing private benefit is overgrazing and a worse outcome for all.

The reason for this outcome can be elaborated through the prisoner's dilemma, an example of game theory. Consider the prisoner's dilemma where two women are arrested as suspects in a crime and interrogated separately. The evidence is weak, so the police want to induce the prisoners to confess to the crime. If neither confesses, the best the police can hope for is to convict on a lesser criminal charge. The police offer each prisoner a deal: Confessing to the crime and implicating her accomplice will lead to conviction on a misdemeanor carrying a very light sentence for herself and a very harsh sentence for her accomplice. The dilemma is created because the offer also states that the very light sentence only applies if the accomplice does not also confess. If both prisoners confess and implicate each other, they both face an intermediate-length prison term, more than a lesser criminal charge but less than staying quiet while her partner confesses.

Neither prisoner can be sure of what the other might do. Had they been able to cooperate, the best strategy for both is to stay quiet because they both will receive only a minor sentence. But without the prospect of cooperation, the individual's best outcome arises when she confesses and implicates the other person, who does not confess. If the prisoners are rationally self-interested, each will suspect that her partner will choose to confess in the hope of getting the best possible deal for herself. Thus, the theory predicts that both prisoners, pursuing self-interest, will confess, resulting in a worse outcome than cooperation. Just as in the case of the tragedy of the commons, cooperation would lead to a superior outcome for everyone (the *common weal*), whereas pursuit of individual self-interest would lead to a far worse outcome. The difficulty lies in finding mechanisms to promote cooperation over individualism.

Self-Interest and CSR

The notion of self-interest can be extended directly into the business world through agency theory, also called the principal-agent problem. Agency theory arises in any employment situation when one person (the principal) hires another (the agent) to perform tasks that benefit the principal but may not serve the interests of the agent and where monitoring the agent's performance is costly to the principal. The challenge is to find a way to ensure that the actions of the agent serve the interests of the owners rather than the interests of the managers; a variety of compensation schemes have been proposed, such as stock options for managers who raise the value of the companies they run.

Stakeholder theory goes one step further, suggesting that businesses and the people who own and run them should take into account the interests of a wide range of people who are affected by the decisions of the business. These impacts may be direct (especially when financial interests are involved) or indirect (there may be spillover effects or externalities). Arguments along these lines lay the foundations for theories of CSR, suggesting that companies have economic, legal, ethical, and philanthropic duties to fulfill in society.

Conversely, the Nobel Prize–winning economist Milton Friedman declared that the only social responsibility of business is to increase its profits or shareholder value. As long as profit is achieved legally, business is considered to have met its economic and ethical obligations. Philanthropic acts, or actions that promote societal well-being but reduce profit or shareholder value, are considered theft from shareholders.

The argument made above parallels Smith's argument that self-interested behavior will (under competitive conditions) result in socially desirable outcomes. But whether the unit of analysis is a business or an individual, pursuit of self-interest is not necessarily straightforward. Issues such as acid rain, global warming, and shrinking biodiversity remind us of the global commons in which business operates. In these examples, pursuit of supposed self-interest (represented by profit in Friedman's robust defense of capitalism) may lead to the opposite, though possibly only in the long run. This begs the following question: If profit and shareholder value are not really business's self-interest, what is and how can it be achieved?

Self-Ownership

The principle of self-ownership asserts that every person has a property in his or her own person and the labor of his or her body. Ever since the 17th-century political philosopher John Locke argued for self-ownership on the ground of self-preservation, many political philosophers, economists, and business ethicists have debated the meaning, extent, and political implications of self-ownership. The basic tenet of classical liberalism in the 18th and early 19th centuries was the idea that individuals owned themselves. To protect individuals' freedom to develop their talents and life plans without intervention, many classical liberals argued that maintenance of law and order and protection of individual liberty were the unique functions of government. Economic liberals in that era, in particular, argued that individuals should structure their economic life without intervention from government. In the latter half of the 20th century, libertarians adopted many of these arguments to reject most state interventions and to ground the right to private property. There are four general features to the libertarian thesis of self-ownership. First, self-owning persons are the rightful owners of their own person and faculties. Second, persons have the power of disposal and transfer—that is, a right to freely sell, rent, or exchange their labor and talents as commodities in an open market. Third, persons have the right to accrue private ownership of the fruit of such labor and talents and not be forced to dispose of their possessions in the absence of prior contractual arrangements. Fourth, persons who respect the similar rights of others have an absolute right to themselves and their properties.

The idea of having ownership rights over oneself may initially seem counterintuitive, if it suggests that there is a distinct thing, the self, which one owns, since it implies that we can treat ourselves as disposable objects and not as persons with intrinsic value. Many have pointed out that treating ourselves as properties that we "own" and can dispose of may counter the Kantian idea of respecting our own dignity and humanity. The 18th-century philosopher Immanuel Kant argues that freedom is one innate right that belongs to all rational persons, who have inherent value and should be their own masters. Kant does not think that such freedom implies that one is the "owner" of oneself, if that implies one is free to dispose of or exploit oneself. He believes that we have to respect our own humanity and rejects any thesis of self-ownership that denies the existence of self-regarding duties.

The question of when one's action may violate one's own dignity and humanity is a complex one. Some believe that organ sales, prostitution, commercial surrogacy, and voluntary enslavement all treat human bodies as mere means, and a thesis of self-ownership that allows such transactions violates humanity and contradicts the idea of being master of oneself because one is relinquishing control. Some also believe that suicide and euthanasia, which seem to be allowed under the thesis of having ownership rights over oneself, destroy one's life and go against the duty of self-preservation. However, others disagree that commodification of body parts is categorically different from the use of one's labor or mental powers for income. Some believe that it is an expression of being the master of oneself when one transfers the power to others. Other critics also believe that the freedom to end one's life, especially in certain painful and terminal medical conditions, protects and preserves one's dignity.

The metaphysical question of what it means to own ourselves is also an interesting one. Some argue that the thesis of self-ownership does not imply that one has two selves, one of which owns the other. It also does not imply that we can rightfully treat ourselves as mere means. They argue that the "self" has a purely reflexive significance—that is, it is self-referential. What owns and what is owned are one and the same, the whole person.

At a fundamental moral level, self-owning is tied to the liberal idea of being autonomous agents. It signifies having moral authority to decide how to live one's life within the constraints of the rights of others. It signifies that without previous commitments and relevant transgressions, it is wrong for others to make use of the agent's body without his or her permission. It implies an exclusive right with respect to our bodies and the use of our talents and/or skills against any coercive action taken toward us. For example, without consent, coercive sexual advances violate the agent's bodily integrity. It is this idea of defining the boundaries of things others can and cannot do to us that makes a thesis of self-ownership consistent with Kant's principle of treating people as ends in themselves and not as mere means. A thesis of self-ownership that focuses on people's autonomy requires that we respect the bodily integrity of each other by preventing the physical coercion of some persons by others. It brings freedom from others and governments, except insofar as we agree to associate with them.

Robert Nozick, who adopts the Kantian idea of not treating people as mere means, is one of the most prominent political philosophers of the 20th century. He argues for a strong theory of rights that takes seriously the existence of distinct individuals who are not resources for others. According to Nozick, self-ownership is based on the fact that persons possess various characteristics. Persons are rational beings who have the ability to regulate and guide their lives in accordance with various self-chosen goals. They are distinct individuals with separate interests, and Nozick conjectures that it is by virtue of their ability to meaningfully shape their lives that they have a right to choose and realize their ends, as long as they respect others' right to do the same.

Some argue that the freedom to control and use one's own body supports a right to reap the benefits of one's choices and to have private property. Such right implies that others have no legitimate claim to your property without prior agreement. The Lockean idea that one has the right to the fruit of one's labor has led many, particularly libertarians, to argue that taxation of earnings from labor and other forms of redistribution of wealth are equivalent to forced labor. It is enslaving the better off for the benefit of the needy and, thus, is a violation of self-ownership. It condones partial property rights in other people and makes some people mere resources for the lives of others. Self-ownership is a central component of the idea of freedom or autonomy, and coercive redistribution of wealth makes a society less free.

Others argue that control self-ownership is very different from income or property ownership, which is not directly about one's body. The claim that we own ourselves does not imply anything about external resources. Control rights are justified on the individualist grounds of liberty, autonomy, and self-determination, framed by the agent's preferences, values, and life path. They can be supported without reference to the distribution of resources as a whole. Income rights and property ownership, on the other hand, are justified and determined by principles that govern the pattern of distribution of goods in the economy—considerations that are irreducible to individualist interests.

The issues of private property and distribution of resources bring up the question of how to reconcile the principle of self-ownership with other moral concerns such as equality. In the past few decades, libertarian and egalitarian thinkers have focused on the issue of whether the distributive and proprietarian implications of this principle preclude any redistributive measures. Many libertarians argue that to protect self-ownership and individual freedom, resource distribution should be based solely on free transactions in the open market. Others, especially egalitarians, argue that a general acceptance of the thesis of self-ownership still leaves open the question of whether agents are entitled to full benefits of their choices and of their natural personal endowments. Some argue that a plausible thesis of self-ownership ought to acknowledge rights to a fair share of society's resources.

Two related arguments are often evoked. First, some argue that self-ownership does not imply exclusive rights to private properties or does not override all other moral claims. While a strict egalitarian approach that supports joint ownership of all resources by the individuals in the population will inevitably conflict with self-ownership, certain efforts that prevent or minimize massive inequalities that may leave some people vulnerable can be legitimate. Interestingly, even though many libertarians find support for extensive property rights in Locke, he argues that one must be sensitive to others' unmet needs. While Locke believes that we have a right to own things for the purpose of self-preservation by mixing our labor with it, he contends that the natural right to self-preservation demands that our appropriation does not make others' situation worse off. Keeping in mind the importance of having access to basic needs, some argue that a plausible conception of self-ownership cannot imply unlimited property rights for some if others are deprived of access to such necessities.

While it is difficult to ascertain a causal relationship between one's appropriation and others' unmet needs, some argue that the idea of unlimited property rights is self-defeating, since it contradicts the libertarian goal of promoting autonomy. Some point out that people who lack access to basic needs will have less opportunity to pursue their own conception of the good, and thus, their autonomy or freedom is severely compromised. They will not have the same opportunity to live an autonomous life and develop their capabilities. In this way, any conception of self-ownership that is grounded in the idea of autonomy ought to ensure that all persons have access to basic needs so that they can fulfill their self-chosen life path.

The possibility that unlimited right to private property may deny some people the opportunity to exercise their autonomy has led many to point out another difficulty in the libertarian thesis of self-ownership. Liberal egalitarians such as John Rawls have argued that, even though rational persons are the legitimate possessors of their talents and are free to use them in accordance with their chosen projects, natural endowments are arbitrary from a moral point of view. The libertarian thesis of self-ownership fails to recognize the fact that it is a matter of brute luck that individuals are born with different talents and skills, such that severe material inequalities that will likely arise undeservedly benefit some and disadvantage others. While respect for autonomy may imply a right to income from one's choices when there is no differential brute luck among agents, it is unfair that unequal natural endowment through no fault of one's own can lead to disparate income levels and/or different opportunity ranges. Such unequal distribution of endowment has prompted many liberal egalitarians to argue that, while there should be respect for persons' right to exercise their talents and reap benefits from such efforts, compensation is owed to those who are disadvantaged for non-choice-related reasons in their endowment. Some argue that the libertarian argument, which understands the fruit of one's labor to include everything that a person produces through his or her labor, is flawed in the face of unequal natural endowments. A more plausible understanding of self-ownership should identify the fruit of one's labor with the subset of the total product of one's labor that is due to his or her choices rather than luck. Some argue that redistribution of wealth is one plausible way to acknowledge and correct undeserved (dis)advantages that result from differential distribution of natural endowments.

The thesis of self-ownership has important implications in business ethics and other social institutions. For example, it helps determine what types of economic and political systems are just, such as whether or what types and levels of wealth redistribution may be justified. At the same time, this thesis has not answered many foundational questions, such as whether all human relations should be market relations and how we can understand any duty of beneficence to other human beings. Sorting out such issues will help explain whether a right to self-ownership is absolute and what counts as the fruit of one's labor. It will also help explain the connection between self-ownership and private property and clarify the extent to which one has a right to accrue properties that are not direct results of one's labor, such as inheritance and gifting.

Self-Realization

Self-realization is defined as the drive to become what one is capable of at his or her fullest potential, often-aligned in management parlance with self-fulfillment. The self-realized person is characterized as having a high level of self-knowledge, an integrated personality that allows for self-expression, an acceptance and tolerance of human nature, and a greater awareness of the human condition. The actualization of personal moral ideals affects participation in socially useful and ethically acceptable work.

To fully understand the essence of self-realization, the corollary concepts of self-actualization and individuation and the interrelated concept of self-disclosure are included. Self-realization, with its focus on human potential and what it means to be human, derives from humanistic psychology.

Historical Underpinnings to Self-Realization

A variety of philosophers, theologians, and literary figures contributed to insights into what it means to be fully human, the cornerstone to humanistic psychology. The texts date back to antiquity, yet continue to shape understanding and influence the teaching and practice of business ethics today.

Prehistory includes the role of the Greek epic, most notably the work of Homer, who created the image of the individual as hero and of life as quest or an adventure. Socrates articulated the practice of dialogue, dialectical conversations that sought deeper truths through examination of daily life. Socratic discourse was both ethical and personal with its focus on achieving character and virtue through knowledge. Plato focused on the values of *true* and *good* as ends in themselves. Justice was the paramount virtue or the sum virtue with regard to one's relations with others. Aristotle's theory of virtue helped define the excellent man as one who excelled in leading a truly human life by adhering to intellectual and moral virtues. The notion of goodness, with its end state of fulfillment or excellence, was found within the context of society. Virtue was regarded as individually and socially beneficial. These philosophers underscored that living a morally good life involved justice, virtue, and character.

The 19th century marked the emergence of existentialist philosophy. Kierkegaard emphasized a humanistic vision of truth where self-consciousness propelled the individual to reach his or her highest potential. Nietzsche focused on awakening, and creating through transformation, an image of a new individual or superman who would create authentic values. Existentialists maintained that individuals had an ethical obligation to self-understanding as part of a purposeful existence. The quest to be fully human was to push the individual to farther reaches with values at the core. The 20th century marked an inclusion of the individual's role as meaningfully understood based on his or her involvement in society. Most notably, Heidegger described the fullness of humanity as the result of being in the world. Buber's philosophy of dialogue and the relationship between *I* and *thou* defined self-development as the result of one in relationship to, and in dialogue with, others.

The focus of humanistic psychology was, and continues to be, on issues that help individuals understand themselves, others, and their environments. The role of self-realization emerged as the foundation to attaining one's fullest potential and becoming fully human. Philosophers and psychologists expanded humanistic psychology to include social interest, community awareness, and spiritual experiences, further supporting the value of pursuing the highest reaches of human achievement and potential.

The single person most responsible for establishing the field of humanistic psychology and most familiar to management studies is Maslow. He identifies a cohesive theory of the self and self-actualization by identifying a hierarchy of five needs. Physiological needs and safety, as low-order needs, are predominantly satisfied externally (i.e., pay, unions, contracts, and tenure). Social belonging, esteem, and self-actualization, as high-order needs, are internally satisfied. Maslow's theory was a psychology of the whole person.

Neither the theory nor the practice of humanistic psychology advocates self-seeking gratification. Seminal researchers of humanistic psychology committed their work to discovering ways to build cohesive relationships and communities. Because self-realization informs one's ethical and moral values and affects the larger society in which one lives, it is important to include its role and influence on business ethics and society.

Self-Realization and Self-Actualization

Psychology is culture bound and often limited by implicit assumptions that create reality. For example, how one manages his or her employees or seeks to establish company stakeholder relationships is embedded in social and cultural assumptions. Such assumptions are often removed from conscious awareness. Thus, the process of self-realization is to make these assumptions conscious.

The best vantage point for understanding behavior is from one's internal frame of reference. Self-realization is a process that brings one to this vantage point. Conscious thought reveals the true self—one unencumbered by the dictates of individual, group, or organizational expectations. Self-realization entails sensitivity to values and raises the question of how individuals prioritize such values, in general and in particular situations. The process involves moral awareness, thought, reasoning, judgment, and intuition. It is not narcissistic self-gratification.

As an ideal, self-realization represents the ultimate actualization of utilizing one's fullest capabilities. A person grows toward this ideal, defined as peak performance and peak experience, through self-discovery. Peak performance is the result of a clear focus on an event that culminates in a more efficient, creative, and productive result than would typically occur. Peak experience is characterized by a sense of profound significance, recognized as the moment of highest happiness and, often, a turning point in one's life. Both terms are cited in management studies as phenomena that leaders, capable of effecting change in groups, organizations, and institutions, experience. Maslow found that self-actualizing people tend to be altruists and their work is equated to a calling or vocation.

Therefore, self-realization is not a goal to achieve but rather a corollary of an authentic life. It is cited in ethical theory because self-realization involves the recognition of one's potential and follows the second formulation of Kant's categorical imperative: that one should treat everyone, including oneself, as an end not merely as a means. This Kantian idea infers that individuals have the capacity for autonomous reasoning, with particular reference to moral judgments.

Second, it is accurate to define self-realization as a continuing process of determining one's role and contribution to society. Classical theories put forward by Plato and Aristotle state that individuals attain self-realization when they achieve their distinctive function—that is, the full development of their unique capacities. Distinctive function can be framed as moral guardianship or stewardship, concepts prevalent in the context of sustainability and the ethical mandate to contribute to sustainable environments. The process of self-realization yields one's sense of responsibility for the improvement of the world as it affects both oneself and others.

Third, implicit to self-realization is individual choice, where a person realizes and acts on his or her distinct capacities. Choosing to engage in society is the basis of individuality. Linguistic expressions of "I am" or "I do" signal ways of entering into relationships with others, the society, and the world. Yet action is personal, and self-realization functions as a tool to help determine what constitutes morally justifiable and socially useful work.

Related Constructs of Individuation and Self-Disclosure

A corollary to self-realization is the construct of individuation. Most aligned with Jung's psychology, individuation refers to a person's awareness of the ways in which he or she is different even though unseen and unrecognized by others. Individuation is a relational process based on one's awareness of his or her social environment.

Characteristics of highly individuated persons include being more creative, exhibiting more leadership behaviors, and displaying a greater willingness to express dissenting and sometimes critical opinions. Highly individuated persons influence social situations by leading others and by generating creative ideas and unusual solutions to problems. Further research, however, is needed to determine more specifically how situational contexts, such as various organizational cultures, differ in the extent to which they encourage individual differences. Given today's global business environment, there is value to assessing how national cultures that differ in terms of individualism and collectivism affect individuation. One can speculate that high individuators may have a stronger social impact in individualistic cultures than in collectivist cultures.

Finally, individuated persons have achieved a high level of self-knowledge. Self-knowledge is often identified as contributing to having insight into the behavior of others and to having a greater awareness and tolerance of the human condition. This capacity of understanding is attributed to the integration of all aspects of one's personality. Self-integration correlates with self-disclosure, the second concept associated with the process of self-realization.

Self-disclosure is explicit communication of self-data that another would otherwise not have access to. Such information exchange is considered a private act that strengthens relationships, expresses emotional experiences, clarifies personal beliefs and opinions, and maintains social control and privacy. Self-disclosure facilitates the movement from self-alienation to self-integration; in other words, self-realization is the by-product of one disclosing himself or herself to another. It presumes authentic dialogue where both parties make themselves vulnerable and available to one another. Elements of trustworthiness, safety, and security are associated with this discourse. The choice to fully disclose and be vulnerable with one person ensures an aspect of mental health that guards against the fragmentation and alienation characteristic of modern life, as also experienced in many business environments. The distinguishing features of self-disclosure include the reciprocal exchange of ideas and using dialogue as the chosen method of communication—two elements cited as part of achieving systems change and organizational learning.

On Ties to Management

Humanistic psychology influences management theories of motivation. It has helped advance the view of the employee as a social, and not a purely economic, being, as evidenced in the human relations model of management practice.

Maslow's Hierarchy of Needs is one of the most enduring theories in management, where self-esteem and self-actualization needs are accepted without question. The ideal of the self-realized person emerged as an implicit and central concept in the seminal management theories of organizational behaviorists Argyris and Herzberg and theorists on work and job design such as Hackman and Oldham. Encouraging participative supervisory and leadership styles, designing appropriate forms of work organization for employees to experience self-actualization, and Theory Y leadership are related to the functions of self-realization.

Examples of self-actualizing behavior include the campaigning for better working conditions for one's coworkers, exposing financial irregularities, and opposing the manufacture of environmentally unfriendly products. The process of self-realization allows one to go beyond the limited context of increased productivity in the immediate job to encompass a wider concern for organizational policy and the role of the organization within a local and global community. Self-realization and individual maturation, which includes moral development, is a central theme that surfaces in the works of Argyris, Herzberg, and Trist, who recognized the relationship between employee development and organizational effectiveness.

In the 1960s and 1970s, there was an upsurge of writing challenging the classical management theories of bureaucracy, the role of autocratic leadership, and viewing employees as economic beings. Behavioral theories of management championed new organizational forms that were more human and facilitative of individual self-realization. Employees were recognized as individuals with social needs, thus linking interpersonal relationships to enhanced organizational performance. In the 1980s and 1990s, although the terms empowerment and self-fulfillment tended to be management parlance for self-realization, meaningfulness of work was deemed important and operationalized as part of one's personal value system. Autonomy in the workplace assumed a position of being a necessary condition for self-realization or personal growth. Today, personal and organizational values are being aligned with those values deemed important in the larger social environment, such as trust, integrity, and security. Ethical business practices are frequently measured against these parameters.

Impact on Business Ethics and Society

The discussion of self-realization, with its roots in humanistic psychology, suggests that the concept be examined at a deeper level to fully realize its role in informing business ethics and society. For one, humanistic psychology emphasizes the role of personal change in self-discovery and in the identifying of one's place in society. There is a continuing need to remind business and society of the dignity and worth of being human—something that gets lost in the day-to-day machinations of doing business. In a broader sense, the question of what it means to be human is quite relevant at a time of assessing the impacts of corporate megamergers and multinational and transnational companies, which can leave employees feeling disenfranchised, adding to the feelings of alienation. Maintaining self-realization as part of management and business practice keeps the focus on human capital as a resource that benefits business and society.

Second, the role of self-realization in workplace autonomy, creativity, and innovation suggests that managers understand that people are not only productive assets but also social beings. There is recognition that employee performance is related to employee achievement of personal effectiveness. The conditions that lead to peak performance and peak experience, associated with high-performing teams and effective leadership, are part of the operationalizing of self-realizing individuals.

Third, inherent in the work of self-realizing is the articulation of those virtues that comprise and guide one's ethical choices. Entering into an understanding of one's own potential reveals the larger network of relationships that has shaped one's worldview. For example, a person's religion, family, ethnic, and cultural affiliations influence and shape his or her attitudes to and behaviors comprising right and wrong. This is not an abstract reality; rather, it shapes the strategic choices that culminate in daily business operations. Since business does not function independent of its social environment, the actions that result from self-realized individuals inform the social contract.

Finally, self-realization is often linked to transformation. Transformation occurs when ordinary perspectives shift and the person gains new insights and self-understanding. Self-realization as a transformative process is about how a person can reach his or her fullest potential and how that potential translates as service to society. Today's social entrepreneurs and social venture partners are examples. Noted as part of the citizen sector movement committed to closing the business-social gap, social entrepreneurs and social venture partners bring entrepreneurial talent to the addressing of social problems. The need for a strong ethical fiber is cited as a necessary ingredient to the success of these ventures. Self-realization is about one's own authenticity and values and how those values influence one's daily ethical approach to business transactions. This is in contrast, and perhaps an antidote, to the excessive greed and egoism evident in many corporate organizations today.

SELF-REGARDINGNESS

Self-regardingness concerns acts and virtues focused on benefiting the self and is a prominent component of a person's orientation to the world. Its strength in relation to other-regardingness has been disputed, with most accounts of human nature also attributing to us a natural concern for others, whereas some other accounts describe humanity as primarily or even exclusively egoistic (psychological egoism). Most scholars would agree, however, that self-regarding tendencies can and do coexist with other-regarding ones in various ways. Self-regardingness should not be confused with selfishness, because it does not necessarily exclude concern for others.

In modern ethics, the moral legitimacy of self-regardingness ranges from its celebration in ethical egoism to its complete denial in altruism. Self-regarding acts and virtues are frequently classified as nonmoral because many scholars understand morality as essentially other-regarding. Thus, self-regarding acts and virtues are viewed as morally inferior to their other-regarding counterparts. Other scholars, however, view self-regardingness as belonging in the moral realm, especially when considered in conjunction with other-regardingness. Self-regarding virtues like prudence and courage can serve the interests of both self and others, and actions can have multiple motives and effects, again serving both self and others. Apparent self-regarding obligations can also be moral obligations when fulfilling them also benefits others. Kant, in particular, claims that we have self-regarding duties based on proper self-respect and that these duties belong in the moral realm because they sustain our moral worth and provide the foundation for performing our other duties. Among the major ethical theories, utilitarianism very clearly incorporates self-regardingness, tempered with the overarching other-regardingness of the self counting as only one among others. It supports the pursuit of personal good until it conflicts with the good of the many.

In historical religious and philosophical accounts, self-regardingness and other-regardingness are intertwined. Whereas the ethics of most major religious traditions emphasize other-regardingness, there clearly is an element of self-regardingness in those traditions with their concern for a person's salvation and/or liberation. The New Testament, for example, makes a self-regarding appeal when it asks what a man will profit if he gains the whole world but loses his soul. It also accepts love of self, but asks that one also love one's neighbor; proper love of self involves love of neighbor. Ancient Greek philosophy perhaps even more clearly links self-regardingness and other-regardingness through the virtues. Achieving a person's highest good requires developing the virtues, not only the other-regarding virtues like justice, but also the seemingly self-regarding virtues like prudence. According to Aristotle, good people should be self-lovers because self-love commits them to the good of others. Whereas modern ethical theories tend to construe prudence narrowly in terms of self-regarding rationality or else discern morally inferior (self-regarding) and superior (other-regarding) versions, the Greeks did not distinguish between rational thinking and moral thinking. For them, self-regardingness was a key part of ethics.

SELF-REGULATION

Self-regulation is the process that determines how one identifies, conceives, analyzes, plans, directs, manages, evaluates, and adjusts what one does. Self-regulation precedes the development of intrinsic motivation, which in turn energizes the appropriate use of reflective judgment. Ethical dilemmas are often personal and paradoxical problems that need to be solved using a decision-making process that frequently involves choosing between two or more viable options. Hence, self-regulation in the ethical decision-making process guides how one processes information that is involved in resolving difficult and complex problems that call into question our values, experiences, and prior learning.

Individuals can either be governed by external forces, such as laws and community norms, or through self-regulation, led by our own sense of values and ethical commitments. To balance between societal norms and personal commitments requires the ability to process well-conceived options and weigh the ethical consequences of various solutions. Failing to develop this skill portends risky consequences for individuals, businesses, and societies as effective leadership and survival requires that all in the community be able to evaluate novel and emerging ethical situations.

The premise of self-regulation in the ethical decision-making process is that one can learn and become better at the evaluation of ethical dilemmas and ways of resolving the problems surrounding the principles of conduct governing an individual or group. Acknowledging that learning to make effective ethical decisions is a developmental process and can be improved through the learning process opens the door to how people utilize self-systems and regulate the way they think about ethical problems. The developmental process allows improvement in the clarity of thinking about the problem, the heuristics about how one solves ethical problems, what values of conscience one will weigh as the problem is solved, and the continued belief that one is competent and consistent in the control of the decision and outcomes of these decisions. The assertion is that the more we develop our ethical decision-making process the more effective we are as leaders, whatever our positions in an organization.

An Ethical Framework Founded on Philosophical Precepts

Research about ethics has centered on the principles that guide our actions and how we evaluate our principles, rules, and goals. The world of ethics is about disciplining the mind through reason to critically apply principles and criteria to a problem to help us select the most ethical act. Ethicists have tried to determine whether we have a set of principles from which we live (deontology) or whether the goals of our lives determine our choices (teleology). This debate is subjugated by considering an ethical framework of four themes that deal with and attempt to balance the juxtaposition of autonomy and equality as well as rationality (following the rules) and sensibility (being flexible). In this way, we can attend to concerns such as hierarchy, compassion, community, and parity. By looking at the ethical issue in terms of balance among competing values, ethicists can acknowledge that we are not guided solely by a set of principles or goals; rather, ethical decision making is deeply informed by how we process information, learn, develop, and regulate ourselves in a world of interpersonal relationships.

Four key philosophies have captured competing notions of what is an ethical act: (a) deontology, which focuses on our duties; (b) utilitarianism (teleology), which focuses on the greatest good for the greatest number; (c) justice theories, which promote integrity-sustaining systems that attend to the needs of the least advantaged; and (d) virtue ethics, where an ethical act is one that is consistent with a good character and reputation. Faced with competing notions of what is an ethical act, in a postmodern, pluralistic community no one reason will be accepted by all as sufficient for action. Because our actions are shaped by the authorities we find persuasive, the traditions that are important, our base knowledge, and our experiences, we often develop a preference for thinking and making decisions based on one of these philosophical threads and call that preference our conscience.

The Role of Self-Regulation and Conscience

As the world evolves and more is known about development and learning, self-systems research begins to highlight the significance of other dynamics in the critical-thinking process. Self-awareness and self-management are often considered the keys to being moral, in that they can inform how individuals use their emotions and empathy as well as their intellect to gather information about how to act in community. Self-awareness includes being sensitive to our strengths and weaknesses—our gifts as well as our blind spots or proclivities for deception. As described by Daniel Goleman in his work on emotions and ethics, self-management involves virtues such as emotional self-control, transparency, and adaptability

Charles Shelton has researched the role of conscience in decisions. Conscience serves as our moral compass, guiding us to do what we ought to do and act how we ought to act. Implementing a conscientious decision involves continuous reflection, discipline, and effort, which are based on observations we make in our childhood and shaped by our environment until we develop a sense of ethical meaning that becomes our code of conduct when faced with ethical dilemmas. Sometimes, to rationalize their decisions based on original beliefs and values, individuals may resort to self-deception if they do not have a disciplined basis for learning new ways of behaving in a changing world, examining the actual issue at hand, honoring the stakeholders involved, and filtering their values in conflict.

Self-systems allow the individual to reassess the "oughts," "shoulds," and "have tos" that have formed absolutist messages that fail when complex issues do not fit into the rigid and demanding templates of viewing oneself and others, when ethical decisions have to be made. Yet conscience reveals personal integrity when we choose to stand up for ideals that can balance questions such as "Who am I as an actor in this process?" "Who is involved?" "What are the possible consequences for myself and others?" How we have developed and continue to develop a sense of conscience influences how we learn and how we regulate our information processing and ethical decision making. An ethically mature person will use both the rational considerations as well as the emotional implications for the key relationships before adopting any course of action. The belief that we can think about, control, and predict the outcomes of our decisions over a broad spectrum of circumstances involving a sense of conscience speaks of the degree to which self-efficacy is involved in the decision-making process.

The Role of Self-Regulation and Learning

Information processing involves how people learn and think through knowledge that is available to them. Common terms that are related to learning are *cognition* (how we think about and acquire knowledge: perceiving, encoding, storing, processing, decoding, and expressing our thinking), *affect* (the emotional interpretation of perceptions, values, and feelings), *metacognition* (the general heuristics that are developed that are overarching strategies for solving problems), and *conation* (the connection of knowledge, affect, and metacognition to behavior and action). It is well known that we are "hard-wired" to some extent by our nature and are born with certain propensities that help us analyze information. It is also clear that skills and abilities are nurtured and developed through the family and culture in which we are raised and that the combination of nature and nurture determines what things we value and how we make decisions based on these values. Enmeshed in the nature and nurture conversation is the degree to which we involve self-determination as well as how we learn and manage information, knowledge, and feelings. Learning is witnessed by a permanent change in behavior, demonstrating new ways of thinking.

Self-regulation is closely associated with the concept of volition and the ability to make choices about what we do through the intentional, deliberate, goal-oriented, and reflective process. Hence, self-regulatory learning processes require that we select and organize information and regulate what we think about, and they are also related to how we process and manage information and how we change our mind about issues given new information and a prescribed way of analyzing information based on a rational and reasonable procedure. The development of self-regulatory learning processes involves meaningful integration of new material and prior knowledge into the information processing networks. Addressing higher-order learning outcomes, such as ethical decisions, are often best formulated and regulated by asking questions such as "Who is the ethical actor?" "Who are the stakeholders?" "What is the context of the issue?" "What values are in conflict?" These questions serve as self-regulation strategies to offer systematic interventions to focus us on the critical issues of making complex decisions. Posing questions offers reflection points that help people consider the interface between rationality and empathy as well as the relationship of individuals within a community, as we seek to make ethical decisions.

The Role of Self-Regulation and Self-Efficacy

Self-efficacy is a related concept that explains how outcomes are dependent on capable and competent action, which creates a sense of causative power. First, self-efficacy influences the sense of personal agency as individuals determine whether or not they are the ones who might be responsible for making an ethical decision. Next, self-efficacy influences to what degree (if any) persons have control over the processing of information, control over making choices about their actions, and the courage to question preconceived ideas and values. As people question their belief systems, they are able to reestablish new values and communicate those new positions. Finally, self-efficacy influences a person's ability to sense that decisions and actions that lead to expected outcomes have a degree of predictability rather than being arbitrary (e.g., based on chance and lacking a pattern for repetition). The development of self-efficacy requires mastery of knowledge and skills. This learning becomes a self-referent belief system that influences one's ability to organize and execute thoughts and actions leading to the evaluation of anticipated consequences and expected outcomes.

Self-regulation and self-efficacy go hand in hand in that people must believe that they themselves can orchestrate knowledge, monitor information, mobilize skills, manage changing situations and emotions, acknowledge perceptions, evaluate alternative courses of action, establish goals and enlist motivation, and direct their actions as well as influence the actions of others who might be involved in the performance of the decision. Self-regulatory capabilities and meta-strategies for solving problems increase the sense of personal efficacy that transfers across different activities and when involved in different settings. Dale H. Schunk and Barry J. Zimmerman found that developmental theorists conceive of self-regulation in terms of incremental and progressive changes in learners that allow them to exert greater control over their thoughts, feelings, and actions.

When Self-Regulation Is Absent

People who lack self-regulation, a sense of conscience, and self-efficacy usually lack the ability to logically think about complex problems in a thorough and regimented fashion. It is difficult for those individuals to formulate a focused frame of reference about the issue at hand. Many skills needed for effective decisions are lacking. They cannot define a problem, develop notions of proof, or evaluate evidence. They are unable to research additional information or develop credible options. Because they lack the foundations for ethical decision making, they cannot use the four primary ethical theories to find a solution that effectively harmonizes competing values. They are unable to balance the rights and responsibilities that must be considered in the decision; explore the results/outcomes that will likely follow their decision (e.g., efficiency, quality); respond to issues of character, virtue, and reputation; and make a choice that will enhance the well-being of the system, organization, community, and global environment.

Recent industry indiscretions like the Enron fiasco highlight the inability of corporate officials to focus on solutions to problems that are well conceived, rational, and made with a conscious effort at understanding the long-term effects for all stakeholders. The inability to process well-conceived options and weigh the ethical consequences of various solutions portends risky consequences for individuals, businesses, and societies. This lack of careful deliberation illustrates the need for self-regulation in the ethical decision-making process. For example, issues concerning stem cell research and terrorism mandate decisions at many levels that involve moral parameters, economic welfare, and personal sacrifice—decisions that do not have familial or societal precedents.

Conclusion

Self-regulation and ethical decisions systematically implement a heuristically designed set of operating principles that allow one to work through a process of decision making. Hence, behavior is predicated on cognitive, metacognitive, affective, and conative mediators. Self-regulation develops from social sources and shifts to self-sources by acquired learning strategies and the ability to guide enactment based on one's own ability to reflect on information, reconstruct knowledge, and determine an outcome. Self-regulation also involves the process of acquiring beliefs and theories about one's own abilities and competencies and how one regulates strategies to solve problems.

Effective decision making requires one to (a) be attentive to the questions at hand, (b) sort out the issues, (c) weigh the values in conflict, (d)generate options to solve a problem, (e) monitor and evaluate the options based on considerations of conscience and self-efficacy, (f) act in a responsible manner correcting for bias and errors of judgment as decisions are confirmed, and (g) reevaluate and learn from decisions made and determine how those decisions should ultimately support the values and goals that hold the most meaning. Using self-regulatory processes in ethical decision making offers a unique approach to solving complex and sometimes paradoxical problems. Self-regulation requires individual accountability and participation in the analysis process based on one's belief systems and conscience.

Self-regulation builds one's self-efficacy so that patterns of analysis take into consideration a disciplined and rational process for considering all the dynamics involved in difficult ethical dilemmas. It allows for decisions to be nuanced by spiritual influences, societal mores, critical thinking about emerging diversities, and new ways of belonging. Self-regulation as it pertains to ethical decision making facilitates reflection of philosophical considerations. In the ethical decision-making process, it allows for adjustments as one learns to reject unconscious arbitrary decisions and embrace conscious and rational choices. Self-regulation encourages people to modify initial values and compare those values to those in question. Finally, self-regulation in ethical decision making allows one to evaluate competing ethical solutions using a broad array of complementary principles and goals. In the process, the ethical actor can move from being right to being responsible.

SELF-RESPECT

Self-respect is a sense of one's worth. Theorists disagree, however, about what kind of worth it is a sense of. According to various accounts, people with self-respect believe that they have full moral status, try to live up to certain ideals, and have a morally good character. Most agree that self-respect differs from self-esteem, though these concepts are related and are sometimes used interchangeably. Self-esteem and self-respect both involve evaluations of the self, but the latter is a specifically moral evaluation. The concept of self-respect has played a larger role in debates in moral and political philosophy than in debates in business ethics. When self-respect is appealed to in discussions of business ethics, it is usually in the service of an argument for workers' rights, especially the right to meaningful work.

Varieties of Self-Respect

Self-respect and its cognate concepts such as dignity, pride, magnanimity, and honor have figured prominently in the writings of philosophers from Aristotle in the 4th century BCE to John Rawls in the 20th century. Arguably, the most important source for contemporary discussions of self-respect is the work of the 18th-century philosopher Immanuel Kant. According to him, we should treat humanity, in our own person and in that of others, never merely as a means, but always as an end in itself. Many scholars interpret this as a claim that humanity should be *respected.* Since Kant's command applies as much to others as it does to oneself, it follows that for Kant, *self*-respect, in addition to the respect of others, is morally required.

The role of self-respect in historically important moral theories has led to discussions of its nature. According to one view, self-respect is a sense of moral worth that people are entitled to have just because they are people. People with self-respect think they have full moral status and are the moral equals of everyone else. Frequently, the nature of self-respect is elucidated by examples. A familiar one, which illustrates this sense of self-respect, involves an oppressed member of a minority group who is exploited by whites but does not complain. (The Uncle Tom figure is often cited.) Suppose this person passively accepts being fired from his or her job for a less-qualified white person and being given less than his or her fair share of social benefits by a white government. This person is not calculating; rather, the individual thinks that whites are entitled to treat him or her this way because of their superior status. It seems right to say that such a person lacks self-respect (perhaps through no fault of the person's own). The reason is that the person fails to appreciate his or her rights, or more generally, his or her full and equal moral status.

Some theorists have claimed that recognizing one's full and equal moral status is necessary but not sufficient for self-respect. According to them, people with self-respect must also try to live according to standards they set for themselves. Some acts are inconsistent with a person's having self-respect—not because they are intrinsically wrong but because they conflict with deeply held beliefs that person has about who he or she is and what kind of life he or she leads. Imagine a person for whom writing songs that protest private ownership of the means of production is so important that she identifies herself to friends and strangers as a Marxist songwriter. Suppose over time she gets fed up with being ignored by society and—not out of any material necessity—sells her melodies to giant corporations to be used as advertising jingles. There is nothing intrinsically wrong with this. But it seems beneath her—that is, incompatible with the self-respect of a Marxist songwriter. It is incompatible not with her status as a moral equal but with the standards she has set for herself.

The two types (or aspects) of self-respect we have considered so far have been called "recognitional," in virtue of the fact that their basis is the recognition of ourselves as certain kinds of individuals (e.g., as moral persons or as Marxist songwriters). Some theorists have claimed that there is also an "estimative" component to self-respect or a type of self-respect that is estimative. According to them, self-respect is based not only on "important" features of people, such as their being moral persons, but on "good" features of them, such as their being honest, trustworthy, or diligent. The basis of estimative self-respect is thus said to be morally praiseworthy character traits and conduct. For example, we might say of people with many praiseworthy qualities that they are entitled to have more estimative self-respect than people with few praiseworthy qualities. People with no praiseworthy qualities are entitled to no estimative self-respect, whether or not those people actually think highly of themselves.

Self-Respect and Self-Esteem

The concept of self has been described not only in terms of self-respect but also in terms of self-esteem. Philosophers usually pursue the former route and psychologists the latter. Thus, the literature on self-esteem is more empirical, and less conceptual and normative, than the literature on self-respect.

However, self-respect and self-esteem are related concepts, as a consideration of psychologists' accounts of self-esteem reveals. According to them, self-esteem is the degree to which a person approves or disapproves of himself. Persons with high self-esteem think of themselves as, on one hand, significant and worthy, and on the other, competent and successful. Whether one thinks of oneself this way is thought to depend both on, as William James said, the ratio of one's successes to one's pretensions and, as Charles Cooley said, others' appraisals of oneself. The domains that have been found to be important for self-esteem include physical appearance, athleticism, intelligence, social acceptance, and parental support.

Like self-respect, then, self-esteem is a sense of worth that is manifested in a person's attitudes, beliefs, and dispositions. But there are differences between them. One is in the nature of the worth at issue. To have self-respect is to value oneself, whereas to have self-esteem is to think highly of oneself.

A second, and related, difference concerns the source of this worth. The bases of self-respect are *necessarily* morally significant features of the person and may or may not be appraisable (i.e., good or bad), whereas the bases of self-esteem are *necessarily* appraisable features of the person and may or may not be morally significant. The fact that one is a moral person or has a certain identity is morally significant and, therefore, is a source of certain kinds of self-respect. But there is nothing good or bad about being a person or having a certain identity. The fact that one is, for example, honest *is* appraisable; but what qualifies this trait as a basis of self-respect is its moral significance. Now contrast this with self-esteem. In addition to being a basis of self-respect, being honest can be a source of self-esteem because it is an appraisable trait. However, one might have high self-esteem by virtue of being good-looking, athletic, or socially accepted. These traits are appraisable, but there is nothing morally significant about them; that is, a person who is good-looking is not for this reason morally good.

The Normative Significance of Self-Respect

Compared with the amount of discussion about the nature of self-respect, there has been relatively little discussion of its importance. What discussion there has been has focused on the first kind of self-respect, according to which having self-respect entails thinking of oneself as having full and equal moral status.

Kant said conceiving of oneself this way is a rational requirement, but few theorists accept this now. Nonetheless, many are convinced that self-respect is highly morally important. Some theorists claim that the appreciation of things that are intrinsically good is itself intrinsically good. Self-respect qualifies as intrinsically good in this view because it is the appreciation of the intrinsic value of one's personhood. Others claim that self-respect promotes moral behavior, as people who have a proper appreciation of their rights are less likely to tolerate abuses of them by others. Still others claim that self-respect has instrumental value. According to them, self-respect is necessary to pursue one's life plans with zeal.

More work remains to be done on the importance of self-respect, especially as it compares with other moral values. This is important for determining the extent to which self-respect should be promoted in society. We might think of self-respect, as some do, as an individual moral requirement. But whether people have self-respect is determined in part by the nature of the social and political institutions as well as the business organizations in which they participate.

Some political theorists—including many on the "left"—embrace self-respect as a distributive ideal. They endorse policies that promote this value, even at the expense of other values. Some support giving homosexuals the right to marry, on the grounds that being denied this right makes it hard for homosexuals to conceive of themselves as moral equals. Others justify social welfare payments by appealing to self-respect, on the grounds that lacking the resources to pursue one's plan of life is incompatible with living according to standards one sets for oneself. These policies are often opposed by those on the political "right," for a variety of reasons.

Theorists' conclusions about the importance of self-respect have been put to use by activists. The struggles of oppressed groups, including women, blacks, and homosexuals, have been framed in terms of self-respect. It was argued, for example, that denying voting rights to women (or blacks) made it difficult for them to conceive of themselves as having the same moral status as men (or whites).

The concept of self-respect has been given less attention by business ethicists than by political philosophers. When it is discussed by business ethicists, it is usually in the context of an examination of workers' welfare. Self-respect has been connected to the availability of work, to meaningful work, and to a living wage. The argument in each case is roughly the same. It begins with the claim that contributing to society is a source of self-respect and that the way many people contribute to society is through work. Thus, if people lack work, they may feel that they are a burden on society, and their self-respect may be damaged. The same is true, it has been argued, if people do meaningless work or fail to earn a living wage. In the former case, although they have work, they do not have work that is stimulating, complex, and creative; in short, they do not have work that seems worth doing. In the latter case, the low level of compensation they receive for their work communicates to them that their work is not valuable. It will be difficult for them to believe that they are making a meaningful contribution to society in either case.

There is a great deal of empirical evidence, beginning with Arthur Kornhauser's seminal work on the mental health of industrial workers, that people's self-*esteem* is adversely affected by meaningless work and, to a lesser extent, low pay. Given the similarities between self-respect and self-esteem, it would not be unreasonable to conclude that people's self-*respect* is adversely affected by these factors, but more work needs to be done to establish this result.

Self-respect-based arguments for meaningful work and living wage provisions are usually met with objections that these measures are too costly and that they interfere with the rights of owners and workers to contract freely. Whether these objections succeed depends on the importance of self-respect compared with other values—a topic that, along with the nature of self-respect, deserves further consideration.

Servant Leadership

The concept of servant leadership was developed by Robert Greenleaf, who drew from his 40 years directing management research for AT&T to create a business and leadership consulting practice centered on his ideas about leaders as servants. After retiring from AT&T in 1964, Greenleaf launched his second career with the publication of the 1970 essay, "The Servant as Leader," in which he acknowledged Herman Hesse's *Journey to the East* with providing the key insight for his theory of servant leadership. In this story, a group of men embark on a pilgrimage to the East, accompanied by their servant, the spiritual and charismatic character Leo. Deep into the journey, Leo mysteriously disappears and the men are so confused and disorganized without him that they fail to complete their journey. Years later, it is discovered that Leo was actually the head of the organization that had sponsored the pilgrimage.

Greenleaf's approach to leadership could be described more as a spirituality of leadership than a theory of leadership, anchored in the human quest for meaning, wisdom, and community rather than in a critical analysis of theory or empirical data. In the 1970 article, which became the first chapter of his book on servant leadership, Greenleaf begins with the assertion that prophetic vision and voices are always present in the world but that people do not always listen to their wisdom. Greenleaf saw in the social upheavals of the late 20th century the seeds of a new moral vision of power and authority that would reshape traditional notions of leadership in organizations. In this social context, Greenleaf reflects the widespread emergence of leadership theory as a discursive domain of people and relationships distinctly different from management theory focused on operations, authority, roles, and tasks.

Greenleaf's framework of leadership as service shows similarities to the larger body of developing leadership literature, for example, the charismatic and visionary "new leadership" theories of Burns, Bryman, Kouzes, and Posner or the charismatic theories of Bennis, Conger, and Kanungo. Greenleaf shares with his contemporaries an emphasis on the dynamic, relational aspects of leadership with special attention to the character of the leader and the leader's relationship to followers. His emphasis on the character of the leader is viewed essentially as the desire and choice to serve; the defining moment for the servant leader is in valuing the good of others through service over a personal drive for power or gain. Servant leadership views people and human communities as the ultimate end (telos) of leadership rather than as the means to an external organizational or political end.

With the formation of his Center for Applied Ethics, now known as the Greenleaf Center, a second generation of servant leadership writers emerged from its seminars, lectures, and publications. Hunter, Autry, and Blanchard, for example, apply servant leadership to business, government, politics, churches, and family life by distinguishing leadership from management and emphasizing the spirituality of work and the character of the leader in influencing and inspiring people for the common good. Covey, Block, Senge, De Pree, Wheatley, and Blanchard view servant leadership as compatible with a more holistic approach to the distributed power dynamics of a collaborative organizational model. Servant leadership is seen by some executives and managers as a means of personal leadership and character development. It has also been applied in some settings as an organizing ethos for enabling people to reach their full potential, thus helping them achieve optimal performance. Phil Jackson, for example, applied a servant leadership philosophy as head coach of the Los Angeles Lakers to build a strong, high-performance team. Herb Kelleher adopted a servant leadership organizational development strategy as CEO of Southwest Airlines to build a culture of shared vision and customer-service-focused community among Southwest employees. This approach is especially attuned to the social mission sensibilities of service and nonprofit organizations but may be less suited to the organizational culture of public corporations with profit margins and shareholder expectations to consider.

Servant leadership is sometimes described as a quiet global revolution taking place in the modern workplace, wherein managers relate to workers as persons rather than as tools or cogs in the production process. With its focus on workers as persons, servant leaders are differentiated from authoritarian, hierarchical leaders by skills and practices of empowerment. By devoting themselves to serving the needs of their individual followers, servant leaders build organizational value and quality through people. Eight central qualities of the servant leader identified by Larry Spears, currently the CEO of the Greenleaf Center, reflect a marked departure from traditional managerial leadership literature in their relational, pastoral tone: listening, empathy, healing, awareness, conceptualization, foresight, stewardship, and commitment to the growth of people.

Critiques of servant leadership emphasize its failure to focus on the goals of an organization because of its emphasis on the people of an organization as ends in themselves. Whereas this critique would perhaps constitute a Kantian approbation of servant leadership, it reflects the commonly held utilitarian approach to business leadership. In this view, servant leadership is acceptable as a practice to the extent that it motivates employees to fulfill organizational goals, but it does not offer a sufficiently robust theory of leadership for the performance challenges of a highly competitive business environment. Servant leadership practitioners respond that the Fortune 500 companies applying the servant leadership philosophy outperform their competitors with more productive, loyal, and purpose-driven employees. Servant leadership may also be seen as narrowly sectarian in diverse organizations consisting of individuals who may be uncomfortable with the use of Scripture and Christian exempla by some who apply it in a religious context. Despite its limitations, servant leadership remains a popular leadership model among American business leaders.

—Lindsay J. Thompson

Sexual Harassment

Sexual harassment is unwanted verbal or physical conduct of a sexual nature. General Recommendation 19 to the United Nations Convention on the Elimination of All Forms of Discrimination Against Women defines sexual harassment to include unwelcome physical contact and advances, sexual demands, the showing of pornography, and sexually colored remarks. Most reported victims of sexual harassment are women. Sexual harassment is illegal in a growing number of countries, many of which recognize that both men and women can be harassers or victims. In the United States, sexual harassment is a form of gender discrimination prohibited by Title VII of the Civil Rights Act of 1964. Title VII holds both harassers and their employers legally responsible and liable for damages and seeks to protect employees who report sexual harassment from retaliation.

Sexual harassment is both widespread and underreported. Surveys indicated that nearly half of working women in the United States and Europe have experienced sexual harassment. More than 90% of Fortune 500 companies have received sexual harassment complaints, and more than a third of Fortune 500 companies have been sued for sexual harassment. Meanwhile, estimates place the reporting rate for sexual harassment at 15% or lower. Reasons for failing to report sexual harassment include embarrassment and shame, a belief that nothing will be done, and fears of hurting one's career or even losing one's job. The U.S. Equal Employment Opportunity Commission (EEOC) received 12,679 charges of sexual harassment in Fiscal Year 2005, with 14.3% filed by men. Complaints peaked in Fiscal Year 1997, when 15,889 cases were filed with the EEOC.

Both victims and employers suffer harm from sexual harassment. Victims have reported resulting anxiety, depression, and sleep and appetite disturbances. Victims may also lose wages when trying to avoid harassment by taking sick leave or unpaid leave, by transferring to new jobs, or by quitting. Reporting sexual harassment can make matters worse if the harasser retaliates. Since there may be few or no witnesses to the harassment, attention may focus on the victim's credibility, opening the victim's life to intense public scrutiny. Companies where sexual harassment occurs suffer consequences such as lower team productivity, a "poisoned" work atmosphere, higher job turnover, increased sick leave, court costs, and damaged company reputation. The average jury award in a U.S. harassment case is $1 million.

Sexual harassment generates both ethical and legal debates. Confusion abounds over what constitutes safe sexual conduct at work. The power dynamics in sexual harassment are increasingly recognized, as are the synergistic effects of gender bias with racism and other forms of discrimination.

U.S. Legal History

Title VII

Title VII of the Civil Rights Act of 1964 was intended mainly to protect disadvantaged minorities from discrimination based on race, religion, color, or national origin. Gender was added by opponents of the law who had wanted to kill the legislation but failed. As a result, women, a majority group, gained protection from discrimination under Title VII.

Sexual harassment became a specific violation of federal law in 1986, when the U.S. Supreme Court ruled in *Meritor Savings Bank v. Vinson* that a hostile environment created through sexual harassment violates Title VII. The Court said victims were entitled to back pay, damages for emotional distress, and attorney's fees.

EEOC Regulations

In 1990, U.S. EEOC defined unwanted sexual conduct in the workplace as harassment when (1) the employee's response to the conduct affects their employment; (2) the conduct unreasonably interferes with the employee's work performance; or (3) the conduct creates an intimidating, hostile, or offensive work environment.

According to the EEOC, harassers and victims can be of either gender, and a harasser can have the same gender as the victim. Harassers could be not only the victim's supervisor but also other supervisors, coworkers, nonemployees, and agents of the victim's employer. Illegal sexual harassment can occur even if the victim suffers no job loss or economic injury and even if the victim isn't the one being harassed. The EEOC guidelines recognize two types of sexual harassment: quid pro quo and hostile workplace environment.

Quid Pro Quo

In quid pro quo sexual harassment, a job benefit is tied to an employee's acceptance of unwanted sexual behavior. For example, a supervisor may demand sexual favors in exchange for a promotion or threaten to fire an employee for resisting sexual advances. Only supervisors can engage in quid pro quo harassment because only they have, or can reasonably be perceived to have, the power to give or withhold job benefits. A supervisor's sexual advances may be shown to be unwanted even if the employee eventually submits to them. Employers are generally held liable for quid pro quo harassment by supervisors.

Hostile Workplace Environment

Hostile workplace environment harassment occurs when an employee is regularly subjected to sexually offensive speech, behavior, or materials. An ongoing pattern of offensive conduct is generally necessary to show that a hostile workplace environment exists.

In the 1993 case of *Harris v. Forklift Systems,* U.S. Supreme Court Justice Sandra Day O'Connor developed a two-fold test for hostile workplace environment harassment: (1) Is the conduct so severe that a reasonable person would find the environment objectively threatening or abusive? and (2) Does the employee perceive the environment as threatening or abusive? Employers are liable in hostile workplace environment cases unless they can show that they took reasonable measures to prevent or correct sexual harassment or that the employee failed to take advantage of these measures.

Several courts have used a reasonable woman standard for determining whether a hostile workplace environment exists, especially in the less obvious cases where men and women tend to disagree. The reasonable woman standard has been criticized as unfair to men, and most courts have dropped it in favor of a consistent use of the reasonable person standard.

Federal Court Interpretations

Federal court rulings in the 1990s and early 2000s interpreted a number of aspects of Title VII. For example, the 11th Circuit Court of Appeals ruled in *Farley v. American Cast Iron Pipe Co.* that an employer with an effective policy against sexual harassment cannot be held liable for creating a hostile workplace environment unless the employee reports the harassment in accordance with the policy and the employer fails to provide a remedy. The court said that even if the harassment is pervasive, the employer will not be presumed to know about it. Employees lost several cases in federal court because they had failed to use the avenues their employers provided to remedy sexual harassment. In *Slayton v. Ohio Dept. of Youth Services,* the employer was found liable for harassment by nonemployees because employees had encouraged it.

State Laws

All states have some form of sexual harassment legislation. These laws typically resemble federal law but expand protection to employees of smaller firms. State laws vary considerably in the damages and remedies provided for a successful sexual harassment claim. More than a dozen states require or encourage employers to train their supervisors and managers in harassment prevention. In California, supervisors may be held personally liable for harm they cause by sexually harassing employees.

International Perspective

A number of international conventions, reports, and agreements either directly address sexual harassment or include material relevant to it. For example, the United Nations Declaration on the Elimination of Violence Against Women, adopted by the General Assembly in 1993, explicitly includes sexual harassment and intimidation in the workplace. Some international documents treat sexual harassment as a form of violence against women or as a barrier to development. Other documents affirm rights that sexual harassment violates, such as the right to dignity at work.

Sexual harassment is illegal in a growing number of nations. By 1992, according to an International Labour Organization survey, Australia, Canada, France, New Zealand, Spain, Sweden, and the United States had laws on sexual harassment. Other industrialized nations treated sexual harassment under tort law, criminal law, or wrongful dismissal. Members of the European Union were required to have laws against sexual harassment by October of 2005. Also in 2005, the Chinese law protecting women was amended to bar sexual discrimination against women and to empower women to lodge complaints with appropriate organizations. Japan's Equal Employment Opportunity Law includes sexual harassment, and India's Supreme Court has expanded the definition of sexual harassment beyond physical contact.

National laws that recognize sexual harassment generally define it in terms of quid pro quo and hostile workplace environment. Penalties for sexual harassment vary considerably from one nation to another.

Preventing Sexual Harassment

Many companies have developed programs in response to court rulings holding employers responsible for both preventing and remedying sexual harassment. Typically, these programs include the following:

- A strong, written policy prohibiting sexual harassment
- A definition of sexual harassment with specific examples of forbidden behaviors
- Procedures for reporting, investigating, and remedying sexual harassment
- A nonretaliation policy
- Education and/or training, including regular reinforcement of the employees' right to a harassment-free workplace

Experts recommend that training programs not only give information about sexual harassment laws and the company's policies and procedures but also raise awareness and offer strategies for intervention. Some experts emphasize the importance of a company's culture—the informal social system that sets norms in an organization and lets people know "how things are really done around here." Company culture has been shown to influence the effectiveness of formal ethics training programs.

Ongoing Debates

Discussions of sexual harassment from an ethical perspective tend to emphasize the abuse of power rather than the sexual element. At the same time, ethical debates have continued over issues such as the following:

- Do victims have an ethical obligation to resist sexual harassment?
- How is sexual harassment best understood?
- How can organizations and individuals best learn to recognize and eliminate sexual harassment?

Not only sexual harassment itself but also the laws surrounding it have become topics for debate. For example, some scholars see a conflict between sexual harassment law and freedom of speech. Other critics ask whether sexual harassment laws enshrine an outdated view of women or represent overkill in an area long covered by common law and tort law.

Shame

Shame is an important mechanism in much of the world for discouraging unethical behavior. Shame may be defined as public censure and disapproval, whereas honor, its opposite, is public affirmation. Shame and honor may be endowed by one's inherited circumstances or family station, but they also serve as negative and positive reinforcements of behavior. Shame takes many forms, including embarrassment, humiliation, loss of face, ridicule, punishment, expulsion from the family, and exile.

Relationship-Oriented Cultures

Shame-based regulation of behavior is most prevalent in relationship-oriented cultures, which rely heavily on personal supervision. This is because the experience of shame, in the sense intended here, requires that other people take note of one's behavior. A relationship orientation is typically found in non-Western countries.

Direct supervision plays a central role in relationship-oriented cultures because authority resides in persons rather than in rules. Rules may be laid down, but they receive their legitimacy from the persons who lay them down, such as parents, teachers, husbands, bosses, elders, or political leaders. These are also high-context cultures, in the sense that behavior norms need not be spelled out explicitly but are learned from the context of everyday life. Activities that superiors allow to proceed without immediate censure are assumed to be permissible.

Relationship-based behavior regulation can be seen in countless everyday business contexts. For example, department stores in relationship-based countries typically ask customers to pay a central cashier rather than the sales person who showed them the merchandise. The customer then brings a receipt to the sales person to pick up the items purchased. The reason for the central cashier is that direct and constant supervision of persons who handle money is viewed as necessary, and it is easier to supervise one person than many.

Loss of face is a particularly important mechanism for enforcing behavior norms, as for instance in many Asian cultures. Exposure of bribery in the news media, for example, may lead to loss of face that is highly damaging to one's personal and professional life even if there are no legal consequences. Loss of face is a powerful force, however, that must be managed with care in everyday business situations. For example, a boss who criticizes employees in front of their coworkers can cause serious loss of face that could lead to poor morale or resignations. It can also result in loss of face for the boss, and consequent erosion of authority, since the boss exhibited poor management skills. Generally, a boss should not cause employees to lose face unless they have already done so by demonstrating gross incompetence in front of their peers or unless their conduct is truly immoral rather than merely inept.

An Ethic of Care

A relationship orientation tends to be associated with an ethic of care, which in turn stems from a conception of human nature defined by relatedness to others. In Confucian cultures, for example, one scarcely exists apart from the family, and in many African cultures, the village, not the individual, is the unit of human existence. As a result, one's first concern is for those with whom one is connected—the extended family, friends, village, tribe, or ethnic group—since this is in essence concern for oneself. Cronyism and nepotism, frowned on in the Western business world, may represent high moral virtue.

Shame-based cultures do not reject justice but view it as a derivative value when it applies. Justice is important to the extent that it is grounded in the fact that caring for significant others is tantamount to caring for oneself. Shame is the primary form of social regulation because it results from a failure to care.

Shame-based cultures may be susceptible to corruption in the form of bribery and kickbacks, since personal relationships are necessary to getting things done. There is a constant temptation to create a relationship quickly by exchanging favors rather than by going through the long process of building mutual trust.

Shame Versus Guilt

Shame is best understood when contrasted with guilt, which is a private rather than a public phenomenon. It is a feeling of regret for doing something one believes to be wrong. (This should be distinguished from a legal sense of guilt as being responsible for an act.) One can feel guilty for an act that is known to no one else, but one cannot be shamed unless others are aware of the act.

Guilt provides a basis for behavioral regulation in rule-oriented cultures, including many Western cultures, much as shame does in relationship-oriented cultures. In rule-oriented cultures, the rules are seen as having authority in their own right. Behavior norms are explicitly spelled out in laws, government regulations, company policies, and instructions. Activities that are not explicitly prohibited by rules are assumed to be permissible.

Guilt-based regulation relies on the fact that people learn to feel guilty for breaking the rules. It, therefore, requires only intermittent supervision, along with the threat of punishment for violating the rules. The central role of guilt and relief from guilt is reflected in the Jewish and Christian faiths, which profoundly influenced the West.

This is not to deny that shame and honor have historically played a role in Western countries. Miscreants were once placed in stocks and pillories for public ridicule, and gentlemen resorted to duels to preserve their honor. In modern times, however, shame and honor tend to be secondary to guilt in importance, as witnessed by the fact that they seem a bit quaint or old-fashioned.

The example of the department store illustrates the difference between guilt-based and shame-based enforcement. In rule-based cultures, customers often pay the sales clerk directly, and all sales persons have access to cash registers. Guilt-based internal regulation along with accounting controls and fear of punishment if caught are viewed as sufficient deterrence against theft.

If a tendency toward bribery is a weakness of shame-based cultures, guilt-based cultures are susceptible to corruption in the form of cheating—perhaps by understating taxable income or altering the books to obtain a more favorable accounting statement. This is due to the reliance on guilt and relative lack of supervision, making the society vulnerable to a minority who are not deterred by guilt. Recent business scandals in the United States, and to some extent in Europe, illustrate this possibility.

Rule-based cultures are associated with an ethic of justice and equality, which again stems from a particular conception of human nature. Human beings are regarded as rational individuals who are ultimately a law unto themselves and, therefore, equal. Since no one has authority over others except when it is sanctioned by rules, social cohesion requires that one accept the rules voluntarily because they are self-evident and logical. This gives rise to an ethic based on equality, fairness, and logic, which is elaborated in Western ethical theories. Rule-based cultures do not reject duties to family and friends but view them as derivative values when they apply. Guilt is the primary form of regulation because it results from a violation of rules one recognizes as inherently valid.

The distinction between shame-based and guilt-based cultures is very general and glosses over many differences within each category, but it is nonetheless valuable for understanding ethics across cultures.

SHAREHOLDER ACTIVISM

Shareholder activism can be defined as the use of shareholder prerogatives, including but not limited to the filing of shareholder resolutions, to attempt to effect some policy change by a corporation and its managers. Shareholder activism encompasses a variety of techniques that holders of common stock in a public corporation use to affect the behavior of that corporation's managers. Shareholder activism can include the voting of shares for or against particular policy initiatives submitted by managers or other shareholders. The more typical use of the term refers to using pressure techniques—like the filing of shareholder resolutions—that seek to influence corporate and managerial behavior. In contrast to the screening out of bad corporate actors envisioned in "socially responsible" or "ethical" investing, shareholder activism relies instead on maintaining ownership positions in corporations to effect social change. Because shareholders possess voting power, they are often able to influence corporate behavior in ways that other stakeholders cannot. Shareholder activism can focus on issues related to corporate governance, social issues, or some combination thereof.

The History of Shareholder Activism

Shareholder activism has a long history in the United States, where SEC rules allow for shareholder direct involvement in corporate governance processes. In a number of other countries—like the United Kingdom, France, and Japan—shareholder activism has also occurred, albeit less frequently than in the United States. The primary vehicle for shareholder activism in the United States has been the shareholder resolution.

Richard Marens has argued that the history of shareholder activism in the United States dates back to the 1940s and 1950s, when corporate "gadflies," such as the Gilbert brothers, pioneered the use of the shareholder resolution as a means of pressing corporate managers to undertake some sort of policy change. During this period of time, shareholder activism was primarily focused on increasing the transparency of corporate decision making and improving the quality of corporate governance, although there were a number of shareholder resolutions focusing on social issues such as the inclusion of women and members of minority groups on corporate boards of directors.

Later work in shareholder activism addressed social concerns more frequently. In 1971, the Episcopal Church filed a social-issue shareholder resolution with General Motors asking that corporation to leave South Africa, which was ruled by a regime that practiced the racial segregation system called apartheid. Under apartheid, black South Africans could not vote or own businesses, mixed race individuals could own businesses but not vote, and all nonwhites were forced to live in certain areas of the country. The Episcopal Church's action marked the beginnings of religiously motivated shareholder activism, and the Interfaith Center on Corporate Responsibility was founded in the early 1970s to bring together religious organizations interested in using the shareholder resolution as a means of advocating social change. Early religious campaigns focused on issues like apartheid in South Africa, infant formula, and fair-lending practices by banks. In recent years, religious campaigns have addressed concerns like sustainability, environmental justice, global warming, and genetically modified organisms. More recently, socially responsible mutual funds, state and local pension funds, and activist groups like People for the Ethical Treatment of Animals have all used shareholder resolutions to seek policy changes from corporations.

Shareholder activism often focuses on issues related to corporate governance and strategy, as shareholders unhappy with financial performance use their ownership prerogatives to try to force corporations to change how they make decisions or to undertake some sort of strategic change, like an asset divestiture or a stock buyback. In the past 25 years, individuals such as T. Boone Pickens, Kirk Kerkorian, and Carl Icahn have bought significant positions in underperforming companies and sought to pressure company managements to increase stock prices. Sometimes these strategies are successful at causing strategic changes (Carl Icahn causing Mylan Laboratories not to purchase another pharmaceutical company in 2004) and sometimes not (Carl Icahn and Time Warner ca. 2005).

In many other cases, shareholder activism focuses on social concerns, as activists attempt to change corporate behavior in areas like employment practices, environmental responsibility, or community relations. Both broad types of shareholder activism can be observed throughout its history.

The Mechanics of Shareholder Resolutions in the United States

The rules regarding shareholder resolutions vary from country to country; in the United States, these are administered by the SEC. Subject to various form and content restrictions administered by the SEC, a stockholder (or group of stockholders) who has owned more than $2,000 of a corporation's stock for at least a year can file a 500-word shareholder resolution asking the corporation to undertake some action. Most resolutions are phrased in terms of requests that the board of directors of the company do something, whether to conduct a study, report to shareholders, adopt a policy, or some combination thereof. When a corporation receives a resolution, it has a number of options:

- The corporation can ask the SEC for a "no-action letter" indicating that the SEC will not recommend enforcement action if the company omits the resolutions. If the SEC grants the no-action letter, the company will usually omit the resolution from its proxy statement. In the absence of a no-action letter, omitting the resolution would put the company in jeopardy of regulatory enforcement, and companies tend not to omit resolutions in such cases.
- If the company chooses not to seek or does not receive a no-action letter from the SEC, it may seek to engage in dialogue with the proponents of the resolution to determine if there is some possibility of agreement that would allow the resolution to be withdrawn. In many cases, the company will agree to undertake the actions sufficient enough to the proponents so that the resolution is withdrawn.
- If the company cannot endorse the resolution and is unable to come to an agreement with the resolution's proponents (or chooses not to engage in dialogue), the resolution is printed on the company's proxy statement, which is sent to all shareholders in advance of the company's annual meeting. Because in the vast majority of cases very few shareholders attend company annual meetings, the proxy statement is the means by which shareholders vote for board members and auditors, in addition to voting on resolutions submitted by shareholders.

A resolution that goes to a vote by shareholders in the United States must receive an increasing percentage of affirmative votes cast by shareholders to be resubmitted to the same company in subsequent years—3% in the first year of submission, 6% in the second year, and 10% for the third and any following years. Receiving increasing affirmative vote percentages helps place further pressure on corporate boards and managers to respond to the issues raised in the shareholder resolution. Although most shareholder resolutions are advisory rather than binding on managers, a resolution that receives a significant percentage of votes cast will frequently bring about changes in corporate policies and practices.

It should also be noted that a less common method of shareholder activism focuses on elections for corporate boards of directors. When a company is performing poorly, shareholders may seek to influence the corporation by withholding votes from one or more directors to demonstrate their disapproval of its performance.

Shareholder Activism in Other Countries

In countries other than the United States, it is significantly harder to submit a shareholder resolution as a means of engaging in shareholder activism. The United Kingdom, for example, requires that a minimum of 100 shareholders sign on to a shareholder resolution before it can be considered at an annual meeting. The ease of submitting shareholder resolutions or engaging in other communication with corporate managers, therefore, affects the extent to which shareholder activism will occur in other countries.

In recent years, however, shareholder activists from different countries have started to work together to file shareholder resolutions with companies outside the United States. This tactic is particularly popular when a particular social issue is cross-national in nature. As shareholder activism spreads to and expands outside the United States, it is likely that such cooperation will increase. It is also likely that increased demands for corporate transparency and shareholder engagement will have the same effect.

The Effects of Shareholder Activism

Shareholder activism can be effective in bringing about changes in corporate behavior, although the nature of such effects would depend on the issues and companies involved. With regard to corporate governance issues, for example, shareholder activism has been effective at bringing about changes like moving from a staggered board to the annual election of directors. When companies are not performing well, shareholder resolutions focusing on the quality of corporate governance often receive majorities of votes cast, causing corporations to adopt the policy change requested. Shareholder activism focused on changes in corporate governance has therefore made a significant impact in recent years, at least in the United States.

In contrast, the vast majority of social issue shareholder resolutions fail to get even 10% support from shareholders. If this is the case, then why would companies engage in dialogue with such shareholders? There are two reasons. The first relates to the "embarrassment factor." Senior managers prefer not to have the social records of the companies they work for publicly questioned. Printing a dissident point of view in a company proxy statement is often embarrassing and raises the profile of a public issue as it relates to the company, and corporate managers may find it advantageous to try to have such shareholder resolutions withdrawn. The second relates to the value that many corporate managers find when they engage in dialogue with their critics. The Gap, for example, started working in 2003 with a public reporting working group convened by the company and composed of its shareholder-critics; the working group has helped the company develop and improve its social responsibility reports over time. Similarly, large companies like General Motors and Ford are almost continually in contact with shareholder activists; here, the idea is that managerial dialogue with those stakeholders who want you to improve your social performance will help you do so.

The popular perception of shareholder activists is that they are gadflies, sincere but annoying individuals engaged in some quixotic struggle against corporations. Sometimes the gadfly moniker is awarded affectionately but more often derisively. Contemporary portrayals of shareholder activists, particularly members and representatives of religious institutions, tend to portray them as either lonely outsiders railing against corporate policies and practices at annual meetings while being ignored or as dangerously deluded (but sincere) folks who don't understand modern capitalism and whose policies would bring about its ruin if adopted. The reality is more complex. Through research, issue definition, and building coalitions outside of their organizations and relationships with corporations, shareholder activists have been able to bring about social change. But most such social change comes not from the shareholder resolutions themselves, which (with a few exceptions, like some corporate governance resolutions) tend to be voted down overwhelmingly by shareholders, but rather from ongoing relationships and discussions with corporate managers. The shareholder resolution, thus, is not an end in itself but rather a tool to bring a company into a discussion of the issues raised in the resolution and then for the company to take some sort of action that starts to address the shareholder activists' concerns. The effects of shareholder activism, therefore, go beyond the filing of a shareholder resolution that is voted on at a company's annual meeting. The long-term relationships and partnership between corporate managers and shareholder activists are what bring about more substantive change in corporate behavior.

Whereas, in the main, shareholder activists have played an important role in changing corporate behaviors and stakeholder expectations, there are real limits to the effectiveness of such strategies. Roberta Romano has noted that shareholder activists (particularly ones focusing on social issues) do not seem to be able to affect the financial performances of targeted firms. Jon Entine has taken a different tack, suggesting that what such activists call "socially responsible" may not be. In this line of analysis, shareholder activists are viewed as promoters of simplistic ideas of corporate right or wrong or particular political agendas that are out of place in a profit-making enterprise. Entine's analysis points out that shareholder activists themselves are subject to critical and ethical analysis. In other analyses, it is noted that shareholder activists generally do not control critical resources and, thus often, must rely on moral suasion—which has practical limits. In some cases—like shareholder activists asking military contractors to adopt ethical criteria for their core business activities—shareholder activism has thus far failed to create corporate changes or popular support. In this instance, the shareholder activist remains the proverbial gadfly who seeks to promote a position outside of the mainstream because what the shareholder activist is asking for—the adoption of a policy that would have significant financial implications in terms of lost sales—is costly to firms receiving such shareholder resolutions. A provisional conclusion might be that shareholder activism that seeks to impose significant financial costs on a firm or that (implicitly or explicitly) criticizes the legitimacy of a firm's core business activities and strategies is likely to be ineffectual.

How Shareholder Activists Manage Their Relationships With Corporate Managers

One of the main contributions that shareholder activists have made to the debate about corporate social responsibility involves defining new social and public issues. The notion that corporations had an ethical responsibility to the majority population of South Africa—which could not vote or engage in a variety of occupations—represented a difference in views between shareholder activists (and many other stakeholders) and corporate managers.

In addition to defining social issues and engaging in public acts to put those issues before the general public (moving resolutions at annual meetings, writing opinion pieces, engaging in demonstrations), shareholder activists have sought to manage their relationships with corporate decision makers by developing (1) *deeper* relationships with corporations and (2) *wider* stakeholder networks.

Deeper Relationships With Corporations

One way in which shareholder activists have sought to manage their relations with corporations is to use the shareholder resolution (or the possibility of one) as a prod to bring companies into a dialogue on a social issue. In many cases, it is true that the social issue shareholder resolution creates two one-way dialogues in which the proponents and the company tell each other what they think about the social issue without any real interaction between them. But in many other cases, there are substantive dialogues that encompass a variety of social issues and last for a number of years.

Wider Stakeholder Networks

Another tactic that shareholder activists have used to manage their relationships with corporations is to develop wider stakeholder networks that collectively interact with companies. Rowley notes that as the density of ties within a social network increases—density here is the proportion of actual ties in a social network as compared with the possible number of ties—the ability of a focal organization's stakeholders (working collectively) to constrain the organization's actions increases. Applied to the present discussion, dyadic ties between organizations and shareholder activists are often not enough to lead to the latter's being able to affect corporate behavior. But if shareholder activists work together with other stakeholder groups that have similar interests and values, the organization's ability to resist the stakeholder coalition's demands is lower than if the organization was just dealing with activists alone.

This is a particularly important approach with highly technical issues or issues that require significant local community involvement. In the past few years, for example, a coalition of shareholder activists and environmental groups have worked together on the issue of climate change. A shareholder campaign in the late 1990s focused on corporate memberships in the Global Climate Coalition (GCC), an organization believed by many in the environmental community to be in opposition to regulatory action on climate change, and companies like American Electric Power, General Motors, and Texaco withdrew from the GCC as a result of this campaign; the GCC ultimately disbanded in 2002. Shareholder activists and environmental groups have been able to approach companies jointly and to be more effective on this social issue than either group would have been if they had been working alone.

What Shareholder Activism Illustrates About Organizational Relationships With Stakeholders

Corporations have similarly changed how they respond to shareholder activists and their social demands. First and foremost, not all companies actively resist or passively ignore such stakeholders. A significant number of shareholder resolutions are withdrawn every year by resolution proponents after the companies receiving the resolutions make some substantive policy change and/or agree to engage in further dialogue. More interesting—but less visible—for the study of organization-stakeholder relations are the number of resolutions that are not filed because of ongoing dialogues between shareholder activists and companies. As noted previously, the impact of shareholder activists is hidden in part because of the many dialogues that go on outside of public view—unlike a very public social issue shareholder resolution that gets voted down at a company's annual meeting. There has been a shift in the behavior of many companies away from reactive responses to the social demands of shareholder activists and toward more accommodative or proactive responses.

Ongoing dialogues with companies illustrate another response to shareholder activism: the development of ongoing, multi-issue relationships between managers and shareholder activists. A number of companies engage in annual dialogues with shareholder activists and provide progress reports on what they are doing with regard to a variety of social issues. Some companies have gone as far as to involve shareholder activists in the process of developing social polices and implementation practices. In some sense, more accommodative and proactive companies seek to bring shareholder (and other) activists into more collaborative and less confrontational relationships and, in so doing, use the expertise of such activists to shape their responses to social issues. Many of these dialogues—like those on global warming and on human rights standards—have brought shareholder activists together with other stakeholder groups and corporate managers in a way that would not have been possible otherwise.

Finally, even companies that don't want to deal with shareholder activists will try to influence public perceptions of the company's legitimacy with regard to a particular social issue, often by engaging in public relations or issuing reports that try to tell their side of the story. Very few companies, interestingly enough, simply ignore shareholder activists—although some responses may be symbolic and others more substantive. Religious institutions like the Interfaith Center on Corporate Responsibility have developed significant expertise in the corporate arena with regard to defining social issues, working in collaboration with other stakeholder groups and engaging in dialogue with corporate managers. Deeper and more cooperative relationships that seek to bring about dialogue and incremental change, combined with the development of broader stakeholder networks, have increased the effectiveness of shareholder activists. But corporations have changed as well in their approaches to shareholder activists. Some corporations seek to ignore or oppose attempts by such activists to change corporate policies and practices, but many others have found that the expertise and ability of shareholder activists to organize stakeholder dialogues helps improve the ability of corporations to manage social issues. This is not to say that most corporate managers are happy to see shareholder activists but rather that more enlightened managers are able to use dialogues with them to better understand and then manage social issues—and by extension, corporation-stakeholder relations. One lesson from shareholder activism for stakeholder management is this: Conflicts between corporations and their stakeholders need not always lead to discord. Sometimes cooperation and dialogue can bring about changes in corporate policies and practices far more effectively than muckraking and confrontation (although the latter often have their place as well).

In short, despite a lack of direct power over corporations and their managers, shareholder activists have been able to bring about social change. The effects of their activism can be felt in how social issues get publicly defined and then responded to by corporations, in addition to their direct interactions with corporations. As shareholder activism—particularly by religious institutions—more directly addresses corporate governance processes and issues of power in stakeholder-corporation relations, it will be interesting to see if the relatively congenial relationships of recent years between many corporate managers and shareholder activists continue.

Shareholder activism also merits further critical and ethical analysis. Shareholder activists, for example, seek to speak on behalf of particular issues and stakeholders, but such self-appointment might be ethically problematic. Shareholder activists, therefore, are one voice—with a unique position as activists and partial owners—in the debate about the social responsibilities of business.

Conclusion

Shareholder activism has done much to influence the debate about the responsibilities of corporations and their managers. Shareholder activism has prodded managers to become more transparent and accountable with regard to their actions on behalf of shareholders. It has also done much to influence the debate about corporate social responsibility and contributed to increasing stakeholder expectations for corporate social performance. The study of shareholder activism illustrates that stakeholders can have an effect on the behaviors of corporations and their managers.

Shareholder Model of Corporate Governance

In the familiar Anglo-American model of corporate governance, shareholders have two important rights: the right to ultimate control of a corporation and a right to all its profits. In addition, shareholders are the exclusive beneficiary of the fiduciary duty of management, which is to say that managers have a fiduciary duty to operate a corporation solely in the interest of shareholders. The role of shareholders in corporate governance can also be expressed by saying that maximizing shareholder wealth is and ought to be the objective of a firm.

These features of the shareholder model of corporate governance appear to place shareholders in a privileged position in comparison with employees, suppliers, customers, and other corporate constituencies or stakeholder groups. As a result, this model, which is often called "shareholder primacy," requires some moral justification. Why should shareholders occupy such a prominent role in corporate governance? Since the shareholder model has also become dominant in most developed market economies, there is also the empirical question of why this model has come to be preferred to the alternatives. What explains the origin and prevalence of the shareholder model?

Although many answers have been given to these two questions at different times, a consensus has emerged recently in the study of corporate governance that draws on new developments in the economics of organization. This consensus has been challenged, though, by the movement in business ethics known as stakeholder theory, which holds that all stakeholders and not merely shareholders should be central to corporate governance. Thus, this recent consensus in the study of corporate governance must successfully counter the challenge of stakeholder theory.

Some Preliminary Clarifications

To the questions of why shareholders should have the right of control and the right to profits, there is a very simple answer: Shareholders are, by definition, the group that has these two rights. That is, whichever group has the right to control a corporation—which also allows it to operate the firm in its own interest—and the right to receive the profits of the enterprise is called "the shareholders." The possession of these two rights also defines "ownership": Ownership of a corporation just means having the right of control and the right to the profits. So to say that shareholders are the owners of a corporation is true as a matter of definition.

In most corporations, especially those that follow the American and British model, the shareholders—which is to say the group with the right of control and the right to profits—are investors or, more precisely, equity capital providers. It should be observed, though, that equity capital providers are not always the owners of a corporation. Some corporations are owned by employees, while others, commonly called cooperatives, are customer owned or supplier owned. Mutual insurance companies are owned by policyholders. Still, the investor-owned corporation is the dominant form of corporate governance in the world today.

So the critical moral question is not why shareholders have the rights they do—this is a matter of definition—but why equity capital providers should be the shareholders. That is, why, should one kind of investor and not employees or some other group have the rights of shareholders? There is also the empirical question of why equity capital providers usually are the shareholders. That is, why has the investor-owned corporation become so dominant?

The answers provided by the recent consensus in the study of corporate governance can be stated very simply: The investor-owner corporation arose and endures because it is, under most conditions, the most efficient form of corporate governance. And it is morally justified because every corporate constituency, acting in a market, voluntarily consents to it, and they consent to it because investor ownership best serves each group's interest. These two claims, especially the second one, obviously require further development.

Approaches to Corporate Governance

The shareholder model of corporate governance originated in the 18th century, and in its long history, many different rationales have been developed for it. The original form of the modern corporation was the joint stock company, in which a small group of wealthy individuals pooled their money for some undertaking they could not finance alone. This form of business organization was justified on the grounds that it represents an extension of the property rights and the right of contract that are enjoyed by everyone. In a pure expression of this argument, the Michigan State Supreme Court declared in 1919 in *Dodge v. Ford Motor Co.* that a business corporation is organized and carried on mostly for the profit of the stockholders. The decision further noted that the profit-making end of a corporation is set forth in its charter of incorporation, which represents a contract among the shareholders who have invested their money.

The decision in *Dodge v. Ford Motor Co.* assumes that a corporation is the property of the shareholders. This assumption is true as long as a corporation has relatively few shareholders who actively control the business. However, the 1932 book by Adolf A. Berle Jr. and Gardiner C. Means, *The Modern Corporation and Private Property,* showed that the stock of large corporations had become dispersed among numerous investors who had little involvement in corporate affairs and that the actual control of corporations had passed to a class of professional managers. The result was a separation of ownership and control, and with this separation, shareholders had relinquished both control and responsibility. As a result, shareholders of large publicly held corporations had ceased to be owners in the full sense and had become merely a provider of one of the resources needed by a corporation.

In a famous exchange between Adolf Berle and E. Merrick Dodd, Dodd argued that with the demise of the argument for shareholder rights based on property and contract rights, the modern corporation should be operated to serve other constituencies besides shareholders. Berle replied that even though shareholder rights had lost their traditional foundation, shareholders should still have formal control because only a strict fiduciary duty to serve shareholder interests could effectively constrain managerial power. His argument, then, is that shareholder ownership is good for the whole of society because only this arrangement can assure that corporations are well run.

Today, the main justification of the shareholder model of corporate governance is founded on an economic approach that conceives a firm as a nexus of contracts between a legal entity called the firm and its various constituencies, most notably employees, customers, suppliers, and investors. This approach begins with the assumptions that in a market, all individuals with economic assets—such as employees with skills, suppliers with raw materials, customers and investors with money, and so on—trade with each other to obtain a greater return and that the greatest return will often be obtained by combining individual assets in joint production. That is, individuals will frequently realize a greater economic return by cooperating with others in productive activity than by participating in a market alone.

In his 1937 article "The Theory of the Firm," Ronald Coase noted that cooperative productive activity could take place entirely in a market. So, he asked, why do firms exist? The answer lies in the costs that would be incurred by individuals in coordinating joint or cooperative production in a market. The transaction costs of making and enforcing all the contractual agreements that would be required are substantial. These costs could be reduced by creating firms in which hierarchical authority relations replace the market as the means for coordinating joint productive activity. Thus, for Coase, markets and hierarchies constitute two fundamentally different means for conducting productive activity. The former operates by exchange, the latter by direct control.

As individuals contribute their assets to joint production, they will voluntarily form firms because doing so brings a greater return insofar as conducting business in a firm rather than in a market reduces costs. That is, the transaction costs of organizing productive activity entirely in a market can be reduced by bringing some of this activity into a hierarchical organization, and this reduction in costs will enable each participant to realize a greater return on the assets that are contributed to joint production. Because of this greater return, individuals with assets would voluntarily agree to contribute their assets to production in a firm.

On this economic view, then, the purpose of a firm is to enable individuals with economic assets to realize the full benefits of joint production. Every group benefits from production in a firm. Employees, suppliers, and investors gain by the opportunity to contribute their assets—labor, materials, and capital respectively—in a lower-cost form of production that brings a corresponding higher return. Customers benefit by being able to purchase abundant, low-priced goods, and society as a whole is enriched by the wealth creation firms make possible. Although some of these benefits can be obtained in a market, there is an additional gain or return from deploying assets in a hierarchical form of production. It is this additional gain that a firm provides, and realizing this gain constitutes the reason why it is formed.

The Role of Governance in Corporations

A firm requires many *inputs.* Economists classify these as land, labor, and capital, although they also recognize the need for managerial expertise to coordinate these inputs. Each corporate constituency interacts with a business organization or firm as *input providers*—employees providing labor, suppliers providing raw materials, and investors providing capital. Each input brings a return, such as employees' wages, suppliers' payments, and investors' interest and dividends. It is necessary in a firm for each input provider to *secure* their return—that is, to employ some means for ensuring that wages are paid, supplier payments are made, and so on. Generally, this security can be obtained by contracts or legal rules that obligate a firm to provide the return due to each corporate constituency.

Governance can be understood as the contractual agreements and legal rules that secure each input provider's claim for the return due on that input provider's contribution to the productive activity of a firm. Accordingly, every asset contributed to joint production will be accompanied by a governance structure of some kind, which may vary depending on the features of the asset provided. That is, the governance structure for securing employees' wages and other benefits may be different from those protecting suppliers and similarly for other input providers.

When the protection for each group's input can be provided by fully specified contracts or precise legal rules, the governance structure is relatively uncomplicated. Customers, for example, are adequately protected, for the most part, by sales contracts, warranties, and the like. The market also provides some protection. Thus, customers are protected by the opportunity to switch from one seller to another. The greatest problems of governance occur for *firm-specific* assets, which are assets that cannot easily be removed from production. When assets are firm specific, the providers become "locked in."

Developing governance structures to protect input providers is also more complicated when contracts and legal rules cannot be developed easily due to *complexity* and *uncertainty.* Contracts and legal rules provide protection only when the situations likely to be encountered can be anticipated and the ways of proceeding in each situation can be specified. When planning is difficult because of the complexity and uncertainty of the situations that might arise, other means must be found to protect stakeholder interests. Despite the three problems of lock-in, complexity, and uncertainty, governance structures for the assets of each input provider are relatively easy to provide for each corporate constituency except one, namely shareholders, the providers of equity capital.

The Economic Case for Shareholder Governance

As already noted, shareholders have a certain bundle of rights that includes the right of control and the right to the profits of a firm. To ask why shareholders should have these rights and thus be the owners of a firm makes no sense. The shareholders are, by definition, whatever group has the right to control and the right to receive the profits of an enterprise. The more relevant question is why, in most corporations, this group consists of equity capital providers and not, say, employees or customers or perhaps all groups.

Part of the answer to this question is also a matter of definition. Equity capital is money provided to a firm in return for a claim on profits—or, more precisely, for a claim on residual revenues, which are the revenues that remain after all debts and other legal obligations are paid. Just as customers buy a company's products, equity capital providers "buy" the future profits of a firm; or, alternatively, to raise capital, a company "sells" its future profits to investors. Unlike the providers of debt, who commit only for a fixed term (their contributed capital must be returned eventually as principal payments), equity capital providers invest for the life of a firm. Their investment is never returned, although stock ownership is alienable in the sense that the rights of ownership can be sold to another party. No matter who owns the shares, though, the capital originally provided remains available to the firm.

In addition, since future profits are risky, investors not only provide capital but also assume much of the risk of a firm. The willingness of shareholders to bear this *residual risk*—which is the risk that results from having a claim on residual revenues rather than a fixed claim—benefits all other input providers. As long as a firm is solvent—which is to say that it can pay all its fixed obligations, such as employee wages, suppliers' payments, and so on—then the claims of these groups are secure.

The remaining question, then, is why equity capital providers, who in effect "buy" the future profits of a firm and "sell" their risk-bearing services, should also have control and thus the right to have the firm run in their interest. The answer is very simple: Control is the most suitable protection for their firm-specific asset. If their return on the asset they provide, namely capital, is the residual earnings or profit of a firm, then this return is very insecure unless they can ensure that the firm is operated for maximum profit. In contrast, the right of control is of little value to other input providers or stakeholder groups because their return is secure as long as a firm is solvent, not maximally profitable. In addition, the return on the firm-specific contribution of other, nonshareholder groups is, for the most part, better protected by other means.

That equity capital providers have control is in the best interests of the other stakeholder groups. First, society as a whole benefits when business organizations are maximally profitable because of the greater wealth creation. If firms were controlled by groups whose interests are served only by firms that are solvent, not maximally profitable, then they would create less wealth. Second, every nonshareholder group benefits when shareholders assume much of the risk of an enterprise because their return is all the more secure. Shareholders are willing to assume this risk—in return for some compensation, of course—because they are better able to diversify their risks among a large number of companies. Employees, in contrast, are very undiversified inasmuch as their fortunes depend wholly on the employing firm. Third, without the right of control, equity capital providers would require a greater return to compensate for the increased risk to their investment. This, in turn, would drive up the price of capital, thus increasing the cost of production for everyone.

As previously noted, firms can be owned by groups other than equity capital providers. Some corporations are employee owned and others are owned by customers or suppliers. These forms of ownership are not common, however, because of their relative inefficiency, which is principally due to higher costs of making decisions and obtaining capital. It is only under certain economic conditions that these costs are offset by other advantages such that other forms of ownership would be preferred by the corporate constituencies involved. These other forms are also unstable inasmuch as employee owners, for example, often find it economically advantageous at some point to sell the firm to investors.

The bottom line, then, is that equity capital providers are usually (but not always) the shareholders of a firm, the group with control and the right to profits, because control rights are the best means for protecting their particular firm-specific asset. More specifically, equity capital providers have provided capital to a firm in return for the firm's future profits, and this claim on future profits can best be ensured by having control. Each group has the opportunity to seek the best protections or safeguards for their own interests, which is to say the return on the firm-specific assets they provide to a firm. Usually, nonshareholder groups are better served by safeguards other than control, which is left to shareholders.

This economic case for corporate governance not only explains why investor ownership is, in fact, the dominant form of corporate governance but also why it is morally justified. On this economic account, each corporate constituency—employees, customers, suppliers, and investors—mutually agrees to cooperate in joint production. Each group seeks the highest return on the specific asset that they provide and also seeks means to safeguard this return. Corporate governance is essentially the contract that firms write with equity capital providers, but other groups write contracts that best protect them. As a result, each group voluntarily consents to a mutually beneficial cooperative venture. The investor-owned corporation thus represents the best cooperative arrangement that can be negotiated among the various corporate constituencies in a free market.

The Stakeholder Challenge

Insofar as stakeholder theory advocates a different form of corporate governance that would extend some of the rights of shareholders to all stakeholders, it does so on two possible grounds. One argument is that stakeholder management—in which managers have a responsibility to serve the interests of all stakeholders and not shareholders alone—provides greater protection for each group's interest. The second argument is that stakeholder management results in a more just distribution of the wealth created by a corporation.

The first argument involves a purely empirical claim about the effectiveness of various safeguards. Generally, nonshareholder constituencies are better served by contractual guarantees than by a fiduciary duty to serve a group's interest, which is the main protection for shareholders. That management has a fiduciary duty to serve shareholder interests does not give them a privileged position; rather, it reflects the inability of shareholders to form the kind of contracts that adequately protect other groups. Fiduciary duties, in other words, are a weak substitute for the stronger contractual safeguards that other corporate constituencies enjoy. There is no evidence that any nonshareholder group, such as employees, would voluntarily replace the contractual safeguards they have with the kind of protections that serve shareholder interests.

To the second argument—that stakeholder management results in a more just distribution of the wealth—there are two replies. First, stakeholder theory may underestimate the extent to which shareholder-controlled corporations, in fact, serve the interests of all stakeholder groups. On the economic account, the purpose of a firm is to enable everyone with economic assets to realize the full benefits of joint production. From the wealth created by business organizations, employees earn wages, customers receive products, suppliers make sales, and so on. The profits of a corporation are merely the returns due to shareholders for their provision of capital. Every group benefits from a corporation's activities, and they benefit all the more when a corporation is operated for maximum profit.

Second, the task of distributing the wealth created by corporations is done largely by the market, not management. It is a mistake to infer that because the purpose of a firm is to benefit everyone, that benefiting everyone is a task of management. Wealth must be created before it can be distributed, and wealth creation, rather than distribution, is and ought to be the main task of management. If the market's distribution of wealth is unfair, then the task of altering this market distribution falls primarily to government. Attempting to alter the distribution of wealth by making changes in corporate governance is not likely to be very effective.

Shareholder Resolutions

A shareholder resolution is a request that shareholders vote on a recommendation that the corporation and/or the board undertake certain action. It appears in a company's proxy statement to be presented at a company's annual meeting. Resolutions, even those supported by a majority vote, are not binding on management, although the shareholders of some companies have proposed changes in corporate bylaws to make the proposals binding. Shareholder resolutions are governed and controlled by both state and federal law, specifically by Rule 14a-8 of the 1934 Securities Exchange Act. The remainder of this discussion will focus on the mechanics of a shareholder resolution, its history and evolution, the purposes underlying the tactic, and corporate responses to resolutions.

Mechanics

Any shareholder with $2,000 or more invested in a company may propose a resolution, as determined by Rule 14a-8 of the 1934 act. Once a resolution has been proposed and approved for submission to all shareholders by the SEC, it must then receive a certain threshold of support to remain alive for submission in subsequent years: 3% in the first year, 6% in the second year, and 10% in the third year qualify for future consideration.

According to Rule 14a-8 of the Securities Exchange Act of 1934, companies can exclude resolutions from consideration if they relate to or contain (1) personal grievances, (2) self-interested proposals that provide a personal benefit to the person introducing the proposal that would not accrue to other shareholders, (3) ordinary business matters, (4) impermissibly vague or misleading statements, and (5) impractical or overly general proposals that the company lacks the power to implement. As opposed to the conditions for exclusion, the major condition for acceptance is that the resolution relates to a substantial business policy and not just mundane business matters. Courts have included employment and social issues as substantial business policies, and corporate governance concerns easily qualify.

History and Evolution

The first wave of shareholder resolutions started in the 1960s and focused on the social causes of the day, particularly equal employment opportunity, napalm production during the Vietnam War, investment in South Africa, and the environment. Social issues of concern more than 30 years later include global warming, human rights, and corporate political practices.

An early pioneer in sponsoring shareholder resolutions was Saul Alinsky, a community organizer from Chicago who targeted firms like Eastman Kodak on equal employment issues. Ralph Nader then adopted the tactic, as part of his pressure on General Motors Corporation through Campaign GM. It was only through religious institutional sponsorship, however, that shareholder resolutions spread rapidly in the 1970s. The Interfaith Center on Corporate Responsibility, since its founding in 1971, has coordinated 200 to 300 shareholder resolution campaigns annually.

In the 1990s, shareholder resolutions began to focus on mainstream corporate governance concerns, relevant to a greater number of shareholders, and executive compensation has been the subject of many resolutions. Since 1990, support levels have grown dramatically from the 3% to 10% range for most social issues to a much higher 20% to 50% range. Many of the traditional institutional investors, including pension funds and labor unions, have sponsored the corporate governance resolutions.

Purposes

The purpose behind most resolutions on mainstream governance issues is to galvanize shareholder support to force an immediate change in corporate policy, though the passivity of many pension funds and mutual funds is an obstacle to achieving such heavy support. On social issues, where it is virtually impossible to build majority support, the purpose is often to promote incremental change. Such shareholder proposals become part of an overall publicity campaign to expose corporate practices to media and public scrutiny and, perhaps, place the issue on the public policy agenda.

Corporate Responses

In the early days of shareholder proposal campaigns, the typical management response was one of reflexive opposition. Some companies learned that negotiation is a better approach. Even GM, which initially and aggressively confronted Ralph Nader, ultimately accepted his resolution calling for a public issues committee of the GM board. As shareholder resolutions have multiplied over time, companies have observed the positive lessons of negotiations, leading to the withdrawal of resolutions. In some companies, management has even endorsed shareholder resolutions, leading to overwhelming votes for their passage.

In deciding how to vote their shares on proxy resolutions, institutional investors rely heavily on a growing market of shareholder advisory services. Institutional Shareholder Services is the largest of such firms, though new firms and established rating services like Standard & Poor's have injected competition into the field. To combat the practice of brokerage firms voting stock held in street names, with those votes invariably being cast to support management's position on a resolution, the New York Stock Exchange is proposing to bar broker votes on behalf of customers who do not provide instructions on proxy matters. If the SEC approves such a rule, share owners would have to opt in and grant permission to brokers to cast votes on their behalf, rather than brokers retaining that power unless their customers opt out.

Shareholders

A shareholder is the owner of an equitable interest in a for-profit corporation. A shareholder does not own legal title to the property of the corporation but owns stock or shares in the corporation. Ownership of the shares or stock of a corporation confers the rights to control the company and to receive residual revenues or profits.

In a close corporation, a family-owned or privately held company, a small number of shareholders own equitable interests in the corporation and often also manage the enterprise. State laws permit greater flexibility in the operations of close corporations than in the operations of the traditional publicly held corporation but also impose greater controls on the transfer of shares to protect the interests of all shareholders. Close corporations, for instance, are often allowed to operate without such corporate formalities as a board of directors. The business form of S corporation also exists, restricted to companies with 75 or fewer shareholders. This form affords certain tax advantages to its stockholders but has become less common, given the rise of the limited liability company and of the limited liability partnership.

The overwhelming proportion of shareholders own stock in larger, publicly held corporations. There are two categories of shares: common shares and preferred shares. The vast number of shareholders own common shares, and their rights are subordinate to those of owners of preferred shares when dividends or dissolution payments are paid. However, common shares confer voting rights that preferred shares do not possess, and there is greater upside potential for common share values to grow as corporate earnings expand. Common share owners have an exclusive claim to corporate earnings and assets that exceed the legal claims of creditors and preferred shareowners.

While voting rights attach to most shares on a one-share one-vote basis, some companies have established two categories or classes within common shares, with only one class having super voting rights. Critics condemn the system for preserving a privileged class of owners, but they serve an important purpose of allowing minority shareholders to keep control with the consent of other shareholders. Allowing a family or the original founders to keep control might benefit the brand or culture of the firm and retain customer goodwill.

In a publicly held company, the widely dispersed shareholders are the principals, and they delegate the day-to-day operations of the company to management, their agents. The result is a separation of management from ownership, which can create a misalignment of incentives between the two. Shareholders desire the maximization of shareholder wealth, and their elected representatives on the board of directors owe a fiduciary duty to shareholders to promote that interest. Meanwhile, management serves the overall interests of shareholders and of the corporation as a whole on a de jure basis. In doing so, management may on a de facto basis pursue other goals besides shareholder wealth maximization, whether those goals are altruistic or based on self-interest. The de jure goals of management are aligned with shareholders, but the de facto goals may diverge. To realign shareholder and management interests, some argue that managers' compensation ought to be partially or largely based on restricted stock or stock options.

Based on the identity of shareholders rather than the types of shares they own, the two major categories of owners are individual investors and institutional investors, the latter playing an increasingly important role in investor capitalism. Pension funds and mutual funds serve as intermediaries for most individuals who want to participate as investors. Two thirds of the stocks in the economy are held by institutional investors. Ninety-five million Americans own stock through mutual funds—double the number that own individual company stocks.

Importance of Shareholders

Pooling the investments of many shareholders has also allowed companies to grow and allowed the evolution from an entrepreneurial economy to an industrial economy in the late 19th and early 20th centuries. Since the United States benefits from a widely dispersed shareholder base, versus the concentrated business ownership structure in Germany and other countries, that large source of capital is especially noteworthy in the United States.

Limited liability of shareholders in the American legal system provides added incentive for shareholders to invest. Whereas they assume the possible residual risk of losing their total investment should the company collapse, this is generally the extent of their liability, leaving their other personal assets out of the reach of creditors. Only when a firm is the alter ego of a group of investors, through domination by large shareholders, commingling of assets, or bypassing organizational formalities, might a court "pierce the corporate veil" and hold the controlling shareholders personally liable. If the firm is undercapitalized, a court might also hold controlling shareholders liable for misconduct by the corporation. Assuming the risk of losing just their investment, however, still provides incentive to shareholders to monitor the conduct of the company and to hold management at least indirectly accountable to them through the board of directors.

Problems Concerning Shareholders

One problem associated with shareholders, especially in close corporations, is the possibility that majority shareholders could oppress the rights of minority shareholders. Majority shareholders owe a fiduciary duty to minority shareholders and are legally liable if they deprive minority owners of their full rights of participation, perhaps even in directing or managing the enterprise.

A larger societal problem about shareholders concerns the state of shareholder power. In the late 20th century, a concern arose that management was not sufficiently accountable to shareholders, that the owners actually played a limited role in governing the corporation, and that imperial CEOs were assuming too much power over directors and shareholders. After the corporate scandals of the early 21st century, shareholders became somewhat more active in exercising their rights and powers, leading some defenders of traditional management and director roles to criticize the rise of the "imperial shareholder."

Given the variety of shareholder interests within both the individual and institutional investor communities, some exercise their powers more than others, with both positive and negative effects. Some hold shares for short periods of time, whereas others are long-term value investors. Because of this, some investors are truly concerned about the operations of companies in which they invest, whereas other shareholders are disinterested and concerned only with making money from short-run changes in the market. Hedge funds, decried by some, are notorious for focusing on the short term. Individual investors are too dispersed to have much impact on corporate governance, but some institutional investors are taking an active role, either by energizing the takeover market or by emphasizing director accountability and independence. Meanwhile, mutual funds and pension funds are faulted for reflexively supporting management in most of the companies they hold.

Global shareholder activism is also moving forward, with U.S. institutional investors bringing pressure on companies based in other countries, whereas foreign investors are exercising their powers in U.S. companies. Given the greater accountability of companies to shareholders in the United Kingdom and the disruptive nature of shareholders in Japan, the development of global shareholder activism strikes fear into the traditional defenders of management and directors. Beyond shareholder pressures, investor relations departments must also serve the needs of shareholders for information, and both add to the costs of corporate decision making.

Legal Powers and Rights of Shareholders

Among the typical powers of shareholders are the powers to amend the articles of incorporation or bylaws, to approve a merger or dissolution of the firm, and to approve the sale of corporate assets. They also enjoy the power to remove directors for cause, and some states even empower shareholders to remove directors by a majority vote without cause. Shareholders also enjoy the right to dividends, though directors will not be held liable for failing to declare dividends if they want to invest that money in corporate expansion or some other legitimate purpose. Articles of incorporation might also confer preemptive rights to shareholders to a prorated share of a new issue of stock by the firm. The major legal powers and rights of shareholders discussed below are voting, inspection of corporate records, campaigns for control, shareholder litigation, shareholder resolutions, and shareholder exit.

Voting

Shareholders can vote either as individuals or as a group. They can agree through a written shareholder agreement to vote their shares together on a specified matter. They can also designate an agent to vote their shares through a written proxy agreement. Finally, they can enter into a voting trust, where they transfer the right to vote their shares to a designated trustee.

The power of voting is crucial to a system of shareholder democracy, and shareholders participate in the election of corporate directors on a one-share one-vote basis. A shareholder who owns 10 shares can, therefore, cast 10 votes for each director position open on the board. A system of cumulative voting is designed to favor minority shareholders by ensuring that they may be able to elect at least one director. For instance, in a company with a nine-member board, a block of minority shareholders with 3,000 shares could accumulate 27,000 votes for one candidate rather than casting 3,000 votes on each of nine open board seats. Assuming that majority shareholders controlled 8,000 shares, they spread their 80,000 votes among the eight other board candidates but could not win every seat. However, few companies have adopted this system, and few state corporation laws require it.

The board or governance committee nominates candidates for the board, and few elections are contested. Hence, a shareholder can either vote or withhold a vote for each board member. Given that most companies follow a system of plurality voting rather than majority voting, a shareholder usually accomplishes little by withholding a vote. The candidate will be elected even if few votes are cast. Nevertheless, symbolic campaigns to withhold votes from directors have been organized to protest corporate problems such as undetected accounting fraud or excessive executive pay. Even symbolic campaigns can have results, though, as in the case of Disney shareholders who withheld 45% of their votes for Michael Eisner in his re-election to the board, tripping off an erosion of his support that led to his ouster from the board and eventual resignation as CEO. Occasionally, campaigns will also be launched to remove specific directors from a board through a shareholder resolution. In the United Kingdom, where the balance of power is struck in favor of shareholders over directors, shareholders can actually vote directors off the board.

Institutional investors have also promoted the adoption of majority-vote systems to replace the plurality systems in many corporations. A majority-vote system would require that each board candidate, whether opposed or not, receive a majority of shareholder votes to be elected. Since shareholder resolutions are not binding, institutional investors have instead pressured companies to change their bylaws to allow majority voting.

Even with majority voting, however, shareholder democracy would not be fully realized since shareholders are still presented with a slate of candidates, or a single candidate for each board seat, nominated by the board. To complete the picture, some believe that shareholders should be able to nominate candidates to the board. Efforts by the SEC to implement a rule calling for shareholder nominations to the board have thus far not succeeded, and such a rule has been opposed by the Business Roundtable and other major business groups.

Inspection of Corporate Records

Shareholders have the right to inspect the books and records of the corporation for a "proper purpose," which the various states define differently. Some states are concerned about an abuse of that right and define "proper purpose" to minimize the possibility of shareholders using the tool to go on "fishing expeditions." Most inspection battles surround attempts to obtain shareholder lists, which corporations guard closely. Aggrieved shareholders often want those lists to wage proxy fights for control of the company.

Campaigns for Control

Shareholders can also engage in proxy fights for control of the ownership structure and board of a company. Wealthy investors, such as the "corporate raiders" of the 1980s, have been joined by activist hedge funds in such battles for control. The hedge funds have been supported in these battles by high-powered law firms and leading investment banking firms. A few investment firms have even sought controlling ownership of underperforming firms to turn them around.

A major barrier to proxy fights over both board elections and shareholder resolutions is the cost, since management controls the proxy machinery. Management can pay for its campaign with shareholder assets, but insurgents must finance their own campaigns. To bring more fairness to such contests, it has been suggested that the corporation reimburse sponsors for the costs of successful campaigns.

Shareholder Litigation

When faced with injury from management fraud, shareholders have the legal power to bring derivative lawsuits, wherein they sue management on behalf of the corporation, and all owners may thereby be compensated. To recover their losses, the U.S. Supreme Court held in *Dura Pharmaceuticals v. Broudo* that shareholders must prove that management fraud rather than a general market decline was the actual cause of their injuries. The 1998 Securities Litigation Uniform Standards Act requires that any losses sustained in the buying and selling of stock must be brought in federal court, not state court, and the Supreme Court in *Merrill Lynch v. Dabit* held that federal law also preempts any state law and requires that cases involving losses sustained from the holding of stock must also be brought to federal court.

In the 1995 Private Securities Litigation Reform Act, Congress sought to empower large institutional investors by requiring that the shareholders with the largest financial interest at stake be appointed as lead plaintiffs in shareholder class-action suits, since their interests were best aligned with shareholders in general. In an attempt to prevent abuse of the securities laws, Congress also limited the power of professional plaintiffs who filed lawsuits for their own pecuniary benefit in order to prompt companies to settle cases for nuisance value.

Shareholder derivative suits can be brought only after a shareholder first complains to the board about possible illegal conduct and fails to receive satisfactory results. Securities class-action lawsuits, however, do not require such advance screening by the board and represent the largest number of lawsuits and also the largest amount of damages awarded directly to shareholders rather than to the corporate treasury.

Shareholder Resolution

A shareholder who owns at least $2,000 worth of stock in a company has the legal right to introduce a shareholder resolution at the annual meeting, so long as that resolution has been approved by the SEC as unrelated to the ordinary business of the firm. There is little question that a resolution related to corporate governance would qualify. Shareholder resolutions are more fully discussed in a separate entry in this encyclopedia.

Shareholder Exit

What is often called the Wall Street Rule gives shareholders the obvious power of selling their shares in a company as their ultimate expression of disapproval. This relates to the alienability of shares and the right of shareholders to sell or transfer their shares. Shareholders may prefer to exercise voice, but exiting is always an option. In this way, the market punishes underperforming companies. Shareholders may sell for other reasons as well, including the promotion of social change. Shareholders in the 1970s helped change the system of apartheid in South Africa by disinvesting from corporations doing business there.

Shareholder Wealth Maximization

The principle of shareholder wealth maximization (SWM) holds that a maximum return to shareholders is and ought to be the objective of all corporate activity. From a financial management perspective, this means maximizing the price of a firm's common stock. In pursuing this objective, managers consider the risk and timing associated with expected earnings per share to maximize the price of the firm's common stock. When this is properly executed, management will also have maximized the future stream of dividends and capital gains that accrue to its shareholders. The most defensible form of SWM looks to long-term rather than short-term maximization.

The maximization of shareholder wealth is described as the "monotonic" view of the purpose of the corporation and, therefore, of the responsibilities of its managers. It is monotonic because it focuses on the interests of a single group, the shareholders, to the exclusion of other groups that may be affected by the activities of the firm or that could benefit from the activities of the firm. It is for this reason that the principle of SWM is controversial. Economic, legal, and moral considerations have been used both to defend and criticize the view that the firm should be managed so as to maximize the interests of a single group, namely the shareholders.

The Justification of SWM

Historically, from a legal perspective, the corporation was regarded during the 19th century as an instrument of public policy with a social responsibility. These social concerns gave way to the idea of managing the firm for the shareholders' profits. Legal theorists began to regard stock ownership as no different from other forms of private property. The corporation was viewed as owned by its shareholders. This legal model is entirely consistent with SWM. The directors' role is to manage the property of the owners, that is, the shareholders. As stewards of the shareholders' interests, their sole responsibility must be to the shareholders, and promoting the interests of other groups would be a misuse of the property entrusted to them. Insofar as private property plays such a powerful role in the American ethos, the argument for SWM, based on the value ascribed to private ownership, has had profound appeal.

At the same time, property rights are viewed as the foundation of a capital-driven economic system, and the principle of SWM also makes sense from the perspective of economic efficiency. The shareholders, as the owners of the corporation, purchase stock because they are looking for financial return. In most cases, shareholders elect directors who then hire managers to run the company on a day-to-day basis. Since managers are supposed to be working in the interests of shareholders, it follows that they should follow policies that enhance shareholder value. Property rights are deemed essential to the workings of the system, and the resulting outcomes are at the same time beneficial to society. Profits are indicative of the fact that an organization has transformed a set of inputs into a productive output of goods or services that have a higher value than the original inputs. Thus, when SWM is properly pursued, the financial benefits are alleged to include the following: efficient, low-cost businesses that produce high-quality goods and services at the lowest possible prices; products and goods that consumers need and want, such as new technologies, new products, and new jobs; courteous service; adequate stocks of merchandise; and well-located establishments.

But one could underline that corporations often have a diversified class of investors with financial claims not only from shareholders but also bondholders and other debtholders. Why is it not more economically efficient to focus on this diversity of financial claimants? It is claimed that SWM remains a more economically efficient *modus operandi* because the maximization of shareholder value requires the initial satisfaction of the financial claims of other investors and interests to secure a profitable return. SWM is, therefore, not inconsistent with the satisfaction of the claims of other investors.

Moreover, defenders of the principle of SWM or shareholder primacy hold that it is not merely consistent with but that it also promotes the interests of all nonshareholders who have financial interests in the firm, such as bondholders and other secured and unsecured creditors. Shareholders are less risk averse than nonshareholders, whereas managing the firm on behalf of interests other than shareholders can lead to greater risk aversion. This will occur if the firm is managed in the interests of its fixed claimants. Fixed claimants, such as bondholders, refer to those financial interests to whom the firm has pledged a fixed rate of return or sum that cannot be varied regardless of the firm's financial success. In contrast, residual claimants are only guaranteed a return after all fixed financial claims have been satisfied, and the amount of the return, if any, will vary according to the financial success of the company. In this situation, bondholders, for example, base decisions on the bankruptcy risk on a firm's cash flows, not the firm's value-maximizing potential from free cash flows. The result may well be that the company fails to invest in new opportunities for growth, innovative products, and new technologies or markets, which in the long run may undermine the capacity to remain competitive. It is argued that shareholders have a greater incentive to induce firms to engage in activities that other claimants such as bondholders may regard as excessively risky. Shareholders, thus, push the managers of the corporation to operate at levels beyond those sufficient to satisfy the interests of fixed claimants. However, it is also true that it is the shareholders who bear the greater loss from excessive risk taking if the firm does badly because, in any case, other claimants have a guaranteed fixed rate of return. At the same time, it is argued that in maximizing shareholder wealth, managers seek to increase market share (insofar as this is compatible with long-term profits), which will increase the size of the pie that is available to all participants in the corporate enterprise. In this way, the success of the company will offer greater security for fixed claimants by ensuring that the firm is in a better position to cover possible future losses and thereby maintain its commitments to its fixed claimants.

Defenders of SWM also argue that attempting to maximize in more than one dimension at the same time may well be impossible unless the multiplicity of objectives can be reduced to an overall monotonic purpose. The resulting loss of direction from pursuing multiple objectives can mean an equally fatal loss of competitiveness. Moreover, managing the firm for a variety of interests including fixed and residual claimants means a diversity of goals in which overall performance cannot be accurately assessed. In contrast, the principle of shareholder value offers an unambiguous standard, which is measurable and observable.

The Contractarian Legal Model and SWM

The earlier legal view of the corporation as a form of property that is subject to ownership rights has given way to a contractarian model, which sees the corporation as a nexus of contracts. This alternative model envisions the corporation as offering an umbrella that allows private parties to contract with one another more efficiently than they could in a market by limiting the transaction costs. This view avoids the ontological issues that result when one regards the corporation as a thing that could possibly be owned. In any case, regarding the corporation and its assets as being owned by the shareholders is highly misleading insofar as shareholders usually have no right to manage these assets or unlimited access to information and records relating to these assets. The corporation is, therefore, more accurately viewed as a device that operates as a nexus for all contracts that various individuals have voluntarily entered into for mutual benefit. Although, theoretically, the activities of the corporation could be carried out by individuals through individual contract in a market outside the corporate structure, the costs associated with enlisting cooperation would be significant. As R. H. Coase argued in 1937, the law in effect offers a standardized form of contract or a set of default rules that facilitate private ordering. This legal entity, which is actually a legal fiction, allows those with money and resources to contract with those who have managerial skills but little money to forge a mutually advantageous cooperative enterprise. Moreover, those with labor to sell but lacking monetary resources or managerial skills can negotiate with the managers acting as agents of the corporation to form employment contracts.

However, according to contractarians, interpreting the corporation as a nexus of contracts rather than a form of property that is owned does not invalidate the principle of SWM. The contractarian perspective describes the corporation as being composed of explicit and implicit contracts held by shareholders and nonshareholders. The interests of nonshareholders, such as employees, suppliers, bondholders, communities, and customers, are protected by contract, law, and regulation. Shareholders are said to be entitled to the firm's residual cash flow. However, the management's obligation to realize and promote this residual cash flow is open-ended because there are no sets of specified actions that can be enforced to realize this objective. In other words, management has a legal obligation to create a healthy residual cash flow, but there are no terms that specify particular actions for achieving this goal. But to give greater definition to the relationship that embodies this particular understanding, the legal system creates a fiduciary duty to maximize shareholder wealth. This fiduciary duty fills the gaps that arise in terms of management's unspecified or imperfect obligations to maximize shareholder wealth.

Moreover, agency theory supplements the contractarian position and adds weight to the view that the purpose of the firm is the maximization of shareholder wealth. Agency problems arise because contracts are not "costlessly" written and enforced. Agency costs include the costs of structuring, monitoring, and bonding a set of contracts among agents with conflicting interests, plus the residual loss incurred when the cost of full enforcement of contracts exceeds the benefits. It is argued that the necessity of a corporate structure in which ownership and control are separated entails that only the residual claimants can provide appropriate monitoring. It follows that the agency costs inherent in a team organization, such as the firm, are controlled, and maximization of output occurs when control rights are assigned to the residual claimants.

We have considered the economic and legal rationales that justify SWM. We will now proceed to consider a normative critique of SWM.

Ethical and Legal Implications of Contractarian and Communitarian Theory

The nexus of contracts view of the corporation also has an underlying ideological basis that embodies a particular moral perspective. We have discussed the view of the corporation as an economic and financial arrangement with an objective of SWM. However, we have not considered whether this particular governance relationship is and ought to be a product of individual choice. Those who advocate SWM argue that we should leave it up to the various participants in corporate activity to specify respective rights and obligations through contract, rather than legally imposing relationships. According to this view, shareholders bargain and secure from management a commitment to a fiduciary duty to direct the corporations so as to maximize shareholder wealth. This is an open-ended responsibility because it is not realistically possible to specify in detail what exactly is to be done to fulfill this fiduciary duty. On the other hand, other participants in the corporate enterprise contract with the agents of the corporation for more specific rights in return for the particular services provided. Accordingly, nonshareholders are free to protect themselves through contracts by bargaining for whatever protections they deem necessary to protect interests that may be threatened by the pursuit of SWM. For example, workers could bargain for protections against a policy of employment at will or seek other legal protections.

The communitarian view stands in contrast to this contractarian position. While contractarians advocate that the law should play a minimal role in structuring relationships, communitarians argue that the law must intervene to prevent harmful externalities that may result from the single-minded promotion of SWM. For example, factories may be closed down and workers laid off to protect profits, but at the same time, this may significantly damage the local community, which depends on this income and indeed may have invested in infrastructure that supports the corporate enterprise. Communities may find it difficult to foresee such events and contract to protect their interests from uncompensated losses. At the same time, public goods that are often essential to the communities in which corporations operate are difficult to secure through the market.

An important difference between the communitarian and contractarian positions is their focus. Communitarians tend to highlight the undeniable social effects of corporate activity, seeing corporations as institutions that have a profound effect on those who are outside the corporation. Accordingly, it is appropriate that the state intervene to enhance the social environment and minimize the deleterious effects of market activity. On the other hand, contractarians focus on the internal relationships. They see the corporation as an organization constituted by private contracts that have been voluntarily entered into. This difference in emphasis sheds light on the important ideological differences that also manifest contrasting and opposing moral values.

Contractarians see society as constituted by autonomous citizens who ought to be free to make the choices that shape their destiny without intervention from outside authority, so long as they are not actively harming other individuals. Governments should not dictate matters involving the type of agreements we make, our individual economic behavior, or the redistribution of wealth. Contractual arrangements are a way in which we express this autonomy and freedom. The latter, they claim, form an important foundational value for our social existence. Communitarians, in contrast, emphasize social interdependence and the fact that individual persons and corporate persons derive many benefits from life in society that have no contractual basis. On this rationale, it is appropriate that the state intervenes to structure relationships that reflect this interdependence and protects constituencies such as workers and the local community from the deleterious effects of unregulated SWM. Although contractarians claim that nonshareholders can always enter into contractual relations to protect their interests from harmful externalities, communitarians point out that unequal distribution of wealth produces inequality of bargaining power. In many cases, nonshareholders lack the resources to bargain and negotiate effectively to protect their interests. In reality, nonshareholder protection from the externalities of SWM depends on people's capability and willingness to pay for contractual guarantees. Communitarians argue that it is unrealistic to believe that unskilled workers have the resources to buy layoff protection from the shareholders or their agents. Ultimately, the existence of contractual relations alone does not ensure that arrangements are fair to all parties or even reflect the individual contributions that are made to the greater social body.

Stakeholder Theory

Many who see a moral dimension to business activities that extends beyond mere contractual obligations and the single-minded pursuit of making money for shareholders propose a stakeholder approach to business activities. Stakeholder theory emphasizes that managers are also moral agents who are responsible to a wide array of groups for their actions. Much of the groundbreaking work is associated with R. Edward Freeman. A stakeholder is broadly defined as any individual or group who can affect or is affected by the achievement of the organization's objectives. If one fails to recognize these responsibilities to other groups, it becomes easy to rationalize a questionable practice that potentially harms nonshareholder stakeholders, such as workers or suppliers, to whom managers supposedly have no moral obligation, in order to realize increased profitability.

The stakeholder theory of corporate responsibility is a developing response to the view that a firm should be run in such a way as to maximize the wealth of the shareholders.

The stakeholder approach argues that it is not only those with a financial claim on the institution who are worthy of consideration, but that there is a multiplicity of groups with a stake in the operations of the firm, all of whom merit consideration in managerial decision making. The word "stakeholder" first appeared in usage in 1963 in an internal memorandum of the Stanford Research Institute and has since become a prominent concept in corporate and academic communities. The theory, which is clearly designed to extend the ethical responsibility of the firm, is an alternative to the monotonic fiduciary model offered by the property rights and contractual approaches. According to stakeholder theory, a person who holds a stake in the activities of an organization, a "stakeholder," is entitled to consideration in some ways similar to shareholders.

Stakeholder theory has also apparently been reflected in changes to the law, especially in the United States. In the 1990s, many jurisdictions in the United States passed so-called "other constituencies legislation" and determined that the directors should consider not only the profit margin in their decisions but also the interests of the employees and the general public. These statutes have been enacted by at least 25 U.S. states. The typical nonshareholder constituency statute authorizes (but does not require) a director of a corporation, in considering its best interests, to consider the interests of persons (often referred to as stakeholders) other than shareholders and frequently also consider generalized factors such as local and national economies, societal factors, and any other factors deemed by the directors to be pertinent. The various nonshareholder constituencies may be seen to include employees, customers, creditors, suppliers, and communities in whom the corporation has facilities. However, whereas some have hailed "other constituencies legislation" as rejecting shareholder primacy, many are far more cautious. It has been pointed out that there is little meaningful case law relating to these statutes and so they still stand in need of interpretation. The American Bar Association's Committee on Corporate Law recommends that constituency statutes be interpreted according to the relatively recent Delaware precedent. This precedent states that courts should not allow consideration of nonshareholder interests without relating such considerations in an appropriate fashion to shareholder welfare. Moreover, constituency statutes apply only to a narrow range of decisions, which essentially involve change of control, that is, takeovers. This means that the range of situations in which boards have the right to consider other constituencies is rather limited. It can therefore be argued that these statutes are really not proshareholder but in fact are designed to entrench management.

Again, many of the arguments used to support SWM can be used to reject the stakeholder model of corporate responsibility. As we pointed out earlier, defenders of SWM would argue that adopting strategies in accordance with the stakeholder view, which means acknowledging the interests of multiple constituencies in addition to fixed and residual financial claimants, may well result in increased indecision and confusion. Satisfying a diversity of interests may well be impossible unless the multiplicity of objectives can be reduced to an overall monotonic purpose. Loss of competitiveness may well follow. As said before, it is not easy to manage on behalf of multiple constituencies when their goals come into conflict, and it may not be socially desirable to give managers unlimited liberty to make choices between competing interests. In contrast, the principle of shareholder value offers an unambiguous standard, which is measurable and observable.

Finally, if the law intervenes and seeks to enforce the stakeholder model, for example, by requiring that investors take on increased liabilities with respect to employees, forgoing employment at will or giving the employees the right to buy the business at less than market value, any benefit to employees might well be short-lived. Investors cannot be compelled to supply capital to the corporation. Shareholders may demand a higher price for capital and thus increase the firms' cost of capital with damaging financial consequences for nonshareholder constituencies. On the other hand, investors may simply look to other forms of investment if the monotonic principle is abandoned and shareholder interests are compromised, resulting in insufficient monetary returns. Alternatively, potential shareholders could invest in real estate, gold, Treasury bonds, or shares in overseas Japanese corporations, to mention a few examples.

Those who disagree with these points and promote the stakeholder model argue that emphasizing the principle of SWM fails to appreciate entrepreneurial risk in the wider, richer context of joint stakeholder relationships. In addition, emphasizing a single responsibility to make money for shareholders fosters a myopic worldview in which managers fail to see themselves as moral agents who are responsible to a wide variety of groups for their actions. In the long run, this monotonic approach may well work to the disadvantage of the shareholder's interests. However, defenders of shareholder value maximization argue that their position does not encompass the exploitation or alienation of the firm's other constituencies. Strategies that do not take into account the morally acceptable relationships with other stakeholders, including effects on the local community, are incompatible with long-term shareholder value creation. In this manner, SWM can be interpreted as an inclusive principle that does not deny that these other interests exist and must be acknowledged in the decision-making process. Ultimately, both those who advocate shareholder value and those who advocate the multi-fiduciary stakeholder approach can make reasonable claims that their preferred approach enhances the interests of all related constituencies. One concludes that the monotonic and pluralistic approaches only become clearly distinguishable in those cases in which managers of a firm, following ethical principles, decide to benefit a particular nonshareholder group in circumstances that negatively affect both short-term and long-term shareholder wealth creation.

Side-Constraints

Side-constraints are anything that acts to confine or restrict. The focus here is on *moral* side-constraints. When we speak of moral side-constraints, we have an understanding of moral rights as requiring that nothing be done to prevent those rights being exercised. So, for example, conceived of in a side-constraint way, a right to freedom of speech requires that nothing should be done to prevent actions qualifying as an exercise in freedom of speech. In short, side-constraints are moral rights conceived of as bestowing an absolute right of noninterference in the exercise of a right.

It is a conception of moral rights that, although variously articulated earlier and elsewhere as part of a long tradition in thinking about rights, finds its definitive statement and first labeling as *side-constraints* in the work of Robert Nozick. There, the conception of rights as side-constraints is presented as the reason for acceptance of an "entitlement" theory of distributive justice. But it could equally well (as Nozick would probably concede) be viewed as a concept constructed to defend such a theory. Either way, conception and theory are intimately bound up together, and accordingly, it is side-constraints in the context of Nozick's theory of distributive justice that will be outlined here.

Nozick's theory of distributive justice is strongly libertarian, uncompromisingly free market orientated, and unflinchingly antiegalitarian. The notion of rights as side-constraints fits in with such an account by making it a violation of rights (specifically, a violation of the right to liberty) to interfere with the workings of free markets to secure a more equal distribution than would otherwise prevail (or, indeed, any sort of predetermined pattern of distribution). The notion of rights as side-constraints does this by coming down on the traditionally free market liberal side of two long-standing disputes over the nature of rights.

First, and perhaps most fundamentally, by making rights absolute, the notion of rights as side-constraints requires rights to be viewed noninstrumentally as things of value in themselves rather than instrumentally as things of value only insofar as they serve a greater good of human welfare and the like. (Clearly, viewed instrumentally, rights could not be absolute, as they could be overridden by the demands of the greater good they are seen as serving.) Second, by understanding rights in terms of requiring others not to interfere in their exercise, the notion of rights as side-constraints understands them in a purely "negative" way as rights to noninterference and excludes from consideration what are contrastingly described as "positive rights," involving a requirement to receive something of benefit from others. (In so doing, it fits in with a free market liberal perspective by excluding a right to welfare provision based on need.)

It follows that acceptance of a side-constraints interpretation of rights is only as good as the above two claims about the nature of rights. Insofar as Nozick offers a defense of those claims (here as elsewhere he cheerfully admits to inconclusiveness), it is by arguing that the alternative of an instrumental and/or positive conception of rights fails to respect the separateness of persons by treating people as a resource to be used by other people. (He presents this as a restatement of the Kantian principle that people should never be treated as means but only as ends.) Such a defense can, however, be questioned at just about any level. Most directly, there is the issue of whether respecting that separateness requires acceptance of the side-constraint interpretation of rights? (Not everyone taking a Kantian approach would agree it does.) In addition, there is the issue of the extent to which that separateness should be respected in the event of conflict with other moral demands: in particular, with the common good. Most fundamentally, there is the issue of the extent to which it should be respected at all. Surely, it can be argued, morality is all about enabling people to live together in collectively advantageous ways, and so the primary focus of moral attention is people as members of society rather than, as seems to be the case with talk of the separateness of persons, the individual in isolation?

Nozick hints at what could be a possible reply to this last and most fundamental objection by suggesting that the separateness of persons should be respected because it is necessary to the fulfillment of individual life plans and, through that, the "meaning of life." But given that any such fulfillment will invariably involve others and require their cooperation, it is an explanation that arguably just brings us back to the primacy of the social over the individual in moral assessment.

Side Payments

When two parties involved in a transaction exchange money that is not part of the transaction itself, the exchange is a *side payment.* It is typically made to induce the recipient to take part in the transaction.

The most notorious side payments are kickbacks and other types of bribes, but side payments can take many forms, some perfectly legitimate. For example, if several countries join a pact to reduce air pollution, a downwind country that has the most to gain from clean air may make a side payment to an upwind country to give it some incentive to participate in what would otherwise be a losing proposition.

Kickbacks and Commissions

Side payments raise ethical questions when they create conflicts of interest or provide incentives to break the rules. The classic example is a purchasing agent for a firm who receives a *kickback* from a vendor selected by the agent. The vendor "kicks back" to the agent some of the profits gained from the purchasing contract. This normally creates a conflict of interest, because it is in the firm's interest to award the contract to the most attractive bidder, while it is in the agent's personal interest to award it to the firm that will provide a kickback.

Kickbacks should not be confused with commissions. Someone who hires an agent, a broker, or a salesperson may pay that person a *commission* for services rendered. The purchasing agent's kickback is not a commission because it is paid by someone other than the party that hired the agent. Commissions normally do not create conflicts of interest but can do so in some circumstances. Real estate agents, for example, typically receive a fixed percentage of the sales price as commission. This may create a conflict of interest for an agent hired by the buyer, since it provides an incentive to negotiate a higher price than necessary.

There are several related types of payments that may or may not create conflicts of interest. An attorney who refers a potential client to a second lawyer may receive a *referral fee* from the second lawyer. This is not a side payment because it is not external to another transaction involving the lawyers, and there is no obvious conflict of interest. Financial advisers (or, more frequently, the banks that employ them) may receive a *retrocession payment* from a mutual fund when the adviser's client buys shares of that fund. This is a side payment but is not identical to a kickback since it normally goes to the bank rather than an individual. It can create a conflict of interest, however, since the bank may give its advisers incentives to recommend funds that pay retrocession.

Bribes, Extortion, and Facilitating Payments

A *bribe* is a payment that is intended to influence the recipient to make a decision that is not in accord with normally accepted criteria for making the decision. A kickback is a particular kind of bribe. Examples of bribes include payments to police offers to induce them to overlook a violation of law or payments to government officials to obtain a more favorable ruling in tax negotiation. (The former can be viewed as a side payment because it takes place alongside a legal, albeit not a financial, transaction.)

Bribery can be distinguished from *extortion*, which is a payment demanded for something to which one is already entitled. A side payment demanded by an electrical inspector for a permit is an extortion payment when the wiring already meets code specifications. The same is true of payments to police officers, who would otherwise report a more serious offense than actually committed, or customs inspectors, who would otherwise indefinitely delay importation of legal goods. Small or routine extortion payments are often called *facilitating payments.* In many countries, government functionaries are paid impossibly low salaries and are expected to make up the difference by collecting such facilitating payments.

The U.S. Foreign Corrupt Practices Act makes similar distinctions when it forbids U.S. citizens from bribing foreign government officials while permitting extortion payments and facilitating payments. However, the distinctions made here are not intended to correspond precisely with legal definitions.

It is sometimes unclear when gifts or entertainment should be treated as bribes, as when a potential vendor treats a purchasing agent to dinner at an expensive restaurant. Many companies bar their employees from accepting gifts valued at more than a certain amount or bearing no company logo.

Side Payments and Corruption

Bribes and kickbacks can be viewed as corrupting in the sense that they tend to undermine social norms or an economic system. Bribes can distract decision makers from their duty, and kickbacks may encourage agents to make economically inefficient decisions. However, many practices around the world that appear to be bribery, particularly to Western observers, may not be corrupting.

One example is the exchange of favors for the purpose of building a long-term relationship. This type of relationship is important in China, for example, where it is known as *guānxì* (a Mandarin Chinese word for "connection" or "relationship"). The gifts and favors are not quid pro quo and are therefore not bribes. Far from being corrupt, they build long-term, stable working relationships that are essential in a culture where mutual trust is historically more important than rules and transparency. Relationship-based business need not create conflicts of interest, as it often does in the West. A purchasing agent may favor his or her friends, but since long-term relationships are the foundation of business, it may be in the company's interest for its agents to do business with people they trust personally.

In much of the world, gifts may be culturally required to show courtesy, respect, or gratitude. It is important to know when gifts are appropriate so that they are not misinterpreted as bribes. Lavish entertainment may be a way of showing hospitality, which is a central value in many cultures.

Bribery is generally corrupting in both rule-based and relationship-based systems, but for different reasons. While bribery in the former encourages people to break the rules, bribery in the latter undermines the long-term and stable relationships on which a successful relationship-based economy depends. Bribery tends to be more common in relationship-based systems, since there is a constant temptation to take short cuts around the hard work of building mutual trust. Yet this should not be read as a signal that bribery is acceptable, just as the cheating on matters such as income taxes prevalent in the West is no indication that cheating is acceptable.

Sidgwick, Henry (1839–1900)

Henry Sidgwick made important contributions to ethics and economics. He argued that intuitive commonsense morality collapses into utilitarianism, comparing as he did so utilitarianism with alternative moral theories. Sidgwick also wrote on economics and argued against socialism.

Henry Sidgwick was born in Skipton, Yorkshire, in 1838; he died in 1900. He was educated at Trinity College, Cambridge, and remained at that university for his entire career. He was highly influenced by the work of J. S. Mill, especially Mill's *The Subjection of Women,* and was a great advocate of female education as well as the education of the working class. He was influential in establishing the all-female Newnham College, Cambridge, in 1871, which was one of the first colleges for women in England. Sidgwick is best known for his first major work *The Methods of Ethics.* His other works include *The Principles of Political Economy, Outlines of the History of Ethics for English Readers, The Elements of Politics*, and *Practical Ethics: A Collection of Addresses and Essays.*

Sidgwick's *Methods of Ethics* was an examination of what he took to be the three most basic methods of ethics to be found in people's common moral reasoning. The three methods of ethics—or ways of arriving through reason at an account of what should be done—were egoistic hedonism (e.g., Epicureanism), intuitional morality (understood mainly as commonsense deontology), and universalistic hedonism (e.g., utilitarianism). (Sidgwick unified both egoistic hedonism and universalistic hedonism under the term *ethical hedonism*.) In assessing these three methods of ethics, Sidgwick argued that intuitive commonsense morality collapses into utilitarianism, in particular a form of indirect utilitarianism by which it would be preferable to keep people ignorant of the utilitarian basis of morality if doing so would result in the greatest happiness for the greatest number in the long term. In addition to the substantive conclusions of *The Methods of Ethics*, this work also secured Sidgwick fame for its methodology, insofar as in it Sidgwick compared utilitarianism with its major alternatives, always ensuring that his account of each theory was historically well-informed.

Apart from his work on ethics, Sidgwick also wrote on economics, having been influenced by Mill's *Principles of Political Economy*, and has become best known for his microeconomic work on human capital and noncompetitive behavior. Although Sidgwick endorsed in broad form the claim of Adam Smith that the common welfare is best secured by each person attending to his or her own self-interest, this claim was qualified when Sidgwick addressed topics such as education, poor relief, child care, and public goods such as national defense and certain types of public works. Such qualifications led Sidgwick to consider the arguments in favor of socialism, a doctrine that he rejected on the grounds that socialistic policies would undermine a person's economic incentives to produce. He did, however, pave the way, through his work on arguments on utilitarian grounds, for a greater degree of state interference aimed at securing the greater good. In addition to his academic work, Sidgwick was also actively involved in promoting religious freedom and education.

Signaling

Signaling refers to market actors' use of visible attributes that convey information to or change the beliefs of other actors in the market. Because signals are under the control of the signaler, they are, at least partially, designed to communicate. Hence, signaling theory essentially captures an economic view of reputation in the market. Signals are observable proxies for unobservable attributes of individuals or organizations. For example, an individual's conspicuous consumption may be a signal of wealth and social status. Organizations may invest in reputation building to signal the greater quality of their products and services. Signals are necessary in uncertain economic environments where sellers know more than buyers (i.e., where information asymmetry exists). In this context, we must distinguish between signals and indices (such as race or gender), which generally are considered unalterable (especially in the short run). A good example of a signal is education, which may, in an uncertain world, communicate to an organization which applicants are the most productive and, thus, who will contribute the most value to an organization.

Michael Spence, whose pioneering work on signaling equilibria won him the Nobel Prize in economics in 2001, used this example of education as a signal in job markets in his path-breaking book *Market Signaling.* In the context of any labor market, the signaling equilibrium is defined as a set of conditional probabilistic beliefs for the employer that, when translated into offered wages, employee investment responses, and new market data, are confirmed by the new market data relating education levels to productivity. Hence, in signaling equilibrium, the employer's beliefs are self-confirming.

Spence showed that usually there are many signaling equilibria, not just one. The simplest case involves comparing two groups of employees where one group doubles the productivity of the other. If education is assumed to function as a signal of differential productivity, the low-productivity applicants will not invest in education at all, whereas rational high-productivity applicants will invest in that education level where the gap between the wage rate and the education cost (= cost of the signal) is maximized. However, Spence also showed that sometimes everyone would be better off if they presented themselves in an undifferentiated pool of applicants. The extent to which the market is able to find a so-called "pooling equilibrium" that still allows differentiation between the two employee groups will depend on the proportions of low- and high-productivity employees and the government's tax scheme on education. Spence showed that with the right tax scheme, such pooling can be made to fulfill the economic criterion of Pareto efficiency.

The standard explanation of signaling and its associated multiple equilibria works because the cost of that signal is negatively correlated with the attribute valued in the market. But even when education costs rise with the valued attribute (i.e., signaling costs vary the wrong way with respect to productivity), a signaling equilibrium may be attained. This outcome will be possible when the attainment of education also raises productivity to a large extent. In other words, when education is productivity inducing enough to justify its costs, the absence of a negative cost correlation does not necessarily destroy a signaling equilibrium (as initially assumed by Spence). Rather, a signaling equilibrium can still be identified. However, in this equilibrium, the private return to education falls short of the social return and hence causes underinvestment in education.

Often, the signaling hypothesis is presented as a contrast to Gary Becker's human capital theory. According to signaling theory, education serves exclusively as a signal and does not contribute to gains in productivity. In contrast, human capital theory is presented as a perspective that holds that educated people earn a return on their investments in education because of productivity gains, which lead to increases in future earnings. However, this contrast is really an oversimplification of the signaling hypothesis. Spence explicitly discussed the case when education serves as a signal *and* enhances human capital. Under those conditions, a Pareto-optimal (fully efficient) equilibrium that accurately distinguishes between high- and low-productivity employees may still exist. But, assuming a particular constellation of net benefit functions to both groups of signalers, the outcome may also lead to overinvestment in education, as was theorized in the simplified no-human-capital model of signaling.

Generally, the signaling hypothesis does not change the private benefits of education for the job applicant. It simply shifts the reason for hiring, promotion, and so on, from productivity gains to (primarily but not exclusively) the signaling function. However, from a social perspective, it may lead some observers to question a lot of investment in higher education because it represents an overinvestment under certain plausible conditions of the market signaling model.

The distinction between education as a signal and education as a way of enhancing human capital may be not only theoretically but also empirically interesting. Some research found that about half the impact of education on individuals' incomes may be due to signaling. Other research shows that education should not be overemphasized as a signaling device only, since employed and self-employed workers tend to acquire approximately equal levels of education. In other words, even groups of employees who do not need education as a signal still pursue it.

The effectiveness of signals in general depends on two attributes. First, a signal that is relatively more costly for the lower-quality types in the market tends to be more effective because this makes it more expensive for the lower-quality types to attain it and, thus, it is more likely to be used as a (valid) signal by high-quality market actors. Second, to the extent that sellers know what types of signals are used by buyers in times of informational uncertainty, they may be tempted to "fake" signals, so that the signals do not validly separate low- and high-quality market actors. This will weaken the value of the signaling device.

Although the examples in the discussion above relied on education in the traditional job market context, signaling applies to many other market contexts. In evaluating credit risk, lending institutions use personal information as signals in their credit-scoring schemes. Because of the high cost of many signals (such as home ownership), though, they de facto become indices in this context. Other contexts in which signaling occurs are selective college admissions and promotions because the informational structure of those markets are usually similar to the job market example. In product markets, warranties can be used to differentiate high- from low-quality sellers. However, in the *private* market for used cars, George Akerlof argued that lemon owners will imitate the signals of non–lemon owners, making the two types of cars indistinguishable to the buyers of used cars. In such a situation, informational intermediaries such as independent rating companies are required to resolve this signaling problem. For this solution to be effective, the signal must cost more with decreasing quality of the car and, in addition, the costs may not exceed the gains from signaling quality to the consumer.

A Business and Society research domain in which signaling was used as an explanation for market behaviors was corporate social performance. Corporate social performance may function as a signal of "employer of choice," which offers superior wages, benefits, work-life balance, and generous training and development opportunities, for example. This way, applicants can use various activities that signal social responsibility to distinguish between good and bad prospective employers. Consequently, over time, better employees who are more highly motivated are likely to migrate to employers high in social responsibility because they signal competitive advantage. Hence, regardless of the instrumentality of social performance in other economic domains, it may lead to positive economic consequences because of its signaling effect (in the minds of the best applicants). If this signal attracts more productive or creative employees that are uninterested in dysfunctional organizational politics, for example, organizations that possess this signal may, over time, outperform other organizations that do not.

Similarly, various socially responsible activities (adopted voluntarily) may serve as signals to government. Firms that deem their compliance costs with potential future government regulation to be high will adopt various self-regulatory policies and practices to secure more lenient regulatory treatment later. This signaling explanation of self-regulation leads to the prediction that the social performance of self-regulators may deteriorate when regulation is imposed.

Silkwood, Karen (1946–1974)

Karen Silkwood, a union activist and whistle-blower, was on her way to submit proof of safety infractions at Kerr-McGee Nuclear Corporation's Cimarron plutonium plant in Oklahoma when she was killed in an automobile accident. Her fight for nuclear plant safety and her death became a rallying point for the fledgling anti–nuclear industry movement.

Silkwood was 26 and a divorcee with 1 year of medical technology in college when she took a job as a metallography laboratory technician at Kerr-McGee's Oklahoma City Cimarron Plutonium Recycling Facility in 1972. She knew little about nuclear power other than that it was thought to be the energy source of the future. That winter, there was a strike by the local Oil, Chemical and Atomic Workers Union, in which she played a part, but the workers were forced to return to work with a more difficult contract.

Silkwood's enthusiasm for the job waned as she learned more about the dangers of plutonium and began to notice the laxity of safety measures at the plant. She resumed her involvement with the union and, because she was outspoken in voicing complaints about plant safety, was elected to the union bargaining committee, the first woman on that committee in the history of the company. Kerr-McGee was behind on production, so employees worked longer hours and carelessness about safety increased. Because the local union did not have much support from the employees and recertification was near, she and two other union officials went to Washington, D.C., to talk with the national union officials and the Atomic Energy Commission. In preparation, she asked Kerr-McGee employees for examples of specific instances of safety violations. She divided these into three major problem areas: (1) lack of training, (2) failure to minimize contamination, and (3) poor monitoring. In Washington, she learned from the national union officials of the link between plutonium and cancer, something never mentioned at Kerr-McGee. She had by this time been exposed and decontaminated twice. She also mentioned that she had seen company employees alter negatives of the pellets to make them look perfect. The officials told her to get proof and that they would arrange an interview with a reporter from the *New York Times.* They also suggested holding an employee meeting with two professors, who talked about the relationship between plutonium and cancer. The recertification vote was held soon after the seminar, and the union won 80 to 61.

After Silkwood obtained microphotographs from Kerr-McGee's files that proved that uranium pellets were altered, she called the national union officials and arranged to meet the *New York Times* journalist. On the way to the meeting, her car crashed into a culvert, and she was killed. The highway patrol called it an accident and did not investigate further. Her folder containing the proof of pellet fixing was never found. Later, a 1984 *New York Times* report implied that the pellets had not been tampered with. Speculations about the cause of the accident and the possibility of foul play were never proven, but a federal investigation of safety and security at the Cimarron plant did take place. Kerr-McGee closed the plant in 1975. An autopsy showed that Silkwood's body was contaminated by plutonium.

In 1976, Silkwood's father, on behalf of her three children, sued Kerr-McGee for personal damages. The trial opened 3 years later in March 1979. Kerr-McGee's lawyers painted Silkwood as a loose woman who had contaminated herself in an effort to cause trouble for the company, while various investigators and company employees testified that she was rightfully concerned about safety at the plant. On May 18, the Oklahoma jury awarded the family $10.5 million. The company appealed, stating that Oklahoma had no jurisdiction because Kerr-McGee was operating under federal regulations set by the Atomic Energy Act. In 1981, the 10th Circuit Court of Appeals agreed with the company, thus reversing the Oklahoma ruling. Two years later, the case was heard by the U.S. Supreme Court. In January 1984, the Supreme Court reversed the Circuit Court's decision in a 5 to 4 vote and returned the case to the Court of Appeals. They did not, however, reinstate the damages. The Court of Appeals sent the case back to the original Oklahoma trial court. The Silkwood family and Kerr-McGee agreed to a settlement of $1,380,000 in August 1986, 10 years after the suit was filed. Kerr-McGee did not admit to liability. Silkwood's three children divided $500,000, her father received $70,000 as co-administrator, and the remainder went for administrative and legal fees.

The case set a precedent in that it allowed state courts to impose punitive damages on nuclear industry companies that were regulated by a federal agency. It also fueled rising concerns about the safety of nuclear power as an alternative source of energy. Karen Silkwood became an icon for antinuclear groups across the United States. A 1983 movie, *Silkwood,* romanticized her and portrayed her as genuinely concerned about nuclear safety. It also showed her as a real human being, warts and all, and implied that she was murdered. However, the real truth remains unknown, about Kerr-McGee's plutonium pellets, Silkwood, and her death.

Single European Act (SEA)

The Single European Act (SEA) was signed in February 1986 in Luxembourg and The Hague and came into force on July 1, 1987. There were several significant provisions of the SEA that brought important modifications to the foundational treaties that had established the European Communities and were agreed to in the 1950s. The European Communities were built on the agreements of the European Coal and Steel Community (ECSC), the European Economic Community (EEC), and the European Atomic Energy Community (EURATOM). To fully appreciate the central role that the Single European Act has played in the formation of the European

Union (EU), a brief history of how the EU became a governing institution in Europe is necessary.

History of the European Union

For centuries, Europe had been the site of horrendous war and strife between its nation-states. In the 19th and early 20th centuries, for example, France and Germany went into major combat with each other no less than three times. War had become commonplace, and its toll on the area's resources and the attendant loss of life was monumental. So leaders in Europe began to see the overwhelming need to forge some long-lasting harmony and peace in the region.

After World War II, the movement toward European integration began, but it did so in rather halting steps. In the early 1950s, six countries—Belgium, Luxembourg, the Netherlands, West Germany, France, and Italy—created the ECSC, which became the first modern, wide-scale economic coalition in Europe. The ECSC served as a supranational body composed of a high authority that had regulatory powers over member states, a council that exercised legislative power, and a court that was called the "European Court of Justice." The thinking at the time was that if a consortium could be successful in managing European economic rivalry, especially the one that existed between France and Germany, then future wars might be avoided. This move toward economic cooperation was also urged by the conditions made by the United States in its "Marshall Plan," which provided $25 billion to assist Europe to rebuild itself from the ashes of World War II.

In 1951, the Treaty of Paris brought forth the birth of the ECSC. Then, 6 years later, when it was clear that economic cooperation in Europe would be possible, the member states of the ECSC deepened their arrangement and through the signing of the Treaties of Rome set up the EEC and the EURATOM. The EEC's goal was economic harmonization in Europe by the establishment of a common market and the removal of barriers to free trade. Trade restrictions, it was agreed, would be lifted in the course of 12 years, but during this transitional period the economic health of member states was so enhanced that all tariffs between them were dropped in 1968. Also on the economic front, the EEC Treaty called for a common policy on agriculture and transportation, uniform customs arrangements, agreements about the deployment of labor, and a common policy on trading with non-EEC parties. Thanks to these initiatives, the EEC became widely known as the "European Common Market," but this is not to say that Europe was a completely free market as of yet.

The Importance of the SEA

In the 1970s and 1980s, the EEC expanded by adding the United Kingdom, Ireland, Denmark, Spain, Greece, and Portugal. This was a time of economic troubles in Europe, especially with the oil crisis reaching its peak in 1973 and new pressures to compete on a global scale as the United States entered an era of more liberalized international trade. If Europeans were to rise to the occasion, then it would have to do so with a unified front that would streamline the major economic and political differences that stood in the way of a genuine integrated Europe. The SEA can be counted as the step that Europe took toward such a true union.

First, while the EEC had established a European Parliament, its role was limited to mostly advisory powers and its officials were not directly elected. The SEA gave the European Parliament expanded powers to include a veto of agreements made and on the admittance of new member states and its members to be elected directly for the first time. Second, the SEA gave more authority to the European Council that replaced the summits and conferences of the European heads of government that were held at the time. This council had limited powers and can be taken more as a way to create a unified executive branch of government that at the same time supplants the individual power of the member nation-states. Not only did the SEA make such significant institutional changes, it also made strides toward political integration of Europe. But the most important and sweeping aspect of SEA's contributions was the timetable it detailed for the creation of single European market in 1993.

With its economic provisions, the SEA began what is now the world's largest trading area. It accomplished this by permitting a genuinely free movement of goods, capital, labor, and services among and between member states. Before the implementation of the SEA provisions, there was some success toward a single market but there were still many barriers such as the differential rates of a value-added tax, and border crossings still required the completing of much red tape in the trucking industry. The SEA was the first attempt to have a Europe without frontiers by going further to ensure union than any agreement before it. In addition to introducing unitary market mechanisms—it had 272 such provisions—it set up social rights standards for workers' health and safety, set up European research and technology development strategies, and created policies designed to protect the environment as well. Hence, the SEA was a major step in the direction of establishing what we now call the European Union as it made a cohesive and harmonious economy the goal for Europe.

Situation Ethics

Situation ethics is a position that holds that moral decision making is contextual or situational. It understands moral rules not as directives but as guidelines that are applicable in most situations but not all and that themselves may change or be modified over time because of their usefulness or lack thereof in varied situations. Ethical judgments must be made within the context of the entirety of the situation, and all normative features of a situation must be viewed as a whole. The guiding framework for moral decision making is stated variously as that of acting in the most loving way or acting to maximize harmony and reduce discord or to enrich human existence.

Situation ethics was developed by an Anglican theologian, Joseph Fletcher, in the mid-1960s as a result of his objections to both fixed, universal moral laws and the view that there are no fixed moral principles at all. The situation ethics of Fletcher was based on the general norm of brotherly love, which is evidenced in different ways in different situations, and he applied this to issues of Church doctrine.

For example, if one holds to the absolute wrongness of abortion, then one will never allow for abortion, no matter what the circumstances within which the pregnancy occurs. Fletcher holds that such an absolute position pays no attention to the complexity and uniqueness of each situation and can result in a callous and inhumane way of dealing with the problem. On the other hand, if there are no principles at all, then the decision is reduced to nothing more than what one decides to do in the moment, with no real moral implications involved. Rather, Fletcher holds, within the context of the complexities of the situation, one should come to the most loving or right decision as to what to do.

This view was influential in Christian communities both in America and Europe for a good number of years, but reached its peak in the 1980s and then began to wane. But while Fletcher is no longer influential, situation ethics is asserting a strong voice within the context of contemporary ethics through the position of American pragmatist philosophy, most notably through its employment of the position of John Dewey. Dewey developed situation ethics in a nonreligious context and as part of a broadly based philosophy, and it is Dewey's position that is most often used in presenting or employing situation ethics in its contemporary form.

Dewey characterizes his position as "instrumentalism" because moral principles are understood as tools or instruments that are used because they work in resolving the conflicts within complex situations in the most harmonious way for all those involved. These principles are experimental hypotheses that are constantly subject to ongoing verification or revision by the demands of the unique conditions of experience.

This view is opposed to the absolutist understanding of fixed rules as inherently valid and universally applicable to all situations, there being no exceptions. It also is opposed to the relativist understanding that there are no normative guidelines but only individual judgments concerning particular cases and that there is no moral justification for evaluating one moral claim as "really" superior to another, with ethical judgments in particular cases coming down to a "my opinion versus your opinion" kind of decision.

For situation ethics in general, moral reasoning is understood as concrete. It is not the "top down" approach of working downward from abstract rules to their application, but the "bottom up" approach of working upward from the full richness of moral experience and decision making toward guiding moral hypotheses.

Morality is to be discovered in concrete human experience where conflicting interests and desires need to be adjudicated rather than in conflicting moral principles or rights that are debated in the abstract.

This position recognizes that rules are often in conflict with each other in concrete cases and offers a way of resolving them by getting beneath them. For example, common sense tells us that in being kind or charitable one must at times "color the truth." Trying to formulate any of these precepts as strictly universal would be impossible because of the endless number of qualifications that would be necessary, many of which could not even be envisioned until they arise in some specific case in its full complexity, and every concrete case is at least a little different from any other—unique in its own way. The relative weight given to any of these guidelines, as well as to a host of other considerations in coming to a decision as to what ought to be done, will depend on the novel and complexly rich features of the situation in which the need for the decision arises. Furthermore, we sometimes have a case where specific rules just are not appropriate and we do not know what should be done, and we have to make a judgment of the individual case in light of our general wisdom of life.

Situation ethics accounts for virtues as emerging through our moral decision making in concrete situations. The most important habits we can develop, according to situation ethics, are habits of intelligence and sensitivity, for neither following rules nor meaning well can suffice. But bringing about good consequences in the contextual richness of different situations through moral decision making helps develop, as by-products, both good character traits as habits of acting and good rules as working hypotheses needing ongoing testing and revision.

According to this position, the past, with its traditions and moral rules, is to be respected, not ignored. Many of our most ingrained rules and traditions have become such because they work remarkably well, and the responsible person will pay attention to them. We make decisions and evaluations within the context of a traditional heritage that gives us a somewhat general consensus about working hypotheses from which to begin our decisions and actions. For example, in our society we tend to agree (to a certain extent, at least, and in a rough general fashion) that lying, cruelty, stealing, killing, selfishness, and so forth are to be avoided in favor of fairness, kindness, freedom, concern for others, and the like. But these can serve only as guides whose meanings are shaped and reshaped by ongoing novel situations and the conflicting values that must be integrated. Rules can change over time, and there are always exceptions to the rules.

Moral reasoning as concrete rather than abstract and discursive incorporates in its very dynamics moral sensitivity and moral imagination. Moral reasoning involves sensitivity to the rich, complex value ladenness of a situation and to its interwoven and conflicting dimensions, the ability to use creative intelligence or moral imagination geared to the concrete situation, and an ongoing evaluation of the resolution. The goal, according to this view, is not to make the most unequivocal decision but to provide the richest existence for those involved. Situation ethics emphasizes that we cannot assign priority to any one basic value, nor can values be arranged in any rigid hierarchy, but we must live with the consequences of our actions within a process of changing unique situations.

Slavery

Slavery can be defined as the forced servitude of a person. In the United States, slavery as an institution ended in 1865 with the conclusion of the Civil War. Other countries ended slavery earlier or later than did the United States, and today, no country officially permits slavery. Slavery-like practices, however, still continue in parts of the world, and the effects of prior slavery represent current corporate responsibility issues for many companies. Finally, the idea of slavery is sometimes used as a metaphor by activists to criticize particular labor practices of companies and their suppliers.

It might seem strange to include an entry on slavery in this *Encyclopedia*. Slavery is often thought of as a long-ended practice relegated to history. But there are still slaves, people working in conditions where they lack true choice, and continuing controversies about the historical effects of slavery, all of which continue to this day. We are not likely to see the end of slavery as an issue for business ethics and corporate social responsibility scholarship and for business practice for some time to come.

Slavery in History

Slavery has occurred in many different cultures and countries throughout history. Slaves were often taken after war by the victorious party or as punishment for a rebellion by a colony. In Europe and the United States, slaves were captured in Africa and then exported. Although some slaves were eventually freed by their owners, most others were kept as slaves—as were their descendents—for their entire lives. Slaves have no control over their lives or their treatment.

Various abolition movements freed slaves in most countries by the late 19th century. These movements also sought (before formal emancipation) to free slaves by moving them to countries and regions that did not permit slavery. But slavery in its most formal sense is still practiced today. Robert Bales has argued that there are still millions of people who are held as slaves in many different—mostly poor—countries. In short, the contemporary view held by many people that the practice of slavery is a historical artifact is inaccurate.

Slavery and Corporate Responsibility

There are three main issues related to corporate social responsibility and slavery. The first issue involves reparations for the descendents of slaves. The second issue involves corporations that are profiting (usually indirectly) from the current use of slave labor. The third issue involves how corporations respond to allegations by activist stakeholders that particular working conditions—in their own or their suppliers' factories—are "like slavery."

With regard to slavery and contemporary corporate responsibility, slavery in its literal form is unlikely to be directly observed but is still a possible ethical issue in supplier operations. "Slavery" may also be used metaphorically to express stakeholders' concerns about particular labor practices. At the present time, the historical effects of slavery are still current issues for some corporations, but this manifestation of the slavery issue is likely to dissipate over time.

Reparations for the Descendents of Slaves

One ethical issue regarding slavery that affects corporations is that of reparations or some other compensation for the descendents of slaves. Although this has largely been cast as a public policy issue (governments providing apologies for slavery and direct reparations to the descendents of slaves), there are also calls for corporations with links to the slave trade (such as banks) or corporations that benefited in the past from such labor to pay reparations to the descendents of slaves. In the United States, as in other countries, the connections between current corporations and 19th-century chattel slavery are somewhat remote. There have been a number of lawsuits filed against companies that are alleged to have profited from slavery during that time period, but these lawsuits are not likely to succeed due to various statutes of limitations. However, the publicity that ensues from such lawsuits brings attention to the issue of slavery and its social legacy.

Slavery during the Holocaust of the 1930s and 1940s in Europe illustrates another example of a reparations movement, albeit one in which the harm and its partial remedy are more immediate. German corporations that profited from slave labor before and during World War II, along with the German government, have paid into a fund that compensated slaves and their descendents. The moral effect of such payments is that German corporations have taken some measure of responsibility for workers enslaved during the Third Reich.

The likelihood of a reparations movement succeeding is largely a function of the immediacy of the slavery. Corporations that profited from the use of slave labor in the 20th century, for example, are more likely to pay reparations than corporations that profited from the use of 19th-century slave labor. In short, the more direct and immediate the tie to slave labor, the more likely that a legal and moral case for reparations exists.

Corporations Currently Profiting From the Use of Slave Labor

Another issue affecting corporations with regard to slavery is current business activities that profit from the use of slave labor. One recent example comes from the cocoa and chocolate industries. A number of allegations emerged in 2001 and 2002 that children were being abducted, sold as slaves to cocoa farmers in the western African nation of Cote D'Ivoire, and were harvesting cocoa that was then sold to chocolate manufacturers. Research by a number of nongovernmental organizations provided evidence for such claims, which posed a significant public-image threat to chocolate manufacturers in the United States and Europe. In response, the Chocolate Manufacturers Association in 2002 created the International Cocoa Initiative, which included representatives from industry, labor, and antislavery organizations, to develop ways of eliminating the use of child and slave labor in cocoa farming. The International Cocoa Initiative issues periodic reports on its progress in the area of preventing the use of slave labor in cocoa farming.

Similarly, the oil company Unocal was accused of profiting from slavery with regard to a natural gas pipeline project in Myanmar (Burma). Myanmar, a country that has been ruled by military dictatorships for most of its recent history, was accused of enslaving people adjacent to the pipeline project and forcing them to work on infrastructure projects related to it. Unocal argued that it did not condone the use of slave labor and was not responsible for human rights violations in Myanmar. The company was sued by villagers and by human rights organizations, with some of the lawsuits ultimately being settled. Here, the allegation was neither that Unocal was itself enslaving workers nor that its suppliers were but rather that it was indirectly profiting from forced labor brought out by an illegitimate national government.

The examples of cocoa farming and Unocal illustrate how the slavery issue is likely to manifest itself for corporations today—not as an issue in which corporations are directly employing slaves but rather as a supplier issue or as an issue related to operating in countries with repressive governments. It is hard to imagine a corporation risking its reputation by directly employing slave labor in its own facilities. But in many supplier relationships—whether in commodities or contract manufacturing—the possibility of profiting from labor that is not truly free still exists. Corporations are increasingly developing codes of conduct and monitoring mechanisms to prevent the use of forced or slave labor in their own operations or those of their suppliers. Such allegations are more likely to occur in operations in lesser-developed countries, with suppliers, in commodity-oriented markets, and in politically nonfree countries.

Working Conditions That Are "Like Slavery"

Finally, the idea of slavery is used to criticize particular labor practices that are "like slavery" or "slave-like." Labor activists, for example, have used the term *slave-like* to describe labor conditions in industries such as rubber and toys. When working conditions are inhumane and workers are being mistreated, allusions to slavery by activist groups and members of the media are possible. The use of slavery as a comparative concept is meant to highlight allegations that the labor of some people is not exactly slavery but somewhat like slavery in that there is some level of coercion by an employer or a lack of freedom by an employee to choose his or her employer and working conditions.

Obviously, an allegation that particular working conditions are like slavery is incendiary. Corporations do not want to be tied in any way to allegations that workers—whether their own or their suppliers' workers—are being treated like slaves. Corporations with significant international operations and/or supply chains, therefore, have strong incentives to undertake programs and policies to ensure that workers are being treated fairly and often seek to communicate information about these programs to particular stakeholders such as consumers.

A broader issue involves defining what true freedom in employer-employee relations means. There are relatively few workers who are actually slaves, even in very poor countries. But many workers may feel coerced by economic circumstances to accept poor wages and working conditions or may wish to organize an independent labor union but cannot do so. Defining slavery is easy, but defining its opposite is considerably harder.

Slavery, Business Ethics, and the Moral Consensus

Today, there is a broad moral consensus that slavery is (and indeed always has been) morally wrong. Slavery is generally regarded as either a historical evil consigned to a prior age or a current evil that occurs in a few parts of the world and now must be ended. Most corporate policy statements, codes of conduct, industry standards, and nongovernmental organization statements on business ethics include language proscribing the use of forced or slave labor. No respectable corporation would seek to profit from slave labor, and language opposing the use of forced or slave labor has become a common part of corporate codes of conduct. Corporate and industry statements regarding slavery tend not to deal with topics such as reparations, however.

The ethical debate about slavery and corporate responsibility largely focuses not on the use of slave labor in its literal meaning but on whether particular working conditions can be appropriately compared with slave labor. In many contexts, the ability of employees to make free choices about whether, for whom, and when to work are less than ideal. Corporations' monitoring of working conditions—whether in their own plants or in facilities owned by their suppliers—and reporting are two of the mechanisms used to assure stakeholders that products are not made in exploitative conditions.

Conclusion

Slavery is both a historical issue and a current issue for corporations. The idea of slavery is morally repugnant to the overwhelming majority of people around the world. There are still controversies, however, about how to remedy the historical effects of slavery, how to prevent the contemporary use of slavery (especially in the operations of suppliers), and whether particular contemporary working conditions can be reasonably compared with slavery. Because of the moral import of slavery, corporations should seek to assure stakeholders that they only use labor—directly or indirectly—that is freely given and not coerced.

Slippery Slope Argument

Two important versions of the slippery slope argument are the logical slippery slope and the causal slippery slope. The basic form of the slippery slope argument is as follows: A particular action seems to be acceptable. But if this action takes place, then another, less acceptable action, will follow. This is followed by an even less acceptable action, and so forth. For example, someone might argue that legalizing prostitution will cause more marriages to break up, which will in turn cause the breakdown of the family, which will finally result in the destruction of civilization.

The logical slippery slope argument is best illustrated by the example of baldness. Removing one hair from an individual does not make a person bald. Neither does removing two hairs, or 100. Therefore, any line drawn between baldness and nonbaldness will be arbitrary. The problem with this argument is obvious: Just because one cannot specify the number of hairs that must be removed for baldness, it does not imply that we cannot identify a person as bald. It only implies that there may be some cases in which it is a toss-up whether we can label a particular person as "bald."

A classic example of the logical slippery slope argument is found in the abortion debate. Some opponents of abortion have argued that human life must begin at conception, since no nonarbitrary line can be drawn in fetal development between conception and birth. However, this argument cannot stand on its own. It depends on a view of personhood that identifies the body at any point of development as being a person. Those who believe that personhood is present only with the coming of self-consciousness would hold that personhood comes much later in biological development than conception. More relevant to the sorites argument is the fact that just because a nonarbitrary line cannot be drawn in fetal development, it does not imply that no line can be drawn at all.

Most slippery slope arguments in ethics are causal. These are usually predictions: If one course of action is taken, it will lead to another course of action, and so on, until it results in actions that are clearly morally reprehensible. For example, an opponent of companies mining data from those who surf the Internet might argue that retrieving information that is not personally identifiable will lead to companies retrieving personally identifiable information, with the end result being a total loss of Internet privacy. This is a causal claim since the argument is that data mining of such information from Web surfers will *cause* the mining of personally identifiable information. The most plausible way to understand such causality is in a psychological sense. That is, opening the door to mining one class of Internet users' data removes psychological barriers to mining other kinds of data. The difficulty is that the claim is about what data mining companies might do in the future. It is much easier to look back in retrospect at actions and see a "slippery slope" than to make a prediction about future behavior.

However, the psychological version of the causal slippery slope argument is not as weak as it might look. In the data mining, a pollster could survey data mining companies and their workers on their attitudes toward retrieving personal information from Web surfers and whether they would in the future be willing to retrieve data traditionally considered to be more "private." Retrospective studies of companies that retrieved (perhaps illegally) personally identifying information from Internet users might be used to predict what would happen in other companies that have not yet gone that route. It is, therefore, possible that a cogent psychological slippery slope argument could be constructed, although the task would be difficult in practice.

Sometimes, in business ethics, slippery slope reasoning is used as an explanation rather than an argument. The term *slippery slope* has been used to explain how small crimes can lead a businessperson to greater corruption: "John Doe, CEO, began to take small bribes from his clients. He slid down the slippery slope to being bought off by nearly everyone with whom he was in contact." Although such a slippery slope is not an argument, with sufficient empirical support it could be a way to understand the moral psychology of a person's slide into vice, and thus useful to virtue ethics.

Small Business Administration (SBA)

The Small Business Administration (SBA) is a federal agency whose mission is to strengthen the nation's economy by enabling the establishment and viability of small businesses and to assist communities in economic recovery after disasters. The SBA has three main strategic goals: (1) to improve the economic environment for small businesses, (2) to help small businesses to succeed, and (3) to restore homes and businesses affected by disasters. The SBA assists prospective entrepreneurs, new start-up businesses, and existing small businesses through a variety of programs and with partner organizations. The SBA was established in 1953 by the Small Business Act.

The SBA created size standards by industry type that define the maximum size that a firm, including all affiliates, may be for eligibility as a small business entity for SBA programs. The two most widely used size standards are 500 employees for most manufacturing and mining industries and $6 million in average annual receipts for most nonmanufacturing industries. There are, however, many exceptions to the size standards, and the SBA's Small Business Size Regulations should be consulted.

The SBA's programs fall into the following four categories:

1. *Small business lending:* The SBA provides loans to new and existing businesses that would not otherwise qualify for loans without the government's guarantee. The SBA's current business loan portfolio of approximately 219,000 loans worth more than $45 billion makes it the largest single financial backer of U.S. businesses in the country.

2. *Federal procurement:* The federal government strives to award at least 23% of its purchases to small businesses. The SBA assists small businesses by helping them get access to the federal procurement system. The SBA also helps government agencies use small business sources.

3. *Technical assistance:* The SBA and its partner organizations provide technical assistance programs to more than 4 million existing and potential small business entrepreneurs annually. The SBA assists new businesses by helping them navigate their way through compliance with laws and other issues in starting and running a business. Some of the SBA's partner organizations to which it provides grants include more than 1,100 small business development centers (SBDCs), 389 SCORE chapters (Service Corps of Retired Executives), and 84 women's business centers. SCORE is a network of more than 10,000 retired and working volunteers who are experienced entrepreneurs and corporate managers/executives. These volunteers provide free business counseling and advice. The SBDC offer counseling, training, and technical assistance in all aspects of small business management. The SBDC's services are delivered through a network of multiple centers and satellite locations. The SBA works to promote and assist women business owners through the Office of Women's Business Ownership. There are women's business centers located in each state and territory.

4. *Disaster lending:* The SBA provides low-interest loans to individuals and businesses that are victims of natural disasters. SBA's disaster loans help homeowners, renters, businesses, and nonprofit organizations finance rebuilding and recovery efforts. Since 1953, SBA programs have provided direct or indirect assistance to 20 million small businesses.

Ethical Issues and the SBA

Over the years, the SBA has been criticized over a variety of questionable actions including benefits to not-so-small businesses and affluent minorities. A recent scandal at the SBA involved the Supplemental Terrorist Activity Relief Act (STAR Act) passed shortly after the terrorist attacks of September 11, 2001. A federal loan program was created to help small businesses affected by the attacks. However, money was poorly managed and loans were made to small businesses not at all affected by the attacks and in some cases to small businesses that were not even in existence in 2001. Recent articles in the *Wall Street Journal* report that the SBA has awarded high-dollar contracts to large companies, but reported them as going to small businesses instead.

Small Business Ethics

Small business ethics refers to social issues and business ethics in small and medium-sized private businesses. Despite the fact that by most measures 99% of private business organizations are small or medium-sized enterprises (SMEs), probably 99% of research on business ethics and society is on large firms and multinationals in particular, giving us a very limited understanding of the relevant issues for small firms.

One of the difficulties of this subject area is the varied approaches to defining "small" business. The usual parameters include number of employees, turnover, sector-specific characteristics, and self-definition. The European Union definition is relatively simple, with small and medium-sized firms being defined as having fewer than 250 employees. The Small Business Administration in the United States offers industry-sector-specific definitions, using turnover and employee numbers ranging from 100 (for all wholesale trade industries) to 1,500 (e.g., for the airline industry). In terms of business ethics and society, the most important perspective is the differing processes and character of smaller business organizations compared with their larger counterparts. The most pertinent perspectives are outlined below.

The Freedom to Act According to One's Own Integrity

In most small firms, the person with ultimate responsibility for running the organization is also the primary owner—that is, he or she is an owner-manager. There may be other shareholders, perhaps family members or business partners, but the convergence of ownership and control of the firm means that the owner-manager acts as both principal and agent. Milton Friedman acknowledges himself that his general maxim of "the business of business is business" does not apply in owner-managed firms since the proprietor has the *right* to spend company money as she or he sees fit, including bringing personal integrity to bear (e.g., for charitable donations). There is no guarantee that owner-managers will be inherently ethical, but the frequent (though not universal) requirement to maximize profit for shareholders is less valid in the small owner-managed firm than in shareholder-owned organizations.

Not Seeking to Maximize Profit

Most owner-managers are not seeking profit maximization but are motivated by factors such as the independence of running their own firm, challenge, and providing a standard of living for themselves and their families. Acting as profit satisficers rather than maximizers may enable more ethical behavior, although there is no absolute clear causal effect, or indeed inverse effect, between ethical activity and profit.

Close Moral Proximity

Small businesses are often embedded in local communities, although there are cases that speak against this—for example, firms operating remotely from their business partners or in virtual networks. Nevertheless, for many small businesses and certainly those whose customers are locally based, physical proximity may translate to moral proximity. Furthermore, the size of the firm, lacking anonymous individuals in vast departments, means that there is nowhere to hide. If a mistake is made or a questionable action taken, it will be simple to identify who is responsible, ending very quickly with the owner-manager. This moral proximity with community and customers can focus the mind considerably on ethical behavior. Owner-managers of small firms often cite employees as their most important stakeholders, in contrast to large firms. Informality and a lack of bureaucracy is usual, with familiarity with the personal circumstances of employees the norm. Accordingly, owner-managers personally feel the burden of maintaining employees' livelihoods. Again, there is no guarantee that this results in ethical behavior, but genuine commitment to employees is very high on the agenda of small businesses, not least because the costs of replacing someone is proportionately substantial.

Reputation and Relationships

Since small firms can rarely undercut their larger competitors on price due to scale disadvantages, they have to find other ways to win business. Flexibility and a personal service are often factors on which small businesses can differentiate themselves. Indeed, the maintenance of personal relationships externally is one of the key characteristics of this type of organization because (1) it is possible due to the small number of people involved; (2) the business *is* personal; (3) since owner-managers are usually "alone" in their business, with no real peers, they often seek companionship with external business partners; and (4) cooperation with others through social capital networks is a means of accessing additional resources. Building on the notion of close moral proximity, these personal relationships are sustained by the good reputation of the owner-manager personally and the business more generally, the two being closely linked and indistinguishable in many instances.

Rejection of Externally Imposed Procedures and Standards

Given the desire for independence, the reliance on informal processes, and the sheer difficulty of maintaining a stable small business, it is not surprising that efforts to impose externally validated standards and procedures are rarely welcomed in small businesses. This includes management systems such as those pertaining to environmental, social, ethical, or human rights standards. Accreditation is often a requirement set by larger firms in the supply chain, but rarely suited to the small firm context. The additional bureaucracy is a vastly disproportionate cost for a small firm and runs counter to the usual informal management style. Similarly, the proximity of stakeholders makes mission statements and codes of conduct potentially redundant. Joining external bodies such as ethics groups and institutes also makes little financial sense and again runs counter to the independence issue. Hence, "measuring" ethics by counting up what standards the organization is signed up to or membership to ethics organizations is nonsensical.

The Importance of Sector

The one external group to which SMEs are likely to be affiliated is their sector or trade organization. Owner-managers are notorious for disliking taking advice from any external organization with which they don't have a personal relationship, but if they accept it from any one institution it would normally be their trade association. While small businesses may be relatively invisible in the media and the public eye, in many cases they will not be so in their sector, where trademarks and quality standards are most likely to have meaning and, again, reputation is key. Related to this is the fact that competitors (in similar sized firms) are often seen more as industry colleagues than enemies. As a result, unlike in large firms, small firms often count competitors as stakeholders to whom they have a moral obligation.

Character of the Owner-Manager

There are some who argue that "entrepreneurs" have a more highly developed cognitive moral development than other business managers. Leaving aside the confusion around the fact that not all owner-managers are entrepreneurial in the financial-growth sense and that entrepreneurs need not run small firms, there is some degree of convincing argument that those running their own business often possess a high level of integrity. It may be that the factors mentioned above, in particular moral proximity, independence, the concern for reputation, the reliance on external networks, and ultimately the responsibility of running your own business, could be interrelated with high levels of integrity.

The above is very much a generalized list of the most important issues relating to ethics and society pertinent in smaller firms compared with their larger counterparts. There are a number of factors that would influence this list. These include the stage of the business (some suggest that business start-up is a time when trust and integrity are compromised); the character and presence or otherwise of the founder; whether the business is a family business (in which case a whole host of additional personal responsibilities and obligations come into play diminishing the independence of the owner-manager, although enhancing the support available to them); sector differences; and national, regional, religious, and ethnic community culture.

While the picture painted above is rather positive about the ethics of small businesses and their owner-managers, it should be viewed against a backdrop of the enormous pressure that they are under to simply survive, as evidenced by the high failure rates. Indeed, during start-up phases, it has been found that owner-managers may well exploit trust relationships (such as previous employers) to get established. Unfortunately, the precise connection between external pressures and ethics in small firms is unclear.

Finally, given the difference between large and small firms in relation to business ethics and society, how might they be influenced and encouraged to act responsibly? The indications are that working through trade sector associations will be most effective, but further empirical research is needed that takes into account those most able to comment on small business ethics—that is, the key stakeholders of customers, employees, competitors, neighbors, family and friends, and the owner-managers themselves.

—Laura J. Spence

Smith, Adam (1723–1790)

Adam Smith is one of the most influential systematic social philosophers in the history of Western civilization. He founded political economy (now economics) as an independent discipline. Smith was a quiet radical, arguing against the status quo, whose observations of human nature and economic activity in Scotland and England continues to influence public policy during the current age of globalization. Smith's first book, *The Theory of Moral Sentiments,* provides the ethical foundation for capitalism. His second book, *An Inquiry into the Wealth of Nations,* provides a wealth of empirical evidence justifying the social benefits of a free market economy.

Background

Smith was born in Kirkcaldy, Scotland. His father, the seaport community's Comptroller of Customs, died 6 months before he was born. Smith's mother, assisted by tutors and wealthy guardians, ensured that her only child received a classical English education that emphasized the virtues of hard work and self-control. He was prone to illnesses and suffered from hypochondria as an adolescent and adult.

At the age of 14, Smith entered the University of Glasgow and studied moral philosophy under the guidance of Francis Hutcheson. While living in Glasgow, he observed the negative impact of protectionist policies and the benefits of free trade with the Americas. At the age of 17, he received a scholarship to attend Balliol College, part of England's Oxford University system, where he studied for the next 6 years.

After graduating from Oxford, Smith became a tutor and gave public lectures on rhetoric, moral philosophy, and law in Edinburgh, the capital of Scotland. There he became lifelong friends with the controversial atheistic moral philosopher David Hume, who was 12 years older than Smith. Much of Smith's later work in ethics built off Hume's writings. Hutcheson, Hume, and Smith were central figures in the Scottish Enlightenment (1740–1800). These three creatively systematic Scottish social philosophers helped to construct the ethical foundation of political and economic liberty in Western civilization.

The Theory of Moral Sentiments and *Wealth of Nations*

Smith obtained a teaching position at the University of Glasgow in 1751, where he became Professor of Moral Philosophy. He taught classes in natural theology, ethics, jurisprudence, economics, and politics. His lectures served as the basis for *The Theory of Moral Sentiments.* In this book, Smith develops his own science of morality based on the tensions between individuals' tendencies to be both self-interested and other-regarding. He concluded moral judgments are formulated by taking the role of an impartial spectator.

The immediate popularity of *The Theory of Moral Sentiments* attracted the attention of Charles Townsend, a volatile English politician who had served as secretary-at-war and was the president of the Board of Trade at the time. Townsend would later author the Tea Act, which led to the Boston Tea Party uprising.

In 1763, Smith accepted a lucrative position tutoring Townsend's 18-year old stepson, the Duke of Buccleauch, for 3 years. Together, they traveled to France and Switzerland, where Smith studied their political and economic systems, discussed contemporary issues with leading intellectuals, and began writing *Wealth of Nations.* Smith returned to Scotland in 1767 and continued writing his economic treatise, integrating historical, anthropological, sociological, political, scientific, and economic information; it was published in 1776.

In *Wealth of Nations,* Smith maintained that no society could flourish when a major portion of its population was poor. He concluded that government should not sanction monopolies. Instead, it should provide citizens the liberty to pursue their own economic interests to compete in business and labor markets, so long as they did not harm others in the process. Smith restricts the duties of government to providing a national defense, a system of justice, public works, and education.

Later Years

Smith spent his remaining years revising editions of *The Theory of Moral Sentiments* and *Wealth of Nations.* He also served as commissioner on the Customs Board for Edinburgh, where he dealt with local economic issues, such as determining taxes on imported and exported goods, raising revenue in a fair manner, and smuggling prevention. Smith started writing two other books, one on jurisprudence and the other on a philosophical history of literature, but he destroyed both manuscripts shortly before his death.

Social Accountability (SA)

SA is the process of assessing and reporting a business's performance on fulfilling the economic, legal, ethical, and philanthropic social responsibilities expected of it by its stakeholders. While corporations have long been held responsible to investors and stockholders, many firms and stakeholders now advocate an expanded view of this accountability, which includes reporting on the role of business within broader society. SA is part of a movement known as SEAAR, the acronym for social and ethical accounting, auditing, and reporting.

Verifying Social Commitment

Social audits, SA reports, and corporate citizenship audits are common names for tools that companies employ to identify and measure their successes and ongoing challenges with social responsibility. Regardless of the name, these reports are important for demonstrating a firm's commitment to ensuring the continuous improvement of its social responsibility efforts. Thus, SA has to be treated similarly to any other corporate initiative in terms of budget, assessment, and executive commitment. Without reliable measurements of the achievement of social responsibility objectives, a company has no concrete way to verify their importance, link them to organizational performance, justify expenditures, or effectively address stakeholder concerns.

Therefore, a key issue with SA is the way in which companies measure, represent, and report on their social responsibility activities and stakeholder relationships. SA reports are currently voluntary, as no law or regulation requires a specific reporting method or verification of the report's claims. Thus, SA is not subject to internal auditing standards and external assurance practices that accompany financial statements and related reports. However, some firms seek independent verification of the SA report. Major accounting firms and other consultants conduct assessments and attestations as to the accuracy and completeness of such reports.

Since this type of verification is rare, critics worry that some SA reports are merely public relations efforts that contain disinformation and distortions. Critics also question the extent to which companies may use these reports to enhance their reputations rather than as tools for sincerely improving stakeholder relationships.

SA8000 Certification

To remedy these concerns and to create a best practices approach, there are several organizations devoted to ensuring SA within the global marketplace. Social Accountability International, formerly known as the Council on Economic Priorities Accreditation Agency, seeks to create and refine consensus-based ethical workplace standards, accredits qualified organizations to verify compliance with these standards, and promotes the understanding and implementation of social performance standards worldwide. SAI developed and supports SA8000 certification for assuring humane workplaces. SA8000 covers eight primary elements: (1) child labor, (2) forced labor, (3) health and safety, (4) freedom of association and right to collectively bargain, (5) discrimination, (6) disciplinary practices, (7) working hours, and (8) remuneration.

Each of the areas includes a number of specific criteria that must be met for a facility to be certified. For example, in the case of disciplinary practices, a facility must demonstrate that it neither engages in nor supports corporal punishment, physical or mental coercion, and/or verbal abuse of employees. The remuneration category requires a facility to compensate employees fairly and legally, communicate clearly about wages and benefits, and ensure wages are sufficient to meet the basic needs and some discretionary choices of its personnel.

In mid-2005, there were nearly 800 facilities certified as SA8000 compliant. These facilities are found in 47 countries, represent 54 industries, and employ more than 450,000 employees. India, Italy, China, and Brazil have the largest number of certified facilities. The industries most prevalent include apparel, textiles, chemicals, and transportation.

AA1000 Process Framework

AccountAbility is another organization dedicated to advancing the area of SA. This group, which was formally known as the Institute of Social and Ethical AccountAbility, performs research to find best practices in corporate accountability, promotes the development of accountability competencies in various professions, works with public policy makers, and promotes effective accountability tools and standards. The AA1000 framework is designed to improve corporate accountability and performance by learning through stakeholder engagement. In this framework, accountability includes transparency, responsiveness, and compliance.

Much like quality control initiatives, AA1000 is focused on processes and principles rather than substantive issues. Thus, AA1000 does not prescribe performance on ethical issues (i.e., child labor) like the SA8000, Coalition for Environmentally Responsible Economies (CERES), Caux Principles, and other issues-based standards. The key process elements of AA1000 include planning, accounting, auditing and reporting, embedding, and stakeholder management. AccountAbility has published a number of other helpful tools, including an assurance standard for assessing materiality, completeness, and responsiveness of an organization's social report and the processes that inform its reporting.

Gap Inc.'s Social Responsibility Report

A number of well-known corporations have published SA reports. Gap Inc. is an international retailer offering clothing and other items under the Banana Republic, Old Navy, and Gap brand names. Along with the traditional corporate annual report, Gap Inc. also published a separate social responsibility report that reflected its activities between February 2004 and January 2005. The 60-page report included a short financial overview and focused on four major social responsibility issues: (1) labor conditions and certification issues within its supply chain and manufacturing sites; (2) core values and ethics training for employees; (3) community involvement and philanthropy through the Gap Foundation; and (4) environmental, health, and safety standards in the firm's manufacturing and retailing operations. To provide assurance for the accuracy of its report, the Gap incorporated specific examples, photographs, the results of stakeholder outreach sessions, and comments from external consultants.

Beyond SAI and AccountAbility, other nonprofit organizations, membership groups, consumer advocates, and companies are devoting efforts to increasing SA. Stakeholders are demanding increased transparency and are taking a more active role in gaining information from companies. Corporations are communicating about their social responsibility via published reports and Web site material. Government regulators are calling on companies to increase the quantity and quality of information disclosed. All these efforts are aimed at increasing companies' SA as well as access to accountability information.

Social Activists

Social activists are people who aim to bring about change in the social, political, economic, religious, environmental, or military policies of an organization or society by staging public protests and rallying social support for their cause. They generally claim to represent the views and concerns of other citizens, thereby acting not only for their own interests but also in the interest of creating a better society for all those concerned. The desired improvement could be more jobs, higher wages, lower prices, safer working conditions, more equitable laws or law enforcement, environmental protection, the end of military action, or any other goal perceived to be vital to the well-being of society. These particular goals were among the motivating forces for significant social action movements that shaped the United States during the past century.

The history of social activists is a venerable one, although those who are willing to publicly challenge contemporary policies and the status quo frequently face derision and harsh criticism, if not loss of livelihood and social acceptance. Arguing for social change inevitably pits activists against those whose interests are vested in the established policies and practices. Some activists have staked and lost their lives while working to achieve their goals.

Notable historical social activists include Henry David Thoreau, who went to prison for a night for his refusal to pay taxes that would support governmental policies he disagreed with. Thoreau's 1849 essay "Civil Disobedience" pioneered the teaching of nonviolent deliberate resistance as a means of reforming objectionable laws. Mahatma Gandhi's independence movement in India against British colonialism involved long marches and hunger strikes in his effort to work collectively for peaceful change. The civil rights movement championed by Martin Luther King Jr. during the 1960s drew guidance and inspiration from Gandhi's methods. Civil disobedience was widely adopted by protestors supporting the racial integration of schools, buses, restaurants, and other social institutions. Despite King's strong advocacy of peaceful change, he was killed by those who hated his message of racial justice.

Other important social activist groups include ACT UP, a group dedicated to achieve lower prices and increased access to AIDS medication, and Greenpeace and Earth First!, two groups of environmental activists willing to engage in extreme acts of sabotage to protect the environment and intimidate those seen to be acting against nature's interests, for example, loggers and oil companies. Antiwar protests during the Vietnam War gathered support across generations and social classes to dramatically influence public opinion and ultimately U.S. policy regarding the war. Subsequent wars have also evoked antiwar protests, albeit on a much smaller scale than the Vietnam protests.

Contemporary businesses have felt the impact of social activists, although the recruiting of public support now occurs electronically more than through street marches. Most social change groups have extensive Internet mailing lists to share information and raise money more quickly and directly. The status of social activists as stakeholders has been debated but is not yet fully explored. Many corporations have learned by experience that they must take the concerns of activists seriously and respond carefully. The protests staged by social activists over the use of child labor, investments in repressive regimes, support or lack of support for benefits for domestic partners, exploitation of environmental resources, and numerous other issues have proved to have an economic impact that cannot be easily ignored. The actions of these groups serve as a vital component in maintaining the balance of power between citizens, governments, and social institutions in market-driven societies.

Social Audits

Social auditing refers to the process of identifying, analyzing, measuring, evaluating, and monitoring the impact of an organization's operations on different stakeholder groups. The auditing process is carried out in five steps.

First, an exhaustive enumeration of the organization's social activities is compiled into a social data bank. Since compiling such a data set may prove to be a daunting task, due to the wide range of social activities that the organization performs, a lengthy and well-planned study may be required.

Second, the compiled data are analyzed such that the meaning and cost-benefit ratios of the social activities may be inferred. Analysis is conducted by using sophisticated statistical analysis tools and expert judgment.

Third, the impacts of the organization's activities on different stakeholder groups are measured. Since measures of social effects are not as well-developed as economic measures, proxies such as opinion and attitude measures are usually used.

Fourth, social performance is evaluated. The effectiveness of the organization's social activities is assessed by comparing actual performance to standards developed using norms and goals. The more clear and specific the norms and goals are, the more accurate the evaluation is. Fifth, continuous monitoring of social effects is maintained.

The success of the social audit depends on the accuracy of the steps discussed above. In addition, three recommendations need to be met. First, the social audit needs to strictly adhere to the selected norms and goals used as standards in the evaluation step. Second, the results of the social audit need to be integrated into the decision-making process of the corporation in the form of feedback as an integral part of the management of the company's social activities. Third, the social audit has to be carried out by competent and skilled professionals who are knowledgeable of the relevant social issues and problems.

The Evolution of Social Auditing

As different stakeholder groups, especially interest groups, increased their pressure on business organizations to pursue more socially responsible goals, and as the notion of corporate social responsibility gained more acceptance, business organizations started responding to their stakeholders' demands. Businesses' responses materialized in efforts such as natural environment awareness programs and equal employment opportunity initiatives. However, a suspicious public demanded measures to assess businesses' social impact, similar to the economic measures that assess a corporation's economic impact. Corporate social performance had to be accounted for. Simply portraying a socially responsible image through a corporate public relations office was not enough any more. The need for a rigorous process that accurately assesses corporate social performance and holds corporations accountable for their practices was clear. Time has come for social auditing.

Types of Social Audits

Research and practice produced several types of social audits. There are six major types of social audits: (1) the social balance sheet and income statement, (2) the social performance audit, (3) the macro-micro social indicator audit, (4) the constituency group attitudes audit, (5) the government-mandated audits, and (6) the social process/program management audit. These six types of audits vary with respect to the intent for which they are conducted, the methods used, the scope covered, and the audit report form. In addition, the group conducting the audit varies among the several types. Following is a brief summary of the six major types of social audits.

The Social Balance Sheet and Income Statement

Similar to a financial balance sheet and income statement, the social balance sheet and income statement represent the social costs and benefits in dollar terms. This type of social audit attempts to parallel the methods of financial accounting. However, the lack of generally accepted standards and guidelines represent a major weakness of this type. In addition, in the absence of generally accepted standards and guidelines, assessment of the audit is at best subjective, if at all possible.

Two versions of this audit have been proposed, the first by Clark Abt, of Abt Associates, and the second by David Linowes, a certified public accountant. Two main differences between the two versions are with respect to audit scope and the group conducting the audit. First, the scope of the Clark Abt version of the audit is the whole company. In contrast, the scope of the Linowes version is the company's voluntary activities. Second, the group conducting the audit, for the Abt version, is composed of an external expert team. The Linowes version, on the other hand, is carried out by a team internal to the organization.

The Social Performance Audit

The social performance audit is carried out through a study of select companies in given industries. The audit results in a critical evaluation of the companies' social performance aimed at influencing investment decisions. Social issues such as environmental pollution and minority personnel policies are usually targeted. External critics conduct the audit. The Council on Economic Priorities and the Interfaith Center on Corporate Responsibility are the main two organizations that support and use this type of audit.

The Macro-Micro Social Indicator Audit

The micro-macro social indicator audit is a quantitative audit that uses both social indicators and indicators of the social performance of companies. The macro social indicators reflect the actual and desired general well-being of a community in general. Areas such as health and safety, education, and housing are usually covered. The micro social indicators, on the other hand, assess a single company's performance in any of the areas covered by the macro social indicators. Using these measures, two types of comparisons may be conducted. The first aims at assessing a single company's progress. To achieve this aim, the social performance of the company in a given year is compared with its performance in previous years. The second contrasts a company's performance to the performance of other companies or the industry as a whole. External or internal experts may carry out the audit. The major strength of this type of social audit is the use of quantitative measures that enables the public to systematically evaluate a company's social performance.

The Constituency Group Attitudes Audit

Most suitable for corporations that interact with different stakeholder groups, also called corporate constituency, the constituency group attitude audit identifies and measures the stakeholder attitudes. The information gathered about stakeholder attitudes and preferences is then used to help corporations better manage social pressures from the different stakeholder groups. An external team of experts carries out this audit. The audit may cover the activities of the whole company or activities of areas of concern.

The Government-Mandated Audits

The government-mandated audits, as suggested by its name, are a type of audit that is required by different agencies of the federal government or by local and state governments. The most notable agencies of the federal government that have required this type of audit are the Environmental Protection Agency, the Equal Employment Opportunity Commission, and the safety and health administration.

This type of audit focuses on corporate performance in specific areas such as environmental pollution, minority personnel practices, and workplace safety. Corporate performance is expressed in numerical and statistical terms. The scope is either the whole company or a division. An internal team conducts the audit on behalf of the overseeing government agency.

The Social Process/ Program Management Audit

This type of audit aims at assessing the effectiveness of select organizational programs that are considered to have a significant social impact. The social process audit, also called the program management audit, unlike other types of audits that focus on program outcomes, takes a holistic approach to assessing program effectiveness. First, antecedents and program development processes are evaluated. At this step, the factors that led to the development of the program are the subject of evaluation. Such factors usually are in the form of organizational and environmental forces that affect corporate decision making. Second, program goals are evaluated. Similar to the first step, the effects of organizational and environmental forces are considered. Third, the transformation process where inputs to the program are transformed into outputs is evaluated. Finally, the program evaluation process itself is assessed.

The standard against which the effectiveness of the program is compared is the set goals. In other words, the actual outcome of the program is compared against the set goals. The evaluation process uses both quantitative and qualitative measures. Quantitative measures such as cost-benefit analysis are used. Qualitative measures, on the other hand, are concerned with the description and analysis of program activities. The two main organizations that are responsible for this type of audit are the Social Audit Research Group at the Graduate School of Business at the University of Pittsburgh and Bank of America.

Corporate Social Accounting, Auditing, and Reporting

Concerned with corporate social responsibility and performance, David Hess argues that further steps need to be taken beyond the current state of social auditing. He proposes the Social Accounting, Auditing, and Reporting (SAAR) system. Under SAAR, the corporation will not only be required to disclose select aspects of corporate social performance but will also be required to put in place a systematic process for evaluating corporate performance. SAAR has four general requirements or characteristics. First, it must be stakeholder oriented. Stakeholder orientation is manifested through (1) taking into account the views of all stakeholder groups, (2) developing a dialogue between the corporation and its stakeholders, and (3) handling the competing views of the different stakeholder groups. Second, the SAAR system must encompass a set of established procedures and policies that ensure effectiveness. Third, the report and the findings of the audit must be verified by independent auditors. Fourth, the report must be disclosed to corporate constituencies in an intelligible and accessible manner. Preferably, the report should be published annually, thus allowing for utilization of the feedback in the next auditing cycle.

Challenges of Conducting a Social Audit

Various factors may interfere with the auditing process and, accordingly, affect its success. These factors may be classified into four main categories—attitudinal, organizational, political, and technological challenges. First, attitudinal challenges are posed by individuals within the organization. Their attitudes toward and acceptance of the audit would influence the process and its outcomes. Personnel attitudes may affect the decision of which programs are to be audited, getting permission to audit, gaining access to the data, and determining how the audit results are to be used. Positive attitudes toward and acceptance of the audit normally would facilitate the process and enhance its effectiveness. Second, the organizational challenges that face the audit refer to those organizational forces that would influence the direction and effectiveness of the audit. Third, the political challenges posed by different interest groups might push the audit away from its rational path. Fourth, the technological challenges are mostly measurement problems: What should be measured, how should it be measured, and which standards should be used?

Critics of the Social Audit

Given the above-stated challenges that face social auditing, some critics argue that due to the lack of standards and generally accepted rules and regulations, the social audit is merely a tool that some corporations use to portray a positive image of social responsibility. The legitimacy, accuracy, reliability, and validity of the audit are questionable at best.

Advocates and Supports of the Social Audit

In spite of the challenges and criticisms directed at the social audit, some companies remain committed to this practice. One of the most widely known social audits is that of Ben & Jerry's, an ice-cream company well known for its social responsibility and philanthropic activities. Ben & Jerry's has published its social audits since 1999 on the Internet. Also, the company's Web site clearly reveals its commitment to corporate social responsibility.

Social Capital

Social capital can be thought of as the stock of social trust, networks, norms, and generally the interconnectedness and strength of relationships among individuals in organizations and communities. Social capital is important since higher levels of social capital are related to the health and prosperity of individuals, organizations, and communities. Social capital might be thought of as the glue that holds members together and enables members of a community to accomplish their goals and solve their problems.

The dictionary defines *capital* as wealth in any form that can be used to produce more wealth. *Wealth* should be understood here as not just money but any asset that is valued and accumulated, including effective goal attainment, happiness, group stability, and peace, or perhaps friendship, love, and affection among members of a group.

Capital or wealth comes in various forms. We might distinguish the following forms of capital:

- *Physical capital*—physical tools or items that increase productivity (e.g., a computer)
- *Human capital*—the knowledge and skills that improve productivity (e.g., the knowledge resulting from an MBA curriculum)
- *Financial capital*—accumulated money that enhances opportunities (e.g., loans or savings to begin a new start-up business)
- *Social capital*—the stock of social trust, networks, norms, and generally the interconnectedness that enable communities to deal more effectively with common problems and issues (e.g., a quick response of volunteers to assist victims of a flood disaster)

Social capital is as old as human social grouping. Alexis de Tocqueville did not use the term but captured the essence of *social capital* in his famous discussion of the propensity of Americans to form civic associations. As an academic concept, social capital can be traced to early in the 20th century. However, the concept became more widely studied and popularized in the 1990s, in particular from the work of Robert Putnam, who argued through systematic empirical analysis that there has been a steady decline of social capital in the United States since the mid-1960s.

Some forms of social capital bond together members of groups or organizations. Such organizations include informal neighborhood groups, organized sports teams, recreational clubs, social clubs, professional groups, community groups, or business organizations. There are usually relatively clear expectations for behavior among members of the group, and higher levels of social capital tend to result in higher levels of enjoyment and trust for members of the groups. These kinds of groups tend to involve individuals who are generally more homogeneous. They create what has been referred to as *bonding social capital.* In these settings, social capital functions as the bonding agent that holds the members together.

Other forms of social capital bridge differences among groups that may be different in some respects (e.g., language, culture, religion). But members of these groups have relatively trusting relationships for purposes of achieving common community purposes. Thus, these forms of social capital have been referred to as *bridging social capital.* These forms of social capital are particularly important in pluralistic societies, and in these settings, social capital might be thought of more as the grease that allows differing groups to find common ground and acceptable solutions to common issues. Thus, pluralistic and democratic societies depend on bridging social capital, as do global business partnerships and global business dealings generally. These bridging forms of social capital are generally more difficult to create and maintain, but they are extremely important in terms of healthy global business environments.

There are various aspects and implications of social capital. One aspect of capital is that it tends to accumulate with use and increase future capacity and wealth. For example, using the latest technology in farming can increase the amount of land farmed or increase the time available for other productive enterprises, thus resulting in greater wealth and further productive investment. Likewise, using the stock of social capital to deal with community problems (e.g., aiding one another after a natural disaster) may solidify relationships, trust, and a spirit of togetherness that can help produce compromise and consensus related to future community issues (e.g., a proposed school bond issue that may be controversial).

There are other social implications regarding social capital. Strong networks of social capital make it more likely that members will cooperate for mutual benefit, and conversely, weak networks make it less likely that cooperation will be possible, thus reducing their ability to address effectively community problems. Groups with stronger social capital have greater social wealth because their networks foster reciprocity norms. There will be ongoing give and take and hence sufficient trust such that giving will be repaid at a later date. There are also generally effective communication and coordination channels for the effective flow of information and perceived transparency to verify and test behavior. There is also generally a history or tradition of collaboration that establishes a base for future collaboration and problem solving.

Originally developed as an attribute of societies and political communities, social capital can by extension be considered a characteristic of organizations and businesses, as well as individuals. Individuals who have strong or dense relationships in a community or organizations may be said to have more social capital. Such individuals are able to attain more of their goals and contribute more effectively to organizational goals because of the strength of their connectedness.

Likewise, business and other organizations can be described as having greater or lesser amounts of social capital. It is expected that those businesses and organizations with higher levels of social capital will be more effective, productive, and profitable. Such organizations will ultimately be more sustainable. Management can take actions to foster and increase trust and social capital in organizations. Prusak and Cohen have suggested various strategies for management. The first set involves helping employees make and retain connections. Included in this set would be giving employees time and space to bond in person; promoting within the organization; facilitating personal conversations through things such as cafes, kitchens, and libraries and encouraging interactions in nonwork activities. Another category of initiatives would be to enable trust among employees and managers by keeping things transparent and giving no reason to distrust, empowering employees to use their own judgment and thereby showing trust in employees, and translating the trust into reward (such as promotions). Finally, Prusak and Cohen suggest that management foster cooperation among members of the organization by giving people a sense of common purpose, establishing rules for cooperating, rewarding cooperation with cash rewards, and hiring the kinds of employees who are likely to be cooperative players.

Social Contract Theory

While there has been a revival of interest in the "social contract," the idea is a very ancient one, with more than a nod given to it in Plato's *Republic* and in the writings of Epicurus, for example, and then again in a great explosion in the 17th and 18th centuries. We also encounter considerable variation, and controversy, in the idea: first, in what it is an idea *about*, and second, in just what the "contractual" element is supposed to consist.

Regarding the first point, the two main options are (1) that it should be exclusively a theory of *politics* in particular or (2) that it should be more generally a theory about moral relations in society as a whole. In the first view, people agree on how they shall be governed by some institutional system of people occupying positions of political power. In the second, however, no one is the "governor"; rather, we agree on a set of *principles* by which we will regulate our interactions. In effect, the second views the social contract device as a means of grounding, and supplying substance to, *morality*.

How different are the two interpretations in this respect? It is difficult to see why we would agree on who would govern us or in what form if we did not also have in mind certain general principles that we expected those forms to exemplify, uphold, or be constrained by. Thomas Hobbes (1588–1676), the first and widely considered to be the greatest of the early modern contractarians, argued that in the absence of government we would all be abjectly miserable, as well as very short-lived, and that the cure for this was to identify some person or small group of people to whom we would turn over our independent liberty of action, thus authorizing a force powerful enough to "overawe" any subgroup of troublemakers and enable people in society to get on with their various projects. That the resulting rulers might prove to be dictators with motives very contrary to what we might like does not seem to have worried him overly. But in light of the 20th century with its Stalins, Hitlers, and Maos, we are all worried about that. And Hobbes, in fact, did supply a remarkably interesting principle: his "first law of nature," which he elaborated into a set of "Laws of Nature" that he supposed the "leviathan" created by social contract would actually fairly well adhere to and enforce among the rest of us as well.

The Hobbesian first law of nature advises us that everyone is to seek peace, as far as possible, and when one cannot get it, then and only then may one proceed to use the methods of war. This powerful idea is closely echoed by most of his successors, including Locke, Kant, and John Stuart Mill. War, reasoned Hobbes, was the problem; peace, therefore, is the solution. War is the problem in the specific sense that if people spend their time and energies fighting, they will be unable to achieve the benefits of cooperation: industry, learning, navigation, agriculture, commodious buildings, arts, letters, or society.

We can readily impute to Hobbes the idea that this first law of nature is itself essentially a "social contract." For it tells us all to seek peace, provided that others do too, and it is recommended as being a good deal for those who participate. Hobbes defines a law of nature as a "precept of reason" that forbids any individual to do what destroys his or her life (meaning the sort of life he or she is trying to live and not just longevity on any terms), or the means of preserving it, and to omit what would best preserve and forward it. This idea of law is purely individual. But its content concerns our relation to all others when those others can be obstacles to the preservation of our life or alternatively sources of support and preservation to it. And they always can be—especially the first—obstacles; so it is in our mutual interests to adopt as a law the forbidding of interpersonal violence, which will be effective insofar as we are rational enough to see the prospect of loss from war and gain from peace.

And why would people be unable to cooperate in the "natural condition?" Why would war break out instead? In Hobbes's account, it is for two related reasons. One is that it could easily appear to people that they could get what they need from those who already have it rather than trying to make it by their own labors. The other is that to cooperate, we need to trust each other, but the nature of cooperation is such that it tends to lay one person open to exploitation by the other, who will "take the money and run" instead of fulfilling his or her part of the bargain. But if agreements can't be relied on, then there's no point in making them—in which case, of course, we couldn't have any of the things that cooperation is necessary for making, which is almost everything valued in society.

Morals to Politics?

The Hobbesian scenario exemplifies the most central ideas of the social contract. First, it embodies the idea that moral restraints are things we *might possibly not have had:* They are not hardwired into the human frame (as they are, he suggested, in bees). So if we are to have them, we must somehow create them among ourselves. And second, there are only our own interests and wants to guide us: Gods and natural laws—as formerly conceived—simply are not in the picture. People are depicted as largely self-interested, so that if we are to have a workable society, it will have to be one that works *in everyone's interest.* Any natural laws will be based on this fact of human nature rather than on any supposed built-in moral features of the world.

Contracts are excellent models for this undertaking. They are made in self-interest: Each party to them is motivated by some interest of his or her own rather than, for example, by love, common feeling, or group identity. And so contracts inherently present a problem of trust that must somehow be overcome. For we each provide something to the other, and this, so far as it goes, is a cost to the providers; in return, we get the benefit of the other part's performance—if that party does in fact perform. But if one performs first, how do we get the other one to do his or her part when the time comes? That is the problem, and Hobbes supposed that the sovereign was the solution: We have the police watching over things to keep both parties in line.

The Political Version

Modern work on the social contract shows that Hobbes was wrong in thinking either that the sovereign would in fact solve our problem or that we could actually create the state to solve it. On the other hand, it has gone far in explaining why Hobbes was mistaken about the extent of the problem as well as the means for solving it. In fact, self-interest will carry us very far under circumstances that are not at all unusual. In particular, when we envisage continued future relations, it is obvious that if we can't be relied on this time, there will be no next time—and yet "next times" are precisely what enable us to advance. And so we stay at the job, even though we could this once rob the till and depart. Furthermore, there are mechanisms for providing enforcement for agreements when needed that can function effectively without the need of a distant "sovereign" or a police state. We can all keep an eye on each other, for one thing, and should. For another, we can always appoint third parties with an interest in seeing to it that our contract is kept: Each of us, for instance, will contribute a bit to pay this third party, who is not otherwise involved, to apply the cudgel to the one who tries to cheat. Yet that same third party can be hired specifically to look after *this* contract; he need not be hired also to look after *all contracts made by anybody* in the society.

Few among modern defenders of government accept any sort of strongly contractarian justification; but, nevertheless, the idea has been enormously influential. Its influence is especially marked in the tendency to regard government as justified primarily by what are called "public goods" problems. These are problems in which some produce, or would like to produce, what would be beneficial if produced, but the benefits cannot be confined to those who produced them. Instead, some can "free ride"—that is, collect benefits without paying the relevant costs. This, in turn, provides a disincentive to the would-be producers, and beneficial actions thus fail to be forthcoming. Advocates of government propose that the solution to this kind of problem is to have an authoritative body that can simply require all to pay, so that there are no free riders. Make peace the public good in question—which it is, after all—and you have Hobbes's argument for the state. Broaden the range of goods of this kind, and you perhaps have modern arguments for the expanded state with its multiplicity of bureaus and agencies.

Contractarianism as a Moral Theory

Jean-Jacques Rousseau (1712–1788) presciently observed that before there could be any sort of specifically political contract, we had to have something like a "contract" to form society itself: Before we elect a government, we need the act by which we *become a people.* For that act must be the true basis of society. Rousseau postulates that we all give ourselves to each other, as it were; and at the same time, he insists that this will be for mutual advantage—that we will each come out of it better off than when we went in, thus mirroring the ideas of Hobbes, despite Rousseau's somewhat alarming language about the total alienation of each to what he called the general will.

Contracting is normally an *act*—but just when could a "social contract" take place? Since, in principle, it is an agreement of all with all, independently of time, it obviously could not be any kind of historical event. It is, then, an abstraction: The idea of the "social contract" is simply a response by any given person to a basic appreciation of our relations to our fellows. We are all different, each with his or her own specific sets of interests and abilities. But we can all do great, even mortal, damage to each other, while, on the other hand, we can also be enormously helpful. Morals will be a "contract" in that each must give something and each must get something—otherwise it would be pointless. What we give up is the liberty to just go ahead and use other people as we like, without thought of what it will do to them. What we gain is the ability to rely on each other so that we can go about our businesses in peace and with reasonable hope of benefiting from our interactions with our fellows. Peace, in short, engenders prosperity, because peace enables cooperation—the source of all wealth and progress. And so, the cost in terms of foregone opportunities for gains from violence is actually meager in comparison with the possible benefits of renouncing that way of doing things. The social contract idea is that rational individuals, appreciating that this is how things are, will be moved to adopt the dispositions to behave along the lines indicated.

Anyone can play, at any time. That is to say, in any situation where we deal with others, we can size up how we stand in relation to them and vice versa, come to appreciate the prospects of a better outcome by both parties if we renounce intentions to benefit at the expense of others and confine ourselves instead to cooperative ways of interacting with them, provided that they do likewise.

Reworking the Contract: Modern Versions

Contemporary adaptations of a contract idea stem largely from the example and influence of John Rawls (1921–2002). Rawls proposes a device, the "veil of ignorance," which we are to pull over ourselves, to ensure that the "contract" will be *fair.* No one is to know what his or her own situation is in the society that is to be regulated by the principles we propose to formulate by unanimous decision. Thus, no one will be able to rig the principles so as to favor himself or herself at the expense of others. Why Rawls should have thought that a contract that had to be *unanimous* among all people would somehow be able to favor any particular person despite that is unclear. Nevertheless, it is a striking and possibly fruitful image.

Complicating matters, however, is what amounts to a measure of mistrust for his device. Not only does Rawls impose the veil of ignorance but he also deviates, to an uncertain extent, from the original idea in positing that we are to allow some influence from pretheoretic moral beliefs in our construction of the theory (the method of "reflective equilibrium"). We also posit that the parties to the deliberation are "equal." That men are in some sense to be regarded as "equal" when we get into the business of assembling principles for all is another old idea, and especially prominent in Hobbes. In the Hobbesian version, however, it is explicit that the equality in question is not one of general abilities, needs, or interests, but rather, it is specific and only with respect to our capability to inflict damage on each other. If this is a reasonable assumption, then it is easy to see why the first law of nature would be what it is: a law requiring all to forego the option of gaining by force and confine themselves to whatever can be achieved by peaceable agreement. In the Rawlsian construction, the parties are asked to ignore all respects in which they themselves might differ from others, and he supposes that the effect of this will be to support principles calling for much more influence on the social structure by political means.

The most important implication of the Hobbesian idea, by comparison with the Rawlsian one, is that society will not be expected to be much more egalitarian in its economic system. People will engage in trades of all sorts, but some will be far more productive than others, for any number of reasons—more intelligent, more energetic, situated in areas more conducive to production, and, of course, sometimes just luckier. In Hobbes's own view, people were to be ready to help those who suffered, say, from industrial accidents or were otherwise really down and out, but this help does not, evidently, extend very far. That implication is still clearer in Locke, who explicitly develops a view of the right of private property, though such a right is certainly lurking in Hobbes as well. With Locke what mattered is our right to the fruits of our own labor, as well as to any results of peaceable commerce thereafter. Thus, inequality of wealth is a perfectly likely, and acceptable, option.

Rawls, however, formulates not one but two principles of justice. The first, at least in some of its versions, was an "equal liberty" principle, more or less similar to Hobbes's second law of nature (which requires us not to insist on any liberties for ourselves that we would not also grant to others). But Rawls's second principle appears to be quite a different matter. According to it, *any* social inequality that we come up with is prima facie problematic. His second principle calls for equal opportunity and "open offices," and all inequalities must be compensated for to those on the downside of the inequality—not just local inequalities in predatory power. In particular, the worst off are to be made as well off as possible, in the sense that if we stuck to equality, then the worst-off people would be still worse off than they would be on the short end of a mutually advantageous exchange.

All such talk of fairness and equality raises a huge problem for the incorporation of the original idea of the "social contract." For that "contract" simply gets us peace and nothing more. Whether there will be what many modern theorists would accept as "fairness" and "equality of opportunity" is entirely up in the air if we suppose that we are only contracting for peace and security. (Hobbes, to be sure, offers germs of the idea, but his later laws of nature, which deal with that, are very narrow in their apparently intended application.) The classical idea was basically that we trade in our ability to make things bad for each other: You don't hurt me, I don't hurt you. That is seen to be the appropriate, fair price of our laying down of our liberty to "invade and despoil," but we don't go further and include a clause requiring mutual assistance. That is, we do not impose affirmative obligations to aid others. In the Hobbes/Locke view, we each retain maximum liberty about everything else, which includes whatever sorts of insurance arrangements we might want to make as privately acting individuals. Their understanding of the social contract, then, seems to be that it will be essentially what is now called a libertarian outcome.

The interpretation of Rawls's second principle has been the occasion for enormous discussion. It is unclear just what the "maximum" principle actually entails. Thus, Rawls appears to allow that considerations of *incentive*, for example, could justify inequality. That is a concession to self-interest that doesn't seem to sit comfortably with his egalitarian tendencies. But if one makes no such concession, it looks as though an all-encompassing egalitarianism of the socialist variety would be forthcoming. Rawls seems to want a sort of safety-net welfare state in the end, but just how that emerges from his principles is impossible to say. Nevertheless, the Rawlsian theory has been very widely accepted, at least in general form, among today's thinkers.

Integrative Social Contracts Theory

Integrative social contracts theory (ISCT) is a recent proposal to use social contract methods to specify the conditions for socially responsible corporate conduct. Here, the idea is to identify the involved parties—stakeholders—and find the basic values of each; then we look for a "hypernorm" capable of uniting all these parties, and we use it to focus on items of local dispute. The corporation is to abide by the results of this kind of reasoning, thus finding its appropriate niche in the relevant social environment. Care would have to be taken to identify elements of preexisting moral norms that are genuinely incompatible with agreement, as is evidently possible with some religious outlooks, for example. And much doubt exists whether this idea can be made to work for this more limited area. It might be, for example, that in the end all disputes would really be resolved on the basis of the property rights of each party, so that it is really just a carrying on of the Lockean idea. But ISCT advocates, generally, seem to think otherwise. At any rate, it appears to be an interesting application of the general idea of the social contract to the important case of business activity.

Conceptual Status of the Social Contract

Besides this question of just what the contract will entail in the way of rights and duties for all, there is a fundamental issue of just how or why conceiving the basic rules of society to be the output of something like a "contract" can actually explain anything or have any normative effect. There are two problems here. In the first place, nothing like a literal contractual procedure can have happened—hence the relevance of the oft-voiced quip that "the social contract isn't worth the paper it isn't written on." And in the second place, there is the criticism advanced initially by David Hume that since the obligation to keep our agreements is itself an important part of justice on any reasonable view of the matter, that obligation can hardly be itself due to an agreement to do so.

To this, the contractualist needs to respond with a very fundamental theory about how morals work. Regarding the first, a distinction needs to be made between the sense of "agreement" in which actual contracts consist and the sense of "agreement" in which they need not involve any sort of contract. The first kind is what social contract theory is about: A and B relate to each other in such a way that A will do something *provided* that B does, and vice versa. The second sense of "agreement" is that in which it merely means that the persons in question are of like mind, that is, they "agree" in what they think, even though they have not *made* an agreement. For example, I think that 2 + 2 = 4, and so do you, but we didn't need to "make an agreement" about it. In this second sense, what I think is not in any way contingent on what you think, and vice versa: It's just that we both size up things in the same way. If we were both to think that we ought to do this or that, then we would in the second sense be in agreement—but not necessarily in the first. Now, the social contractualist does think, very essentially, that it is a central feature of morals that each person constrains himself or herself in a way that makes his or her own behavior *contingent* on the actions of others: A will, for example, refrain from inflicting harm and damage on B *provided that* B refrains from inflicting it on A. Now, if both of them see the wisdom of acting thus—which is agreement in the second sense—then the claim that the resulting situation amounts to a "social contract" in the first sense, even though no literal bargaining led up to it, becomes plausible. The sense is that there is a universal requirement of reason that we refrain from certain kinds of actions *provided* that everyone else does so too. (More precisely, A refrains from doing *x* to B provided that B refrains from doing *x* to A, but suppose that C does *x* to D? A is not then necessarily involved. Each has the right to protect himself or herself from the assaults of all others as best as possible, and each likewise has the right to assist others who may solicit his or her help in warding off such assaults. But none of us is released from the requirement simply because somebody somewhere is breaking it in relation to *someone.*) This shows the way in which the social contract theory is distinctive. It does not require that literal contracts have been made, but it does require that the resulting principles make the conformity of one person specifically contingent on the conformity of others.

It is important to appreciate that any individual person may embrace contractualism, whatever others do.

Any particular person can say, "I'll refrain from doing such and such to others, *provided that* they do the same to me." In so resolving, that person behaves very different from the one who resolves to take maximum advantage of others with no regard for their responses: If they resist his intended depredations, he fights harder—or not, depending on his estimate of his chances of victory; and if they do not resist, he takes them for all they are worth, killing, raping, or robbing as he pleases. The contractarian theorist proposes that the difference between those two is the difference between the moral and the amoral; and in the case where his victims were peaceable folk not expecting this kind of behavior, the aggressor is not just amoral but downright immoral.

The Central Problem of Contractualism: Why Be Moral?

This account just given does, however, retain the basic idea that morality is *generated from our interests.* The main point of contractualism is to supply a real explanation of morality that at the same time provides rational motivation for it. We refrain from killing because if others do too, then our life expectancy is greater than if killing is routinely allowed and practiced; we keep our agreements because if others do so as well, then we (as well as they) can reap the benefits of cooperation. In both cases, the problem is that individuals could benefit from breaking the rules if others respect them. Thus, it seems always in each person's interest to break rather than keep the rules. But, of course, if that is general, then the whole thing is pointless. And also the reason for the word *seems* is clear: That everyone's interest is served by paying no attention to promises and having no regard for others is shown to be false by the fact that general practice of that kind leads to a state of complete misery and desperation for all. To commit oneself to principles with such consequences is arguably irrational, not rational.

This is illustrated by the familiar "game" explored in formal game theory known as the prisoner's dilemma. Mutual cooperation, as in keeping one's agreement or refraining from violence, is the second best of the logically possible outcomes for each. But breaking the agreement is better for either—*provided* that the other does *not* break it. For if both break it, then both come out worse than in the mutual-cooperation case. As Hobbes saw, the big problem concerns the case where the agreement is such that one party acts significantly earlier than the other (the case he calls covenant). Why, then, would the other bother to keep his end of it?

The problem, then, is how to motivate people to cooperate under the circumstances. There have been many discussions of this, but in the main there are two serious alternatives. One points to the fact that in society we do not "play" the "game" just once, but rather we do so over and over again. This is called "iteration." In an iterated game of this kind, things are different. If there are a precisely known number of plays, things will break down, for at the last play, the next-to-last move will be to defect, and the other player will know this, and it will all come unstuck. However, if the last move is not known, the situation changes completely. Then the smart money, as they say, is on cooperation, generally speaking. This has become known as the "folk theorem" in game theory. And it is generally true in real life that there is no known, predictable last play. Self-interest, so long as it involves at least a modest interest in the agent's own future, will generally carry the day in favor of keeping agreements.

A very different idea, proposed by Professor David Gauthier, has it that the rational agent will abandon what he calls "straightforward maximization," in which defection would be seen as the rational move, in favor of what he calls "constrained maximization," which calls for cooperating with those who are ready to cooperate and defecting only against those who defect instead. In this, Gauthier's strategy perfectly embodies the essence of the social contract. But it also raises severe questions about how reason is going to get it installed in the psyche of the would-be cooperator. And, of course, it requires solution of a possibly insoluble problem: How do we tell whether the person we are about to interact with will or will not prove to be a fellow cooperator?

All is not lost, however. In the first place, the folk theorem is very much with us. And in the second, game theorists tend to ignore or sidetrack what we may call the sociology, or perhaps the phenomenology, of morals. People do not just act: They also criticize each other (and themselves). They react to what others do, as well as acting as best as they can themselves. Why not assemble, then, a set of directives for which behavior to reinforce and which to condemn, and then go to it? One can plausibly argue that that is exactly what we do and that it works pretty well if not perfectly.

Some argue that the kind of morality that emerges from the social contract idea is too narrow and self-interested to pass muster. Those who say this may perhaps have insufficiently appreciated the effect of prisoners' dilemma. They may also have insufficiently appreciated our extrarational potential for cooperation: Fellow feeling, love of mankind, and a considerable fund of altruism, rational and otherwise, are encouraged in the social contract along with the narrower requirements of justice. The other point is that it is not, after all, settled just what precisely *will* be the "terms" of an appropriate social contract. Would it, in fact, include more than the classical mutual refraining from inflicting harm and damage? Would it include, perhaps, the panoply of contemporary ideas—gender equality, civil liberties, and extensive welfare services, all understood as going well beyond mere mutual nonviolence? It is arguably too early to say with confidence.

The moral level is primarily the individual level, and it is here that the likely upshot of the social contract is that each person's primary obligation is to refrain from harm and damage and to keep whatever agreements he or she voluntarily makes. However, it is plausible also that a minimal amount of positive concern for others would be forthcoming. Where we can help others greatly at a very small cost to ourselves, the social contract arguably says we ought to. Where the cost is large, however, social contract cannot require performance, since *mutual* advantage will always be its general form. But perhaps things will look different at the political level.

Political Contractarianism

There are two different but related ideas of how the contract idea might feed into the creating and sustaining of political institutions. One stems from the Hobbesian idea that morality is too weak to do the job: People's commitment to moral restraints binds us "in foro interno"—that is, it binds the will to the desire that people behave like that—but does not necessarily extend to practice in the real world, that is to say, it does not bind "in foro externo." So the idea of political contractarianism is that we should now call in the state to do the job: An effective sovereign will keep peace among us by threatening us with much more than "mere words" if we fail to perform. The sovereign, in effect, turns what would have been prisoner's dilemmas into no-brainers: If reneging on my contract will cost me a year in jail as well as the loss of whatever goods I was contracting for, then my motivation to perform is likely to be excellent.

The other strain of argument goes in two directions. First, it raises the question whether the level of mutually beneficial activity might be higher when institutionalized. Supporters of the welfare state, in particular, may argue that collectivizing many concerns, such as for health, economic security, and old-age security, will yield benefits that relying on individual initiative may not. And second, it takes the question of conflicts of individual interests to what may be seen as a wider level, namely, that on which the contending parties embrace not just possibly conflicting *interests* but also conflicting *ideologies*—conflicting philosophies of life.

Concerning the first of these, there is no question but that democratic government, especially, has been accompanied everywhere by a great increase in the level of intervention by the state into the lives of citizens in those respects. The question can be asked whether this is a step in the right direction. In one view of the matter, only misinformation, or the tendency of groups to seize powers to extract benefits from others, or both, is responsible for the belief that collectivization can "work" in these respects. Such theorists hold that we would actually do better without the state and that the original social contract limiting the state to prevention of interpersonal mischief remains the best way for all. In another view, the state's activity enables a much larger "social dividend" than would otherwise be possible, and the way to divide it is, as with Rawls, to pay special attention to the needs of the worst off. The latter is the standard view among social philosophers at present, but it can hardly be said to have been "proven."

The problem of rival ideologies is different and arguably more intractable. Can there be cooperation and mutual benefit among peoples at loggerheads over religion and much else? The various parties who differ in these ways, many of them perhaps ready to resort to lethal weapons to press their ideas on others, may well be tougher customers than individual parties acting in their own particular interests. Sectarianisms of various kinds bring people to intense, prolonged, and profound clashes, historically and in contemporary times. The contractarian proposes that even these deeply conflicting ideologies can benefit from cooperation, enforced by a strong state in which each participates, or at least by the kind of interstate cooperation that, again, is scarcely possible on the individual level.

Not all, but a great many, of historically actual cases of such conflicting group beliefs are religious in nature, and the classic liberal solution—which is surely the solution suggested by the social contract—is the principle of freedom of religion. Why would differing religions accept such a principle? The reasons are pretty strong. Neither can expect to persuade the others of their "errors" in any short term, and meanwhile, if they instead resort to force, there will be war—and war of a particularly vicious kind. Each will have to decide whether the expected costs outweigh any benefits that might derive from subduing the other parties, but the contractarian will argue that it is a plausible bet that they will indeed do so—especially since sectarian war making will also endanger the lives of bystanders, potential trading partners from otherwise noninvolved parts of the world, and so on. History makes it easy to believe that the consequences of uninhibited religious warfare are thoroughly horrible for all—the Thirty Years' War in Germany in the 17th century stands as a classic example. So if what it takes is a strong state to enforce a kind of general treaty that people will refrain from trying to promote their religious ideals by force, the contractarian argues, then we'll all be ahead if we support such a state. Even in strictly religious terms, it may be further argued that no one will lose, since their prospects of genuinely promoting their religions by means of force are virtually nil anyway. This sets the stage, we may suppose, for general acceptance of religious liberty as a principle to be recognized and enforced by governments everywhere—or, at least, everywhere that there is any religious diversity, which is virtually everywhere. The contractarian may also argue, of course, that the level of individual creativity on ideological as well as other fronts is likely to be much higher when people can live without fear that others stand ready to do violence to them for even thinking about these matters. So long as all are free to accept or reject any given thinker's ideas, what do we have to fear? And the major contractarians have, of course, always supported strong principles of religious and other freedoms for these reasons.

Social Costs

The term *social cost* refers to the larger effects on society of externalities created through productive economic activity. The theory of social cost attempts to analyze the total cost of economic activity, including not only the cost to those directly involved in the transaction but also to society as a whole. It attempts to allocate responsibility for harm caused by economic activity among the various parties affected. This theory has application across a broad spectrum of economic activities, but it is particularly important in evaluating the environmental impact of certain kinds of production. By attempting to assess the effects of externalities on the surrounding community, it seeks to determine how best to account for and correct for those externalities, with the goal of minimizing the overall harm caused by production.

A common example involves two industries that use the same area, such as a fishery and a factory situated adjacent to one another. The fishery relies on clean water to raise its fish, while the factory uses the lake to dump polluting chemicals. By dumping into the lake, the factory causes harm to the fishery, thus imposing a cost on agents who are not involved in its production process. Social cost theory seeks to determine what kind of compensation, if any, is owed to the fishery by the factory.

One possible approach would be to require that the factory, as the polluter, bear the cost of cleaning up the damage caused by its pollution, restoring the lake as much as possible to a pristine condition. To do so, however, would be to impose a cost on the factory in the name of the fishery, thus making the factory liable for the fishery's loss. Alternatively, the factory may choose to install pollution filters that would prevent the lake from becoming contaminated, but this would still impose a cost on the factory for the sake of ameliorating a cost to the fishery.

Another approach would involve government regulation of the polluting industry to reduce the externalities and the attendant harm to others. This could be done in a number of ways. Government might come in as a neutral arbitrator among the various parties to balance the relative costs and benefits of the various options available. Alternatively, it might require the polluting industry to install the filters that it might otherwise have found to be too costly. It could also choose to levy a fee on the industry—requiring it to pay according to the amount of damage done. In theory, this governmental intervention will allocate responsibility on the basis of the source of the pollution. The most well-known approach to this strategy is a "Pigou tax" (named after British economist Arthur C. Pigou, who developed the idea in which fees are levied on a per-unit basis according to the cost of the pollution, with the goal of "internalizing" the costs of the externalities, creating an incentive for industry to create fewer polluting emissions). In practice, such governmental interventions are often less than optimally efficient and are looked at askance by many economists, particularly those of the more libertarian persuasion.

A variety of market-based solutions has been proposed to deal with social costs apart from (though sometimes in cooperation with) government intervention. One example of such a market-based solution allows firms to trade "pollution credits," through which those industries that find it difficult to bring pollution down to an acceptable level would be able to buy the right to emit more pollution from those industries that are able to reduce their pollution below those levels. This seems to have had some success in reducing pollution in some areas but does not solve the problem of social cost as much as it does relocate it, as those industries that are engaged in heavy pollution are simply enabled to continue doing so through the allocation of a right to pollute. This strategy is similar to, though not identical with, the Coase theorem.

Ronald Coase argued in "The Problem of Social Cost" that the key problem in evaluating responsibility in cases such as this is that the harm caused is not one-sided. It is not simply the case that the factory is harming the fishery through its pollution. It is also the case that by requiring the factory to compensate the fishery, the factory is being harmed. Coase argues that, in the absence of liability for the damage caused by the fishery, the allocation of resources will be identical to what it would be if the factory were made liable. In other words, requiring the factory to compensate the fishery does not produce any more efficient an economic outcome than not requiring compensation.

The Coase theorem states, "If property rights are fully allocated, competition leads to efficient allocations." That is to say, when the right to property is clearly articulated (e.g., who owns the lake in our example above), market forces will determine how responsibility is to be apportioned. Thus, if the fishery owns the lake, the factory may choose to pay it for the right to pollute in its water rather than install filters. Alternatively, if the factory owns the lake, the fishery may pay the factory to install the filters. However, all this assumes that there are no transaction costs associated with the transfer of the relevant rights. Such transaction costs are inescapable, however, and Coase argues that in matters of economic and social policy, it is only by examining the allocation of transaction costs that it can best be determined how responsibility should be allocated.

This theory raises several interesting questions. For example, does the creation of an efficient system for allocating transaction costs according to property rights necessarily address the moral question of whether some form of social justice is thus achieved? Is the economically most efficient solution, in other words, necessarily the fairest?

Furthermore, Coase's theory seems to assume that all property rights are fully allocated and, thus, there exists no "public property," or even any "public goods." All goods are understood as private goods that can be negotiated among private parties. Even in such a set of circumstances, however, there may be public implications to these private transactions that are not accounted for in the transaction costs. In accepting the Coase theorem, are we thereby committing ourselves to a total rejection of the principle of public goods? Is there any way, given Coase's principles, that any conception of "common resources" can be maintained?

Even were one to conclude that the Coase theorem offers the most economically efficient answer to the question of social cost, it does not necessarily answer the moral questions associated with the problem.

Each of these strategies—whether legal, regulatory, or market based—has its pros and cons. It is only on the basis of a pragmatic evaluation of the actual harm done and the actual solutions that are available in a given set of circumstances that it can be determined what course of action should be followed. In some cases, governmental action may be the best course available; in other cases, market forces will do the job better. The moral principle underlying the entire question of social cost is whether those who have not given their assent to be affected in a particular way by a particular industry are entitled to some form of protection from or compensation for the harm to which they are subject. Although the various solutions offered disagree on the answer to the question, and the mechanisms by which protection or compensation may be given, they recognize the question as a valid issue to which economics owes society an answer.

Social Discount Rate

The discount rate adjusts future benefits and future opportunity costs for accurate comparison with present values. Other entries for "Discounting the Future" and "Net Present Value" explain the mathematics of discounting to net present value. The social discount rate is the discount rate that should be applied to cost-benefit analysis of government investment projects generating benefits and costs over time. In economic theory, such government projects should provide public goods demanded by consumers who will not voluntarily reveal their true preferences in terms of paying for those goods. A prominent example is water resource projects for irrigation and electricity.

A simple illustration demonstrates the role and importance of the social discount rate. Suppose that a specific water resource project yields annually a 7% net benefit above opportunity cost. (In nominal dollars, $100 of cost incurred annually produces $107 of benefit.) Each year out into the future, the net present value of this 7% net benefit declines. The social discount rate determines the rate of that decline in net present value. If the social discount rate for a government project is set at 10%, then the project should not be undertaken because the net benefit of 7% annually is less than the social discount rate for the optimal allocation of the resources to be consumed as opportunity costs. If the social discount rate for a government project is set at 4%, then the project should be undertaken because the net benefit of 7% annually is greater than the social discount rate for the optimal allocation of the resources to be consumed as opportunity costs. Whether to undertake the project or not depends on the proper social discount rate.

In economic theory, the discount rate should equilibrate demand for savings by investors and supply of savings from savers. A saver does not spend his or her full income on current consumption. How much to save involves a comparison of the value of current consumption in relationship to future consumption. The discount rate is effectively a rate of compensation for deferring current consumption to future time periods.

The social discount rate selected for a government cost-benefit analysis is an important decision. It should reflect the true social opportunity cost of public investment. In economic theory, cost-benefit analysis should result in a mix of government and private market investments that maximizes overall social welfare. Government investment choices may displace private investment, reducing the future supply of private goods.

There are two schools of thought concerning selection of a social discount rate. One school argues that the private market rate of interest should be used to evaluate government projects. The argument is that, since government investment may reduce private investment, government projects should show at least the same rate of return as private projects. Otherwise government investment funds should remain in private hands. This argument assumes relatively strong capital market efficiency. In technical language, the market interest rate should equilibrate the marginal rate of time preference by savers with the marginal rate of return on private investment, and the market interest rate should be the same as the marginal rate of social time preference. The other school of thought argues that private citizens are shortsighted in evaluating present consumption of private goods relative to investment in future consumption of public goods. The marginal rate of social time preference is in effect too high. The argument is that government should exhibit greater patience than private citizens to promote the long-term welfare of society. Long-term welfare involves intergenerational equity.

This theoretical debate is of great practical importance. One school argues that the market rate of interest should be used in evaluating government projects. This rate would tend both to reduce the number of projects approved for funding and to favor projects with early benefits. The other school argues that the government bond rate should be used. The U.S. government bond rate is effectively risk free and thus significantly lower than the market rate of interest (which includes a risk premium). This rate would tend both to increase the number of projects approved for funding and to favor projects with highest total benefits independently of opportunity costs. Thus, a related controversy is what risk associates with a specific government project as distinct from the total pool of government investments.

The theoretical debate has marked bearing on competing philosophies of business and society. The libertarian theory of society argues in effect that the social discount rate should be relatively high. Most aspects of society should be left to private voluntary choices exercised by individuals, who are best situated to determine their own best interests. Libertarianism is strongly opposed to government activity. Socialism argues in effect that the social discount rate should be relatively low and certainly well below the market rate of discount. Many aspects of society and markets should be taken over by the government, because individuals are often mistaken about their own best interests and the best interests of the collectivity.

SOCIAL EFFICIENCY

The term *efficiency* is used in a variety of contexts. For example, engineers use the term to denote the ratio of output to inputs for specific physical activities. The engineering concept of efficiency is similar to the economists' concept of technical efficiency. A production activity is technically efficient when the maximum possible amount of physical output is being produced for a given quantity of inputs. These concepts of efficiency imply that there is no "waste" in the production process; however, physical measures of efficiency do not necessarily imply that society is as well-off as it could be given the resources that are being used to produce existing rates of output. This is because physical measures of output do not take into account the value that society places on different outputs. In the extreme, for example, an economy might produce the maximum feasible quantity of a given set of products given existing best-practice technology, even though there was little demand for those products on the part of consumers. Clearly, society would not be well served by an economy functioning in this way. From a social perspective, an economy is performing efficiently when productive resources are used so as to maximize the *value* of output produced. Put differently, social efficiency is defined as the condition whereby it is impossible to reallocate productive resources to different activities so as to create a more valuable set of outputs.

Measuring Value

An obvious question that might arise is, "How are *social* values of different outputs and inputs established?" After all, consumers are unlikely to have identical tastes and preferences, while workers, landowners, and other suppliers of inputs are likely to differ in their skill levels and other endowments. Hence, members of society will differ in their individual valuations of the many different outputs and inputs that characterize economies. In capitalist economies, the forces of supply and demand establish the values of outputs and inputs. Specifically, market-clearing prices, that is, prices that equate supply and demand, ordinarily serve as measures of value. The reliance on market-clearing prices as measures of social value can be conceptually justified by acknowledging that buyers should be willing to pay, at a maximum, what any quantity of a good is worth to them rather than go without that good. This implies that the market demand curve for a good should represent the valuation that consumers, in the aggregate, place on different quantities of the good. Similarly, sellers should be willing to supply to buyers any given quantity of a good only if the price received at least covers the incremental cost of supplying that quantity. This, in turn, implies that the market supply curve for a good can be taken to represent the incremental cost of supplying different quantities of the good in question. Under reasonable assumptions, the market demand curve is presumed to be downward sloping, while the market supply curve is presumed to be upward sloping.

If markets function reasonably well, prices will adjust so as to equate supply to demand. Under several specific assumptions that will be discussed in the next section, the market-clearing price that equates supply to demand can be taken as a measure of the value that society places on the last unit of output produced and consumed. This is because, as noted above, the demand curve is an expression of the monetary value that consumers place on various amounts of a good. At the same time, the market-clearing price also measures the incremental cost of producing the last unit of output sold, since the supply curve is a schedule of the incremental cost of producing various amounts of the good in question. Hence, the market-clearing price establishes the monetary value of the marginal unit of any product and equates that value to the incremental cost of producing the marginal unit. This analysis applies equally to products sold for final consumption or for use as inputs in further processing activities.

The Concept of Social Surplus

If the market-clearing price represents both the value that consumers place on the last unit of output consumed and the incremental cost of producing that last unit, it can be easily shown that society is as well-off economically as it can possibly be at the market-clearing equilibrium. The relevant concepts here are consumer surplus and producer surplus. Consumer surplus is defined as the maximum amount that consumers would willingly pay for any quantity of output (rather than go without the product) less the amount that they actually pay. The maximum amount that consumers would willingly pay is the area under the demand curve corresponding to any quantity purchased. The amount consumers are actually required to pay in the marketplace is the price of the product multiplied by the quantity purchased. The difference between the amount of money that consumers are willing to pay and the amount that they actually pay is a measure of how much better-off consumers are by purchasing any given quantity of a good.

Producer surplus is defined as the amount of revenue that producers realize in the marketplace over and above the minimum amount they require to make their product available to buyers. The former is equal to price times quantity. The latter is the area under the sellers' supply curve corresponding to any quantity supplied. Producer surplus is therefore a measure of how much better-off sellers are as a result of supplying any given quantity of a product. The sum of producer and consumer surplus is called *social surplus.*

The concept of social efficiency is directly linked to the concept of social surplus. Specifically, if social surplus is being maximized at the current market-clearing price and quantity, it is impossible by definition to make buyers and sellers collectively better-off by choosing a different combination of price and quantity. That is, any reallocation of resources that leads to more or less of the good in question being produced will reduce the value that society realizes from economic activity in the market in question. Simply put, it is not possible to reallocate productive resources to create more value to society as represented by consumers and producers. Hence, the existing amount of production can be said to be socially efficient. Moreover, if social surplus is maximized in every individual market, the collection of those markets—that is, the entire economy or society—can be said to be efficient.

Some Caveats

As noted above, reliance on market-clearing prices as measures of social value rests on specific assumptions that should be made explicit. Perhaps the key assumptions are that the demand curve fully reflects the social value (or benefit) of consuming different possible quantities of a good, while the supply curve reflects all costs *to society* associated with producing different quantities of the good. The relevance of these assumptions can be illustrated by assuming the counterfactual, for example, some costs of producing a good are incurred by members of society other than the producers of that good. This situation is often invoked when scientists discuss the phenomenon of environmental externalities.

Externalities

In the presence of cost externalities, the market supply curve will not reflect all costs to society. Rather, it reflects only the costs incurred by producers of the good. As a result, at the market-clearing quantity and price, it is not the case that the value consumers place on the last unit consumed equals the cost to society of producing that last unit. Since producers ignore costs that are incurred by others, at the market-clearing price and associated quantity, costs to society must be greater than the costs to producers or the benefits to consumers. The socially efficient output rate will, therefore, not be produced in the presence of cost externalities such as air and water pollution. Indeed, society would be better off if less of the product in question were produced. If producers could somehow be made financially responsible for the external costs that they impose on society, the producers' incremental costs would increase by the monetary value of the cost externalities that they create. This, in turn, would require producers to charge higher prices and result in less output being produced and sold at the market-clearing price.

Cost externalities are ubiquitous in market activities and their widespread presence provides a theoretical justification for government intervention into the free market. Air pollution from burning fossil fuels such as coal is a prominent example. Steel factories, for example, use coal intensively as a fuel, and the particles from the heated coal were a major source of air pollution in the Great Lakes area where steel plants are located. Federal government requirements for factories to install "scrubbers" in smokestacks have dramatically reduced this source of pollution, as the scrubbers catch much of the particulate released before it can escape into the atmosphere.

Demand externalities are seen by economists as being much less ubiquitous than cost externalities, although the presence of demand externalities provides an equally compelling theoretical rationale for government policy intervention into private sector activity. Put simply, the free market will fail to produce a socially efficient output rate in the presence of externalities. In theory, government intervention can encourage the attainment of social efficiency by ensuring, through one means or another, that external costs (or benefits) are fully incorporated into the production and consumption decisions of private sector participants. Precisely which policy is preferable to best accomplish this purpose is a complex issue that is well beyond extended discussion in this entry. As a rule, economists recommend that public policies infringe as little as possible on free market activities while ensuring that externalities are incorporated into the free market process. As such, economists argue that the absence of clearly defined and enforceable property rights is frequently the underlying source of externality problems and that the establishment of such rights by regulators or courts is, therefore, often the preferred public policy response.

Market Power

Another critical assumption underlying the case that market prices reflect social values and promote the realization of social efficiency is that those prices are determined in competitive markets. By definition, markets are competitive when no single seller or buyer, or any group of sellers or buyers, has the ability to influence prices by the amount he or she sells or buys. If this condition is violated, sellers or buyers are said to enjoy market power. As a general statement, when market power exists, the equilibrium output rate will be less than the socially efficient output rate. The impact on price depends on whether sellers or buyers enjoy market power. When sellers possess market power, the equilibrium price is likely to be higher than the competitive price, while the opposite is true when buyers enjoy market power. Once again, a theoretical argument exists for government intervention into private sector markets. In this case, government intervention would presumably seek to mitigate market power and restore competitive pricing. Antitrust laws are the basis for preventing the accumulation of market power, as well as its exploitation. As in the case of government regulation to address externalities, there is controversy concerning whether the application of antitrust laws moves markets closer or further away from social efficiency, although most economists support government efforts to ensure competition.

Fairness

As noted above, social efficiency implies that the maximum value of output is being produced given the available inputs an economy possesses. An equivalent statement is that a nation's real income is as high as it can be given its productive resources. It does not imply that the distribution of the real income produced is *fair* or even acceptable. For example, free market activities could produce an outcome where a relatively small number of people enjoy extremely high incomes while many others suffer in poverty. Where substantial inequalities in the distribution of income are widely regarded as unfair, policies will be implemented to reallocate wealth from the "rich" to the least well-off. The public policy goal in this context is to accomplish income redistributions while maintaining efficient production, that is, socially efficient output rates, to the greatest extent possible.

A prominent public policy issue is whether there is a necessary trade-off between social efficiency and "equity." To be sure, any analysis of this issue requires a precise definition of what is meant by equity. For example, if equity is defined narrowly as the uniform application of rules of law to all individuals without discrimination, there is no reason to believe that social efficiency will be harmed by the pursuit of equity. On the other hand, if equity is defined more broadly to encompass approximate equality in material standards of living rather than just equal rights under the law, the potential for conflicts between social efficiency and equity is both real and complex.

A consideration of this potential conflict is well beyond the scope of this entry. Suffice to say, economists and other social scientists are uncertain about the precise nature of the relevant trade-off; however, there is some agreement that large divergences across households in material standards of living will lead to social conflict and other pathologies that, in turn, can seriously harm production and the efficient functioning of markets. Conversely, efforts to eliminate income disparities through progressive taxation and social welfare programs can, beyond some point, encourage inefficiencies such as the growth of the "underground" economy, black markets, and long-term unemployment.

Conclusion

The pursuit of social efficiency ultimately reflects the importance to society of maximizing society's overall standard of living where living standards include both material and nonmaterial goods. For example, music and leisure can be as much a part of a nation's standard of living as flat-screen televisions and BMWs; however, social efficiency is not equivalent to social welfare. The latter is a broader concept that encompasses considerations such as equitable distributions of income, natural justice, and morality. Policy makers may need to balance among these different components of social welfare where they are not completely complementary.

Social Engineering

Social engineering is the design and implementation of systems and incentives in a human group, institution, or community to accomplish explicit objectives in its allocations of well-being. Examples of such systems and incentives include socially responsible investing and subsidies, taxes and other confiscations of private property, regulations, and socialism.

Social engineering is intended to bring about a moral and fair society. It focuses attention on an intended just distribution throughout society of basic human rights (e.g., housing, health care, food, etc.) and negative freedoms (e.g., freedom from want). One example of social engineering is the affirmative action programs in the United States. These are government orders and regulations intended to bring about ethnic and racial diversity in the important U.S. institutions of commerce, education, and housing. Other examples include minimum-wage laws intended to reduce the ranks of the working poor and private social entrepreneurship ventures intended to fundamentally change the distribution of well-being in poor social segments.

Social engineering effectiveness depends, in large part, on the integrity of decision makers to act for the benefit of society and without regard for their personal self-interest. Important ethical principles include integrity, honesty, social responsibility, compassion, empathy, the avoidance of conflict of interest, and justice.

There are trade-offs between moral ideals and real-world consequences that call for consideration of positive and negative rights (e.g., freedom for autonomous individuals to make choices vs. freedom from poverty). A consequential, or teleological, approach to social engineering suggests cost-benefit analysis and feasibility issues not likely to be included in deontological, or purely philosophical, approaches. Ethical issues concern the need to balance between commutative and distributive forms of justice. For example, distributive justice principles support a socially engineered society in which people who score well on standard tests receive the same social allocation of welfare as people who score poorly; commutative justice supports engineering society to give all test takers fair access to social institutions where their natural endowments can take them as far as their talent enables.

To ensure smooth functioning of social engineering, government must enforce regulations, raise funds to finance social projects, seize private property that can be put to better social uses (the practice of eminent domain), and monitor the activities of society along dimensions of interest to social engineers. Important ethical issues here are balancing positive and negative rights (e.g., freedom to act vs. freedom from harm), self-interest versus utilitarian benefit, and individual autonomy versus social welfare.

One important issue in the practice of social engineering is that the definition of *well-being* is subjective, that is, based on individual perception. This calls attention to issues of fairness in the process of engineering society. Self-interested individuals want to effectively participate in the group, institution, or community to increase their personally defined welfare, subject to the rights of others. The rights of others, however, may call for personal sacrifice for the gain of others. The ethics of persuasion are important in this process of social engineering.

Adam Smith wrote (*Wealth of Nations*, 1776) that free self-interested exchange most efficiently uses society's resources to bring about social welfare. A laissez-faire approach to social engineering, grounded in ethical principles of economic efficiency, designs and implements systems and incentives to ensure the smooth functioning of free markets. Important ethical principles in this approach include cost-benefit analysis, honesty, trust, contract, autonomy, liberty, compliance with government requirements, and private property.

Social Entrepreneurship

Social entrepreneurs create social value through the use of the entrepreneurship model. Social entrepreneurship relates to many business forms but fundamentally exists as a model that organizations are able to use in pursuit of goals directed toward building value for the society within which they are embedded. Organizations built on this model follow closely with the traditional path of entrepreneurship, pursuing perceived opportunities to achieve their goals. The key to understanding social entrepreneurship lies in acknowledging that it transcends traditional business model boundaries and can occur in any sector of business, such as in the private for-profit or not-for-profit sector or in the public sector.

To engage in social entrepreneurship, the organization is typically driven by a social entrepreneur. The social entrepreneur shares many similar skills with the traditional entrepreneur. These shared skills are identified as designing a mission with the core purpose to create and sustain value; pursuing new opportunities to serve the mission; engaging in continuous innovation, adaptation, and learning; acting boldly without being limited by the resources currently available; and exhibiting a level of heightened accountability to the stakeholders affected and for the outcomes as a result of the mission. The distinguishing factor for social entrepreneurs is that they create *social* value through the use of this model to create economic value.

While the entrepreneurial skill set is very similar between the traditional entrepreneur and the social entrepreneur, there is a large difference regarding their individual value orientation. Social entrepreneurs are more likely to have experienced some sort of transformative experience during their life, which pushes social improvement to the front of their core values. Most social entrepreneurs are also very active in the social sector throughout their lives, beginning at an early age. This social activism is then combined with their entrepreneurial skill set to enable them to pursue their social missions through social entrepreneurship.

Social entrepreneurship can often be confused with other business models or practices that are designed to create accountability to society within the business sector. Two other terms that are sometimes misused are *social ventures* and *social enterprises*. Both social ventures and social enterprises are the legal entities that are created as an end result of social entrepreneurship.

It is also useful to distinguish between a social venture and a social enterprise. Most frequently, the term *venture* is used to describe organizations that are the result of a venture capital investment, but with social ventures this is the result of social venture capital. The term *enterprise*, on the other hand, is typically associated not with an organization built on venture capital but with one that secured its financing through other means. Regardless of the methods of financing, both social ventures and social enterprises are two possible outcomes of social entrepreneurship. Social entrepreneurship must also be differentiated from terms such as *sustainable enterprises*, *corporate social responsibility*, and *business ethics*. While it is possible for a social venture, or a social enterprise, to practice social responsibility or sustainability, they are different concepts within the same theoretical sphere of social awareness.

A Brief History

Although social entrepreneurship has only recently received significant academic and professional attention, the fundamental concept has been in practice by individuals throughout the history of business enterprises. Some examples from the past include David Brower (the United States), Vinoba Bhave (India), Florence Nightingale (the United Kingdom), and Jean Monnet (France). David Brower was the Sierra Club's first executive director and built it into a global network designed to serve environmental issues. Vinoba Bhave founded the Land Gift movement in India, allowing the redistribution of more than 7,000,000 acres of land to the landless untouchables, individuals who were low-caste Hindus and viewed as "polluted" and separated from the rest of society. Florence Nightingale revolutionized health care through the foundation of the first school for nurses. Jean Monnet led the reconstruction of France after World War II and established methods to integrate Europe economically.

These individuals pursued their missions and extensively influenced the societies around them through creativity, leadership, and a vision of social improvement. These acts are distinguished from those of other socially conscious individuals by the entrepreneurial methods used to pursue their social goals. These social entrepreneurs paved new paths to pursue these ideas. Individuals such as these, along with countless social advocacy groups and community initiatives, have all set the foundation from which the current identity of social entrepreneurship has been derived.

Social entrepreneurship began to gain visibility and definition through the work of Bill Drayton and his founding of Ashoka in 1980. Ashoka became the first to pioneer into the concept of "social venture capital," providing funding for entrepreneurial individuals in pursuit of social change through innovation. The founding of Ashoka marked the beginning of social entrepreneurship as a functional and practical business theory. As social entrepreneurship continues to gain prominence and validity, it is becoming an increasing popular topic of academic discussion.

With the increase in practical applications of social entrepreneurship, it has become clear that it is a viable model within any of the business sectors. Social entrepreneurship is often categorized as a cross-sector model, in which the organizations applying the model often lie somewhere in the middle of the continuum that runs between the private for-profit and not-for-profit sector and the public business sector, blurring the boundaries of these traditional business sectors. However, as blurred as these boundaries may become, the legal distinctions between organizations in each of these sectors still exists, making it useful to examine the distinctions between each.

The For-Profit Sector

Social entrepreneurship within the for-profit sector references organizations that are legally defined as existing to generate profit, while the organization defines its primary mission as one grounded in social improvement or development. When considering these for-profit organizations, it is important not to confuse the act of social entrepreneurship with the act of stewardship. The stewardship model describes organizations that acknowledge their responsibility to society and act on those responsibilities but still identify their primary objective as that of generating profit. For the for-profit social entrepreneur, the ultimate objective is to design a process that allows the organization to generate profit as a by-product of its improvements to society, as opposed to generating social value as a by-product of profit.

By maintaining the for-profit business model, it is easier for these organizations to achieve long-term financial sustainability. This occurs because the organization is often more successful at obtaining sustainable revenue streams. These revenue streams are more stable because the organization understands that its products must not only be socially beneficial but also just as attractive as a competitor's product, even if the competitor isn't driven by the same social standards. This is the result of consumers who may not know, or care, about the social mission behind the company.

Another variation of social entrepreneurship also occurs frequently within the for-profit sector—social intrapreneurship. Similar to social entrepreneurship, social intrapreneurship has become increasingly popular over the last decade. The distinguishing characteristic of entrepreneurship and intrapreneurship is that intrapreneurship occurs within preexisting organizations, often creating extensions of the same business or expanding into new businesses. One of the attractive features of intrapreneurship is the ability to fund these efforts through the preexisting organization. Thus, often the efforts of intrapreneurship are more successful because the risk of financial failure is smaller when the organization is backed by a secure revenue stream.

Excellent examples of for-profit social entrepreneurship can be found in organizations such as Newman's Own or Ben & Jerry's. Founded in 1978 by Ben Cohen and Jerry Greenfield, Ben & Jerry's began with a single ice cream shop. Explosive growth netted Ben & Jerry's sales of more than $155 million by the year 2000, amid rumors of Ben & Jerry's becoming the target of takeover interest. The rumors were confirmed as Ben & Jerry's was acquired by Unilever, an Anglo-Dutch corporation, in early 2000.

Nothing in the foregoing overview captures the spirit of social entrepreneurship undergirding Ben & Jerry's. In 1985, company founders Ben and Jerry institutionalized their long-standing commitment to social and environmental issues by establishing the Ben & Jerry's Foundation, funded through donation of 7.5% of the company's annual pretax profits. The company has not relegated its social and environmental action to its funding of the Foundation. At every decision point, the leadership of Ben & Jerry's has sought to provide social benefits from the ongoing operation of their primary business. Among many other initiatives, in a successful effort to divert its ice-cream waste from the local wastewater treatment facility, Ben & Jerry's began feeding a pig farm with its ice-cream waste; the company helped establish a nonprofit initiative known as "1% for Peace"; they came out against bovine growth hormone, based on concern about its adverse economic impact on family farming; introduced Rainforest Crunch ice cream through its scoop shops, with sales of the ice cream indirectly benefiting rainforest preservation efforts; and to help combat Vermont dairy farmers' losses during a period of volatile prices in the dairy industry, Ben & Jerry's paid a dairy premium totaling half a million dollars to the family farmers who supply the milk for Ben & Jerry's ice cream.

The Not-for-Profit Sector

Not-for-profit social entrepreneurship is represented by organizations that have legally defined themselves as existing for some other purpose than to generate profit, a direct inverse to for-profit organizations. However, within this model, many of these organizations are engaging in what would typically be classified as for-profit business practices to attain sustainability within their business model.

Within the not-for-profit sector, three primary types of organizations exist—public benefit, mutual benefit, and religious. The most common use of social entrepreneurship within this sector is within those designated for public benefit. This is because of the nature of the models; a public benefit not-for-profit exists to benefit the public. Both mutual benefit and religious not-for-profits are less focused on widespread social improvement and are more focused on providing services for a very specific audience. However, it is still possible for social entrepreneurship to exist in each of these types.

The social entrepreneurship model is often mistakenly associated with social activism within the not-for-profit sector; however, the two concepts are fundamentally different. Social activists pursue a social goal as their main mission but are distinguished from social entrepreneurs because they pursue these changes external to the business environment. The distinguishing factor in social entrepreneurship is that these organizations pursue their social goals while simultaneously engaging in market-driven activities. Organizations acting in this sector are typically less financially independent than those in the for-profit sector. With not-for-profit organizations, the fiscal gains through entrepreneurship act less as a method of profit generation and sustainability and more as a method of offsetting their costs or expanding their programs. While they are not as financially independent as their for-profit counterparts, the offset expenses do allow these organizations to engage in more creative opportunities that may not be possible through grants and donations alone.

However, with the expansion of revenue streams for these organizations, an issue arises with the allocation of these subsidizing revenues. Within the United States, any income a not-for-profit generates that is not substantially related to the social purpose of the organization becomes taxable. This is the result of the competition for the consumer's purchasing power. Many for-profit organizations feel that without the tax an arena is created for unfair competition. For many not-for-profit organizations, this means that becoming entrepreneurial and seeking new revenue streams may not be as effective as hoped.

Ben & Jerry's is again instructive on this point. Perhaps the company's most notable foray into social entrepreneurship has been the establishment of the PartnerShop program, a series of scoop shops that are independently owned and operated by community-based nonprofit organizations. Ben & Jerry's waives the standard franchise fees and provides additional support to help nonprofits operate strong businesses among youth and low-income folks by providing economic development and employment opportunities. It should be noted that social entrepreneurship has been around for centuries in the form of enterprises such as gift shops and thrift shops associated with churches and museums.

The Public Sector

Outside of entrepreneurship in the private sector, it becomes more difficult to engage in social entrepreneurship, often because of inherent political and administrative constraints. Whereas the not-for-profit organization can be burdened with donors and grants who have predefined goals for the organization, the public organization is also held to often more stringent preestablished rules, regulations, and legislation. However, where the public sector has succeeded in engaging in social entrepreneurship, such efforts have enabled the institutions to expand beyond their previous constraints, thereby increasing the effect and reach of their mission. The driving force for entrepreneurship in the public sector has been a combination of a need for increased resources to fund specific programs and for a way to counteract the perceived inefficiencies of government programs.

Given that entrepreneurial activities such as risk taking are often looked down on by the public and government officials, social entrepreneurship often occurs much more frequently than intrapreneurship. Typically, entrepreneurship occurs when tasks are outsourced from local governments to organizations created specifically to coordinate specific tasks for the government outside of the public sector where it is able to function beyond the typical regulatory constraints. These organizations are then able to not only support the programs or entities they were designed to support through their services or products but are also able to generate extra revenue by expanding their programs to other organizations that can derive benefit from them.

There exist numerous examples of social entrepreneurship within the public sector. Following years of developing customized information technology applications for in-house use, the City of San Diego outsourced its information technology function to a standalone not-for-profit entity, the San Diego Data Processing Corporation. One principal goal of this initiative has been to successfully market government-specific technology applications to other California municipalities, all the while continuing to meet the technology needs of the elected officials and staff of San Diego. Product endorsements and "city stores," which sell items such as customized street signs, are becoming increasingly common; at the state and national levels, adopt-a-highway programs represent efforts by governmental agencies to engage in social entrepreneurship that serves to offset the high cost of road maintenance through revenue-generating alliances with private business enterprises.

Securing Funding for Social Entrepreneurs

Similar to profit-oriented entrepreneurship, social entrepreneurship is often a process undertaken by individuals who have a vision and are pursuing that vision. Funding for these ventures can come from grants, donations, or what has been called social venture capital. Social venture capital, first defined by Ashoka, is the process of securing funding to advance the interests of the organization through investors who wish to have a stake in the organization. As such, social venture capital is often focused within the for-profit sector of social venturing; however, it is possible for social venture capital to be invested in not-for-profit sector ventures as well.

An important issue in building social venture capital has been designing a way for investors to receive feedback from the organizations they have invested in to know whether their investment has been successful or if the organization is not doing as well as it should be. In the typical venture, this can be done through simple financial analysis and benchmarking as the organization develops and evolves. With a social venture investment, this is much more difficult because of the difficulty of measuring social impact. The success with developing these social feedback tools is evident through the rising number of organizations that have been created to provide social venture capital such as Ashoka, Social Venture Partners, the Social Venture Capital Foundation, the Schwab Foundation, and others.

Measurement Tools for Social Entrepreneurship

Regardless of the sector social entrepreneurship occurs in, it has become increasingly important to design methods to measure the impact social entrepreneurship has on its stakeholders. Much of the measurement throughout its history has relied on qualitative, case-based research. While this type of research has been able to define the areas that social entrepreneurship affects, it is less effective at measuring the actual level of impact that it has on society. The need for measurement has led to the development of tools that allow organizations to measure both financial and social impact. This is frequently called double-bottom-line (DBL) or triple-bottom-line (TBL) analysis. TBL divides the goals of an organization into three sectors—social, environmental, and financial. DBL divides the goals into two sectors—social and financial. DBL is the more often cited tool within social entrepreneurship, but both attempt to achieve the same goal of dividing the organization's impact into defined areas and measuring the effectiveness of that impact in each area.

To measure the goals of an organization using DBL, they are often redesigned in a way that allows the impact on society to be quantitatively measured. This enables the organization to track the success or failure of its social initiatives similarly to that of a financial initiative. Columbia University's Research Initiative for Social Enterprise (RISE) is one group that has contributed to this research. They have identified and analyzed several methods for identifying and measuring social impact. Their efforts have identified social impact measurement in three key areas of analysis—processes, impact, and monetization. Process analysis allows organizations to measure the correlation of their outputs with their social goals. Impact analysis allows organizations to analyze the effect these outputs have on society and compare them with the next best alternative for their resources, a method that is equivalent to measuring the opportunity costs of the organizations' operational processes. Monetization analysis allows the firm to place dollar values to its social impact and is the most effective in demonstrating a direct correlation between money invested and the social return.

One example of monetization analysis is social return on investment. This method, designed by REDF (formerly the Roberts Enterprise Development Fund), is used to develop a cost-benefit analysis of a social project. Rubicon Landscape Services used this method to analyze the impact their organization made by employing people with disabilities and economically challenged individuals. By calculating the amount of money they were saving the government in social service costs and the amount of additional tax revenue generated through their employment, they were able to measure the impact this program had on society with a precise dollar amount.

All three measurement methods enable the social entrepreneur to gauge his or her success at using the organization's resources in the most effective manner to support the social mission. In addition to the RISE project, many other organizations have also begun developing their own private and publicly available measurement tools, which provide a way for social venture capitalists to measure the impact of their investment, as well as a way for organizations to gauge their own success and make adjustments as they grow.

Criticism of Social Entrepreneurship

Critics of social entrepreneurship, and corporate social responsibility, believe the purpose of business activity is to serve the interests of stockholders, leaving social action to entities existing beyond the private for-profit sector. These critics argue that business leaders are ill equipped to make informed social decisions and that business leaders are solely responsible for acting in a manner that benefits the individuals who have employed them. This stance is grounded in the theory that economic returns and social returns are inherently at odds with one another, causing the pursuit of one return to reduce or eliminate the other.

Social entrepreneurs have found that this stance is inadequate for serving the needs of the community. Entities beyond the private for-profit sector have been unable to provide for many of the needs of the community. Social entrepreneurs have identified this gap in service as a viable business opportunity. The businesses built on these opportunities have a positive link between economic returns and social returns, both within the organization, and in its influence on its stakeholders. Thus, although many critics believe that social responsibility is counter to economic responsibility, social entrepreneurs have found a method that allows the two to act in parallel.

Education

Along with the growing number of social investment and analysis organizations, social entrepreneurship has also become increasingly popular with universities and other educational institutions. Many business schools have not only introduced social entrepreneurship into their MBA curriculum but some have also begun to build centers focused specifically on social entrepreneurship. Examples include Duke University's Center for the Advancement of Social Entrepreneurship, Columbia University's Research Initiative for Social Enterprise, and Oxford University's Skoll Centre for Social Entrepreneurship. In addition, competitions have come up to promote social entrepreneurship within these universities, such as the Global Social Venture Competition held at the University of California, Berkeley. Universities have also begun to reward competitors within traditional business plan competitions for being socially cognizant of their impact on society.

Conclusion

Social entrepreneurship has become an increasingly influential business model. It allows for organizations in all sectors of business to ground themselves on socially conscious missions and goals while still retaining the beneficial traits that have been previously available only to the for-profit sector. Social entrepreneurs are able to do this through recognizing and pursuing feasible business models that provide innovative products and services, allowing it to generate revenue while still serving its primary social goal. Social entrepreneurship has been given the opportunity to grow in impact and popularity due to its increased presence in the business and academic realms and will continue to expand as a viable business model as the global society continues to call for more socially conscious and accountable organizations.

Social Ethics

Ethics is the application of normative standards to assess right action. Social ethics focuses on the ethical reflection as it pertains to social structures and communities of persons such as our government, school systems, and church organizations and refers to a set of standards around which we organize our lives and from which we define our duties and obligations. It results in a set of norms that establishes acceptable behavior patterns and is concerned with what people ought to do. Examples of social ethical dilemmas that occur in the business environment are privacy rights; sexual harassment; gender, age, and race discrimination; child labor; and environmental protection.

Who Determines What Is Normative?

From a social constructionist perspective, what a society or organization considers to be "ethical" is a product of dialogue among its members. Dictionary definitions of *ethics* and *ethical* support this view. It is the members of a particular group that define what is or what is not ethical based on the meaning making done in their own processes of dialogue.

Dialogue originates in the public sphere, and those words, statements, and expressions are essentially actions performed with social consequences. Kenneth Gergen argues that dialogue is a form of coordinated action and the meaning of any utterance depends on its functioning within a relational environment. Because meaning is born in relationship, an individual's lone utterance contains no meaning. Rather, it provides the potential for meaning, a potential that can only be realized through another's contribution. This back and forth dialogue is the key building block to creating shared meaning and a shared reality. The central focus of generative dialogue is to bring realities (such as systems of social ethics) into being and bind them to particular patterns of action.

Ethical issues become a domino effect, and the logic of one is used by the culture to frame the debate on the other. One powerful example of this is bioethics. Biotechnology and genetics technology is advancing faster than any other area of our culture. The Human Genome Project, funded by the federal government, mapped the DNA strands to identify every human gene and its function. The results mean a degree of control that the human race has never had before. What will we do with this knowledge and control? Should we clone human beings? How should we think about the issue of using animal organs in human beings? Should we place animal tissue in human beings? Should we use gender selection when parents want to choose whether to have a boy or a girl? All these medical practices are currently being done or can be done.

This same logic is used in the euthanasia debate, where the focus is on the right of the person to die with dignity. Some states now sanction doctor-assisted suicide using the implied right of privacy that formerly sanctioned the practice of abortion. Based on the implied right of privacy, a person who is ill and no longer desires to live can legally receive assistance from a doctor to commit suicide. With the baby boomers getting older, the pressure for widespread euthanasia will grow.

The Impact of Business on Society

This notion of ethics as a product of dialogue is particularly important in a business environment that is increasingly global and cross-cultural. Globalization represents an enormous intensification of ethical conflict; as organizations expand into foreign locales, there is a tendency for the reality within the organization to deviate from the surrounding community. The import of alien constructions of the real and the good may come into sharp conflict with local understandings. Particularly in developing nations, businesspeople face cultures, customs, and norms that may conflict with their own ethical standards. Examples of ethical issues that global managers face, which may be completely new to them, include corruption and money laundering, human rights under totalitarian regimes, workplace conditions, and environmental issues.

Ethical and legal concepts are contextual and culture specific. There is general disagreement on what behaviors or practices are considered appropriate, legal, ethical, or moral across cultures. What is commonly practiced and socially acceptable in one culture is repudiated in another. Ethics and morals differ not only among various countries but also among individuals in the same country. To contribute to the shared sense of what is good in the local community, organizations must discuss and integrate the values of the local community in their business practices. Notions of right and wrong or justice and injustice are validated by the values and attitudes of a given culture.

Large corporations are capable of influencing mainstream societal events. Their power is not only economic but also social and political. A notable example of a corporation weighing legal, financial, and ethical points of view is the case of Johnson & Johnson's response to the Tylenol crisis in 1982. Under the leadership of CEO James Burke, the company made the decision to clear all store shelves in the Chicago area of extrastrength Tylenol after several deaths had been linked to their product. In addition, the company recalled 31 million unsold bottles and was completely candid with the medical community, the media, and the public about the situation.

Privacy has become a major issue in recent years for both government and business. The vast amount of personal information that is collected and the need to protect this information became especially sensitive after the passage of the Freedom of Information Act in 1966. This act was intended by Congress to make the government more accountable for its actions but had the inadvertent consequence of compromising the confidentiality of information about private individuals. With the proliferation of new technologies, some businesses insist that workplace monitoring is necessary.

Supervisors can eavesdrop on the telephone conversations of employees and, for example, call up on their own computer screens the input and output of the computers of their employees. In addition to collecting records of telephone calls such as the number of calls, duration, and destination, some companies are collecting medical data from employee assistance plans, which help in handling personal problems and drug addictions. These data can be used to terminate employees or defend against workplace injury claims. In some cases, hidden cameras and microphones are used to observe workers without their knowledge.

Electronic mail (e-mail) is another area in which the right to read employees' e-mail has been debated. To avoid misuse of the company communication system or to investigate misconduct, some employers claim a right to monitor employees' messages. E-mail stored on company fileservers is often backed up on magnetic tape and can be easily restored, leaving a trail of information. In the event of employee misconduct, e-mail messages as well as voice mail messages have been used to strengthen a case to reprimand or even terminate an employee. Some argue that the evidence left in e-mail messages reveal the true nature of behavioral issues and provide useful insight into an employee's conduct. One recent example is of an employee manifesting erratic behavior including frequent unexplained absences and significant performance issues. On reading this employee's e-mail, it was discovered that she was running a drug dealing operation—selling prescription drugs to other employees as well as outside contacts.

The growth in database marketing has also been facilitated by computer technology, which is able to combine data from many sources and assemble them in usable form. Consumer privacy can become an issue when health information such as prescription data from pharmacies and patient records is shared and used to target a market for direct mailings. Internet users often find data mining "cookies" stored on their hard drives after visiting online stores, which recognize repeat users of their Web site from past visits. Cookies benefit users by eliminating the need to enter information each time, but they can also provide the site owner with data about what pages are visited; how much time is spent on each one; and demographic data such as age, gender, and zip code without the owner's consent.

Another example of social ethical issues facing business organizations is discrimination that may occur in a variety of situations such as age, religion, race, gender, and sexual orientation discrimination. Discrimination is an ethical issue beyond any legal protections because it is at the core of fairness in the workplace. Discrimination can be a subtle or not-so-subtle factor in hiring, promotions, and layoff decisions. People who do not fit the "corporate profile" may be passed over for advancement for a variety of reasons that are not covered in legislation. Some employers create job requirements that could automatically eliminate certain employees, not because of their qualification but because of personal circumstances. An example of this is age discrimination resulting from the benefits that employers perceive in marginalizing or shunting older employees aside to make room for younger employees who may be considered to have more up-to-date skills and innovative ideas. Younger employees are less expensive to employ because older employees generally have higher salaries and make more use of the fringe benefits.

Religious discrimination in employment involves conflicts between the religious beliefs and practices of employees and workplace rules and routines. Employees sometimes request revised work schedules for time off to observe religious holidays or Sabbath observance. Members of some religious groups have special dress or grooming requirements, such as a yarmulke for Jewish men and a turban and a beard for Sikh men. Some employees have religious objections to performing certain kinds of work or to submitting to medical examinations; others request prayer breaks and special foods in the company cafeteria.

Several large corporations such as Intel and IBM have created GBLT (gay, lesbian, bisexual, transgender) business units that work directly with GLBT business units in other organizations. One idea behind the creation of these business units is to provide a safe, nonhostile, open, and inclusive working environment for GBLT employees. Managers within these corporations realize the effectiveness and work productivity that is created when individuals share a social identity.

Increased attention to the problem of sexual harassment and developments in the law has made employers more aware of their responsibilities. Some employers struggle to define sexual harassment as well as determine how serious the problem may be and who is responsible for preventing it. In 1980, the Equal Employment Opportunity Commission (EEOC) issued guidelines on sexual harassment that made a distinction between two kinds of harassment. One is *quid pro quo* harassment, in which a superior uses his or her power to grant or deny employment benefits to exact sexual favors from a subordinate. The other kind is *hostile working environment* harassment, in which the sexual nature of the conduct of coworkers and others causes an individual to be very uncomfortable. Whether a work environment is hostile or offensive is not easily determined, and much depends on the attitudes of the employees involved and the response of management to employee concerns.

Social ethical issues engage our deepest values and beliefs. The ideal of a nondiscriminatory and just society is clear, and finding the proper solutions to such challenging social ethical dilemmas requires an ongoing dialogue. It is imperative that an open and honest dialogue continue where beliefs, values, and opinions about social ethical issues are respectfully considered.

Social Investment Forum

The Social Investment Forum (SIF) is a national non-profit trade association, based in Washington, D.C., dedicated to promoting the concept, practice, and growth of socially and environmentally responsible investing. As of January 2006, the Forum's membership included more than 600 social investment practitioners and institutions (private investors are served by joining the SIF partner, *Co-op America*).

Founded in 1981, the SIF conducts and communicates research on socially responsible investment. The Forum provides listings of financial professionals, mutual funds, information sources, and community investments that provide socially responsible investing. With its Web site, annual conference, socially responsible investor mailing list, membership directory, and Listserv, SIF supports a community of committed financial professionals. Furthermore, it offers an annual monetary award, the Moskowitz Prize (named for the pioneer investigator Milton Moskowitz, senior editor of *Business and Society Review,* who first published comparisons of the financial performance of screened and unscreened portfolios). The award recognizes outstanding research on socially responsible investing.

The Moskowitz Prize, begun in 1996, is the only global award recognizing outstanding quantitative work on socially responsible investing. The three criteria for the award include (1) the practical significance to practitioners of socially responsible investing, (2) the appropriateness and rigor of quantitative methods, and (3) the novelty of the results. Beginning in 2006, the prize will be administered by University of California at Berkeley's Haas School of Business. SIF will continue to serve as a consultant in prize awards.

News and trends in the socially responsible investment industry are reported by the Forum on its Web site, at its annual conference ("SRI in the Rockies"), in its quarterly newsletter to members, and in its biennial report on social investment trends (the latest report is titled "2005 Report on Socially Responsible Investing Trends in the United States, 10 Year Review").

A related program, Social Investment Forum Advocacy & Policy Program, provides communication, research, and advocacy on public affairs related to socially responsible investing.

Socialism

Socialism is an ideology that places great emphasis on eliminating, or reducing, the disparity between social classes, largely through the more equal distribution of resources, including property. Variations of socialist thought have existed for hundreds of years, evidenced by Plato's *Republic* and even the Book of Acts in the New Testament. In a socialist society, the means of production are owned and controlled by the community as a whole. In a capitalist society, however, the resources and businesses are owned and operated by private parties. Furthermore, at the heart of capitalism is the belief in a free market that operates with minimal restrictions.

This entry will briefly examine current versions of socialism, followed by a review of socialism through modern history, and will end with an assessment of the status of socialism today.

Socialism Today

Despite the fact that North Korea and Sweden both have socialist governments, they are at opposite ends of the spectrum in terms of their political applications of socialism. In North Korea, a socialist country since 1948, all means of production are state owned. Furthermore, it essentially is a totalitarian dictatorship, where the single ruling party quells all forms of dissent, thus alienating the regime from democratic world powers. North Korea's socialist state has also been plagued with difficulties. It has experienced widespread poverty and famine since the end of Russian subsidies in the 1990s.

Socialism in Sweden, however, is characterized by relative prosperity within a multiparty, democratic state and a mixed economy. Sweden, a socialist country since World War II, differs from North Korea in that most business enterprises are privately owned. Socialism in Sweden focuses more on providing social welfare services than on communal ownership and control of the means of production. Northern European socialist movements are often called "social democratic" to indicate their gradualist social welfare agenda and compatibility with democratic values and institutions. To better understand the variations between countries such as Sweden and North Korea, it is necessary to have some historical background on the socialist movement.

Response to European Industrial Revolution

Socialism emerged in Europe in the early 1800s, largely in response to the failings, or perceived failings, of the Industrial Revolution. The Industrial Revolution began in Great Britain. Technological innovations, such as the creation of the steam engine in the 1780s, were applied to both manufacturing processes and to new means of transportation. The factory system, coupled with the development of large and complex railroad networks by the 1840s, dramatically enhanced Britain's productive and distributive capacity. Britain's competitive advantage was expressed in the rapid expansion of its international trade, both inside and beyond its colonial empire.

While Great Britain advanced into the industrial age, the rest of mainland Europe lagged behind. The French Revolution and subsequent Napoleonic Era (from the 1790s to 1815) fostered political, social, and economic instability, thus impeding industrial development on the continent. The working class, and its defenders, grew increasingly frustrated with the industrialized society that gradually enveloped them. It was in this context of rising discontent with unfettered capitalism that socialism gained popularity.

Early Socialists, Including Karl Marx

Early socialist ideas appeared in post-Napoleonic France, as French thinkers and economists attempted to grapple with the new industrial world that was emerging. For example, individuals such as Count Henri de Saint-Simon and Louis Blanc argued that it was the duty of the government to close the income gap between the propertied and working classes. They advocated government intervention to distribute private property more equally.

Germany also had its share of socialist pioneers. German nation-states (Germany was not a unified nation until 1871) witnessed the influx of the cheaper English-made goods during the 1820s and 1830s, devastating individual craftsmen and German society as a whole. Displaced workers blamed the laissez-faire capitalist society they lived in, which allowed a few wealthy industrialists, bankers, and merchants to prosper while the working class as a whole suffered. It was amidst this dissatisfaction with capitalism that socialism further developed as a concept under Karl Marx, a German-born philosopher.

Marx differed greatly from the earlier socialists. Whereas earlier French socialist advocates had pleaded for help from the middle classes, Marx heaped scorn on the "bourgeoisie," claiming that the middle classes had no interest in helping out the working classes or changing the status quo. Marx thought of socialism as merely a transitional phase between capitalism and communism, a classless and stateless society where property and resources would be distributed equally among all people. In the *Communist Manifesto* of 1848, written by Marx and Friedrich Engels, another prominent German thinker, the authors predicted a bloody socialist revolution between the bourgeoisie (middle class) and the proletariat (working class). In the end, the numerically superior proletariat would triumph and confiscate all private property and distribute it equally among the masses. The state would also regulate all social, political, and economic decisions, and eventually class divisions would erode and the society as a whole would prosper. Once these gains were achieved, the state would wither away, thus creating a communist society where all worked together in cooperation and harmony.

Marx's ideas fascinated many Germans, as many believed that capitalism was clearly flawed, evidenced by the high poverty rate and unequal distribution of resources in the various German nation-states in the 1840s. As a result, socialist radicals and other liberal nationalist reformers rose up in arms and attempted a hostile takeover of Prussia, the most powerful German nation-state, but they were ruthlessly squashed by the ruling class in the failed revolution of 1848. In the wake of the failed takeover, the Prussian government sought retribution against those who had taken part in the revolution and, as a result, many of the participants fled Prussia in terror.

Socialism in the United States

Socialism did not die with the revolution of 1848, as socialist-leaning Germans took their ideas elsewhere in Europe and to the United States. Between the 1840s and 1860s, Germans made up more than 25% of all immigrants into the United States. Socialism's relative popularity can be seen in the U.S. labor movement in the 1870s and 1880s. Socialists, particularly German-American socialists, were active in a variety of labor struggles. Socialists were especially visible in the struggle for the 8-hour workday, which reached a disastrous culmination in Bayview (Milwaukee, Wisconsin) and Haymarket Square (Chicago, Illinois) in 1886, where state militias and local police opened fire on demonstrating, unarmed workers.

Despite the hostility that socialists encountered in America, a socialist party was formally created in 1901, with Eugene Debs as its presidential candidate. Debs received more than 400,000 votes in the presidential election of 1908 and roughly 800,000 votes in 1912.

Socialism lost power in American politics in the aftermath of the socialist-led Bolshevik Revolution in Russia in 1917. The Bolshevik Revolution essentially destroyed the fledging socialist movement in the United States, as all socialists were viewed as proponents of violent upheaval and, therefore, socialism lost most of its appeal.

Bolshevik Revolution

As previously mentioned, the Bolshevik (majority) Revolution occurred in 1917, under the leadership of Vladimir Lenin and other prominent Russian socialists. The Revolution took place because of the severe poverty and unequal distribution of resources in the czarist nation of Russia. Further fanning the flames of revolution was the devastation caused by Russia's involvement in World War I.

Leninism was predicated on the belief that socialist change could only occur through a violent revolution. The Communist Party "vanguard" ruling elite exercised autocratic power in the name of the "dictatorship of the proletariat." Dissidents were eliminated ruthlessly. Lenin's successor, Joseph Stalin, forced Russian peasants onto collective farms and applied a central planning model to develop heavy industry.

The Bolshevik Revolution created deep fissures within the socialist camp. Many believed that the creation of the Soviet Union was merely an extension of what Marx envisioned. Other socialists, however, believed that a socialist society could be created through peaceful means via democratic methods.

Huey Long and the New Deal

Socialism witnessed something of a revival in the United States in the 1930s, largely due to the Great Depression. Many Americans looked at the Great Depression as proof of the failings of unregulated capitalism and, thus, were more willing to embrace other ideologies, such as socialism. For instance, Huey Long, the abrasive Louisiana politician, firmly embraced aspects of socialism within his Share Our Wealth (SOW) society. As part of his SOW plan, Long stated that every American should have a car, a house, a radio, and other basic necessities. Long also spoke of confiscating all incomes more than $1 million a year and using the confiscated monies to support SOW. In addition, Long claimed that the state should confiscate all family fortunes in excess of $5 million.

In the context of the Depression, the SOW program drew widespread support, not only from Louisiana and other poverty-stricken areas in the South but also from around the country. President Franklin Delano Roosevelt (FDR) witnessed the popularity of Long's SOW program and sought to squelch any possibility of Long's ascendancy to the presidency. Therefore, FDR adopted many of Long's ideas and put them forth as part of his New Deal legislation, thus robbing Long of his popularity. The New Deal created many of our contemporary social welfare programs in the United States, such as unemployment insurance and social security.

Socialist Setbacks in the United States

After World War II, socialist-leaning thought once again lost appeal in the United States for two main reasons. First, World War II crippled Japan, Germany, France, and Britain, leaving the United States and the Soviet Union as the two remaining superpowers. Even though the two were allies for much of World War II, they became mortal enemies in the postwar years, as each nation sought to prevent the other's ideology and way of life from spreading across the globe. In essence, the world was reduced to a geopolitical chessboard, on which Cold War moves were played.

With the emergence of the Cold War, countless Americans grew paranoid about a possible communist revolution in the United States. The irrational fear manifested itself in McCarthyism, named after the firebrand senator from Wisconsin, Joseph McCarthy. Any group or individual with progressive leanings during this era was labeled as communist and, therefore, was portrayed as a threat to the internal security of the United States. Labor organizations in the United States, such as the American Federation of Labor, engaged in their own leftist witch hunts, so that no one could levy devastating procommunist allegations against them. As a result, socialism in the United States suffered a crippling blow from which it would never recover, even with the worldwide collapse of communism in the late 1980s.

The second reason for the eclipse of socialism in the United States was the relative prosperity of the American working class in the postwar years. World War II generated unheard of sums of wealth, not only for the leading industrialists but also for their workers. Therefore, where the Great Depression provided a fertile testing ground for the spread of socialism, the "Golden Years" of the 1950s greatly dampened the appeal of socialism in America.

Socialist Success in China and Elsewhere

Though reduced to a fringe movement in the United States, socialism throve elsewhere. China became the second nation to witness a socialist revolution, as socialists came to power in 1949, largely because of the devastation and turmoil caused by World War II. Chinese socialists, led by Mao Tse-Tung, adopted their own brand of socialism that once again focused on the violent seizure of power and redistribution of societal resources, which was viewed particularly favorably by landless peasants. China was also akin to the Soviet Union in that both were totalitarian states.

China was not the only country to undergo a socialist revolution. World War II created a power vacuum throughout the world, as former European imperial powers, such as England, France, and Germany, could no longer afford to maintain their colonial empires. Countless countries in Africa, Latin America, and Asia witnessed liberation movements, some of which were socialist in nature. For instance, many Vietnamese united under a socialist and nationalist movement, led by Ho Chi Minh, to oust the French and form an independent Vietnam.

Socialism also played a prominent role in the Cuban revolution of 1959. The gross social inequality and poverty of prerevolution Cuba provided a perfect breeding ground for socialism. The Cuban revolution was led by Fidel Castro, whose promises of equality and social justice found widespread appeal. Once again, however, the violence associated with this takeover, and the land seizures, was very akin to Leninist socialism.

Numerous African countries experimented with socialism in the wake of their independence movements in the 1950s to 1970s. For instance, Tanzania, under Julius Nyerere, was a socialist nation until the 1990s.

Various Latin American nations, such as Chile, also turned to socialism in democratic elections in the 1970s, only to have their governments undermined by procapitalist forces, led by the United States.

Current Situation

Socialism as a whole suffered great losses in the late 1980s and 1990s, largely as a result of the development of the highly interwoven economic system known as globalization. Advancements in communication and transportation technology allowed for the world to become more interconnected than was ever possible before, thus paving the way for globalization. Leading the globalization revolution was the United States, the sole remaining superpower in the wake of the Soviet Union's collapse in the late 1980s. Therefore, globalization revolves around the United States and the concept of free market capitalism.

Due to globalization, only handfuls of states currently remain socialist, and among these remaining countries, there is a great degree of variation. For instance, on one end of the spectrum are the socialist nations of Cuba and Vietnam. A much different form of socialism exists in Scandinavian countries such as Denmark and Norway. For instance, the socialist governments in Scandinavia are democratically elected, and most businesses and corporations remain privately owned. The governments are responsible for maintaining a very comprehensive welfare state, however. In addition, socialist countries in Scandinavia are characterized by the lack of an impoverished class, as well as high taxes.

In closing, socialism continues to live on in varying forms and is actually witnessing a resurgence in Latin America. For instance, Uruguay, Bolivia, Chile, and Venezuela all have recently elected socialist-leaning governments. The rise in socialism in Latin America can be explained, yet again, by dissatisfaction with extreme poverty and highly unequal distribution of resources. The newly elected socialist governments in Latin America, however, are more ideologically similar to Scandinavian governments than they are to Cuba, as they feature privately owned enterprises, mixed with some level of state ownership. In all likelihood, however, these newly elected governments in Latin America will soon witness more of an integration of free market capitalism, because globalization appears to be inevitable. Yet the world will continue to witness periodic socialist movements in response to the perceived failings of globalization, as developing countries will have difficulty keeping pace with the more developed countries that are already firmly part of a global economy.

Socially Responsible Investing (SRI)

Socially responsible investing (SRI) refers to financial contributions into investment vehicles designed to combine the traditional investment philosophy favoring profit maximization with a values-based component seeking nonfinancial benefits. Such nonfinancial benefits are often referred to as social returns. These social returns vary in scope but can be broadly defined as company policies and actions that enhance a socially responsible investor's specific environmental, religious, or social values. These enhancements may or may not have any impact on the profit-maximization component of the socially responsible investment and may actually cause a socially responsible investment to decrease in value. *Socially responsible investing* is the common term for this practice in the United States but the concept is also referred to as "ethical investing," primarily in the United Kingdom, or "values-based investing."

Today, major institutional investment groups such as corporations, hedge funds, insurance companies, mutual funds, pension funds, religious institutions, and universities, along with the environmentally/religiously/socially motivated individual investor, are entering the realm of SRI. According to the Social Investment Forum (SIF)—the most prominent SRI industry group—more than $2.16 trillion was invested in 2003 in professionally managed portfolios that implemented at least one core aspect of SRI. The SIF claims that this figure, representing one out of every nine dollars invested professionally in the United States, grew from $1.19 trillion in 1997 and from $40 billion in 1984. On the other hand, it is important to note that many scholars and investment professionals remain skeptical of this investment philosophy. Many academic studies demonstrate that socially responsible investors are not able to achieve either their desired social objectives or a competitive return, at least when compared with traditional investing practices focusing on profit maximization alone.

SRI is an umbrella term covering three core investing groups—(1) environmentally motivated investors, (2) religiously motivated investors, and (3) socially motivated investors. While all three groups seek social returns along with capital appreciation, the major difference between the groups stems from the motivations behind their investment practices. Environmentally motivated investors seek corporate policies and actions that either benefit or do no significant harm to the environment—both in the United States and abroad. Religiously motivated investors are guided by specific faith-based issues such ethical treatment of employees. Socially motivated investors, on the other hand, desire company policies and practices that adequately address key social issues such as diversity, HIV/AIDS, as well as corporate governance. The history of SRI demonstrates that all three groups played a prominent role in the establishment of SRI as a major player in the investing landscape of the 21st century.

SRI also encompasses three core subject areas—(1) social screening, (2) shareholder advocacy, and (3) community investing. While social screening is by far the most popular of these categories—with $2.14 trillion invested in this manner in 2003—each of the other areas comprises a growing component of the SRI community.

A Brief History of SRI

SRI has religious roots. In fact, scholars trace the earliest form of social screening of investment opportunities back over 2,000 years to the Hebrew Bible. More recently, socially conscious investors played a major role in the religious communities of pre- and postrevolutionary America. In prerevolutionary America, the Methodists, followed by the Quakers, developed the habit of refusing to support companies involved with alcohol, gambling, or tobacco. Investments in all three of these industries were considered "sin stocks" and were screened out—or ignored—by the commercial practices of early American religious communities. The institution of slavery was also an issue of concern to many early American socially responsible investors, with specific groups avoiding companies dealing in the slave trade.

From the 17th century until the mid-20th century, the concept of socially screened investment remained a small, religiously centered, movement. However, in the 1960s, as movements against the Vietnam War emerged alongside the civil rights, women's rights, and environmental movements, investors took a renewed interest in SRI. Socially responsible investors, in tandem with a multitude of other groups and institutions, wanted to be certain that their investment money was not being used to support the war or to keep minorities in a second-class status. The key issues for SRI advocates in the 1970s were the nuclear arms race and the environment. It was during the 1970s that the first socially responsible mutual funds were created, allowing investors to pool their funds together to achieve greater social returns. In the 1980s, worldwide attention focused on apartheid in South Africa and companies were lobbied by the SRI community—and eventually mandated by the Anti-Apartheid Act of 1986—to stop doing business in South Africa.

The decade of the 1990s saw a renewed interest in the environment and the somewhat tenuous relationship between the corporate mission of profit maximization and corporate policies and practices designed to protect the environment. These issues coincided with the commencement of the major tobacco litigation cases and calls for avoidance of one of the top three "sin stocks"—tobacco. The most relevant SRI topic from the dawn of the new millennium to the present is corporate governance. Originating with the recession of 2001 and peaking with the major corporate scandals that plagued the economy thereafter, corporate governance and business ethics have become major issues in the SRI community as well as in the traditional investing world. Interestingly, a few key issues retained prominence over this half-century period of modern SRI. Issues such as abortion, contraception, HIV/AIDS, sin stocks, and unfair labor practices in Third World countries remain compelling and are always on the radar screen of SRI.

Three Categories of SRI

As mentioned above, SRI is traditionally divided into three core categories—social screening, shareholder advocacy, and community investing. These three categories are not mutually exclusive—for example, a socially responsible investor may practice social screening while also investing in community development projects. The majority of socially responsible investors, however, focus on social screening and shareholder advocacy, although community investing is growing in prominence as the SRI movement itself expands.

Social Screening

Social screening is a means by which investors either divest a financial holding or invest in a particular company based on the company's social record—or lack thereof. The basic premise underlying social screening is the idea that companies that meet the social standards required by SRI screens will be the most profitable and successful companies in the long term. Social screening can be divided into two types—(1) negative screening and (2) positive screening.

Negative screening occurs when an investor divests a specific stock or industry group holding from a portfolio based on a company's practices diverging from some criteria of social investment. Once an investor screens a stock out of a portfolio, the ownership relationship between the company and the shareholder ends and often so does the investor's ability or desire to institute social change at the organization. It is for this reason that many shareholders refuse to sell shares of a company with a poor social record and instead choose the path of shareholder activism, as described below.

Positive screening occurs when an investor seeks out a specific stock or industry group and invests because of positive social policies and actions of the company. Many SRI organizations have created sophisticated software intended to search for just this type of investment opportunity. Companies that produce certain products—such as the sin stocks mentioned previously—have a hard time meeting the criteria required to be included in a positive screen. Interestingly, even a company producing a more socially accepted product will also miss the cut if such a company has poor corporate governance standards or employment practices.

Depending on the volume of shares subject to both negative and positive screening, such screening practices may alter stock prices due to the decreased demand caused by negative screening and the increased demand for a company's stock caused by positive screening. As SRI continues to grow in volume of dollars invested, SRI proponents hope such supply/demand attributes cause companies to become more responsive to the voice of socially responsible investors.

Shareholder Advocacy

While social screening is intended to serve the dual purpose of altering the supply/demand equation for a specific company stock and to satisfy the ethical desires of the socially responsible investor, this category is not the only means at the disposal of socially responsible investors to satisfy their goals. Investors desiring to change corporate practices often turn to the shareholder advocacy category. Shareholder advocacy proponents attempt to take advantage of share ownership and the potential of such ownership to obtain access to management and to other shareholders. This access can be a bit misleading, however, because the purchase of a small amount of stock will create a relationship with the company, but a more significant stake may be necessary to truly obtain access to and attention from company management. A significant ownership position allows shareholders to engage in three primary shareholder advocacy tactics: (1) discussions with management, (2) shareholder resolutions, and (3) boycotts.

Discussions With Management

The SRI community currently rallies around the idea that discussions with management should be the first step taken in efforts to create desired social returns. In fact, certain SRI institutional investor groups state that they will attempt discussions only and exclude other, more confrontational, shareholder activism tactics.

Discussions with management occur when shareholders group together and arrange meetings with high-level executives who run the company on such shareholders' behalf. Often, the issue discussed is a corporate policy or activity that the SRI proponents allege is endangering the environment (such as deforestation) or an issue shedding a negative light on the company's public image (such as excessive executive compensation). Often, if company management feels a change is warranted, these face-to-face encounters result in an amended corporate policy and no further action is necessary. Management is often more willing to engage in these informal discussions because a mutual understanding and compromise often limits the shareholder resolutions that occur under the second category of shareholder activism.

Shareholder Resolutions

Assuming the shareholder and management discussion session proves unfruitful, socially responsible investors often turn to a more structured and persuasive option—the shareholder resolution. A shareholder resolution is a proposal by a shareholder or a group of shareholders recommending a change in company actions or policies regarding a particular social issue. The proposal process and content requirements are governed by the Securities and Exchange Commission (SEC). The SEC mandates that proposals must be submitted to management at least 4 months before the company mails its proxy materials and can be no longer than 500 words. Such resolutions must meet other procedural hurdles as well; the proposals may only be advisory and nonbinding on management, and the proposing shareholder(s) must own at least $2,000 worth of company stock (or 1% of the company's total stock outstanding) and must have owned such stock for at least 1 year. If these procedural hurdles are met, then the proposal may be included in the company's annual proxy statement unless the company propounds one of a few specific regulatory reasons for exclusion. Once in the proxy statement, the proposal must be formally presented at the company annual meeting and then such recommendation is subject to a vote of shareholders present or voting via proxy.

Most shareholder resolutions concerning environmental, religious, or social issues do not garner a majority of shareholder votes. However, a mere 5% to 7% of the total votes cast in favor of a proposal at a company annual meeting may represent millions of shareholders—a large voice against the company practice at issue. Therefore, companies often take even the slightest approval rates as an impetus to enter into discussions previously avoided or to amend current company policy to comply with the desires of the proposing shareholders. Management likes to avoid shareholder resolutions because of the potential for negative publicity and because executives and the board of directors are charged with creating company policy and do not like policy dictated from shareholders who might not have a clear understanding of the complete operational picture. Investors, on the other hand, view this type of advocacy as an acceptable exercise of their power as owners of the company.

Another interesting development in this part of the shareholder advocacy process is that since August 2004, mutual fund managers have been required to publicly disclose their votes on issues that could materially affect their portfolios. Therefore, socially responsible investors holding shares through mutual funds—and therefore not allowed to vote their shares at the annual meeting—are now able to discern whether their particular SRI fund manager is helping them achieve their desired social returns.

Boycotts

Socially responsible investors also use various forms of protest—such as economic or physical boycotts—in an attempt to vie for corporate social responsibility. Although this form of shareholder activism can occur at any stage in the process, usually boycotts are attempted only after the discussion and resolution processes have failed. Many boycotts are purely economic protests whereby consumers refuse to purchase, sell, or handle a company's product or service on a local or a national level while also attempting to enlist more consumers to follow suit. Another form of boycott—the physical protest—is employed less often and resembles a social protest rally at which socially responsible investors might be joined by various other company stakeholders and physically protest outside a company establishment or headquarters. Both forms of boycotts use the publicity from the boycott to garner attention and support from other investors and from the general public for the social cause and against the company policy.

Community Investment

Community investment is the process by which socially responsible investors direct investment funds into lower-income and less economically successful communities that have been historically underserved by traditional financial services. The goal of community investing is to provide access to basic banking services, capital, credit, equity, and health care previously unavailable inside the community. These programs are designed to stimulate the economic growth such areas desperately need. Community development capital is most often used in microlending initiatives to lower-income entrepreneurs, building affordable housing, and assisting in employment efforts within the immediate area. Community development financial institutions—such as specialized banks and credit unions, venture capital community development accounts, and microenterprise loan funds—receive the majority of these funds and serve as the distribution center for the community investment area.

Community investment is the most recent addition to the SRI core categories. The concept, however, is demonstrating its potential based on a plethora of community success stories and a steadily growing resource base. From 2001 to 2003, assets held by community development institutions increased 84% from $7.6 billion to $14 billion. As SRI moves into the future, community investment appears as if it will compete for attention from socially responsible investors with the predominant tactics of social screening and shareholder activism.

Soft Dollar Brokerage

Soft dollar brokerage, or simply soft dollars, is an arrangement in which brokerage firms offer institutional investors products and services other than the execution of trades. Institutional investors, such as mutual funds and pension funds, pay a commission to brokerage firms to execute trades of securities. In addition to executing trades, brokerage firms offer some institutional investors credits for other products and services, most commonly proprietary research. These products and services, which are typically provided by a third party, such as research firms, are paid for by the brokerage firm. The credits for these products and service are called soft dollars.

This arrangement began in the 1950s with the growth of institutional investors during a period of fixed commissions for securities traded on the New York Stock Exchange. Barred from competing for volume customers by offering lower commissions, brokerage firms offered various nonprice benefits, including research services, in lieu of lower commission rates. After the system of fixed commissions was abolished in May 1975, the practice of soft dollars continued. Although commission rates declined after that date and customers could pay for only the execution of trades, soft dollar arrangements continued to be an important form of competition among brokerage firms and a significant source of resources for institutional investment funds.

The legislation ending fixed commissions, the Securities Act Amendments of 1975, reiterated that fund managers have a fiduciary duty to secure the best execution of trades, which includes paying low commissions. However, Section 28(e) created a safe harbor that allows soft dollar arrangements as long as the managers believe in good faith that a higher-than-market commission is reasonable in relation to the value of the brokerage and research services provided.

For such a little-known practice, soft dollars has received a surprising amount of moral concern, with some observers claiming that it did not pass "the smell test." Soft dollars was the subject of a 1998 report by the Securities and Exchange Commission, and in the same year, the Association for Investment Management Research issued extensive guidelines for soft dollar arrangements.

Moral criticism of soft dollars has two sources. First, soft dollars is a virtually invisible process that appears to depart from the ideal of arm's-length economic transactions. In soft dollar arrangements, the managers of institutional investment funds seem to be paying brokers more than necessary for executing trades and receiving other benefits in return. The costs of execution and research are bundled together in ways that other parties (e.g., mutual fund investors) may not be aware of and cannot easily evaluate. Expressed in the terms of agency theory, investors (the principals) have the task of monitoring fund managers (their agents). The lack of transparency and market forces makes the monitoring of fund managers by investors more difficult. As a result, investors either suffer the agency costs of inadequate monitoring or else are forced to incur additional monitoring costs. That transactions should be unbundled and made transparent are key elements not only of sound financial practice but also of effective monitoring.

Second, investment fund managers, as fiduciaries, have a fiduciary duty to act in the best interests of a fund's investors. This includes obtaining "best execution" and using any soft dollars solely for the benefit of a fund's investors. However, soft dollars appears to create incentives for fund managers to advance their own interests or the interests of a fund's adviser to the detriment of investors. This would be not only a violation of fiduciary duty but also an unacceptable conflict of interest. Fund managers might unjustly enrich themselves through soft dollar arrangements by engaging in excessive trading or "churning" designed merely to generate more soft dollars. They might also use soft dollars for purposes other than research that benefits a fund's investors, and finally, the benefit from soft dollars may make managers more careless about monitoring the quality of a brokerage firm's execution. All these possibilities would violate the safe harbor provision of Section 28(e), but critics of soft dollars complain that the vagueness of this law leaves investors with inadequate protection.

Some defenders of soft dollars argue that these moral concerns are misplaced and that soft dollar brokerage is not only morally justified but also economically sound. First, to the criticism that the practice tempts fund managers to violate their fiduciary duty to seek "best execution" and use any soft dollars in the investors' interest, defenders argue that the intense competition in institutional investing would punish fund managers who did not use all resources for the benefit of investors. Second, they argue that instead of increasing the monitoring costs of investors, soft dollars aligns the interests of investors and fund managers because fund managers are in a better position than investors to monitor the execution of trades by brokerage firms.

This agency argument is rather complex, but the debate between critics and defenders can be settled ultimately only by an empirical comparison of fund performance. If funds that use soft dollars produce superior returns to those that do not, then their practices, including soft dollars, would appear to be more efficient. The evidence to date is that soft dollars has a slightly positive correlation with fund performance, which suggests that the practice succeeds in solving investors' agency problems.

Critics of soft dollars generally favor two measures: restricting the scope of section 28(e), thus giving fund managers less of a safe harbor and mandating greater disclosure of soft dollar practices. Defenders of soft dollars would expand the scope of Section 28(e), thus giving fund managers greater discretion in making arrangements with brokerage firms. Although they are not opposed to greater disclosure, in principle, some defenders question the usefulness of this information for investors and whether the cost would exceed the benefit.

Speciesism

Speciesism is a term found primarily in the literature dealing with animal rights. It is used in a derogatory fashion to designate a bias or prejudice analogous to racism or sexism. In speciesism, the bias is in favor of the fundamental interests of humans as opposed to those of nonhumans. A "speciesist" would be someone who favors and demonstrates partiality toward humans over animals and who believes that humans have special traits that animals lack (reason, language, technological skills, etc.), thereby making them superior and more important beings. In this way, speciesism can be seen to be a product of a strong anthropocentrism that holds humans to be the focus of and purpose for the universe.

The first expression and use of the term *speciesism* in a formal way came in 1970 when clinical psychologist Richard Ryder of Oxford University used the term in a leaflet that he had privately printed about the abuses of animal experimentation and animal abuse. Ryder reported that the term came to him while he was taking a bath and contemplating the way humans treat animals. Since Darwin had shown that humans too are animals, Ryder thought that speciesism was just like racism and sexism—a form of prejudice based on morally irrelevant physical differences.

We can find more extended arguments about speciesism in the writings of animal rights advocates such as Australian ethicist Peter Singer. Singer is known as a "preference utilitarian," which means that morally correct action produces the most satisfaction of preferences. But, with respect to animals, Singer holds that they, just like humans, have such preferences or interests and that it would be a moral mistake to overlook their interests even though most people do. The mistake of not granting equal moral consideration to the interests of animals is a form of speciesism according to Singer. An even more egregious form of it would be to give the interests of human beings preference over those of other beings merely because the former interests are those of a human being. Hence, for Singer, it is more appropriate to treat all beings as individuals and not as members of a species.

The issue of animal experimentation in medicine is one that is often pointed to as being biased by speciesism. Animal rights advocates hold that animal experimentation in medicine is morally objectionable and should be discontinued. They argue that just because animal experimentation may lead to advances in medicine and this might be beneficial to humans, such benefit is no good reason to put animals in situations that cause them great pain and suffering as is the case with medical experimentation done on them. The claim that beneficial outcomes for humans is the result of such experimentation and therefore justification enough to continue the practice is nothing more than prejudice in favor of humans because they are humans, that is, a form of speciesism, in the eyes of animal liberationists.

Speculation and Speculator

Speculation is investing in some asset with the hope of profiting from a price change in asset. Sometimes speculation is regarded as a form of risky and imprudent investing, and some would contrast speculation with investing. A speculator is one who speculates. Speculation is an action that is the result of *speculare*—in other words, to observe from a height; of considering the signs of the stars to take a specific action at the propitious moment with the best probability of success; and of scrutinizing something intently. Speculation is applied to the environment of investment markets, referring to those operations in which someone—the speculator—buys shares or commodities at a low price in the hope of selling them at a higher price in the future, generally the near future. Those who speculate on the stock market are thus investors who move in the short term. At times, the speculator is associated with the player or the manipulator. However, there are important differences between them that are worth explaining, because "playing the market" and "manipulating the market" are generally considered somewhat unethical activities. Although speculation does not enjoy a good image in the public mind, it merits stating that genuine speculation contributes to the common good. This is because it improves the operation of the markets, while the manipulator always takes an unfair advantage at the margin of ethics by altering the prices of shares and the player operates on the stock exchange like someone who risks money on games of chance, without reflection and without any well-founded reasons to justify his bet. On the contrary, the person who speculates with good intentions, seeking a profit and assuming a risk, does so by implementing decision mechanisms that are quite different.

Speculation requires serious effort to gain a competitive advantage on other investors, anticipating possible future scenarios on which decisions must be taken today. Speculators with technical preparation and experience take detailed notice of the multiple short-term factors that explain the quotation price of a share. They study the direction of the economy, are alert to indicators, and rationally decide with knowledge about the cause on well-founded hypotheses.

The benefits of speculation are to reduce market fluctuations; to provide the market with liquidity; to increase the volume of transactions; and to efficiently place financial resources, through the agility with which speculators react—investing or disinvesting—to new information. In short, if speculation is carried out in good faith—that is, with professionalism and rigor, without any fraud or illicitness—we should consider it as a high exponent of economic intelligence.

However, there are some less desirable effects to speculation: If it becomes an end in itself and is immune to ethical considerations and the end objectives of economic life, it could contribute to increasing the distance between the financial and real economies. Furthermore, this distancing can create economic imbalance at a worldwide level, making the difference between rich countries and poor ones even greater.

Spencer, Herbert (1820–1903)

Herbert Spencer was a British philosopher and sociologist who developed and applied evolutionary theory to areas such as psychology and sociology and whose influence at the time was almost as great as that of Charles Darwin. But his evolutionary theory, which accepted the view of Lamarck that organic modifications produced by use and disuse are inherited, gradually gave way to Charles Darwin's theory of natural selection.

Spencer's first book, *Social Statics, or the Conditions Essential to Human Happiness*, in which he argued that what characterizes the development of organisms is the tendency to individuation, presents a defense of human freedom and individual liberties and attacks the utilitarian claims of Jeremy Bentham and John Stuart Mill, with its understanding of individuals as merely the means to the goal of the general social well-being. Spencer held that society was evolving toward increasing freedom for individuals and that as a result the intrusion of government should be kept to a minimum. In his second book, *The Principles of Psychology* (1855), he detailed certain psychological aspects of Mill's position to which he strongly objected.

His nine-volume work *A System of Synthetic Philosophy* provides a systematic account of his views in biology, sociology, ethics, and politics and a synthesis, organized through his evolutionary theory, of a broad range of findings in the natural and social sciences. Synthesis was always important to him. He thought not only that the goal of each science or area of inquiry was to arrive at the fundamental principles that accounted for its data but also that the data and theories of each science affect, and are affected by, the finding of the others.

Spencer held an "organic" view of society, believing that social life was an extension of the life of a natural body and that social "organisms" reflected the same evolutionary principles or laws as biological entities. These principles also provided a natural law basis for moral science and political science. This social evolution did not contradict his individualism, for he held that society was an aggregate of individuals and social change was dependent on prior changes of individual members. Individuals were always fundamental, and the formation of societies was instrumental or contractual, the result of the human motivation to join together to counter tendencies toward war and violence in general. The natural inclination of humans is to preserve their lives, and rational self-interest called for the formation of societies.

Recently, there has been a revitalized interest in Spencer's thought because of a growing interest both in evolutionary principles as operative in society and in his powerful arguments for natural rights and attacks on ulilitarianism.

Spontaneous Order

A spontaneous order is a pattern or structure of items or elements whose very regularity is generated by the interaction of the elements themselves. Sometimes referred to as self-organizing systems, endogenous orders, or polycentric systems, such orders are not the result of explicit agreement, legislated design, or a direct outcome of biological instinct. Although spontaneous orders appear in both nature and society, this entry focuses only on the idea of spontaneous social orders. Diverse phenomena such as language, money, the division of labor, the common law, prices, rules and institutions, and society as a whole have been explained as spontaneously generated phenomena. The very possibility of such unintended and decentralized coordination challenges the commonplace assumption that any complex social pattern must be the result of a designing mind.

Order, Spontaneity, and the Invisible Hand

In an abstract sense, order is constituted by relations among parts or elements. So understood, order has less to do with power, authority, or control than with comprehensibility. Within an order, elements are so related, in regularities and patterns, that if one understands some subset of the elements and relations, then one may form predictions, or reliable expectations, about other parts of the whole. Within a society, the elements would include individuals and organizations, including business firms. Society manifests order insofar as relations or interactions among individuals and organizations allow individuals to form reliable expectations about the conduct of others.

There is always some sort of order within any society, but an order is spontaneous insofar as it is unintended. An outcome is intended precisely when that outcome is desired by the acting agent, and the agent performed the act to bring about that outcome because the agent believed that this outcome would be the effect of that action. A paradigm instance of an *intended* action would be when a lawgiver enacts a law and that law has precisely the effect desired by a lawgiver. On the other hand, for any *unintended* result, there is a lack of correspondence between intention and effect. Thus, in an unintended or spontaneous social order, regularities or structures arise as individuals, with particular aims and purposes, respond to their own situations and adjust their conduct in light of what other persons are doing. A series of mutual adjustments occurs among individuals so that common patterns of conduct emerge even though such regularities are not the intention of any particular individual but arise, as Adam Smith suggests, by an "invisible hand." Thus, one may explain such orders by employing, what have come to be called, "invisible hand explanations." Such value-neutral (or descriptive) explanations should characterize a set of initial conditions, describe how individuals interact in those conditions, and specify some principle that explains how the interaction of agents within these conditions brings about patterns that were not part of any one individual's intention. These patterns then allow these same individuals to form reliable expectations. Such orders, whose spontaneity may be a matter of degree, emerge either in a specified slice of time or over longer periods of time (as in the case of cultural evolution).

Significant Theorists

There have been numerous discussions of spontaneous order. Some 18th-century thinkers—including Bernard Mandeville, David Hume, Adam Ferguson, and Adam Smith—incorporated the idea of unintended social regularities into their social theories. Smith's idea of the "invisible hand" points to his understanding of how beneficial outcomes may be brought about by individuals who are motivated by a private, rather than a public, interest. Within the social sciences, the Austrian School of Economics has emphasized the importance of spontaneous orders. For example, Carl Menger, in his *Principles of Economics* of 1871, provides an account of the unintended emergence of a common currency. In *Problems of Economics and Sociology* of 1883, he describes how the essential task of the social sciences is to explain institutions that serve the general good but are not directed by a designing intelligence.

F. A. Hayek, a 20th-century Austrian economist, has delineated an ideal type of spontaneous order that emerges from a legal framework of universal and abstract (purpose-independent) laws. These laws would, in general, proscribe types of actions rather than prescribe specific acts, and they would demarcate and protect private property. Within such a framework, and in conjunction with other moral and social customs, individuals will interact and sometimes innovate and experiment. The underlying legal rules permit individuals to act on their own knowledge and in relation to their assessments and beliefs about what others are doing. Patterns and regularities, including those of the market, will emerge spontaneously. For example, freely moving prices will signal to disparate and anonymous individuals how they might mutually coordinate their expectations. Such a spontaneous order, Hayek contends, allows for greater complexity than could have been wrought by centralized organization or design. The complexity of a society is directly related, therefore, to the degree of spontaneity that is permitted by the underlying legal framework.

Spontaneous Order, Business, and Society

This is one of the implications of the idea of spontaneous order. Yet the conception of the market as a spontaneous order also reveals how the myriad interactions of commerce have no predetermined end or result. If the market lacks a purpose or *telos,* then the attempt to construe markets as goal directed improperly describe commercial societies. Similarly, the attempt to impose, via legislation, an overall goal on markets may disrupt self-coordinating tendencies inherent in society. An additional implication, notably argued by Hayek, is how the complexity of spontaneous order reveals the inherent limits of human reason and social planning. Such complex and beneficial societies, he explains, are achieved by instituting a classical liberal rule of law, as noted above. Nonetheless, it is not entirely clear how the descriptive thesis of a spontaneous order must imply a normative claim about the political order. One may argue, conditionally, that if the goods of a spontaneous order are desirable, then a certain political order ought to be instituted. However, such a hypothetical argument does not justify which kind of order (or kind of goods) is desirable for a society.

This last conclusion suggests a critical puzzle about the very identification of *order.* Some thinkers have suggested that market economies do not, in fact, reflect order but disorder. How could there be such disagreement over the order of the market? Perhaps what counts as an order (spontaneous or not) depends on one's interests or concerns. For any assertion that some phenomenon is orderly, there are other sets of relations that one could have discerned. Whether some specific relations are comprehended as orderly may depend, therefore, on whether those relations cohere with one's interests. For example, the patterns or relations of a society include the commercial but there may exist other relations of interest, such as religious or cultural patterns or structures. It has sometimes been suggested that some relations (such as the economic) may crowd out or diminish other relations (such as the traditional or the religious). Whether this might be the case is an interesting question that relates not only to the very identification of order but also to whether some kinds of patterns predominate over others.

Nonetheless, the notion of spontaneous order has relevance for business ethics. Hayek maintains that the market is a self-adjusting and coordinating force and that a spontaneous order will manifest greater complexity than a designed order. The very dynamism of commerce does not, therefore, preclude stable expectations about individuals, actions, products, and modes of production. This consideration suggests, therefore, that the self-organizing or coordinating forces at work in society ought not to be ignored, whether in descriptive analysis or in normative argument. A second, and corollary, point relates to organization and management. In a large firm or corporation, it may be possible to set in place structures that permit spontaneous orders to develop within the organization or to emerge in relations between the organization and parties external to it (e.g., stakeholders). For example, procedures of interaction within the firm (or within some division of the firm) may permit or encourage employees to cooperate with one another (or with suppliers or customers) in ways that allow for adjustments, changes, and adaptations that are not mandated or otherwise stipulated. The outcomes of such processes could serve the aim of the firm, perhaps encouraging innovation that could not otherwise have been foreseen by management, and may enhance trust and cooperative relations between the firm and other individuals or organizations.

A third point of relevance shifts the focus to more general normative questions. Even though prices serve to coordinate economic (and other) conduct, there will exist, within society, other patterns and structures, including those that manifest moral norms. These moral regularities, perhaps the result of spontaneous emergence, may cohere with the overall market order. An imposition of alternative moral standards from outside these processes might disrupt the coordination endogenous to the society. Whether and how such disruption occurs, or whether it is counterbalanced by the good that such disruption may bring, is a question political economists, political philosophers, and business ethicists must also consider.

Stakeholder Economy

A *stakeholder economy* is a social system of production and exchange that is intended to protect the interests of all persons and organizations affected by the activities of buyers and sellers. A stakeholder economy is organized for the participation of stakeholders in its institutional mechanisms to allocate capital resources, to produce goods and services, and to distribute them in response to demand. Thus, a stakeholder economy is intentionally governed for the interests of broad and diverse segments of society rather than for the more narrow interests of the owners of capital and the holders of wealth.

In North America, the term *stakeholder* comes from the colonial era when it was the practice for land owners to mark their property by putting stakes in the ground. Those who did so were said to have a *stake* in the community. In addition to the owners of capital and the holders of wealth, today's stakeholders are composed of distinct and diverse groups in a society. For example, buyers and sellers clearly have a stake in the ethical functioning of a society's economic system. Other affected groups with an interest in the fairness and integrity of economic activities include employees, nongovernmental advocacy organizations, and the populations of local communities. Some also argue that posterity, the future generations yet unborn, are stakeholders whose interests are affected by the sustainability of current economic activities and today's decisions that are likely to affect future financial health, availability of natural resources, and the level of environmental pollution.

Clearly, there are many distinct groups of diverse stakeholders. They have in common, however, their perception that something they value is at risk because of society's actions, or inactions, to produce and exchange goods and services. Commutative justice depends on public-policy-making mechanisms that allow all these distinct and diverse stakeholders, including the stewards of posterity, to participate in economic governance and exchange. Such mechanisms include broad representation of social groups on advisory, legislative, and regulatory committees. Commutative justice in a stakeholder economy also gives voice to the diverse groups in capital allocation decisions for production and distribution.

In a context of scarce or finite resources, decision makers are not likely to be able to simultaneously satisfy the preferences of each and every stakeholder. In this situation, broad inclusion compels each group to use the tools of public persuasion and to exercise its political power to realize its preferences in the governance of the economy. The effectiveness of the stakeholder economy is likely to depend on cooperation, consensus, and coalition building to balance the power of any large group with much at stake. A stakeholder economy requires integrity in the public process for interest groups to influence the activities of businesses and organizations. Principles of procedural justice are important to ensure fairness in the process of making decisions that trade off and balance responsiveness to individual stakeholders.

The World Bank, because of its important role in stimulating the development of economies, has relied on a rigourous approach to stakeholder analysis that focuses on the integrity of government operations and public policy decision making. Central to the Bank's approach is the assumption that the stakeholder groups with the most resources and the most at stake are most likely to realize their preferences in public policy processes governing the economy. Importantly, the World Bank also has found that the positive social effects of a developing economy are significantly diminished in societies where public-policy-making institutions are captured by one stakeholder group to the exclusion of others.

The overall lesson from the experience of the World Bank is that both economic development and respect for human rights depends on working closely with powerful stakeholders while simultaneously giving all stakeholders fair opportunity and access to government institutions that govern the economy. The operational effectiveness of a stakeholder economy, therefore, depends on powerful stakeholders avoiding conflicts of interest as they assert their self-interest and liberty while at the same time responding to the rights of less powerful stakeholders in the community.

Current obstacles to the ability of stakeholders to participate effectively in the functioning of an economy include business consolidation, corruption, and the lobbying activities of interest groups. Businesses grow larger and broaden their scope as they consolidate in mergers and acquisitions. As they grow, their resources increase but the salience, or importance, of many other stakeholder groups to it may diminish in significance. Stakeholder analysis suggests that this situation allows the consolidated business to be most likely to realize its preferences in the economy. This issue is particularly urgent for stakeholders in a global economy in which managers may operate a business system of global proportions while other stakeholders are organized in smaller groups separated by country, culture, and language. Thus, the outcome of consolidation and globalism may be a fragmented and ineffective stakeholder economy.

The justice of outcomes expected from an effective stakeholder economy depends on the honesty and integrity of social institutions. Many have commented, for example, that the pervasive role of lobbyists in the U.S. public-policy-making apparatus is an obstacle to an effective stakeholder economy. Lobbyists are advocates paid to influence government on behalf of a group with a special interest. In the United States, lobbyists are regulated in their activities to protect against the hazards of corruption. Nevertheless, one common criticism of lobbyists is that their effectiveness depends on access to substantial financial resources, but those with such resources may contribute to procedural corruption, and stakeholders without such resources are locked out of the public-policy-making process required for the smooth functioning of an effective stakeholder economy. This criticism is consistent with the stakeholder analysis approach to government operations discussed earlier in this entry.

In sum, the stakeholder economy views business as a production mechanism to improve the welfare of all social groups that have an interest in the allocation of resources in society. The goal of the stakeholder economy is to to apply the principles of commutative justice broadly across all social groups to ensure the fair access of each to participate and to benefit from the functioning of the economy. Key to the smooth functioning of the stakeholder economy is the integrity of the public policy process in which stakeholder groups influence the regulation of the economy.

Stakeholder Engagement

Stakeholder *engagement* is an emerging approach for thinking about and acting on the complex interplay of relationships and responsibilities of business *in* society. It focuses on engaging all stakeholders caught up in a shared problem domain in an interactive dialogic learning process so that the messy, interdependent problem can be understood jointly and addressed cooperatively. It is an extension or, some would argue, a transformation of the theory and practice of stakeholder *management* and the stakeholder theory of the firm. Both stakeholder management and stakeholder engagement arise from R. Edward Freeman's 1984 classic definition of stakeholders as any individual or group who can affect or are affected by the achievement of the organization's purposes or by their unintended consequences. The stakeholder concept dramatically expands the scope of executive responsibilities beyond just the fiduciary duty of a managerial agent to serve the economic interests of the firm's shareholders. Managers are expected to consider the interests of all who have a direct stake in the firm (such as customers, suppliers, and employees) or an indirect stake in the firm (such as interest groups, government, or nongovernmental organizations) because of the firm's operational impacts on the external community or natural environment.

The concept and practice of stakeholder management is *firm centered* and calls on managers to review and exercise unilateral control over a series of bilateral stakeholder relationships. These take on a "hub-and-spoke" configuration, as managers of the corporate hub work to minimize potential threats to the firm's primary objective function of enhancing financial performance for shareholder principals. This management activity involves the negotiation of trade-offs between financial and social performance expectations. This typically will reduce short-term financial returns but may, arguably, preserve the long-term financial viability of the firm by improving its reputation or perceived legitimacy in the eyes of potentially threatening stakeholder groups, such as irate employees, customers, or environmentalists. Such accommodations are justified as being necessary to avoid or minimize the threat of negative stakeholder responses, such as consumer boycotts, pressures for regulatory intervention, or other adverse actions. In contrast, stakeholder engagement is a *network-centered*, learning-based process of manager/stakeholder interactions, which locates the firm within a web of multilateral relationships and explores ways to achieve system sustainability by enabling the firm's managers to work with their stakeholders while addressing complex, interdependent, emergent, and messy problems.

Initiating a process of engagement within a stakeholder network requires a dramatic extension of the responsibilities and capabilities of business managers, as well as the enabling of a variety of stakeholder voices, often represented by nongovernmental organizations (NGOs), such as Greenpeace or Amnesty International. Ann Svendsen and Myriam Laberge, two leading Canadian consultants on "whole system change," have characterized this process as "cocreative engagement," highlighting the emergent role of business managers as conveners and facilitators of multi-stakeholder-learning dialogues that bring the "authentic voices" of stakeholders to the table. They define a stakeholder network as a web of groups, organizations, and/or individuals who come together to address a complex, cross-boundary problem, issue, or opportunity. The manager's role must necessarily be one of facilitation and support rather than control because the firm is just one participant within a problem domain that encompasses multiple perspectives on the nature and extent of the problem, as well as perceptions of how each network member is affected by that problem and by potential solutions. The starting point for the convening of a stakeholder network is the recognition by those who share the messy, interdependent problem that no single party can resolve it successfully without engaging with others in the problem domain.

Svendsen and Laberge characterize the stages of cocreative engagement as proceeding from *outreach* to *collective learning* and finally to *joint action/ innovation.* The driver for the initial stage of outreach, where membership in the stakeholder network is extended, often is a reputation crisis experienced by a major corporation. One such is Nike. This reputation crisis, typically, is triggered by the outraged reactions of activist stakeholders to managerial assumptions, methods, and oversights in addressing a sensitive issue, such as creating environmental damage or threats to human rights through their business operations in developing countries. Thus, Nike managers initially responded angrily and defensively to NGO criticism of working conditions in the shoe and apparel plants of their Asian subcontractors. They felt that such criticisms were overblown and taken out of context, arguing that wages and working conditions in these plants were comparable with or preferable to locally available alternatives. Moreover, they insisted that any abuses of employee rights were the responsibility of the local contractors and government regulators. They represented Nike as being primarily concerned with delivering a solid return to its shareholders, as well as a superior product at a reasonable price to its customers. However, escalating stakeholder/NGO complaints and a spreading consumer boycott, especially on college campuses, forced Nike managers to reconsider their "Go it alone" stance. Thus, stakeholder engagement can, to some extent, be forced on a company. Nike's management team, headed by CEO Phil Knight, grudgingly shifted from an adversarial to a more accommodative stance and joined in a multi-stakeholder dialogue with other apparel companies, labor and human rights NGOs, and some governments, including the Clinton administration. Out of this process of engagement within a stakeholder network emerged a voluntary "No Sweat" apparel industry code of conduct that defined socially responsible business "citizenship" performance. Thus, stakeholder engagement is associated with a trend toward heightened *accountability* in corporate social and environmental, as well as financial, performance (i.e., the "triple bottom line"). This requires increased *transparency* in business operations so that these broadened performance expectations can be monitored and compared. Notably, stakeholder NGOs have become actively engaged not only in helping formulate voluntary industry or business performance standards but also in monitoring and certifying compliance to these standards. Business, government, and NGO representatives have taken on these new roles and responsibilities after they recognized that they could not accomplish their goals acting alone. Other stakeholder engagement success stories are offered by Steve Waddell, in his 2005 study of an emerging interactive, collaborative process of societal learning and change.

Critics of this new approach to stakeholder engagement, and particularly of the call for a new management responsibility to foster stakeholder dialogue, point to the risk of strategic or operational delays from stirring up a senseless cacophony of contending stakeholder voices. This criticism can be met by pointing out that stakeholder engagement and dialogue processes are largely unnecessary when "business as usual" rules and conditions apply. Thus, examples (especially successful examples) of stakeholder engagement remain the exception rather than the rule for management practitioners. Even so, Jorg Andriof and Sandra Waddock, leading scholars of the emerging theory and practice of corporate citizenship, argue that stakeholder engagement processes are an appropriate response to unfolding institutional and competitive developments in the global environment of business. Accelerating environmental turbulence (rapid, unpredictable changes) associated with hypercompetitive pressures in the global marketplace is forcing business organizations to forge new network connections. They do so to enhance their organizational learning capabilities needed to guide rapid adaptive responses and to help manage rising social risks posed by activist stakeholders who feel they should have a "say" in mitigating the impact of corporate actions on internal and external constituents. As the boundary separating the business organization from its external environment becomes more permeable, management assumptions about exercising control within a closed organizational system are giving way to a search for new ways to engage stakeholders within an open-system environment. In effect, managers have to learn how to negotiate this complex, unfolding environment by developing a capacity for cocreative engagement via dialogic interaction within the stakeholder network.

Making sense of network relationships requires a more system-based or holistic approach to learning and doing. Stakeholders and business organizations grappling with a messy, open-ended problem first have to realize that they cannot handle it alone. Before they can learn how to work together, each network member must come to realize that furthering a particular identity and purpose is intertwined with the successful functioning of the whole. A critical aspect of this interactive dialogic learning process is the search for common ground, which provides the shared cognitive (thinking) and affective (feeling) foundation from which cooperation and creative adaptation can arise. Dialogue is an open-ended, interactive mode of inquiry that invites participants to speak with an authentic voice (without guile and reflecting the true self), to listen respectfully, and to question not only others' but also their own initial "mental maps" about the nature of the shared problem and different ways network members relate to it. Dialogue encourages reflective inquiry within a process of collective learning, which can move participants toward a cocreative construction of shared meanings, and codevelopment of ethical norms of behavior to guide trust-based network interactions. Reflective dialogue deepens inquiry into underlying causes, rules, and assumptions to enable the reframing of old problems in new ways, thus opening a path to innovation and system change.

Ultimately, stakeholder engagement is about building and sustaining relationships within a shared problem domain. Whereas conventional management theory characterizes the management of these relationships in terms of exploiting resource dependence or minimizing transaction costs, an emerging theory and practice of open systems or network management calls attention to the need to build trust and invest in "social capital"—the connective glue and lubricant for cooperation and information exchange within networks. While proactive stakeholder engagement may not be needed to guide day-to-day operations, many business managers are coming to recognize that a growing number of complex, messy, and interdependent problems, ranging from failing public schools to urban blight, and even global warming and rising energy costs, are threatening the overlapping economic, political, social, and ecological systems within which business firms operate. The insight that growing systemic problems are impinging on business success may well provide a compelling rationale for a new, more proactive approach to corporate social responsibility. Moving beyond philanthropic and public relations gestures, a growing number of leading corporate citizens are beginning to engage with stakeholder activist groups and other strategic partners to find new ways of relating, learning, and working together to resolve some of the messes that our old ways of thinking and doing have created or failed to address successfully.

Stakeholder Responsibility

The primary focus of stakeholder theory has been the proposition that firms have a moral responsibility to take into account the interests of stakeholders other than just stockholders. Given the focus on the corporation within organization studies, this emphasis in theorizing is understandable. The emphasis on corporate responsibility to stakeholders has not to date been balanced by a complementary focus on the responsibilities of stakeholders. Though some models within the stakeholder literature portray a two-way relationship between the firm and the stakeholder, writers predominantly argue that firms are responsible for taking into account stakeholder interests, without noting the reciprocal moral responsibility of stakeholders to consider the interests of the firm in their actions and policies. A focus on stakeholder responsibility compels theorists, corporations, and stakeholders to direct greater attention to the importance of the responsibilities stakeholders have to firms and to other stakeholders who are part of the collective enterprise.

Corporate Responsibility and Stakeholder Theory

With the emergence of stakeholder theory in the mid-1980s and its rapid growth up to the present time, numerous writers questioned the primacy of corporate responsibility to shareholders. Writers building the foundation of stakeholder theory argued for expanding the domain of corporate responsibility beyond shareholders to include a number of critical stakeholder groups.

Over time, the legitimacy of the stakeholder perspective has grown and has influenced the direction of work in business ethics, organization theory, and the strategic management literature. Stakeholder theorists have argued for managers to acknowledge the moral "stake" of stakeholders by paying attention to stakeholders and their interests for both prudential reasons (i.e., it is good for the firm and its profitability to listen to stakeholders) and normative reasons (i.e., they argue that there are compelling moral arguments for considering stakeholder interests).

Corporate and Stakeholder Responsibility

As noted above, there has been a lack of attention to the fundamental question of whether stakeholders have moral responsibilities to firms. This is not to say that the topic of stakeholder responsibility has been completely ignored by business ethics writers. A series of articles and books were published in 2002 to 2003 that attempted to establish a conceptual foundation for stakeholder responsibility. This work emphasized the importance of stakeholders assuming responsibility for negative outcomes associated with actions directed to firms and other stakeholders and reinforced contemporary notions of responsibility in terms of accountability and responsiveness.

There are other ways of understanding responsibility in relation to stakeholders. Tracing the term back to its Latin roots (*respondere*), responsibility literally means to *pledge back*. In contrast to notions of responsibility that focus on an externally imposed obligation, this form emphasizes the idea of people and organizations choosing to pledge things to each other to foster cooperation and a better life for all. This definition of responsibility extends what it means to be a stakeholder beyond the traditional definition of stakeholders as individuals, groups, or organizations potentially affected by the actions and policies of an organization. Stakeholders are not only the recipients of organizational actions but actors as well with reciprocal responsibility for the implications of their actions in relation to firms and other stakeholders.

The idea of stakeholder responsibility draws its legitimacy from fundamental philosophical arguments. There are consequentialist arguments for both corporate and stakeholder responsibility that focus on whether a person, firm, or stakeholder can produce benefits or harms that are of importance to others. Writers have devoted primary attention to corporate responsibility particularly in light of their size and power and the potential significance of harms and benefits associated with corporate actions. From a stakeholder responsibility perspective, attention shifts to stakeholders, who are responsible for reciprocating benefits from firms and other stakeholders and addressing intended and unintended harms, particularly deriving from the role responsibilities of stakeholders and their ability to inflict harm on (or create benefit for) the firm and other key stakeholders. In the same way that responsible corporations must consider how specific actions and policies might harm stakeholders, especially those who are in highly dependent and potentially vulnerable positions, stakeholders bear reciprocal responsibilities as well for taking into account potential harms to firms and other stakeholders.

Beyond an emphasis on consequences, specifically responsibility for negative consequences, there are arguments for stakeholder responsibilities that rely on a deontological or rule-based approach to ethics, particularly those connected to justice and the ethics of interdependence. Notions of reciprocity and responsibility—for benefits and harms—are central to the literature on justice and fairness. The notion of reciprocity is a fundamental element of justice and fairness, and contemporary business ethics scholars have developed a "principle of fairness" to determine whether firms have responsibilities to stakeholders (Does the firm receive benefits from the stakeholder?) and to which stakeholders firms should give primary attention (How significant are the benefits received from a particular stakeholder?).

This literature provides a rich foundation for thinking about firm responsibility to stakeholders and can be extended to consider how firms benefit from their interactions with stakeholders. Employees, customers, suppliers, investors, and other stakeholders benefit in a variety of ways from their relationships with firms and each other. Employees gain in tangible (e.g., wages) and intangible ways (commitments) from their relationships with firms. Customers may come to appreciate the high-quality products a firm offers and value as well the service employees provide in purchasing these products. The receipt of these benefits from firms may generate responsibilities on the part of employees and customers to these firms (and other stakeholders). In drawing attention to the benefits stakeholders gain from specific relationships with firms and other stakeholders, considerations of fairness and reciprocity encourage stakeholders to recognize reciprocal responsibilities for helping others achieve these goals and interests.

In like manner, as agents of the firm, stakeholders have a responsibility to create benefits for the firm that further the firm's and stakeholders' mutual interests. There are strong signs that many firms understand and depend on such responsibility in their operations. For example, firms presuppose and depend on employees taking ownership of customer service and acting responsibly toward them. Many firms take steps to put into place supplier codes of conduct that establish responsibilities critical for suppliers to fulfill for these firms to achieve important goals and commitments to other stakeholders.

As more attention is directed to stakeholder responsibility, there will be opportunities to enrich the business ethics literature and create an understanding of business ethics that emphasizes both corporate and stakeholder responsibility.

Stakeholder Theory

Every company exists in a network of relationships with social actors that affect and are affected by the company's efforts to achieve its objectives. Taken together, these actors are the company's *stakeholders*, implying that they hold a stake in its conduct. Typically, stakeholders of a for-profit company include its customers, employees, stockholders, suppliers, the local community, and many others groups.

Stakeholder theory is the term used to describe broadly the systematic study of these relationships, their origins, and their implications for how companies behave. As used in this context, the word *theory* raises serious problems. Social scientists who study stakeholder relations are interested in many empirical questions, such as why companies and stakeholders behave as they do and why companies succeed or fail. They use the word *theory* to refer to a specific set of cause-and-effect relationships used to answer such questions. The controversy (as explained below) is whether stakeholder theory, as a social science theory, points toward a unique set of causal statements about why organizations behave as they do that no other theory identifies. On the other hand, ethicists use the term *stakeholder theory* to describe a coherent and original answer to the central philosophical question in organizational ethics, How should organizations behave? There is less controversy about whether stakeholder theory is a form of ethical theory, though this does not mean that the theory's content is uncontroversial among ethicists. This entry discusses the development of stakeholder theory in both these contexts (social science and philosophy) and details its answers to both empirical and ethical questions.

Historical Background

The term *stakeholder* is not a new one. It dates back at least as far as the early 18th century, where it sometimes appeared in British legal cases to describe a party holding a stake in a financial transaction. In the narrowest sense, a stakeholder was a neutral party to a transaction or wager who held the money in trust—literally holding the stakes. However, by the early 19th century—as detailed in the *Oxford English Dictionary*—the term had acquired a more expansive definition in two ways. First, its meaning expanded to include all parties to a financial interest, and second, it broadened to describe those parties holding an interest in the broader political system or commonwealth. In some sense, this more expansive use of the term would set the stage for its emergence as a term in the study of business and society.

While the term did not appear explicitly in writing about management for much of the 20th century, the notion that executives must pay attention to the demands of an organization's multiple constituencies has a long history in the early-20th-century precursors to the modern field of organization theory. Mary Parker Follett, an early American management thinker, portrayed the organization as nested in an environment of other actors, each mutually influencing and defining each other. To Follett, the manager's job was to integrate the conflicting interests held by these constituencies, and the success of the company depended, in no small part, on managers recognizing the need to (a) manage all relationships with as much attention as they traditionally paid to personal matters and (b) achieve some degree of creativity in how they dealt with conflicting demands.

Likewise, in his classic book *The Functions of the Executive*, Chester Barnard foreshadowed the eventual emergence of stakeholder thinking. For Barnard, an organization is a cooperative scheme, the result of a conscious effort by many people to work together. As such, an organization's survival depends on its relationship to its environment and its ability to satisfy those individuals interacting with it. The central role, in Barnard's thinking, of executive responsibility—the suppression of personal interest in service of the cooperative scheme—also heralds the eventual exploration of the moral side of stakeholder theory. Barnard introduces notions of balance and touches on questions of whether subordinates should be treated as having intrinsic value (valued for their own sake) or should be treated instrumentally (valued only for what they can do for the executive or the company). These are questions that, today, arise frequently in writing about companies and their stakeholders.

The early works of Follett and Barnard, though often neglected today, played some role in the emergence of the open systems view of organizations in postwar organization theory and, in turn, these authors laid much of the intellectual groundwork for theorizing about stakeholders. Efforts by Peter Blau, W. Richard Scott, William R. Dill, and James Thompson all centered on the nature of the external environment in which organizations existed, paying particular attention to the nature of the *organization set*—the immediate relationships surrounding an organization. In the ensuing decades, the attention of most organization theorists would shift from the study of organization sets to organization fields, a higher level of analysis at which all organizations and their constituents interact to create institutional norms and rules. Yet the initial insight that a company plays multiple roles within a bounded set of actors would lay the groundwork for the advancement of stakeholder theory as a continuing effort to explore the nature of organization set interactions.

The term *stakeholder* emerged in the study of organizations and management in the early 1960s through the work of the Stanford Research Institute, in the work of Albert Humphreys and others. There, efforts to map program management processes and improve long-range planning techniques led to greater attention on the parties to a management process—that is, its stakeholders—and their role in determining the success of a change program. Both Kenneth Andrews and Igor Ansoff, early advocates of the study of corporate strategy, used the term explicitly and suggested that stakeholders might have something to do with the overall strategy formulation process in a company. However, the term did not attract much attention until the early 1980s with the publication of two books, Ian Mitroff's *Stakeholders of the Organizational Mind* of 1983 and R. Edward Freeman's *Strategic Management: A Stakeholder Approach* of 1984. Of the two, Freeman's has made the more lasting contribution to stakeholder theory.

Freeman's Seminal Contribution

R. Edward Freeman's book *Strategic Management: A Stakeholder Approach* (1984) is widely recognized as the first major work in stakeholder theory, though misunderstandings about its contents abound. It is, therefore, worth devoting some attention to the nature of Freeman's argument and its implications for the subsequent development of stakeholder theory.

The starting point for Freeman's book is to trace those previous schools of thought that lay a groundwork for thinking about a company's strategy in stakeholder terms. There are four primary schools—the corporate planning literature, open systems theory, the study of corporate social responsibility, and organization theory. For each, Freeman discusses the contributions made to the stakeholder concept. Chief among these contributors are the organization set theorists cited above, systems theorists such as Russell Ackoff, corporate strategists such as Ansoff, and business and society scholars such as Lee Preston and James Post. This section can, in some ways, be read both as a history of the stakeholder concept and as an intellectual genealogy indicative of the various circles in which Freeman was moving at the time that he was conceiving of and developing his approach to stakeholder management.

Freeman's definition of the term *stakeholder* remains the most commonly used (and is the basis for the definition provided above), despite frequent criticisms of its breadth. He writes, "A stakeholder in an organization is (by definition) any group or individual who can affect or is affected by the achievement of an organization's objectives" (p. 46). This definition also lays the groundwork for the visual figure, a hub-and-spoke diagram with the company at the center and stakeholders ranged around in a circle, most commonly associated with stakeholder thinking. Most subsequent writers, however, ignore Freeman's warning that if stakeholder thinking remains at such a generic level—ignoring the specific groups and complex interrelations that characterize actual company-stakeholder interactions—it would have little practical value.

The most obvious and lasting contribution of Freeman's book is the emergence of what has come, more recently, to be called instrumental stakeholder theory—the idea that companies that manage their stakeholder relationships effectively will survive longer and perform better than those companies that do not manage stakeholders well. (This entry will discuss more recent contributions to this stream of research.) In developing this argument, Freeman also offers what remains the most in-depth description of the actual practices and processes by which a company might be said to manage these relationships well. He suggests that stakeholder management "competence" includes a commitment to monitoring stakeholder interests, an ability to formulate strategies for dealing with stakeholders, sophistication in segmenting stakeholder needs, and the alignment of specific business functions (e.g., public affairs, marketing) to dealing with stakeholder needs. In essence, Freeman's book remains one of the most thorough "recipe books" for managers interested in stakeholder management, and far more than its contribution to theory, this remains its greatest strength.

As for Freeman's role in the emergence of an ethical literature on company-stakeholder relations, the genealogy is slightly more complicated. After all, Freeman's book contains little reference to the question of how companies should treat stakeholders, at least insofar as the question goes beyond merely prudential matters of survival or profit. The book contains only one passing reference to ethical and political theory (a stray citation of the writing of the philosopher John Rawls), and it would be a few years before Freeman would acknowledge that, only in later conversations, did he begin to explore seriously the question of stakeholders as moral agents. Yet Freeman's own training as a philosopher and his relationship to the burgeoning scholarly community of business ethicists probably created the conditions by which the 1984 book serves as a foundational work in ethics-based stakeholder theory, despite the fact that it contains little explicitly intended to kindle such discussion.

Stakeholder Theory in Organizational Ethics

As stated above, stakeholder theory can be looked at as a marriage of two somewhat different theoretical enterprises—ethical and empirical. The first is the search for an ethics-based stakeholder theory. From its onset, in the early 1990s, this project started with several attempts by Freeman and other like-minded philosophers to formulate a so-called normative core from which to deduce the moral obligations of the company in dealing with its stakeholders. Many scholars thus sought to establish a clear philosophical foundation on which to ground statements about how companies *should* treat their stakeholders. Almost every major ethical theory—utilitarianism, property rights, feminist ethics, and Kantian deontology—offered some basis for relevant arguments.

At its heart, the quest for a normative core for stakeholder theory has clear roots in the more long-standing debate over the purpose of the corporation in a capitalist society. Ethicists tend to draw a sharp distinction between stockholder and stakeholder models of capitalism—the central question being "For whose benefit should the corporation be run?" The stockholder model, which received its most ardent defense from Nobel laureate Milton Friedman, holds that the corporation must strive to maximize returns for its shareholders. The property rights of its shareholders, the nature of fiduciary duties, the legal mandates surrounding corporate governance, and public policy considerations all offer some support for the stockholder model.

Set in opposition to this model, however, the stakeholder model holds that a corporation owes obligations to more than just the stockholders. For example, Thomas Donaldson and Lee Preston (in a widely cited article) argue that a more expansive notion of property rights allowed stakeholder groups to make legitimate claims on the value produced by the corporation. Each of the attempts to derive a normative core from some established school of ethical theory arrived at similar conclusions, though often from very different starting points. The object of the corporation, they argue, is to maximize stakeholder wealth—which includes but is not limited to stockholders.

With time, the pursuit of a normative, or ethics-based, stakeholder theory has gone beyond the simple pursuit of a normative core. Today, three major problems occupy ethicists interested in how companies should treat their stakeholders—identification, distribution, and procedure. Each has received attention in existing research but each demands further elaboration.

Identification

The problem of identification seems simple enough: Who should managers of a particular company identify as its stakeholders? Given the potentially vast number of actors claiming a stake in the company's operations, identification involves determining which actors truly have enough moral standing to be considered stakeholders. This is a moral problem rather than merely a question of description. A local business may well pay protection money to a local crime boss, and this person may affect and be affected by a company's actions. However, few ethicists would argue that crime bosses have moral standing vis-à-vis a company. Indeed, companies may well treat any number of social actors as salient (i.e., requiring attention) without considering them to have the moral standing afforded by ethics-based stakeholder theory.

From the earliest days of stakeholder theory, the identification problem has produced a great number of distinctions. Early stakeholder theorists spoke of stakeholders as either primary or secondary, indicating that some groups may have greater or lesser claims to stakeholder status. In a frequently cited article, Mitchell, Agle, and Wood suggest that the characteristics of power, legitimacy, and urgency not only determine who the company is likely to consider salient (an empirical question) but which groups merit this attention (a normative one).

It is, however, Robert Phillips's book *Stakeholder Theory and Organizational Ethics* that offers the most coherent and complete answer to the identification problem. Drawing on a principle of justice as fairness first articulated by John Rawls, Phillips contends that a company should consider as stakeholders all those parties that participate in the cooperative scheme surrounding it. In other words, a company has an obligation to attend to the claims of parties insofar as it willingly receives benefits from them. Based on this notion of fairness, Phillips distinguishes between legitimate stakeholders (i.e., those that possess moral standing based on claims of fairness or reciprocity) and derivative stakeholders (i.e., those parties whose claims on a company are indirect, deriving from their relationship to a legitimate stakeholder). Thus, a company must recognize employees as a legitimate stakeholder because the company willingly accepts benefits from the employees' efforts; however, the company need not consider the labor union acting on behalf of employees a legitimate stakeholder, except insofar as their claims derive from their relationship to employees. In sum, Phillips grounds the debate over identification more firmly in the realm of ethical theory and offers one possible solution.

Distribution

The second and arguably greater ethical question in stakeholder theory is the problem of distribution, "How should a company distribute the value that it creates?" Of course, this is a highly simplified way to express the problem, as businesses tend to generate very different types of value (many of which are incommensurate with each other), operate over long time frames in which seeming trade-offs can worsen or resolve themselves, and generate enormous costs that may well be treated as morally different from the value the company creates. If a company damages the natural environment, for example, it deprives community members of certain intangible goods (peace of mind, quality of life) for which monetary value does not fully compensate. Many of the costs involved manifest over long periods of time, during which the immediate benefits to the company of polluting may place the company in better (or worse) position to remedy the environmental problems that arise. Finally, if the damage leads to deaths in the community, these costs are unlikely to fit naturally into a cost-benefit calculation along with returns to stockholders and employee salaries enjoyed by other stakeholders.

Despite the complexities, stakeholder theorists have continued to wrestle with the distribution problem. To a great degree, solutions to the distribution problem are set in contradistinction to the notion that companies (particularly corporations owned by stockholders) owe all their residual value to their owners. Alexei Marcoux, in an important article in the *Business Ethics Quarterly*, mounts a vigorous defense of this principle. He contends that the notion that a company owes a fiduciary duty to shareholders—a duty to act first and foremost in the interests of shareholders—is the natural moral analog to other situations where fiduciary duties apply. Information asymmetries, the degree of possible harm, and the need for trust all create conditions where the company should acknowledge a fiduciary duty to it stockholders similar to that of doctor to patient or lawyer to client. Of course, this idea—equally present in Friedman's justification based on the property rights of owners—actually offers only an incomplete response to the distribution problem. After all, we may agree that shareholders, as owners of the company, deserve special consideration and still have few answers about the right way to distribute value and costs. Many of the decisions companies make and the trade-offs they address have only incidental impact on stockholder value.

In most such cases, the causal relationships are so tenuous as to make considerations of fiduciary duty and residual wealth not useful, if not altogether irrelevant, for solving the practical moral problems involved. Consider a simple example of an airline deciding how much airline baggage to allow on the airplane. Insofar as a company (rather than regulators) still gets to make this choice, managers must decide between passenger convenience and the well-being of employees—flight attendants are often injured trying to help passengers with oversized carry-on baggage. To say "the company should do whatever is best for the shareholder" is to say very little indeed. There is no evidence that baggage policies are a major determinant of customer preference and little more evidence that employee morale translates directly into financial returns in this industry. Indeed, fuel costs (a very important driver of profit in the industry) are not affected either way, as the baggage will end up somewhere on the airplane regardless of whether it is checked or carried aboard. The company is still left to decide how to distribute the good among two conflicting stakeholder claims. Though this is a trivial example, it may be more representative of the problems faced by management on a daily basis.

The general principle often attributed to stakeholder theory is that companies should distribute value broadly, that the company should be managed so as to create value for all its stakeholders. In specific terms, Phillips offers the clearest interpretation of this general principle. He argues that a company owes obligations proportional to the relative contribution that the stakeholder makes to the success of the cooperative scheme. Of course, by marking out such a specific position, Phillips exposes himself to critiques that the resulting allocations are still too narrow to be morally justifiable. After all, some groups (e.g., local communities) may offer few tangible benefits to a company, contributing little to the cooperative scheme, but still deserve some consideration if, for example, the company decides to erect a particularly ugly building that will destroy property values for miles around. Still, the distribution question awaits a more persuasive argument.

Procedure

The problem of procedure concerns the proper role of stakeholders in the formulation of strategies and policies that affect them: Does a company have an obligation to engage with stakeholders and invite their input into policy decisions? Regardless of the moral issues involved, many companies do offer ways for particular stakeholder groups to express their viewpoints. However, given that companies, especially very large corporations, can exercise a great deal of power (often on a par with governmental power) over customers, employees, and local communities, the question of whether managers owe an obligation to provide due process (e.g., via grievance processes, consultations, etc.) remains an important moral question.

Arguments in this vein tend to find their roots in one of two traditions. On the one hand, ethicists may choose to draw on the work of German philosopher Jürgen Habermas. Habermasian, or discourse, ethics hold that morally right decisions in a political context are only possible insofar as they are created through open public discussion and deliberation. The only way to honor man's nature as a reasoning being is to respect reason's role in the act of communication and deliberation. Applying this principle of communicative reason, Jeffrey Smith has argued that a company has an obligation to consult with its stakeholders so that the resulting decisions will not only be better but more ethically legitimate than those created in a vacuum.

A second perspective on the moral problem of procedure is the emerging discussion of multistakeholder dialogue. Though not necessarily rooted in any particular ethical theory, authors such as Jerry Calton and Stephen Payne, drawing on insights from William Isaacs and David Bohm, argue that dialogue is a natural and important facet of all human relationships and that suppressing dialogue in stakeholder relationships is both imprudent and unnatural. It is not clear, of course, what the extent of this dialogue must be—who should be involved, how long it should last—but Calton and Payne seem to suggest that these considerations should flow organically from the dialogue itself rather than according to any external constraints.

Stakeholder Theory as Social Science

If stakeholder theory is (as suggested above) a marriage between two somewhat different theoretical enterprises—the ethical and social science traditions—the latter has been the more fickle partner. Many social scientists researching these interactions have done so while, more or less, accepting the notion that the normative project remains an essential part of stakeholder research. For these theorists, accepting that stakeholders have intrinsic value is a shared premise for stakeholder theorizing. In other words, the social scientist must accept a fundamental ethical principle and then embark on research that advances understanding either the empirical or the ethical implications of this premise. The ideal outcome, then, is some *convergent stakeholder theory*, a phrase coined by Thomas Jones and Andrew Wicks, in which both efforts combine in a hybrid that includes both a sophisticated morally grounded concept of how companies should treat stakeholders and an empirically robust causal chain linking such moral behavior to desirable outcomes.

A minority of social scientists doing research on stakeholders tend to reject this desire for convergence and see it as a threat to traditional assumptions about how to do proper social science. From this perspective, stakeholder research is merely one domain of scholarly activity that studies how companies and their stakeholders interact, and the relationship between the ethics- and social science–based traditions is, at best, at arm's length. There is, they might argue, no reason to privilege the ethics-based element of stakeholder research (as both ethicists and those seeking convergence have tended to do). Indeed, within this second camp, there is even considerable controversy as to whether there is such a thing as "stakeholder theory," if the term *theory* is interpreted solely in social scientific terms. They ask, Does stakeholder theory refer to some unique set of causal factors that theories of power, resource dependence, networks, and institutions do not encompass?

The interplay between these two camps serves as an intellectual backdrop against which good social scientific investigation of these interactions continues unabated. This section discusses the three main areas of investigation covered to date.

What Are the Effects of Stakeholder Management?

Building on the foundation laid by Freeman's (1984) book, one of the most popular subjects for study in the stakeholder research tradition has been the question of whether it matters (financially) how a company manages its stakeholder relationships. In other words, does stakeholder management actually correlate with widely valued outcomes such as profit or stock price?

In this realm, Jones's influential *Academy of Management Review* article from 1995 on instrumental stakeholder theory remains the central work. Jones argues there that the most important characteristic of a company's behavior toward its stakeholders is its moral quality, the presence or absence of dishonesty and/or opportunism. (It is worth noting, here, that this emphasis on morality as the distinguishing feature of good stakeholder management constitutes a departure from Freeman's original model of stakeholder management as largely concerning the procedures undertaken by the company.) Jones proceeds to argue that opportunism and dishonesty will tend to make stakeholders unhappy and lead to increased contracting costs, whereby stakeholders exact higher costs from the company up-front as a way of safeguarding against future opportunism. These costs translate into lower financial performance for the company. In contrast, companies that are honest and trustworthy in their dealings with stakeholders have more efficient contracting and achieve a competitive advantage. Jones then offers an extended list of specific practices (e.g., disproportionate executive compensation, poison pills, and greenmail) that qualify as opportunism and should, thus, correlate with lower financial performance.

A great deal of empirical research has been done to substantiate, either directly or indirectly, the claims of instrumental stakeholder theory. Much of this research has followed not from the theoretical claims of authors such as Freeman and Jones but from the corporate social responsibility literature that Freeman acknowledged as one of his intellectual antecedents.

Much research, of varying levels of scholarly rigor, has been conducted on the subject of the relationship between corporate social performance and financial performance. They address the rather simplistic question, Does "doing good" lead to "doing well"? Insofar as social responsibility can be taken as a rough proxy for stakeholder management, much research hints at the fact that stakeholder management can have some measurable effect on financial performance.

More persuasive, perhaps, is that genre of empirical research designed to test the specific theoretical propositions advanced by instrumental stakeholder theory. Berman's 1998 study of executive compensation, for example, suggests that companies with abnormally high levels of executive compensation do, indeed, underperform those that do not. Subsequent examinations of similar data also suggest that companies that attend to some important stakeholder issues (e.g., product safety and employee well-being) perform better than those that do not. But there is no evidence to suggest that this relationship occurs because the companies value stakeholders intrinsically; rather, it could occur because of the interaction between business strategy and the treatment of stakeholders.

Of course, it is worth noting that financial performance is not the only outcome variable of interest in stakeholder research. Broader questions of societal welfare may also arise from the ways that companies interact with their immediate stakeholders; however, these remain waters uncharted by stakeholder researchers.

What Are the Sources of Stakeholder Management?

A second interesting area for social science inquiry is the question of why companies adopt certain approaches to stakeholder management. Often branded "descriptive" stakeholder research, this research represents the least promising area of research for those interested in advancing convergent stakeholder theory and the most promising area for those seeking to study company-stakeholder interactions on their own terms. After all, to study how a company manages its stakeholders requires that theorists appeal not to "stakeholder theory" but to more established organization theories to account for a phenomenon (stakeholder management) that is interesting in its own right.

Two contributions to this genre stand out in particular; ironically, both were published in the same issue of the *Academy of Management Review* in 1997. Timothy Rowley's network theory–based account of stakeholder management posits that a company's approach to managing its stakeholders will depend, in no small part, on the company's structural position relative to its stakeholder set. Companies existing in dense networks of stakeholders or who are more central will behave different from those in less dense networks or who have less central positions. Rowley's efforts represent a groundbreaking attempt to conceive of the stakeholder set not as a traditional hub-and-spoke system evoked by simplistic readings of Freeman but rather as a web of interrelated groups tied both to the company and to each other. Yet, as network theoretical accounts of organizational phenomena grow more sophisticated, Rowley's effort seems only a simple first step in what must become a more elaborate model of company behavior.

Ronald Mitchell, Bradley Agle, and Donna Wood's article on stakeholder salience is the second important contribution to the descriptive genre. Mitchell, Agle, and Wood posit that stakeholders possess varying levels of three important characteristics—power, legitimacy, and urgency. Insofar as stakeholders possess more of each characteristic, they will be more salient in managers' thinking, receiving priority in decisions about how to allocate value. This model is a useful integration of important insights from various schools of organization theory (i.e., resource dependence, institutional theory, and social cognitive theories), and the ability to categorize stakeholders using these characteristics is a useful managerial heuristic. However, this account also raises stumbling blocks for those who would seek to build further stakeholder theory based on it. Subsequent researchers have (a) offered various interpretations (and misinterpretations) of the term urgency; (b) overlooked the article's emphasis on managerial perception (it is, after all, not how powerful and legitimate the stakeholder is but how powerful and legitimate managers perceive them to be that determines salience); and (c) ignored the extremely simplistic notion of salience, which serves as a vague proxy for the complexities inherent in classifying approaches to stakeholder management.

Indeed, these two contributions, though exemplary, offer two caveats to those who would understand why companies adopt certain approaches to stakeholder management. First, their appeal to existing schools of organization theory, though well-conceived, exposes the stakeholder research domain to the popular critique that stakeholder research has no theory of its own. Second, their emphasis on the causal factors involved (networks, stakeholder characteristics) rather than on the outcome (stakeholder management) does little to remedy the confusion (which must, by now, be apparent to the reader) surrounding how we conceive of stakeholder management. The practices cited by Freeman, the moral qualities of Jones, and the general orientations envisioned by Rowley, Mitchell, Agle, and Wood are all elements of a many-headed beast, and we have little reason to prefer one to the other, scattering the continued efforts of stakeholder researchers.

Why Do Stakeholder Groups Behave as They Do?

From a practical standpoint, a more interesting question for the manager is the issue of how to predict stakeholder behavior. This question forms the basis of the third and, at present, the most rapidly growing stream of stakeholder literature, asking "Why do stakeholder groups behave as they do?" Marshalling theories of collective action, resource dependence, game theory, and social identity, stakeholder researchers have explored this question in several steps, starting first with the question of why stakeholder groups mobilize and then advancing to the question of why, when they do mobilize, they choose the influence strategies that they do. A final step, as yet relatively unexplored, is what conditions determine whether or not these influence strategies actually succeed.

The question of stakeholder mobilization would, at first glance, seem simple enough. Stakeholders act when their interests are threatened. For many years, students of business and society argued some variant of this thesis, contending that stakeholder action resulted from some violation (real or perceived) of the stakeholder group's expectations. When they did not receive what they expected, they tended to strike, boycott, protest, or otherwise mobilize against the company. This was both an intuitive and, in many cases, entirely adequate explanation, but in many important cases, stakeholders mobilized around relatively small violations of their interests, and in many more instances, groups with clear interest did not mobilize or, at least, did not manage to do so in sufficient numbers to have much impact.

Efforts by Timothy Rowley and Mihnea Moldoveanu represent one attempt, premised on an identity-based account, to explain these phenomena. They argue that interests do play an important role in mobilization; so, too, does the collective identity of stakeholder group members. Groups (e.g., certain activist groups) that see protest as a fundamental piece of their group identity are more likely to mobilize. Moreover, structural conditions can strengthen or undermine a common sense of identity. People who are, for example, both parents and churchgoers may be much more likely to mobilize against television violence than those who occupy only one of those groups. Likewise, some groups will possess more or less of the resources necessary to overcome the considerable barriers to collective action for stakeholder groups. Here, again, previous experience with protest and overlapping identities play an important role. In sum, companies must attend to the constellation of interests and identity that surround them, lest they inaccurately assess the likelihood of stakeholder group mobilization.

A second important step in this stream of literature involves the study of why stakeholder groups, once mobilized, choose the strategies that they do to influence the company. Here, the work of Jeff Frooman, extending resource dependence theory to a stakeholder context, sheds some insight. Frooman maintains that a stakeholder's choice of influence strategy depends on just how dependent the stakeholder group is on the focal company for resources and on how dependent the company is on the stakeholder. Depending on how these conditions combine, stakeholders will choose to act either directly or indirectly and will choose either to coerce or compromise with the company. Subsequent empirical research on the subject suggests that there is much to these insights, though other institutional factors may be at play as well.

The final step in this area remains relatively unexplored: When do these influence strategies succeed or fail to change company policy? Here, as Rowley has argued in his earlier piece, a link can be forged back to the question of antecedents of stakeholder management, yet much works remain to make this connection explicit.

Conclusion

Stakeholder theory remains a high growth field of research in the study of business and society, with numerous articles and books being published each year. With students of business strategy and organization theory now showing renewed interest in studying this subject, this is likely to continue. This entry has only hinted at the complexities of this literature, yet it is hoped that it has shown important steps in our evolving understanding of the empirical and normative dimensions of company-stakeholder interaction.

Statism

Statism is a term employed to characterize practices, examples, or doctrines of state intervention that are regarded as illegitimate exercises of power. There is no single theory of what constitutes statism. However, since the appellation is negative, the reference of the term *statist* (or the specific example or theory of statism) will depend on what one holds to be an unjustified exercise of state power. For example, an anarchist may view any instance of state action as statism, a businessperson may believe that certain regulations are statist, and a citizen may regard government wiretapping as statist.

The term presupposes a basic distinction between state and society. Max Weber characterized the modern state—emerging only after the Renaissance—as exercising a monopoly of legitimate force over a territorial area. So understood, the state also includes institutional divisions (executive, judiciary, legislative, or administrative branches) and possesses an identity distinct from any particular ruler who wields power. To propose, therefore, that some law (or policy) is an instance of statism implies that the law is an unjustified extension of the state into a realm of society that should be free of such intervention. In keeping with this conception, some, such as the early-20th-century writer and critic Albert Jay Nock, draw an explicit distinction between a government and a state, asserting that a government seeks to provide only the functions necessary for community life. Once a government expands beyond the provision of peace and security, it becomes a state. In contrast, some argue that states are necessary for solving problems of collective action, including the provision of public goods. The state is *necessary* because individuals will not cooperate voluntarily to provide these goods. However, such claims remain contestable; in fact, many governmental activities are not undertaken to supply public goods. Attempts to plan the economy, to construct a welfare state, or to diminish inequalities of wealth require the sorts of programs and policies sometimes deemed statist. Whether or not such laws or policies are statist depends on whether they have a publicly acceptable justification. Of course, justifications of state action vary and will depend, for example, on debated notions of rights or on competing conceptions and evaluations of liberty or equality. If one concludes that a law limits freedom of action, one may deem the law to be statist; on the other hand, if one understands this law as serving to enlarge opportunities for all, then one may conclude the law to be justifiable.

Although few would describe themselves as statists, there have been theorists who have claimed that the state is supreme. In the 19th century, Heinrich von Treitschke characterized the state as an organic unity, the legalized constitution of the nation. This understanding also found expression in some of the 20th-century Italian fascists, who regarded the state as the foundation of the nation and conceived the unification of the individual's will with the state as the locus of freedom. Communist regimes proved totalitarian even though Karl Marx forecast the elimination of the state once class divisions disappeared. However, he also maintained that the proletariat must first assume power (the "dictatorship of the proletariat") to destroy the bourgeois state. Nonetheless, the need to exercise political power was emphasized by both V. I. Lenin, who asserted that state repression was required in the transition to socialism, and by his successor, Joseph Stalin, who continued the repressive structures he claimed were necessary to preserve communism.

Most would agree that the 20th century witnessed a dramatic growth of state power, and not just in those states deemed totalitarian. Even if state action is necessary or justifiable, it may elicit further acts that are not so justifiable. Indeed, a steady increase in statist practices may occur as individuals adopt assumptions or metaphors that excuse (but do not legitimate) state action. For example, the democratic ethos may encourage the idea that whatever the government does, "we do to ourselves." In addition, habits and dispositions may incline individuals to look, unthinkingly, to the state to respond to any economic or social problem, thereby encouraging policies that will be deemed statist. However, the governmental response may be worse than either allowing the problem to continue or permitting an indirect, nongovernmental solution to arise. If one has a disposition to state solutions, then one may be inclined less to make a comparative assessment of alternatives than to assume that the governmental resolution will solve the problem without any costs, side effects, or unintended consequences.

Are there political or social structures that may better ensure that the actions of state will be justified and legitimate and, therefore, less likely to be characterized as statist? There may be four—revolution, secession, a written constitution, and public opinion. John

Locke famously argued that if a government breaches its duty to protect natural rights, then the citizens may revolt. The threat of revolution, a drastic and last resort, may serve to counter dire instances of repression but only if the threat appears probable to the rulers. However, a right to secede from a centralized state poses a different threat to unjustified state power: If a sufficient number of individuals (in states, provinces, or cities) find a policy illegitimate, they could petition to secede. The very threat of secession—whether by right or by revolt—promises a loss of power that may lead rulers to consider carefully their proposed actions. In the third place, a written constitution, such as that of the United States, may provide some security against unjustified actions. However, the efficacy of a constitution depends on its particular clauses and, more important, on public beliefs about the significance of the document, its legitimacy, and its proper interpretation. Perhaps the most significant means of limiting the power of the state and forestalling statist practices lies, therefore, in public opinion. The great insight of Étienne de la Boétie, writing in the 16th century, was that any state secures its power, even a ruthless sort, through public opinion. To provide a brake on statist policies, the public must have knowledge and judgment to discern what is legitimate and the will to resist propaganda.

How might statism relate to the problems and issues of business and business ethics? A statist policy is one that seems, at least to some, to be without justification. Given this understanding, those who seek to enact government policies or to set in place economic or business regulations must be able and willing to justify these policies as warranted and just. In any recommendation for or against a government policy, law, or regulation, the business ethicist must make a comparative argument as to the value, justice, and cost of the regulation (or the overall complex of *all* regulations), weighing the proposal against alternatives (including that of instituting no policy, law, or regulation). A corollary concern is whether an increase in the dimension and reach of the state serves, as the sociologist Robert A. Nisbet counseled, to diminish the significance of nongovernmental associations intermediate between the state and the market, as well as the relations and bonds that have arisen via tradition and custom. To the extent that state action has such powerful effects, so does it weaken the very sinews of society.

Stem Cell Research

Stem cells are found in plants and animals, but most moral issues involve human stem cells. Such cells have two significant properties: (1) they can divide to form other types of cells and (2) they can divide indefinitely—that is, they are potentially "immortal." There are three major types of stem cells. A *totipotent stem cell* can divide to form any kind of bodily cell, as well as an entire organism; an example is a fertilized egg (zygote). A *pluripotent stem cell* can divide to form many different kinds of bodily cells, such as neurons or heart cells. A *multipotent stem cell* can divide to form cells of a specific kind: Blood stem cells can form the various types of blood cells, such as red and white blood cells, but cannot divide to form liver or pancreatic cells.

Stem cells can be harvested from the adult (such as from bone marrow or brain tissue), from umbilical cord blood, from the placenta, and from embryos.

Human embryonic stem cells (hES) are harvested from the inner cell mass of the embryo at the blastocyst stage, about 1 week after conception. The sources of embryos include aborted fetuses, but more often, spare embryos donated from fertility clinics. Stem cells can also be harvested from embryos made through cloning adult body cells.

Stem cell research is promising because stem cells could be used to grow replacements for damaged body cells, such as neurons to treat victims of spinal cord injury, Parkinson's disease, or Alzheimer's disease. Other possible diseases that could be treated include heart disease and diabetes. One day, entire organs may be grown.

There has been virtually no opposition on moral grounds to research on adult, umbilical cord blood, and placental stem cells (the placenta, which like the umbilical cord is part of the afterbirth, is a nutrient-carrying organ joining the umbilical cord to the wall of the uterus). Stem cells from cord blood and the placenta are usually classified as adult stem cells. But many scientists believe that because embryonic stem cells, unlike adult stem cells, are naturally pluripotent, they could be used more effectively to grow many types of cells. In contrast to adult stem cell research, embryonic stem cell research has stirred a storm of controversy, with the lines of debate paralleling the abortion issue.

The Moral Status of the Embryo

Since embryos are destroyed in harvesting hES, a key issue is the moral status of the embryo. Is it a human person, with full human rights? Is it a group of cells with no more rights than an isolated group of liver cells? Or does its status lie somewhere in between? Those who believe in the embryo's personhood hold that harvesting hES is immoral, equivalent to manslaughter. They argue that any line drawn after conception limiting human personhood is arbitrary. They further argue that adult stem cells (including cord blood and placental stem cells) can be used just as effectively to develop treatments for disease.

Those who deny any special moral status to the embryo support harvesting hES. They argue that the embryo lacks personhood due to the early embryo's absence of sentience and a developed nervous system. Some argue that because such embryos, either discarded from fertility clinics or cloned for the purpose of harvesting stem cells, will not develop in the womb (because they will not be implanted), they lack any special status above other body tissues.

Another argument is that the United States could fall behind other countries unless federal funding for hES is approved. Debate over hES remains intense in predominately Roman Catholic countries such as Ireland and Italy. However, other nations, such as South Korea (the current leader in stem cell research), the United Kingdom (which has a bank of hES), China, Australia, and Singapore support hES research.

The third option, defended in 1999 by the National Bioethics Advisory Commission (NBAC), as well as by Geron Corporation's Ethics Advisory Board (GEAB), holds that although embryos have some moral status, they are not human persons. The NBAC, established by executive order in 1995, met from 1996 to 2001 and consisted of members from several professions, including philosophy, theology, medicine, and law. Geron Corporation, in business since 1992, is a company specializing in using telomerase, an enzyme involved in cell life span, in research on cancer and on the aging process, and in using hES to treat chronic diseases. Geron has funded research in harvesting hES.

The NBAC report affirmed that discarded embryos could be used for stem cell research, with adequate informed consent from the donor(s). It recommended a ban on selling embryos and that care be taken not to destroy more embryos than absolutely needed for research. The GEAB agreed that although embryos deserve some respect, they lack personhood. hES research is ethical due to the potential for reducing the suffering of individuals with debilitating diseases. The board also emphasized the importance of informed consent by the donor(s), forbade reproductive cloning and cloning to create chimeras, held that the benefits of research should be available to countries with limited resources and that an ethics advisory board (in addition to an institutional review board) should approve stem cell research projects.

The continuing debate over the moral status of the embryo has fueled the continuing controversy over funding hES research. During the Clinton administration, the NBAC recommended federal funding for hES research. But on August 9, 2001, President George W. Bush, though supporting federal funding on stem cell lines derived from embryos that had already been destroyed, did not fund hES research on new cell lines. The ruling did not affect privately funded hES research. He also supported funding for research on adult and animal stem cells as well as on umbilical cord blood and placental stem cells.

Informed Consent and Justice Issues

Other moral issues surround stem cell research. Questions arise concerning proper informed consent. Many hES are harvested from embryos discarded during the process of in vitro fertilization. Issues have arisen concerning the quality of informed consent by the woman or couple donating embryos for research purposes. Does the donor clearly understand that the embryo will be used in scientific research and that it will be destroyed in the course of such research? Are donors aware of the potential benefits and limitations of research on stem cell lines? In addition, a litany of potential benefits of hES research may overwhelm the donor into feeling she has to donate. Do donors know of the potential profit a company can make from stem cells and whether such profit will be shared in any way with the donor? If there is no financial compensation, is this made clear to the donor? Should donors be made aware of the moral debates concerning the status of hES research?

A second group of issues is related to justice. Who shall have access to the fruits of both adult and embryonic stem cell research? Will areas in the United States underserved by the health care system have the same access as areas with adequate health care? What about Third World nations—should they have equal access to treatments derived from stem cell research? But if they receive treatments free, or at a considerable discount, is this fair to Western consumers who must pay full price?

Business Practice Issues

Moral issues also arise related to business practices in companies involved in stem cell research. Although the Geron Corporation formed an ethics advisory board, the corporation has been criticized for deciding to go ahead with the research before the board released its report. Given its close association with the corporation, the extent of the board's independence has been questioned. The broader issue is whether a company should forge forward into the business of stem cell research (especially hES research) before adequate discussion of ethical and societal implications.

Another set of business-related issues involve a company's property rights over the donated embryos and the stem cell lines derived from such embryos. If financial benefit accrues to a company from research on these lines, should the donor receive compensation? Given the patents over cell lines and other research, will the company freely share information gained through research with scientists outside the company? Should patents of stem cell lines be prohibited by law?

A third business-related issue concerns the relationship between the corporation and the academy. Geron funds researchers at several universities, part of a larger process of corporate funding of scientific research at universities. Is there a conflict of interest between scientists' responsibility to the profession to do basic research and their duties to the corporation?

Finally, issues arise concerning the morality of a corporation's private deliberations over stem cell research and its moral dimensions. Some have argued that deliberations should be made public, so that society as a whole can make more intelligent moral choices regarding stem cell research.

Stewardship

A steward is someone who manages or takes care of another person's property, person, or other assets when those assets are put in trust to that individual.

In most conceptions of stewardship, the steward is supposed to place personal interests below those of other people or below the interests of the collective as a whole. In management theory, the concept of stewardship requires managers to subordinate their own personal interests to those of the organization as a whole.

There are several major theories of stewardship in the management literature. One version of stewardship is that managers are stewards or caretakers for the invested resources of companies' owners or shareholders. In this view, which can be found in economic theories of the firm, managers have a fiduciary or fiscal responsibility to ensure that the investments of shareholders into the company through the purchasing of shares in the firm are wisely used. In this view of stewardship, managers are seen as agents of the owners or shareholders and are responsible for the overall well-being of the firm and all its resources. Members of the board of directors are theoretically elected by shareholders to serve as stewards for the interests of shareholders in major decisions made by companies; thus, directors are also stewards and agents of owners.

Another theory advanced by Peter Block focuses on leaders as stewards, a type of leadership he termed *servant leadership*. The other major conception is stewardship theory, which has been developed by James Davis, David Schoorman, and Lex Donaldson and focuses on subordinates in organizations as being trustworthy and willing to help the organization through their work efforts rather than resistant to organizational initiatives. It too emphasizes the good of the organization as a whole, rather than individual interests, and is positioned to counteract some of the assumptions of agency theory, which assumes that managers in organizations will only act to maximize shareholder returns if appropriate safeguards are in place and will seek instead to maximize their personal gains.

Stewardship and Servant Leadership

Servant leadership, according to Peter Block, writing about the relationship between stewardship and leadership in an organizational context, means that a person is held accountable for the good of the whole organization by operating as a servant leader—that is, in service to others in the organization. This perspective on leadership can be contrasted to leadership based on authority and attempts to control others, where the emphasis tends to be on personal gains and self-interest. The key to stewardship in Block's view is the idea of service or servant leadership. Service needs to be authentic or real to be effective. Block argues that service is authentic when there is a balance of power that allows individuals who are not in formal positions of authority to be responsible for their own actions; when the first commitment is to the larger entity, organization, or community rather than the self; when the purpose of the enterprise is jointly defined; and when rewards are equitably and fairly distributed.

The idea behind stewardship is one of reallocating power and resources and the generation of meaning and purpose in an organization more equitably among all the participants in an organization rather than simply locating it in persons holding positions of authority. This view of leadership suggests that empowerment and individual responsibility are critical factors in creating successful organizations. From the perspective of stewardship, when organizations face crises, particularly economic crises, they should focus not on a wealth maximizing or economic goal but on quality, participation, and service. Rather than calling the way the organization is run management, as is typical, Peter Block says it is best to call it governance. This form of governance is focused on partnership and empowerment rather than more patriarchal or authoritative forms of managing. Partnership in this model has four key elements: exchange of purpose or the capacity for each individual to define vision and values for the enterprise, the right to say no or express one's point of view even when one does not get one's way, joint accountability in that each person is responsible for what is happening in the organization and its results, and absolute honesty.

Governance in a stewardship model emphasizes partnership based on an assumption that power can be balanced among individuals in an organization because there is an underlying assumption that all individuals can be trusted to be responsible for their own performance. This notion of empowerment has four elements. One is that survival is in an individual's own hands and that no one else is responsible for that individual's safety or use of voice. Another is defining purpose or the use of one's voice to define one's own purpose in the organization. Third is commitment or emotional investment to the organization, and fourth is being a steward not just for one's self and individuals below a person in the organization but also for those above that individual in the formal structure.

Similarly, under a stewardship model of leadership, the dependency that is created in a patriarchal system, where subordinates are believed to seek safety and consistency over personal responsibility and democracy, is reduced. Individuals are expected to act autonomously and with a commitment toward meeting the organization's goals. A steward or servant leader is more democratic than typical hierarchically structured organizations because there is an assumption that people wish to be empowered to serve the organization's best interest and are willing to assume responsibility for their own safety and freedom.

Peter Block outlines a stewardship contract based on a set of guiding principles. The first principle is to maximize the choice for those closest to the work, and the second principle is to reintegrate the managers and the doing of the work under the assumption that everyone is doing some management of work and everyone should do some of the work of the organization. Third is to let measurements and controls serve the core workers, and fourth is to yield on consistency across groups and support local solutions rather than seeking a top-down, one-size-fits-all way of organizing. Next is to recognize that service is everything and people are accountable to those they serve as well as to those upward in the organization, which leads to the principle that management as a job title should be deglorified and demystified. Other principles underlying stewardship are the ending of secrecy and enabling of disclosure or transparency and the need for demanding a promise that people will actually commit themselves to acting in the best interests of the organization. The final principle is to redistribute wealth so that the reward system links everyone's rewards to the success of the team and the organization as a whole.

The structure of an organization and basic management practices in an organization using stewardship as its model of leadership may need to shift to emphasize customer relationships first and indeed even organize around customers rather than in other ways, improve products and services, and transparently report results. Work flow and job design shift so that power and responsibility are shared among teams, and discipline is handled by a team of peers rather than higher ups in an organization. Because responsibility is located within the team, it is the team that decides what to purchase and from whom, as well as how to undertake quality control.

Stewardship Theory

Stewardship theory is the second management perspective on stewardship. It puts forward a set of positive assumptions about managers and subordinates in an organization. With roots in psychology and sociology, stewardship theory assumes that leaders' behavior in organizations and other collectives emphasizes the good of the organization over individual interests. Stewardship theory was proposed as a counterpoint to agency theory, which has at its base a model of economic "man" as a self-interested, rational actor interested only in personal gain, who will calculate costs and benefits in taking any action and make decisions that favor the decision maker's self-interest. In corporations, managers, in particular the top management team and the chief executive officer, are seen through the lens of agency theory as agents of the investors or owners, who are called principals. The assumptions of agency theory suggest that agents, that is, the managers, will favor their own as opposed to principals' interests unless there are structural safeguards that prevent them from doing so. Under these circumstances, managers will abrogate their fiduciary responsibility to owners.

Stewardship theory takes the opposite view of managers' actions in organizations. Specifically, stewardship theory assumes that stewards will focus on the goals of the whole organization or collective rather than personal goals or self-interest and that this emphasis on organizational goals will benefit the principals of the organization, that is, the owners whose interests are represented by the stewards. That is, managers will fulfill their fiduciary responsibilities to owners. The basic idea is that the steward will gain satisfaction by closely aligning the steward's own interests with those of the organization, particularly a business firm, so that the principals' or owners' interests will be achieved. The fundamental notion is that corporate governance and ultimately performance will benefit from leaders who are stewards for principals or investors because all stakeholders will benefit from the organization's success. Such leaders are expected to be more cooperative because they believe that cooperation is more productive and useful than other forms of behavior, such as competition, and because they focus on the needs of the collective as a whole.

Stewardship theory has performance implications because the assumption is that when the steward's, typically the managers and particularly the chief executive officer, and the organization's goals are aligned, the interests of principals and other stakeholders will be met because stewards believe that their own needs will be met in the context of serving organizational interests. Stewardship theory also assumes that stewards can be trusted to serve the organization's interests and that they should be granted autonomy to do their jobs without excessive supervision. As a result, the costs of monitoring, creating incentives to motivate managers and subordinates, and competitive behavior are expected to be less when a stewardship model is in place in an organization. Under this line of reasoning, stewards will be granted greater autonomy to do what they believe is right for the organization because their interests are organizationally aligned with those of principals or owners.

The developers of stewardship theory suggest that there are a number of factors that differentiate it from agency theory. The key differentiator is motivation. In contrast to agents, who are supposed to be focused on extrinsic rewards that have specific market value to them, stewards focus on intrinsic rewards that tend to be intangible and not readily quantified, such as the opportunity for personal growth and achievement, affiliation or relationships, and what psychologist Abraham Maslow terms self-actualization. Stewardship theory also proposes that stewards will more closely identify with the organization than those who are not stewards and will be highly committed to its goals. Another area of difference between stewardship and agency theory is in the use of power. Agents use what is called institutional power, which has at its base coercion, legitimate authority, and the capacity to provide rewards and punishments. Stewardship relies more on personal power, which includes what is called referent power in which one person identifies with another person, and expert power or the power that derives from knowledge that is task relevant. Differences in the organizational culture and style also influence the extent of stewardship present, with high-involvement organizations and more community- or collectivist-oriented cultures more likely to foster stewardship than more control-oriented and individualistic organizations. Stewards also view themselves as more equal to subordinates than do agents, who tend to have what is called high power distance.

Stewardship theory is especially relevant in the context of corporate governance, because it focuses attention on the controversy about whether the chief executive officer and chairman of the board should be the same individual or not. Stewardship theory argues that it would be best to combine these functions if the executive is a steward because there will then be alignment between the individual and organization's best interests and the organization will ultimately perform better.

STEWART, MARTHA (1941–)

Martha Stewart was a very popular and influential American celebrity in the late 1990s and early 2000s, a virtual media icon who ran afoul of the law and served prison time. Stewart was born on August 3, 1941, in Jersey City, New Jersey, and when she was 3 years old, her parents, Edward and Martha Kostyra, moved her and her five siblings to Nutley, New Jersey. Because of her legendarily strong work ethics and character, she received a partial scholarship to Barnard College in New York City. To pay the remainder of her tuition, she worked as a model for television commercials and magazines. At Barnard College, she met her husband Andrew Stewart, and they married during her sophomore year in 1961, just before she graduated with a bachelor's degree in European history and architectural history. In 1965, she had her daughter Alexis, and within 2 years she became a stockbroker. When recession hit Wall Street in 1973, Stewart decided to leave the brokerage and move to Westport, Connecticut, with her husband and daughter.

Stewart became a writer and columnist for the magazine *House Beautiful,* while simultaneously serving in a similar capacity for the *New York Times.* In 1982, she coauthored her first book, *Entertaining*, and shortly thereafter she started publication of her own magazine, *Martha Stewart Living.* By this time, she was a regular guest on the morning network talk shows, and she even appeared on "The Tonight Show" and "Late Night with David Letterman." In 1993, she began her own syndicated television program, "Martha Stewart Living," and she became a well-known and much-loved celebrity, her empire capped by the creation of Martha Stewart Living Omnimedia, Inc. She was the American guru of housekeeping, cooking, gardening, decorating, crafts, and holiday parties.

However, her period of prosperity lasted only about a decade. In 2004, at age 62, Martha Stewart stood trial on charges of conspiracy, obstruction, securities fraud, and lying to investigators in connection with the sale of her stock in ImClone, a biotechnology company. Standing trial alongside Stewart was her former stockbroker, 41-year-old Peter Bacanovic, who faced the same charges in addition to perjury and falsifying documents. Stewart's troubles stemmed from her sale of shares of ImClone on December 27, 2001, one day before the FDA announced it had rejected the application for approval of ImClone's cancer drug, Erbitux—news that caused the company's stock prices to plummet.

It was Stewart's response to the subsequent federal probe that ultimately proved incriminating as prosecutors claimed that she not only conspired with Bacanovic to cover up evidence concerning the sale but also lied publicly about her involvement in the scandal to protect the stock price of her own company, Martha Stewart Omnimedia. Bacanovic claimed he and Stewart sold her ImClone stock after having a "selling conversation" on December 20, 2001, a week before the sale was executed. During that conversation, Bacanovic said he and Stewart reviewed her entire portfolio, not just her shares of ImClone, and agreed to sell her shares in the company if the price sunk to $60.

Although she made $51,000 by selling her shares in advance of the announcement, Stewart was never charged with insider trading. Stewart, ever the domestic diva, even while facing a maximum of 30 years in prison, would join her daughter Alexis every morning before court to have their hair and makeup done. Stewart was convicted in March 2004 of lying to investigators and conspiring with Bacanovic to cover up the circumstances surrounding the stock trade during the federal probe that followed. On July 16, 2004, Martha Stewart was sentenced to 5 months behind bars and 5 months house arrest, with an additional 2 years probation and $30,000 fine.

Stewart issued statements proclaiming her innocence before, during, and after the trial. Her supporters criticized the investigation as being sexist, saying that federal agents unfairly targeted one of the richest women in the world (whose wealth directly resulted from her reputation, the public perceptions of her) while ignoring far worse criminals. In a sense, one's perceptions of and attitudes about this case reflect the mind-set, background, and perspective of the perceiver as much if not more than the facts about Martha Stewart and her fall from the pinnacle of American society.

Strategic Corporate Social Responsibility

Strategic corporate social responsibility is the attempt by companies to link those largely discretionary activities explicitly intended to improve some aspect of society or the natural environment with their strategies and core business activities. While corporate social responsibility has historically referred to a firm's economic, legal, ethical, and discretionary responsibilities to society, strategic corporate social responsibility, in general, represents discretionary activities that form a company's community relations function or foundation, including corporate philanthropy, volunteerism, and multisector collaborations. Corporate social responsibility can be compared with the mere general concept of corporate responsibility, which is a company's complete set of responsibilities to its stakeholders, societies where it operates, and the natural environment, as manifested through its operating practices.

Corporate social responsibility represents the direct efforts by a company to improve aspects of society by the firm as compared with the integral responsibilities that every firm has with respect to primary stakeholders such as employees, customers, investors, and suppliers. The use of the term *strategic* implies that the discretionary socially oriented activities of the firm are intended to have direct or indirect benefits for the firm—that is, to somehow help the firm achieve its strategic and economic objectives. There is a wide range of ways in which companies can use corporate social responsibility activities strategically. These ways range from helping local schools improve so that, long term, the workforce will be better educated, to improving local conditions in the community so that it will be easier to recruit and retain employees, to improving the firm's reputation among customers so that they will continue to use the company's products and services, as well as numerous other examples.

Sometimes termed *enlightened self-interest*, strategic corporate social responsibility initiatives are closely linked to strategic philanthropy and cause marketing. They attempt to help achieve a company's core mission and strategies by providing a socially beneficial foundation for enhanced economic value added. This benefit to the firm happens through improved reputation from the social desirability that key stakeholders, such as customers and employees, feel for being affiliated in some way with a company perceived to be more socially responsible or, more directly, through increased use of the company's products and services that are tied to donations to specific charitable organizations.

Some observers object to strategic corporate social responsibility on the grounds that the company cannot or should not both be doing moral or social good while also profiting financially. Other observers see no necessary conflict in what is called doing well and doing good, because for companies that are under increasing pressure for good short-term results, strategic corporate social responsibility represents a way for them to attempt to meet the needs of multiple stakeholders, particularly investors and societal stakeholders, including customers, employees, and investors concerned with corporate responsibility, simultaneously.

There is significant and growing evidence from a large number of research studies that companies that are more socially responsible, or more responsible in general to all their stakeholders, perform at the same level or somewhat better than less responsible companies. This empirical evidence suggests that there are no necessary trade-offs between profitability in terms of financial performance and responsibility, even explicitly socially beneficial activities. Companies with good corporate social responsibility records, according to employee and consumer surveys, may find it easier to recruit and retain employees, attract and keep new customers, and even attract investors concerned about issues of corporate responsibility, also called socially responsible or ethical investors.

STRATEGIC PHILANTHROPY

Strategic philanthropy is an approach by which corporate or business giving and other philanthropic endeavors of a firm are designed in such a way that it best fits with the firm's overall mission, goals, and values. This implies that the business has a carefully articulated strategy and that it understands how to integrate its philanthropic initiatives with this strategy in actual practice. A major characteristic of strategic philanthropy is that the motivation is not solely altruistic. To understand how strategic philanthropy has become an everyday practice, it is useful to trace this concept as it has unfolded in business history.

Beginnings of Corporate Philanthropy

The concept of philanthropy evolved through business history even before the broader corporate social responsibility movement had taken shape. The concept of business responsibility that prevailed in the United States during most of its history was fashioned after the traditional, or classical, *economic model* of the firm. Dominant in the late 1800s and early 1900s, the economic model of the firm thought of the marketplace as the primary determinant of what business firms did in their communities and in society. The pattern of corporate philanthropy in Europe and other parts of the Western world paralleled its development in the United States. Unfortunately, though the marketplace did a reasonably good job in deciding what goods and services should be produced, it did not fare as well in ensuring that business always acted generously, fairly, and ethically. In addition, business created many social problems and the view was developing that business had some responsibility for these social problems that extended beyond just producing goods and services.

Years later, when laws began to be passed constraining business practices, it might be said that a *legal model* emerged. Society's expectations of business changed from being strictly economic in nature to encompassing issues that previously had been at business's discretion. Over time, a *social model* of the firm emerged. What this social model did, in effect, is embrace both the economic and legal emphases and add yet another layer of expectations by society that business would assume some role in addressing social problems and issues that had arisen.

In the late 1800s and early 1900s, initial indications of business's willingness to contribute to the community were localized efforts toward meeting community needs through philanthropy, or business giving, and paternalistic practices. It is evident that businesspeople did engage in philanthropy—contributions to charity and other worthy causes—even during the periods that were dominated by the traditional economic view. Voluntary activities to improve, beautify, and uplift the community were evident. One very early example of this was the cooperative efforts between the railroads and the Young Men's Christian Association immediately after the Civil War to provide community services in areas affected by the railroads. These initiatives, in hindsight, can now be seen as early examples of strategic philanthropy, because they benefited both the communities and the railroads.

The emergence of large corporations during the late 1800s played a major role in hastening the movement away from the strict classical economic model of the firm in society. As the economy transitioned away from one dominated by small, powerless companies to large corporations with more concentrated power, questions of business responsibility began to be raised. By the 1920s, community service had become much more important for business. The most visible example of this was the Community Chest movement, which received its impetus from business.

One example of early progressive business ideology was reflected in Andrew Carnegie's 1889 essay "The Gospel of Wealth." Carnegie asserted that business must pursue profits but that business wealth should also be used for the benefit of the community. Philanthropy turned out to be one of the best ways in which firms could benefit the community. A prime example of this was Carnegie's funding and building of more than 2,500 libraries for communities.

Corporate philanthropy continued to grow into the 20th century and by the late 20th century had become one of the institutionalized ways by which businesses could aid communities, the growing number of nonprofit organizations, and other national and international groups. Today, corporate philanthropy is considered to be one of the foremost means by which companies fulfill their social responsibilities and come to be regarded as good corporate citizens.

Philanthropy Defined

Before developing the concept of strategic philanthropy further, it is useful first to examine the concept of philanthropy itself. The word *philanthropy* has generally been defined as a concern for or love of humankind. Philanthropy has been linked to efforts to demonstrate this fondness or concern for humankind through charitable gifts, aid, or donations. Though most people would not philosophically disagree with the concept of philanthropy, throughout history some have. Friedrich Nietzsche, for example, objected to it as a concept of universal good because he thought it represented the weak parasitically living off the strong. Ayn Rand is another major philosopher who held a similar view. Political views on philanthropy have also been present. Most governments have been supportive of philanthropic efforts on the part of companies and individuals and have supported these efforts through tax incentives and tax breaks. Though the term *philanthropy* seems to imply some altruistic expression, as in "love of humankind," today the concept more nearly refers to the giving of resources for the benefit of others.

Conceptually, today, philanthropy may be seen as a part of companies' corporate social responsibility or corporate citizenship initiatives. Archie Carroll has argued that philanthropy fulfills businesses' discretionary responsibilities to be good corporate citizens. These philanthropic activities are voluntary, guided only by businesses' desire to engage in social activities that are not mandated, not required by law, and not generally expected in an ethical sense. Philanthropy is "desired/expected" in most societies. The public has an expectation that business will engage in philanthropy, in part because it has become so much a part of business tradition and in part because many believe it is part of the social contract between business and society, especially between business and the local community. Others believe business should engage in philanthropy to partially offset some of the social harm or social problems business has engendered.

By the first decade of the 2000s, philanthropic initiatives include corporate giving, matching programs in which companies match contributions given by their employees, product and service donations, employee volunteerism, partnerships with local governments and other organizations, and any other kind of community involvement on the part of the organization and its employees. These philanthropic initiatives are in response to ongoing needs in the community in areas such as education, culture and the arts, health/human services, and civic and community activities. In addition, special needs arise due to emergencies such as the tsunami in Southeast Asia in 2004 and Hurricanes Katrina and Rita in the United States in 2005.

Strategic Philanthropy Takes Shape and Evolves

The concept of strategic philanthropy has evolved out of traditional forms of business giving. Early on, corporate giving was more focused on the needs that had arisen in the community and so philanthropy was more altruistic in nature—more focused on an exclusive consideration of the needs of others. With the passage of time and the heightened competition and cost pressures that have characterized the business community in the past several decades, corporate executives have begun looking more carefully at the kinds of impacts philanthropic efforts might have. It has become evident that business can not only help others but help itself at the same time, and this germ of thought is what has produced the modern strategic philanthropy emphasis. At the same time, corporate giving has become institutionalized and professionalized, and as it has been turned over to professional managers, top management has come to view the giving function as one that should deliver more specific, direct benefits to the company, and thus, the idea of strategic philanthropy has been born and cultivated in a business climate that has been more driven by profitability and accountability toward the bottom line.

Strategic philanthropy is an approach to business giving that seeks to achieve goals for the community or recipient of the giving and for the business itself as well. Strategic philanthropy is more focused. It does not just address any legitimate need in the community but rather focuses on those needs or issues that are consistent with or aligned with the firm's overall mission, objectives, programs, or products/services. A classic example of strategic philanthropy is the Ronald McDonald Houses sponsored by McDonald's hamburger chain. The Ronald McDonald Houses are facilities usually built near children's hospitals to help families who want to be close to their children who may be receiving longer-term treatment at the hospital. The Ronald McDonald House Charities maintains more than 200 houses in 44 countries around the world where families can stay together for free when traveling for a sick child's treatment and 48 rooms within hospitals for the same purpose. McDonald's, which has long viewed children as one of its target markets, thus is able to generously contribute to children and their families, thus enhancing its own interest or strategy at the same time. The children and their families win and McDonald's as a corporation wins. It should be clarified that McDonald's, as a company, initiated and sponsors the Ronald McDonald House Charities, but many other companies also contribute to the charity. In addition, each chapter also relies on individual contributions. In a sense, then, this is an ideal example of strategic philanthropy in that McDonald's gets high name recognition and publicity for the charity, even though the company is just one of the many supporters of the charity.

In using strategic philanthropy, companies strive to align their corporate giving or community relations initiatives with their own goals, objectives, or markets. The idea is to have a double impact—a positive impact on the recipients of the philanthropy and some kind of positive impact on the businesses' bottom lines or strategies. Two other examples are worthy of mention. The first is Novartis' creation of its nonprofit, Novartis Research Institute for Tropical Diseases. The nonprofit Institute allows it to focus on the discovery of new drugs for treating neglected diseases. The company benefits and the victims of neglected diseases benefit. Second is IBM's On Demand Community Program. This program permits IBM employees around the world to share the company's technology and other resources with the agencies where they sign up for volunteer service. Both parties benefit.

Strategic management expert Michael Porter has argued that the term *strategic philanthropy* has begun to be used to explain virtually any type of charitable giving that has some definable theme, focus, or approach that builds bridges between the businesses that are giving and needs in the community. Porter has been critical of strategic philanthropy, arguing that the link between the companies and the charities are often weak, tenuous, or semantic. He suspects that most of these initiatives really do not have anything at all to do with corporate strategy but are aimed at achieving positive publicity or goodwill for the companies and for improving employees' morale. His belief is that for strategic philanthropy to be viewed as genuine or valid, it needs to effectively integrate social and economic goals in such a way so as to produce legitimate social impact in the community. Of course, his criticisms may be broadened to include any corporate citizenship initiatives on the part of business, not just philanthropy.

Cause-Related Marketing

One of the shapes or variations that strategic philanthropy has taken on is that of cause-related marketing, or cause marketing. Many critics claim that this is more marketing than philanthropy, but others have held that it is an extreme form of strategic philanthropy in that the link between the businesses' interest and some social or public cause is tightly tied together. In cause marketing, each time a consumer uses a service or buys a product, a donation is given by the company to the charity. Thus, cause marketing has sometimes been referred to as "quid pro quo philanthropy."

One of the earliest examples of cause-related marketing was in the early 1980s when American Express Company introduced a program whereby it would contribute 1 cent to the restoration of the Statue of Liberty each time one of its credit cards was used to make a purchase. This initiative generated $1.7 million for the restoration of the historical monument and a substantial increase in the use of the company's cards. Today, American Express coordinates its philanthropic and marketing efforts with its community business program and cause-related-marketing campaign to help small business owners acquire access to the credit and resources they need to start or grow their businesses. So the company now gives a portion of credit card charges to three national nonprofit organizations specializing in community economic development when American Express Community Business Card customers use their cards. Today, many different companies have linked using their products or services to the amount they would then donate to some worthy charitable cause.

Just as Porter has been critical of strategic philanthropy, he has especially been critical of cause-related marketing. He thinks these efforts are more targeted toward improving the companies' reputations than doing good in the community and, thus, fail as authentic efforts toward strategic philanthropy. In his view, the best way to maximize philanthropy's value is to follow a path that effectively combines pure philanthropy with pure business in such a way that genuine social and economic values are created.

The Business Case for Strategic Philanthropy

The impetus behind the movement toward strategic philanthropy has been the expectation by CEOs and top echelon executives that for corporate giving to continue, the "business case" for it has to be established. The business case is the argument or rationale as to how the business is specifically benefiting from the philanthropic endeavors. It is the explication of reasons why business is believed to be benefited by the philanthropy. One of the leading business groups supporting the idea of strategic philanthropy is Business for Social Responsibility (BSR), a nonprofit association of firms and executives who support the idea of integrating business's social role with its economic objectives. BSR has assembled research that indicates that companies, through their philanthropic giving, may

- increase customer loyalty and enhance brand image,
- strengthen employee loyalty and productivity,
- enhance corporate reputation, and
- expand into emerging markets.

In short, specific business advantages that strengthen the companies' bottom lines are achievable through carefully designed philanthropic initiatives.

An interesting aspect of strategic philanthropy is that two firms in the same industry may decide to pursue divergent philanthropic projects and initiatives while both are focusing on the bottom-line benefits to the company as well as helping the community. In the home improvement/products industry, for example, The Home Depot supports sustainable forestry, community impact grants, and volunteerism, while Lowe's, its major competitor, supports Habitat for Humanity, sponsorship of American Red Cross disaster relief, and community college scholarships. Executives in these two firms made strategic choices to engage different philanthropies but with doubtless similar objectives in terms of strategic impact on the company's profitability and reputation.

Since strategic philanthropy is a part of corporate social responsibility initiatives, it follows that these same benefits accrue due to these efforts. Also, it can readily be seen that most of these reasons are business related, not philanthropy related. Thus, the business case is strengthened. Finally, it is worth noting that Paul Godfrey has developed and presented an analysis of literature and research that supports the idea that (a) corporate philanthropy can generate positive moral capital among stakeholders and communities, (b) this moral capital can provide business owners with insurance-like protection for a firm's relationship-based intangible assets, and (c) this protection contributes to shareholder wealth. Thus, through logic and research, he has added to the business case for corporate philanthropy, especially strategic philanthropy.

Strategic Planning

Strategic planning is a periodic, typically annual process in which organizations' top managers review the organization's strategy, which is its overall direction, competitive positioning, and the resources needed to achieve its short- and long-term goals and objectives. Strategic planning has several phases: formulation, analysis of the strategic environment internally and externally, development and selection of strategic alternatives, and implementation, with feedback from results incorporated as necessary changes in the plan. Strategic planning is part of the overall strategic management process and represents a formal opportunity for the management team to review, assess, and redirect, if necessary, the company's plan of action for a specified period of time into the future. One criticism of the strategic planning process is that it is based on a rational and logical view of the management process, which may not be realistic in today's competitive and highly dynamic environment, so many strategic planners recognize the need to constantly revise the strategic plan as new information is received or conditions facing the organization shift.

Strategic planning begins with specifying an organization's long-term vision or mission, that is, its purpose for existence; focusing on the development of goals and objectives that will enable the organization to achieve that vision; and identifying the means through which the vision will be achieved, typically through the major business units and functions of the enterprise, such as marketing, operations management, finance and accounting, technology and information systems, and human resources. The analytical phase of strategic planning focuses internally on the company's resources, capabilities, core competencies, and its strengths and weaknesses, in what is called the resource-based view of the firm. External strategic planning focuses on the organization's positioning within its industry using industry and competitor analysis. Most often, strategic planning is undertaken by the chief executive officer of an organization and the top management team, including the top managers of any business units. Sometimes many others are involved in the process as well so that the process is inclusive and the goals developed are well understood and agreed to by all the people who will have to implement the plan.

Internal Analysis for Strategic Planning

Strategic planning teams generally focus on a number of key questions focused internally. A basic question tends to be, "What business are we in?" Answering this question helps define the basic mission or purpose of the organization and suggests some boundaries to its activities, as well as indicating the priorities for management attention. Defining what business the company is in provides a solid basis for the determination of the company's vision—that is, how it hopes to affect the world through its business operations.

Another useful strategic planning question is, "What is our strategic intent, coupled with, how or through what strategies or means are we going to achieve our vision?" Strategic intent is a future-directed focused assessment of what you will do to make your definition of what business you are in real. It should be focused, crisp, and clear to everyone to be effective and is based on an analysis of the internal strengths and weaknesses of the firm, combined with an assessment of external opportunities and threats. Analyzing the combination of strengths, weaknesses, opportunities, and threats is sometimes referred to as SWOT analysis. Sometimes SWOT analysis is accomplished by looking at the various business units; at other times, there is an assessment of the core functions of the organization, such as marketing, finance and accounting, operations and logistics, distribution, supply chain management, human relations, and other important areas.

Another important question focuses on what makes this organization unique or different from similar organizations. This uniqueness, which sets that organization apart from others, provides a basis for competitive advantage and is called the organization's distinctive or core competency. Core competencies are built on internal organizational resources, analyzed through a perspective called the resource-based view of the firm. Core competencies are defined as the things that an organization has that are rare, valuable, difficult to imitate, and not easily substituted.

Having identified the internal strengths and weaknesses of the organization, the management team then can ask, What are the critical success factors that we have or need to satisfy? Identification of critical success factors, which are those skills or resources that are necessary for success in a given industry or competitive situation, helps managers focus on next steps.

External Analysis for Strategic Planning

External analysis focuses on the current and expected competitive, societal, and political situation of the organization. External analysis includes industry and competitor analysis, as well as evaluation of trends that might affect the company's performance. Industry analysis, which is based in the thinking of economist Michael Porter, allows the management team to assess the company's position with respect to its competitors, suppliers, customers, threats of new entrants into the industry, or threats from potential substitutes for the company's products or services.

External analysis also involves an assessment of the ways in which the general environment facing the organization affects it. For example, many management teams gather data on demographic trends that might affect the firm, the sociopolitical climate of countries where it operates, technological shifts, local cultures in places where it has facilities, and related issues. External analysis includes stakeholder analysis, which helps a company identify the status of critical relationships that it has with its primary stakeholders, investors, employees, customers, and suppliers, or its secondary stakeholders, such as communities and governments, depending, of course, on the nature of its business.

Focus, Implementation, Evaluation, and Feedback

A key part of any strategic plan is selecting from among the various strategic alternatives open to the organization, which should have been revealed through the internal and external analysis phases. The next step is to implement the plan, which is typically carried out by business units or functional managers responsible for specific divisions, products, and functions in the enterprise. Implementation also involves the allocation of resources among the business units if the organization has multiple divisions or among functional areas such as marketing, sales, operations, and human resources if there are no divisions. Priorities identified in the evaluation and analysis process help managers determine how to allocate resources most effectively.

Critical to the success of any plan is evaluating the outcomes or results of initiatives taken, gathering feedback from key stakeholder groups as well as operating results, and feeding that information back into the strategic plan so that revisions can be made. The key is to think about strategic planning as an ongoing process that evolves with the adaptations that the organization needs to make to continue to perform effectively in its environment.

Strategy and Ethics

Strategy is commonly understood to be a plan of action adopted by an organization to attain its goals, while ethics can be described as a system of moral values and principles that govern the conduct of an individual or a group. In a business enterprise, strategy reflects a company's pattern of decisions, commitments, and actions undertaken by the company to improve its competitiveness and generate profits for its owners. However, earning a profit is not the only goal of a business. It must provide quality products for its consumers, continued jobs for its employees, and taxes for its government. In the process of formulating and implementing strategies, potential conflicts arise in the goals of the company's various stakeholders such as stockholders, managers, employees, suppliers, government, and society at large. It is while dealing with these conflicting goals that managers face ethical dilemmas in prioritizing the demands of various constituents that form the core of the strategy-ethics interface, which we address in the following paragraphs.

Ethics in business strategy has gained renewed focus due to the scandals that have unfolded in recent years at several major corporations in the world including Enron, Arthur Andersen, Tyco, and Adelphia in the United States; Parmalat in Italy; and Livedoor in Japan. As a consequence of these business debacles, numerous employees lost jobs, shareholders lost wealth, governments lost taxes, and society as a whole suffered. To prevent future occurrences of such widespread harm, the U.S. government enacted the Sarbanes-Oxley Act in 2002 to ensure governance mechanisms to protect the interests of shareholders and other stakeholders of the firm. The U.S. Corporate Sentencing Guidelines also provide a strong incentive for businesses to promote ethics at work. Tort laws, contract law, intellectual property law, and securities law all govern business behavior. However, while the law can regulate the basic actions of the firm, it tends to be reactive in nature and contains several ambiguities that present opportunities for unethical practices. Therefore, merging company strategy with an ethical framework can guide managers in their task of strategy formulation and implementation. We briefly describe the concepts of strategy and ethics as commonly understood and then discuss the role managers play in the interface between the two.

Strategy

Companies try to pursue strategies that will help them remain competitive and earn superior returns. While formulating a strategy, a company thoroughly analyzes its external and internal environment. The external environment includes general or macroenvironmental conditions such as global trends, industry conditions, and competitive environment. The internal environment includes the company's internal resources and capabilities such as knowledge, technology, physical assets, manpower, and capital. Based on the perceptions of its environmental opportunities and threats, and internal strengths and weaknesses, a firm will consider different strategies and implementation approaches. A company achieves sustained success only if it has an astute, timely strategic game plan, revises its strategies according to changes in the environment and company situation, and implements the strategies with proficiency. Competitive success requires companies to position well in the existing market space, develop and use distinctive competencies to support their strategy, and design internal systems and practices to effectively implement the strategy. The industrial organization (I/O) model suggests that companies should first assess the external environment, select industries with high potential for superior returns, and then develop strategies as called for by the industry. I/O theory suggests that internal resources and capabilities should be developed as called for by the external environment. On the other hand, the resource-based view suggests that the primary basis for strategy and sustained advantage are internal resources and capabilities of the company. Companies, thus, need to develop resources that are valuable, rare, nonimitable, and nonsubstitutable and craft strategies that will help both exploit current resources and develop new resources. Strategy formulation, therefore, involves analysis of both external and internal aspects of a company and developing an appropriate course of action or strategy. Strategy implementation involves developing internal organizational structure, systems, and processes to execute the strategy and matching them to the strategy.

In a large company, strategies exist at multiple levels and, correspondingly, ethical issues also arise at multiple levels. Corporate-level strategy relates to the decisions and priorities of corporate managers of large diversified corporations (such as General Electric), which may include the choice of the mix of different types of businesses it will have under its corporate umbrella, that is, whether to acquire, merge, or sell off individual business units. Each of these decisions will have ethical implications such as should employees be laid off, or will the merger stifle competition? Functional strategies relate to the pattern of actions and priorities of various functional areas such as production, marketing, human resources, and finance. Again, ethical issues can arise in each functional strategy. Production of defective products can injure innocent people, toxic production processes pose a threat to the environment, misleading product information and deceptive advertising can misguide buying decisions, excessive monitoring can invade employee privacy, and so on.

Ethics

To understand ethics and its relationship to strategy, it is important to briefly consider some philosophical underpinnings. The utilitarian approach espoused by John S. Mill and Jeremy Bentham in the 18th and 19th centuries evaluates action based on the following maxim: greatest good for the greatest number of people. Many businesses adopt this approach to evaluate a course of action by using a cost-benefit analysis. However, costs are often hidden. For example, damage to the environment cannot be readily quantified. Besides, utilitarianism as a framework does not consider the rights of all parties concerned and, therefore, can be unfair to the minority. A small number of employees may be laid off to garner greater profits for many investors, so while this action may be consistent with the utilitarian approach it may be unfair to those few employees affected by job loss. The Kantian or rights approach framework advocates that people be treated as ends and not as means and that basic individual rights of all should be respected. Moral theorists argue that fundamental human rights are the base of the moral compass managers navigate by when making decisions that have an ethical impact. However, the rights approach is not useful when the basic rights of two groups of individuals are in conflict. The justice approach propounded by John Rawls evaluates a strategy based on the impartial and equitable distribution of benefits and harm among stakeholders. This framework suggests that managers should weigh a course of action behind a *veil of ignorance* of the particular characteristics of the people involved, and economic goods and services should be so distributed as to be just and advantageous to the least advantaged groups in society. The virtue approach developed by Aristotle is based on virtues such as honesty, fairness, trust, and toughness. According to this framework, moral virtues and habits enable a person to live according to reason and, thus, make ethical decisions. Moral education aimed at improving moral reasoning and debate and the ability to summon courage to take a principled stand regardless of pressure or punishment are considered very important.

Viewed as a continuum, a business strategy can range from being egoist to altruistic, drawing again on the philosophical underpinnings of ethics. Ethical egoism suggests that each person ought to pursue his or her own self-interest, and an action is considered right when it serves one's personal goal. Ethical egoism does not forbid actions that may help others when interests of the self and others coincide. In contrast, altruism is devotion to the interests of others. It is "other directed" behavior at the cost of one's own self-interest. Altruism emphasizes loyalty, devotion, and the subordination of self to a cause, a person, or an ideal. Put in the context of business ethics and strategy, egoism suggests that a business should focus on its primary goal of providing returns to its owners, the challenge being, however, to find the path that aligns the interests of a firm and its managers with those of all stakeholders. An altruist strategy, on the other hand, would have the firm forgo some of its immediate gains and profits to benefit some constituent, say employees or even society, by investing resources in providing health care or education or in mitigating poverty.

Strategy-Ethics Interface and Role of Managers

Strategy and business ethics are inseparable from each other. While the corporation is a separate entity for legal purposes, it cannot act on its own will. The behavior of the corporation is the result of decisions made by the managers and top executives of the firm. Managers act as agents of the shareholders, who are one set of the stakeholders of the firm. Agency theory postulates that managers, instead of acting in the interests of their principals (owners of the firm), will act opportunistically in their own interests when not properly monitored. Such managers are ethical egoists who focus on self-interest and self-promotion. Indeed, the recent scandals of fraud mentioned earlier have been attributed to the failure of adequate monitoring of executives entrusted with the task of making decisions for the benefit of the corporation. The managers put their own personal welfare ahead of others' welfare. In an alternative view, managers are perceived to be stewards of the distinct stakeholders of the firm, acting altruistically to promulgate ethical strategies that create value and meeting the needs of all constituents of the firm. Stewardship theory is based on the premise that managers will act in a manner consistent with the long-term interests of all stakeholders basing their decisions not on short-term gains for themselves but on corporate principles that enable their firm to be viable through actions that promote sustainable profitability. Sustained profitability of the firm requires long-term investments that may not bear immediate returns. High emphasis on short-term economic returns may be detrimental to the interests of several stakeholders and the society at large. Yet employees are evaluated every year, and companies need to meet stock market's quarterly performance expectations—both short-term horizons. While the notion of "performance" is multidimensional and includes social, environmental, and economic performance, the economic dimension generally supersedes others. Some argue that strategy is at odds with ethics primarily because of the overriding concern of strategy with instant economic performance and the inability of managers to find the point of equilibrium between long-term investment and short-term reward.

While the notions of egoism and altruism described above are the two ends of the continuum to evaluate strategy with the perspective of ethics, a practical "middle" perspective is often used to balance the needs of multiple stakeholders. The notions of corporate social responsibility, corporate citizenship behavior, and corporate accountability are more appropriate to explain the interface of strategy and business ethics. As corporations are members of society, they should engage in socially responsible actions in a manner consistent with fundamental social, moral, philosophical, and ethical principles. The corporation should play an active role in benefiting society, even helping solve problems such as environmental degradation. Even from the extreme economic perspective of strategy, enlightened self-interest dictates that pure business interests are best served by being intertwined with social interests. A company enhances its business when various stakeholders support it. Employees are likely to be more motivated and committed when they perceive their employers to be just, transparent, and doing the right thing; customers are likely to be loyal when the company has a reputation for fair dealing and providing safe products; suppliers are likely to be consistent and reliable when they are treated with consideration; lenders are likely to extend credit readily when they have confidence in the governance and accounts of the firm. In sum, the costs of doing business will be reduced for a firm that follows an ethical strategy that is responsive to the needs of all stakeholders, which eventually leads to better economic performance ensuring greater shareholder returns.

Strategy and Ethics in the Global Context

Modern corporations operate in several competitive environments, national boundaries, societies, and cultures. The notion of ethical standards varies across countries and cultures, and managers are faced with many ethical dilemmas globally. Practices that are illegal and certainly unethical in the United States may be acceptable in some other countries. While gift giving is common and might be expected in the Japanese, Oriental, and Middle-Eastern cultures, it is unacceptable in the United States as it can be construed as bribery. While labor laws in developed countries ensure a minimum level of ethical behavior toward employees, absence of such laws in developing nations have led multinational corporations to adopt sweatshop labor conditions, use of child labor, and unsafe working conditions to reap cost efficiencies. Countries that do not legislate or have environment protection laws find themselves dumping grounds for toxic or hazardous waste by corporations following a strict wealth maximization strategy for shareholders to the exclusion of other objectives. Corporations, thus, are confronted with a great number of strategies and contextual conditions that contribute to their facing ethical dilemmas.

Several international organizations such as Social Accountability 8000, Global Compact, International Labour Organization, and United Nations Commission on Transnational Corporations provide uniform guidelines and codes of conduct to multinational corporations. These guidelines are not mandatory laws and cannot be enforced. However, many companies have found that when they have swerved away from following an ethical strategy, they have become a target of negative media attention leading to loss of customers, as Nike did when their sweatshop labor practices in developing countries came to light.

Strategizing Ethically

As noted earlier, strategy and ethics are intertwined. Higher ethical standards and practices improve a firm's image and reputation, and this intangible resource is likely to provide a sustainable advantage to the firm. While violating basic ethical norms may provide temporary benefits and short-term economic gains, long-term financial performance is likely to improve when firms consider the interests of all stakeholders, which results in a positive image of the company. Even investors and shareholders seek out companies that implement ethical strategies that ensure profits by following principles, as evidenced by the growth and popularity of social investing in portfolios such as domini social investments.

Strategizing ethically would mean that businesses should deeply embed ethical principles and standards in their mission, strategies, and day-to-day practices. Managers need to set high ethical standards, need to be cognizant of ethical principles while formulating and implementing strategies, and need to recognize and reward employees who follow ethical standards and penalize those who do not. Statements about the long-term direction and strategy can include a company's philosophy and values, key corporate values can be incorporated in the company's mission statement and then translated into the employee code of conduct, and the code of conduct could be strictly followed and reinforced. Similarly, the design of the organization and formal reporting systems can ensure enforcement of ethical standards and practices at all levels and in all functional areas of operation. Besides formal mechanisms, informal mechanisms such as organization culture, shared norms, values, and beliefs can be very useful in fostering an ethical climate within an organization. Human resource practices, such as recruitment, compensation, training, and promotion decisions, can also be geared to explicitly value and emphasize ethical standards. A well-developed whistle-blowing policy that allows benign disobedience and encourages constructive criticism can also be instrumental in cultivating an ethical climate. Many firms have trained ethics officers whose job is to monitor ethical behavior and counsel managers when the need arises. Above all, managers as leaders could set an example by their own behavior and serve as referent models to employees throughout the organization.

Stress, Job

Job stress is a harmful physical or emotional response employees experience when they have expectations that they cannot fulfill because of their capabilities, resources, or needs. Stemming from stressors in the workplace, such as time pressure and role overload, job stress may result in harmful consequences for both individuals and organizations. Outcomes of job stress may be physiological, psychological, or influence an individual's behavior at work. For example, an individual's health may be affected, burnout may occur, and productivity levels may also suffer as a result of job stress.

Early signs of job stress include headache and stomachache, difficulty sleeping and concentrating, short temper, and low morale. Research also suggests links between job stress and cardiovascular disease, musculoskeletal disorders, and psychological disorders. Stress in the workplace is linked with increased absenteeism, tardiness, and turnover intentions. A further understanding of the causes of workplace stress, as well as preventative measures, would benefit both individuals and organizations. Although many believe that both individuals and organizations should share the responsibility for preventing and alleviating job stress, many organizations believe that the responsibility for stress management rests solely with employees. Organizational change efforts targeted toward stress reduction can impact the bottom line.

Causes of Job Stress

Job stress is widespread and rising for many reasons, some of which include the working conditions and expectations of employees. Workplace stressors may lead to job stress, which in turn may lead to outcomes of stress. Different individuals respond differently to job stressors, and some employees do not experience job stress. Yet most people find certain working conditions stressful.

In a model illustrative of the stressors-strains (outcomes) relationship, work environment stressors, such as role conflict and time pressure, are common characteristics of the work that may adversely affect an individual (cause human strains). These work roles encompass conflicting or ambiguous job expectations, too much responsibility, and role overload at work. Additional job stressors stem from economic conditions that pressure organizations to make rapid changes to their workforces, including restructuring and downsizing; these changes often lead to increased work expectations and longer working hours on the part of the surviving employees. U.S. employees now work longer hours than employees in most other countries. Other common stressors include job insecurity, inability to deal with rapid change, and lack of career opportunities. In addition, management styles and organizational cultures that limit participation by employees, do not foster communication throughout the organization, and do not support family-friendly policies are other common sources of job stress. When coworkers and supervisors do not support employees, increased levels of stress and increased outcomes of stress may be experienced. How tasks at work are designed can also influence stress levels of employees. Task design is concerned with workload expectations, as well as work hours, shift work, rest breaks, tasks with little meaning to employees, and tasks that do not use employees' skills and provide little feeling of control. Finally, unpleasant and dangerous working conditions may also lead to increased levels of stress.

Prevention and Reduction of Job Stress

One recent survey reported that 40% of workers felt that their jobs were either very or extremely stressful. Individuals can lessen the effects of job stress in several ways. These include balancing work and personal life, having supportive friends and coworkers, and maintaining a relaxed and positive outlook. Stress management programs offered by organizations for their employees can also be helpful in alleviating and sometimes preventing job stress as well. A healthy work environment may be created and maintained by organizations that offer such programs, if they also aim to reduce stress through organizational change efforts.

To determine the changes that organizations need to implement, the underlying causes of stress need to be diagnosed. Some examples of changes that may be implemented include limiting employees' workloads, clarifying roles and responsibilities, designing meaningful jobs, encouraging participation in decision making, and allowing for social interaction among employees. Organizations that recognize good performance and provide career development for employees, among other things, demonstrate both high levels of productivity and healthy, low-stress work. Any stress-reduction process must include problem identification, intervention, and evaluation.

Subsidies

In the broadest sense, a subsidy is a grant or other financial assistance given by one party for the support or development of another. However, in a business environment, the kind of subsidies most likely to raise legal and ethical issues are those given by a government or a philanthropic foundation to a person or association for the purpose of promoting an enterprise considered beneficial to a specific subsection of the public or the public in general. A subsidy can be legal, illegal, ethical, or unethical, depending on its effects. The first British subsidies were grants given by Parliament to the King in the Middle Ages to replace taxes formerly collected by the Crown. Now, however, subsidies are granted for reasons such as to keep prices low, to maintain income, or to preserve employment. Governments grant subsidies for several reasons. A governmental subsidy can help eliminate a region's industrial, economic, or social disadvantages, or it can facilitate the restructuring of an industry, especially when changes have become necessary because of changes in trade and economic situations. In addition, a subsidy can be used to sustain employment, to encourage retraining and change in employment, to encourage research and development, or to redeploy industry to avoid congestion and environmental problems.

For example, the U.S. government subsidized Amtrak in an effort to maintain passenger service where it might not otherwise be profitable. Metro transit systems are often subsidized, as is agriculture, housing (the HUD program), regional development, medical care and treatment (the Medicare Prescription Drug Program), and educational development. In addition to federal subsidies, individual states may grant subsidies. For example, Pennsylvania has subsidized medical malpractice insurance for doctors, and Montana grants subsidies to help parents provide for special needs children. As an example of a private (nongovernment) subsidy, Patrick Taylor, an oilman and philanthropist, developed a subsidy scholarship program (the TOPS program) for all Louisiana high school graduates with B+ grade point averages who attend Louisiana public colleges and universities. Corporations may similarly subsidize new ventures, supporting them until they show a profit or prove to be unprofitable.

In addition to different kinds of subsidies, subsidies can take many different forms. Although governments sometimes make direct payments such as cash grants, many subsidies are indirect. They may take the form of research and development support, tax breaks, provision of raw materials at below-market prices, insurance, or low-interest loans or low-interest export credits guaranteed by a government agency.

Subsidies, while intended to support the public interest, can violate ethical or legal principles if they lead to higher consumer prices or discriminate against some producers while benefiting others. Domestically, subsidies granted by individual states are unconstitutional if they in any way discriminate against out-of-state producers, thus violating the Privileges and Immunities Clause or the Dormant Commerce Clause of the U.S. Constitution. Subsidies, while immediately beneficial to an industry, may in the long term prove to have unethical, deleterious long-term effects. Internationally, subsidies that affect global prices, especially export subsidies of agricultural products, are controversial, regarded as both harmful and unethical by developing nations, and depending on their nature and effects are discouraged by international trade agreements such as the World Trade Organization (WTO).

Domestic Subsidies and the U.S. Constitution

The U.S. federal government has given subsidies to its farmers since the Great Depression of the 1930s. In 2005, U.S. farmers received $14 billion yearly in production and support subsidies. The main thrust of such agricultural legislation has been to support farmer income and ensure abundant production. The most subsidized U.S. farm products include wheat, corn, rice, cotton, sugar, peanuts, soybeans, and milk products. Milk subsidies, in particular, have led to some famous Supreme Court decisions.

In most of the 50 states in the United States, federal marketing orders guarantee a uniform minimum price for producers of raw milk. In the 1990s, however, Massachusetts dairy farmers were apparently facing a particularly difficult time even with the federal minimum, so state legislation was passed authorizing a tax assessment of all milk sold by dealers to Massachusetts retailers. These tax funds were then distributed to Massachusetts dairy farmers. A side effect of this subsidy was to make it more expensive for out-of-state farmers and dealers to sell milk in Massachusetts, as compared with in-state farmers and dealers. An out-of-state dairy farm brought suit. The Supreme Court ultimately ruled that the Massachusetts subsidy violated two clauses of the Constitution. First, because it benefited in-state farmers at the expense of out-of-state farmers, it violated the Privileges and Immunities Clause, which mandates that “the Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several states.” Furthermore, the Massachusetts milk subsidy violated what has come to be known as the *Dormant* or *Negative* Commerce Clause.

The Commerce Clause provides that Congress has the power to regulate commerce “among the several states.” Sometimes the Supreme Court decides that a law passed by Congress (a federal statute) violates the Commerce Clause, but the Supreme Court has also found that a logical consequence of the Commerce Clause is to make it illegal for states to regulate interstate commerce. A state regulation that is illegal and unconstitutional because it affects interstate commerce is described as a violation of the Dormant or Negative Commerce Clause. Thus, in addition to violating the Privileges and Immunities Clause, the Massachusetts milk subsidy was unconstitutional because it interfered with interstate commerce.

Long-Term Effects of Subsidies and Ethical Controversies

In addition to being illegal because it violates the Constitution, a subsidy can be regarded as unethical if it weakens an industry economically. For example, the arguments in favor of agricultural subsidies are several. Proponents argue that government support is necessary to achieve the goals of supporting the farm economy and ensuring a low-cost food supply. Farmers are at risk because demand for agricultural products is inelastic, meaning that consumers continue to buy similar quantities of food regardless of price increases or decreases, yet as storage is limited farmers have to sell regardless of the price they receive. In addition, farmers are particularly vulnerable to weather and changes in market conditions. Thus, to stay in business, it is argued that farmers need to be protected from the risk of low prices. Furthermore, even though only 2% of Americans live on approximately 2 million farms, culturally Americans identify themselves with farmers and feel it is in America's interest to preserve small farms. Finally, because more than half of U.S. Senators come from largely rural states, the farm states have very strong representation in Congress.

Arguments against agricultural subsidies are also strong. Farm subsidies for crops such as cotton are often granted on the basis of how much acreage was planted the previous year. As a result, it has been argued that these farm subsidies, rather than helping farmers survive, have acted as a "cancer" on rural America: They raise land prices significantly, making it hard for young farmers to get started because farms that benefit most from such subsidies are large, established, consolidated farms, not small family farms. In addition, subsidy programs generally encourage monoculture—raising the same crop year after year on the same plot of land—because benefits are tied to crop yields on a specified acreage planting base. Large-scale monoculture contributes to soil erosion by depleting nutrients in the soil because planting the same crop drains a particular nutrient from the soil year after year without any opportunity for replenishment. Furthermore, it has been argued that farm subsidies have kept marginal land in production, resulting in overproduction and lower prices, and have discouraged farmers from switching to crops that have proven more profitable based on market pressure rather than subsidy potential. Thus, while some subsidies are very beneficial and make possible things that might otherwise be difficult to achieve, they can have long-term complicated unethical or illegal effects that were not anticipated when they were first conceived.

Subsidies and Global Commerce

In addition to raising domestic legal and ethical issues, subsidies raise legal and ethical issues in a global context. Subsidies are considered to be unfair trade practices when they affect a second country's industry: Government A's subsidy of a particular industry puts comparable products produced in Country B at a competitive disadvantage when A's products are imported into B. While competition and lower prices usually benefit the public, when low prices are the result of subsidization, their export into a second country may cause serious economic disruption of the domestic industry, including lost profits, an excess of available goods, layoffs, and even widespread bankruptcy. In addition, the artificial advantages to consumers in the second country gained from subsidization lead to a misallocation of domestic resources. Manufacturers of a product selling primarily in the home market will make decisions concerning expansion based on their perception of how their product competes in the marketplace. If the cost of an imported competing product is low due to subsidization, domestic manufacturers may perceive that their company is not competitive even though it remains the low-cost producer in his market.

WTO Controversy Surrounding Agricultural Subsidies

The WTO is a global international organization dealing with the rules of trade between nations. Although WTO was created in 1995, the heart of the WTO is the General Agreement on Tariffs and Trade (GATT), negotiated and signed originally in 1948 by the bulk of the world's trading nations and ratified by their governments. Although GATT was first passed in 1948, it has been modified in several rounds of negotiations. The Uruguay Round, which ended in 1994, culminated in the creation of the WTO. The nature of GATT is that of an agreement, a contract among nations, and the WTO helps implement that agreement. The WTO is not an international government and cannot itself sanction governments, but its members can sanction each other for unfair trade practices by raising duties against members who do not follow GATT rules. The WTO's stated goals include encouraging countries to liberalize trade, ensuring that individuals, companies, and governments know what the trade rules are around the world, and thus helping producers of goods and services, exporters, and importers conduct their business.

The rules of the WTO prohibit some subsidies and allow countries to increase duties when they find that a subsidized imported product is harming a domestic industry. However, those rules have long made an exception for subsidized agricultural products because many countries, including the United States and the European Union, the two largest agricultural exporters, have long subsidized such products and repealing such subsidies would have serious political implications. As recently as 2002, the U.S. Congress raised farm subsidies. In 2005, U.S. farmers received $14 billion in agricultural subsidies and European Union farmers, $47 billion. European dairy subsidies were such that each cow reportedly received the equivalent of $2.20 per day, an amount greater than the daily income of many people in developing countries.

The ethical implications of such subsidies are as complex in a global perspective as they are domestically. Cotton growers in the United States reportedly received half of their income from the U.S. government under the Farm Bill of 2002. The deficiency payments stimulated overproduction and resulted in a record cotton harvest in 2002, much of which was sold at low cost on the world market. This depressed world cotton prices to a level far below the break-even price of most growers around the world: African farmers received 35 to 40 cents per pound for cotton, while U.S. cotton growers, backed by government-deficiency payments that made up for market prices, received 75 cents per pound. African nations, like other developing countries, argued that they must be able to export their principal commodities to survive but subsidies such as the U.S. cotton deficiency payments were crippling Africa's chance to export its way out of poverty.

Members of the WTO have long since agreed in principle that agricultural subsidies should be scaled back. However, it has been extremely difficult to reach specific agreements on how and when members should reduce such subsidies. The original Uruguay Round of negotiations produced the first multilateral agreement dedicated to subsidies and was implemented over a 6-year period that began in 1995. Under this scheme, measures that support domestic prices or subsidize production in some other way such that they have a direct effect on production and trade must be cut back. Measures with minimal impact on trade can be used freely. They include government services such as research, disease control, infrastructure, and food security. They also include payments made directly to farmers who do not stimulate production, such as certain forms of direct income support, assistance to help farmers restructure agriculture, and direct payments under environmental and regional assistance programs. Direct payments to farmers to encourage them to limit production are also permitted, as are government assistance programs encouraging agricultural and rural development in developing countries.

Despite implementation of the Uruguay Round, international discussion on whether these subsidies should be discontinued remains highly emotional with concerns about food security, past food shortages, and the special place that farms and farmers have in a society's history. The Doha Round of WTO negotiations in 2001 resulted in an agreement that members would work to phase out all forms of export subsidies and reduce trade-distorting domestic support of agriculture. Nevertheless, the subsequent September 2004 round of talks in Cancun, Mexico, collapsed in an impasse between rich and poor countries—particularly over the issue of subsidies provided to farmers in the United States, the European Union, and Japan. A coalition of 21 developing countries, led by Brazil, India, and China, urged developed countries to quickly eliminate the use of trade-distorting agricultural subsidies, but most of the developing nations were unwilling to budge on their own protectionist measures. Furthermore, a group of West African cotton-producing nations challenged the United States to make cotton a test case, but the United States was then unwilling to meet the West African demands.

In the December 2005 Hong Kong Round of negotiations, however, in an effort to avoid replication of the Cancun stalemate, the United States agreed to terminate cotton subsidies in 2006, without demanding a similar concession on the part of other members. The meeting concluded with an agreement to eliminate all forms of export subsidies by the end of 2013. Whether this agreement will result in decreased friction between developed and developing countries remains to be seen. As of January 2006, the anticipated effect of the U.S. cotton concession is an immediate global rise in price of 10% to 15%.

WTO Discouragement of Trade-Disrupting Subsidies

Under the WTO agreements, countries periodically negotiate and state the duty rates on various products they will charge all other WTO members, with the ultimate goal being the progressive lowering of those rates and the liberalization of trade. They cannot normally discriminate between their trading partners. If one country is granted a special favor, such as a lower customs duty rate for one product, then all other WTO members must be given the same rate. This principle is termed *most favoured nation treatment*. Some exceptions are allowed. For example, countries can set up a free trade agreement that applies only to goods traded within the group—discriminating against goods from outside (such as the North American Free Trade Agreement and the European Union). Or they can give developing countries special access to their markets. Or a country can raise barriers against products that are considered to be traded unfairly from specific countries. The GATT contains an Agreement on Subsidies and Countervailing Measures (SCM Agreement), which has been used increasingly by both developed and developing countries in recent years.

The SCM Agreement addresses both the subsidies countries may grant to various domestic industries and the use of countervailing measures to offset injury caused by subsidized imports from other countries. The GATT defines subsidy very broadly as anything given by the government that confers an economic benefit on the recipient. However, only two categories of subsidies are prohibited under the SCM Agreement: subsidies that support products to be exported and subsidies that prefer domestic goods over imported goods.

In addition to prohibited subsidies, the SCM Agreement specifies actionable subsidies. These are subsidies that are not prohibited, but can be challenged if they injure or seriously prejudice a member's domestic industry or if they nullify the benefits that GATT was created to confer. Under the SCM Agreement, a member country is not allowed to impose a countervailing duty unless it has investigated and found subsidized imports, injury to a domestic industry, and a causal link between the subsidized imports and the injury.

These rules apply to WTO members that are considered to be developed countries. However, exemptions are provided for developing countries. The lower a member's level of development, the more favorable the treatment it receives with respect to subsidies. Thus, for example, least developed countries and members with a GNP per capita of less than $1,000 are exempted from the prohibition on export subsidies.

Members must notify the WTO of all specific subsidies that they grant and must also update those notifications every year. Members are also required to notify the WTO of their countervailing duty laws and regulations and any countervailing actions they take. If a member objects to a subsidy or a countervailing duty imposed by another member, or otherwise believes that trade rules have been violated, that party can file a complaint and the dispute will then be resolved through the WTO's dispute resolution process, which is much like a trial conducted by a panel of experts from member countries. If it is unhappy with the panel report, the subject country has a right of appeal to the WTO's Appellate Body.

If the country that is the target of the complaint loses, it must enter into negotiations with the complaining country (or countries) to determine mutually acceptable compensation—for instance, tariff reductions in areas of particular interest to the complaining side. If no satisfactory compensation is agreed on, only then may the complaining side ask the Dispute Settlement Body for permission to impose limited trade sanctions ("suspend concessions or obligations") against the other side. The Dispute Settlement Body must grant this authorization unless there is a consensus against the request. Thus, the ultimate consequence for not following GATT rules is the *possible* imposition of higher import duties by other members.

Sunset Laws

A "sunset law" or "sunset provision" is a law that provides for the automatic termination of a government program, agency, or law on a certain date, unless the legislature affirmatively acts to renew it. Sunset laws were widely promoted in the United States in the 1970s as reform measures to eliminate bloated and unresponsive government bureaucracies. Political theorist Theodore Lowi, for example, touted sunset provisions as diminishing interest-group power over government programs and as promoting more active legislative oversight. Legislators would have to be convinced of the independence and efficacy of programs facing sunset provisions if these programs are to survive, and they would presumably not renew programs that were failing or that served only a few special interests.

In spite of support from prominent politicians and government reform groups such as Common Cause, no comprehensive federal sunset law was passed in the United States. A majority of states did create sunset programs, however, and a large number of individual federal statutes were drafted with sunset provisions. These generally provided for formal review of agencies, boards, and commissions, with program termination looming for those that could not persuade sunset audit staff (and the legislators to whom they reported) of their efficacy.

The 1970s sunset provisions were not terribly successful in practice, however. From the beginning, many of them exempted larger agencies from any review. Moreover, by the early 1980s, it was widely recognized that the de facto burden of proof had shifted from agencies undergoing sunset review to the staff conducting it. Program renewal was commonplace, and actual sunsets were rare. Agencies—supported by the powerful interest groups that sunset laws were supposed to disempower—successfully defended the status quo. Since the 1970s, a large number of laws passed with sunset provisions have had those provisions removed by technical amendment well before any audit or review takes place. Nonetheless, some scholars have argued that while few state programs are actually threatened by sunset provisions, sunset laws have to some extent encouraged more active legislative oversight than previously existed.

In current political practice, sunset provisions are used tactically in at least two ways. First, they are used as a bargaining chip in gathering votes in favor of controversial legislation. The presence of a sunset provision can persuade a wavering legislator (or that legislator's public) of the "purely temporary" nature of a controversial law. Thus, for example, sunset provisions are thought to have been partially responsible for the bipartisan support for the USA PATRIOT Act, which greatly enhanced federal prosecutorial powers in the wake of the September 11, 2001, terror attacks on the United States. Sunset provisions can also be used cynically to reduce the projected costs of a new program, tax, or tax reduction. Public statements can be based on estimates that only forecast costs out to the sunset date, even if it is expected that the program will eventually be renewed or have its sunset provision repealed.

SUPEREROGATION

A fundamental question in business ethics is whether organizations have a responsibility, or even a right, to engage in activities—perhaps aimed at betterment of society—beyond their formally designated roles of providers of goods and services. For example, should firms pay more attention to the environment than is required by law? Should they provide better pay and working conditions than law and market conditions demand? If they do engage in such acts, what are the associated costs to shareholders and others? Similarly, at the individual level there has been growing emphasis on individual actions that exceed formal role requirements to assist others in the firm, meet deadlines, protect the organization, or otherwise "go above and beyond the call of duty." These issues have deep roots, founded in the concept of supererogation.

The combination of two Latin words (*supererogare*), supererogation essentially means "to pay over and above" or "to do more than is required by duty." Supererogatory acts combine elements of optionality and praiseworthiness. The term first appeared in the Latin translations of the scriptures; a New Testament reference is found in Luke 10:35, in the parable of the Good Samaritan. It was later adapted by ecclesiastical writers for the "excess of merit" attributed to saints—works or good deeds over and above what is required for their own salvation and the merit of which is transferable to others in need of indulgence.

According to this view, actions of "superabundant merit," typically collected by the works of Jesus and the saints who greatly exceeded what was required for their own salvation, are deposited in the Spiritual Treasury of the Church to be disposed by the Pope and the bishops for remitting the sins of others. The institution of Indulgences, by which sinners could buy remission of their sins if they "took up the cross" against the infidel in the Crusades or, later, through contributions to the coffers of the Catholic Church, developed in the late Middle Ages. Indulgences were even offered to markets, taverns, and brothels if they gave a substantial portion of their profits to the Church.

The concept of supererogation drew fierce attacks during the time of the Reformation. Luther, Calvin, and Anglican theologians condemned the idea of "super-meritorious" actions and the corruption associated with the commercialization of the system of indulgences that it justified. They argued that no person can do all that is strictly required as a duty, much less exceed it.

This antagonism toward supererogation, coupled with the cessation of the institution of indulgences in the Catholic Church, led to a sharp diminution in interest in the concept of supererogation. In fact, the concept did not appear in nonreligious ethical theory until Urmson's seminal 1958 article "Saints and Heroes" (though Urmson did not actually use the term). Urmson argued that, in addition to the traditional threefold classification of moral actions as obligatory, permitted, and prohibited, there were acts that were praiseworthy though nonobligatory (actions that are good to do but not bad not to do). Since then, supererogation has again been widely discussed and hotly debated. While the context has shifted from theological to ethical, the terms of debate often remain similar.

Heyd wrote that supererogation is a characteristic of attributes of acts rather than persons. According to his analysis, an act is supererogatory if and only if

- it is neither obligatory nor forbidden;
- its omission is not wrong and does not deserve sanction or criticism;

- it is morally good, both by virtue of its intended consequences and by virtue of its intrinsic value (being beyond duty); and
- it is done voluntarily for the sake of someone's good and is thus meritorious.

McKay added the notion that the act should have a potential cost to the agent. In undertaking the task, the agent risks losing something to which he or she might normally be entitled. Because of this cost, the permission not to perform the act despite its moral goodness is normally granted to such acts. Examples of supererogatory actions might include a nurse rendering aid to plague victims or a soldier sacrificing his or her body to a live grenade to save colleagues. At the organizational level, an example might be the actions of Aaron Feuerstein, CEO and owner of Malden Mills. When a 1995 fire burned most of Malden Mills to the ground and put 3,000 people out of work, most employees thought Feuerstein would build overseas to cut labor costs and their jobs would be lost forever. To the surprise of almost everyone, Feuerstein—feeling it would be unconscionable to put 3,000 people on the streets and devastate the local communities—rebuilt the plant and continued to pay his idled workers during the months until the plant was again operative.

To most people, the idea of actions that are "above and beyond the call of duty" seems intuitively reasonable. However, standard forms of ethical theory seem unable to accommodate supererogatory acts. Deontological ethical theories relate to what ought to be done, to duties and obligations, and to justice and right. According to this perspective, since all morally good action is obligatory, there cannot be a separate class of morally good actions the omission of which is not wrong. Teleological ethical theories argue that there are just two categories of acts: obligatory (if they maximize the highest good) and forbidden (if they do not). As such, pure teleological theories such as utilitarianism grant supererogatory acts no unique status, placing them in the general class of acts that are obligatory because they maximize the overall good.

Although the term *supererogation* rarely appears in the organizational literature, its central idea—performing beyond requirements—is now widely discussed and researched using terms at the individual level such as *organizational citizenship behavior*, *extrarole behavior*, and *prosocial behavior*. The common theme of these terms is a sense of going beyond what is strictly required in one's formally designated role. For instance, organizational citizenship behaviors consist of those actions such as helping coworkers, protecting the organization, and giving extra effort as needed that are not in one's job description but contribute to the maintenance and enhancement of the social and psychological context that supports task performance. With growing emphasis on teamwork, flexibility, and collaboration in modern organizations, such behaviors are increasingly crucial.

As with supererogation, the concept of *organizational citizenship behavior* and associated terms highlights a variety of thorny issues. For example, if extrarole behaviors come to be recognized in performance appraisals and rewards, can they reasonably be considered supererogatory? If extrarole behaviors become expected, do they truly remain extrarole? For example, employees of Nordstrom's are known for going beyond what is strictly required in their roles. Nevertheless, such behavior is now generally expected of those employees and failure to display them may be viewed as a deficiency. And, at the organizational level, there is fierce debate over whether acts that go beyond legal requirements to help society are in the best interests of shareholders and other parties dependent on the firm. In the Malden Mills case cited earlier, for example, the company filed for bankruptcy in 2006, and many wondered whether Feuerstein's benevolence was partly the cause.

In sum, the concept of supererogation raises many provocative questions, and there are certainly no comfortable conclusions regarding its ethical status. Nevertheless, the notion of supererogation "makes sense" to most people; is clearly important; and poses fundamental challenges to conceptions of the nature and limits of duty, the role of ideals and rationalization in ethical judgment, and the connection between actions and virtue.

SUPPLY-SIDE ECONOMICS

The origins of the supply-side economics school of thought can be traced to the 1970s as a conservative reaction against postwar Keynesian "demand-side" economic policies associated with changes in government spending levels to smooth out business cycles and to fund social spending programs. The central idea in this framework is that government can stimulate growth in aggregate supply through suitable tax policies, which in turn will result in an expansion of gross domestic product, accompanied by a decline in inflation.

The policies associated with supply-side economics are typically tax cuts. A prime example of such a policy is a cut in the top marginal income tax rates, which has the greatest effect on the highest income earners. According to the theory, a reduction in the marginal income tax rates will raise the after-tax compensation of the income earners. Since they will get to keep more of their earnings, individuals will now have an incentive to work harder and thus raise their earnings. Furthermore, some individuals who may have previously opted to stay out of the labor force may now be enticed back into the workforce. Consequently, the supply of labor increases, which in turn will cause an increase in the aggregate supply of goods and services in the economy. The projected results are higher output, lower unemployment, and lower inflation.

One variant of the supply-side argument asserts that the reduction in tax rates will result in increased tax revenues for the government. This argument is encapsulated by the Laffer curve (Arthur Laffer reportedly drew the curve on a restaurant napkin), which depicts the effect of tax rates on revenues. Initially, as tax rates rise, so do revenues, but after a certain point, any further increase in tax rates is accompanied by declining revenues as the higher tax rates begin to exert a stultifying influence on work effort. Furthermore, higher tax rates may also encourage increased use of tax avoidance measures; in some cases, these measures might include illicit efforts to conceal income. Under these circumstances, a reduction in the tax rate will not only engender greater work effort but also reduce the extent of tax evasion, leading to a robust increase in economic growth and an overall increase in tax revenues.

Proponents of a flat tax also make similar arguments. Notably associated with Steve Forbes, flat tax proposals seek to levy the same (low) tax rate on all incomes, thereby effectively providing a sizeable tax cut for high-income earners. To prevent large increases in the budget deficit, some versions propose outlawing the myriad tax deductions currently enjoyed by the middle class and upper-income groups. These include eliminating the mortgage interest deduction, a particular favorite of homeowners and the real-estate industry. Stiff resistance from those who would be affected by the loss of such tax breaks has frustrated proponents of the flat tax.

The empirical evidence on the relationship between tax rates and revenues is mixed, at best. Most studies show that cutting tax rates leads to less revenue, not more. The Reagan administration's tax cuts of the early 1980s resulted in a decrease in tax revenues. Between 1980 and 1984, a period when average incomes (per person, adjusted for inflation) rose following the tax cuts, revenues from personal income taxes (per person, adjusted for inflation) fell. The decline in revenues continued throughout the decade; by the end of Reagan's second term, the record of large budget deficits had been firmly established.

Another example of a supply-side policy is a cut in the capital gains tax. The argument here is that such cuts, by raising the after-tax return on stocks, will encourage greater savings by households. The consequent fall in real interest rates will stimulate investment by firms, which in turn will lead to increases in the country's capital stock, eventually causing the aggregate supply to rise and economic growth to accelerate. A related argument is that lower income and capital gains tax rates will stimulate entrepreneurial activity, thereby creating new jobs while also expanding personal and aggregate income from the sale of new goods and services.

The empirical evidence on this, too, is mixed. Effecting changes in consumer behavior regarding savings decisions is not an easy task. Cutting capital gains taxes might simply reward those who might have invested in stocks anyway, without attracting any significant new savings. And even if savings and investment rise, the attendant changes in the capital stock and, thus, economic growth will occur after several periods. The growth effects of such tax cuts, then, may be seen as manifesting themselves in the long run; in the short run, the likely effect is reduced tax revenues and larger budget deficits.

The policies associated with supply-side economics rest on the assumption that consumer behavior (and, in some cases, producer behavior) will change in a predictable manner when consumers are presented with certain tax cuts. More precisely, the assumption is that supply-side tax cuts will lead consumers to work more (increase labor supply) and save more (increase capital stock). In each case, however, the presumption may be turn out to be unduly optimistic or, worse, faulty.

The empirical evidence suggests that the effects of tax cuts on labor supply and savings decisions are modest. Thus, these policies are unlikely to deliver significantly faster economic growth and even less likely to produce an increase in revenues that will offset the initial tax reduction. The likely result—larger budget deficits.

Cuts in taxes may also have perverse effects. For instance, a cut in the income tax rate, by leading to an increase in the after-tax earnings, might encourage individuals to work less and save less. Individuals may work less because they might wish to enjoy a greater amount of leisure, which they can now do without sacrificing any income. Similarly, an increase in after-tax earnings may induce consumers to save less in the current period, since they are now in a position to maintain a higher future consumption level without sacrificing current consumption. If these effects prevail, the results of the tax cuts will be contrary to those anticipated in the conventional thinking on supply-side policies.

Supply-side policies also mainly benefit the affluent. The reduction in the highest marginal income tax rates will raise the after-tax compensation of the highest income earners, leaving those at the lower-income strata largely unaffected, thereby exacerbating income inequality in society. Similarly, cuts in capital gains taxes (and estate taxes) will also predominantly leave the wealthy better-off, since they are the ones with large holdings of stocks (and estates). Thus, supply-side policies tend to militate against an equitable distribution of income while constraining public spending on social programs, such as health care and social security.

Surplus, Consumer and Producer

In economics, *consumer's surplus* refers to the difference between what a buyer actually pays for a product and the maximum that he would have been willing to pay. If one would have been willing to spend $40 on a shirt, but find it on sale for $10, one would realize a consumer surplus of $30 on the purchase. *Consumers' surplus* is used to refer to the aggregate difference between what consumers would be willing to pay for a given good or service and what they actually do pay (the market price).

Producer's surplus, inversely, is the difference between the price actually received by a seller (or sellers) for a product and the minimum price at which the seller (or sellers) would have been willing to sell. *Producers' surplus* is the equivalent aggregate measure. Thus, consumer's surplus is a demand-side welfare measure, and producer's surplus is a supply-side welfare measure. *Social surplus* is the sum of consumer and producer surplus and is a measure of the total welfare gain from market transactions.

Surplus Under Price Competition

Within any given market, price competition tends to minimize producer surplus and maximize consumer surplus. (The exact nominal value of producer and consumer surplus in any given market depends on the cost and demand structures of that market.) According to economic theory, producers are forced by price competition to sell their products at marginal cost (roughly, the cost to them of producing the last item to be sold). Every consumer—even those who value a product very highly and would be willing to pay much more for it—will be able to buy that product at its marginal cost and, thus, realize substantial consumer surplus. Producers in a competitive market also realize some producer surplus, however. The amount realized will increase to the extent that the producer's average production costs are below the market price.

Price Discrimination and Surplus

Price discrimination is the sale of identical goods to different buyers at different prices. Price discrimination on the part of sellers can shift social surplus from consumers to producers. A seller who can price-discriminate perfectly will charge each of his buyers exactly the highest price that that buyer is willing to pay. Such a seller will sell the same amount of goods as would be sold in a competitive market, but no buyer will realize any consumer surplus, and the seller will realize the maximum possible producer surplus. Perfect price discrimination, in other words, gives all the social surplus to the producers.

Perfect price discrimination is difficult to achieve, since it involves knowing each individual customer's willingness to pay. It is also difficult to maintain: It is undercut by price competition and, even where there is little competition, by arbitrage among customers. But even imperfect price discrimination transfers some social surplus from consumers to producers. This is why retailers commonly use various tactics (e.g., airline "Saturday overnight stay" rates that create differential prices for business and nonbusiness flyers) to charge their different customers prices closer to their maximum willingness to pay.

Monopoly and Surplus

A perfectly price-discriminating monopolist would, in theory, be able to sell the same number of goods as would be sold in a price-competitive market, while keeping all the social surplus on the producer's side rather than on the consumer's side. In practice, however, because price discrimination is difficult to achieve and maintain, monopolists have to set a single price for all their customers. In these circumstances, monopolists famously maximize their profits by producing fewer goods, but charging more for each. This strategy ends up splitting the social surplus. Some—more than in a competitive market—is kept by the monopolist as producer surplus. Some—less than in a competitive market—is kept as consumer surplus by those buyers who value the monopolist's product most highly. Importantly, however, the total amount of social surplus produced in this situation is less than would be produced either in a regime of perfect price competition or in a regime of perfect price discrimination. Social surplus is reduced because the monopolist's uniform high price displaces some transactions entirely. Some potential consumers are simply priced out of the market, so some goods are never sold—and no surplus is ever realized on those absent sales. (The economic loss due to these absent transactions is what economists term *deadweight loss*.)

The same thing occurs when groups of sellers band together in an attempt to transfer social surplus to themselves from their consumers. Cartels, price-fixing agreements, geographic market division, and other illegal competition-limiting techniques have the effect of making the allied sellers behave like a single monopolist. The upshot, again, is increased prices and decreased production, a transfer of social surplus from consumers to producers, and a reduction in total social surplus.

Antitrust and competition laws generally aim to prevent this kind of reduction in social surplus from the level that would be realized by competitive markets. An important secondary goal of antitrust and competition laws is the transfer of as much social surplus as possible from producers to consumers. The latter goal is not pursued everywhere: Retail price discrimination, for example, shifts surplus away from consumers and toward producers, but is not illegal under American antitrust laws. Several factors may explain this, including the difficulty of policing price discrimination schemes (which makes enforcement challenging) and the historical inability of sellers to price-discriminate effectively (which makes enforcement relatively unimportant).

Marketing and Consumer Surplus

A number of advertising schemes make use of the notion of consumer surplus, though not by that name. Marketers on televised infomercials, for example, regularly ask viewers how much they would be willing to pay for a given product, before actually displaying its price. The (hoped for!) contrast between what the consumer would be willing to pay and the actual price eventually displayed is designed to impress the viewer with the amount of consumer surplus he stands to realize by purchasing the product. A similar tactic involves displaying the presale price of an item next to its new, on-sale price; here, the old price is meant to represent what consumers have historically been willing to pay for the product, and the contrast between the nonsale and sale prices is an indication precisely of consumer surplus (assuming, of course, that both prices are honestly displayed).

Sustainability

Sustainability is an evolving concept that expresses holistic thinking integrating society, economy, and ecology. This concept has been advanced to guide actions within present society to ensure continued existence and prosperity into the foreseeable future. Therefore, *sustainability* can be defined as an integrated understanding of the interconnectedness of human activity with all related man-made and naturally occurring systems. The goal of sustainability is often conflated with the approach needed to attain the goal—*sustainable development.* Understanding these two terms is an essential first step for addressing a set of global challenges embodied by sustainability. To that end, the Brundtland Commission, created through the United Nations, published a report in 1987 in which *sustainable development* is defined as seeking to meet the needs and aspirations of present society without compromising the ability to meet those of future generations.

Because of profound changes to our shared ecological systems, the question of sustainability is being considered around the world. From advancing ozone depletion, which leads to progressively higher levels of life-damaging radiation, to accelerating greenhouse gas emissions, which contribute to complex climate change, to habitat destruction, which results in decreased biodiversity, shared ecosystem resources are being depleted or damaged. Among the consequence of ecosystem damage and loss are that it can threaten and create social unrest in the future, while at the same time drive numerous species toward extinction. Abject poverty that attends the growing gaps between the rich and the poor is a proven driver of environmental degradation and fuels resource, trade, and policy disputes. This type of economic unrest has provided a source of motivation to address sustainability issues not only in organizations such as the United Nations but also at the World Bank and the World Trade Organization.

As our society wrestles with the meaning and actions implied by sustainability, it is helpful to consider that more than 400 years ago the Haudenosaunee (also known as the Iroquois) had their "Great Law," which, in part, requires that leaders consider the impact of their decisions on the seventh generation following that decision. There are other such examples of statements regarding sustainability from the past that very clearly define our collective responsibility to protect and plan for the future. Understanding the recurrence of this theme in human society helps us to understand the centrality of sustainability. It is also instructive to note that thinking about sustainability is not the same as achieving a sustainable outcome. Many civilizations have risen only to prove unsustainable, the Haudenosaunee being among them. What is very different today is the accumulating metrics and resulting data that confirm the impact of human activity on global ecosystem services, such as water cycles, carbon cycles, and resource renewal cycles to name a few. Climate scientists are in general agreement that global warming is real, and it is the product of human activity. The main questions now are as follows: How bad will the consequences be? How fast will they manifest? What can be done to mitigate some of the damage already done?

Sustainability explores how we collectively and individually move into the future while learning to understand how global ecosystem services underpin the social and economic activity on the planet. Business organizations are human society's most efficient resource concentrators, transformers, and distributors; thus, they create what might be called a "corporate ecology" and, therefore, business-oriented solutions central to any working and attainable definition of sustainability.

A few business organizations have viewed increased emphasis on sustainability as an opportunity. If environmental and social costs are included as additional performance metrics, then those firms that comply early and set new standards may be able to create a basis for competitive advantage. For instance, when the California Environmental Protection Agency found that two-stroke engines (the type often used in lawn mowers and gas-powered gardening equipment) were causing a large amount of air pollution, it began to demand more stringent emissions standards for these machines. At first, these new standards were opposed by industry, but a few innovators not only were able to meet the new standards but exceeded them and used 33% less fuel with their more efficient motors. In this case, a sustainability effort, once embraced by these companies, provided the compliant companies with a competitive advantage and achieved a social and environmental objective simultaneously. Sustainability, when pursued by businesses with creativity and purpose, can achieve financial, social, and environmental objectives in an integrated and positively reinforcing manner.

The concept of sustainability is not without its detractors. Some notable scholars, such as Julian Simon, feel that the combined mental power of more people will solve whatever environmental or social problems further human activity produces. The Cato Institute in 2002 concluded that sustainable development is a dubious solution in search of a problem or that it is simply a restatement of a commonsense position of taking care of one's own productive resources that is already well addressed by the current free market policy. It has also been argued that the cost of taking action to comply with sustainability initiatives such as the Kyoto Treaty on Climate Change would cost the U.S. economy a disproportionate amount. These arguments were central to the Bush administration's refusal to become a signatory nation to that agreement on "greenhouse gas" reduction. Some climate scientists and ecologists argue that greenhouse gas damage to ecosystems services may be irreversible and this damage has real costs now that will grow in the future. A concept as complex and far-reaching as sustainability will always present business and society with very conflicted and ambiguous trade-offs.

Because business organizations are uniquely transformative institutions in modern society, how business approaches the concept of sustainability is of primary importance. This central role of business in modern society is also discussed in such topics as corporate social responsibility, corporate citizenship, and corporate ecology. A number of management efficiency approaches have been suggested for business organizations that could make important contributions to our societal goal of sustainability. Some of these include ISO14000, triple-bottom-line accounting, the balanced scorecard approach to strategic management, natural capitalism, the natural step, industrial ecology, Zero Emissions Research Initiative (ZERI), ecological foot printing, and ecoeffectiveness (cradle-to-cradle model). In the following sections, these approaches will be discussed briefly.

ISO14000

ISO stands for the International Standards Organization. It is a nongovernmental organization that has grown out of the General Agreement on Tariffs and Trade. As the World Trade Organization pursues agreements on global trade, quality standards have become increasingly important. One of the outcomes of the 1992 Rio Summit on the Environment was the creation of ISO14000 to create a comprehensive set of standards designed to address the most pressing environmental issues for organizations in a global market. As it currently stands, these standards are voluntary for organizations to abide by. However, the ISO14000 is building on up-to-date environmental health and safety standards. These are important standards and make significant contributions to our understanding of sustainability. However, the ISO does not make specific mention of sustainability and states as its primary focus the application of best practices that are geared toward helping organizations come into compliance with globally accepted standards on environmental health and safety. Depending on the application, the ISO approach to standardized reporting and efficiency measures can lead a company to improvements or to follow an industry to the lowest common denominator of acceptable practice.

Triple-Bottom-Line Accounting

This term and approach originated with the publication of John Elkington's 1998 book *Cannibals with Forks: Triple Bottom Line of 21st Century Business.* In it, Elkington argues that accounting practice should be expanded to include environmental and social costs as well as financial costs. Some scholars argue that corporate social responsibility, or corporate social performance, must measure the social, environmental, and economic performance of the corporation for a firm to be consistent in its approach to these commitments to good practice. There are obvious problems associated with assessing the costs to society for various corporate actions. According to Elkington, the price of a product should include the cost of the ecological services consumed in the production of the product and embodied in the use and disposal of the product. Great strides in ecological economics and research in social capital have helped create metrics to fill in these gaps. The triple-bottom-line approach would have a substantial impact on how organizations operate and may advance our understanding of sustainability. But there are many scholars and practitioners who oppose this type of approach, arguing that it confuses the division of labor and would make firms inefficient and uncompetitive.

Balanced Scorecard

This systematic approach to enterprise management was developed in the early 1990s, by Robert Kaplan and David Norton, as a way to remove some of the vagueness out of strategic management. This approach was not developed specifically as a tool to achieve sustainability, but it has promise as such. Like the triple bottom line, the balanced scorecard approach requires that management look beyond financial measurement; it incorporates a more holistic systems perspective into organizational management. This system uses what has been referred to as a double-loop feedback: One loop is business process focused, and one loop is strategic outcome focused. Both loops are intended to use measurements to provide managers with data on which decision making is based. The application for sustainability comes from the reliance on internal and external data collection and an inherent acceptance of a systems approach.

Natural Capitalism

In 1999, Paul Hawkins, Amory Lovins, and L. Hunter Lovins published a book proposing the redesign of industry based on biological models. They argue that the living systems of the earth are in decline and that the next industrial revolution will be driven by corporations. Natural capitalism is built around the idea that business opportunities become more abundant as entrepreneurs recognize environmental resource limitations. Those that can do more with less will prosper. The advocates of natural capitalism propose four interlinked principles to unlock and ultimately restore natural capital: (1) radically increase resource productivity; (2) adopt closed-loop systems and zero waste in industry; (3) sell services in place of selling products; and (4) recognize that natural capital is the source of future prosperity, thus that businesses will be incentivized to invest in its maintenance. This approach is not only an explicit plan for the concept of sustainability but also a vision of what sustainable business practice might look like.

The Natural Step

This approach is the outcome of a series of studies initiated by Karl-Henrik Rob, who established principles for sustainable society based on thermodynamics and natural cycles. Since 1989, the Natural Step Foundation has been refining and promoting its four-phase program. These phases are (1) aligning key decision makers and stakeholders around a common understanding of what it takes to be a sustainable society, (2) creating baseline data that detail the resources necessary for an organization to be sustainable, (3) creating a vision-driven strategic plan based on the data gathered through the study of the organizational system, and (4) recognizing that success depends on step-by-step implementation and continued support. While this approach is comprehensive and holistic, an organization's implementation of this approach seems dependent on the Natural Step Foundation and may be self-limiting because of restrictive access. Here again, as in natural capitalism, the emphasis and essence of the approach to sustainability is on systems thinking, confronting natural resource and cycles dependence, and creating strategies to support the health and continuation of these processes.

Industrial Ecology

The idea of industrial ecology, which has grown rapidly over the past decade, originated in a 1989 publication by Robert Frosch, and a book by this title was published by Graedel and Allenby in 1994. Very simply, industrial ecology is the idea that an industrial system should function like an ecosystem. There is no waste product in nature; the end of one process is the beginning of another. Some scholars have defined industrial ecology as the science of sustainability. Yet others would argue that this overreliance on science is the weakness of industrial ecology. It has been said that the answer to the question of sustainability will not be engineered; society must come to an understanding of the interdependence of natural systems and their limitations. These writers advocate caution regarding industrial ecology and suggest that technological fixes help human populations extend their overconsumption of resources, whether they are renewable or fixed in quantity. However, all would agree that industrial ecology will be at least part of the solution, because it provides the engineering solutions that can teach us to do much more with less consumption and helps eliminate waste and pollution.

Zero Emissions Research Initiative

ZERI is a concept and a network started by Pauli and deSouza at the United Nations University in Japan. The ZERI network has more than 50 projects worldwide that are applying the ZERI sustainability ideas regarding biodiversity, waste elimination, creativity, and efficient design. ZERI is similar to the Natural Step in that it employs systems thinking to address business, production, and consumption problems. ZERI seeks to create a global network of participants to create alternative organizations that produce goods and services in ways that alleviate poverty and reduce environmental degradation. ZERI is another holistic, systems-based approach to sustainability—one that seeks to model human organizations based on our understanding of naturally occurring systems.

Ecological Footprint

Ecological Footprint is a tool created in 1993 by Mathis Wackernagel and William Rees to help quantify human demand on natural systems relative to the planet's ability to meet those demands. By showing that these demands are consistently in excess of the planet's ability to sustainably provide for these demands, the Global Footprint Network seeks to get business, government, and communities to adopt more sustainable behaviors. Unlike most of the other approaches presented here, the footprint concept is a tool that helps individuals and organizations get a sense of what their actions cost in terms of ecological services. This is an important place to start when considering the meaning and application of sustainability. Our current global ecological footprint overshoots ecosystem capacity by almost 20%, which can be absorbed for a time but not without damage and not indefinitely. Tools such as ecological foot printing are important for people to map our current trajectory and to be able to measure change when action is taken.

Eco-Effectiveness (Cradle-to-Cradle Model)

This is a management consulting and sustainability model that is similar to the approach of natural capitalism. It was developed by Michael Braungart and William McDonough in 1995. The idea of eco-effectiveness is not simply doing more with less but designing products and services in ways that are systemically appropriate. Such products and services are designed to produce no waste and to support rather than disrupt natural systems. By studying the industry as a natural system, this concept seeks to design business processes that mimic metabolic systems both biological and mechanical. Like natural capitalism, this approach envisions the next industrial revolution as one where the end of a product use cycle is the beginning of the next nutrient cycle—where waste equals food and ecological intelligence drives profitability and competitive advantage.

As this brief survey of approaches for addressing sustainability illustrates, many scholars and practitioners have expressed urgency and insight about the global need for sustainability. A successful approach to sustainability will not be engineered. Simply building better, more efficient products will not on its own yield a sustainable future. Along with the efficient use of resources, sustainability requires some fundamental changes in how organizations work on all levels, from the individual action to international coordination. These are not insignificant changes. This fact alone captures the profound difficulty in even defining sustainability—sustainability will have different meanings depending on the level of analysis; ultimately they must all contain the understanding that a sustainable world cannot support irresponsible and inequitable resource use.

SWEATSHOPS

By common agreement, a sweatshop is a workplace that provides low or subsistence wages under harsh working conditions, such as long hours, unhealthy conditions, and/or an oppressive environment. Some observers see these work environments as essentially acceptable if the laborers freely contract to work in such conditions. For others, to call a workplace a sweatshop implies that the working conditions are illegitimate and immoral. The U.S. General Accounting Office would hone this definition for U.S. workplaces to include those environments where an employer violates more than one federal or state labor, industrial homework, occupational safety and health, workers' compensation, or industry registration laws. The AFL-CIO Union of Needletrades, Industrial and Textile Employees would expand on that to include workplaces with systematic violations of global fundamental workers' rights. The Interfaith Center on Corporate Responsibility (ICCR) defines sweatshops much more broadly than either of these; even where a factory is clean, well organized, and harassment free, the ICCR considers it a sweatshop if its workers are not paid a sustainable living wage. The purpose of reviewing these varied definitions is to acknowledge that, by definition, sweatshops are defined as oppressive, unethical, and patently unfair to workers.

Sweatshops exist in all countries, including the United States, and have a lengthy history. One finds sweatshops in certain countries where there are no laws protecting workers from oppressive working conditions, as well as in those countries where the conditions allowed by the local laws remain substandard according to international laws. However, if by definition sweatshops involve the violation of laws, then no *legal* sweatshops can exist in those jurisdictions where there are significant worker protection laws. In fact, a 1994 U.S. Department of Labor spot check of garment operations in California found that 93% had health and safety violations, 73% of the garment makers had improper payroll records, 68% did not pay appropriate overtime wages, and 51% paid less than the minimum wage. For example, in 1995, labor officials in California uncovered a garment operation where more than 80 Thai workers were laboring behind razor wires and under armed guards making less than $2 per hour. In 1996, Labor Department officials found minimum wage violations in 43% of the firms sampled and overtime violations in 55% of the firms. Inspections of U.S. garment factories in 1999 continued to find wage and hours law violations at 61% of the factories in Los Angeles and 63% of the factories in New York.

However, strict labor laws, effective labor unions, and the growth of employee mobility and opportunity have attempted to eliminate sweatshops in developed countries. The vast majority of sweatshops currently are found in economically underdeveloped countries, especially those with large pools of unskilled labor, high unemployment, and few regulatory constraints. In an unregulated environment, the more broad definitions apply to include workplaces where the owner is not violating any local laws but instead is perhaps violating international standards of human rights, such as provisions found in the United Nations Declaration of Human Rights. But in those developing countries, the incentives and circumstances arguably leave employers with few options. To attract purchasers for their goods, suppliers must keep labor costs low and, therefore, pay workers on a "piece rate" basis rather than hourly, where workers' wages are based on the number of items they produce during a particular time period. Consequently, the longer and harder an employee works, the more he or she will be paid. In some circumstances, since the piece rate is so low, workers have no choice but to contribute extraordinary hours to merely survive, hence the ICCR's emphasis on subsistence wages as the primary element of a modern-day sweatshop.

Why do sweatshops exist, if their mistreatment of workers is so unquestionable and where countries in the developed world have put into place significant worker protections? In fact, there remain persuasive reasons why we have them in our global economy and even why we should permit them. Though some are present simply because there are those in human society who will abuse their power at the expense of those without power, there are far more that exist because they play a role in the economic cycle of development. There are two fields of thought in connection with their continued existence.

First, free market economists suggest that sweatshops represent the cheapest and most efficient means for developing countries to expand export activities and to improve their economies, benefiting stakeholders, including the employees subject to the challenging conditions. In fact, they would argue that the *only* path to economic development for these poorer countries may lie in their ability to compete effectively—perhaps exclusively—on a world scale. This economic growth brings more jobs, which will cause the labor market to tighten, which in turn will force companies to improve conditions to attract workers. In fact, several commentators argue that encouraging greater global production will create additional opportunities for expansion domestically, providing a positive impact on more stakeholders. Moreover, if the suppliers raise wages to at least subsistence levels, they will need to raise their prices to the contracting retailers, who will then arguably seek lower prices elsewhere—and find them, otherwise known as the "race to the bottom." Though an unpopular sentiment with the general consuming public, and often characterized by the polarizing and volatile name "prosweatshops," many economists argue that the maintenance of sweatshop conditions is therefore supported by economic theory.

The second field of thought with regard to the continuation of these conditions is based on the contention that the current situation is perceived as "bad" only when considered through the perspective of those in developed economies. Where individual workers are faced with the choice of no job or a job that pays a subsistence wage, the workers will opt for the job. Similarly, when parents are faced with wages that do not allow them to feed, clothe, or house their entire family, they do not consider child labor to be unethical. Instead, it is often the only means by which the family can reap sufficient income with which to feed that child. Accordingly, if regulations or other strictures are imposed that demand conditions similar to those in developed countries, the multinationals will have no incentive to house their operations or to seek suppliers in developing countries, and will accordingly remain in their home countries, depriving the workers in the developing countries these positions.

Similarly, along this line of thinking, some philosophers assert that, as long as the worker has freely chosen the position, it is ethnocentric, paternalistic, and imperialistic to then impose alternative values. No one is forcing the worker to work under these conditions; therefore, the conditions should be permitted. If no worker would accept these conditions, the employer would be forced to ameliorate them.

On the other hand, labor advocates state that this argument contains a fallacy of choice. A worker forced to choose between accepting a position under substandard conditions to feed his family or declining the position and watching his family starve does not have true freedom of choice. They contend that it is precisely the imposition of Western expectations of free choice and the empowered worker that create a false analysis of the circumstances under which these workers accept the positions. While those in developed economies might be able to envision declining a job if the position described is unsuitable, in those environments where unemployment is exceptionally high and no public system of welfare or education exists, workers may not perceive that they have that option. The learned helplessness, whether actual or perceived, prevents the workers from impacting their environments to proceed down the route described by the economists.

Moreover, the traditional concept of free trade fails to provide social clauses for the protection of workers serving that trade environment and should therefore be curtailed. While free trade agreements encourage multinational companies to do business with developing economies, thereby increasing the gross national product of those economies, it is argued that these agreements are at the expense of (or "on the backs of") the workforces involved. In addition, these advocates suggest that allowing this economic process to take its course may not necessarily lead to the result articulated by the free market economists and, similarly, voluntarily improving legal compliance, wages, and working conditions will not inevitably lead to the negative consequences the free market advocates threaten.

There are innumerable examples of questionable sweatshop labor practices. Included below are discussions of four major areas of concern—child labor, wage rates and work hours, worker health and safety, and worker constraints and treatment—to provide a taste of the nature of sweatshop problems. To avoid confusion throughout the above debate and to raise the discussion above mere terminological discussions, it therefore remains critical to develop a deeper understanding of the meaning of the term *sweatshop* and the conditions to which it refers, even if the resulting definition remains a stipulative one.

Basic Human Rights

Any exploration of sweatshops would be incomplete without a discussion of the basic human rights that ethicists contend to be inalienable, though the determination of which rights would so qualify is far from resolved. To effectively consider the definitions mentioned above, it is important to stipulate the standards to which one should hold a multinational and its product or service supply chain. Yet the identification of global fundamental workers' rights is a challenge not only because of the debate that rages with regard to universalism versus relativism but also because of the challenge of determining the degree of protection. For instance, even if there was agreement that employers should pay a living wage to their workers, there is no agreement with regard to the determination of how to determine what that wage should be.

One scholarly analysis reviewed a variety of global labor standards to determine whether in this array of emerging standards there existed any such norms with respect to labor standards. The following basic labor rights were determined to have *relatively* universal acknowledgment in the range of codes and documents reviewed for that study:

- Just and favorable working conditions, including a limit to the number of hours a human should have to work each day and a healthy working environment
- Minimum age and working conditions for child labor
- Nondiscrimination requirements regarding the *relative* amount that a worker should be paid and the right to equal pay for equal work
- Freedom from forced labor
- Free association, including the right to organize and to bargain collectively in contract negotiations

Thus, there is an argument that, at least in theory, there is some agreement about what rights *ought* to be respected. On the other hand, however, as mentioned above, there remains broad disagreement with regard to the parameters of fundamental human rights and this study suggests but one option for their identification. A cursory review of conditions around the world reveals that, though perhaps accepted by some as basic human rights, these standards are not necessarily respected as such.

Child Labor

As discussed briefly, there may be persuasive reasons why parents might encourage their children to work. However, in developing countries, children may begin work at ages as young as 3 years and often in unhealthy conditions. The labor that exists almost always precludes children from obtaining an education, as children often work on a full-time basis. In extreme cases, children are forced into slavery, often in the guise of indentured servitude or apprenticeship training. When referring to the nature of children's work, the International Labour Organization (ILO) Bureau of Statistics reports that most children working as paid employees are paid much less than the prevailing rates in their localities, even when compared with the legal minimum wages—receiving only one sixth of the minimum rate in one survey finding; also the younger the working child, the lower the wage payment.

On average, girls work longer hours than boys but are paid less than their working brothers doing the same type of work, and children are generally not paid for overtime work. The ILO reports that, in the Philippines, more than 60% of working children are exposed to hazardous working conditions and 40% of those exposed experience serious injuries or illnesses including those that result in amputations and loss of body parts. Because work takes children out of school, more than half of the child labor force will never be literate. And because of substandard working conditions, child employees will grow less than those who didn't work as children and the child workers' bodies will be smaller, even into adulthood. By the time child laborers reach adulthood, most will irrevocably be sick or deformed; the children are unlikely to live to be 50 years old.

As horrendous as these conditions appear, many ask whether there are always better alternatives. Free market economists point out that, in many circumstances, the wages these children earn are what pays for their food each night. If the children are denied jobs in communities where welfare systems are not in place, their very existence may be threatened. Often suppliers respond to multinational corporations' concerns by summarily and immediately terminating young workers, even when the local law would allow their employment. The impact of this dismissal on the children's survival may be devastating. In addition, if children are not permitted to work in mainstream ventures, they are often forced into the underground professions involving drugs and prostitution to help support themselves and their families. Until such time as welfare systems become prevalent throughout the developing countries, the answer to the question of children in the workplace is not an obvious one.

Wages and Hours

Sweatshop employees are often paid very low wages and are required to work very long hours, sometimes with no provision for overtime. Alternatively, if they refuse to work overtime in some circumstances, they may lose the pay already earned. The piece rate production quotas are often so high that workers are unable to leave the work floor to eat or use the restroom for fear of falling below quota, which often results in a loss of pay for those pieces submitted. The wage levels are far below the wages paid for similar types of employment in developed countries, even after restating wages in terms of country-specific purchasing power. An example of very low wages comes from a study of Honduran labor. In Honduras, workers earn only an average of $24.27 per week. However, basic necessities for a Honduran family cost $22.75 per week, which leaves an average family's wage earner with only $2.05 for transportation, school expenses, clothing, and other items. According to the National Labor Committee, El Salvadoran workers producing NBA jerseys make fewer than three jerseys per hour at $0.24 per jersey, which then sell for $140 in the United States. This $0.60 per hour is only about one third of the Salvadoran cost of living.

Under some extraordinary circumstances, workers are expected to pay for the opportunity to work; at some factories, workers must pay work deposits and monthly tool deposits. Recovery of deposits generally depends on how long workers stayed at the factory. In one factory, workers lost their deposits if they did not stay at the factory for at least 2 years. Similar conditions have existed in Saipan, where workers were forced to pay a recruitment fee of $2,000 to $7,000 before they could begin working.

Frequently, minimum wage and maximum work hours laws have been enacted but have not been effectively enforced. In China, workers at one factory reported that they regularly work 16-hour days, 7 days a week during peak production times, despite Chinese labor laws that establish a maximum 49-hour workweek.

Health and Safety

Working conditions in sweatshops may seriously threaten worker health and safety. The ILO and the World Health Organization have concluded that the shift of industrial production to developing countries will *increase* the global occurrence of occupational disease and injury. In El Salvador, for example, workers at one factory had to endure intense heat, poor ventilation, contaminated drinking water, and a limit on bathroom breaks of one per day. As punishment for breaking rules, workers were forced to stand in direct sunlight. Children who work often encounter some of the worst health and safety conditions. Workers in sweatshops are often missing key pieces of safety equipment such as face masks to ensure safe breathing or work in environments with insufficient means of emergency exit since employers may lock the doors and windows to prevent theft during working hours.

Sweatshop employers frequently impose and brutally enforce rigid constraints on their workers. Neil Kearney, the general secretary of the International Textile, Garment and Leather Workers' Federation, explains that in the garment industry workplace management by terror is standard practice. Workers are routinely verbally abused, shoved, beaten, and kicked, even when pregnant. Kearney claims that attempts to unionize are met with the utmost brutality, sometimes with murder. Although illegal, Mexican *maquiladora* factory (operations that assemble imported materials for export) operators require women to take pregnancy tests or prove they are menstruating as a condition of employment, and women thought to be pregnant are not hired. In El Salvador, women who work in manufacturing industries have been required to take company-provided birth control pills daily in the presence of their supervisors.

Finally, forced labor continues to exist in certain countries. A 2005 study from the ILO reports that at least 12.3 million workers are trapped in situations involving forced labor around the world. Forced economic exploitation occurs in sectors such as agriculture, construction, brick making, and informal apparel and footwear manufacturing and does not seem to discriminate between men and women as does much of traditional apparel and footwear manufacturing, where one finds significantly more women and children involved than men. Forced labor also includes forced commercial sexual exploitation, which involves almost entirely women and girls. In addition, children younger than 18 years make up 40% to 50% of all forced laborers.

International Nongovernmental Response

International nongovernmental organizations (NGOs) have attempted to step into this fray to suggest voluntary standards to which possible signatory countries or organizations could commit. For instance, the International Labour Office has promulgated its Tripartite Declaration of Principles Concerning Multinational Enterprises and Social Policy, which offers guidelines for employment, training, conditions of work and life, and industrial relations. The "Tripartite" nature refers to the critical cooperation necessary from governments, employers' and workers' organizations, and the multinational enterprises involved. These guidelines are not legally binding yet one can see the very clear need for such a document from the introduction to the Declaration, which explains the following:

- Multinational enterprises play an important part in the economies of most countries and in international economic relations. This is of increasing interest to governments as well as to employers and workers and their respective organizations. Through international direct investment and other means, such enterprises can bring substantial benefits to home and host countries by contributing to the more efficient utilization of capital, technology, and labor. Within the framework of development policies established by governments, they can also make an important contribution to the promotion of economic and social welfare; to the improvement of living standards and the satisfaction of basic needs; to the creation of employment opportunities, both directly and indirectly; and to the enjoyment of basic human rights, including freedom of association, throughout the world. On the other hand, the advances made by multinational enterprises in organizing their operations beyond the national framework may lead to abuse of concentrations of economic power and to conflicts with national policy objectives and with the interest of the workers. In addition, the complexity of multinational enterprises and the difficulty of clearly perceiving their diverse structures, operations, and policies sometimes give rise to concern either in the home or in the host countries, or in both.
- The aim of this Tripartite Declaration of Principles is to encourage the positive contribution that multinational enterprises can make to economic and social progress and to minimize and resolve the difficulties to which their various operations may give rise, taking into account the United Nations resolutions advocating the establishment of a New International Economic Order.
- This aim will be furthered by appropriate laws and policies and measures and actions adopted by the governments and by cooperation among the governments and the employers' and workers' organizations of all countries.
- The principles set out in this Declaration are commended to the governments, the employers' and workers' organizations of home and host countries, and to the multinational enterprises themselves.
- These principles are intended to guide the governments, the employers' and workers' organizations, and the multinational enterprises in taking such measures and actions and adopting such social policies, including those based on the principles laid down in the Constitution and the relevant Conventions and Recommendations of the ILO, as would further social progress.
- To serve its purpose, this Declaration does not require a precise legal definition of multinational enterprises;

this paragraph is designed to facilitate the understanding of the Declaration and not to provide such a definition. Multinational enterprises include enterprises, whether they are of public, mixed, or private ownership, which own or control production, distribution, services, or other facilities outside the country in which they are based. The degree of autonomy of entities within multinational enterprises in relation to each other varies widely from one such enterprise to another, depending on the nature of the links between such entities and their fields of activity and having regard to the great diversity in the form of ownership, in the size, and in the nature and location of the operations of the enterprises concerned. Unless otherwise specified, the term *multinational enterprise* is used in this Declaration to designate the various entities (parent companies or local entities or both or the organization as a whole) according to the distribution of responsibilities among them, in the expectation that they will cooperate and provide assistance to one another as necessary to facilitate observance of the principles laid down in the Declaration.

- This Declaration sets out principles in the fields of employment, training, conditions of work and life, and industrial relations that governments, employers' and workers' organizations, and multinational enterprises are recommended to observe on a voluntary basis; its provisions shall not limit or otherwise affect obligations arising out of the ratification of any ILO Convention.

The UN Declaration of Human Rights

On December 10, 1948, the General Assembly of the United Nations adopted its Universal Declaration of Human Rights, calling on all member countries to publicize the text of the Declaration and to cause it to be disseminated, displayed, and read. The Declaration recognizes that all humans have an inherent dignity and specific equal and inalienable rights. These rights are based on the foundation of freedom, justice, and peace. The UN stated that the rights should be guaranteed without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth, or other status. Furthermore, no distinction shall be made on the basis of the political, jurisdictional, or international status of the country or territory to which a person belongs. The foundational rights also include the right to life, liberty, and security of person and protection from slavery or servitude, torture, or cruel, inhuman, or degrading treatment or punishment.

Articles 23, 24, and 25 discuss issues with immediate implications for sweatshops. By extrapolation, they provide recognition of the fundamental human right to nondiscrimination, personal autonomy or liberty, equal pay, reasonable working hours and the ability to attain an appropriate standard of living, and other humane working conditions. All these rights were reinforced by the United Nations in its 1966 International Covenant on Economic, Social, and Cultural Rights.

Next Steps

These are but two examples of standards promulgated by the international labor community, though the enforcement of these and other norms is spotty. In the apparel industry in particular, the process of internal and external monitoring has matured such that it has become the norm at least to self-monitor, if not to allow external third-party monitors to assess compliance of a supplier factory with the code of conduct of a multinational corporation or with that of NGOs. Though a number of factors affected this evolution, one such factor involved pressure by American universities on their apparel suppliers, which resulted in two multistakeholder efforts—the Fair Labor Association, primarily comprising and funded by the multinational retailers, and the Worker Rights Consortium, originally perceived as university driven. Through a cooperative effort of these two organizations, large retailers such as Nike and Adidas have not only allowed external monitoring but Nike has now published a complete list of each of its suppliers.

As discussed above, a common response to the criticisms of these types of labor practices is to note that, no matter how well-meaning and accurate the criticisms, there is simply no viable alternative for people in many developing nation labor markets. Free market or neoclassical economists contend stridently that this is not necessarily the case. They concur that attempts to redress sweatshop conditions must take into account the pressures of globalization and the poor economic conditions of developing nations. But as long as significant global disparities in wages and working conditions exist among nations, labor practices that are unacceptable in one nation may be used in other nations to secure contracts with multinational corporations (the race to the bottom). Second, in the current global regulatory environment, nations are not permitted to impose import bans on sweatshop-based goods since the World Trade Organization's (WTO) current interpretation of its rules declares such practices protectionist.

Multinational corporations such as those discussed above seek to avoid these negative outcomes by embracing the positive consequences to a proactive response to questions regarding global labor practices. Employees who are treated with respect tend to be more loyal and productive workers; consumers in industrialized countries increasingly prefer to purchase goods and services from companies that treat workers with respect; and potential employees increasingly care about the ethical reputations of the companies with whom they take a job, raising the cost of low-reputation companies to hire high-quality employees. These forward-thinking organizations can be categorized as exhibiting "positive deviancy" with respect to their labor practices.

Nike and Adidas represent several examples of positive ethical deviancy among firms that have been subject to previous criticism by the media or NGOs for their treatment of workers. In actuality, intense media scrutiny often forces firms to be creative in their responses to common globalization challenges. For example, after years of sustained criticism of supplier labor practices by NGOs, Nike CEO Philip Knight accepted responsibility in 1998 at the corporate level for the poor treatment of workers by Nike suppliers. Knight explained that, as of the day of his pronouncement, Nike was committed to increasing minimum age requirements for workers in factories, improving factory health and safety conditions so that they comply with U.S. standards, expanding worker education programs, increasing support for microenterprise loan programs, and involving NGOs in the factory monitoring process.

Though these and other multinational corporations—including Dow Chemical, Chiquita, and Levi Strauss & Co.—are often viewed as positive deviants from the current norms among their peers, their efforts have not only garnered attention but will also serve as models for other organizations with regard to the appropriate treatment of their workers and of those of their suppliers, while remaining sustainable from a long-term perspective. There is no *one* solution to sweatshops and other labor challenges posed by contemporary corporate globalization. However, the programs and initiatives that have successfully been implemented by positive ethical deviants can be used as a basis for other multinational corporations to develop their own economically enhancing and ethical labor programs and initiatives that demonstrate respect for the most basic human rights while remaining profitable.

Moreover, the traditional concept of free trade fails to provide social clauses for the protection of workers serving that trade environment and should therefore be curtailed. While free trade agreements encourage multinational companies to do business with developing economies, thereby increasing the gross national product of those economies, it is argued that these agreements are at the expense of (or "on the backs of") the workforces involved. In addition, these advocates suggest that allowing this economic process to take its course may not necessarily lead to the result articulated by the free market economists and, similarly, voluntarily improving legal compliance, wages, and working conditions will not inevitably lead to the negative consequences the free market advocates threaten.

There are innumerable examples of questionable sweatshop labor practices. Included below are discussions of four major areas of concern—child labor, wage rates and work hours, worker health and safety, and worker constraints and treatment—to provide a taste of the nature of sweatshop problems. To avoid confusion throughout the above debate and to raise the discussion above mere terminological discussions, it therefore remains critical to develop a deeper understanding of the meaning of the term *sweatshop* and the conditions to which it refers, even if the resulting definition remains a stipulative one.

Basic Human Rights

Any exploration of sweatshops would be incomplete without a discussion of the basic human rights that ethicists contend to be inalienable, though the determination of which rights would so qualify is far from resolved. To effectively consider the definitions mentioned above, it is important to stipulate the standards to which one should hold a multinational and its product or service supply chain. Yet the identification of global fundamental workers' rights is a challenge not only because of the debate that rages with regard to universalism versus relativism but also because of the challenge of determining the degree of protection. For instance, even if there was agreement that employers should pay a living wage to their workers, there is no agreement with regard to the determination of how to determine what that wage should be.

One scholarly analysis reviewed a variety of global labor standards to determine whether in this array of emerging standards there existed any such norms with respect to labor standards. The following basic labor rights were determined to have *relatively* universal acknowledgment in the range of codes and documents reviewed for that study:

- Just and favorable working conditions, including a limit to the number of hours a human should have to work each day and a healthy working environment
- Minimum age and working conditions for child labor
- Nondiscrimination requirements regarding the *relative* amount that a worker should be paid and the right to equal pay for equal work
- Freedom from forced labor
- Free association, including the right to organize and to bargain collectively in contract negotiations

Thus, there is an argument that, at least in theory, there is some agreement about what rights *ought* to be respected. On the other hand, however, as mentioned above, there remains broad disagreement with regard to the parameters of fundamental human rights and this study suggests but one option for their identification. A cursory review of conditions around the world reveals that, though perhaps accepted by some as basic human rights, these standards are not necessarily respected as such.

Child Labor

As discussed briefly, there may be persuasive reasons why parents might encourage their children to work. However, in developing countries, children may begin work at ages as young as 3 years and often in unhealthy conditions. The labor that exists almost always precludes children from obtaining an education, as children often work on a full-time basis. In extreme cases, children are forced into slavery, often in the guise of indentured servitude or apprenticeship training. When referring to the nature of children's work, the International Labour Organization (ILO) Bureau of Statistics reports that most children working as paid employees are paid much less than the prevailing rates in their localities, even when compared with the legal minimum wages—receiving only one sixth of the minimum rate in one survey finding; also the younger the working child, the lower the wage payment.

On average, girls work longer hours than boys but are paid less than their working brothers doing the same type of work, and children are generally not paid for overtime work. The ILO reports that, in the Philippines, more than 60% of working children are exposed to hazardous working conditions and 40% of those exposed experience serious injuries or illnesses including those that result in amputations and loss of body parts. Because work takes children out of school, more than half of the child labor force will never be literate. And because of substandard working conditions, child employees will grow less than those who didn't work as children and the child workers' bodies will be smaller, even into adulthood. By the time child laborers reach adulthood, most will irrevocably be sick or deformed; the children are unlikely to live to be 50 years old.

As horrendous as these conditions appear, many ask whether there are always better alternatives. Free market economists point out that, in many circumstances, the wages these children earn are what pays for their food each night. If the children are denied jobs in communities where welfare systems are not in place, their very existence may be threatened. Often suppliers respond to multinational corporations' concerns by summarily and immediately terminating young workers, even when the local law would allow their employment. The impact of this dismissal on the children's survival may be devastating. In addition, if children are not permitted to work in mainstream ventures, they are often forced into the underground professions involving drugs and prostitution to help support themselves and their families. Until such time as welfare systems become prevalent throughout the developing countries, the answer to the question of children in the workplace is not an obvious one.

Wages and Hours

Sweatshop employees are often paid very low wages and are required to work very long hours, sometimes with no provision for overtime. Alternatively, if they refuse to work overtime in some circumstances, they may lose the pay already earned. The piece rate production quotas are often so high that workers are unable to leave the work floor to eat or use the restroom for fear of falling below quota, which often results in a loss of pay for those pieces submitted. The wage levels are far below the wages paid for similar types of employment in developed countries, even after restating wages in terms of country-specific purchasing power. An example of very low wages comes from a study of Honduran labor. In Honduras, workers earn only an average of $24.27 per week. However, basic necessities for a Honduran family cost $22.75 per week, which leaves an average family's wage earner with only $2.05 for transportation, school expenses, clothing, and other items. According to the National Labor Committee, El Salvadoran workers producing NBA jerseys make fewer than three jerseys per hour at $0.24 per jersey, which then sell for $140 in the United States. This $0.60 per hour is only about one third of the Salvadoran cost of living.

Under some extraordinary circumstances, workers are expected to pay for the opportunity to work; at some factories, workers must pay work deposits and monthly tool deposits. Recovery of deposits generally depends on how long workers stayed at the factory. In one factory, workers lost their deposits if they did not stay at the factory for at least 2 years. Similar conditions have existed in Saipan, where workers were forced to pay a recruitment fee of $2,000 to $7,000 before they could begin working.

Frequently, minimum wage and maximum work hours laws have been enacted but have not been effectively enforced. In China, workers at one factory reported that they regularly work 16-hour days, 7 days a week during peak production times, despite Chinese labor laws that establish a maximum 49-hour workweek.

Health and Safety

Working conditions in sweatshops may seriously threaten worker health and safety. The ILO and the World Health Organization have concluded that the shift of industrial production to developing countries will *increase* the global occurrence of occupational disease and injury. In El Salvador, for example, workers at one factory had to endure intense heat, poor ventilation, contaminated drinking water, and a limit on bathroom breaks of one per day. As punishment for breaking rules, workers were forced to stand in direct sunlight. Children who work often encounter some of the worst health and safety conditions. Workers in sweatshops are often missing key pieces of safety equipment such as face masks to ensure safe breathing or work in environments with insufficient means of emergency exit since employers may lock the doors and windows to prevent theft during working hours.

Sweatshop employers frequently impose and brutally enforce rigid constraints on their workers. Neil Kearney, the general secretary of the International Textile, Garment and Leather Workers' Federation, explains that in the garment industry workplace management by terror is standard practice. Workers are routinely verbally abused, shoved, beaten, and kicked, even when pregnant. Kearney claims that attempts to unionize are met with the utmost brutality, sometimes with murder. Although illegal, Mexican *maquiladora* factory (operations that assemble imported materials for export) operators require women to take pregnancy tests or prove they are menstruating as a condition of employment, and women thought to be pregnant are not hired. In El Salvador, women who work in manufacturing industries have been required to take company-provided birth control pills daily in the presence of their supervisors.

Finally, forced labor continues to exist in certain countries. A 2005 study from the ILO reports that at least 12.3 million workers are trapped in situations involving forced labor around the world. Forced economic exploitation occurs in sectors such as agriculture, construction, brick making, and informal apparel and footwear manufacturing and does not seem to discriminate between men and women as does much of traditional apparel and footwear manufacturing, where one finds significantly more women and children involved than men. Forced labor also includes forced commercial sexual exploitation, which involves almost entirely women and girls. In addition, children younger than 18 years make up 40% to 50% of all forced laborers.

International Nongovernmental Response

International nongovernmental organizations (NGOs) have attempted to step into this fray to suggest voluntary standards to which possible signatory countries or organizations could commit. For instance, the International Labour Office has promulgated its Tripartite Declaration of Principles Concerning Multinational Enterprises and Social Policy, which offers guidelines for employment, training, conditions of work and life, and industrial relations. The "Tripartite" nature refers to the critical cooperation necessary from governments, employers' and workers' organizations, and the multinational enterprises involved. These guidelines are not legally binding yet one can see the very clear need for such a document from the introduction to the Declaration, which explains the following:

- Multinational enterprises play an important part in the economies of most countries and in international economic relations. This is of increasing interest to governments as well as to employers and workers and their respective organizations. Through international direct investment and other means, such enterprises can bring substantial benefits to home and host countries by contributing to the more efficient utilization of capital, technology, and labor. Within the framework of development policies established by governments, they can also make an important contribution to the promotion of economic and social welfare; to the improvement of living standards and the satisfaction of basic needs; to the creation of employment opportunities, both directly and indirectly; and to the enjoyment of basic human rights, including freedom of association, throughout the world. On the other hand, the advances made by multinational enterprises in organizing their operations beyond the national framework may lead to abuse of concentrations of economic power and to conflicts with national policy objectives and with the interest of the workers. In addition, the complexity of multinational enterprises and the difficulty of clearly perceiving their diverse structures, operations, and policies sometimes give rise to concern either in the home or in the host countries, or in both.
- The aim of this Tripartite Declaration of Principles is to encourage the positive contribution that multinational enterprises can make to economic and social progress and to minimize and resolve the difficulties to which their various operations may give rise, taking into account the United Nations resolutions advocating the establishment of a New International Economic Order.
- This aim will be furthered by appropriate laws and policies and measures and actions adopted by the governments and by cooperation among the governments and the employers' and workers' organizations of all countries.
- The principles set out in this Declaration are commended to the governments, the employers' and workers' organizations of home and host countries, and to the multinational enterprises themselves.
- These principles are intended to guide the governments, the employers' and workers' organizations, and the multinational enterprises in taking such measures and actions and adopting such social policies, including those based on the principles laid down in the Constitution and the relevant Conventions and Recommendations of the ILO, as would further social progress.
- To serve its purpose, this Declaration does not require a precise legal definition of multinational enterprises;

this paragraph is designed to facilitate the understanding of the Declaration and not to provide such a definition. Multinational enterprises include enterprises, whether they are of public, mixed, or private ownership, which own or control production, distribution, services, or other facilities outside the country in which they are based. The degree of autonomy of entities within multinational enterprises in relation to each other varies widely from one such enterprise to another, depending on the nature of the links between such entities and their fields of activity and having regard to the great diversity in the form of ownership, in the size, and in the nature and location of the operations of the enterprises concerned. Unless otherwise specified, the term *multinational enterprise* is used in this Declaration to designate the various entities (parent companies or local entities or both or the organization as a whole) according to the distribution of responsibilities among them, in the expectation that they will cooperate and provide assistance to one another as necessary to facilitate observance of the principles laid down in the Declaration.

- This Declaration sets out principles in the fields of employment, training, conditions of work and life, and industrial relations that governments, employers' and workers' organizations, and multinational enterprises are recommended to observe on a voluntary basis; its provisions shall not limit or otherwise affect obligations arising out of the ratification of any ILO Convention.

The UN Declaration of Human Rights

On December 10, 1948, the General Assembly of the United Nations adopted its Universal Declaration of Human Rights, calling on all member countries to publicize the text of the Declaration and to cause it to be disseminated, displayed, and read. The Declaration recognizes that all humans have an inherent dignity and specific equal and inalienable rights. These rights are based on the foundation of freedom, justice, and peace. The UN stated that the rights should be guaranteed without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth, or other status. Furthermore, no distinction shall be made on the basis of the political, jurisdictional, or international status of the country or territory to which a person belongs. The foundational rights also include the right to life, liberty, and security of person and protection from slavery or servitude, torture, or cruel, inhuman, or degrading treatment or punishment.

Articles 23, 24, and 25 discuss issues with immediate implications for sweatshops. By extrapolation, they provide recognition of the fundamental human right to nondiscrimination, personal autonomy or liberty, equal pay, reasonable working hours and the ability to attain an appropriate standard of living, and other humane working conditions. All these rights were reinforced by the United Nations in its 1966 International Covenant on Economic, Social, and Cultural Rights.

Next Steps

These are but two examples of standards promulgated by the international labor community, though the enforcement of these and other norms is spotty. In the apparel industry in particular, the process of internal and external monitoring has matured such that it has become the norm at least to self-monitor, if not to allow external third-party monitors to assess compliance of a supplier factory with the code of conduct of a multinational corporation or with that of NGOs. Though a number of factors affected this evolution, one such factor involved pressure by American universities on their apparel suppliers, which resulted in two multistakeholder efforts—the Fair Labor Association, primarily comprising and funded by the multinational retailers, and the Worker Rights Consortium, originally perceived as university driven. Through a cooperative effort of these two organizations, large retailers such as Nike and Adidas have not only allowed external monitoring but Nike has now published a complete list of each of its suppliers.

As discussed above, a common response to the criticisms of these types of labor practices is to note that, no matter how well-meaning and accurate the criticisms, there is simply no viable alternative for people in many developing nation labor markets. Free market or neoclassical economists contend stridently that this is not necessarily the case. They concur that attempts to redress sweatshop conditions must take into account the pressures of globalization and the poor economic conditions of developing nations. But as long as significant global disparities in wages and working conditions exist among nations, labor practices that are unacceptable in one nation may be used in other nations to secure contracts with multinational corporations (the race to the bottom). Second, in the current global regulatory environment, nations are not permitted to impose import bans on sweatshop-based goods since the World Trade Organization's (WTO) current interpretation of its rules declares such practices protectionist.

Multinational corporations such as those discussed above seek to avoid these negative outcomes by embracing the positive consequences to a proactive response to questions regarding global labor practices. Employees who are treated with respect tend to be more loyal and productive workers; consumers in industrialized countries increasingly prefer to purchase goods and services from companies that treat workers with respect; and potential employees increasingly care about the ethical reputations of the companies with whom they take a job, raising the cost of low-reputation companies to hire high-quality employees. These forward-thinking organizations can be categorized as exhibiting "positive deviancy" with respect to their labor practices.

Nike and Adidas represent several examples of positive ethical deviancy among firms that have been subject to previous criticism by the media or NGOs for their treatment of workers. In actuality, intense media scrutiny often forces firms to be creative in their responses to common globalization challenges. For example, after years of sustained criticism of supplier labor practices by NGOs, Nike CEO Philip Knight accepted responsibility in 1998 at the corporate level for the poor treatment of workers by Nike suppliers. Knight explained that, as of the day of his pronouncement, Nike was committed to increasing minimum age requirements for workers in factories, improving factory health and safety conditions so that they comply with U.S. standards, expanding worker education programs, increasing support for microenterprise loan programs, and involving NGOs in the factory monitoring process.

Though these and other multinational corporations—including Dow Chemical, Chiquita, and Levi Strauss & Co.—are often viewed as positive deviants from the current norms among their peers, their efforts have not only garnered attention but will also serve as models for other organizations with regard to the appropriate treatment of their workers and of those of their suppliers, while remaining sustainable from a long-term perspective. There is no *one* solution to sweatshops and other labor challenges posed by contemporary corporate globalization. However, the programs and initiatives that have successfully been implemented by positive ethical deviants can be used as a basis for other multinational corporations to develop their own economically enhancing and ethical labor programs and initiatives that demonstrate respect for the most basic human rights while remaining profitable.

T

Taoist Ethics

Taoism (or Daoism) is one of two major Chinese philosophies of life and stems from the writings of Lao Tzu. Rooted in living a life characterized by balance and harmony, Taoism focuses on the significance of the individual life, spontaneity, and being tranquil. Confucianism, the dominant philosophical system throughout much of Chinese history, focuses on society. It promotes the value of social order, responsibility, and being active. On the surface these two wisdom traditions appear to be contradictory, but in actuality they are complementary. Both have greatly shaped Chinese civilization and its social structure, family traditions, and business culture and practices.

During the latter part of the 20th century, Taoist and Buddhist thought became a popular alternative to Western religious traditions that were seen as rigid and constraining. They provided a personal spiritual approach to life and self-development that was liberating and not rule based. Over time, Taoist thought also influenced business concepts, particularly management, leadership, and mentoring. Some even used it in understanding organizational behavior and business forecasting. With the notion of globalization being the foundation for many 21st-century business strategies and marketing efforts, understanding and respecting Taoism and its ethical principles is important for developing effective working relationships with business professionals in China and other parts of the East.

Background

Lao Tzu, the attributed author of the *Tao Te Ching* and the founder of Taoism, is considered to be a contemporary of Confucius (551–479 BCE). While some say that he was born in 604 BCE, little is known about him. It is uncertain if he was a historical person or merely the preeminent "Grand Old Master," as his name implies. Unlike other major Chinese thinkers such as Confucius and Buddha, Lao Tzu was not a preacher nor an active organizer or promoter of a social or spiritual tradition.

The *Tao Te Ching* (*The Way and Its Power*) is one of the central writings of Taoist philosophy. It is a mere 81 chapters—short poetic sayings and proverbs—reflecting on how people can become one with the Way of the universe (*Tao*) and live a harmonious life. Legend holds that Lao Tzu, a well-respected sage, when leaving to live in Tibet, jotted down a few pages recounting his thoughts on the request of a gatekeeper at the Hanko Pass. These pages became known as the *Tao Te Ching* and have been used by both rulers and common folk. The text in its present form, though, is the work of several individuals.

The other core Taoist writing is *Chuang-tzu,* written by Chuang Chou around 300 BCE. Chuang Chou was a Taoist scholar sought out by the king to be his adviser. He declined, choosing not to serve any specific ruler. He focused on spiritual and social liberty, encouraging people to seek freedom from all forms of tyranny and oppression, even death.

Today, Taoism has three primary forms: philosophical, religious, and programmatic arts to vitalize the human person. Philosophical Taoism is concerned with maximizing *te,* or power, by conserving it, while the programmatic arts seek to expand its quantity. The former promotes thoughtful reflection to preserve power. The latter strives to energize human beings by using herbs and movement (e.g., the practice of *t'ai chi* *chuan*), as well as breathing exercises and yoga to increase or unblock *ch'i,* the essential and vital energy that flows through human beings. Religious or Church Taoism helps individuals deal with life issues, illness, and daily problems by invoking deities and accessing their power by performing various rituals.

Fundamental Taoist Concepts

The following discussion of Taoist principles and ethics focuses on its philosophical form.

Life is not uniform but filled with diversity. Characterized by the symbol of *yin/yang,* the universe is constituted by male and female, light and dark, good and evil, beauty and ugliness, active and passive, and so forth. Opposites are aspects of the whole, the *Tao,* each complementing and balancing the other.

The boundary between opposites is not rigid, for each partially resides in the other. Each component of the opposite is necessary, for, in essence, each is a phase of the continuous cycle of life, one flowing into the other. They are like one season turning into the next.

While the source of life cannot be known, its attributes can be discerned by reflecting on nature, particularly water. The goal of life is to become aligned with the *Tao,* the Way or Path, draw on its animating power (*te*), let actions flow spontaneously, and take pleasure in the *Tao's* graceful flow. An individual's strength and capabilities come from the *Tao.*

The notion of *Tao* is multifaceted and has three core meanings. It can be understood as the way of ultimate reality, the way of the universe, and the way of human life. The first understanding refers to the eternal *Tao,* that is, the ineffable, transcendent source and end of all life. The next meaning pertains to the rhythm and power in nature, the immanent, life-giving principles that structure life itself. The last interpretation refers to human existence when it is grounded in the eternal *Tao* of the universe. All these understandings are interconnected.

Besides the *Tao* and *te,* the other central principle of Taoism is *wu wei,* the stillness and quiet that gives rise to effortless, creative action. In light of *wu wei,* life is a dance characterized by suppleness, simplicity, and freedom. Individuals are relaxed and adaptive, wasting no actions. Human action and work become appropriate and effective through attunement with the *Tao* and inaction, not personal skill, control, and force. Effective actions receive their power from the *Tao's te* flowing through the individual.

Thus, just as water is soft but can move and wear away hard stones, life is paradoxical. The *Tao* and *wu wei* are like water, for they flow, are soft, and have a power to overcome great obstacles.

Taoist Ethics and Values

While Taoism is an overarching philosophy of life, it does not have a delineated set of ethical principles like some Western philosophical systems. One reason is because it does not subscribe to contrived morality, since one of its central tenants is to let go of control. Embedded, though, in its views are particular ethical perspectives and values.

As discussed, central to Taoism is the embracing of the *Tao* and accepting it as the source of personal power. Stillness and suppleness give birth to appropriate and effective action. These concepts are fundamental to the Taoist notion of ethics. From these principles stem ethical values that guide how individuals live and work. Key ones are harmony, balance, selflessness, humility, simplicity, and detachment.

Taoist ethics focuses on being, not doing, on living a life characterized by harmony with the world, not on striving to identify correct decisions and actions. Therefore, decisions are to fit with the natural flow or order of things. Women and men are to perform what is required by the particular situation and nothing more.

To see the universe's rhythm and be in balance requires self-knowledge. Being self-aware enables women and men to let go of personal worth and desires that hinder them in making room for the Tao and others in their lives. Therefore, people are encouraged to be selfless and not to be self-assertive or competitive.

Aggressiveness, position, and possessiveness too often lead to violence, harming both people and nature. In this manner, individuals are to develop lives characterized by simplicity, humility, and detachment. Life's three treasures are mercy or compassion, frugality, and not being first. Lao Tzu holds these virtues as being vital and transformational.

People are to be authentic, unobtrusive, and simple. Life is to be uncluttered and lived in moderation. Worldly position and possessions have no ultimate value. Often they disorient and distract people from their primary purpose and lead to strife, disunity, and oppression.

Taoism, Business Organizations, and Leadership

A Taoist approach to business and organizational operations focuses on balance, diversity, creativity, and the meaningfulness of work. As with all of life, companies are characterized by *yin* and *yang* aspects. Administrators are challenged to be aware of these qualities, developing policies, practices, and work environments that respect each quality and unleash its power. In this manner, the organizational structure and culture, along with the established work values, allow individuals, and the company as a whole, to move with the natural forces of the universe. The company reaches its mission and goals by promoting understanding and harmony instead of creating adversarial relationships and competition.

In such a workplace, the overarching organizational culture stresses operating for the sake of a larger purpose, and creating value for all stakeholders. There is a balance between strategic goals and work meaning, between corporate achievement and work satisfaction, between financial profit and employee well-being. Administrators seek to both lead and manage, aiding organizations to continuously evolve and adapt to the market environment while being consistent with their philosophy and traditions. When issues need to be addressed and problems resolved, the root cause—that is, cultural belief, leadership style, operational practice, corporate policy, and so forth—is identified and altered, as needed.

Taoist thought also holds much wisdom for women and men who are modern business professionals working in a highly competitive environment driven by market share. Many of the *Tao Te Ching's* sayings are specifically directed at leaders.

In Taoism, leaders learn how to guide and manage by first being followers. Through mentoring they learn how to live simply, be flexible, work from creative stillness, and not become caught up in the allurement of success, power, and money.

Being self-aware, reflective people, leaders try to understand and be sensitive to what is occurring at any given time. They trust the process and let things unfold naturally. Unless necessary, they do not intervene. They strive not to be coercive or manipulative, for the less a leader interferes, the more freedom others have and the more responsibility they will take.

Leaders are humble professionals who do not manage by power and authority. Nor do they consider themselves better or more privileged than others. They value all staff members, respecting them as talented people with dignity and recognizing their vital contributions to the organization. Not prizing position and status, leaders do not seek recognition or take credit for organizational accomplishments.

Leaders embrace diversity, seeking to understand and draw on the strengths of polarities instead of trying to get rid of them. They mentor by example rather than by mandates, rapprochements, or punishments. Leaders motivate and empower their employees, enabling them to discover their talents, reach their potential, and be successful. Above all, leaders guard their integrity and do not let anything compromise it.

—Charles F. Piazza

Tariffs and Quotas

Tariffs are taxes imposed on foreign-made goods (imports) coming into a country. The tax (also referred to as a duty) raises the price of the good. This has the immediate effect of shielding domestic manufacturers from some of their foreign competitors, and thus tariffs are referred to as protectionism. The tax protects domestic producers (and the labor employed by those domestic firms) from foreign competition by allowing relatively less efficient domestic producers (who must charge a higher price than more efficient firms if they are to recoup their costs) to remain in business. Simultaneously, the product price rises, and the government collects tariff revenues from its domestic consumers, who must pay both the original price of the import and the amount of the tariff. Thus, the winners from tariffs are the government imposing the tariff and the domestic firms and labor whose products receive tariff protection, while the losers are domestic consumers, who pay higher prices for the product and consume less of that product than they would at the free trade price.

While a quota has the same impact as a tariff, it differs in the government action taken. With a quota, the domestic government does not impose a tax on imports but rather restricts the *number* of units of a product that may enter the country from foreign manufacturers. And, as with a tariff, the price of the good increases and the amount of the good supplied by domestic firms increases. However, unlike with a tariff, the government does not collect any revenue.

Tariffs and quotas are examples of a redistributive policy, where the *costs* of the policy are broadly distributed among domestic consumers and foreign competitors, while the *benefits* are concentrated with the protected industries and their labor. Conversely, the economic benefits of free trade are broadly distributed among all consumers and foreign producers, while the costs are concentrated in the noncompetitive domestic firms, making the incentives to fight free trade often stronger than the incentives to fight trade protection.

Political economists recognize beneficial reasons for imposing tariff or quota protections, beyond just job protection. First, many nations protect militarily important industries to ensure that national firms retain the ability to manufacture or innovate products deemed critical to national security; industries such as electronics, computers, aerospace, and even agriculture have been protected using national security rationales. Second, since it is virtually impossible for new entrants in some industries (particularly those with steep learning curves) to compete successfully against established firms from abroad, some countries protect "infant industries" in the hope that sheltering new domestic firms from the full onslaught of competition will enable the domestic companies to become viable long-term global competitors and thus provide the country with important employment and technological benefits. The commercial aircraft (particularly Airbus in the European Union) and semiconductor industries (particularly in Japan) are among the more celebrated examples of infant industry protection. Finally, some countries respond to foreign nations' imposition of tariff or quota protections by retaliating with their own protectionism; this "tit-for-tat" tariff-setting sometimes prompts the first-tariff-imposing nation to lift its tariff.

More recently, the arguments for imposing trade protection have focused not just on broad national benefits that may flow from protection, as in the above examples, but rather on advancing important social goals. Thus, activists have increasingly sought trade restrictions in the past decade to keep domestic firms from exporting manufacturing activities to foreign countries that have fewer or laxer labor and environmental protections (such as allowing child labor or prohibiting unionization). Critics of globalization argue that multinational firms can gain competitive advantage by exploiting national differences in health, labor, and environmental regulations and that this puts pressure on domestic firms and results in a socially destructive "race to the bottom." In short, as is seen in the popular press's coverage of trade policy, the topic of tariffs generates much controversy and disagreement over its winners and losers.

Welfare Effects of Free Trade and Tariff Protection

Microeconomic theory has demonstrated that free trade (the absence of tariffs or quotas) is unambiguously good for consumers and the overall efficient allocation of resources within a country. Free trade makes consumers and a nation better off in two ways. First, consumers are able to purchase more goods due to differences in which nations have a comparative advantage in producing. For example, Central American nations can grow fruits more cheaply than can northern European countries. Thus, if these countries can trade, then the Central American nations will produce more fruit than just what their domestic consumers demand, because they have export markets for the fruit; similarly, northern European countries will have access to far more fruit, and at substantially lower prices, than if fruit was grown only domestically. In this way, free trade enables consumers to purchase more units of a product, at cheaper prices, and often greater varieties of products than if they were restricted to products only sold by domestic firms.

There is also a second benefit from free trade to a country. Firms in a free-trade country will use the resources of that country most efficiently when they produce the goods that the country produces relatively more efficiently than other countries—this is the heart of David Ricardo's theory of comparative advantage. Firms in northern European countries will create more wealth-producing, say, cell phones (as does Nokia) than they would by using the same resources of capital, land, and labor to grow fruit since the growing conditions for fruit are much better in Central America than in northern Europe, while northern Europe has the highly educated labor force necessary to design cell phones. In short, international trade theory concludes that the competition that comes with free trade encourages the most efficient allocation of resources.

Tariff protection has the opposite effect. Domestic consumers and the economy as a whole in a protected country are worse off. This can be seen in Figure 1, which illustrates the various impacts of a tariff. First, under a tariff, the price of the good increases from P to $P + t$, where t is the percentage amount of the tariff. Unsurprisingly, since demand generally drops when the price of a good rises, the amount of the good consumed under the higher tariff price decreases from Y_1 to Y_3. The amount of imports consumed also changes under tariff protection. Under free trade, consumers purchased Y_2 units of the good from domestic producers; these producers had costs that were less than the cost of foreign producers (as can be seen by the fact that the domestic supply curve—which is also the marginal cost curve for the firm—is under the world supply curve). In other words, consumers fill demand from domestic suppliers as long as doing so costs the same or less than buying imports. Consumers purchase from domestic suppliers until the domestic supply curve intersects with the world supply curve (without tariff); at that point, consumers will fulfill the rest of their demand from imports, which are cheaper than the products offered by the higher-cost domestic suppliers, for a total amount of imports from Y_2 to Y_1.

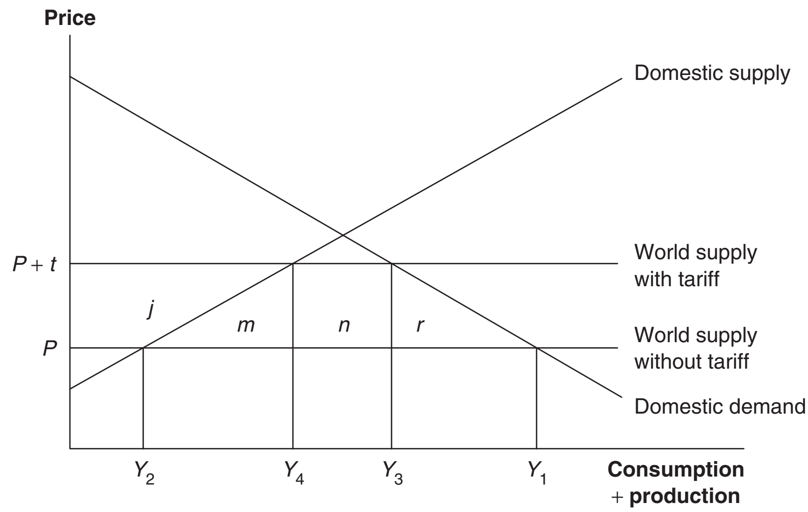

Figure 1 Welfare Effects of a Tariff

When the tariff is imposed, it shelters higher-cost domestic producers from lower-cost import competition by raising the price. Thus, domestic producers supply Y_4 units of the product under tariff protection, or to the point where domestic supply intersects with the world supply (with tariff) curve. At that point, consumers will buy Y_4 to Y_3 units of exports until their demand is fully filled by Y_3 total units. The amount supplied by domestic producers has increased under protection, and the amount supplied by imports has decreased. The total amount consumed has declined from Y_1 to Y_3 because the price of the good has increased by the amount of the tariff.

The effects of a tariff are further characterized by transfers and deadweight losses. There are two transfers associated with a tariff or quota. First, area j represents the *redistribution effect,* or a transfer from consumers to protected domestic producers, in the form of the higher price, $P + t,$ paid by consumers to domestic producers in the presence of the tariff. Second, area n represents the *revenue effect,* or a transfer from consumers to the domestic government in the form of the tariff duty. Under a quota, however, area n does not go to the domestic government, but rather to the foreign country. Recall that with a quota, the country is restricting the amount of imports; the policy emphasis is thus on moving from Y_1 to Y_3; with this restriction in supply, the price increases. Since no tax is imposed with a quota, the domestic government does not collect the money; instead, the higher price paid for the product as a result of its restricted supply goes to the foreign firms.

In addition, there are two deadweight losses associated with a tariff. First, area m represents the *production effect,* or national welfare lost through inefficient domestic production. One way of thinking of this effect is by imagining how less efficiently a domestic firm that is not competitive in global markets, such as a large, integrated U.S. steel company, uses productive resources such as capital and labor, compared with a highly competitive firm in the United States, such as Microsoft. The country would be wealthier with Microsoft using the steel company's resources because Microsoft sells so much of its product abroad, in addition to at home. Second, area r represents the *consumption effect,* or the loss of welfare to consumers for no longer being able to obtain units Y_3 through Y_1 of the good at the free trade price of P. These consumers are made permanently worse off. Conceptually, they can be thought of as people who could have afforded a cheap, imported car at the free trade price but who with the price increase of a tariff or a quota must continue to ride the bus.

The industrial adjustment that accompanies free trade, via the removal of tariff or quota protection, for example, is not without real costs. Since tariffs are unambiguously good for protected firms and the labor working for those firms, the loss of tariff protection is unambiguously bad. Moreover, labor and firms in declining, globally noncompetitive industries have a powerful incentive to lobby politicians for tariff protection since their firms and jobs are being threatened by competition from foreign firms. The incentive to save one's job or firm is typically much more powerful than the incentive for consumers to lobby to prevent a tariff from being imposed on tomatoes, for example. Most people know when their job is threatened by foreign competition, and are sufficiently motivated by this potential loss to exercise their political voice to save their livelihood. On the other hand, few people are aware of the tariff on tomatoes and, even when they are, are unlikely to take the time to exercise their political voice to oppose a tariff that adds only a few cents to a relatively inexpensive purchase. Thus political economists agree that it is generally much easier politically to obtain protection than to reverse it.

Economic models of international trade generally ignore the human costs of free trade that result in political opposition to it. The costs can be the transition costs of moving from a traditional economy (usually agrarian) to an industrialized economy—a transition that is often very harsh (as Karl Marx famously observed of England's industrialization in the middle 1800s). The global economic integration that occurs with free trade is also criticized for homogenizing formerly distinct countries and cultures. Thus, there is concern that as countries industrialize, such as China is doing currently, they lose much of their unique culture and traditions. Some countries impose tariff and quota protection on goods in an attempt to preserve their national identity; the French, for example, do this by limiting the number of American-made films that can enter the country. Despite such criticisms of free trade and global economic integration, there are still many observers who feel the benefits of trade expansion and liberalization are greater than the costs. What these supporters most often point out is that no country that has allowed relatively free trade to operate since World War II has experienced a famine—for the first time in human history. Moreover, basic living standards appear to increase sharply in countries practicing free trade, after the initial adjustment to import competition, whereas countries practicing tariff and quota protection often lag behind in national wealth creation and in innovation.

Tariff levels have declined dramatically in the United States (and most other industrialized countries) since the 1930s, when the U.S. Congress gave the authority to negotiate trade agreements to the president; this authority enabled the United States to champion the Global Agreement on Tariffs and Trade (GATT), beginning in 1947, the precursor to today's WTO (see Figure 2). Increasingly, trade agreements are focusing on nontariff barriers since GATT and the WTO have been so successful in reducing overall tariff levels. Nontariff barriers to foreign goods are practices such as domestic content laws, health and safety regulations that discriminate against foreign producers, and preferential taxes, subsidies, and contracts. While these are currently the biggest barriers to trade, they

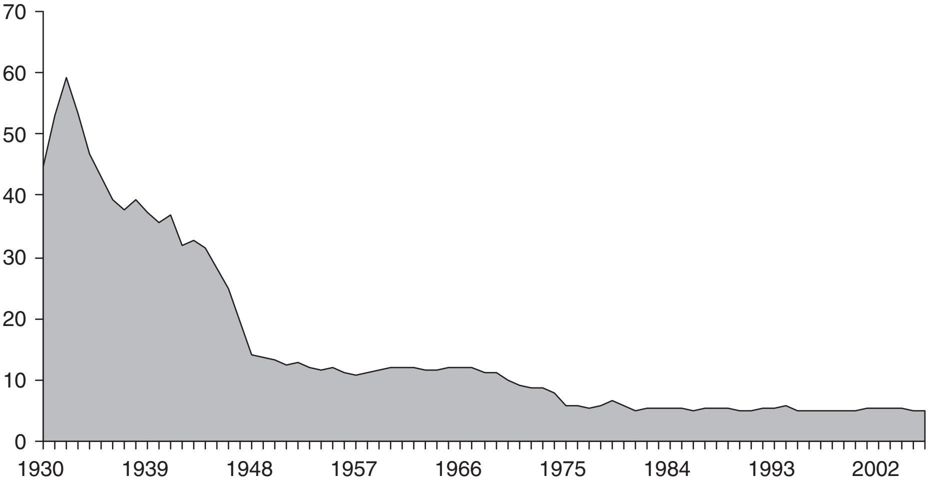

Figure 2 U.S. Average Tariff Rate (%), 1930–2006

are also more difficult to negotiate than are straightforward tariffs or quotas.

Tawney, Richard Henry (1880–1962)

Richard Henry Tawney was born in Calcutta, India, and died in London. Educated at Balliol College, Oxford, he held academic appointments at Glasgow, Oxford, and the London School of Economics. He was a founder of the Workers Education Association, an educational venture providing university-level courses for workers that eventually became an extension college within Oxford.

A prominent socialist, Tawney was a prolific writer with numerous books, pamphlets, and newspaper articles to his name. As a member of the British Labour Party, he served on major public commissions and committees that addressed policy issues in labor and education. Trips to China in the early 1930s and the United States in 1941–1942 brought him into contact with laborers in a very social context and resulted in articles and a book comparing their situation with that of English workers.

Tawney was a major figure in the development of the field of economic history and social history. He maintained that the historical endeavor must move beyond simple narrative accounts to an integrative examination of the complex web of social forces surrounding the economic system. Searching for the historical foundations of the English economy, he studied the 16th-century conflict between large landholders and small farmers over the issue of enclosure (*Agrarian Problem in the Sixteenth Century*). In the process, he discovered the important role of the English Church, which laid the groundwork for his subsequent historical examination of the relationship of economics and religion (*Religion and the Rise of Capitalism*). While acknowledging Max Weber's insights into the Protestant work ethic, Tawney disputed his conclusion that the foundations of capitalism can be traced solely to the internal, spiritual aspects of early English Puritans.

Tawney's intellectual search focused on two major issues: why rich and poor continue to coexist in a capitalist system and how to organize a new society built on economic and political equality. His critical analysis of industrial capitalism (*Acquisitive Society*) revealed what he understood to be its devastating impact on society. He argued that the dual focus of capitalists on profit and wealth unhinges the economic system from its primary purpose, to contribute to society's growth and welfare. He concluded that capitalism uncouples property rights from social purpose, diminishes the role of the industrialist as a member of a profession, and taints the working class by infecting it with a desire to acquire wealth.

Carefully weaving a path between Marxist advocates and opponents, Tawney accepted a modified market system as appropriate for the emerging new society. He advocated governmental intervention to channel the behavior of industrialists, protect workers, and eliminate poverty. He envisioned a classless society built on full equality in relationships in a community built on human fellowship (*Equality*). As a democratic socialist, he also advocated the dispersion of political and economic power to individuals to ensure the embodiment of the principle of equality.

TAX ETHICS

Tax ethics concern the values, practices, and consequences of taxation as a means of distributing the benefits and burdens of citizenship, including evaluation of the conduct of taxpayers and their accountants and financial advisers in determining and taking responsibility for their fair share of the tax burden. The moral framework for evaluating taxation considers both ends and means in the apportioned tax burden, an accounting of the economic distortions caused by taxation itself, and an assessment of the impact on the economy of public goods and services, their impact on the larger economy, and their impact on social equity. Ethical concerns about taxation center on the proper integration of competing claims: social justice, individual freedom, economic productivity, and efficiency applied to the tax system itself as well as to the instrumental value of taxation in achieving broad social policy goals. Ethical concerns about individual responsibility concern the willingness of taxpayers and tax practitioners to discern and honor the moral claims and financial obligations of citizenship.

In democratic societies, tax ethics are often viewed in terms of simple justice: What is fair? The modern democratic view of tax equity is viewed progressively: Taxpayers of equal means should bear an equal tax burden, and taxpayers of unequal means should bear a proportionally unequal tax burden. The consideration of what is fair taxation and the development of the progressive theory of tax equity has a long history that is still in the making. In recent years, a "postprogressive" approach to taxation has developed with a focus on the role of taxation in economic growth and productivity as a means of achieving social and economic justice. During that time there has been an increased use of tax mechanisms, such as taxes and surtaxes on utilities, travel, alcohol, and tobacco, that shift the tax burden away from income toward consumption.

Historical Approaches to Tax Equity

As Cicero observed 2,000 years ago, taxes are the mainstay of the state. Governments must collect revenues to provide even minimal public services; the challenge is to create a tax system that optimally distributes benefits and burdens. Modern approaches to tax equity began with the introduction of Enlightenment principles of equality and the notion of the social contract into the political economy. Philosophers, economists, and social theorists have been debating the principles and methods for achieving a just system of taxation ever since. Thomas Hobbes believed that people would cooperate with others in sharing the burdens of civil society to achieve its benefits. Recognizing that some public services are more effectively and efficiently provided to all citizens through government agency, Adam Smith established the equitable pricing principle of taxation. Although all citizens enjoy the benefit of public services (e.g., they are protected by the military and have access to the court system without regard to their tax contribution), the underlying approach of equitable pricing derives from economic benefit; people should pay proportionally for the benefit they receive from public services. Smith argued that justice is achieved when wealthier members of society pay a greater share of taxes because they also enjoy greater economic benefits from their membership in society.

John Locke argued that property rights and earnings entitlements constitute a more compelling approach to distributive justice than taxing according to benefits received. In this view, people are entitled to the use and usufruct of their wealth and taxation. Accordingly, the competitive economics of the marketplace is considered the best mechanism both for satisfying people's needs and for achieving equitable distribution of goods and services. Proponents of property entitlements as the foundation of tax equity exert a continuing influence in appeals for limited government and marketization of public goods and services. Contemporary libertarians such as Robert Nozick regard property rights as sacrosanct and advocate a minimal role for government in provision of core public services such as defense and public safety, with some arguing that taxation itself is an unjust taking of private income and wealth.

Critics of this approach, however, are quick to point out that the market of public goods and services does not function exactly like the private market. First, there is little or no competition. Although some elements of public sector competition might be desirable, it is unlikely that the free market benefits of competing police forces, courts, or military forces would outweigh the negative consequences of inefficiency and destabilization. Second, John Stuart Mill's lighthouse example illustrates that many public services are nonrival; the light is available to all, and it would be inefficient (if not impossible) to restrict its rays only to those who pay for it. Third, a society that values human worth and dignity is morally obligated to make some public accommodation for people in dire cases of poverty and hardship, which means that the cost of their public benefits will be paid by someone else. Most theories of optimal taxation have attempted various arguments to justify the assumption of a progressive tax burden for the wealthy.

Utilitarian theories have been influential in the development of modern approaches to tax equity. Mill originally posited the principle of "equal sacrifice," arguing that everyone should sacrifice equally to provide the benefits of public goods and services. Since people are positioned differently on the wealth and income scale, an equal tax cannot be imposed fairly on all. Mill theorized that the marginal utility of income falls as income rises, therefore reducing the amount of sacrifice imposed by tax increases proportioned to wealth. In this view, wealthier people can assume a greater share of the tax burden while still maintaining an equal share of sacrifice. Similarly, the tax burden imposes an equal sacrifice on people positioned together horizontally at various points on the vertical income and wealth scale, and therefore they should pay the same amount of tax. Jeremy Bentham believed that communities of rational people would willingly choose a social contract with egalitarian distribution of burdens to achieve the social good of a civil society as a benefit for themselves.

Economists joining the debate in the past century questioned the basic assumptions of the utilitarian case for progressive tax equity. Economic models could not substantiate either the decreased marginal utility of income as it rises or the derivation of equal utility from public benefits by people of equal income. With the theoretical underpinnings for progressive taxation threatened, economists sought to formulate an economic model of social welfare function to demonstrate the optimal distribution of resources. Economic modeling was incorporated increasingly into the public policy process, shifting the focus of tax structure from equity to efficiency and to the broader relationship between tax policies and economic growth. By the middle of the century, the case for progressive taxation, so firmly entrenched in the social conscience of democracy, could no longer be grounded on utilitarian arguments. Marginal personal income tax rates climbed to a high of 90% and corporate tax rates reached more than 75% in the early 1950s; the economic impact of progressive taxation had political consequences. While Americans have consistently favored progressive taxation, they also understand the value of economic growth generated from less progressive taxation. Widespread calls for tax cuts for business and the wealthy to stimulate the economy have often been met with concerns about shifting the tax burden down the income scale and spurred renewed theoretical attention to tax equity. Economists have succeeded, however, in promoting a public awareness of tax equity within a broader context of the economy as an essential asset of the commonweal. This understanding has helped reframe public discourse about tax ethics as a means of actualizing a civil society of distributive justice and equal opportunity and protection of human rights.

One of the thorniest problems in theorizing tax equity is the problem of reconciling political equality with the natural inequality of human endowments. How can people born with a wide range of innate abilities that position them with greater or lesser comparative advantage be treated fairly in the distribution of social benefits and burdens? John Rawls's theories of human rights and distributive justice have had a strong influence on contemporary approaches to this problem. According to Rawls, the premise of equal worth is best realized if individuals choose among various options of distribution benefits and burdens without regard to their own status, imagined as a veil of ignorance. From this position of impartiality, people would make choices to maximize the good for everyone, and inequalities would only be tolerated if they served to improve the status of the least advantaged.

Applying Rawls's theory to tax equity, progressive tax rates would be just if devised from behind the "veil of ignorance," with the intent of maximizing benefits for all and permitting only inequalities that benefit the least advantaged. With the justification for tax equity based on the premise of equal moral worth rather than incalculable assumptions about comparable utility, sacrifice, or ability to pay, the moral debate of distributive justice shifted more toward the social and economic impact of various tax mechanisms and the constitution of the social safety net as a foundation for public affirmation of equality. The concept of distributive justice developed by Rawls has been influential in justifying and explaining the legitimacy of taxation as an instrument of the public good in the modern state.

Taxation as Social Policy

In the broadest sense, taxation is an instrument of social policy. Tax revenues fuel the political will of the citizenry through programs and initiatives that foster the type of society they value. The basic social policy questions are the following: (1) What should government do for its citizens? (2) What should government expect citizens to do for themselves? In a free, democratic society, it is expected that government provide goods and services that not only meet the expressed needs of its citizens but also spur the economy and promote the values of democracy and freedom for the flourishing of a civil society. Most tax scholars would agree that the American system of taxation has been effective when measured against these social goals, but there are admittedly some glaring failures. As tax policies in recent decades have shifted the tax burden away from the wealthy and focused on stimulating economic growth and efficiency, the income and wealth gap between rich and poor has become a matter of increased attention and moral concern.

One of the most elusive social policy goals is the elimination of extreme poverty, with its devastating effects on children, families, and neighborhoods. There are certainly intractable social inequities that draw the attention of those who advocate increased investment in a social safety net. For example, the United States, the wealthiest nation in history, does not have a universal access health system; its infant mortality rates and children's school achievement scores do not compare favorably with other wealthy, industrialized nations. Although some argue for a dramatic shift in public spending toward more substantial investment in programs that serve poor children, families, and neighborhoods, others claim that poverty is not itself the problem but the result of other social problems people have created for themselves; individuals who have made poor choices or squandered their opportunities should not be bailed out by the majority of citizens, who have worked hard to be productive members of society. Others who agree that poverty is a problem argue that the benefits of economic growth eventually trickle down to benefit all.

Recent public policy initiatives reflect a social goal of fostering initiative and productivity among the poor rather than reinforcing dependence. Keeping holes in the social safety net may make it a less attractive destination—and perhaps motivate people to become taxpayers rather than recipients of tax-funded programs. In contrast, the premise of equal human worth, the foundation of modern civil societies, presents the human capabilities of each citizen as a moral claim on society; in this view, it is the corresponding duty of a civil society to develop the capabilities of its citizenry. These concerns are amplified in examining the moral implications of the global political economy. One ethical measure of taxation is the degree to which a society has effectively developed the human capabilities of its citizens and cultivated the corresponding political will to pay for the investment in its human capital. Human societies are also ethically responsible for the way they care for their citizens when they are not able to be productive: during childhood, sickness, or other periods of frailty.

The mechanisms of taxation (e.g., tax on personal and corporate income, property, consumption, gifts, and wealth transfer; user fees, licensure fees, and social security tax; special levies for public works, services, and projects; rate structures; exemptions and allowances) are as important morally as the goals they are intended to achieve. For instance, critics of consumption tax object to its heavy burden on people of lower means who spend a proportionately greater share of their income on necessities, advocating instead a focus on the higher incomes, inheritances, property, and luxury items of wealthier citizens. And critics of the "sin taxes" on alcohol and tobacco insist that such tax mechanisms unfairly single out certain classes of people for a disproportionately heavy tax burden.

History has shown that the equity intended by taxation policies and mechanisms is not always achieved. Well-intentioned tax mechanisms can shift benefits and burdens to distort relative economic positions or to stabilize the position of a corporation. For instance, legal tax shelters designed to achieve specific public policy goals can relieve some wealthy taxpayers of their entire tax burden. The alternative minimum tax (AMT), established decades ago by the U.S. Congress to ensure fair tax payment from wealthy taxpayers with creatively legal tax shelters, was not indexed for inflation and has imposed a dramatically heavier tax burden on middle-income earners several decades later. A consumption or luxury tax may drive the wealthy to external markets. Arguably, high corporate tax rates can be passed on easily to individuals.

Raising property taxes may spur short-term revenues but create a disincentive for home ownership, depress the real estate market, and slow long-term property tax revenues. These consequences are important ethical considerations in evaluating the long-term effectiveness of tax mechanisms in achieving desired ends.

Tax mechanisms may also disrupt the public economy of revenues, goods, and services. For example, a "flat tax" is often proposed as a simplifying tax mechanism without examining the resulting downward shift in tax burden away from upper-income earners toward middle-income earners. Since the 1960s, the economic consequences of steeply progressive tax structures have been understood as negative for the poor and middle-income earners as well as for the wealthy; tax mechanisms have since shifted to stimulate economic growth, productivity, and efficiency rather than to transfer wealth directly down the economic scale. Advocates of postprogressive tax policies insist that the continued strength of U.S. economic performance can be attributed, at least in part, to this change of tax structure. As discussed earlier, however, a tax structure focused on the social goal of economic efficiency and productivity may not be effective in addressing the moral claims of citizens who are unable to be productive and may inhibit the productivity of citizens who need special supportive services to participate fully in society.

Ethics for Taxpayers and Tax Practitioners

Individual taxpayers and tax practitioners are inevitably influenced by their personal views of society, the role of government in society, and the proper use of public funds in achieving social goals. Taxation takes money from people who have earned it for purposes often defined by others as desired social policy. How does the individual respond to the moral obligation of taxpaying, especially when the social policy goals of taxation conflict or do not coincide with his or her own view of the good society? What is the ethical framework for justifying the payment of taxes? How does this framework support the personal choices of taxpayers and the professional conduct of tax practitioners?

Citizens, as individuals and corporate entities, are morally obligated to pay their fair share of taxes as defined by law. The ethical legitimacy of government taxation has been well established on the grounds of social contract and distributive justice theory. Citizens who object on moral grounds to specific social policies or programs funded through tax revenues or to the fairness of tax mechanisms may express their views through transparent engagement in the policy process rather than through refusing to comply with the tax system. In cases where tax law could be legitimately interpreted or applied with different tax consequences, the taxpayer is morally obligated to make what she considers a fair judgment with attending disclosures and payments. It is reasonable to expect that a taxpayer with complex business interests and transactions would seek the counsel of a tax practitioner in discerning a rigorous interpretation of fair tax. Taxpayers are morally obligated to be truthful about their financial status and operations but not to pay more than a reasonably determined fair share of tax based on truthful financial disclosure.

In addition to the moral obligations outlined for taxpayers, tax practitioners who advise taxpayers and prepare taxpayer returns operate under professional obligations to their taxpayer clients, their professional colleagues, the government, and society. Tax practitioners are obligated to advise their clients truthfully in full knowledge of the tax code and its legal obligations. They are obligated to maintain a current level of professional knowledge and seek the counsel of colleagues when unique circumstances of their clients exceed the range of their own knowledge and expertise. They are obligated to perform their duties honestly and transparently while guarding the privacy of their clients and their sensitive financial information. Tax practitioners are also obligated to participate through their professional associations in the development and clarification of standards for upholding the professional competence and integrity of tax practitioners. Tax practitioners should be mindful of their influence on the conscience of their taxpayer clients.

TAX HAVENS

A tax haven is a nation other than your own that has lower tax rates and more confidential banking procedures than are found where you reside or normally do business. These havens are made up of about 70 countries and jurisdictions (generally small in size) that provide no-tax or low-tax status and offer a variety of taxation-related incentives to individuals and organizations who wish to bank, incorporate, or headquarter their business within the country in question.

Tax havens are controversial, especially since much of the world's wealth (up to one third) is held "offshore" in such entities. Opinions also differ as to their overall impact, so it is helpful to distinguish between the legal, illegal, and unethical practices associated with tax havens. After all, tax collectors have been unpopular as far back as biblical times. In the Middle Ages, Robin Hood and William Tell were romanticized for fighting against oppressive taxation. A number of serious researchers have also argued that the American Revolution was a successful scheme of tax resistance.

Tax havens are part of the ongoing development of global financial markets. The offshore banking phenomenon began as a legal way for bankers to avoid the taxes and lending restrictions associated with highly regulated national financial markets. Deregulation of national financial markets arose in the 1980s in part as a response to the loss of business in international lending to offshore banks. National (as well as state and local) governments also play the game of offering tax-break incentives to attract foreign investment. Lobbyists also work overtime in the halls of Congress to create or hang on to various legal (if perhaps not always ethical) tax shelters and loopholes.

Tax haven countries offer their services in exchange for service fees and being enriched with assets that help make them politically and economically stable. Foreign corporations, trusts, and partnerships may have valid business purposes for using offshore entities and accounts. Most, however, do so for illegal rather than legitimate reasons.

Lack of transparency (noncooperation with banking regulators of other countries) is one of the major criticisms. Wealthy foreign individuals and enterprises often use these offshore nations as financial centers to disguise business transactions and hide assets. In this context, the world of offshore finance is one of dummy companies, shadow bank accounts, untraceable post office boxes, foreign registries, and other questionable activities. One example involves the substantive role of tax havens in disguising and sheltering illegal drug profits.

Growing resources are being devoted to identifying transactions that are blatantly illegal attempts to defraud creditors, investors, and taxing entities. Such use of tax havens generally serves no business purpose other than to divert income and conceal assets for taxpayers who have no actual operations in the foreign tax haven. Scams are rampant.

The size of the problem is staggering for those nations witnessing a flow of resources overseas through electronic money transfers and other means. In his book *Offshore: The Dark Side of the Global Economy,* reporter William Brittain-Catlin estimates that one third of the world's wealth—or $7 trillion—and 80% of international banking transactions take place in the shadowy offices of banks in the Cayman Islands or the Islamic financial center of Labuan, Malaysia. As much as half of world trade might be routed through tax havens, with huge chunks of capital in the world's stock exchanges "parked" offshore at some point. Furthermore, London's Tax Justice Network (TJN) in 2003 reported that rich individuals worldwide had hidden more than $11.5 trillion of their assets in such hideaways.

Annual tax losses through legal and illegal capital flight to the havens are projected at $225 billion. It is estimated that the United States loses a minimum of $60 billion, although the numbers may be much higher due to lack of effective oversight. Taking advantage of these international markets is a veritable "who's who" roster of very large corporations such as Wal-Mart, Citigroup, BP, and others who are alleged to be hiding their profits in tax haven institutions, away from the eyes of investors, regulators, journalists, and the public.

U.S. persons are taxed on their worldwide income regardless of where it is earned or sourced. Thus, the incentive for using a tax haven is to convert a U.S. taxpayer who is supposed to report all his worldwide income to a "nonresident alien" reporting no income and thus paying no income tax.

A corporation's earnings are taxed twice—once at the corporate level when initially earned and then at the shareholder level when dividends are distributed. The use of a foreign corporation can be beneficial because it can result in deferral. If a foreign corporation has no U.S. trade or business and earns only foreign source income, the corporation's earnings will not be subject to U.S. tax until they are repatriated in the form of dividends to U.S. persons who are shareholders.

Tax havens work by taking advantage of their sovereignty to attract foreign businesses by deliberate public policies. Resident lawyers work with these governments to legally set up a system of little or no income tax in the jurisdiction under their control. They also offer the ability to form entities quickly. This is coupled with a veil of secrecy created through strict laws against disclosure of banking and business records. In effect, tax havens typically refuse to enter into treaties or information agreements with other nations that might open up their records to independent scrutiny. At the same time, these states also take advantage of modern international banking, communication, and transportation facilities. Once up and running, they promote their services with a "wink and nod" about undertaking transactions for clients even though there often is no economic substance other than to evade taxes.

Legislation introduced in the U.S. Senate in April 2005 recognized certain countries as tax havens (see Table 1).

Categories of Tax Havens

Zero Tax Haven

A zero tax haven is a country where there are no income, capital gain, or wealth taxes of any sort and in which there are facilities and legislation under which one can incorporate and/or form corporations, foundations, and trusts. The governments in these countries earn revenue from charging fees on documents of incorporation, valuing corporations' shares, and registration fees.

No Tax on Foreign Income Tax Haven

These countries do impose income taxes on individuals and corporations but not on foreign-sourced income. Countries in this category include Hong Kong, Liberia, Panama, the Philippines, Venezuela, Jersey, Belize, Guernsey, the Isle of Man, and Gibraltar.

Low Taxation Tax Havens

These countries generally tax a small amount on corporate income and have double-taxation agreements with many high-tax countries that when structured

correctly work to reduce the overall degree of taxation. These include Cyprus, the British Virgin Islands, Liechtenstein, Oman, Switzerland, Jersey, and Guernsey.

Special Incentive Privileges

These countries give special incentive privileges to offshore companies and qualified holding companies. These countries include Luxembourg, the Netherlands Antilles, and Singapore. In addition, *international business company tax reductions* are offered by Antigua, Barbados, Grenada, Belize, and Jamaica.

An offshore scheme must assist in moving money or property outside the host country, operating offshore assets to produce further untaxed income and bringing the money home to spend. At their lowest level, offshore financial promotions are simple frauds and another way of inducing victims into phony investment schemes. At the other extreme, they involve a complex series of offshore entities designed to conceal the true ownership and control of assets and income. The following steps are common to them:

- Creation of the offshore structure: Promoters introduce people to offshore structures and use professionals such as attorneys, accountants, and private bank departments of both domestic and foreign financial institutions.
- Concealing transfers of money or other property to the offshore entity: Due to money-laundering laws, the transportation of currency is not widely used. Devices commonly used to get money offshore include (1) creation of an offshore business banking account, (2) fictitious invoicing for payments characterized as legal, consulting, or management services, (3) loans and gifts, (4) interest paid on loans, (5) insurance premiums, (6) transfers of assets in exchange for private annuities, (7) deferred compensation structures, (8) factoring of accounts receivables, and (9) use of a domestic trust so that diverted income can be disguised as deductible expenses or as distributions to an apparently unrelated beneficiary.
- Sales and transfers of property: People structure phony sales of property to a foreign entity, in exchange for a note they do not expect repayment on. The foreign entity with the note immediately sells the assets to a third party who remits the proceeds offshore. This gets title to the property—and its future earnings—offshore. Nonexistent equipment may be purchased from a person's foreign trust and depreciated over a 5-year period even though the payments being made are to the individual himself.
- Maintenance of control of funds while offshore: Banks and trustees virtually give the taxpayers full control of their assets. Many trustees offer various forms of secured communication so that the U.S. person can communicate without fear of detection. Trustees can easily create front corporations inside and outside the United States to carry out instructions.
- Determining a safe way to move money back onshore: People who were not willing to pay tax on the money when it was moved offshore do not want it taxed when they bring it back. Some popular ways of repatriating funds include (1) using credit cards to draw funds from an offshore account; (2) gifts from foreign relatives; (3) loans from mystery offshore lenders; (4) loans from domestic lenders secured by offsetting deposits of offshore funds; (5) use of property titled to offshore entities at zero or below-market rental; and (6) bogus transactions such as purchases, sales of property, and leasing that have no real business purpose or economic substance.

Tax shelter sales are no longer just the province of shady promoters but have become big business assigned to talented professionals at the top of their fields and able to draw on the vast resources and reputations of the country's largest accounting firms, law firms, investment advisory firms, and banks.

Over the past 10 years, federal statues and regulations prohibiting illegal tax shelters in the United States have undergone repeated revision to clarify and strengthen them. Today, key tax code provisions not only prohibit tax evasion by taxpayers but also penalize persons who knowingly organize or promote illegal tax shelters or who knowingly aid or abet the filing of tax return information that understates a person's tax liability. Additional tax code provisions now require taxpayers and promoters to disclose to the IRS information about certain potentially illegal tax shelters. Nevertheless, the system is flawed. Attempts have been made to introduce much tougher legislation, but there are many interests benefiting from the havens, who are quietly opposing efforts to beef up regulation.

While the attempt to minimize government payments to do business is not unlawful or outside ethical boundaries per se and may even offer some benefits within the global economy, tax havens raise a number of social and ethical issues. The secrecy that tax havens provide encourages corruption. Generally, individuals, corporations, and trusts are taxed on their worldwide income. It follows that if tax havens are used, ethical individuals, corporations, and trusts would report this income and pay tax on it. Unethical individuals, corporations, and trusts use tax havens for the illegal purpose of disguising their true income and evading taxes. This has a particularly damaging effect on developing countries because the use of tax havens undercuts their efforts to secure funding and development assistance.

Those promoting "virtue of selfishness" and "looking out for number one" values may applaud such outcomes, but most ethical systems would have difficulty with the current tax haven phenomenon. Deontological (duty-based) ethical approaches generally would be concerned about falsity and the failure to be even-handed in providing information to the variety of stakeholder audiences that depend on honesty in financial reporting. John Rawls is neo-Kantian in that his "veil of ignorance" deductive device works like Kant's categorical imperative in deriving universal normative principles based on fairness. This encourages equal treatment of all without regard to status—not secrecy to defraud.

More recently, Donaldson and Dunfee have argued that social contracts exist. Their hypothetically derived macrosocial hypernorms are similar to Kantian and Rawlsian universal ethical norms, but their extant microsocial community norms for defining "moral free space" could well be helpful in clearing up the moral ambiguity, as well as the legal laxity, of tax havens. Even many utilitarian (outcome-driven) ethicists would tend to find the hidden nature of tax haven practices rather unsavory, especially when such transactions are illegally disguised to evade lawful taxes.

Tax Incentives

A tax incentive is a special provision of the tax code designed to foster particular behavior on the part of tax-paying firms or individuals with the intention of encouraging some particular behavior that is believed to be socially beneficial. There has been a move toward designing specialized tax incentives that encourage saving for particular activities or spending on special goods and services. Unlike other tax provisions, which define the amount or transaction subject to tax and the rate or rates at which the tax applies, tax incentives represent deliberate departures from otherwise applicable taxes to encourage the activity at which the incentive is directed. For this reason, these subsidies are described as tax expenditures. These can take many forms, such as permanent exclusions from income, deductions, deferrals of tax liabilities, credits against tax, or special rates. These departures from the normative tax structure represent government spending for favored activities or groups effected through the tax system rather than through direct assistance.

Corporate Tax Incentives

Especially since 1960, the United States has relied on tax policy to direct private investment toward social objectives. The use of business tax incentives—that is, the adoption of particular features of the tax code as instruments of public policy rather than merely as revenue-raising devices—goes back at least to 1954, with the introduction of accelerated depreciation. Business tax incentives have been justified above all as a stimulus to capital formation. Even when the rationale is job creation, it is job creation via capital investment. Incentives have been provided for areas as diverse as the continued use and rehabilitation of older structures in an effort to arrest urban decay, research and development costs to encourage innovation, and employment subsidies to increase employment among the poor.

Tax subsidies often favor larger firms within an industry and can alter industry structure. Even if the price of products is not affected, the larger firms receive an advantage by having more earnings after taxes and consequently more resources for investment and greater growth potential. On the other hand, if these larger firms do pass the full tax savings on to consumers, they may be able to lower product prices below the average costs for smaller firms facing higher effective tax rates, potentially driving some of the small companies out of business and increasing industry concentration.

Individual Income Tax Incentives

A number of tax incentives are available to individuals. These can be in the form of deductions from taxable income, gifts, or savings accounts that can grow either tax-free or tax-deferred. Some examples are given below:

- Deductions: Expenditures for home ownership, excess medical expenses, state and local income taxes, property taxes, and gifts to charity can be used to reduce taxes.
- Gift and estate taxes: Under current law, individuals are permitted to make gifts of $12,000 per recipient, per year, free from any gift or estate taxes. This allowance permits a substantial sum to be transferred to heirs free of tax. While yearly amounts may be small, consistent use of this annual exemption can lead to the tax-free transfer of large amounts of wealth.
- Education savings: The Coverdell education savings account (ESA) and Internal Revenue Code Section 529 savings plans are structured so that after-tax dollars grow tax-free. Earnings are never taxed if withdrawals are used for qualified education expenses.
- Retirement savings: Individual retirement accounts (IRAs), 401(k) plans, and 403(b) accounts all offer incentives to save for the future. Closely related are employee stock purchase plans (ESPPs), which are employer-sponsored programs that permit employees to save by purchasing company stock, while contributions to them and accumulations within them are subject to favorable tax treatment.
- Health savings accounts: Several options are available for saving for future qualified medical and retiree health expenses on a tax-favored basis.

Tax Credits

A tax credit is an amount subtracted from the gross tax to determine the net tax due. Credits, then, are similar to prepayments of the tax and are not a part of the computation of taxable income, the tax base. Therefore, tax credits are more beneficial to taxpayers than tax deductions. There are three general groups of tax credits. First, there are credits related to business operations and investments. These consist of credits for expenditures such as for historic rehabilitation, research and development costs, hiring individuals from targeted groups, environmental remediation costs, development of renewable resources, and low-income housing developments. Second, there are credits allowed to individuals only because of some special need, such as the child care credit or the credit for the elderly and people with disabilities, or for purchasing certain targeted products, such as electric and clean fuel vehicles. The third group consists of credits related to prepayments and includes credits such as those allowed for income taxes paid to foreign countries and off-highway use of fuels. The availability of such tax credits provides behavioral incentives for taxpayers above and beyond other tax incentives specifically written into the tax code as deductions against income.

State Tax Incentives

The effects of variations in states' corporate income tax regimes can have a significant impact on new capital investment by business as state governments attempt to encourage job creation or capital investment that would not have occurred without such incentives. A key structural feature of the state income tax in the United States is the apportionment formula used to subdivide a multistate firm's income among jurisdictions with which they have sufficient contact (nexus). In general, a corporation's business income is apportioned among the states based on what portion of its sales, payroll, and property occur in each state. The theory is that these factors will fairly reflect the tax attributable to each state. While the Tax Reform Act of 1986 did away with the federal investment tax credit, a number of states have not only preserved their investment tax credit but have also enacted new or expanded investment-related tax credits, such as enterprise zone credits, new facilities credits, and corporate headquarters (relocation) credits. The effect of such incentives is to lower the tax cost of doing business in that state. Thus, these incentives act as substitutes for or complements to tax rate changes or apportionment formula changes designed to accomplish similar objectives. In addition to these credits, many states offer income tax exemptions, property tax exemptions, sales and use tax exemptions, and supplemental accelerated depreciation options to attract businesses to locate within their borders. Some economists consider state tax incentive programs, which seek to influence corporate plant location decisions, to be state-based "industrial policy" initiatives, which can distort free market mechanisms for allocating resources toward their "highest and best use," thereby triggering potentially adverse economic and social welfare consequences. If competing states are overly aggressive in offering location tax incentives, they may bid away most of the social gains from the investment, thereby benefiting the corporation, but not necessarily society as a whole.

International Tax Incentives

Issues of tax competition among nations have become controversial with the globalization of the economy. Many countries have established extra tax incentives for domestic businesses, as well as tax incentives promulgated for the purpose of attracting foreign businesses. A number of organizations, including the United Nations, the World Trade Organization, and the Organisation for Economic Co-operation and Development, have established special dispute resolution procedures allowing nations to air their grievances and resolve them amicably, as international consensus is needed as to where income should be taxed. Historically, active income has been taxed at its source and passive income at a taxpayer's place of residence. Thus, the country where the income is generated has the primary right to levy taxes; the country where the recipient of the income resides has a residual right to tax passive income. However, nations allow varying profit calculating methods and transfer pricing rules in an effort to find universally applicable means of attracting inbound investments while at the same time protecting domestic businesses from unfair competition. Multinational corporations (MNCs) use internal transfer pricing policies to allocate income among their subsidiaries to take advantage of some lower host country tax rates. Host country governments monitor MNC transfer pricing practices in an effort to minimize such tax avoidance behavior. The legislative objective is typically to focus on long-term goals, such as the economic health of the country, the substantial increase of internal revenue, and the protection of national economic interests. Some critics of MNCs regard such shopping for preferential tax treatment to be an abuse of economic power, which has the effect of shifting welfare gains away from the host country and toward the corporate interest.

Tax Incidence

The incidence of a tax is the distribution among taxpayers of that particular tax's economic burden (i.e., the sacrifice of taxpayer utility or welfare). Tax incidence ignores distribution of any benefits received from government expenditures. Tax incidence, tax burden, and tax shifting are closely related notions. Statutory incidence is the initial distribution among taxpayers of a legal obligation to remit tax receipts to the government. Economic incidence is the final burden of that particular tax on the distribution of economic welfare in society. The difference between initial incidence and final incidence is tax shifting.

For example, the government may levy a tax on gasoline sales, typically as so much per gallon. Initially, this tax falls on the retail seller of gasoline, who is responsible for remitting tax receipts. The retail seller commonly passes this tax fully to the purchaser of gasoline, who bears the final burden. The government intends that the final user of gasoline bear the economic incidence of the tax, and uses the retail seller as a tax collector.

Tax analysis dates back to the French Physiocrats, who immediately preceded Adam Smith's *The Wealth of Nations* of 1776. Economists study incidence and shifting using tools of partial equilibrium analysis and general equilibrium analysis. Tax incidence concerns fairness or justice of impact of taxes. Equal sacrifice theory argues that each taxpayer should make the same sacrifice of utility or welfare. There are three competing principles of equal sacrifice. Absolute equal sacrifice argues that each taxpayer should bear the same degree of burden. Proportional equal sacrifice argues that each taxpayer should sacrifice the same proportion of welfare. Marginal equal sacrifice argues that each taxpayer should give up the same utility from the last (i.e., marginal) dollar of income or wealth yielded to government.

It is typical to divide taxpayers into incidence groups by income or wealth to measure the degree of progressivity or regressivity. Taxes levied on an ability to pay principle can be classified as regressive, neutral, or progressive. A regressive tax places a higher burden on taxpayers of lesser means. A progressive tax places a higher burden on taxpayers of greater means. A proportional tax with an exemption for taxpayers of low income or wealth exhibits some degree of progressivity. The personal income tax is typically levied using graduated rates rising with the taxpayer's income; and an exemption can be applied for taxpayers of low income.

The burden or sacrifice of a tax, whether levied on the ability to pay principle or the benefit principle of taxation, can be measured as the money amount of tax receipts collected. All taxes other than the poll (i.e., head or capitation) tax exhibit some excess burden, defined as an economic burden greater than those receipts. All other taxes destroy more economic value than the government collects, because taxpayers change their economic behavior in response to the taxation. An excess burden of a tax is a form of deadweight loss of consumer welfare. Only the poll tax cannot be shifted.

The concepts of incidence and economic burden can be applied more broadly than to taxes. Any effect, such as injuries or illnesses, may be distributed unevenly and generate economic burden. Tariffs, monopolies, and theft can be treated as taxes on consumer welfare.

Tax Reform Act of 1986

The Tax Reform Act (TRA) of 1986 was the most extensive review and overhaul of the Internal Revenue Code by the U.S. Congress since the inception of the income tax in 1913 (the Sixteenth Amendment). The purpose of the TRA was to simplify the tax code, broaden the tax base, and eliminate many tax shelters and preferences. The TRA was intended to be essentially revenue-neutral though it did shift some of the tax burden from individuals to businesses. Although often described as one of President Ronald Reagan's (a Republican) greatest legislative legacies, the TRA was officially sponsored by two leading Democrats, Representative Richard Gephardt of Missouri and Senator Bill Bradley of New Jersey, and was strongly supported by the House Ways and Means chairman, Representative Dan Rostenkowski of Illinois (a Democrat). The legislation was signed into law on October 22, 1986.

The TRA reduced the number of individual income tax brackets from 14 to 2. The TRA also lowered the top tax rate for individuals from 50% to 28% and raised the bottom rate from 11% to 15%. The TRA removed millions of low-income citizens from the income tax rolls. The TRA ended tax code provisions for individuals to deduct interest on consumer loans; however, it increased personal exemptions and standard deduction amounts and indexed them to inflation. The TRA revised tax credits for amounts that individuals could contribute to certain types of individual retirement accounts (IRAs). The TRA strengthened the "alternative minimum tax" provisions of the income tax code for individuals, which were first created in 1978. The TRA passive loss limitation provisions reduced the use of certain tax shelters by wealthy individuals.

The corporate tax rate was reduced from 50% to 35%. The TRA repealed corporate tax preferences for the investment tax credit for the purchase of depreciable assets, lengthened certain asset lives for cost recovery, and limited bank deductions for loan-loss reserves in a given year. It also reduced the allowances for certain business expenses, such as business meals, travel, and entertainment, and restricted deductions for certain other expenses. One provision of the TRA created an alternative minimum tax for corporations (at a rate of 20%) to replace an existing corporate add-on minimum tax.

Since the passage of the TRA in 1986, tax code revision has become virtually a perennial event, resulting in the return of many tax breaks and an increase in the number of tax brackets. Of particular note were the Revenue Reconciliation Act of 1990 under President George H. W. Bush, the Revenue Reconciliation Acts of 1993 and 1997 under President Bill Clinton, and the Economic Growth and Tax Relief Act and Reconciliation Act of 2001 under President George W. Bush.

Teaching Business Ethics

Teaching business ethics at universities involves delivering instructional material on the social value of commerce aimed at helping students understand society's expectations of business responsibilities and the responses of corporations and their agents. Although investigation into the role of commerce in society has been a topic of discussion throughout recorded history, teaching ethics in university business schools is largely a product of the latter part of the 20th century. Specifically, interest in teaching business ethics grew in the 1960s as a result of business school reform spurred by the publication of the Ford Foundation study *Higher Education for Business* and the Carnegie Corporation report *Education of American Businessmen.* This development was reinforced in the 1970s when the American Assembly of Collegiate Schools of Business (now the Association to Advance Collegiate Schools of Business) revised its accrediting standards to grant business and society course work common-body-of-knowledge status in business schools. This revision occurred around the same time that Social Issues in Management became a separate division of the Academy of Management and a partnership was established between philosophers and business and society scholars to explore a common interest in business ethics. As a scholarly enterprise, teaching business ethics has been shaped by a cross-fertilization of ideas from this partnership, as well as by insights from the social, political, and management sciences.

While the number of stand-alone business and society and ethics courses peaked in the late 1980s, interest in teaching business ethics was rekindled by an unprecedented eruption of corporate scandals around the turn of the new millennium. As news of corporate malfeasance and indictments of corporate executives for breaching their fiduciary responsibilities unfolded, many knowledgeable observers called for business schools to do more in educating students about their future responsibilities to society. While there are many methods for doing so, a common challenge for business ethics educators is to blend philosophical notions of right and wrong with the practical realities organizational decision makers face. One approach is to begin instruction with a broad notion of a social contract between business and society as a backdrop for helping students understand the social value of commerce and how ethics relates to it.

Levels of Analysis for Teaching Business Ethics

Before students are exposed to a detailed knowledge of business ethics, many instructors find it helpful to address the value of commerce with a social contract approach to the legitimate role of business in society. A utilitarian interpretation of this contract is that society grants legitimacy to business as an institution because of its potential to serve the greater good by producing goods and services that society otherwise would not have. According to Archie Carroll, this foundational economic responsibility is attenuated by the requirement that firms adhere to the law and the expectation that they embrace important ethical norms not embodied in law. In addition, some members of society want corporations to carry out discretionary responsibilities by giving back to the community in the form of contributions to charities or other worthy causes.

Framing business ethics in terms of the social value of commerce and corporate responsibilities makes it possible for students to grasp early on that society's expectations of business are informed largely by two major ethics traditions: utilitarianism, which emphasizes the social consequences of corporate actions, and deontology, which focuses on the various duties or responsibilities corporations have to constituent groups or stakeholders. In the first case, business actions might be deemed ethical by a consequential evaluation of the distribution of harms and benefits to stakeholders. Stated simplistically, if the benefits, especially economic gains, outweigh the harms, then the greater good is said to be served by the role of corporations in society. In the second case of deontology, business conduct may be evaluated as ethical if corporate agents carry out various duties to stakeholders, motivated by respect for the dignity and intrinsic value of these constituents. Both utilitarianism and deontology can be invoked by the instructor to reinforce the understanding that the social value of commerce depends on business using its considerable power wisely for community flourishing, which amounts to some mixture of economic, legal, ethical, and discretionary responsibilities under the terms of the social contract.

While utilitarianism focuses on the ends or consequences of action, the deontological approach eschews treating people merely as means to ends. Hence, on the stakeholder level of analysis, teaching business ethics in terms of corporate responsibilities involves imparting knowledge of the rights that various stakeholder groups may assert and notions of justice and fairness that support such rights and concomitant expectations of duties from corporations and their agents. For instance, an instructor could ask students to consider that consumers who pressure firms for safe products may assert their right to be protected from harm, buttressed by the claim that to pay for a product that causes harm is unjust or unfair. This assertion of a right to fairness implies that corporations have a duty to ensure the safety of their products, even when not required by law and ideally out of respect for the inherent dignity of their customers, which is consistent with the duty-based perspective. At the same time, the instructor can encourage students to grasp that the cost of product safety may adversely affect the economic performance of a firm, its ability to compete with other firms in the industry, and financial returns to shareholders, all of which affect a utilitarian calculus of desired outcomes from a firm's point of view.

This type of example delivered early on in business education can help students realize the role that public policy can play in balancing business's pursuit of economic ends with various duties or responsibilities to stakeholder groups shaped by views of rights and justice. In the case of consumer safety, students can be encouraged to comprehend that consumer protection laws and the role of federal and state agencies in enforcing such laws are a vital part of the social contract between business and society. At this juncture, students are in a position to consider the power that corporations have to influence the laws that govern them through lobbying and other forms of political advocacy. On this macro level of instruction, it is also appropriate to emphasize the importance of the natural environment, the responsibility business has to preserve this host environment, and the critical role that public policy and government agencies, such as the Environmental Protection Agency, have in protecting the public interest in this area.

In other words, the social contract can be a logical starting point for conveying that the social value of commerce can be analyzed in terms of corporate responsibilities that are shaped by normative traditions, including utilitarianism, deontology, rights, justice as fairness, and environmental ethics. Concurrently, students can be introduced to some descriptive or factual elements of the business and society relationship, such as specific laws and regulations and corporate political actions that affect them.

After students have been exposed to this big picture or macro view, they are in a position to consider how corporations can facilitate the social value of commerce. This involves delivering instructional material at the organizational or midrange level of analysis as corporate social responsibilities or an organization's ability to respond constructively to stakeholder expectations that firms adhere to the law as well as ethical norms over and above the letter of the law. A key topic for teaching ethics at this level is moral leadership or the influence that executive leaders have in conjunction with their boards of directors in establishing socially responsible business practices, which might include some level of corporate philanthropy or discretionary responsibility. A learning goal in this area of corporate governance can be for students to understand the boundary-spanning mechanisms available to executives who seek to enact moral leadership, such as the office of public affairs for tracking and attending to stakeholder expectations of responsibilities and industrywide "best practices forums" aimed at instituting and maintaining collective ethical self-governance among peer firms.

A logical extension of this discussion is for the instructor to point out that an executive can work with his or her board of directors and an ethics officer to formulate and implement ethics compliance and training programs defined by an ethics code of conduct in conjunction with hiring procedures that screen potential employees for ethical standards consistent with socially responsible goals. At the same time, a classroom exploration of moral leadership can consider the role of the executive in establishing an ethical culture or climate in which employees or internal stakeholders are treated fairly, not only out of a respect for their inherent dignity as humans à la deontology but also because a firm's ability to respond constructively to external stakeholders and survive economically in that environment may depend on an internal culture of solidarity and commitment to such goals. It is at this level of instruction that the strategic, consequential, or instrumental aspects of ethics in corporate life can become clearer to students, especially since they can identify with their future roles as employees or managers.

Finally, business ethics instruction should illuminate how ethics in individual decision making relates to the social value of commerce and corporate responsibilities. For example, an instructor can explain the nature of ethical dilemmas individuals can face in organizations, as when whistle-blowers experience internal conflict in balancing a commitment to social responsibility with loyalty to their firms. Whereas the instructor can emphasize ethics as utilitarianism, duty, rights, and justice in the societal and organizational domains, it is appropriate to highlight virtue or character ethics and integrity at this individual level. Virtue ethics implies that moral managers and employees are those who have imbibed certain character traits, such as fairness, honesty, and benevolence, while the literature on integrity suggests that decision makers are able to use such characteristics coherently to establish publicly their trustworthiness and ability to make balanced judgments in the face of moral complexity. According to a dialogic perspective, this ability depends on being able to respect, listen to, and give voice to various stakeholder concerns. Perhaps the most important thing for students to appreciate at this level is that ethics in action depends to some extent on the cognitive ability of individuals to factor values and ethics consciously into decision making that is responsive to societal interests.

Lawrence Kohlberg's widely applied model of moral development can be used to reinforce this point. According to this model, there are three levels of moral development, each embodying two sequential stages of learning. Specifically, the preconventional level involves a focus on self based on a reaction to punishment and seeking of rewards, in Stages 1 and 2, respectively. If individuals learn to move beyond this self-centeredness to consider the expectations of others, then they are able to reason at the conventional level, conceptualized as Stage 3, or conformity to family and peer group conceptions of right and wrong, and Stage 4, or an adherence to the rule of law and custom. In comparison, a person who can reason at the postconventional level of Stage 5 is able to focus on humankind in terms of moral principles, including human rights, social contracts, and constitutional precepts that are broader than those embodied in immediate referent groups or a particular society's customs and laws. Stage 6, the apex of moral reasoning in Kohlberg's framework, is denoted by an ability to define right and wrong in terms of principles of justice, fairness, and rights that can be generalized to all humankind. Students exposed to this material may be able to grasp not only the other-regarding perspective that marks socially mindful decision making but also that they themselves should seek to develop the ability to reason beyond the confines of habit and legal custom. A consideration of this ideal may help prepare them for the dilemmas in international business environments where multinational corporations operate in developing countries that lack the legal or customary protections afforded workers and consumers in more advanced industrial economies. In other words, teaching business ethics involves preparing students for cultural variations in the social contract between business and society that define stakeholder expectations of corporate responsibility.

Delivering Business Ethics in the Curriculum

Methods of delivering ethics in business schools vary. Some schools require a stand-alone business and society or ethics course, some rely on infusing ethics across the curriculum, and others do both. In addition, schools can augment ethics content with extracurricular initiatives, such as hosting guest speakers, offering service learning projects, and establishing endowed chairs in ethics. As of this writing, most business ethics professors have gone on record as preferring that some kind of stand-alone ethics course be required in the curriculum. Their rationale is that a common body of knowledge delivered in a stand-alone course is the most effective way of ensuring that students are exposed to ethics material holistically in terms of consistent learning goals, which include the goal that students understand society's expectations of business responsibilities and the responses of corporations and their agents. The stand-alone course can then serve as a fulcrum for infusing ethics into other courses in specialized ways. Consider, for instance, that a discussion of the social contract in an ethics course can inform and give context to a presentation of socially responsible investment funds in finance. A stand-alone ethics course can also be foundational to extracurricular activities. For example, students who compete in national ethics case competitions will be better prepared if they have previously demonstrated a basic knowledge of ethics conveyed rigorously in a stand-alone course. Delivering such a course in the curriculum can also help ensure that students are able to discuss ethics knowledgeably with recruiters who increasingly expect potential employees to understand the evolving compliance environment for business shaped by Sarbanes-Oxley, Federal Sentencing Guidelines for Organizations, Securities and Exchange Commission rules, and other regulatory measures relevant to the social contract between business and society.

In terms of classroom pedagogy, there is a growing interest in teaching ethics with interactive learning techniques, including actual or simulated cases, computerized assignments, written assignments, and films or film clips. Notably, actual cases can be used to highlight corporate conduct on the societal, organizational, and individual levels so that students can inculcate an integrated understanding of how business ethics relates to practice. Another development in teaching ethics is the increase in courses offered in continuing professional education programs, particularly in accounting, which has experienced an exponential growth in states requiring ethics coursework as a condition for Certified Public Accountant (CPA) license renewal. As of this writing, a continuing education course in accounting ethics is required by a majority of states, whereas prior to the outbreak of corporate scandals and the demise of the accounting firm Arthur Andersen, only a few states mandated such a course. This development may prompt new teaching material designed specifically for the specialized needs of accounting practitioners.

Support for Teaching Business Ethics

There is no dearth of textbooks and support material for teaching business ethics. After new business ethics textbooks appeared in the 1960s in tandem with interest in reforming business education, a preponderance of textbooks became available. Whether labeled "Business and Society," "Corporate Citizenship," "Social Issues in Management," or simply "Business Ethics," these textbooks typically relate ethics to the societal, organizational, and individual domains described previously. In addition, many supplemental materials for delivering ethics in the curriculum are available, such as course or curricula descriptions and resources that lend themselves to interactive learning, including case studies, simulations, and films and film clips.

Journals devoted to the subject of teaching business ethics include the *Journal of Business Ethics Education* and *Teaching Business Ethics,* while other pedagogically oriented journals, such as the *Journal of Management Education* and *Academy of Management Learning and Education,* include ethics as a topical area. Other journals address the teaching of business ethics more indirectly by serving as a repository for research that can influence the content of textbooks and resource material over time. Examples in this category include *Business & Society, Business Ethics Quarterly,* the *Journal of Business Ethics,* and, to a lesser extent, *Academy of Management Review, Academy of Management*

Journal, and *Academy of Management Executive* and other journals geared to broader management topics. Publications such as *Business Ethics Magazine* and *Compliance and Ethics* are especially timely resources for teaching ethics in the classroom, given their focus on current events. Examples of associations that sponsor conferences that include presentations relevant to business ethics pedagogy are the International Association of Business and Society, Society for Business Ethics, and the Social Issues in Management and Organizations and the Natural Environment Divisions of the Academy of Management.

Teapot Dome Scandal

The Teapot Dome scandal occurred during the administration of President Warren G. Harding. Albert B. Fall, secretary of the interior, secretly leased three federal oil reserves to several oil company officials in 1921 and 1922 and received personal compensation from them. This scandal and accusations of influence peddling and corruption by several of President Harding's political appointees resulted in congressional investigations and court cases that extended throughout that decade.

Underground petroleum reserves on federal government lands had been set aside for possible use in a national emergency by several previous administrations. Two of these oil reserves were located in California, and a third was near Casper, Wyoming. The property in Wyoming was called Teapot Dome due to the shape then of a rock formation on that land. Legislation in 1920 gave control of these federal oil reserves to the secretary of the navy. President Harding issued an executive order in 1921, though, transferring authority over these naval oil reserves to Fall, his secretary of the interior.

Without taking bids, Fall issued exclusive leases to Edward L. Doheny of the Pan American Petroleum Company for the two California reserves and to Harry F. Sinclair of the Mammoth Oil Company for the Wyoming property in 1921 and 1922. Rumors and accusations were raised concerning these transactions, and Senator Robert M. LaFollette of Wisconsin called publicly for action on these allegations. The U.S. Senate authorized an investigation in April of 1922 by its Committee on Public Lands. During the political tension over this scandal in 1923, Fall resigned as secretary of the interior in March, President Harding died in August, and Senator Thomas J. Walsh presided over a Senate investigation that began in October. After accounts of Fall's personal financial gain resulting from the oil leases began to emerge in Senate testimony in January 1924, President Calvin Coolidge announced his plans to nominate two special counsels, one Republican and one Democrat, to investigate further and prosecute. The Senate shortly thereafter passed a resolution charging delays and obstructions by the attorney general, Harry M. Daugherty, another Harding appointee, for his handling of the Teapot Dome investigation and for corruption and influence peddling within the Justice Department. Daugherty resigned in March 1924.

The three oil reserves were returned to the federal government by Supreme Court decisions in 1927. Fall was eventually convicted of bribery, was fined $100,000, and served less than a year in prison. Although oil company officials Sinclair and Doheny were not convicted of conspiracy, Sinclair was found guilty of criminal contempt for jury tampering in a later and related investigation. He also served a short prison sentence of less than a year.

The implications and significance of this scandal have drawn mixed comments from historians. Supporters of conservationist policies and critics of excessive business influence on government officials could claim to have prevailed in this controversy, but questions related to the appropriate roles of business and government in natural resource development and planning remain unresolved.

Telecommunications Act of 1996

The Telecommunications Act of 1996 attempted to bring more competition to the telephone market for both local and long distance service. It permitted firms that served competitive local markets to enter the long distance market, and it attempted to implement a single layer of regulation at the federal level. However, some state and local regulation will exist for years to come.

The deregulation that was brought about by this act enabled competition within the local exchange areas that had been effectively monopolies for many years. It also provided new regulations such as forcing the local carriers to share their communications facilities with competitors at rates established under the act's guidelines and ensuring that each competitor was treated in a fair and equitable manner.

Additional provisions of the act removed restrictions on media ownership and resulted in immediate consolidation within that segment of the industry. Yet another provision provided guidelines for Internet indecency, but the Supreme Court ruled that provision was unconstitutional under the First Amendment. Another significant provision also protected Internet service providers from liability for content of third parties on their service.

This act had many far-reaching effects. It eliminated the firmly entrenched monopoly that had been in existence on local and long distance telecommunications services. This provision effectively opened the local markets to long distance carriers, cable television providers, and other local carriers. The act permitted local telephone companies to provide long distance services when they could prove that local competition existed in their existing markets.

As a result of this legislation, many direct benefits are being realized today. Businesses have seen a reduction in communications costs as they have leveraged the competitive environment to restructure their communications platforms and services. Along with the reductions, these businesses have purchased new tools and services to increase productivity. These new services have forced the adoption of and adherence to many new standards. These standards make it easier for consumers to move between carriers and to be assured that mobile devices can work wherever the user is located, even worldwide.

The act has addressed some ethical implications as well. It has restricted advertising and marketing campaigns by the larger companies to foster competition. Another stipulation required that services between carriers be provided on a cost-plus basis and that those costs be the same to all carriers in the area. It also required wholesale services to be unbundled, which forced the local carriers to provide only the specific service needed. To ensure a truly competitive environment, carriers were required to allow the consumers to take their phone number with them as they changed carriers. Other provisions required reciprocal compensation for calls between carriers.

Finally, the act called for all carriers to maintain equal quality and timeliness or parity among all carriers in providing local services including directory assistance, operator assistance, E911, new telephone number access, installation time frames, repair services, and repair time frames. All have to be provided under the same conditions as the incumbent will provide these services to direct customers. Violation of this provision results in heavy fines and potentially the denial of the right to provide other services.

Teleopathy

Teleopathy is the unbalanced pursuit of purpose by either individuals or organizations. This mind-set or malaise has been described as an occupational hazard of business life and the key stimulus to which business ethics is a response. Its three principal symptoms are fixation, rationalization, and detachment.

Fixation

Unlike determination, perseverance, and tenacity, which are often considered positive traits of both individuals and organized groups, fixation is usually regarded as a negative trait, akin to obsession, addiction, and dependency. This negative trait involves the domination of a person's consciousness (or an organization's culture) by a persistent goal, objective, or desire—out of proportion to its importance in the larger scheme of things. Fixation is a kind of misplaced devotion or loyalty that in philosopher Immanuel Kant's language ultimately entails treating the self as a means, not an end.

Rationalization

Often when fixation is present, rationalization is not far behind since rationalizing means offering superficial reasons for behavior when more honest reasons might elicit criticism. Rationalization is typically a temporary form of self-deception or "denial," allowing individuals or groups to suspend normal moral inhibitions when taking action. Two broad types of rationalization are common in business settings: One departs from fiduciary obligations to shareholders (market rationalization), and the other departs from law and regulatory permissibility (legal rationalization).

Detachment

When fixation and rationalization are repeated on a regular basis, they become habitual (or cultural), resulting in a kind of indifference to the human impacts of decision making. Head and heart become disconnected. Objectives become idols; obstacles become threats; second thoughts are silenced—and eventually, second thoughts disappear.

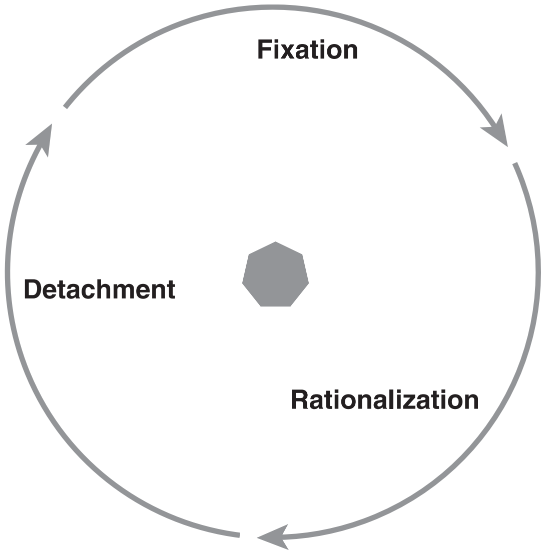

Figure 1 Teleopathy Manifested in Three Symptoms: Fixation, Rationalization, and Detachment

Illustrations

Examples of teleopathy in the behavior of both individuals and organizations are not hard to find (e.g., Jeffrey Skilling and Andrew Fastow, senior executives of Enron; Bernie Ebbers, CEO of WorldCom; and Dennis Kozlowski, CEO of Tyco). The corporate scandals of 2002 resulted in the Sarbanes-Oxley Act, aimed at mitigating abuses in accounting and financial reporting. In the wake of the 2003 crash of the *Columbia* space shuttle, the Columbia Accident Investigation Board (CAIB) indicted the organizational culture, accusing NASA of shortening the launch schedule for a critical section of the space station to meet an overarching goal. The presence of fixation, rationalization, and detachment in these cases is apparent. Less apparent is the antidote to the malaise. Market forces, laws, and regulations are necessary but not sufficient. The prevention of teleopathy must ultimately be personal and cultural. This means moral awareness and corporate conscience, two essential requirements of business leadership.

Terrorism

Terrorism is the exercise of unconventional violence to achieve political objectives. What fits this simple definition is a matter of considerable dispute. Often, those in positions of political power characterize as terrorism those challenges to their established political authority that—rather than employing conventional means to political change, from peaceful discourse to declared warfare—employ violent, frequently surprise, attacks, in some cases on innocent civilian targets. Those who incite, endorse, or commit such attacks may defend them on ideological or religious grounds as the most expedient way to make a statement and effect change against a more politically, economically, or militarily powerful adversary. They may contend that the real terrorists are those in political power who engage in overt or covert military action and political maneuvering to defend and consolidate their authority.

Anywhere it is a threat, terrorism disrupts the ordinary rhythms of life, causing the mother to worry about the safety of her children in public places and the business traveler to second-guess the necessity of a trip, resulting in large-scale consequences for human well-being and economic welfare by infecting daily behaviors with fear and uncertainty. In contemporary, developed markets, it is asymmetric terrorism that is most economically disruptive and which is therefore the primary focus of this entry—especially the September 11, 2001, attacks on the United States. The politics of this kind of terrorism are largely motivated by global economic inequality and associated resistance to perceived cultural imperialism. In a broad sense, the victims of terrorism are not only those whose lives and interests are lost or harmed by terrorist attacks, but also all those whose well-being is at risk as a result of conditions that breed terrorism.

History, Forms, and Economic Impact

Terrorist acts are committed by isolated individuals, one of the hypothetical profiles of the anthrax murderer who sent the global postal system into hysteria with a few contaminated letters in the weeks after September 11, 2001; by well-coordinated, multinational networks, such as al-Qaeda—the organization responsible for the September 11 attacks using airplanes to destroy the World Trade Center and part of the Pentagon; and by the many possibilities in between. Undoubtedly, terrorism dates back to unrecorded history, but there are early examples of terroristlike behavior in the *Iliad*, for example, in Hektor's threatened desecration of Patroklos's body and Achilles' treatment of Hektor's body in revenge—notwithstanding that both deaths occurred in the course of declared warfare. Both the state's violence against its enemies in the French Revolution and the secessionists' violence against the state in the American Revolution have been raised, not without controversy, as examples of how, in modern times, terrorist tactics have effectively tipped the balance of power relations to advance political aims. In recent decades, political factions described as terrorists by the reigning political powers have managed to cause persistent political agitation over the course of decades, leading to neither outright victory nor failure. Examples include Hamas in Israel, Hezbollah in Lebanon, the Shining Path in Peru, Tamil Tigers in Sri Lanka, Euskadi Ta Askatasuna in Spain, and the Irish Republican Army in the United Kingdom.

Violence or threats of harm to human beings can be committed by terrorists, using means from primitive weapons and makeshift explosives strapped to suicidal agents to rare chemical and nuclear materials. Other terrorist means may include spreading computer viruses and attacking critical infrastructure elements such as power and transportation, disrupting the flow of economic and other human activity without direct injury to persons. Characterizing terrorism as exercising unconventional violence raises the question of what form of violence is conventional and what makes it more acceptable than the unconventional kind. Along with the political controversy over defining terrorism, there is philosophical controversy around why precisely it is bad and whether, if all nonterrorists agree that it is bad, it can ever be morally justified—even as its perpetrators often cast their activities as fulfilling moral and religious obligations.

Given the variety of its forms and the dispute about what it is, it is not possible to estimate reliably what the economic costs of terrorism may be. However, they are indisputably monumental, and growing, as social tolerance for uncertainty decreases while the potential damage that a single act can cause increases. One conservative estimate suggests that the insured losses caused by the September 11 attacks were greater than $40 billion, while the direct costs of increased security for risk mitigation will be, over time, orders of magnitude greater, not even factoring in the indirect costs of economic disruption.

Economics, Ethics, and Terrorism

It is evident, then, that there are difficult economic problems regarding the costs of terrorism, as there are troubling ethical problems about the moral status of terrorism. Setting those problems aside for resolution elsewhere, our focus here will be particularly on the intersection between all three—economics, ethics, and terrorism. For although terrorists tend to foment passions about political unfairness, religious irreverence, and military injustice, in many cases, the conditions that produce the kind of extreme communal anger that drives groups of terrorists to collective action—which can cause sustained damage, economic and otherwise, over time—have much to do fundamentally with global economic inequality, in which privilege and poverty coexist. This is not at all to say that poverty always leads to terrorism, that poverty is the only cause of terrorism, that poverty ever justifies terrorism, or that terrorism is always an effective equalizing measure. However, social scientists and political commentators have noted repeatedly that the contemporary terrorist movements that pose the greatest threat to the global economy today are fueled by extreme anger among primarily young men from failed states who are hopeless about their communities' chances of achieving relative material self-sufficiency on earth in the shadow of perceived Western, especially American, interference. Recruited from all elements of society for the promise that their anger can be cultivated into extremism, they may conclude that their prospects of being an antiestablishment hero or of being rewarded in an afterlife paradise outweigh the risks of being a terrorist.

Not that all terrorists are materially destitute. Another way in which economics, ethics, and terrorism intersect is in financing for terrorism. While material well-being may be a general disincentive to engage in terrorism, some leaders of terrorist factions have themselves been quite well off. Much of al-Qaeda's early funding, for example, is said to have come from the economically successful family construction business of its leader, Osama bin Laden, who left the peaceful comforts of upper-class Saudi society to become the world's most wanted terrorist. Moreover, bin Laden and his followers have been able to raise funds for their continued operations, much of it coming from the business profits of wealthy sympathizers whose resentment, like bin Laden's, is directed at the culturally and militarily imperialistic effects of Western economic dominance. Although al-Qaeda and its allies justify their actions with the rhetoric of religious *jihad*, it is doubtful that their popular following—which enables them to recruit martyrs, raise funds, attack, and continuously hide from capture and destruction—would be as strong without the accompanying conditions of poverty, unemployment, and lack of material hope.

Even as bin Laden's enemies sought to isolate him physically and economically, the continued pipeline of funding for al-Qaeda raised concerns that al-Qaeda's targets—especially, the United States—were funding both sides of the war on terror. As the United States spent money to mitigate the terrorist threat, its dependence on oil from countries with ties to al-Qaeda meant that some of its spending circuitously reached the hands of terrorists. With similar historical irony, the United States once supported the cause of bin Laden's *mujahideen* allies in Afghanistan when their common enemy was the Soviet Union.

Clamping down on funding for terrorists has led political powers to enlist businesses in the war on terror, creating a legal obligation for business to expend resources on mitigation of terrorism risk. For example, shortly after the September 11 attacks, the U.S. PATRIOT Act was signed into law, imposing costly preventive and detective activities to support prohibitions on transacting with terrorists. The surveillance provisions in such legislation led to controversy about the balance between national security and citizens' privacy rights. Further blurring the lines between public interests and private spending, lawmakers in various jurisdictions have enlisted the cooperation of business regarding the security of global supply chains, safety of citizens, and other public goods touched by private enterprise.

While such security provisions have imposed substantial costs on business, terrorism has also created economic opportunities in some industries. Demand for terrorism insurance ebbed and flowed after September 11, creating an uncertain market in which some insurers sold policies without having to pay claims, while the uneven demand made affordable pricing troublesome without government intervention. Immediately after September 11, faced with ethical questions about whether to pay out life and property claims to victims given the extraordinary nature of an event that was not contemplated or documented in most policies, the insurance industry was generally credited with responding honorably. Meanwhile, the demand for defense contractors' products and services increased with growing warfare and the need for new security technologies, leading in a few cases to the age-old misbehavior of overcharging governments in times of great chaos. Some manufacturers responded to the perceived terrorist threat with necessary innovations, such as improved airline baggage screening equipment, while others exploited public fear and sentimentalism, with products ranging from questionably effective skyscraper parachutes to questionably tasteful memorabilia.

One idea that tragicomically illustrated the complicated balance between economics, ethics, and terrorism was a proposed predictive market sponsored by the U.S. Defense Advanced Research Projects Agency. The market was purportedly based on sound economic theory and practice, that market mechanisms can have predictive value when individuals place monetary bets on future events, insofar as they are more likely to risk more capital on the probability that something will occur when they are in a position to render an educated hypothesis. Applying predictive markets theory to terrorism, the policy analysis market came to be caricatured as a "terrorist futures" market. Once its details were disclosed to public figures, it was cast as so ethically repugnant as to be shut down almost immediately, leading to the resignation of the head of the Terrorism Information Awareness program.

September 11, 2001

Nearly 3,000 people from all levels of the economic pyramid died on September 11, 2001, in most cases because that day they had shown up for work. In the "Portraits of Grief" published by the *New York Times* in the weeks and months after the attacks, there were recurring sentiments expressed by survivors of how work was in many cases a means to the end of a better life—more time with family, pursuit of education, enjoyment of leisure and play, and in numerous cases, helping others, at home and abroad, who needed material support. The September 11 Victims Compensation Fund, established by the U.S. government to provide monetary benefits to victims' families roughly commensurate with anticipated future earnings, raised ethical questions about what a life is worth and whether the wealthy bond traders at the top of the World Trade Center deserved more than the firefighters who climbed the stairs from the bottom to try to save lives; than the wait staff at Windows on the World, who searched in vain for water to comfort suffocating patrons; or than the homeless man who wandered the ground floor corridors as though they were sidewalks.

Within the "city in the sky" that was the World Trade Center, where tens of thousands of people worked and thousands more visitors coursed through each day from nearly every nation, the specter of economic inequality was ever present but not immediately evident to the typical, hurried office worker. The Twin Towers had been attacked by terrorists once before, on February 26, 1993, vulnerable because of their symbolism of American economic might. When they came down in 2001, virtually shutting down with them the global economy, some responded that they should be rebuilt as soon as possible. The argument continued that the economy should remain open for business to demonstrate that terrorists could take down buildings but could not fundamentally alter the way of life they were attacking. Others, no less critical of terrorism waged on innocent people, responded to the tragedy by reflecting on that way of life. They explored the meaning of work within the good life and sought ways in which to share the economic benefits of world trade beyond the economically privileged nations and economically privileged classes within those nations. Terrorism is not to be credited with motivating solutions to the problem of global economic inequality; however, eliminating the extreme inequality that persists today will go a considerable distance toward future elimination of extremist terrorism, which threatens global well-being.

Tobacco Industry

See Ethics and the Tobacco Industry

Tort Reform

Tort reform encompasses the litany of legislative attempts to limit the extent of civil liability in tort cases, particularly product liability cases. Manufacturing businesses, doctors, and their insurance companies are the major proponents of these efforts to limit expenses related to product liability injuries. Employment law, securities fraud, medical malpractice, and environmental issues also constitute the area of tort cases and their related reforms. Both federal and state legislatures have passed a variety of statutes that attempt to modify the alleged imperfections of the court's tort system.

History of Tort Reform

As a developing United States sought economic stability, *caveat emptor* (let the buyer beware) was the guiding legal principle in civil liability cases. The Industrial Revolution, with its ability to distribute products to a vast array of consumers, required a rethinking and extension of product liability laws through warranties in contract theory and under the doctrine of negligence in tort. The latter proved significant in that privity of contract was not required so that nonpurchasing users and bystanders could recover for injuries caused by a certain product. In the early 1960s, strict liability in tort was recognized and led to an explosion in lawsuits, including class actions in relation to asbestos and other products. As the economy and particular industries such as insurance struggled during the 1980s, affected businesses, doctors, insurance companies, and their political representatives called for tort reform as a remedy. Subsequently, legislative debate and reform has occurred at both the state and federal levels in a number of areas of concern in tort actions.

Current Legislation

Current tort reform legislation exists at both the state and federal levels. The American Tort Reform Association provides an updated sampling of state reforms in the primary areas of punitive damages (32 states), noneconomic damages (23 states), joint and several liability (40 states), collateral source rule (23 states), prejudgment interest (15 states), product liability (16 states), class action (8 states), attorney retention (7 states), appeal bond (33 states), and jury service (12 states).

Federal legislation has focused on civil liability protections (via limited liability and federal jurisdiction) for industries most susceptible to economic risk. For example, the insurance industry, air security companies, air transportation businesses, the financial securities industry, medical device providers, Amtrak, credit unions, vaccine providers, the nuclear power industry, and coal mining companies all receive some sort of federal protection. The federal government seems to justify the legislative shelters granted these specific industries because of their significant economic vulnerability in the current commercial climate. For example, insurance companies (mid-1980s), air transportation (post 9/11), and the financial securities industry (early 21st-century accounting frauds) have each faced a major financial crisis recently. The federal legislation was enacted to ensure that these industries would not be completely devastated by their respective predicaments and could continue providing their invaluable services to society. Other federal laws protect teachers, principals, volunteers, donators of food, and federal drivers to make certain that they may keep on offering their socially desirable and essential services without interruption. The economic rationale for these legal safeguards is to compensate for the inability of the listed service-oriented enterprises to generate any significant self-protecting income, more than it is to address any extreme crisis. Stricter controls on class-action suits is the most recent tort reform to find favor in Congress as of 2005.

Tort Reform Proposals

Proponents of tort reform suggest a variety of methods to reduce the costs associated with product liability cases. Obvious examples include implementing a limit to the amount of damages one may receive in any case and the elimination of strict liability (responsibility regardless of fault), returning to the negligence standard in all cases. Other recommendations include placing limits on the amount recoverable for pain and suffering, restricting lawyers' compensation (with greater correlation to the actual recovery of clients), requiring losing plaintiffs to pay defendants' legal fees (with even greater punishment for frivolous lawsuits), ending joint and several liability (ability to recover the entire amount of damages from any one of the culpable defendants), and abolishing or limiting punitive and other noneconomic damages, especially for products approved by regulators. Procedural suggestions hope to diversify and broaden jury pools, restrict the collateral source rule so that insurance or workers' compensation recovery will be both admissible and an offset of damages, limit the amount of appeal bonds and prejudgment interest, reduce the statute of limitations and statute of repose, increase the burden of proof, use more stringent evidentiary rules, and establish an efficient form of alternative dispute resolution. To avoid political partiality and inflated fees, attorney sunshine laws seek to require legislative approval of large contingency agreements when states sue for reimbursement against certain businesses (e.g., the tobacco lawsuits).

Arguments in Favor of Tort Reform

The protection of business from the sometimes overwhelming legal costs of product liability is the major argument in favor of tort reform. These costs then have a negative ripple effect on dependent businesses, consumers, and other stakeholders in society. The argument states that prices increase, innovation decreases, jobs are lost, and all citizens are essentially taxed by the costs to support the inefficient tort legal system. Tort reformers believe that frivolous lawsuits burden business and impair the economy and that even legitimate lawsuits disproportionately benefit the lawyers instead of the actual victims. The tort system itself is criticized for an inefficiency that spends billions of dollars without awarding a significant percentage of that amount to injured parties. The tort system, tort reform advocates say, benefits trial lawyers more than the actual victims, especially in class actions where the percentage of successful claimants who receive their awards is surprisingly low. In addition, personal injury claims seem to vary in value from one state or jurisdiction to another, creating inconsistencies in insurance rates and jury awards. A uniform federal tort reform law arguably rectifies such irregularities. Finally, tort reform would prohibit the controversial effort to "legislate through litigation," that is, the attempt to bring about regulatory changes and objectives through litigation instead of through the legislative process. The increase in the number of tort cases, the number of attorneys, and the amount of monetary awards are all cited as causes for the escalation in overall costs to the tort system.

Arguments Against Tort Reform

Plaintiffs' trial lawyers (and consumer advocates) opine that businesses should be held responsible for their products so that they are motivated to make better and safer products over which they have ultimate control. Businesses are also in a better position to absorb and assume the costs associated with injuries caused by their products. They can also pass on those costs to consumers. Also, to truly stimulate companies to manufacture safer products, be more forthcoming, and respect the environment, the monetary damages for injurious products and the risk of placing such products in the market need to be appropriately high. The entire litigation process lends itself to an increase in information and punishment that leads to safer products and practices. Thus, the tort system regulates business in a manner that efficiently complements the functions of official governmental regulatory agencies. Furthermore, enormous debilitating verdicts against business are indeed rare and often reduced on appeal even when they do occur. Tort reform, according to its critics, would simply insulate businesses from their legal and social responsibilities.

Conclusion

Both federal and state legislatures have passed a variety of statutes in an attempt to rectify the imperfections of the tort system. The remedies consist primarily of methods of reducing the overall costs related to such litigation. There also exist some procedural rules designed to promote more equitable resolutions. Because tort reform is essentially a recent historical development (since the 1980s), it will naturally take a little time to discover its most effective manifestation. Both the positions in favor of and against tort reform testify to its legislative immaturity.

One major challenge to the current tort reform debate is the dearth of agreed-on data that would provide a starting point for a constructive discussion between the advocates and dissenters. Verifiable statistics about legal costs, job losses, safety benefits, and attorney and claimant rewards seem to be a must before real headway can be made in the controversy.

Tort reform also indirectly raises the question of federalism versus states' rights. If reform is really the solution to tort liability concerns, should the federal or state government be the primary conduit of implementation? And is the primary role for business regulation incumbent on the legislature or on the free market system itself? In a real sense, tort liability and tort reform mirror the current question about corporate social responsibility: To what degree shall business be held responsible for injuries to the public in connection with unsafe products, financial fraud, deceptive advertising, and environmental degradation? And is tort law a desirable form of legal insurance for social mishaps, or is tort reform a necessary guardian for economic prosperity? Tort reform seems to be in an awkward stage of requiring companies to fairly compensate injured claimants without burdening businesses to the point of bankruptcy and allowing a minority of overzealous lawyers to exploit the imperfections inherent in the system.

Torts

Torts are civil wrongs in violation of a protected interest or right (and its related duty), other than a breach of contract. Intentional torts, negligence torts, and strict liability torts make up the three primary classifications of torts. Assault and battery, automobile accidents, and faulty consumer products are a few of the many sources of torts. Torts usually involve the violation of an individual's right to bodily security or property interests, the legal guarantee to engage in (or refrain from) certain conduct, or the right to receive (or be protected from) specific treatment from another. The infringement of a said noncontractual right and violation of its related duty is a civil wrong or legal tort (derived from the same French word, which means "to twist"). The same action may be both a civil tort and a crime (e.g., an assault). The courts and law remedy civil torts with monetary damages and injunctions.

Social and Ethical Implications

The most basic social and economic relations require a respect for one's bodily safety and for one's property interest. Tort law has traditionally provided a moral minimum of behavioral guidelines toward a variety of personal and property rights. The enforcement of torts has historically protected said rights, deterred infringement of related and future interests, and compensated for violations thereof. Besides the obvious rights and utilitarian foundation for the protection of such tort interests, the structure of tort law advances both compensatory and distributive justice.

Tort protection of property and bodily rights advances the economic efficiency on which society depends for its overall development. Tort law tries to reduce the costs associated with the injuries connected with the violation of said rights and with the expense inevitable in preventing them. This goal is achieved partially by a tort system designed to award damages in a manner and through an amount that promotes precautionary protection of important personal rights and property interests. Tort law awards monetary damages to individuals whose rights have been violated by the intentional destruction of their property, the accidental injury to their physical person, or their sickness caused by a defective product. Greater security in said rights is a natural outgrowth of the tort system's fair process and substantial sums afforded to the injured and of the compensatory and punitive damages inflicted on both present and future perpetrators. The freer flow of information and increase in safety are said to further testify to these benefits. Plus, the opportunity to have one's day in court protects the notion of justice inherent in the legal system and the nation for which it was founded.

However, many argue that the compensation is overly punitive, that it essentially results in a tax on consumers, and that it discourages technical innovation. Strict product liability in tort is the starkest example of these criticisms since it imposes legal liability on businesses even if they exercise ordinary care. Thus, under the notion of distributive justice, strict liability places the costs of both the injuries and the prevention on the businesses in part simply because they are arguably better situated to insure against them and redistribute said costs to a large number of consumers.

Intentional Torts

Intentional torts derive their name and classification from the fact that the perpetrator (or *tortfeasor*) intended to commit the wrongful act or intended to bring about the wrongful consequences (or knew with substantial certainty that such consequences would occur). Intentional torts are committed against either a person or a person's property. Intentional torts against a person's right to bodily security consist of assault (creating apprehension of immediate harmful or offensive contact), battery (unwelcome, offensive contact), false imprisonment (restraint of another's freedom without good reason), and intentional infliction of emotional distress (caused by an extreme and outrageous act). Common examples include physical altercations between coworkers and the prolonged and uncomfortable detainment of shoplifters.

Other intentional torts against the person, but not the person's bodily rights, include malicious prosecution, defamation (false, negative communication that damages a person's reputation through written libel or oral slander), invasion of privacy (by intruding into a person's individual affairs, publicly disclosing private facts or information that places a person in a false light, or misappropriating a person's name or likeness), and fraud (knowing misrepresentation of material facts). Celebrity gossip magazines occasionally give rise to these torts. Newsworthy public figures relinquish part of but not all their privacy in the eyes of the law.

Intentional torts particular to business include wrongful interference with contractual or business relationships and trade disparagement. Conversion (civil theft), disparagement of property, private nuisance (inhibiting enjoyment of one's property), and trespass on land or personal property encompass a few of the intentional torts against a person's property. Although the violation of the protected rights by itself is enough for receiving compensation for an intentional tort, damages will be awarded in relation to the severity of the injury to the person or the person's property.

Defenses to intentional torts include consent, defense of self, others, or property (with the degree of force limited to what is reasonably necessary), recovery of wrongfully taken property, merchant's privilege to detain, and private and public necessity (in cases of emergency). These defenses excuse legal responsibility for the intentional transgressions of individual rights.

Last, it should be noted that torts committed in cyberspace are a growing phenomenon. Although traditional media such as television, radio, magazines, and papers could be held responsible for defamation, the same is not true for Internet service providers (ISPs). The Communications Decency Act of 1996 essentially insulates ISPs from liability for defamatory postings, destructive viruses, spam, and e-commerce gone awry. Conversely, the originator of these injurious actions could be held liable under traditional tort theories.

Negligence

Like intentional torts, negligence involves an act that wrongfully violates a protected right in one's property or person. However, contrary to intentional wrongs, negligence describes unintentional tortious acts that violate one's duty to exercise ordinary care under the circumstances (also referred to as due care or reasonable care). The degree of care required varies in relation to a reasonable person under the circumstances. For example, legal responsibility for a delivery person's driving accident will depend in part on whether she was driving reasonably under the circumstances of the road, weather, and traffic. Most jurisdictions will hold professionals (like doctors, lawyers, and accountants) to the reasonable skill and knowledge level of someone in that profession. Thus, malpractice is negligence by a professional. Another difference between intentional torts and negligent torts involves the requirement that the duty-breaching act cause the injury to the protected right. This "causation" condition is automatically satisfied where intent is found because intent includes the desire to bring about the consequences. But negligent acts are unintentional by their very nature in that they do not anticipate or intend the harmful consequences. Yet, the law imposes liability for such behavior to hold people responsible for their actions, to promote a certain standard of care within society, to compensate individuals injured by the actions of another, and to influence others to guard against future possibilities of negligent indiscretions. Most states enforce responsibility for negligent actions that "proximately cause" the injuries in question. Proximate cause has been defined by most courts as existing when the consequences were reasonably foreseeable; that is, a reasonable person should know that the action could result in the potential injurious consequences. A minority of states find legal causation when the act is a "substantial factor" in bringing about the injury. If a driver is speeding or driving haphazardly, injuries resulting from such driving would most likely satisfy causation since it is reasonably foreseeable that that type of driving would result in an accident and injuries to another.

To receive compensation for another's negligence, an actual injury to one's person or property must have occurred. This requirement further distinguishes negligence from intentional torts, which allow recovery for the intentional violation of the right itself without requiring an accompanying physical injury (intentional infliction of emotional distress being an exception in some jurisdictions). The amount of damages awarded will, of course, depend on the seriousness of the injury and the level of negligence. Punitive damages may be awarded when the *tortfeasor* is found to have been malicious or grossly negligent, that is, exhibiting a reckless disregard or indifference to the rights of and consequences to others. Punitive damages are usually given in an effort to discourage any similar future wrongdoing by the particular or potential defendants.

Defenses to Negligence

The primary defenses to negligence, those circumstances that excuse legal liability even though one failed to exercise ordinary care, include assumption of the risk and comparative negligence (with contributory negligence also remaining in a minority of states). Although technically not a defense, exercising ordinary care under the circumstances (and thus not being negligent) is the most obvious way a defendant avoids liability. Since proximate cause is needed to impose negligence liability, a superseding or intervening event that breaks the chain of causation is a defense to any additional damages subsequent to such an intervening event. For example, a driver who negligently injures a person in a car accident is not responsible for any additional injuries resulting to that individual during the subsequent ambulance ride that results in a second accident.

Assumption of the risk, which can be express or implied, relieves liability when and because the injured party is aware of and assumes an ordinary risk (but not a peril that is extraordinary). For example, a worker may venture into a construction area that she clearly perceives as containing some degree of danger. She will usually be precluded from recovering for any injuries resulting therefrom since she was or should have been aware of the risk and thus assumed it voluntarily.

Comparative negligence is a defense that reduces the amount of damages recoverable from an act of negligence by the percentage of negligence apportioned to the injured party's own careless actions. For example, if an injured party who suffered $100,000 worth of injuries is found to have been 20% responsible for his own harm, then he will only receive $80,000, his overall recovery being reduced by his comparative negligence. Some states honor this proportional reduction all the way to 1% (which obviously raises the possibility of the plaintiff being liable to the defendant). Other states, meanwhile, permit the plaintiff to recover only if the plaintiff's negligence is not more than (or sometimes not equal to) the defendant's. Maryland, Alabama, Virginia, North Carolina, and the District of Columbia do not yet follow comparative negligence, still adhering to the doctrine and defense of contributory negligence, which precludes any recovery whatsoever by the injured party when his or her own negligence contributed in any degree to the injury (unless the defendant still had a last clear chance to avoid said injury).

Particular Negligence Doctrines

Most of the following special negligence doctrines impose (or excuse) legal responsibility under very specific circumstances. *Respondeat superior* holds an employer vicariously responsible for the tortious actions of its employees or agents while they are acting within the scope of their employment. *Res ipsa loquitur* creates a rebuttable presumption of negligence when the circumstances surrounding the injury indicate that negligence occurred. The injury resulting from a violation of a statutory duty results in *negligence per se* when the statute designates it so. The *danger invites rescue* doctrine holds the negligent party additionally responsible for any injuries suffered by someone trying to help the party originally hurt by the negligent individual. *Good Samaritan* statutes protect people who try to help others in need from actions of negligence unless their efforts were reckless. Each of these special doctrines represents public policy decisions made to compensate society for (and protect it from) harmful events that need to be more precisely addressed within the context of negligence theory.

Strict Liability

Strict liability (or no fault) in tort essentially imposes legal liability for certain types of actions and their resultant injuries on the actor, regardless of his or her lack of negligence or intent to injure. A presumption of responsibility is placed on individuals in certain legally identified circumstances (e.g., abnormally dangerous activities and the distribution of defective products) because of the seriousness of the potential injuries (as to quality or quantity) and because the primary ability to prevent such injuries seems to reside with the actor. Strict liability is imposed on these individuals even if they exercised ordinary care under the circumstances and would not be legally responsible for negligence because the belief is that with their primary control over the situation or injury-inducing subject matter they have both the duty and the ability to prevent such injuries. In formalizing the legal obligation under strict liability, policy makers endeavor to persuade potential plaintiffs to take appropriate safety precautions.

Strict liability in tort was originally (and continues to be) applied to ultrahazardous or abnormally dangerous activities involving dynamite, chemicals, radioactive materials, and wild or dangerous animals. The high risk, potential seriousness, and uncommon nature of these activities led logically to legal liability irrespective of fault. More recent public policy concerns have led to strict liability being applied to certain types of copyright infringement cases. But by far, the most significant and controversial areas of strict liability are found in strict product liability.

Strict Product Liability in Tort

Although contract warranty and negligence law had methodically been chipping away at the doctrine of caveat emptor (let the buyer beware) since the beginning of the 20th century, it was not until the mid-1960s that the law seriously eviscerated most historical protections when the doctrine of strict liability in tort was extended to a variety of products during the consumer protection movement. Section 402A of the Restatement (Second) of Torts, issued in 1964, articulated that strict liability awaited sellers of products in a defective condition that was unreasonably dangerous. In 1997, the Restatement (Third) of Torts: Products Liability clarified the meaning and application of defective products to include defects in manufacturing, design, or warnings, which together encompass packaging, instructions, testing, and pretty much everything else surrounding the production and distribution of a product. Because the doctrine is based on tort theory and not on contract law, every party in the chain of distribution (manufacturers, assemblers, packagers, wholesalers, distributors, retailers, and lessors) is strictly liable for its role in the distribution of a defective product to anyone injured (i.e., every consumer, user, purchaser, lessee, family member, guest, employee, indirect beneficiary, or bystander) by its use and foreseeable misuse (including accidents reasonably foreseeable from any use). The business community and its insurers, realizing the potential breadth and severity of this liability, have proposed reforms in strict liability laws since the 1980s.

Defenses to Strict Product Liability

As "strict" as product liability law may appear, the doctrine does not impose absolute liability. Defenses against strict product liability do exist, providing protection from legal responsibility under certain circumstances. For one, the seller is not responsible for commonly known dangers found in an obviously and unavoidably dangerous product. This defense protects businesses from responsibility for injuries related to things such as knives and hammers but does not excuse liability for ultrahazardous activities. Another defense applies when the defective product is bought by a sophisticated purchaser since this person is expected to be especially aware of the product's risks. Also, protection from strict liability may exist if the product (like certain medicines) is considered safe according to the best scientific knowledge at the time since the law does not desire to hold someone responsible unfairly for an unknown danger. Comparative negligence is still technically a defense against strict liability in that it can reduce the amount of damages recoverable.

Conclusion

The three primary categories of tort law are intentional torts, negligence torts, and strict liability torts. Each plays a significant part in moderating the social and economic relationships among society's stakeholders. Although all three doctrines, like most laws, have a strong ethical basis in rights, duties, consequences, and compensatory justice, it is the more recent development of strict liability that seems to use Rawlsian distributive justice as a justification.

Business has realized an inordinate amount of benefits in postindustrial age society, while workers and consumers have borne the brunt of its burdens. Strict liability in tort seems to be one way the legal system tries to protect society from further potential injustices. Or restated more benignly, the tort system promotes protection of important personal and property interests by redistributing the cost of prevention primarily on the businesses because they are better positioned to protect against such injuries with their expertise, control, and financial resources. But the final distribution of responsibility has yet to be fully determined as tort reform endeavors to redefine strict liability and the framework of justice it establishes.

Total Quality Management (TQM)

The goal of total quality management (TQM) is for an organization to realize continuous improvement in its business processes for the benefit of its end customers. These processes involve the procurement of material, the production process, and the distribution of final goods to the customers. As an integrative process, TQM requires the use of both information and human resources to foster continuous improvement. It may also be considered the philosophy supporting modern supply chain management. Since today's firms often find it advantageous to establish flexible contractual relationships, as opposed to inflexible mergers, it is important for potential supply chain partners to demonstrate a mutual commitment to raise quality. Despite a lack of agreement on a precise definition, TQM has been used as a clarion call to initiate a change in process—which may or may not conform with any other type of organization's attempt to raise quality. Therefore, TQM is best understood as an intention to achieve something rather than something subject to a strict definition.

Quality itself may have different definitions; therefore, it should come as no surprise that any technique sought to manage it would be limited in terms of the assumed definition of quality. One view is that quality comes from uniformity and conformity of the product to the demands of the marketplace. Another view is that quality is evidenced from the product's availability and ultimate usefulness. These definitions have an important difference in terms of customer service. The first purports a strong form of consumer sovereignty, while the second recognizes that the producer has a role to play in educating the consumer as his or her demands in the marketplace form and evolve.

TQM, as a systems approach, seeks to lower costs and increase customer service at the same time. While these twin goals may be looked on as a trade-off, the focus on all the people within an organization, and along its supply chain, brings to the fore the need to work toward a common goal (i.e., customer satisfaction) by the sharing of information. What is required is a consensus over what defines quality along the supply chain and what is necessary to maintain it over the long run. Of course, market realities such as changes in technology and customer tastes mean that the process must be subject to change and adaptation. As such, TQM must be part of the long-term strategic vision of any organization wishing to practice it.

TQM may be looked on as a business philosophy applicable to all facets of manufacturing and service provision. Its roots may be traced to the pioneering work of quality theorists such as W. Edwards Deming and Joseph M. Juran in the late 1940s and early 1950s. Both took notice of the Union of Japanese Scientists and Engineers, formed in 1949, to improve Japanese productivity and quality. While both Deming and Juran developed their ideas through studying U.S. firms, it was the Japanese manufacturing sector that took most strongly to their work. Deming began his work with the Japanese in 1950 and Juran followed in 1954. At first the emphasis was on methods of statistical quality control; that is, randomly sampling output to estimate the likelihood of defects. But, through Deming and Juran, the emphasis soon expanded from collecting statistics to the wider task of examining organizational processes. In other words, a paradigm shift was occurring beyond merely controlling defects to one where defects were to be prevented. Quality was now seen as part of efficiency. Customer satisfaction was to be sought as opposed to profit in and of itself. While TQM, as a concept, grew out of this work, it must be noted that the pioneers themselves never used the term. Referring to TQM in 1994, Deming himself noted that it was a buzzword, that there was no such thing, and that the term carried no meaning. Typical of buzzwords, and as noted above, there is no standardized definition of TQM since the term has been adopted in a wide variety of ways over several decades. The actual term *total quality management* was coined in 1985 by the Naval Air Systems Command, which adopted its own version of quality management.

Models for achieving quality in business processes are suggested, for example, by the International Organization for Standardization (ISO) and the British Standards Institution (BSI). It should be noted that while firms enjoy signaling their certification by such auditing organizations, the signal does have its limitations. For instance, ISO certification merely attests that the firm in question has a process in place for quality control that was validated under audit conditions. One should in no way infer from this that the firm's final product is defect-free and of consistent quality. It was the process quality that was vetted, not the product quality.

As an example of this long-term process, TQM would not require the firm's purchasing department to simply look for the lowest cost vendor; rather, the firm should seek the vendor offering the best cost-quality combination. Of course, issues such as vendor longevity and flexibility would be a part of the assessment of quality. If the firm operates within tight time frames (e.g., just-in-time supply and lean manufacturing), then vendor flexibility would be particularly important.

Once the goal is determined and quality defined by all organizations along the supply chain, these organizations have to be aware of their particular competitive advantages and how to maintain them. They must be willing to outsource and in-source to control overall supply chain costs and enhance the logistical flows of inputs, outputs, and financial capital.

TQM reached the height of its popularity in the 1980s when many U.S. firms came under the belief that they needed to compete more effectively with their Japanese rivals in the area of quality. The results were mixed in that some firms found it difficult to deploy such a fundamental change in process, while others began to question TQM's return on investment. The main issue was that the cost side was easier to measure than was quality, with its inherent subjectivity. Over time TQM came to be viewed as a necessary but not sufficient program for maintaining competitive advantage.

Social concerns have also entered into the discussion of product quality. For example, ISO 14000 is a program that audits specifically for environmental impact, while ISO 26000 is intended to audit for "social responsibility" on the part of the firm. In other words, the practice of TQM has expanded beyond the business processes and continuous improvement initiatives contained strictly within the organization and its supply chain partners. Positive spillovers to external organizations may now be considered a part of quality management. As with all variants of TQM, education and training is very important for all employees to feel that they have a part to play in the organizational changes that are to be engendered.

In summary, TQM may be seen as having three principles: focusing the organization on its customer; continuously improving business processes; and promoting teamwork internally and externally through supply chain integration. Techniques must be used to measure success in these three areas and aggregated in some way to manage quality. Therein lies the challenge for organizations today.

TQM requires a change in business culture at all employee levels as much as it does a change in business activities. All employees must be involved. Indeed, the right cultural attitude is necessary to recognize the need for continuous improvement. Focusing on activities alone is not sufficient; TQM requires a long-term process of lowering costs, increasing revenues, empowering employees, and satisfying customers. Systematically increasing quality may indicate a commitment to business ethics as well. Empowered employees and satisfied consumers are raised by TQM to a strategic level commensurate with profits and market share.

Toxic Waste

Toxic waste is waste material that can cause death or injury to living creatures. Waste is considered toxic if it is poisonous, radioactive, explosive, carcinogenic (causing cancer), mutagenic (damaging chromosomes), teratogenic (causing defects in the unborn), or bioaccumulative (accumulating in the bodies of plants and animals and thus in food chains).

Toxic wastes result from industrial, chemical, and biological processes. In the early years of the 21st century, U.S. factories released 3 to 4 million tons of toxic chemicals into the air, land, and water annually, including more than 70 million pounds of known carcinogens. Toxins are also found in household, office, and commercial wastes, such as batteries and pesticides, and in cell phones and computers. Five hundred billion gallons of U.S. groundwater are contaminated with uranium and other toxic chemicals. Another 800 million gal of uranium waste is buried in landfills, trenches, and unlined tanks.

The "dirty dozen"—12 of the world's worst chemical toxins—comprises nine chemicals used as pesticides (aldrin, chlordane, DDT, dieldrin, endrin, heptachlor, hexachlorobenzene, mirex, and toxaphene), two by-products of chemical production and the burning of chlorinated substances (dioxins and furans), and a group of industrial pollutants known collectively as polychlorinated biphenyls (PCBs). Toxins such as arsenic, beryllium, cadmium, copper, lead, nickel, and zinc are chemicals known as persistent toxins because they linger in the environment for long periods.

The Dangers of Toxic Waste

In 1962, Rachel Carson, a biologist, ecologist, and writer, penned *Silent Spring.* The book described how DDT entered the food chain and accumulated in the fatty tissues of animals, including human beings, and caused cancer and genetic damage. Carson wrote that a single application on a crop not only killed targeted insects for months but also destroyed countless more and remained toxic in the environment even after it was diluted by rainwater. Carson argued that DDT and other pesticides had contaminated the entire world food supply. A powerful chapter titled "A Fable for Tomorrow" portrayed a nameless American town where all life—from fish to birds to apple blossoms to human children—had been "silenced" by the insidious effects of DDT. *Silent Spring* provoked widespread public alarm. Carson's conclusion that pesticides had contaminated the entire world food supply raised awareness of the dangers of persistent bioaccumulative toxins.

Well before *Silent Spring,* the risks of toxic wastes were evident. For example, lead was a known toxin in the 19th century, with reformers documenting lead poisoning in the workforce and leading cleanup efforts. Nevertheless, auto companies, oil companies, and the government authorized the manufacture, distribution, and use of tetraethyl lead in gasoline in the 1920s. Health officials warned against depositing millions of pounds of inorganic lead dust onto the streets from car exhaust. However, the lead industry pointed to lead's importance to the automotive and petrochemical industries, calling tetraethyl lead a gift from God.

Similarly, despite evidence of lead paint's toxic effects on children as early as the 1920s, the lead industry campaigned for decades to deter concerns. The National Lead Company, manufacturer of Dutch Boy paints and lead pigments, produced children's coloring books, including *The Dutch Boy's Lead Party*, extolling the benefits of lead paint. The federal government finally banned lead in paint and gasoline in the 1970s and 1980s.

In the 1950s in Minamata, Japan, deformed fish floated in Minamata Bay. Cats "danced" in the streets, often falling in the sea and drowning. Townspeople began to tremble, stumble, shout uncontrollably, and experience paralysis, hearing and vision problems, and body contortions; at least 3,000 died. Children were born with the "disease." The ailment was later diagnosed as mercury poisoning resulting from the Chisso Corporation's manufacturing of acetaldehyde. Mercury from the production process spilled into the bay and entered the food chain, including seafood, which was the town's primary protein source. Concentrations increased dramatically at each level of the chain. While mercury was long known to be a toxin—the neurological degeneration caused by mercury used in hat-making in the 19th century led to the phrase "mad as a hatter"—Minamata vividly highlighted its dangers in the food chain.

Hooker Chemical and Plastics Corporation used an empty canal in Love Canal, a section of Niagara Falls, New York, in the 1940s and 1950s to dump 20,000 tons of toxic waste in metal drums. After the canal was filled and the land given to the city, houses and an elementary school were built on the site. By the late 1970s toxic chemicals leaked through their drums and rose to the surface, resulting in high rates of birth defects, miscarriages, cancer and other illnesses, and chromosome damage. Families were evacuated and a national emergency was declared. Tensions ran high; on May 19, 1980, Love Canal activists took two government representatives hostage overnight.

The September 11, 2001, terrorist attacks raised concerns about potential sabotage of toxic waste. Eighty thousand tons of highly radioactive waste awaiting transportation from U.S. nuclear power plants to storage facilities could be targeted by terroists when it travels through 39 states on roads and railway lines. Also, 15,000 chemical plants and refineries nationwide could be terrorist targets, with more than 100 of them putting at least a million people at risk. An attack on a single New Orleans refinery, containing 600,000 pounds of hydrofluoric acid, could jeopardize the city's entire population. Related to this, three Superfund toxic waste sites in and around New Orleans were flooded in 2005 by Hurricane Katrina, and some experts argue that toxic chemicals released into New Orleans floodwaters will make the city unsafe for full human habitation for a decade.

The devastating 2004 Indian Ocean tsunami washed vast amounts of toxic waste—including radioactive waste, lead, heavy metals, and hospital wastes—onto the shores of Somalia and other nations. The legacy of decades of illegal dumping by European and other nations, that waste has already been linked to acute respiratory infections, abdominal hemorrhage, skin reactions, and sudden death after inhalation. These and other high-profile examples—including the *Exxon Valdez* oil spill, the Chernobyl disaster, the Bhopal gas leak, and the Three-Mile Island scare—have raised public awareness and concern.

Costs

Toxic wastes result in huge costs in terms of economic expenditures, human health, and the ecosystem. By one estimate, exposure to toxic substances costs industrialized countries $300 billion annually. The U.S. Geological Survey projects cleanup costs for existing environmental contamination in the United States of as much as $1 trillion.

Toxic waste has been implicated in deaths and health problems such as cancers, birth defects, miscarriages, low birth weight, neurological disorders, liver disease, developmental disorders, hypertension, and heart defects. An estimated 50,000 to 100,000 Americans die annually from the effects of outdoor particulate pollution alone. Cancer rates have risen each year since 1970, with growing levels of environmental toxins cited as a primary cause. Children under 5 years of age, who represent 10% of the global population, bear 40% of the environment-related disease burden, and childhood cancers have increased dramatically.

Toxic wastes also cause massive damage to the ecosystem, endangering or destroying animal and plant life. Such wastes overwhelm natural restorative processes, destroy habitats, kill off sensitive species, and reduce biodiversity. The bald eagle population's decline as a result of DDT use is a vivid example. Similarly, PCBs and other toxins are blamed for many whale deaths.

Laws

Many U.S. laws regulate toxic waste. The 1970 Federal Clean Air Act, last amended in 1990, forms the basis for the national air pollution control effort. Its elements include hazardous air pollutants standards, stationary source emissions standards, and other standards and enforcement provisions. The Toxic Substances Control Act of 1976 requires the Environmental

Protection Agency to regulate potentially hazardous industrial chemicals, including halogenated fluorocarbons, dioxins, asbestos, PCBs, and vinyl chloride.

The Resource Conservation and Recovery Act (RCRA) became law in 1976 and regulated the safe handling and disposal of hazardous wastes. It created the "cradle to grave" system to keep track of such wastes.

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), enacted in 1980, created the Superfund Program to deal with toxic waste dumps. CERCLA provided liability for those responsible for illegal waste dumping and a trust fund to clean up sites when the responsible parties could not be found or determined. Releases of CERCLA hazardous substances in amounts greater than their "reportable quantity" must be reported to the National Response Center and to state and local government officials.

The Emergency Planning and Community Right-to-Know Act amended CERCLA in 1986 to require mandatory public disclosure of release of toxic substances. The annual report of the Toxic Release Inventory (TRI) continues to provide detailed information to communities about the types and amounts of toxins that are legally released into the environment.

In addition to such regulations, toxic waste producers are facing growing numbers of "toxic tort" cases. A "toxic tort" is personal injury or property damage from exposure to toxic substances due to the fault of another party. Victims can sue for medical expenses, lost wages, and pain and suffering.

Dealing With Toxic Wastes

Approaches to dealing with toxic wastes include prevention, disposal, and bioremediation.

Prevention

The ideal would be to eliminate toxic waste production. Toxins can be reduced though substitution of nonpolluting alternatives. For instance, chlorine, which is used to bleach wood and results in the formation of dioxins, could be replaced with oxygen. Efficient production processes and proper maintenance of machinery also reduce toxins. Recycling of some wastes, such as expensive heavy metals, can cut both toxins and costs.

The aim of the "green chemistry" movement is to use chemistry for the design of chemical products and processes that reduce or eliminate the use and generation of hazardous substances. Chemicals may also be added to waste to reduce their toxicity.

Disposal

Disposal forms include land disposal, incineration, and bioremediation. With land disposal, waste is buried in landfills that should be permanently sealed to contain the waste. Landfills may be lined with clay or plastic, or waste may be encapsulated in concrete. However, leaks may occur. Incineration may be at low temperatures, used primarily for urban refuse, or high temperatures, best for many industrial wastes such as tar, paint, pesticides, and solvents since they prevent the formation of dioxins.

Bioremediation

Bioremediation is the use of living organisms to degrade hazardous organic contaminants or transform hazardous inorganic contaminants to environmentally safe levels. Some microorganisms use oil as a source of food, producing compounds that can emulsify oil in water and facilitate the removal of the oil. Successfully applied following the *Exxon Valdez* oil spill, bioremediation treats contamination in place, thus avoiding removal-disposal costs, harnesses natural processes, and reduces environmental stress associated with conventional cleanup efforts. Gene-splicers are also now working to engineer the genes of one radiation-resistant bacterium to produce a "superbug" to decontaminate the world's most intensely radioactive wastes.

Phytoremediation uses plants to remove hazardous substances from soil. For example, genetically altered trees containing the *merA* gene can be planted on contaminated sites, draw in heavy metals such as mercury, and then either transform them into less toxic forms that are dispersed into the air and diffused or trap them aboveground for later harvest.

Social and Ethical Issues

Some social and ethical issues relating to toxic waste, such as illegal dumping of wastes and cover-ups of dangers, have already been identified. Several others deserve consideration.

Negative Externalities

Negative externalities are costs imposed on society at large but not borne by the organization that generates the costs. When toxins generate societal costs that producing firms do not bear, such externalities exist. This shifting of costs raises fundamental questions of fairness. Negative externalities are also a major source of market failure since they encourage firms to overproduce goods and services with external costs.

For example, the Superfund program relied on a trust fund to pay for so-called orphan sites, for which parties potentially responsible for the wastes can't be found or no longer exist. The fund was initially supported by a tax on chemical and oil companies, which generated about $2 billion annually for remediation of contaminated sites. However, the tax expired in 1995, and Congress has not reinstated it. As such, citizens are bearing an increasing percentage of cleanup costs.

Trading Credits

With cap-and-trade, industry is given a capped number of "credits"—an amount of pollution that companies can emit legally. Firms producing less than their allotted quota can sell the remainder to other companies. For example, the 2005 Clean Air Mercury Rule established "standards of performance" limiting mercury emissions from coal-fired power plants and created a market-based cap-and-trade program aimed at reducing nationwide utility mercury emissions.

Advocates say that once limits are set that reduce overall levels of pollutants, market forces can most efficiently deal with allocation of pollutants across firms and industries. However, critics note that this lets some companies pollute more than others, subjecting nearby communities to disproportionately intense levels of emissions and creating dangerous "hot spots."

Exporting Toxic Waste

One approach taken to dealing with toxic waste is to send it elsewhere. Harvard University president Lawrence Summers, then chief economist and vice president of the World Bank, wrote in a now-notorious internal memo, "I think the economic logic behind dumping a load of toxic waste in the lowest wage country is impeccable and we should face up to that."

An estimated 50% to 80% of U.S. electronic waste is shipped to developing countries, risking spillages. Receiving countries often lack expertise and technology to safely deal with toxic waste, thus putting locals at risk. Greenpeace estimates that 90% of obsolete ships—many containing toxins such as asbestos and PCBs—are broken up in India, Bangladesh, Pakistan, China, and Turkey. "Shipbreakers," many of them children, often lack protective gear.

The Basel Convention seeks to control the transboundary movement of hazardous wastes and hazardous recyclable materials and to promote their environmentally sound management. The Stockholm Convention on Persistent Organic Pollutants (POP) aims to eliminate the dirty dozen of persistent organic pollutants.

The Rotterdam Convention on Prior Informed Consent requires exporters to notify of any export of potentially hazardous substances. Exporting countries must also comply with decisions of importing countries and those countries through which waste will pass. Critics of prior informed consent argue that future generations inheriting the costs of toxic waste, including disease, death, sterility, and birth defects, have no voice in that consent.

Environmental Racism

A nationwide study found race to be the most significant predictor of location of commercial hazardous waste facilities and uncontrolled toxic waste sites, an even greater influence than poverty. Differential access to power and decision making among black and white communities institutionalizes disparities in site location. Sixty percent of black or Hispanic Americans live near an uncontrolled toxic-waste site. A growing grassroots movement has developed in response to this "environmental racism."

Environmental Activism

Along with grassroots movements, environmental activism may take other forms. For example, Greenpeace, with offices in 41 countries, spends $360 million annually on environmental activism. Its mission statement says it "uses nonviolent, creative confrontation to expose global environmental problems and to force solutions for a green and peaceful future." Greenpeace members have, for instance, interfered with the dumping of toxic waste at sea and invaded nuclear facilities.

More extreme activist groups, such as Earth First!, use "ecotage," blockading roads, sinking ships, bombing power stations, or engaging in other forms of "monkeywrenching," the illegal sabotage of industrial development efforts. To advocates, ecotage is a generally nonviolent and productive means of responding to oppressive groups and practices. To critics, it is vandalism, potentially life threatening, and better termed *ecoterrorism.*

Conclusion

Current stocks and future production of toxic wastes raise critical social issues worldwide. These issues are complex and interrelated, pose difficult trade-offs, and often involve conflicting economic, social, and political forces. Failure to successfully address them will lead to disastrous human, economic, and ecological consequences. Success will depend on public awareness and pressure, corporate social responsibility, sound governmental policies and practices, and international commitment and cooperation.

TRADE ASSOCIATIONS

A trade association is an organization created by a group of individual businesses or business owners to promote, enhance, and protect the mutual interests of its members. One type is the *industry association,* which comprises companies operating within a specific industry or sector (e.g., National Restaurant Association, Motion Picture Association of America, Securities Industry Association). In Europe and Japan, these may be organized into a national representative body called an *employers' organization or federation* (e.g., Federation of German Employers Association, Industry Club of Japan). Another is the *business* or *peak* association, which comprises a variety of companies and business owners within a local, regional, or national geographic area (e.g., Business Roundtable, U.S. Chamber of Commerce, National Association of Manufacturers, National Federation of Independent Business, Japan Chamber of Commerce, German Chamber of Industry and Commerce).

Trade associations are differentiated from other groups according to their purposes and membership. A *professional society* or *professional association* comprises individual members who join together to protect and further the aims of a specific profession (e.g., American Medical Association, American Institute of Architects). *Labor* or *trade unions* are member organizations designed to provide benefits to, and represent the interests of, individual workers, particularly in relationship to business management (e.g., United Auto Workers, Teamsters). In Europe, these are called an *employee association* or a *craft trade association* and are organized into a national entity (e.g., Central Association of German Craft Trades).

Trade Association History and Development

The evolution of trade associations is interwoven with the growth of modern nation-states, particularly those with a democratic capitalist system. They were formed to provide a bridge between government and business in shaping national economic policy as countries grew into industrial giants. Their growth in the United States, Germany, and Japan illustrates the differing impact of political and economic systems on their development.

Voluntary associations in the United States in the late 18th and early 19th centuries were organized to solve myriad social problems not being addressed by democratically elected local, state, and national governments. Voluntarism captured the imagination of many individual traders and shopkeepers who joined a complex network of associations to promote the public good. They recognized the power of collective action for protecting their own commercial interests and organized local business associations. The American pluralistic political structure also forced the associations to promote their economic views as political interest groups. Led by prominent industrialists in the late 19th and early 20th centuries, new national associations were organized with the objective of ensuring the smooth operation of cartels within and across industries. The populist movement forced these associations to curtail "antitrust" activities and to refocus on ensuring competition within individual industries. Concurrently, local associations cooperated to build national organizations (e.g., U.S. Chamber of Commerce and National Association of Manufacturers) to represent business in Washington, D.C.

The European context, with its strong, traditional institutions, set the stage for a different path of development. Government took the responsibility for organizing and guiding the growth of emerging national economies. Public officials encouraged powerful industrialists to organize business associations to aid in these coordination efforts, particularly in mobilizing for World War I. These new national associations, decimated during World War II, were reactivated as government and business partnered to rebuild devastated societies. The German government incorporated both industry and employer associations into a national structure that included employee associations to shape economic policy. Membership was mandated by law with companies joining either a business or employer association. The coordinated market model gave trade associations a stronger role than those in America, with its free market model.

Japanese governmental officials requested prominent business executives to organize voluntary business associations similar to the American chambers of commerce in the late 19th century. The creation of new industry trade associations accompanied the growth of heavy manufacturing companies. Membership for all businesses in the Chamber of Commerce was mandated by government at the turn of the century. The industry associations became cartels to protect individual industries, leading to a split with the Chamber and the formation of the Industry Club of Japan prior to World War II. Major industries, through their powerful associations, fueled the war effort and then assumed leadership in the creation of the *keiretsu* in the postwar period. Research associations and export promotion associations have also emerged to assist businesses in technology development and entry into world markets. Both chambers and industry associations are closely related to the national government in the development and implementation of economic policy.

Trade Association Activities

Trade associations engage in two primary sets of activities—providing member services and influencing governments. Activities designed to benefit members directly or indirectly include the following:

- Sharing information on industry production levels, sales, costs, and new products and services to provide a foundation on which members can plan and operate more successfully
- Promotional advertising about an industry or business in general to enhance its public image or to shape an opinion on public policy issues
- Meetings of executives to discuss issues and determine policy that will enhance member companies
- Research and development of operations, products, and issues, an especially important service to European and Japanese companies
- Standard setting for best practices to encourage state-of-the-art operations and ethical conduct
- Training and education to ensure that managers and employees are better equipped for business operations, an extensive set of programs in many European countries
- Advocacy for capitalism as the preferred economic system through advertising to the public, funding of economic research institutes, and organizing public events

Activities designed to influence government include the following:

- Indirect activities
  - *Issue research* to determine the impact of public policy issues on member companies
  - *Grassroots organizing* to encourage constituents to contact elected or appointed government officials about specific issues on legislative or regulatory agendas
  - *Issue advertising* to inform the public and shape their opinions on specific public policy issues
  - *Coalition building* with other associations or groups to organize ad hoc groups for advocacy of a position on a public policy issue
- Direct activities
  - Governmental officials are lobbied to exert influence on their decisions. In the United States, associations

have offices in Washington, D.C., as well as key state capitals to gain access to, and maintain contact with, elected and appointed governmental officials. Associations build a network of personal relationships with officials that can be used by member companies. They coordinate with member company offices in campaigns to influence the legislative and regulatory processes. Lobbyists contact individual policy makers to provide information and present the position of the association on specific public policy issues. They also make presentations at governmental hearings, host meetings, and organize public events about these issues. They work with the legislative branch to draft new legislation and the executive branch to develop new regulatory rules. Exerting influence on government policy makers is different in other countries. In Europe, associations are quasipublic so that government officials must use them for advice on economic issues. Company and association executives meet regularly with governmental officials to shape economic policy and work closely with labor associations on labor and social policy. In Japan, associations play a major role in public policy development through consultation with governmental officials and political parties. The lack of transparency often makes it difficult to identify the extent of their influence.

– Efforts are made to aid the election and reelection of governmental officials. Associations focus on candidates who are sympathetic to the needs and views of business in general or a specific industry. They maintain an independence from political parties, although they may work closely with them during an election. In the United States, associations form political action committees to help individual candidates fund election campaigns. They may also contribute to national and state parties for each election. Recently, they have been instrumental in creating ad hoc organizations to develop and issue advertising campaigns to differentiate candidates and parties. By law, these campaigns may not be coordinated directly with the candidates. In Europe and Japan, political parties are pivotal to the shaping of public policy, so associations rely on member involvement with the parties to exert influence. They make financial contributions to parties but avoid being visibly connected with individual candidates. Electoral activities are secondary to the more direct strategies for influencing public policy makers.

The public policy process includes two types of voluntary member associations: (1) *special interest groups*, which focus on the promotion of the narrow interests of their members, and (2) *public interest groups*, which coalesce around a public policy issue(s) to inform the public and influence governmental bodies for the good of society. Trade associations are criticized for their attempts to unduly and inappropriately influence the public policy process for their special, narrow self-interests, for example, tax breaks, deregulation, barriers to entry into an industry, and governmental contracts. Business leaders counter this criticism by attempting to portray trade associations as operating in the public interest through promoting a healthy business climate while protecting the market from unnecessary governmental interference.

Globalization and Trade Associations

Trade associations are awash in the waves of globalization with proliferation around the world. While they are structured differently in each country, they typically provide usual member services and act as a collective voice for business interests in relationship to national governments. The U.S. Chamber of Commerce was a pioneer in organizing chapters throughout the world, first to cater to American companies engaged in international ventures but now to cater to domestic firms. These associations allow multinational enterprises (MNEs) to establish contacts in host countries and act as a collective voice for business in the public policy process.

Globalization has posed new issues for trade associations. The friction between large firms operating in global industries and small and medium-sized firms focused on domestic markets has grown. For example, the advocacy by major American associations for the North American Free Trade Agreement and major European associations for the European Union has come under criticism by those weakened by the influx of foreign competitors. This differential impact has accentuated member demands that associations become more attuned to individual company needs, provide new services, and develop positions on public policy with greater care.

Associate leaders face a number of other challenges: whether to grant membership to foreign-owned firms, how to represent the interests of both domestic and foreign-owned firms to national governments, which firms to include as members with industry boundaries blurred by technological advances, and how to deal with strong public interest groups. The current structure of employer, business associations, and employee associations in partnership with government for shaping economic policy is a special challenge to European association.

The growth of regional and international governmental organizations has triggered the development of comparable associations to represent business interests. BUSINESSEUROPE, (formery Union des Industries de la Communauté Européenne [UNICE]), the peak association of European business, has been organized to represent business in Brussels. However, European industry associations continue to be nationally focused, with only loose coordination across borders. The World Trade Organization and key United Nations agencies have heightened the concern of MNEs about the need for a collective business voice on world economic and trade policy. International associations have been organized (e.g., Association of International Automobile Manufacturers, World Coal Institute), although they are not truly representative of all firms in an industry.

Trade Balance

The trade balance is a number that compares the monetary value of a country's flow of exports with its flow of imports over a specific period of time. The number is calculated exclusively from the current account of the country's balance of payments. If the number is positive, it indicates a trade surplus in that the monetary value of the exports sold exceeds the monetary value of the imports purchased; in other words, the country's international trade activity has generated a net inflow of monetary value. If, on the other hand, the number is negative, a trade deficit exists because the value of exports sold is not enough, by itself, to generate the funds necessary to finance the value of the imports purchased. In this case the country's international trade activity has generated a net outflow of monetary value to its trade partners. Theoretically, the trade balance could be zero, but independent pricing of exports and imports, combined with the timing of the millions of international transactions taking place, makes it nearly impossible in practice for the value of a country's flow of exports to equal the value of its flow of imports.

The precise structure of the trade balance is not generally agreed to beyond the fact that it is made up of certain items that can be either exported or imported by a country over the time period in question. Pairings of a variety of items as exports and imports are found in the current account of a country's balance of payments. Any or all of these may be used to calculate a trade balance. The items in question are goods (tangible items), services (intangible items), current transfers (gifts and charity), and income (business profits).

In terms of goods and services, it is obvious that value may enter or leave the country as a result of receiving payment for exports or making payment for imports, respectively. Similarly, if more charitable donations are made abroad, value leaves the country. However, value can be similarly transferred abroad when it is the result of income generated on an asset situated in one country but owned by someone in another. Investment income is, therefore, another component of the trade balance. Profits transferred home when generated by assets (e.g., stocks and branch plants) owned abroad indicate a monetary inflow in the same way as when an export is sold. When a foreign entity transfers abroad the profits it generates in the host country, an outflow of monetary value occurs in the same way as when an import is bought.

It should be obvious that care must be taken to understand which items from the current account are being used in any reported trade balance statistics and which are not. For example, if a country has a trade deficit in goods alone, the current account itself could very well be in surplus. In this way, the problem of how the trade deficit, as reported, is to be financed is not really an issue because of the narrow way in which the deficit was defined. Of course, if the country's goods trade is taken to be a key indicator of its economic health, then a trade deficit in goods is informative in that particular regard. However, since the service sector has been gaining in importance in many advanced economies, a trade balance that includes services becomes a more descriptive measure of international trade activity.

The social implications of the trade balance depend on how the country wishes to be perceived economically by its trade partners. The structure of the trade balance, and whether it is in deficit or surplus, will have a lot to do with that perception. A trade deficit is often perceived domestically as a sign of weakness supposedly leading to a loss of sovereignty since the country is in debt to others. This is simplistic because it depends on whether or not the debt is sustainable. If these excess imports are used to invest in the society, then the future economic growth expected would be a means of financing the debt. On the other hand, if the imports are merely fueling a consumption binge, there is little chance that this would generate future economic growth.

A trade deficit may also be perceived as an unfair outcome especially if the country's trade partners use protectionist policies to shut out the country's exports. Trade barriers distort normal trade flows and require negotiation among the affected countries so that barriers are taken down in ways that create reciprocal benefits and yet do not destabilize key industries. For example, in many countries the agriculture sector has grown dependent on government subsidies. Removing these too quickly can displace farmers and add uncertainty to their crop production plans. Therefore, while trade barriers can be enacted quickly, the process of removal is much more complicated because of vested interests that form around them.

Protecting key sectors against unfair trade competition is duly sanctioned by international law. However, countries are often tempted to protect those sectors that wish not to adapt to the pressures of globalization. The developing world has a competitive advantage in the form of low-cost labor; and this tends to attract companies looking to lower their costs of production. Keeping out the imports generated in these countries will indeed protect domestic jobs but has the effect of maintaining higher production costs and denying export income to them. If a trade deficit did occur because of the prevalence of low-cost imports, the development process in the emerging economy would, over time, lead to a higher demand for items from the more advanced countries.

In general, the trade balance does indeed have social implications, but it is unwise to make social policy based on it because it is something which, in many ways, merely reflects social policies. The trade balance is merely a scorecard and not a social tool, notwithstanding the pressures by various interests to treat it as such.

—Darren Prokop

TRADEMARKS

A trademark refers to any word, name, symbol, or device used to indicate the origin, quality, and ownership of products and services. The scope of a trademark is broad and includes design, sound, smell, color, product configuration, or groups of letters, numbers, or combinations thereof, which are used to distinguish or identify goods or services made, sold, or provided by others. The primary purpose of a trademark is to provide accurate information to a consumer about the origins of a product. A service mark is the same as a trademark except that it identifies and distinguishes the source of a service rather than a product. As consumers become familiar with trademarks and service marks, and the products and services they represent, their definitions may acquire a secondary meaning, as one denoting quality or reliability. This meaning may also qualify a product or service for trademark status, even though it might not be considered distinct or unique, because it has allowed the consumer to identify with a particular good or service. However, not all words or symbols are eligible for trademark protection. For example, one could not get a trademark for certain generic terms, such as pizza. Yet the name "Pizza Hut" represents not only the sale of a product (pizza) but also a unique brand identification denoted by name and logo, which is well known to the public.

Protecting a Trademark

Trademarks are protected through registration, maintenance, and enforcement. Trademarks are protected by federal and state trademark laws, as well as by common-law rights that arise from the actual use of a mark. Although it is not necessary to register a trademark or service mark, there are important benefits to be gained from doing so. If a trademark has federal registration, it serves official notice that the trademark belongs to the registrant. Other benefits of federal registration include the evidence of ownership of the trademark, the invoking of jurisdiction in federal courts, the ability to obtain registration in foreign countries, and allowing the owner to file with the U.S. Customs Service to prevent importation of infringing foreign goods. These benefits have significant meaning to a trademark owner in the event that another company or entity in a different geographic market decides to sell competing products under the registrant's trademark, which may not only create customer confusion but also damage the registrant's reputation if the registrant decides to enter the same market. So long as the registrant can provide official documented information proving that registration of a trademark predates the disputed trademark, the registrant has the right to demand that the other party discontinue the use of the trademark, as well as the right to institute civil proceedings for possible damages or lost profits.

Because common-law trademark rights are grounded in actual and prior use, even federal registration does not give a registrant a right to stop others who have used the same mark in their local markets prior to a registrant's application.

Since trademarks identify the origins of products and services, it is of critical importance that a trademark maintain its uniqueness. Failure to maintain a trademark may lead to loss of product or service identity, rendering the trademark generic. Once this occurs, products or services lose their identity and move into the public domain to be used freely by anyone. Major causes of identity loss, such as misuse of the trademark or abandonment of the trademark, may encourage other parties to use the trademark for their own needs. This may not only result in consumer confusion regarding the origin of goods and services but also result in brand damage as customers turn to other sources to fulfill their needs since they no longer feel this product represents the qualities or services that led the customer to purchase it in the first place.

Issues Affecting Trademarks

A general issue facing the trademark is infringement. Since all trademarks can be infringed on, an issue has arisen regarding the "dilution" of a trademark that is considered famous, as opposed to trademarks that are not. The Federal Trademark Dilution Act addresses this, but this is quite subjective. So the bulk of the responsibility falls on the trademark owner, with limited government support for detecting, pursuing, and bringing actions against the trademark violators.

The universal rise of the Internet has added a further dimension to trademark enforcement because violators can now infringe on a global basis to such a degree that the trademark owner cannot possibly keep up with all the violations. The issue here is that there are limited mechanisms for global regulation of the Internet, so it is difficult to track down and enforce violations of jurisdictional standards.

The issue of "likelihood of confusion" is a major issue since there is no statutory guide or uniform rule of case law. The federal courts have developed tests for this definition but nothing that is uniform. The burden of proof falls on the mark owner, who must show that some significant amount of confusion happened but not that anyone was actually confused. All the above-mentioned issues will have an effect on trademarks and trademark owners; however, the social and ethical issues need to be addressed to bring an awareness of these problems to the forefront.

There are certain social and ethical issues that revolve around trademarks, which include subliminal influences of a trademark representing an item deemed harmful for use, for example, tobacco products.

Looking at ethical issues from another viewpoint, it is necessary to address the issue of trademark damage that can be done quickly, sending erroneous information throughout the world via the Internet and other electronic mediums. Other well-known trademarks represent various items in which the familiarity of the trademark is paramount to company profits, regardless of the potential harm that may be caused by constant overuse of the products.

A major producer of consumer products with a global presence had its famous trademark tarnished when a competitor used electronic media to link this particular company with satanic cults. The amount of damage done to this company's reputation was substantial, and the amount of time and money spent to disprove the allegations was quite expensive. Litigation has gone on for more than 10 years. A small company could never afford this type of legal action and would be ruined. The issue here is not who won or lost the case but the future damage inflicted on a company and its trademark. The company in question was able to survive this because of its sheer size and brand recognition, but it did suffer from loss of business, from customers who believed the allegations and have continued to boycott the company's products. This is a prime example of the power and scope of the Internet and its influence on global business.

These examples show the influence that trademarks have on the public; they also show how vulnerable trademarks are to the various information-bearing vehicles available to the world. The enforcement of trademark protection, although well-meaning, is far from comprehensive or fair. The smaller trademark owners have a difficult, if not impossible, time trying to go after trademark infringers on a global basis. They are constrained by finances as well as industry clout, as opposed to the large multinationals, which have the assets and clout to go after parties who attempt to use or infringe on their trademarks. This in itself is a moral and ethical issue of the haves versus the have-nots and needs to be addressed to maintain fairness in the world of trademarks.

Trade Secrets, Corporate Espionage and

Trade secrets consist of information not generally known or easily ascertainable that provides the owner with a competitive advantage because the information is secret and the owner has taken steps to keep it secret. Corporate or industrial espionage occurs when one company spies on another to steal its trade secrets or proprietary information. Every business has proprietary or confidential information, some of which may be protected as trade secrets. In an information economy, where ideas and innovation have value, trade secrets are an important form of intellectual property. They constitute the largest class of assets and the most valuable property for most U.S. corporations. Trade secrets may involve technical information, such as details for a new manufacturing process. Secret recipes for a cola, cupcake frosting, and cookies can also be trade secrets. Courts have found nontechnical information to be trade secrets, including plans for new products, methods of doing business, competitive studies, and nonpublicly available information about customers.

A large number of both civil cases for trade secret misappropriation and criminal cases for corporate espionage involve insiders. This might occur when an employee downloads trade secret information from the company's server to take to a new employer. Recently, cases of corporate espionage, involving competitors using improper or illegal methods to gain access to trade secrets, have been on the rise. These cases have included the use of technology to try to steal trade secrets from a competitor's computer systems and a college student employee of a copying service photocopying trade secrets from a civil litigation case. Trade secret law protects proprietary information. It also regulates competitive business conduct that amounts to unfair competition. Trade secret law seeks to draw the line between lawful competitive intelligence and unlawful commercial espionage. As one Supreme Court justice put it, the purpose of trade secret law is to maintain the "standards of commercial ethics and the encouragement of invention."

Sources of Trade Secret Law

Trade secret law in the United States is a complex mix of state and federal law. Civil liability for misappropriating a trade secret is primarily the province of states. This makes trade secret law different from laws protecting other intellectual property. Comprehensive federal statutes provide nationwide protection for patents, copyrights, and trademarks. These statutes define the owner's rights and provide criminal and civil remedies for infringement. Because trade secrets are protected on a state-by-state basis, variations in the law occur from one state to another. Although there are common elements, this means it is possible that information protected as a trade secret in one state may not receive protection in another. To create more consistent trade secret protection, in 1979 a national law conference created the Uniform Trade Secret Act (UTSA). Most states and the District of Columbia have adopted all or part of the UTSA. But because not every state has enacted every section of the UTSA and because interpretation of provisions may differ, there is still not uniformity in civil protection for trade secrets in the United States.

Although there is no federal statute providing for civil liability, in 1996, Congress passed the Economic Espionage Act (EEA) to make stealing trade secrets a federal crime. A recent report to Congress indicated that private or public actors in almost 100 countries have targeted sensitive U.S. technologies. The EEA seeks to combat this by making international economic espionage, when the theft of the trade secret is for the benefit of a foreign government, a crime. It also criminalizes corporate espionage, when the theft can't be linked to a foreign government but when it benefits a third party.

Civil Liability for Trade Secret Misappropriation

To receive trade secret protection, confidential information must meet the definition of a trade secret. Once that has been established, a determination must be made as to whether a particular use or disclosure is a misappropriation or a proper means of gaining access to the trade secret.

Definition of Trade Secret

Precisely defining which confidential information is or is not a trade secret is difficult. Part of the reason stems from differing definitions and tests under state laws taking different approaches to trade secrets. One of the most widely accepted definitions of *trade secret* is found in the Restatement (Second) of Torts, which defines a trade secret as any formula, pattern, device, or compilation of information that is used in one's business and that provides an opportunity to obtain an advantage over competitors who do not know or use it. Courts applying this definition consider a number of factors to assist in determining whether a particular piece of information qualifies as a trade secret. These factors include the following: (1) the extent to which the information is known outside the business, (2) how many employees or others involved in the business know the secret, (3) how extensive the measures taken to guard the secret have been, (4) the value of the information to the business and its competitors, (5) the amount of time or money involved in developing the information, and (6) how easy or difficult it would be to properly acquire or duplicate the information. This definition and test highlight the three elements necessary for trade secret protection: The information must be secret, it must have value, and the owner must make reasonable efforts to keep the information secret.

Trade secrets must be secret. The UTSA definition of *trade secret* requires the information to be not generally known and not readily ascertainable by proper means. Thus, information that is publicly known, generally known in a particular profession or industry, or part of the general skill an employee needs to do a job cannot be a trade secret. An invention that begins its life as a trade secret will lose that protection when it is made public in a patent application. Although trade secrets must be secret, no state requires absolute secrecy. Providing trade secret information to key employees whose work depends on using the trade secret will not disqualify the information from protection. But once the secret is available in public sources or is disclosed without protection, it is no longer a trade secret.

Trade secrets must also have value. Depending on their approach to trade secrets, states define *value* differently. Those following the Restatement (Second) of Torts require that the trade secret's value come from the actual, competitive advantage it provides. The UTSA protects more. Like the Restatement, it protects information that provides actual competitive advantage. It goes further by protecting information that has the potential to provide economic value, as well. In other words, it protects information that is valuable because it is secret.

It isn't enough that the information is secret and valuable. Trade secrets only receive protection if the owner treats the information as valuable and takes steps to protect the information from public disclosure. The law doesn't require heroic efforts to protect confidentiality. The UTSA requires that the owner's efforts be reasonable under the circumstances. Because a court will determine whether an owner's efforts were reasonable, it isn't always clear how much security is required. Depending on the nature of the trade secret, reasonable measures could include physical measures, such as restricting visitors from areas in which trade secrets might be observed, requiring special passwords to access trade secrets on company computer systems, stamping files "confidential," and shredding papers containing the trade secrets. Businesses also use nondisclosure contracts with employees, independent contractors, and potential business partners to create contractual obligations regarding disclosing trade secrets. Courts have found that conforming to the ethical and security standards of a particular industry are evidence that the security measures are reasonable. As a general matter, the more valuable a trade secret, the more extensive the efforts must be to protect it.

Misappropriation of Trade Secrets

Misappropriation occurs when an individual uses or discloses a trade secret without permission or learns about the trade secret through improper means. The UTSA defines *improper means* by listing bad acts. Theft, bribery, fraud, illegal wiretapping, and computer hacking are all improper means by which to acquire a trade secret. However, conduct that is otherwise lawful but that a court finds does not meet generally accepted standards of commercial morality and reasonable conduct may be misappropriation. In one case, a court found that flying over a construction site and taking aerial photographs to ascertain a secret process in a new plant's layout, while it did not violate the law, was improper and found this to be misappropriation.

A properly obtained trade secret may be misappropriated if it is improperly used or disclosed. This can happen if a person uses or discloses a trade secret in violation of a duty of confidentiality or by breaching a nondisclosure contract.

Civil Remedies

A trade secret owner may bring an action for a court order preventing disclosure or use of a misappropriated trade secret. If a trade secret has been disclosed, the court may order the wrongdoer to stop using the trade secret and to pay money damages. Damages could include profits lost by the owner, profits the defendant obtained by wrongfully using the trade secret, the amount of a reasonable royalty for use of the trade secret, or the loss of the value of a patent because the trade secret was disclosed before the patent application. In cases in which the misappropriation was willful and malicious, the court may award double the actual damages and, in some states, attorney's fees.

Criminal Liability for Trade Secret Theft and Economic Espionage

Illegal trafficking in stolen trade secrets costs American companies billions of dollars every year and affects small businesses as well as the Fortune 500. In addition to civil remedies for misappropriation, some states make theft of trade secrets a crime. Prior to enacting the EEA, federal prosecutors had few legal options for combating commercial and economic espionage. At that time, there were reports of various governments placing moles in American companies, breaking into hotel rooms to copy documents, hiding listening devices on national airlines, and wiretapping to gain access to secret information for the benefit of their domestic companies. The EEA remedied this by making economic and commercial espionage federal crimes, and these crimes are among the most important prosecuted by the Computer Hacking and Intellectual Property Unit of the U.S. attorney's office. Section 1831 criminalizes economic espionage and applies when an individual knowingly acts on behalf of a foreign government or an agent of a foreign government. Section 1832 applies to commercial theft of a trade secret and applies regardless of who benefits. The majority of cases are prosecuted under Section 1832 because proving a foreign government's involvement may be difficult. This happened when two defendants, originally from China, were indicted on both conspiracy to commit offenses of economic espionage and possession of stolen trade secrets allegedly stolen from four Silicon Valley companies. The trade secrets were seized at the San Francisco airport when the defendants were attempting to fly to China. The EEA prohibits theft of trade secrets and obtaining a trade secret by fraud. Because the value of trade secrets can be stolen without physically taking an object, downloading and duplicating them is criminal. A recent case indicted a departing employee who downloaded proprietary information and e-mailed it to a new employer. Receiving, buying, or possessing the trade secret is also a crime, as is attempting or conspiring to commit these offenses. The EEA will apply to actions done outside the United States if the acts furthered a criminal offense in the United States as long as the individual involved is a U.S. citizen or permanent resident. Given the serious nature of economic espionage sponsored by a foreign government, an individual convicted of violating Section 1831 may be imprisoned for up to 15 years and fined $500,000 or both, and an organization may be fined up to $10 million. An individual convicted of Section 1832 trade secret theft can be imprisoned for up to 10 years, fined up to $250,000, or both, and an organization can be fined up to $5 million for a violation.

Tragedy of the Commons

A "tragedy of the commons" occurs because people take something out of or put something into a resource because each individual who has a right to the resource perceives that the benefits derived from doing so outweigh associated costs. In the familiar example, a commons may be a field on which sheep can graze, and all those in a village may use such a field to feed their sheep. The "tragedy" occurs because rights to use the resource are widely assigned or collectively owned, with no one person having the right to exclude the others. Each person or entity that has a right to use the resource does so without regard to the actions of others or the value of the resource, and eventually the resource is wasted or depleted. In the above example, the result is overgrazing of the commons. Each villager who owns sheep will seek to maximize the benefit he or she derives by using the resource. Other examples are familiar as well. They include the use of aquifers, hunting territories, and fishing grounds.

The cause or logic of the tragedy is easily described. Each person with ownership rights derives some benefit from using the commons. For instance, in thinking about adding another sheep to his herd, our villager will consider how this benefit is affected by the costs. But the costs of adding one more sheep are spread across all villagers using the commons, so the costs accruing to the individual villager will only be a fraction of the real costs of increasing the herd. Thus, the individual villager perceives that the benefit he derives is increased by more than the costs of adding one more sheep to his herd. Since we assume that our villager will act rationally, he will add another sheep to his herd. And since all villagers who have herds will perceive the same low costs, additional sheep will be added to the herd of each villager, and overgrazing of the commons will be the result.

In this case, the tragedy is occurring because people are taking something away from the commons. But a tragedy of the commons can also occur by dumping or putting something into the commons as opposed to taking something out of it. Again, examples are familiar. They include pollution of the air, land, oceans, and waterways. In each case, something is dumped or put into the commons.

Garrett Hardin, in a remarkable essay published in 1968, argued that "technical solutions" when applied to a subset of problems such as population growth and the environment will not work. He defined a technical solution as one that required a change in the techniques of the natural sciences, which demanded little or no change in human values or ideas of morality. For instance, in the above example, a technical solution may be the fertilization of the field. Since no technical solution is available in this subset of problems, a solution might be found in an appeal to the morality of resource users. But Hardin argued that appealing to the conscience of resource users will not work because self-interest will trump other considerations and that a solution can only be found coercively.

Theoretically, a tragedy of the commons *can* be solved by legal or administrative means. For instance, solutions could include sole management of the resource—and assigning rights to use on the basis of some idea of "fairness," for instance, first come, first served. Another frequently suggested solution is to privatize the commons. Resource owners then bear the full costs of depleting the resource, and in an effort to minimize costs, resource owners might husband it. Or the resource usage could be regulated. For instance, government can restrict the total number of sheep grazing on the commons. But Barton Thompson observes that even with available solutions and even though participants in a commons problem know that sooner or later the tragedy will occur, the problem persists. Thompson uses fishing, groundwater extraction, and global warming to illustrate the difficulties of preventing the tragedy and asks why even in the face of abundant evidence that a problem exists resource users have proven to be not only unreceptive but actively hostile to solutions.

Thompson posits that resource users resist solutions to the commons problems due to three reasons. First, a solution will require resource users to use less of the resource than they have enjoyed. Second, each problem is characterized by significant scientific or social uncertainty, and third, each problem involves an intertemporal trade-off between a loss today and a greater loss tomorrow.

Thompson argues that solving the tragedy is not simply a matter of enjoining resource users to give up some present consumption to preserve the resource in the future. Rather, resource users see the potential solution as constituting a sure loss rather then a restricted gain—and Thompson observes that most people are willing to risk much to avoid a sure loss. Since a sure loss is involved with a solution, resource users avoid it.

Associated with a commons problem is uncertainty—both scientific and social. In all three examples that Thompson discusses, there is a great deal of scientific uncertainty as to how the commons is affected, what the impact might mean in the future, and whether or not a technical solution is available. When there is uncertainty, people commonly engage in wishful thinking—that the resource is in better shape than it actually is. Moreover, even if resource users believe that there is a problem, they must determine a fair means of allocating the burden of solving the problem. Thus, even if a technical solution is available, there remain problems associated with social uncertainty. There are multiple fairness rules, and most people perceive that the one that benefits them the most is the fairest. For instance, talks on reducing greenhouse gas levels are plagued by differing interpretations of fairness. Developed countries insist that developing countries share the burden of solving the problem because they will benefit, but developing countries see developed countries as being "at fault" and so they believe that developed countries should assume more of the burden of solving the problem.

The third barrier to preventing a tragedy has to do with intertemporal trade-offs. Thompson avoids the debate about what discount rates are appropriate for making these sorts of trade-offs, focusing instead on his observation that people have difficulty making *any* sacrifice to avoid uncertain future loses, assuming instead that they may be able to avoid or reduce or ameliorate future risks.

But Thompson doubts the problems he has discussed can be solved coercively through the courts. Most of the remaining commons problems are international in scope, and there is no outside entity that can impose a solution. (Even internal commons problems require a cause of action to support a lawsuit.

Often this is lacking, as in the case with aquifers where resource users own the land above the aquifers. Moreover, it is difficult to get non–resource users sufficiently interested to expend the political and legal capital necessary to impose an outside solution.)

Getting an effective solution will, in Thompson's view, require three steps. The first is convincing persons that a problem exists and that it warrants coercive action. The second step is getting resource users to agree on the general structure of the problem's solution, and the third step is allocating the burden required for the solution among resource users.

Reducing scientific uncertainty about the problem may help convince persons that a tragedy will occur. But even with evidence, there are difficulties associated with all three steps. As Thompson points out, all three steps are intertwined. For instance, convincing persons that a problem exists might remind persons that the solution will entail a loss. And we have discussed above the ways in which people commonly react to the prospect of a certain loss. But given that most commons problems are international in scope and that there exists no outside mechanism to impose a solution, he sees negotiation as the only solution.

The problems associated with the tragedy of the commons are associated with natural resources and the "right" to use them because they are somehow perceived to be without cost. Rights can be assigned through law to protect property—and thereby promote social or economic goals. But the policies and laws that are formulated to protect property can achieve results that are unintended or that are diametrically contrary to the desired social or economic goal. One such instance is the assignment of rights that give rise to a "tragedy of the anticommons."

Tragedy of the Anticommons

The tragedy of the commons refers to a problem in which multiple ownership or usage rights results in a resource being depleted or overused. In this model no one person has the right to exclude others. The mirror image of that problem is when exclusion rights prevent persons from using a resource so that the resource in question is underused. This is known as the tragedy of the anticommons.

Michael Heller first identified the problem when he observed that in postsocialist economies, in contrast to the expectation that new entrepreneurs would fill the stores, many privatized storefronts remained empty while kiosks, stocked full of goods, proliferated in the streets. He speculated that new or transitional governments were failing to assign or endow any one individual with a bundle of rights that represented full ownership of the resource. Instead, fragmented rights were distributed across a variety of stakeholders, and the burden of collecting these rights prevented usage of the resource. Heller noted that a full economic model had not been developed to describe the anticommons.

Heller and Rebecca Eisenberg subsequently applied the anticommons model to biomedical research, arguing that privatization of biomedical research may result in a proliferation of intellectual property rights that may prevent life-saving innovations downstream in the course of research and development. (*Upstream* refers to research relatively far removed from a commercial end product; *downstream* refers to research that is relatively close to being translated into a commercial product).

The problem that they identify is distinct from the problem of underusage inherent in a patent system, whereby society confers a monopoly for discovery that raises prices and restricts usage. This cost is willingly borne by society to promote invention and disclosure. The problem they identify arises when a user needs access to multiple patent inputs to create a single useful product. The resulting high transaction costs associated with obtaining the rights to use multiple patent inputs may result in inhibiting rather then facilitating the transfer of technology from the labs for ultimate commercialization and use by society.

In some instances, these transaction costs can be avoided or minimized. For instance, there is an industry-wide trend in the biomedical research industry to "vertically" or "horizontally" integrate. In the former case, one company can simply buy another company, acquiring in the process the rights to any patents held by the acquired company. In the latter case, companies can form strategic alliances or joint ventures. Furthermore, companies can ignore existing patents and the associated costs of licensing them. It is possible, although we have not seen them emerge in this area, that a "patent pool" of complementary knowledge is created. Other strategies include some form of collaborative arrangement such as cross-licensing, where two companies enter into an agreement to essentially share agreed-on patents (which may or may not involve cash payments). Or companies may decide that it is in their interests to defensively patent, hoping that a substantial portfolio of patents will give them some leverage in future negotiations. In addition, the industry has acted to put specific information in the "public domain," making it free (or at least affordable) and accessible to anyone.

But these solutions generally rely either on the market or on a willingness to break the law. Heller and Eisenberg caution against relying on either to avoid a biomedical anticommons. First, the potential value of upstream patents is speculative and it is likely that owners will overvalue their discoveries. Second, antitrust laws might inhibit the formation of patent pools. Third, intellectual property rights belong to a large, diverse group of holders in both the public and private sectors, whose agendas may conflict. Fourth, owners are likely to diverge in their willingness to infringe or to put information in the public domain. Moreover, recent court decisions have reminded researchers that substantial penalties exist for deliberate infringement. James Buchanan and Yong J. Yoon, in demonstrating the formal symmetry between the two models, noted that inefficiencies introduced by competing and overlapping regulatory bureaucracies are widely known and illustrate the pervasiveness of the anticommons setting in many areas of modern economic interactions.

Summary

The tragedy of the anticommons is the mirror image of the tragedy of the commons. Theoretical solutions to both problems exist. But in both situations implementing a solution is likely to be marred by the internal logic of the models, and the rationality of the actors, which even if it is biased, demands that self-interest trump other considerations. More realistically, some kind of solution will be found to both problems only when society is willing to spend the political and economic capital to enforce a solution. Unfortunately, this is likely only after some cataclysmic event or series of adverse events that make society aware of the consequences of a "tragedy."

Transaction Costs

Transaction costs are the costs of exchange incurred when firms engage in economically motivated relationships. There are four distinct forms of transaction costs: search, contracting, monitoring, and enforcement costs. Search costs are the costs of gathering information for identifying and assessing potential trading partners. Contracting costs are costs of negotiating a mutually beneficial contract or agreement. Monitoring costs are the costs of ensuring that each party to the contract or agreement fulfills his or her obligations. Finally, enforcement costs are the costs of sanctioning the party not performing according to the terms of the contract or agreement. All forms of exchange are subject to different levels of transaction costs. They are socially important, in addition to being economically unavoidable, because they represent a deadweight, or nonproductive, cost of doing business. Transaction costs are unavoidable, but they also decrease efficiency and are often areas where one party can take advantage of another.

Transaction Cost Economics

The best-developed articulation of the impact of transaction costs on business and society is a branch of economics (and increasingly law) known as transaction cost economics (TCE). TCE focuses on comparing the transaction costs associated with different institutional means of completing a transaction, thus explaining why some economic transactions occur within hierarchies, such as firms, rather than between individuals across a market. The most fundamental claim of TCE is that transactions will be governed by institutions that minimize their associated costs. Two main types of institutions are identified. First are markets, in which the identity of the transacting parties is irrelevant because there is no dependency between them; if one party reneges on the terms of the transaction, the other party is not significantly worse off, typically because the "aggrieved" party can seek legal redress through classic contract law and because the assets can often be redeployed at low, or little, cost. However, in some transactions, the identities of the parties do matter, or courts cannot realistically enforce contracts. This, of course, raises the issue of institutional morality: The governance of economic exchanges by contract reduces opportunism only if there is a well-developed, efficient, and noncorrupt legal system to enforce contracts. In places where lawsuits take decades to resolve, or where judges decide cases based on cronyism rather than legal merit, the threat of suing for breach of contract does not constrain an opportunistic party from taking advantage of their "honest" partner.

The second institution is a hierarchy, or an internal organization, where responses to unanticipated disturbances to a transaction are resolved internally, by fiat. Fiat is the power exerted by the central authority in the organization to ensure smooth and efficient transactions. In addition, hierarchies can also control behavior through organizational culture. For example, Enron had a well-known culture of risk taking and pushing legal limits in pursuit of new markets and profits prior to its downfall. Conversely, Starbucks has a strong corporate culture of social responsibility and integrity and thus is less likely to become a future corporate malfeasant.

The main costs associated with hierarchies are bureaucratic and organizational costs. The market will be used to govern transactions where the parties are not vulnerable to reneging; conversely, hierarchies arise when the parties would be made significantly vulnerable or worse off if one of them were to pull out of the transaction. TCE emphasizes three sources of vulnerability: bounded rationality, opportunism, and asset specificity.

Bounded Rationality, Opportunism, and Asset Specificity

Unlike traditional economic theory, TCE does not assume that people are rational. Indeed, TCE explicitly states that while people *intend* to behave rationally, they are *actually* incapable of doing so. For example, in a contract between two firms for a joint venture (JV), the partners can probably predict in advance some of the ways in which the JV may become unstable, but they could probably never predict all the ways in which one or the other partner could be harmed. Since economic actors are not all-seeing, they cannot foresee everything that may occur. This view of limited rationality is, of course, a feature of many decision-making theories, not just TCE.

In addition, some economic actors behave opportunistically—they will take advantage of the other party to advance their own interests. Examples of opportunistic behavior include making false promises, misrepresenting intentions, reneging on a deal, or changing the terms to benefit oneself. Such behavior leaves the "honest" party worse off. Opportunism can come from two sources. Most obviously, an economic agent may intend to take advantage of its partner from the outset. On the other hand, an economic agent may sincerely intend to fulfill its end of a bargain but become incapable of doing so. For example, Firm X contracts to buy a product from Firm Y for an agreed-upon price. Firm X has every intention of paying Firm Y on delivery of the product but goes bankrupt before Firm Y can finish manufacturing the product, and Firm X is unable to pay Firm Y. This example is not a case of opportunism (self-interest seeking with guile) but rather a case of bounded rationality—neither firm could foresee that Firm X would become unable to pay. TCE thus predicts that governance structures arise to protect against both uncertainty and opportunism. There is the uncertainty of often not knowing which economic agents are opportunistic, as well as not knowing which trustworthy economic actors may become incapable of performing as promised. To manage the second type of uncertainty, asset specificity becomes a critical factor.

Finally, parties to a transaction are made vulnerable not only by their own bounded rationality and the potential for opportunistic behavior but also by the amount of irreversible investment they have made to support the transaction. For example, a developer building a house in the large, virtually uninhabited California desert area of Death Valley for a client is very vulnerable to that buyer potentially reneging on the deal. Why? Assume that the developer has sunk 6 months and $250,000 into building the house—who else would pay for it, in the middle of a desert? Moreover, the developer cannot pick up the house and move it to a populated area without being made worse off since it will be quite costly to move and reassemble the house. While many transactions are highly asset specific, some have virtually no asset specificity. For example, if I invest in a pencil-making facility to supply pencils to one customer, and if that customer pulls out of our contract, so many other buyers of pencils exist that I am unlikely to be significantly harmed because I can recoup my investment in the pencil-making factory by selling the pencils on the open market. A partner's vulnerability as result of asset specificity is closely related to the condition of small numbers. When the number of parties with whom one can potentially contract is large, then opportunism can be lessened or eliminated by switching contractual partners. However, if the number of parties with whom one can contract is limited, then the party's vulnerability to opportunism is elevated. Since most economic exchanges expose the parties to some form of vulnerability, safeguards arise. Specifically, TCE predicts that when bounded rationality and opportunism are present, but asset specificity is not, then market exchanges will arise. When bounded rationality, opportunism, and asset specificity are all present, then hierarchies such as vertically integrated firms will arise.

Safeguarding Transactions

With respect to the prediction of TCE about when markets will govern transactions, there are countless situations in which economic agents make investments, but they are not specific to one transaction or client, and thus the agent is not vulnerable. This is the pencil factory example: If I cannot sell my pencils to my original buyer, I can find other buyers, thus limiting my losses. What protects me is the strength of competition in a market (which stems from the many buyers for a product with standard features) that allows me to be "made whole" by some other economic agent. Under these circumstances, the transaction costs associated with searching for the original or a different buyer, monitoring buyers, writing a contract, and investing in enforcement are minimal. However, this is not the main case TCE seeks to explain; exchanges across competitive markets are already well explained by microeconomic theory.

Rather, the case TCE seeks to shed light on is what happens when bounded rationality, opportunism, and asset specificity are all present. Under these conditions, TCE predicts that various forms of economic hierarchy, such as vertically integrated corporations, will arise. Rather than specializing in one aspect of the business's value chain and outsourcing other components to specialized agents across a market, which is comparatively efficient, we see firms internalize some of these components by forward or backward integrating (i.e., specializing in multiple portions of the value chain). For example, if a gasoline retailer were to backward integrate, it might go into exploration for crude oil and refining of that crude. Conversely, if an oil company that has historically only drilled for oil begins selling refined gas at gas stations, it has forward integrated into retail operations. Despite the increased administrative costs of taking on more of the functions in the value chain, the firm no longer has to incur monitoring costs of potentially dishonest suppliers, contractors, or JV partners; it has made itself less vulnerable to opportunistic outsiders by internalizing many functions. What it has lost in productive efficiency it has gained in decreasing its transaction costs.

Influence and Critics

TCE has been applied to a number of business phenomena such as buyer-supplier relationships, mergers and acquisitions, joint ventures and alliances, employment contracts, and debt versus equity financing. The most famous, recent proponent of TCE has been Oliver E. Williamson, an economist at Berkeley's business school. However, TCE also has detractors. Many sociologists question its assumptions: Are all economic exchanges subject to transaction costs? Are all economic exchanges free from the realities of social norms of exchange? Are all parties to an exchange subject to the assumption of opportunism?

Critics argue that TCE overlooks many social incentives that people have to be trustworthy: concern over reputation, the likelihood of working with someone again, motivations other than maximizing profit. Many motivations tie economic actors to one another in beneficial ways. However, the embedded assumption about business behavior in TCE is that loyalty, honesty, and integrity are less powerful human motivators than short-term self-interest and profit seeking and that governance of exchanges by contract is a necessary substitute for trust. Many sociologists argue that human qualities such as trust, compassion, integrity, and justice help control transaction costs and that the governance structures TCE focuses on are unnecessary because the parties in many exchanges will not behave opportunistically. For example, although the search costs associated with identifying a trustworthy trading partner may be high, the costs related to contracting, monitoring, and enforcement will be significantly lower, thus allowing exchanges across a market between trustworthy partners to occur smoothly, even in the presence of opportunism, bounded rationality, and asset specificity. Moreover, partners with a reputation for trustworthiness are generally more highly sought after than economic actors known for cheating. Consider, for example, the Seller and Buyer ratings that eBay employs: All buyers and sellers are asked to provide feedback that is then publicly posted for future parties to consider prior to making or accepting a bid from someone. Sellers with a poor reputation for shipping paid-for items will soon have far fewer bidders than sellers with a reliable reputation. Trust and integrity thus do serve as governance mechanisms in many transactions, but these are not the governance mechanisms that TCE is centrally interested in.

Conclusion

Transaction costs are a powerful and robust way of understanding exchange relationships from both an economic perspective and a social perspective. From an economic perspective, few theories explain so many economic relationships as TCE. However, by understanding that transaction costs associated with economic relationships are subject to social realities such as trust, integrity, and justice, we can understand the conditions under which transaction costs are mitigated, thus allowing a more general transaction cost perspective to explain a larger spectrum of exchange relationships.

Transfer Pricing

The American Marketing Association defines transfer pricing as "the pricing of goods and services that are sold to controlled entities of the same organization, for example, movements of goods and services within a multinational or global corporation." Transfer pricing is an *intra*firm transaction that affects costs and profitability at the subsidiary level and overall after-tax profitability for the firm at the corporate level. How the firm accounts for its various intrafirm transactions is therefore of interest to host governments, who would understandably want to investigate any suspicions of tax evasion through transfer pricing practices.

Host governments are naturally concerned to ensure that multinationals are not using creative accounting to avoid paying taxes. As a result, host governments may impose restrictions and enact laws that curtail such practices if the intent is to avoid taxation. While different governments may have different laws prescribing how transfer pricing is to be accounted for, in general the principle of "arm's-length" transaction is the approach least likely to violate legal requirements. By *arm's-length transaction*, it is meant that a "fair" price is charged between subsidiaries as though these subsidiaries were unrelated. We should note, however, that such fair prices are often allowed to contain additional charges for technology transfer, R&D, other overhead expense allocations, and the like. The upshot is that even arm's length is not necessarily clear-cut or straightforward. For instance, the IRS's *Treasury Regulations Section 1.482,* which is one of their publications pertaining to transfer pricing (among other things), runs to 103 pages.

If multinational or global corporations were few in number and minimal in economic impact, the issue of transfer pricing would be of only passing interest to most. However, multinational companies (MNCs) are becoming more and more pervasive, and mergers and acquisitions serve to make them even more powerful and omnipresent than ever before. Consequently, what these companies do to avoid taxes is of major import to most national treasuries and by extension to the economies of those societies. Corporations have always tried to minimize their tax obligations, and few would question any entity's (individual or otherwise) attempt to legitimately reduce its tax burdens. However, transfer pricing as an instrument to reduce or eliminate a multinational's taxes sometimes resembles "creative accounting" and corporate malfeasance. Especially in situations where an MNC is operating in a developing country and uses transfer pricing as a means to minimize its taxes payable to that country, such practices may be criticized as a blatant attempt to exploit a developing country's resources.

Global or multinational companies can manipulate transfer pricing to their advantage in at least two common ways—by adjusting the prices being charged intracompany, and by deciding what and how much of intrafirm goods and services will be bought. In an MNC, a lot of purchasing and selling take place within the boundaries of the firm itself. For example, say the Singapore subsidiary of XYZ Oil Company sells its lubricants to the Australian subsidiary for resale in Australia. The price that Singapore charges is the cost that Australia pays. Yet in the final analysis the funds stay within the firm. If not for taxation, the price being charged by Singapore (the transfer price) does not have an impact on the overall profitability of XYZ Corporation worldwide.

Contrast this with a scenario where multinationals do not exist. The "same" transaction is undertaken by an independent Singaporean company selling to an independent Australian entity. The funds change hands in this new scenario. Price matters here, regardless of tax implications.

It is obvious that transfer pricing decisions within the firm can have significant income tax consequences for the corporation as a whole. Consider a simple illustration, where the firm only has two international subsidiaries, A and B. If A has lower income tax rates than does B, then it makes sense for the company to make more profits in A (and pay less taxes) than in B. One way to do this is through transfer pricing, in which case the company would want A to charge higher prices (and make more profits), which adds to B's costs (and thus lower profits). In so doing, the company minimizes the amount of taxes it has to pay.

The multinational firm can also manipulate transfer pricing to its advantage by deciding to buy more (or less) of certain intrafirm products and services. Even if the price itself was based on an arm's-length evaluation, the fact remains that subsidiary A may be buying something from subsidiary B that it does not really need, but which it still has to pay for. The following example illustrates this point.

Exxon in 2002 sold its Disputada de las Condes copper mine operations in Chile to Anglo American for U.S.$1.3 billion. In the mid-1970s, Exxon had bought the mine for U.S.$80 million. Since that time, Exxon reported operating the mine at a loss every year, never paid taxes in Chile, and even accumulated gross tax credits of more than U.S. $0.5 billion. Further, to avoid paying Chilean taxes on capital gains from the sale, the sale was to be consummated in a foreign country.

Questions arose over the nature of these losses that Exxon suffered over the 23-year period of ownership. Apparently, Exxon's Disputada subsidiary borrowed heavily from Exxon's Bermuda-based financing arm and other Exxon entities, and the interest payments on these loans caused Disputada to operate continuously at a loss, resulting in a negative net worth and no income tax. Exxon was able to withdraw funds from Disputada not in the form of profits (taxable at a 35% rate) but as interest payments (taxable at a maximum rate of 4%). Furthermore, since a large share of the interest payments went to Bermuda, where the financing arm was located, Exxon paid no income tax on those profits either.

The subsequent public outcry and Chilean government investigations resulted in an agreement by Exxon to pay the Chilean government U.S. $27 million in taxes (a relatively small amount relative to the magnitude of the operations and the sale). Partly because of incidents such as this, moreover, the Chilean government subsequently passed a law requiring large mining companies to pay a 3% royalty on copper sales regardless of profitability. Transfer pricing is, and will continue to be, an issue that various governments have to wrestle with as MNCs get even bigger and more numerous.

Transparency

Transparency has two general meanings with regard to ethical behavior in business. The first meaning relates to a business's openness to making information about its policies and performance (both financial and social) available to stakeholders. The second relates to corrupt behavior (generally some sort of bribery) with regard to interactions between a business and the government officials with which it interacts.

Three Questions Regarding Transparency, Openness, and Business Ethics

Three key questions regarding transparency with regard to openness to stakeholders merit examination:

1. About what should businesses be transparent?
2. To whom should businesses be transparent?
3. How should businesses communicate with their stakeholders to demonstrate transparency?

About What Should Businesses Be Transparent?

There are two broad categories of information about which businesses should be transparent: financial and social. A lack of transparency with regard to either can reduce trust for an individual business, an industry, and the institution of business.

In the United States, many of the business scandals of the 1990s and 2000s can be understood in terms of a lack of financial transparency. Many companies engaged in accounting fraud to make their financial results look better, and many such examples of fraud have been linked to a desire to increase executive compensation through stock options. George Staubus notes that accounting failures represent breaches of fiduciary duties that one party owes others. A lack of financial transparency—whether understood in terms of overt fraud by company managers or some other failure to disclose relevant information about the true financial state of a company—violates some of the most fundamental duties that managers owe their stakeholders, especially stockholders.

A second area of information about which businesses are expected to be transparent is social performance. In the past 30 years stakeholders have expected more and more information about a variety of social performance indicators, including environmental performance and treatment of employees. Transparency about financial performance has a direct effect on stockholders and may also affect other stakeholders, such as employees who lose their jobs and pensions. Transparency about social performance, however, affects nonshareholder stakeholders such as employees and communities directly, with a secondary effect on stockholders.

Transparency expectations for businesses, it should be noted, are likely greater for public corporations than for privately held firms. The ethical duties owed to nonshareholder stakeholders with regard to social performance transparency, however, accrue to all organizations no matter what their ownership structure is.

To Whom Should Businesses Be Transparent?

A stakeholder perspective on transparency would suggest that businesses owe duties of transparency to a variety of stakeholders. Because stockholders have ownership interests, public corporations owe fiduciary duties to them that include financial transparency. Nonstockholder stakeholders do not own the firm but have interests (jobs, a clean environment) that would be furthered by financial and social performance transparency. Expectations about financial and social performance transparency have increased recently, as stakeholders are increasingly demanding more and more timely information about a variety of performance indicators.

Stockholders can use financial transparency to decide (1) whether or not to remain invested in a corporation and (2) if changes in the corporation's strategy or practices should be sought (the latter mostly useful to large stockholders). Nonstockholder stakeholders similarly benefit from transparency with regard to social performance, which they can use to advocate for changes in corporate policies and practices.

How Should Businesses Communicate With Their Stakeholders to Demonstrate Transparency?

There is an extensive literature on financial and social performance transparency. Much of this literature has addressed how corporations can and should make such information available to their stakeholders.

Financial performance measurement and transparency has received considerable regulatory attention in the United States (through the Sarbanes-Oxley Act of 2002 and other legislation) and in a variety of other countries. Expectations for reporting financial performance include more timely information, information about future business prospects, and full disclosure of adverse information.

For social performance, there are a number of standardized reporting regimes—such as the Global Reporting Initiative—that address what and how often corporations should report publicly. Much recent attention with regard to social performance transparency has been focused on the relationship between social performance reporting and transparency. Of course, when a business engages in social reporting in an effort to improve transparency, it opens itself to questions about whether its performance indicators are sufficient and whether it is adequately monitoring social performance (including independent verification thereof).

One interesting recent development in this regard is the establishment of industry-level codes of conduct and reporting regimes that attempt to standardize reporting and expectations for transparency. Such initiatives seek to reduce the potential competitive advantage of poor social performance by some members of an industry. The International Council of Toy Industries and the Electronics Industry Code of Conduct are two examples of industry-level cooperation that improves social performance transparency.

Transparency and Accounting

Any discussion of transparency would be incomplete without a discussion of the role of accounting in furthering transparency. Many corporate scandals have implicated public accounting firms that aided corporate managers trying to hide information about the true financial performance of their firms. Some are examples of actual fraud, such as intentionally misreporting revenues or expenses. Others are not examples of illegality but rather of attempts to apply generally accepted accounting principles and accounting regulations in ways that ultimately were misleading. In obeying the letter of an accounting rule, many corporations and their accounting firms violated the spirit of the rule—to increase transparency.

Organizational managers owe ethical duties to their stakeholders that include financial transparency. But other stakeholders—like accounting firms—similarly owe such ethical duties as well. Accounting education and professional practice have focused increasingly not just on the content of accounting rules but on broader ethical duties owed to users of accounting information.

Transparency and Corruption

A second meaning of transparency focuses on corruption with regard to a business's interactions with governments. In the United States, the Foreign Corrupt Practices Act (FCPA) was passed in 1977 and amended in part by the Omnibus Trade and Competitiveness Act of 1988 and the International Antibribery and Fair Competition Act of 1998; this body of legislation deals with bribery and other forms of corruption, coming about after a number of scandals involving U.S. businesses during the 1970s. Other countries have similar kinds of legislation, although enforcement is often weak.

Transparency in this regard is important because of the effect that bribery has on countries; bribery transfers public wealth to private hands in a corrupt way—and in poor countries takes away from other needs—while contributing to a poor climate for economic growth and activity. A number of studies have shown connections between public corruption and slow economic growth. Furthermore, a lack of transparency in this regard increases public cynicism toward business.

Transparency in this regard is a problem in many countries. In many commodity-rich countries (oil would be one example), poor national-level governance is both a symptom and a result of corrupt behavior by businesses seeking an advantage. When a business bribes a public official to secure a contract or to overlook an environmental or human-rights violation, both the business and the government official are engaged in immoral behavior that ultimately hurts the people in that country.

Transparency and Trust

Another essential issue with regard to transparency is trust. In the same way that personal relationships between people rely on openness, so do relationships between organizations (whether nonprofit organizations, governments, privately held businesses, or for-profit corporations). Increased transparency can increase trust, and reduced transparency decreases trust.

There is considerable cynicism about businesses in many countries. Much of this cynicism focuses on the supposed secrecy and dishonesty of businesses. Lying to one's stakeholders—whether stockholders, governments, local communities, suppliers, or employees—is morally wrong, of course. But engaging in undue secrecy similarly violates ethical duties that organizational managers owe stakeholders.

There is a need for businesses and industries—and indeed the institution of business—to counteract public cynicism about business through increased transparency. When organizations are transparent about social and financial performance, public trust in business increases. When businesses are seen to be less than fully transparent, trust declines—and pressures to control the behavior of business through regulation increase. In the United States, the FCPA and the Sarbanes-Oxley Act of 2002 are direct results of a lack of business transparency. Trust is essential for not just the institution of business but for any organization. Transparency and trust are highly correlated.

The Future of Transparency

Generally speaking, it is reasonable to expect that businesses will face expectations for greater transparency in the future. Groups such as Transparency International have been addressing issues related to bribery and corruption, bringing attention to how business activities affect good and bad government behavior. Businesses will also face increased expectations for disclosure regarding financial and social performance.

The relationship between transparency and corporate governance will likely be the subject of increasing academic and practitioner attention in the future. Boards of directors—as stewards of shareholder interests—will have to think through what sorts of financial and social performance data should be disclosed and how.

Another interesting topic to consider is the effects of industry-level norms and initiatives that focus on social performance disclosure. As previously noted, industries as varied as petroleum and electronics are starting to develop industry-level codes of conduct that include expectations for transparency regarding elements of social performance. Corporate endorsement and involvement in such programs will increase transparency, although stakeholders such as activist groups will continue to push individual companies and industries to improve still further in this regard.

Conclusion

Demands for greater transparency—whether from stockholders, consumers, governments, employees, or other stakeholders—are likely to increase over time. With regard to financial performance, corporations have legal and ethical duties to disclose information to their stockholders and other stakeholders. Businesses will have to weigh when it makes sense to withhold information about social and financial performance and when openness is necessary. The bias generally should be toward more transparency from businesses with regard to various aspects of performance to their stakeholders.

—Harry J. Van Buren III

Transparency, Market

The word *transparency* can mean different things to different people. In the corporate finance world, people use the term to refer to the degree to which a firm's accounting choices help investors understand the valuation of items on the firm's balance sheet. In the banking world, *transparency* often refers to the banker's knowledge of credit characteristics associated with a loan customer or a trade counterparty. In the world of futures and securities markets, the word *transparency* refers to the degree to which financial exchanges publicly disseminate real-time information on transaction prices, quotations, order flow, and other market variables. It is this case that is addressed here.

A completely transparent market would be one where all relevant market information is instantly and freely available to all potential investors. Some observers distinguish between pretrade transparency, that is, information disseminated ahead of a trade, and posttrade transparency, that is, information disseminated after a trade.

In the United States, the United Kingdom, and other domains, the level of government-mandated market transparency has become a source of contentious public debate. A central element of this debate is the extent to which market forces can be relied on to supply the level of transparency demanded by the public. The debate has intensified due to recent innovations in trading technology that allow for the capture and dissemination of vast amounts of market information at low cost. Government-mandated transparency requirements are often based on the premise that complete transparency is a desirable goal.

Economists have been more circumspect in opining on the desirability of complete transparency. Some observers have argued that complete transparency may actually result in investors having access to less information. This is because mandated transparency sets up a paradox: As securities prices become perfectly known, there is less individual return to discovering new information. Requiring complete transparency can reduce the incentives of individual investors or analysts to gather fundamental information and incorporate it into market prices. If the incentives for gathering information are reduced, prices will be less informative.

The provision of transparency involves both social benefits and social costs. Therefore, identifying the socially optimal level of transparency, that is, the level of transparency that balances social benefits and social costs, is an important consideration in the public policy debate on the subject. Optimal transparency may not be consistent with complete transparency, a concept that implicitly assumes that transparency provides benefits at no cost. The public policy debate on transparency hinges on the question of whether financial exchanges, such as the New York Stock Exchange, possess sufficient private incentives to provide the socially optimal level of transparency.

The provision of transparency is costly because for financial exchanges to disseminate market information, this information must first be produced. Producing market information, what economists refer to as "price discovery," is a costly activity requiring considerable investment by a financial exchange. Restrictions on the use of market information can be viewed as a means of protecting the exchange's investment in producing accurate prices. Under this view, exchanges hold property rights to the information they produce, analogous to a trade secret. Exchange-imposed restrictions on the dissemination of information can reduce the externality problems associated with information production; that is, exchange-imposed restrictions serve to limit the use of information by off-exchange traders who do not contribute to the price discovery process at the exchange. Government-mandated transparency reduces the exchange's return on its investment in information production (because information is given away for free to rivals who have not paid the costs of its production). The result can be less accurate prices, higher costs of trading, or both.

Mandated transparency may also have distributional consequences. Mandated transparency may redistribute benefits from information producers to information consumers and from some classes of information consumers to others.

In the absence of government regulation, transparency can be viewed as one dimension of competition between competing marketplaces. By choosing to make information widely available at low cost, financial exchanges can attract order flow to their trading venues from customers who value transparency. By attracting order flow, markets become more liquid and trading costs decline. Financial exchanges will choose the transparency level consistent with profit maximization. Choosing the appropriate level of transparency will necessarily involve trade-offs. On the one hand, too little information provided to market participants can result in a reduction in trading volume as fewer investors are attracted to the trading venue. On the other hand, too much transparency can also lead to a reduction in trading volume. For example, if a dealer's inventory position can be discerned from the contemporaneous dissemination of transaction prices and volume, other traders may be able to take advantage of this information at the dealer's expense. Thus, the willingness of dealers to make a market will in part be determined by the level of transparency selected by the exchange. In addition, too much transparency helps facilitate off-exchange trading that can reduce liquidity on the transparent exchange. Liquidity can also be reduced if higher transparency leads to higher price volatility.

Other traders may not value transparency as highly and may prefer to trade in more opaque environments where their trades can take place in greater secrecy. For example, an institutional trader contemplating a large market-moving transaction may prefer secrecy to reduce the price slippage that would result from having other traders know his intentions. If transparency is mandated, traders who value secrecy may trade less often or search for venues in other jurisdictions that offer greater secrecy. A reduction in trading volume from large transactions can reduce market liquidity and reduce the information contained in that order flow from reaching the market.

The analysis of the effects of transparency becomes more complex when traders can trade in multiple jurisdictions, each with a different policy governing market transparency. Consider two side-by-side jurisdictions, one with a low level of market transparency (the opaque market) and one with a high level of transparency (the transparent market). Traders in the more opaque market can monitor prices in the transparent market, but traders in the transparent market cannot see prices in the opaque market. This means that the opaque market will have better information: its knowledge of prices on the transparent market and at least some portion of the order flow to the opaque market. This informational asymmetry allows members of the opaque exchange to exploit price differentials between exchanges, causing bid-ask spreads in the transparent market to widen in anticipation of the arrival of informed order flow. Requiring a high level of transparency may result in the unintended consequence of creating higher trading costs (e.g., higher bid-ask spreads) for customers because of the informational asymmetry with less transparent markets.

An important set of players in the provision of transparency are information vendors such as Bloomberg. These vendors form contracts with financial exchanges to receive flows of real-time information. The revenue received by financial exchanges from vendors helps offset some of the costs associated with offering transparent markets. Information purchased by information vendors is then disseminated to subscribers of the vendor's services. This thriving market for real-time data reminds us that an important dimension to transparency is price. Financial exchanges are willing to provide high levels of transparency for a price. Debates about the appropriate level of transparency can be recast as a debate about the price of transparency. In fact, in markets under the jurisdiction of securities regulators, the price of market data is regulated to ensure that the administered price is "fair and reasonable." For markets under the jurisdiction of futures market regulators, the price of market data is determined by the market.

Ultimately, competing views concerning the effects of mandated transparency can best be analyzed with empirical evidence. Currently, little evidence exists. In the absence of empirical evidence, regulators must decide which entity is in a better position to judge the appropriate level of transparency, and its price: the exchange or the government. Advocates of mandated transparency believe that the government is in the better position to make this determination. Opponents of mandated transparency believe that the exchange is in the better position. Ultimately driving these competing regulatory views is a philosophy about the nature of the exchange itself. Advocates of mandatory transparency tend to believe that exchange-imposed restrictions on information dissemination are the result of anticompetitive conduct. Opponents of mandatory transparency tend to believe that exchange-imposed restrictions on information dissemination are the result of financial exchanges acting to protect their private property, and simply a reflection of one form of competition between competing market centers. Under this view, market forces can be relied on to efficiently determine the appropriate level of market transparency—for a price.

—James A. Overdahl

Transparency International

Transparency International (TI) is a nongovernmental organization (NGO) based in Berlin that cooperates with business, government, and civil society to combat corruption around the world. TI works at the national and international levels to lessen both the supply and demand of corruption, which it defines as the abuse of entrusted power for private gain. Launched in 1993, TI began because most world business and government officials were ignoring corruption. Yet some people in both developed and developing nations were concerned about the large-scale bribery by businesses as they "bought" officials and politicians in the developing world; such corruption hurt economic development and undermined human rights.

TI raises awareness about the damaging effects of corruption, advocates policy reform, works toward the implementation of multilateral conventions, and subsequently monitors compliance by governments, corporations, and banks. TI estimates that the amount lost to bribery in government procurement worldwide is more than $400 billion each year. TI has chapters in 95 countries, which work to increase accountability and transparency in their own nations. In addition, there are regional networks of TI chapters that cooperate on regional issues in Latin America, South Asia, Southern Africa, and Central and Eastern Europe. China and Saudi Arabia do not have chapters because independent chapters there are not possible, and TI will not accept a mere government-sponsored chapter. TI does not expose individual cases of corruption; however, it does train journalists to investigate and expose cases of corruption in their countries. Thus TI works to make long-term gains against corruption by focusing on prevention and reforming systems.

TI has worked with the leading industrialized nations of the world, through the Organisation for Economic Co-operation and Development (OECD), in establishing an antibribery convention for its member states. Chapter members in European nations, especially in Germany and France, pressured their own governments to support the pact. Moreover, TI insisted that there be effective monitoring systems. Earlier, Latin American TI chapters cooperated to enact an antibribery convention in that region.

A principal vehicle for combating corruption is providing information or transparency, hence the name. TI has received much media attention and therefore has been effective with its annual Corruption Perception Index (CPI). The CPI is a list of countries (146 in 2005) in rank order from least corrupt to most corrupt. To compile this index, TI uses 18 surveys of businesspeople and country analysts that inquire about a country's corruption; they will not list a country unless they have at least three polls. Statisticians at TI then average these polls to arrive at their annual list. TI held its first annual meeting in 1994 and began publishing the CPI in 1995. In the current CPI ranking, the least corrupt are Finland, New Zealand, Denmark, Iceland, and Singapore; the United States is number 18 out of 146 countries. The most corrupt are Chad, Myanmar, Nigeria, Bangladesh, and Haiti. For the current CPI, the annual ranking of countries, and much other valuable information on TI, see TI's Web site (http://www.transparency.org).

TI found that corruption is rampant in 60 of the 146 countries that it ranked and that the public sectors of those countries are plagued by bribery. These 60 countries scored less than 3, compared with a clean score of 10 on the TI list; a total of 105 countries scored less than 5 on that list. TI also measures the countries in which corruption seems to be decreasing, and those countries in which it is increasing. TI challenged the myth of the northern moral superiority of the industrialized nations when it developed data showing that private firms from wealthy northern nations were principal agents undermining governments in developing nations because of their bribes.

TI responded to criticism that in its index it was only listing the countries that receive bribes and that those bribes often come from people in wealthier countries. Thus, they now also publish a Bribe Payers Index (BPI). The BPI is a rank order list of those countries from which it is perceived that bribes are initiated. TI was also appointed the Secretariat for the International Anticorruption Conference, and it has organized conferences in Peru, South Africa, the Czech Republic, and South Korea.

TI also provides information in its annual *Global Corruption Report* (GCR), which presents an overview of the state of corruption around the globe. The report brings together news and analysis. The report focuses on reforms, along with national and regional trends, in articles by journalists, NGOs, and academics from around the world. The 2005 edition focuses on *Corruption in Construction and Postconflict Reconstruction.*

The Business Principles for Countering Bribery is a cooperative initiative of TI and Social Accountability International. It is offered as a benchmark for business firms in designing their own anticorruption principles. Developing these principles followed TI's approach of cooperating with other groups, and it is seen by TI as the first step of a long-term process of working with the private sector to raise the standards of practice to counter bribery. The principles were drawn up in partnership with representatives of business firms, universities, trade unions, and other nongovernmental bodies.

The World Bank and its lawyers initially opposed the work of TI. However, in 1995, a new World Bank president joined the effort to combat corruption because he saw that corruption was thwarting the bank's development programs. Some political and business leaders from around the world have supported TI's efforts, often at considerable cost to themselves. When TI examined institutions in various countries, it found that again and again political parties are the most corrupt institution; this was also true in the United States.

A search of business articles (e.g., one conducted through LexisNexis) on the subject of TI shows the widespread and profound impact TI is having on countries and firms worldwide. Local news organizations around the world publicize the TI index, either praising their country's high ranking or publicizing and perhaps making excuses for a country's low ranking. For example, Nigeria was ranked third from last, and commentators said that it is unfair to compare the bribery in poor countries with that in wealthy countries, which have a developed social welfare system that cares for people's needs. In another incident, the national president of Kenya's chapter of TI in 2002 was asked by a new president to help clean up corruption in the country. But he resigned 2 years later because there had been so little progress in combating corruption.

Triangle Shirtwaist Fire

The Triangle Shirtwaist Factory is best known as the site of a deadly fire that blazed for 18 minutes in the late afternoon of March 25, 1911. On the ninth floor of the Asch Building, which housed the factory just off Washington Square in New York City, hundreds of young women and girls were trapped by fire. Thirty or more workers jumped to their death on the pavement below, while more than 100 working girls burned on the factory floor. The resulting public outrage prompted the creation of the New York Factory Investigating Commission. This commission launched an era of remedial factory legislation.

Throughout the late 19th and early 20th centuries immigrant girls and women were recruited to work in the garment industry sweatshops. Italian, Jewish, Polish, and Slavic women worked long hours in these unventilated and minimally heated factories. Although female workers were actively recruited into the recently organized International Ladies' Garment Workers' Union (ILGWU), the founders of the union believed that women had neither the ability nor the commitment to sustain leadership roles in the union.

The garment industry was thriving as working women became eager consumers of ready-made clothing. As profit opportunities grew for factory owners, they cut wages, put more workers in smaller spaces, and introduced strict workplace monitoring to reduce pilferage and wasted time. Firsthand accounts of life in the factories describe them as cramped and filthy. In November 1909, a mass meeting of factory workers convened in New York to demand better wages and improved working conditions. When the male leaders hesitated to commit to a plan, a 15-year-old Ukrainian-born girl stood up and called on her fellow workers to strike. The response to her call began the Uprising of the Twenty Thousand.

Within 2 days, 20,000 to 30,000 factory workers in New York went on strike. The walkout quickly spread to Philadelphia and became an important milestone in the women's labor movement. For 3 months the workers picketed in the cold, withstanding the hardships of weather and lost wages in hopes of improved conditions, hours, and wages in the sweatshops. In February 1910, an arbitrated settlement was reached with most of the factory owners, although some refused to sign the agreement. One of these was the Triangle Shirtwaist Factory, where Clara Lemlich, the instigator of the Uprising, worked.

Triangle's ninth-floor factory rooms had inadequate fire escapes, no sprinklers, and exit doors locked from the outside to prevent worker theft of materials. When fire broke out, spreading quickly through hanging fabric and paper patterns, 500 women and girls were trapped inside. A few escaped by running to the roof, or getting the last run of the elevator downstairs, but many resorted to jumping out the windows, crashing to the ground as appalled observers watched. By night, 146 corpses were piled on the 26th Street pier.

In December 1911, the owners of the Triangle Shirtwaist factory went on trial for manslaughter. Despite enormous public outrage and grief, the all-male jury returned a verdict of not guilty, in response to the judge's insistence that the owners could only be found guilty if the jury believed that they knew the workshop exit door to the stairway was locked. However, over the subsequent 3 years, 36 new laws were enacted following the recommendations of the Factory Investigating Commission to reform the state labor code and mandate safer working conditions in factories. One commission member was Frances Perkins, who later became secretary of labor in the Roosevelt administration.

TRILATERAL COMMISSION

Founded in 1973 with the support of David Rockefeller and other notable private citizens, the Trilateral Commission has sought to create a forum for substantive contact between corporate and other social leaders concerned with more closely aligning business and governmental actions in three regions of the world. The Commission hosts an annual meeting and also publishes studies and reports (*Triangle Papers*) that cover a wide range of topics.

The Commission is one of a number of major organizations whose members influence public policy discussion and formulation, especially in terms of international affairs. *Trilateral* refers to the three major geographic areas of democracy and wealth: Pacific Asia (particularly Japan), Europe (especially the European Union countries), and North America (the United States and Canada, with Mexico recently added).

Membership in the Trilateral Commission is by invitation. Currently there are about 350 high-level individuals from business, public service (excluding current political officeholders), media, academia, labor unions, and other nongovernmental organizations. Leadership consists of the regional chairmen, deputy chairmen, and directors, along with an executive committee of approximately 40 other members.

The Commission's mandate has been to encourage its members to build institutional linkages within the major democratic industrialized areas of the world that focus on international collaboration. The Trilateral emphasis on the importance of geopolitical interdependence has in fact borne fruit—helping mitigate friction on a number of issues such as trade between nations—and the Commission is among the leading proponents of greater global integration.

Because so many Trilateral members are also active in similar international business groups working outside the glare of regular news reporting, the organization has been subject to much criticism. For example, the Commission has been seen as a front for large corporate interests more concerned with setting up a global state than in protecting national sovereignty. Thus it is not uncommon to see the Trilaterals linked with the Council on Foreign Relations and the Bilderberger group, among others, as part of a loose-knit "family" of foreign policy conspirators. This, of course, is a matter of dispute. However, a continuing ethical concern involves the substantial amount of behind-the-scenes corporate power-wielding that occurs without much publicity or democratic accountability.

Triple Bottom Line

The "triple bottom line" captures the three ways in which a company's performance can be conceptualized and measured. John Elkington refers to these three domains as economic prosperity, environmental quality, and social justice. The concept of the triple bottom line implies that a company's effectiveness cannot be judged by financial performance alone. To become more sustainable, a company needs to meet the requirements and expectations of most, if not all, of its stakeholder groups, which include shareholders, employees, customers, suppliers, the local community, and the natural environment. Performance with respect to all these stakeholder domains is reported, for example, in Global Reporting Initiative (GRI) measures, on which an increasing number of companies rely. However, some observers argue that even future generations must be considered in such stakeholder measures since the UN's Brundtland Report defined *sustainable development* as "development that meets the needs of the present world without compromising the ability of future generations to meet their own needs." The concept of the triple bottom line pays tribute to the interdependence of the aforementioned three broad areas, in the sense that there is no social progress without economic development and there is no economic or social prosperity without ecological sustainability. Furthermore, the concept acknowledges the interrelationships between these three areas, which are in constant flux due to social, political, economic, and environmental influences.

Economic Prosperity

This element of the triple bottom line represents, to some extent, a company's conventional financial bottom line. Usually, profitability is used as a proxy of the financial strength and value of a company's physical and financial assets. As per standard accounting practice, profit figures are expressed as earnings per share (EPS) or return on assets (ROA). However, under the triple-bottom-line nomenclature, economic prosperity is a broader concept than financial performance because it takes into account a company's direct and indirect economic impact on various stakeholders (e.g., in the form of investments, dividends, or wages). For example, to achieve economic prosperity, companies use and deploy human capital or knowledge-based assets. To achieve economic prosperity, companies must constantly evaluate their employees' skills, experiences, and knowledge. These elements are often dubbed *intellectual capital,* which companies must maintain, develop, and enhance to achieve economic prosperity.

Hence, the concept of the triple bottom line requires that companies think more broadly about economic prosperity than just ROA. Particularly the sustainability agenda pushes toward long-term business planning. For example, Porter and van der Linde argued that, especially in the long run, there is no trade-off between environmental protection and economic competitiveness. Furthermore, a psychometric meta-analysis by Orlitzky, Schmidt, and Rynes showed that the empirical links between the economic, social, and environmental dimensions of corporate performance are, on average, positive and strong or moderately strong. In contrast, conceptualizing social and ecological improvements as in "natural" opposition to business success may only hinder the implementation of the triple bottom line. Therefore, in line with the empirical evidence, corporate executives must be persuaded that this broader thinking about company performance (as explained by three complementary, or synergistic, rather than contradictory forces) will, in the final analysis, pay off for the companies that they lead.

Environmental Quality

Environmental quality addresses the ecological bottom line. It focuses on a company's impact on the natural environment. Environmental resources consist of renewable resources (e.g., wood, fish, corn) and nonrenewable resources (e.g., soil quality, fossil fuel). The natural environment also provides so-called ecosystem services, such as climate stabilization and water purification. Many of these services are presently invaluable, that is, either no known substitutes exist or there is one available only at a prohibitive price. To achieve environmental quality, companies should consume natural resources at a rate below either their natural reproduction or the development of substitutes. They should not emit pollution that is greater than that which can be absorbed by natural systems.

This argument running opposite to conventional economics is that not all types of natural resources and ecosystem services have substitutes in the form of economic capital or technological innovations. In the short run at least, many resources and ecosystems are irreplaceable. Complex combinations of various natural resources in an ecosystem restrain their substitutability. Forest ecosystems, for example, offer raw material for paper (which is substitutable), but forests also absorb carbon dioxide (CO_2), regulate the flow of rainwater, and provide protection for native plants and animal species. Hence, in many ways, environmental quality and economic prosperity are complementary. Companies have to improve or maintain the quality of natural resources to provide for their long-term economic prosperity. This improvement or maintenance represents the aforementioned investment in *natural capital,* which is likely to explain the performance of future, sustainable organizations.

One of the foremost goals in achieving environmental quality is eco-efficiency. According to the World Business Council for Sustainable Development (WBCSD), *eco-efficiency* is achieved by the delivery of competitively priced goods and services that satisfy human needs and bring quality to life, while progressively reducing ecological impacts and resource intensity throughout the life cycle, to a level at least in line with the Earth's estimated carrying capacity. More specifically, eco-efficiency can be achieved through (a) dematerialization, which involves the substitution of knowledge flows for material flows or product customization; (b) production loop closure, which returns every output to natural systems as a nutrient or as an input to future manufacturing; (c) service extension, in which customers lease rather than buy goods, especially durable goods (such as interior furnishings); and (d) functional extension, which enhances the functionality of products, often in the form of additional service delivery.

Social Justice

Social justice refers to the company's human and social bottom line. This element of the triple bottom line is often called "corporate social responsibility" (even though many scholars would consider social responsibility to include environmental responsibilities as well). Social justice concerns a company's impact on knowledge, skills, motivation, and loyalty of employees and business partners. Proxies for this impact might be turnover, training opportunities, and occupational health and safety within the company. More broadly, social justice also refers to how a company may influence social aspects in its relationships with various external stakeholders, such as involvement in community projects, entrepreneurial culture, and encouragement of innovative suggestions furthering social progress.

To accomplish social justice, companies need to add social value to the communities within which they operate. They can do this by effectively communicating with their stakeholder groups, involving their stakeholders in learning and development opportunities, increasing the number of choices available to customers, and respecting property rights.

A problem with such an aim is that a company typically cannot satisfy all stakeholders simultaneously. Some decisions in favor of certain stakeholders may require trade-offs (e.g., capital invested in state-of-the-art recycling technology will prevent this money from being invested in workers' training and development), which makes these types of business decisions inherently distributive. However, an acknowledgment of this balancing act does not necessarily imply an inevitable erosion of *social capital,* which is a capability that arises from the prevalence of trust in a society (or in certain sectors of society). Because the level of trust between a company and its external stakeholders is a key determinant of long-term survival, a company must clearly identify the status of certain stakeholder claims and, more often than not, engage in a variety of stakeholder dialogues and partnerships.

Like natural resources, social resources are not always substitutable. Companies can introduce economic incentives (e.g., lower prices of products or higher salaries) to substitute for dissatisfaction of their stakeholders. However, economic substitutes have their limits in a social context. Certain social resources such as community spirit, innovative culture, or reputation have no traditional economic substitutes. Hence, in many ways, social justice or social responsibility can be seen as a precondition for a company's economic prosperity and environmental sustainability.

The triple bottom line emphasizes the need for integration of these three dimensions of economic prosperity, environmental quality, and social justice. The concrete measurement of these dimensions aids in this integration in practice.

Triple-Bottom-Line Reporting

The metaphor of the triple bottom line highlights the importance of measurement and reporting in all three domains of company activities and impact. In line with the increasing popularity of the triple bottom line, many corporations shifted from reactive, accounting-based reporting to proactive, value-added, and comprehensive reporting of a company's performance. Triple-bottom-line reporting is supposed to address both primary stakeholders (e.g., employees, investors, business partners, customers) and secondary stakeholders (e.g., governments, social activists, communities, the media) and provide these stakeholder groups with valid, comprehensive, and reliable data about a company's economic, environmental, and social performance. Apart from financial indicators, a company's triple-bottom-line report typically includes narrative statements (such as an explanation of equal employment opportunity policies and programs) and environmental impact measures (such as amount of waste by type and destination).

Although there is at present no universally accepted reporting model, the GRI is a comprehensively developed framework that is widely used. Established in 1997, the GRI sought to bring together business executives, accountants, social and environmental activists, labor organizations, the United Nations Environmental Programme (UNEP), and governments to enhance the comparability and legitimacy of triple-bottom-line reporting standards worldwide. The GRI elements are (a) CEO statement; (b) key indicators; (c) profile and financial performance; (d) policies, organization, and management systems; (e) stakeholder relations; (f) management performance; (g) operational performance; (h) product performance; and (i) sustainability statement. However, so far, integration of these different domains of the triple bottom line has proven elusive. Triple-bottom-line principles similar to the GRI have been promoted by the Caux Roundtable (a coalition of European, U.S., and Japanese business leaders) and the Clarkson Centre for Business Ethics & Board Effectiveness, as well as a number of private organizations, such as SustainAbility, Trillium Asset Management, and KLD Research & Analytics, Inc.

Reporting about the traditional bottom line (i.e., the company's financial performance) is a well-established practice grounded in standard methodology and common systems. Yet, as mentioned before, under the triple-bottom-line approach, economic performance is more broadly defined. Therefore, a step toward more comprehensive reporting on companies' economic prosperity has been made by replacing the conventional financial performance indicators, such as ROA or return on earnings (ROE), with economic value added (EVA), an indicator promoted by several U.S. investors. Application of EVA shows whether a company is adding or destroying value. Within this reporting approach, profit figures are adjusted for the expenses of the environmental resources (natural capital) employed.

The 1990s saw a tremendous growth in environmental reporting. However, the practices of environmental accounting and reporting have been inconsistent and varied across industries, regions, and governmental requirements. To improve the situation, the International Chamber of Commerce has developed the Charter for Sustainable Development, which consists of 16 principles for environmental management. The Charter has provided a common basis for improving business environmental performance, thereby minimizing reporting differences. By the end of the 1990s, a majority of large corporations in the United States (more than 50%) and the United Kingdom (more than 75%) issued environmental reports.

Social accounting and reporting began to gain advocates and practitioners a few years after environmental reporting. Social accounting measures the quality of stakeholder relationships and social performance of a company. In 1997, the U.S. Council on Economic Priorities developed a code of conduct named Social Accountability 8000 (SA 8000), which defines both the criteria for workplace conditions and a system of independent verification of factory compliance. Then, in 1999, UN Secretary-General Kofi Annan announced the proposal to create the UN Global Compact at the World Economic Forum in Davos, Switzerland. The Global Compact provides nonbinding recommendations related to corporate social performance. In another effort, the Institute for Social and Ethical Accountability (ISEA), formed in 1995, created accounting and auditing standards in a comprehensive framework that is called AA1000. Companies such as The Body Shop, British Telecom, and Royal Dutch/Shell, together with organizations from the nonprofit sector, joined up to be proactive in implementing the AA1000 standards with independent assurance. These developments suggest that in only a few years social reporting evolved from a marginal to a central activity of many large companies.

One of the major challenges with respect to triple-bottom-line reporting lies in the integration of environmental and social reports in the company's conventional accounting systems. Environmental and social reports are qualitatively different from financial accounting and auditing. In the case of the former two domains, there is currently an absence of standard methodology as they are more open to subjective opinion or interpretation. Some areas of environmental and social performances, such as the level of trust or employee morale, are measured by collecting stakeholders' perceptions of performance. Information is usually collected through interviews, focus groups, surveys, and stakeholder meetings. For example, the AA1000 framework provides guidance on the selection and administration of these data collection techniques. Some other areas of performance, such as sponsorship and gas emissions, can be measured through the use of more "objective" data. In short, economic performance is assessed with standardized systems and protocols, whereas environmental and social accounting systems still suffer from an absence of standard methodology and lack of accounting and auditing experience. Because of this ongoing debate about environmental and social reports, though, it becomes essential for business to assess these domains internally—via regular *responsibility,* or *social audits.*

Critiques

The concept of the triple bottom line has attracted a few critics, who claim that the concept is synonymous with *corporate social responsibility* and is not novel. Furthermore, the aforementioned lack of standardized, aggregate measurement has been criticized. Critics often contrast the triple bottom line with the concept of the financial bottom line, which they consider internally consistent. Yet, as argued by Meyer and Gupta, there is empirical evidence that different measures of economic performance not only *can* contradict each other but also are in fact *likely* to do so. In fact, financial measures may be as prone to measurement error and deliberate distortion as other organizational performance variables. There have been several important developments that represent clear attempts to bring triple-bottom-line measures (e.g., GRI) in line with the concept and thus enhance construct validity. Given the relatively brief history of this comprehensive model of organizational effectiveness, it may be unrealistic to expect perfect measures. Different business contexts militate against a "one-size-fits-all" model of the triple bottom line for any firm of any scale in any industry.

Motivations

Since 1997, the concept of the triple bottom line has gained tremendous currency, especially among managers of large international corporations whose reputation is on the line on a daily basis. Of course, companies adopt the triple-bottom-line principles for a variety of reasons. Some do so because their executives believe in and espouse these principles. Other managers embrace the concept (at least publicly) because they are expected to comply with stakeholder values or because they regard this approach as a useful marketing tool. In short, there may be all kinds of "motivations" of triple-bottom-line accounting. As the triple bottom line can be conceptualized as an inherently moral-normative concept, the second-guessing of ulterior business motives is understandable. However, raising questions about company motives is confused for two main reasons. First, some authors regard Elkington's notion of sustainable development as inherently utilitarian. This means it is primarily concerned with business contributions to social value and minimization of environmental impact as two *outcome* measures, or *consequences,* of company performance. Second, more generally, attributing "motivations" to organizations ascribes human features to these social entities at the collective level. Talk of some "corporate motivation" may misapply a fundamentally individual-level concept to higher levels of analysis in social theory. Hence, in the end, such ethical fault-finding in organizational motives might often be counterproductive because, ultimately, motives can only be inferred at individual levels of analysis, whereas outcomes can be measured and evaluated at higher levels.

Conclusion

The triple-bottom-line concept, in general, addresses the evolving relationships between business and society. Such relationships involve complex issues of measurement and assessment of a company's performance through three different lenses. It also requires careful consideration of various aspects of stakeholders' perceptions of business processes and outcomes. Therefore, the main challenges continue to lie in the operationalization of the triple bottom line. The implementation of the triple-bottom-line philosophy requires integrative dialogues between stakeholders that seem to be in opposition—for example, companies and environmental groups, shareholders and employees, industries and local communities, and governments and businesses. These stakeholder groups need to develop various partnerships to reconcile tensions between their goals and achieve integration of economic prosperity, environmental quality, and social justice. Some recent empirical research indicates that many of these tensions and oppositions may be dysfunctional social constructions that are, in the final analysis, more apparent than real.

TRUST

Trust is essential for establishing and maintaining mutually advantageous, even amicable, relationships in business or other cooperative social arrangements. A violation of trust will severely test and may end the relationship. There is an old saying that trust arrives on foot but leaves on horseback.

The Definition Problem

Despite nearly unanimous agreement on the importance of trust as a lubricant for expediting market exchanges and as a glue for cementing cooperative relationships in that market, scholars have failed to achieve consensus on its definition. They have tended to focus on different aspects of trust observed through different disciplinary lenses in a wide variety of contexts, from individual (micro) to organizational (meso) and even societal (macro) levels of analysis and at different stages of development.

Virtually all definitions of trust include two conditions. (1) *Vulnerability*—The person who trusts someone else voluntarily places valued assets at risk when entering into a one-time exchange or an ongoing relationship with another party. (2) *Expectation of reciprocal regard or treatment*—The prospect of mutual gain from cooperative behavior gives rise to an obligation to treat each other fairly, that is to say, without opportunism or guile, and with some expectation of goodwill in the face of vulnerability. Even where trust may appear blind, as in the case of an infant's dependence on its mother, there is an implicit expectation of unqualified goodwill. Blind trust of a stranger may be either foolish or saintly, but it is hardly rational. Consider the case of hiring a babysitter. Parents place their children at some risk when they invite a stranger to serve as a caregiver while they are away. They can mitigate this risk by investigating the background and qualifications of the sitter. They might check on the certification of the candidate by a professional babysitters' association. In the absence of such macro-level institutional assurance, they could ask for letters of reference, either from previous clients or from reputable persons who could attest to the candidate's sterling character and love of children. References from known parents in the neighborhood would weigh more heavily than the word of strangers. Hiring a relative would be even more reassuring, given the strong ties of family feeling. Direct evidence of the sitter's qualifications could be gathered once employment commenced. Especially cautious parents might set up a secret "baby cam" to monitor electronically the sitter's behavior in their absence, possibly providing a live feed to a security firm. However, this kind of covert monitoring would seem better suited to allaying distrust. Trust is most likely to arise from the sitter's personal interactions with the family while providing impeccable care. This history of trust-based behavior can cement a long-term employment relationship and even develop the affective bonds of friendship. Thus, trust arises both from the prospect of vulnerability and from efforts to mitigate that risk by forging bonds of reciprocal benefit and regard.

Different Disciplinary Perspectives on Types and Levels of Trust

In general, psychologists have tended to focus on the internal cognitive attributes of those who confer and seek trust, primarily at the interpersonal (micro) level of interaction. Economists have tended to think of trust in terms of ways of minimizing mistrust in economic transactions at the interpersonal or firm (meso) level of analysis. Sociological treatments have focused primarily on the meso (network) and macro (societal) levels of analysis, where trust is treated as an organizational or institutional variable embedded in relationships. Philosophers have devoted remarkably little attention to trust, other than as a desirable indirect outcome of principled action after considering what is right, just, and fair in governing relationships. The recent emergence of turbulent, hypercompetitive market conditions has stimulated considerable cross-disciplinary interest in finding ways of mobilizing trust over time within knowledge-creating networks. A convergence of perspectives on trust across disciplines and at different levels of analysis points to the need for better understanding of the role of ethical, trust-based governance within networks in efforts to develop and sustain a dynamic competitive advantage over time. Thus, much of the definitional confusion can be resolved by recognizing that different disciplines tend to focus on the trust phenomenon at different levels of analysis and from either static or dynamic (stages of development) perspectives. Special attention will be devoted to the treatment of trust within the discipline of economics since this treatment underlies transaction cost assumptions about the role of corporate governance mechanisms for minimizing mistrust in hierarchical relationships.

The Transaction Cost Economics Perspective on Trust

When complete contracts govern discrete market transactions—where the terms of one-time economic exchanges are specified, costs and benefits to both parties are measurable, and the contract is enforceable under the law—there is little need for trust. Under such circumstances, valued resources of the buyer and seller are hardly at risk. Trust has potentially greater scope when contracts are "incomplete" or "relational." Such contractual relationships are open-ended and emergent over time, where the terms are not specified fully and thus are subject to learning-based clarification or renegotiation as the exchange relationship unfolds. Institutional economist Oliver Williamson argues that incomplete or relational contracting is much more common than is complete contracting, particularly at the meso level, where business firms are engaged in ongoing economic exchange relationships. This insight gives rise to the "transaction cost-based" theory of the firm, whereby Williamson and others argue that managerial monitoring of underspecified relational contracts, backed by corporate governance mechanisms to control for potential managerial opportunism, tends to minimize transaction costs of hierarchical relationships inside the firm.

Since Williamson defines opportunism as the pursuit of self-interest with guile, it becomes quickly apparent that trust is severely circumscribed within the transaction cost-based theory, as well as in the closely associated "agency theory" of corporate governance. Agency theorists, such as Michael Jensen and William Meckling, argue that the innate opportunistic, self-serving inclinations of human nature must be taken into account by the design of managerial control and incentive systems within the firm. They propose dealing with the "agency problem" (where managers are inclined to serve their own, rather than the ownership, interest) by more closely aligning the interests of managerial agents and shareholder principals. Taking maximization of shareholder value as the unitary purpose of the firm, agency theorists seek closer interest alignment between agents and principals by improving transparency in financial reporting, minimizing conflicts of interest, and designing executive compensation schemes weighted toward bonuses and stock options that pay for superior *financial* performance. Managers are paid to think and act like owners. Such structural remedies seek to recognize and compensate for the inherent *untrustworthiness* of human nature. Many economists are inclined to regard trust as more of an irrational, idiosyncratic, emotional state of mind, which cannot assure efficient and profitable market transactions. Indeed, most of the control and incentive schemes offered by agency theorists and transaction cost economists seem more intent on deterring outbreaks of self-interest with guile, rather than on enhancing trust. Thus, deterrence-based "trust" is the outgrowth of efforts to diminish distrust by controlling for the potential of opportunism, rather than a form of trust, per se.

Trust as an Embedded Source of Social Capital

Alternatively, a growing number of scholars have come to argue that trust has real economic value because it not only reduces monitoring and control costs in business transactions but also encourages cooperation, information sharing, and the joint creation of new knowledge, generated within or among firms—hence the recent interest in a "knowledge-based" (similar to a "resource-based") theory of the firm. The work of Janine Nahapiet and Sumantra Ghoshal is especially helpful in developing this argument. If the firm is a social community specializing in creating and transferring knowledge with speed and efficiency, then the key to developing the dynamic competitive capabilities of this network must lie in efforts to invest in and improve returns on a community's *social capital.* This term first appeared in studies of how and why some urban or regional communities developed networks of strong and weak ties that enabled trust and cooperative enterprise to emerge, innovate, and flower into collective action. The operative word here is *developed*—drawing attention to learning processes that enable forms of trust to evolve over time, strengthening and becoming more *embedded* in social relationships. As trust in social relationships builds, social capital accumulates from the cohesiveness and solidarity of strong ties and from the new information and multiple perspectives available in weak ties.

A Developmental Perspective—From Calculative to Relational Trust

Efforts across scholarly disciplines to arrive at a comparative and developmental framework of trust focused on aspects of *calculative* and *relational* trust. Calculative (sometimes called calculus-based) trust arises from the context of shallow or short-term dependence or interdependence between trustor and trustee, primarily at the interpersonal or organizational level of analysis. It is associated with treatments of rational decision-making processes in economic exchanges. A potential exchange relationship is evaluated to determine whether the likely return from cooperation outweighs the risk to valued assets placed in the hands of the trusted party. A positive evaluation of risk and return is based not only on the strength of deterrence safeguards (to reduce distrust) but also on the availability of evidence attesting to the credibility and competence of the trusted party. Given the shallowness or absence of a direct personal connection, trustworthiness is determined from indirect evidence, such as letters of reference or credit reports that attest to a person's or an organization's reliability, competence, and reputation for fair dealing.

The evolutionary stages of trust are mirrored in changes in the terms and conditions of the "prisoner's dilemma" game—a classic role-playing simulation of game theorists in which each "prisoner" must evaluate the costs and benefits of a self-interested or a cooperative strategy. When neither prisoner has any information about the motives of the other, then the winning strategy is to rat out the other prisoner in exchange for a reduced sentence. In the absence of information about the other prisoner's intentions, blind trust is foolhardy. However, Robert Axelrod has shown that a cooperative "tit-for-tat" strategy based on trust followed by verification of reciprocal regard offers more gains or, at least, reduced losses for both parties over time. By extending this game to an infinite number of plays, others have shown that a tit-for-tat strategy of building trust and cooperation over time has a higher payoff than do strategies of either unconditional opportunism or one-sided altruism. Thus, over the long run, self-interested rationality discovers the net benefit of at least some degree of cooperation with others. It is at this point of learned self-awareness of the value of working and living together with others over time that calculative trust begins to fade into relational trust.

Relational trust builds from a history of direct, personal interactions over time, where both parties demonstrate a willingness to forego the possibility of short-term gain from a default of contractual or moral obligations. Relational trust can arise out of the earlier stage of calculative trust, though some authors prefer to think of these as discrete forms of trust. The initial rational assessment of costs and benefits associated with an opportunity for cooperative exchange can be enriched by the growth of more emotional ties of friendship. Thus, relational trust is also known as "affective trust," where a handshake, or even a hug, can take on new meaning as the relationship deepens. Relational trust may evolve into an even deeper form, frequently called "identity-based trust." Over time, the reciprocal perception of "I" and "thou" can be transformed into the shared identity of a "we" relationship. Under conditions of deep interdependence, equivalent to a marriage, partners feel that they can act with the other party's interests in mind since their interests are virtually synonymous. Such deep emotional ties are not irrational since they typically are built over time from a history of mutual advantage and shared regard. Moreover, a violation of trust in a marriage or a friendship can be devastating to the relationship. Even so, a violation of calculus-based trust tends to be more damaging since shallow relationships built on rational calculations and indirect evidence tend to be more fragile when they are not supported by subsequent facts on the ground. Relational trust is more resilient because emotional bonds tend to stretch before they snap. An act of contrition followed by sincere efforts to renew commitment to the other can restore relational trust over time. Trust, but verify. In other words, honesty is the best policy, both in personal relationships and in business dealings, over the long or short run.

What is the connection between ethics and trust? Social scientists have been reluctant to trace a link between behavioral manifestations of trust and the normative realm of ethics. They prefer to describe and predict what "is" in the "real world," whereas moral philosophers are more concerned with deriving normative rules that point the way toward achieving an idealized "good life." The failure of philosophers to agree on a set of decision rules (Kantianism, utilitarianism, pragmatism, virtue ethics, and social contracting, among others) for deriving ethical norms has not improved prospects for integrating the realms of "is" and "ought." Economists, as reluctant and partial converts to the possibility that trust (as opposed to the deterrence of distrust) may have some economic value, are even more reluctant to confer on ethics a role in economic decision making. Business ethicists ask corporate executives to suspend their laser-like focus on profit whenever an ethical dilemma arises that requires consideration of the rights, values, and interests of nonowner stakeholders in the firm. When the bilateral obligations of principal-agent relationships are supplanted by the more complex, multilateral demands of a multistakeholder network, prospects for enacting a straightforward economic "rationality" dim. Economists resist normative calls for a more comprehensive corporate citizenship practice, to the extent that such calls appear to be driven by emotional appeals to altruism, rather than to the "rational" pursuit of self-interest. Management scholars, noting the growing role of intra- and interorganizational cooperation in leveraging competitive capabilities, have drawn attention to the importance of trust in developing and sustaining productive relationships. However, they have been less successful in showing how management practices that create and maintain trust relate to ethical governance.

Remarkably, even moral philosophers have not considered the trust/ethics connection very carefully. LaRue Tone Hosmer, a notable business ethicist, observed that philosophers tend to regard trust in relationships as a fortuitous by-product of the responsible application of ethical judgment. However, trust becomes a central concern and an essential output of ethical decision making in the "good life" when all members of a community come to realize that they can't achieve their own ends without taking into account the rights and interests of others. Ultimately, ethical norms guide the actions of men and women of *goodwill,* who voluntarily assume the risks and responsibilities of working out productive relationships according to the principles of fairness and justice. Thus, trust necessarily arises from an amalgam of self-interested and other-regarding motives, neither of which is sustainable separately for long in the real world.

Trust in Ethical Governance Processes

In the *Academy of Management Review* special issue on trust, Blair Sheppard and Dana Sherman relate different processes for producing trust to the kinds of risks associated with the shallowness or depth of dependent and interdependent relationships. Thus, in a context of shallow dependence, a calculative trust assessment of the risk of a party's unreliability in living up to the terms of a short-term exchange relationship is reinforced by deterrence-based safeguards against opportunistic violation of a reasonably complete contract (a lawsuit, regulatory action, etc.). In a context of deep dependence, however, such as one in which risk to the welfare of a child is involved, deterrence threats are reinforced by claims of obligation that are binding, not only on the party who may harm the child but also on those in a social network who may be aware of the potential for harm. When harm does occur, blame is placed not only directly on the perpetrator but also indirectly on anyone who should have exercised an oversight responsibility. Thus, in situations of deep dependence, the expectation of procedural justice to minimize the risk of harm is closely associated with the condition of trust. Expectations within such relationships take the form of psychological contracts, which are tested periodically, followed by occasional clarification or renegotiation to assure that all parties understand and live up to their obligations. Relational trust may well develop in this context, but the vertical relationship tends to be stable over time. In situations of shallow interdependence, parties in ongoing horizontal relationships must engage in active discovery through exploratory dialogue, often facilitated by contiguity (such as the colocation of parts suppliers and assemblers) and electronic communication linkages. This is the equivalent of prisoners confronting the dilemma of whether to cooperate by opening a communication channel to explore ways to cope with uncertainties in their relationship. Such exploratory exchanges tend to forge the affective bonds of relational trust, which facilitate coordination and cooperation within an open-ended, emergent relationship. In the context of deep interdependence, identity-based trust is produced when parties in an ongoing relationship have internalized each other's values and preferences to a point where the risk of mistaking each other's intentions is controlled by discursive construction of a shared meaning.

Conclusion

The above analytical and developmental framework has powerful implications for the role of ethical governance processes in building and sustaining trust. In situations of shallow dependence, rational calculations of the risk of unreliable or incompetent behavior, backed by institutional mechanisms for deterring distrust, leave a relatively modest scope for ethics as an auxiliary tool for minimizing transaction costs in short-term exchanges. Ethical considerations have a larger role in reinforcing the normative obligations associated with deep dependency in more lasting vertical relationships. Ethics has a critical role to play in generating affective and identity-based trust within learning processes that govern interdependent relationships, particularly at the meso level of intra- and interorganizational alliances. To the extent that capability building (especially knowledge creation) supplants cost reduction as a rationale for cooperation, the production of relational trust via dialogic interactions is essentially an investment in social capital, from which increased cooperation in the production of new knowledge flows. While deep dependence obligations can be embedded within hierarchical relationships, sustaining both shallow and deep interdependence requires a collaborative, consultative style and open communication for managing near-horizontal relationships among network partners. To the extent that knowledge creation in interdependent networks supplants transaction-cost reduction in hierarchies, the scope for ethical interactions among managers and stakeholders of value-creating networks will grow. When value is defined more broadly, to encompass social and environmental as well as economic measures, the management of complex stakeholder networks must take into account more fully the role of trust and ethical obligations of fairness and justice to govern cooperative efforts to realize the promise of the good life.

Trustees

A trustee is a person who safeguards the assets or property of a trustor for the benefit of a third party who is the beneficiary. In law, a trustee is someone who has the legal authority to manage money or property on behalf of another person. However, the trustee, the trustor, and the beneficiary may be the same person or multiple persons. A trustee can also be a member of a group of people, known as a board of trustees, which is responsible for managing the financial affairs of an institution or organization. The first section of this entry presents specific examples of trustee appointments and their general roles. The second section reviews a trustee's fiduciary duties. The final section offers a brief history of trustees.

Types of Trustees

In its simplest form, a trust is nothing more than an agreement between a trustee and a trustor by which the trustor places assets in the hands of a trustee who then minds them for the trust beneficiaries. A trust is used when a person is unable or unwilling to manage his or her own assets and, thus, places them under the direction of a trustee. A trustee is expected to manage the assets as the trustor would if he or she were willing and able.

Trusts have become increasingly common and popular because of the flexibility they offer in estate and tax planning. Trusts can be used to avoid the expense of probate proceedings, save on estate taxes, support a favorite charity, provide for children, or take care of a pet after the death of a person. Trusts can be used to shield assets from lawsuits and creditors. Trusts can operate during the life of the benefactor and after his or her death. A trustee can be a responsible family member, a friend, or an adviser. Trustees can be changed at the discretion of the trustor.

Trustees may be designated by a trust agreement or by a will, or they may be named or appointed by a court. A corporate charter may enable a bank or trust company to act as a trustee. Trustees may be elected, as in the case of a township trustee, who acts for the benefit of the public. Township trustees provide essential services to the residents and businesses of a township. Areas of responsibility include the township budget, fire and police departments, parks and recreation, zoning and planning, small-claims court, emergency medical service, schools, community centers, shelters, and libraries.

Trustees may be persons who are charged with managing or disposing of the property of a debtor. Trustees may also be any group or board of persons elected or appointed to manage the affairs of an institution such as a college, hospital, library, or other not-for-profit organization. In some cases, the board of trustees is also known as the board of directors. Three examples follow of prominent types of trustees.

Trustees in Bankruptcy

The U.S. Trustee Program is provided by the Department of Justice to promote the efficiency and to protect the integrity of the federal bankruptcy system. The primary role of the U.S. Trustee Program is to serve as the "watchdog" over the bankruptcy process. To further the public interest in the just, timely, and economical resolution of cases filed under the Bankruptcy Code, the program monitors the conduct of bankruptcy parties and private estate trustees, oversees related administrative functions, and acts to ensure compliance with applicable laws and procedures. It also identifies and helps investigate bankruptcy fraud and abuse in coordination with U.S. attorneys, the Federal Bureau of Investigation, and other law enforcement agencies. A trustee may be appointed by the U.S. Trustee Program. A bankruptcy trustee may also be elected by creditors or appointed by a judge to administer the bankruptcy case.

The bankruptcy trustee's duties include (1) collecting and reducing the assets of the bankruptcy estate to cash, (2) operating the debtor's business with court approval if that is necessary to preserve the value of the business assets, (3) examining the debtor at a meeting of creditors, (4) filing inventory reports and making periodic reports to the court on the financial condition of the estate, (5) investigating the debtor's financial affairs, (6) examining and validating proofs of financial claims for and against the business, (7) furnishing information relating to the bankruptcy to interested parties, and (8) opposing discharge of debts through bankruptcy if advisable.

A trustee is appointed or elected in every bankruptcy case under Chapter 7 and Chapter 13 involving personal bankruptcy and under Chapter 12 for the reorganization of family farms. In most Chapter 11 cases involving businesses, the bankruptcy case is administered by the debtor or person going through bankruptcy, rather than by a trustee. The role of the trustee varies depending on the type of bankruptcy case.

Trustees of Not-for-Profit Institutions

Not-for-profit entities are organized to fulfill social or public service objectives rather than to generate profit for investors. The social objectives may be religious, charitable, educational, medical, research-oriented, artistic, or literary in nature. Not-for-profit entities rely on external funding rather than accumulated profits to maintain their operations. Funding may come from multiple sources including private donations, grants from government and foundations, revenue from the organization's activities, and income from the organization's endowment. Fund-raising is an aspect of trusteeship that differentiates trustees of not-for-profit organizations from board directors of for-profit corporations. In the case of arts institutions, trustees often act as both donors (trustors) through the money they provide and as trustees in supporting the values and goals of the institution. Trustees of arts boards are most often recruited from the ranks of the affluent who possess valuable skills, financial resources, or the ability to raise funds.

College and university trustees may be elected by voters or invited to serve as representatives of various constituencies. Universities operate through a system of shared governance, meaning that the trustees concentrate on the overall mission of the organization, while faculties take care of academic matters such as curriculum, teaching, and hiring and promoting professors. The overall mission is decisions about finance, physical planning, fund-raising, and hiring and firing presidents. The traditional roles of the trustees are to defend and promote the interests of the institution and to represent the concerns and needs of the public, which subsidizes and sustains higher education.

Trustees in Companies or Corporations

Managers of corporations may be trustees with a fiduciary duty to serve not only shareholders but also other parties. Corporate managers are trustees primarily in the administration of company-sponsored pension plans. Under the Employee Retirement Income Security Act of 1974 (ERISA), anyone who exercises discretionary control or authority over plan management or plan assets is a trustee (fiduciary) with obligations to the exclusive benefit rule; prudent person rule; diversification rule; and adherence to plan documents rule. The fiduciary may not get involved in a prohibited transaction—transactions involving plan assets, transactions involving employer real estate or securities, and transactions involving self-dealing. Acting in the interests of the employer and acting in the interests of the plan participants may create a conflict of interests.

Fiduciary Duties of the Trustee

Generally, a trustee's duties are to protect and preserve the trust property and to ensure that the property is used solely for the benefit of the beneficiary. Use of the property must be in accordance with the directions contained in the trust agreement.

A trustee has a fiduciary duty to the beneficiary or beneficiaries. A fiduciary duty requires one to subordinate all personal interests while acting for the benefit of another person. It is the highest standard of duty implied by law. Specifically, a fiduciary duty includes acting in good faith, disclosing information in all matters relevant to the trust relationship, loyalty to the beneficiary, obedience to the terms and instructions of the trust agreement, due care in making decisions, and acting for the express benefit of the beneficiary.

The fiduciary duties developed from a need to control the great amount of discretion available to trustees in the absence of the grantor or trustor. However, over the years fiduciary duties have expanded to situations unconnected to a trust. In addition to trusts, fiduciary obligations are found in many different types of relationships including principal and agent; doctor and patient; executor and beneficiary; banker and customer; lawyer and client; and board director and company. Thus, a trustee is a special type of fiduciary. Trustees are involved in fiduciary relationships, but not all fiduciary relationships involve trustees.

A fiduciary relation is a very broad term including both technical fiduciary relations and those informal relations that exist whenever one person trusts in or relies on another. The fiduciary relation is founded on trust and confidence invested by one person in the integrity and fidelity of another person. Such a relationship arises when one person depends on or is especially vulnerable to the actions of another, resulting in an uneven distribution of power and control in the relationship. The relation can be legal, social, domestic, or merely personal. A breach of fiduciary responsibilities makes the trustee liable to the beneficiaries for any damage caused by such breach.

Professional Expertise

The status of being a fiduciary gives rise to certain legal obligations, including the prohibition against investing the money or property in investments that are speculative or otherwise imprudent. In some states, the Prudent Man Rule states that a fiduciary such as a trustee for pension funds may invest the trust's money only in a list of approved securities designated by the particular state. In other states, the trustee may invest in a security if it is one that a prudent man of discretion and intelligence would buy to provide a reasonable income and to preserve the capital investment. In New York, the Prudent Man Rule applies to a trustee who is bound to employ the high degree of diligence and prudence in the care and management of a fund that prudent men of discretion and intelligence in such matters employ in their own affairs. A federal Prudent Man Rule that governs the investment of pension funds is found in ERISA. ERISA Section 404(a) requires a trustee to exercise the same care, skill, prudence, and diligence that a prudent person would use under the circumstances if he or she were acting in a like capacity.

The Prudent Man Rule is also known as the Prudent Investor or Prudent Person Rule. This principle applies to a fiduciary (trustee) who must invest in only those securities or portfolios that a reasonable person would buy. The origin of the rule is an 1830 case involving Harvard College versus Amory that stressed two points for a trustee to consider when making investments—probable income and probable safety. The trustee must consider both.

However, history has shown that a trustee's obligations extend beyond following the Prudent Man Rule that refers to an ordinary prudent man of business. In 19th-century England, complaints and cases brought against trustees were decided not by juries but by chancery judges whose decisions had the effect of setting precedents for increased responsibility and legal liability for the trustee. As a practical matter, trustees in England and also in the United States need to possess greater financial and professional expertise than an ordinary businessman to avoid violating the standard of due care in making decisions.

Personal Attributes

A trustee's personal attributes of integrity, loyalty, and setting aside self-interest in acting on behalf of a beneficiary are equally important. The classic case of *Meinhard v. Salmon* demonstrates that a trustee may not use his or her superior position of power and expertise to make a secret profit at the expense of a beneficiary. Justice Benjamin Cardozo made the following statement in 1928 upholding the importance of fiduciary duties (*Meinhard v. Salmon,* 249 N.Y. 458, 164 N.E. 545):

> Many forms of conduct permissible in a workaday world for those acting at arm's length are forbidden to those bound by fiduciary ties. A trustee is held to something stricter than the morals of the marketplace. Not honesty alone, but the punctilio of an honor most sensitive is then the standard of behavior. As to this there has developed a tradition that is unbending and inveterate. Uncompromising rigidity has been the attitude of the courts of equity when petitioned to undermine the rule of undivided loyalty by the "disintegrating erosion" of particular exceptions. . . . Only thus has the level of conduct for fiduciaries been kept at a higher level than that trodden by the crowd. It will not consciously be lowered by any judgment of this court.

Current Issues

Among the fiduciary duties that may be the most commonly neglected is the duty to provide to the beneficiary disclosures, information, and an accounting of trust transactions. Legal scholars and practitioners recommend changes to the U.S. Trust Code that would provide for resolution of trust beneficiary complaints about the absence of information about management of the trust; understandable accounting summaries of the transactions used to manage the trust; the size and nature of trust management fees; timely responses to inquiries made by the beneficiary; and the desire to be informed of or involved in the decisions made involving the trust's affairs.

Brief History of Trustees

Managers (trustees) were used to administer the Islamic *waqf* in the ninth century. The *waqf* consisted of property, land, farms, or oases that generated revenues for religious or charitable purposes. A *waqf* could also be used for private purposes. By declaring his estate as *waqf* and his descendants as trustees, a rich man could provide an income for his surviving family.

Other examples include the Knights Templar, who acted in a fiduciary capacity (as trustees) sanctioned by English royalty in the 12th century. The Templars were successful in circumventing religious objections to the lending of money for interest. Acting as fiduciaries, the Templars organized the payment of pensions, mediated transfers of funds from England to the Middle East, and provided international banking services.

Some authorities trace the origin of trusts and trustees to the medieval practice of knights leaving a trusted individual to safeguard their families and their land while fighting in the Crusades. Other legal historians claim that the modern trust has its roots in 13th-century England. At that time, the feoffee (pronounced "fee-fee") acted as a trustee for land held for the benefit of a third party. The term *feoffee* continues in use in the modern-day United Kingdom.

Trustees in Medieval England

The feoffee's (trustee's) role was to ensure that family assets were maintained intact for the benefit of the family. The need to place the protection of the beneficiary family and its interests above the interests of the trustee arises from the medieval idea of chivalry. The original protection for the beneficiaries was only the trustee's solemn oath to act properly to protect the beneficiary and the interests of the beneficiary in accordance with the instructions given by the trustor or the grantor. Originally, trustees could not accept payment for their good deeds, and only individuals could serve.

In some cases, feoffees held land and buildings for the benefit of Franciscan friars, who were forbidden to own any kind of property. Land was conveyed to a suitable person in the area to hold for the use of the friars. At the time of the trustee's death, the responsibility passed on to his heirs as successor trustees.

In the 13th century, the feoffee had title to the property, and the beneficiary was intended to have the possession of the property. Between the 13th and 15th centuries, no legal mechanism existed by which a beneficiary could seek action against a feoffee or trustee who did not perform his fiduciary duties. However, by the early 15th century, courts of equity, acting on behalf of the king, began to play a role. The primary means of resolving complaints by the beneficiaries about the feoffee was to appeal to the English chancellor, who enforced the obligation to protect the beneficiary and his interests.

As a consequence of the Statute of Uses in 1536, two types of trustees emerged. The passive trustee simply passed on the title to the property to the beneficiary. The active trustee assumed the imposed duty to manage the property as intended for the benefit of the beneficiary. In spite of the recognition of the obligation to protect the beneficiaries and their interests, the success of the trust in achieving its purpose to benefit a third party depended heavily on the character and integrity of the trustee. To the present day, fiduciary duties are an important social and ethical issue. Heavy emphasis is placed on the responsibility of the trustee to the beneficiaries.

—Eleanor G. Henry

Trusts

The trust, or more accurately, industrial trust, is a legal structure that emerged in the 1880s and 1890s in the United States as a mechanism for consolidating industries. A trust is a legal arrangement where property owners transfer control of their property to a separate entity—the "trust"—that manages the collected properties for the benefit of another party, which can be the original owners or someone else. Legal title to property is held by that one person or entity, the trustee, for the benefit of another, the beneficiary or beneficiaries. The trust structure was employed by industrial companies in the United States to establish economic monopolies over goods and services: All (or substantively all) participants in an industry would exchange their property for dividend-paying ownership shares in the trust, which would then be able to act unilaterally when setting prices, regulating output, and maintaining collective unity among the trust's member entities. Trusts attempt to circumvent conditions of free competition by uniting industry players into a single entity for the purpose of controlling the economic activities within the industry.

After the U.S. Civil War (which ended in 1865), the second half of the 19th century witnessed a substantial expansion of the railroads and the subsequent emergence of national networks for the transportation and distribution of goods. These changes transformed the U.S. economy from a collection of agrarian-centered, localized markets to a national marketplace dominated by large-scale industrial production. Meanwhile, the growing pace of innovation in numerous industries led to increasingly complex, automated processes that created higher capital and fixed costs for business firms. With the greater economies of scale occasioned by large-scale production, businesses focused their efforts on increasing profits by controlling the entire productive process from raw materials to finished goods. The increasing volatility of financial markets during this period, as demonstrated by the panic of 1873 and subsequent national economic depression, further stimulated business efforts to consolidate industries, lessen the economic risks of what was termed "ruinous competition," and provide increased economic stability in the new environment.

These economic forces spurred industries to initiate attempts at coordinating activities among competing firms. However, the initial efforts at forming and maintaining economic monopolies or oligopolies foundered on several legal and practical issues. First, pooling agreements and cartel arrangements to fix prices and divide markets not only violated common-law restrictions on restraint of trade but also proved unenforceable in court. In addition, corporate laws—which under the principle of states' rights resided within the power of the states rather than the federal government—often prevented corporate entities from owning shares in other corporations and even from doing business outside their home states. Finally, competitive pressures among involved firms often tended to produce incentives for participating enterprises to violate coordinating agreements, regardless of their economic efficiency or statutory legality.

Businesses searched for new legal structures that could organize economic activities in ways deemed favorable to their growth and profitability. The trust (industrial trust) was the culmination of their efforts to develop a legally acceptable and economically beneficial framework. Standard Oil Company, founded by John D. Rockefeller, pioneered the industrial trust in 1882. In adapting the legal concept of the trust to an industrial setting, Standard Oil persuaded the stockholders of 30 companies in the economically critical oil industry to turn control of their corporate stock over to nine trustees, who then could exercise all voting rights for this stock in a coordinated fashion. In return, these previous stockholders received shares in the newly created entity—the trust—which entitled them to receive financial returns based on the overall performance of the new combined entity. This legal framework enabled Standard Oil to centralize economic and managerial control over all the participating companies without developing illegal agreements or cartel arrangements. Furthermore, the trust structure allowed the combined entity to coordinate activities across state boundaries, thereby expanding its geographical reach, while eliminating the incentive to cheat by ensuring the distribution of profits based on the overall performance of all firms in the industry.

A wide range of industries, among them sugar, linseed oil, cottonseed oil, cordage, cattle, and whiskey, quickly followed Standard Oil's lead and adopted the trust form. Industries creating trusts possessed several elements in common: All were process-based industries with newly developed technologies for handling large batches of goods; all encountered variable market demand for their products, while facing onerous storage costs for unsold goods; all had experienced serious recent imbalances between supply and demand leading to cutthroat competition; and all had tried in the past to control these situations through the use of collusive agreements and pools.

Trusts could be either "horizontal" or "vertical" in nature. A horizontal trust, such as the Sugar Trust, united industry participants who performed similar economic tasks—such as producing specific goods—into a single source for such products. This combination eliminated competition among the different firms in the marketplace as under the trust structure they functioned as a single firm in the performance of their activities. A vertical trust, such as the Standard Oil Trust, combined under one controlling entity the various functions required for the production of goods or services in an economy—for example, from the provision of raw materials through manufacturing to distribution and sales—to eliminate competition and possible conflict along any phase of the production process. In addition to these monopolization motives, trusts also facilitated the rationalization of firm activities: the standardization and regularization of business processes, and the elimination of duplicate activities.

The business concept of the trust bore similarities to both cartels and monopolies. Trusts tended to be national in their scope, whereas cartels often function internationally. Furthermore, prior to the passage of antitrust legislation, trusts were legally created entities; monopolies, on the other hand, can develop through several means, such as active interventions in the market (where one business entity gains control over supplies of a good or service) or statutory action (where government grants a business entity a regulated position of dominance). After the passage of the Sherman Antitrust Act in 1890, the industrial trust was superseded by mergers as the legal mechanism for creating combinations of industrial entities.

Truth Telling

Truth telling refers to the communication of complete and accurate information to another individual or group of individuals. Telling the truth is generally considered to be a positive act, often associated with character traits of honesty and integrity. Most human interactions involve the communication of information in some fashion, and if asked, we would state that we would like others to be "honest" and "tell the truth." When engaging in interactions with others, human beings rely on truth telling as a fundamental element in determining the outcome of the interaction, the relationship, and the larger fabric of society. These determinations are largely based on the value and protection of trust as a social good. It would be hard to maintain relationships as the foundation of society without trust. Thus, the maintenance of trust through telling the truth has individual, organizational, and societal implications.

Honesty

Telling the truth is widely associated with the concepts of both honesty and integrity. As noted above, honesty and integrity are considered desirable or virtuous characteristics. In fact, many moral philosophers have suggested that honesty and integrity are crucial to achieving the cardinal virtues. A number of scholars in the field of business ethics have also described telling the truth as the opposite of lying or as a dimension of dishonesty. In her book on lying, Sissela Bok suggests that telling falsehoods destroys social trust and creates unfairness in relations with others. She argues that Aristotle's initial perspective on telling the truth should be adopted as a means to a more stable and fulfilling society. Aristotle suggested that the truth is noble and full of praise, while falsehood is, in itself, mean and culpable. Bok points out that telling a lie requires a reason, while telling the truth does not. She and other scholars have argued that honesty is required for trust since a society based on lies or dishonesty will collapse.

Empirical research done on honesty has also examined truth telling. For example, a study conducted in the late 1990s showed that the construct of honesty comprises three different dimensions. The researchers found that honest behavior consists of respect for ownership of property (a dimension they called possession); giving complete information, not keeping secrets or omitting information (a dimension they called omission); and giving truthful or accurate information without misrepresentation (a dimension they called commission). Truth telling, then, typically embodies giving both accurate (commission) and complete (omission) information. Lying is considered to be the opposite of telling the truth and, thus, is considered dishonest behavior because it conveys either inaccurate or incomplete information to another person. Note that this would include behaviors such as bluffing, communicating outright falsehoods, and even communicating a false impression through dissembling or impression management.

Integrity

Telling the truth is also widely linked to the concept of integrity. Integrity has been interpreted to mean wholeness or strength of character and is often associated with fairness and trust, like honesty. Truth telling, or being honest, as a behavior is a foundation for establishing the characteristic of integrity. Integrity is considered to be a cornerstone for creating and maintaining relationships with others because it inspires trust, the foundation of such interactions. For example, in their work on integrity, Kathlyn and C. Gay Hendricks suggest that authentic speaking and resonant listening form one of four pillars of integrity in human organizational interactions. What they call "authentic speaking" is, in essence, truth telling. They argue for telling the truth as a means of increasing the degree of integrity in business organizations and destroying the myths that support lying to coworkers. Others have argued that honesty, courage, and respect are three components of integrity and that to create rich and meaningful communities in work organizations, we need to learn how to be more honest, courageous, and respectful of other human beings.

Many scholars have suggested that honesty is a foundation for creating a community within organizations where long-term relationships are based on trust and engagement of the whole person at work. Thus, truth telling begins with individual behavior but has organizational and societal implications as well. When we talk about lying or telling the truth, we are almost always concerned with the behavior of an individual. However, we also talk about bluffing, impression management, deception, and fraud (as forms of lying) when we examine the implications of these behaviors for business, social organizations, government, and society in general. It is helpful to look at the implications of truth telling, or the lack thereof, for individuals, organizations, and society as a whole.

Individual Implications

There are both psychological and physiological implications for individuals who don't tell the truth. Several practicing psychologists have noted a resurgence of ethical therapy in clinical psychology. Ethical therapy is used in treating mental illness. It is based on the perspective that such diseases can be treated by removal of unethical values or behaviors. (Note that dishonesty would be considered an unethical or undesirable value in this case.) Of course, it has long been known that lying is associated with increased stress, an increased heart rate, and perspiration. These physiological changes are what lie detector tests are based on. Many argue that such stress is unhealthy. For example, James Pennebaker has conducted studies that suggest a clear connection between truth telling (and openness) and increased well-being. His work shows that open and honest expression of feelings in communication strengthens an individual's immune system and overall health. This physiological improvement, in conjunction with the psychological improvement, suggests that individuals can benefit from telling the truth. Furthermore, other scholars have pointed out that an ongoing problem with practicing deceit is that the deception must be maintained. This takes a significant psychological toll on individuals engaged in this process.

Benefits can also be obtained in relationships with others through telling the truth. Individuals engage in interactions with others as the basis of relationships. Such interactions, many have argued, cannot be maintained or allow for collective action without truth telling. These authors suggest that if everyone expected everyone else to lie, there could be no trust and therefore no relationships with others. This leads to some perspectives on the implications of truth telling for relationships and organizational or institutional interactions.

Organizational Implications

Organizations are formed to accomplish tasks with more efficiency and effectiveness compared with individuals acting alone. Much of the research on increased effectiveness and efficiency has centered on group or team interactions and performance. Several researchers have found that increased truth telling and trust among team members has led to improved team performance due to strong, cooperative relationships. The other side of strong, cohesive team membership is a tendency to exclude outsiders and potentially create circumstances for groupthink. However, most of the research suggests that organizations with strong relationships based on trust are more successful on a number of dimensions. Others have suggested that the creation and maintenance of a culture within an organization is a function of the relationships, behavior, and norms established by the members. Organizational cultures based on truth telling have been suggested to provide a more solid basis for creating a community of cooperative members engaged in collective action. Even Peter Senge's powerful work on organizational learning suggests that it isn't defensiveness that is harmful in organizations; it is the concealment of defensiveness that harms the success of the business.

In short, many scholars have noted that organizations are microcosms of society as communities formed by relationships among the internal members and external constituents. This perspective leads to substantial overlap between organizational implications and societal implications of not telling the truth. The maintenance of community relationships requires telling the truth for creating the trust necessary for improved performance and success. The success of an internal organizational community has been measured by effectiveness, efficiency, and even assessments of providing meaningful work, while the success of the organization in relationships with external constituents has most often been measured by accomplishment of organizational goals via exchanges with such constituencies. Many researchers have examined the impact of stakeholder relationships on the successful accomplishment of organizational goals and have suggested that truth telling, honesty, integrity, and respect are key components in creating and maintaining such critical relationships.

Societal Implications

While some suggest it would be impractical, and perhaps even uncompetitive, to have all information in business organizations shared, others have noted that transparency in the form of clear and accurate communications can lead to successful long-term relationships in the market. Early writing in business, such as that of Albert Carr, suggested that bluffing should be considered acceptable in business interactions. He argued that bluffing (as a form of deception) is appropriate because everyone knows and understands that it is occurring. This might include behaviors such as exaggerating in a résumé or in advertising material or creating a false impression during an interview. Later scholars such as Sissela Bok have taken issue with this perspective to suggest that interactions based on deception create relationships that are unstable and cannot be sustained. In fact, Donald McCloskey, in his article on bourgeois virtue, reminds us that moral sentiment must ground a market since trustworthiness is required for exchange. Collective action in society, like that in organizations, cannot be accomplished without trust, as a result of honesty and truth telling.

When we discuss the implications of deception in business arrangements such as marketing or advertising information, we are often concerned with how this will affect the level of trust and the long-term relationships between buyers and sellers in the marketplace. For example, almost anyone who has had an experience as a victim of deceptive or false advertising describes the outcome in terms of loss of trust as well as loss or discontinuation of the relationship. Experiences and outcomes such as these led to the creation of the Caux Round Table of business organizations, interested in promoting more ethical business practices around the world. The Round Table developed a set of principles to guide organizations in achieving ethical business activities. In fact, the third of the Caux Principles links truth telling (as sincerity and transparency) to trust as a critical cornerstone of the ethical behavior of business.

Conclusion

In conclusion, truth telling, as a dimension of honest behavior, is generally considered to be a critical component for successful accomplishment of individual health and well-being. It is also key to creating and maintaining relationships with others as the means to collective action and successful and continued societal exchanges and interactions. It remains such a key component due to the role it plays in creating trust as a cornerstone for human interactions at an individual, organizational, and societal level. Without the establishment of such trust, interactions of a variety of natures would not be possible and the nature of human behavior and interactions would be irrevocably changed.

Tyco International

During the 1990s, Tyco International, under the leadership of CEO Dennis ("Deal-a-Month-Dennis") Kozlowski, had become one of the most admired publicly owned conglomerates on Wall Street. The electronics and medical supplies company achieved $36 billion in annual revenue, consisted of more than 2,300 subsidiaries, and employed more than 270,000 people. Kozlowski was among the highest paid corporate executives in the United States, receiving more than $286 million in compensation from 1997 through 2001, including $137.5 million in 2000 alone.

But beginning in 1995, Kozlowski and Chief Financial Officer Mark Swartz started stealing what would amount to $170 million from Tyco in unauthorized loans and bonuses and defrauding investors of an additional $430 million through tainted stock sales. Kozlowski and Swartz filed materially false annual reports and proxy statements with the SEC, lied to auditors, and falsified accounting entries to conceal secret compensation arrangements. In 2005, both executives were convicted on 22 of 23 counts of grand larceny, conspiracy, securities fraud, and falsifying business records and sentenced to up to 25 years in prison.

Stealing From Tyco

Kozlowski, born into a working-class New Jersey family, joined a Tyco subsidiary as an auditor in 1975. He progressed to the top of the corporate ladder, becoming CEO and chairman of the board of the $3 billion company in 1992. Five years later, Tyco changed its charter to be incorporated in Bermuda to avoid paying U.S. taxes. Over the next 3 years, Kozlowski achieved 20% annual growth rates by acquiring 700 companies. Kozlowski, as chairman of the board, handpicked board members and dominated board activities.

As CEO and CFO, Kozlowski and Swartz had a strict fiduciary duty to act at all times honestly and in good faith with a view to the best interests of company shareholders. They breached their fiduciary duties and treated company resources as their private bank account by engaging in the following illegal activities.

Abuse of KELP Loans

In 1983, Tyco established a "Key Employee Loan Program" (KELP) to provide low-interest loans to Tyco executives and employees for the purpose of paying federal income taxes on vested shares of Tyco stock. From 1997 to 2002, Kozlowski improperly borrowed $242 million from the loan program to pay for the purchase of art, antiques, yachts, automobiles, jewelry, a New York City apartment, a Massachusetts mansion, business investments, and more than $1 million toward a $2 million private birthday party for his new wife on an exotic Italian island. During the same time period, Swartz improperly borrowed $72 million from the loan program to fund his personal investments, business ventures, real estate holdings, and trusts. Kozlowski and Swartz failed to disclose their improper use of KELP loans to the board of directors, the SEC, or shareholders.

Abuse of the Relocation Loan Program

In 1995, Tyco established an interest-free loan program for employees relocating from corporate headquarters in Exeter, New Hampshire, to new corporate offices in New York and, subsequently, Boca Raton, Florida. Beginning in 1996, Kozlowski improperly borrowed $28 million in relocation loans to purchase personal properties in New Hampshire, Massachusetts, and Connecticut, and a $7 million New York City apartment for his soon-to-be ex-wife. During the same period, Swartz improperly borrowed $9 million in relocation funds, purchasing a yacht and funding real estate investments. Kozlowski also gave these interest-free loans to other key employees, including $10 million to Tyco's chief legal counsel, who purchased a ski chalet in Utah.

Self-Engineered Forgiveness of Tyco Loans

Without board knowledge, Kozlowski forgave his repayment of $57.9 million in KELP and relocation loans and loans of $29.1 million to Swartz. Both executives avoided paying taxes on this economic windfall by not claiming the loan forgiveness as compensation. Kozlowski also forgave the more than 40 loans given to executives who relocated to Florida. The employees signed confidentiality statements that hid this benefit from shareholders.

Concealed Related Party Transactions With Tyco

Kozlowski sold to Tyco his New Hampshire estate for $4.5 million, three times its fair market value. Tyco also significantly overpaid Swartz for some of his real estate holdings.

Secret Bonus Plan

Following the acquisition of the security company ADT, Kozlowski paid himself a $700,000 cash bonus, 148,000 shares of Tyco stock, $700,000 cash, and $16 million in loan forgiveness, without board knowledge. Swartz received a $350,000 cash bonus, 74,000 shares of Tyco stock, and $8 million in loan forgiveness. Other executives received smaller bonuses. The board was not informed of any of these transactions.

Undisclosed Accelerated Stock Vesting

Kozlowski improperly accelerated the vesting of Tyco common stock, resulting in personal gains of $8 million. He did the same for Swartz, though for half the amount.

Concealed Perks From Shareholders

Kozlowski had Tyco purchase a New York City apartment for $17 million and pay an additional $14 million for renovations and new furnishings, including an infamous $6,000 shower curtain; then he lived in it rent-free. He also donated more than $40 million of Tyco funds in his own name to various charities and flew the corporate aircraft for personal use. Swartz enjoyed similar perks, also without board knowledge.

Fraudulent Stock Sales

Kozlowski and Swartz secretly sold hundreds of millions of dollars worth of Tyco stock to company subsidiaries.

Discovering the Scandal

In July 2001, Kozlowski authorized a $20 million finder's fee to board member Frank Walsh, a personal friend and chairman of the board's Compensation Committee, for helping to initiate the acquisition of the CIT Group. Kozlowski instructed Walsh to hide the finder's fee from the other board members. Six months later the board found out and demanded that the extravagant fee be rescinded. Walsh refused to give the money back and Kozlowski defended his actions. The board's Audit Committee then began an investigation of all transactions between Tyco and senior managers, including loans, charitable contributions, and use of apartments and other assets.

With the internal investigation under way, but unknown to the board, Kozlowski was subpoenaed by the New York County District Attorney's Office on May 3, 2002, for suspicion of sales tax nonpayment on art purchases. Kozlowski had evaded paying New York City's 8.25% sales tax by having empty boxes shipped to Tyco headquarters in New Hampshire for invoice signatures, while the $13.1 million paintings, which he inappropriately purchased with a low-interest company loan, were being delivered directly to his Fifth Avenue apartment. Kozlowski was arrested for tax evasion a month later and forced to resign. Only then did the board learn about Kozlowski's illegal use of company funds over the previous 6 years.

On September 18, 2005, Kozlowski and Swartz, after an initial mistrial due to jury problems, were found guilty, given prison sentences of up to 25 years, and ordered to pay restitution and fines. As with Enron, Tyco's stock price declined significantly as a result of the scandal. But unlike Enron, Tyco had a solid business plan, and an internal investigation concluded that the fraud did not affect the company's prior financial statements. Shareholders elected an entirely new board and made executive severance contracts subject to shareholder approval. A Tyco executive is no longer able to serve as board chairman.

Tylenol Tampering

One of the most significant examples of business ethics and corporate crisis management involved the actions of Johnson & Johnson (J&J) during the Tylenol tampering crisis. In the fall of 1982, a subsidiary of United States–based J&J, McNeil Consumer Products, learned that seven people in Chicago had died from taking Extra-Strength Tylenol capsules that had been laced with cyanide. The management was convinced that the tampering did not occur at its plants, meaning that it must have taken place once the product had reached Illinois. J&J faced a dilemma, how best to handle the crisis without damaging the reputation of the company, when the company had quickly established that it could not be held liable for the tampering.

Reports on the firm's decision-making process during the crisis indicate that the company placed the safety of its customers first, before considering profit implications. A nationwide voluntary recall took place, involving approximately 31 million bottles of Tylenol, representing more than $100 million in sales. Consumers were told not to use any type of Tylenol product until the cause of the tampering had been established. Production and advertising of Tylenol ceased. The company offered to exchange all Tylenol capsules that had been purchased for Tylenol tablets. Relations were quickly established with the Chicago police, the FBI, and the Food and Drug Administration (FDA). A toll-free crisis phone line was set up for concerned consumers. Senior executives, including CEO James Burke, were readily accessible to the media. As part of a longer-term response, the company reintroduced Tylenol capsules with new triple-seal tamper-resistant packaging. Despite the firm having its market share drop from 33% to 18%, it wasn't too long before the company was able to recover its position. Following a second tampering incident in 1986, J&J made the decision to offer Tylenol in a caplet form, as opposed to a capsule form. No one was ever convicted of the tampering incidents and subsequent deaths.

Probably the most significant aspect of how J&J handled the crisis was the apparent corporate culture that existed at the time. According to J&J executives, turning to the firm's credo enabled them firm to make the right early decisions that led to the comeback phase. The credo, initially written in 1943, stated that the firm had obligations to society beyond merely profit maximization or enhancing shareholder value.

As a direct consequence of the Tylenol murders, U.S. Congress approved in 1983 a new "Tylenol Bill" that made maliciously tampering with consumer products a federal offense. In 1989, the FDA set national requirements for all over-the-counter products to be tamper-resistant.

Unlike many other firms, which often fail to react quickly on discovering potential danger to their stakeholders, J&J is remembered as a company that possessed an ethical corporate culture enabling the firm to handle the Tylenol tampering crisis quickly, openly, and honestly. By doing so, J&J was able to protect and enhance its corporate reputation into the future.

U

Underground Economy

The underground economy encompasses any economic activity not reported to the government and, therefore, beyond the reach of tax collectors and regulators. The term may refer to either illegal activities or to ordinarily legal activities performed without the securing of required licenses and payment of taxes. Synonymous terms, especially when applied to these latter activities, are shadow economy and working off the books. Examples of legal activities in the underground economy include unreported income from self-employment, barter, do-it-yourself work, and neighbor help. Illegal activities include drug dealing, trade in stolen goods, smuggling, illegal gambling, fraud, and theft.

The size of the underground economy in the United States has been estimated to be $1 trillion in 2005. This represents about 9% of the total U.S. GDP. If taxes could be collected on these trillion dollars, the federal budget deficit would be wiped out. The underground economy is even larger than many other countries', accounting for up to 40% of economic activity in developing nations. Unreported economic activity tends to occur when excessive taxes, regulations, price controls, or state monopolies interfere with market exchanges. Failure to recognize or enforce private property rights and contractual agreements may also encourage underground economic activities.

Measurement of the underground economy is difficult because, by definition, its activities are not included in any government records. Its size may be extrapolated from sample surveys and tax audits or estimated from national accounting and labor force statistics. One of the most commonly used indicators is the demand for currency, especially bills of large denomination. Hundred-dollar bills, for example, are seldom used in legitimate business transactions. Increased demand for these bills indicates a rapid growth in the underground economy since 1970. Although the dollar has long been the currency of choice in the underground economy, the euro is gaining popularity.

Motivation of Participants

People work in the underground economy for a variety of reasons. Most people working off the books do so to supplement their mainstream jobs. The mainstream job provides benefits, such as health care and pensions, and the work off the books provides additional income. The mainstream job is needed also to provide a visible source of income if the worker should attract the attention of the authorities. This unreported moonlighting is especially prevalent in European countries, where holding a second job is often illegal. In the United States, working off the books is usually motivated by a desire to avoid income taxes. As income and social security taxes have increased because of the "bracket creep" effect of inflation, the incentive to avoid taxation has also increased.

Some workers in the underground economy have no mainstream jobs. Most of these are people who lack the skills, social networks, or documentation necessary to obtain jobs in the mainstream economy. The jobs held by these people, many of whom are undocumented immigrants, often pay less than minimum legal wage and fail to comply with government standards of health and safety. Some full-time underground economy workers with marketable technical skills choose this type of work because the jobs may pay more than mainstream jobs. A third category of workers prefers the underground economy jobs because of the personal freedom provided by temporary, irregular work.

Employers in the underground economy also have a variety of motives. Nonpayment of income, excise, and payroll taxes is a major motivation. Avoidance of labor laws and licensing requirements and fees is also a factor.

Ethical Issues

Whether the underground economy is seen as more harmful or helpful depends on one's values and political philosophy. Those who look to the state as the guarantor of fair wages and labor practices see the growth of the underground economy as a major threat to social welfare. The nonpayment of taxes from this sector reduces the money available for social programs, and the workers do not enjoy the legal protections afforded to mainstream workers.

Mainstream companies complain of unfair competition from underground enterprises that do not have to pay taxes or minimum wages. Where there is significant underground economic activity, as in construction, the wage standards of the entire industry may be lowered over a wide region.

Defenders of the underground economy tend to come from either a utilitarian or a libertarian perspective. The utilitarian argument is that the underground economy is the ultimate safety net for people who cannot find work in the mainstream economy. As undesirable as many of these jobs are, they are better than nothing, and they may provide entry-level work in many fields for recent immigrants and other disadvantaged workers. Advancing technology makes many workers redundant, and for these surplus workers the underground economy may be the only work available. The low-cost goods produced by the underground economy may also improve the welfare of those who cannot afford mainstream products. For moonlighting workers with mainstream jobs, the income from the underground economy may be what enables them to maintain their families while paying the taxes on their reported wages. For these reasons, some economists argue that the government should support the existence of a thriving underground economy as a complement to mainstream activity.

Libertarians may see the underground economy as the last bastion of free enterprise, where the buyer and the seller or the employer and the employee may meet and contract freely without outside interference or restriction. Libertarians argue that it is only in the underground economy that the true value of a product or service may be found. The underground economy may also be viewed as a natural correction to overly centralized and bureaucratic economic systems. When legal restrictions make it impossible for consumers to satisfy their desires through the mainstream economy, the underground economy offers a bypass, a direct connection between buyer and consumer. As such, it may be seen as both a safety valve and an alternative path for the mainstream economy.

Unemployment

When a resource is not being used in conjunction with other resources to produce either a tangible or intangible product, it is said to be idle or unemployed. Unemployment may be either voluntary or involuntary.

Unemployment is a state in which any type of productive resource or factor of production, for example, labor, land, capital, or entrepreneurial ability, may find itself, although the social problem of unemployment is considered more acute for labor than the other resources. Consequently, governments and private sources collect and report more information with greater frequency on the employment status of labor than the other resources, and governments often design and implement policies to reduce unemployment of labor.

Statistics are calculated and reported on capital employment, which is provided in terms of "capacity utilization" rates and land-use data are also kept.

Determining the state of employment or unemployment of machinery and land is problematic given their multiple uses and the need for repair, replacement, and regeneration. Government policies can also enhance and encourage the use of capital and land and make some use choices more or less favorable—for example, through land-use zoning laws.

Due to problems of measurement, an unemployment rate for entrepreneurs or others self-employed does not exist. Measuring and observing entrepreneurial ability and capacity independent of the individual involved are currently impossible.

Treating unemployment as a yes-no or binary variable may also obscure the fact that some resources at some time may be underemployed—that is, working, but either not in their preferred field or occupation or not working for the number of hours per week they would prefer, or both.

Defining and Measuring Unemployment of Labor in Practice

For purposes of the most commonly reported statistical definition, at any time, a productive resource like labor may fall into one of three categories. Labor may be employed, unemployed, or not be in the labor force. At this point, definitions become somewhat arbitrary and may differ by country and even within a country; however, the Organisation for Economic Co-operation and Development (OECD) reports standardized unemployment rates for its 27 member countries including 22 European countries, Australia, Canada, Japan, South Korea, and the United States.

To be considered unemployed for purposes of the monthly household survey conducted by the U.S. Bureau of Labor Statistics (BLS)—whose definition is broadly consistent with that used by the OECD—a respondent must have actively, albeit unsuccessfully, sought work within the past four calendar weeks. Respondents are considered employed if they have worked at least 1 hour for a wage or 15 hours or more in a family business within the past week. The data are self-reported, and the issues of part-time employment versus desired full-time employment and working in a second-choice occupation are unaddressed in the monthly reported unemployment rate. However, supplementary surveys are taken by the BLS to gauge these different measures.

Those who are neither employed nor unemployed by the BLS definitions are considered to be out of the labor force. Those in the first two categories, employed and unemployed, constitute the labor force. One might be out of the labor force for any number of reasons including age, incarceration, retirement, full-time school attendees, those choosing to work in the home at household production, and so on.

The household survey is supplemented by the payroll survey where the BLS surveys employers on the number of wage/salary–earning employees they have in their firms in the survey month. Typically, the household survey shows a larger number of people employed relative to the payroll survey, as the self-employed (and those working in small family businesses) self-report as employed in the household survey, while they are missed in the payroll survey of firms. This difference in the data and how the data are collected and reported often becomes a political issue. Typically, a challenger will focus on the smaller number of employed as reported in the payroll surveys, and incumbents will highlight the higher reported employment in the household survey.

Sources of Unemployment

There are three major sources of unemployment: job losers, job leavers, and new entrants/reentrants into the labor force. These sources of unemployment result from the choices and behaviors of employers, employees, and those who seek to become employed. Employers laying off or firing workers create job losers. Employees who leave employment in search of better jobs are job leavers. Those who enter the labor force in search of employment are unemployed until they secure a job.

The measurement concept is similar for the other productive resources. A capital good, for example, a robotic welder in an automobile assembly plant, may be laid off—thus be a job loser—with a concomitant loss of income for its owner. Owners of capital may move machinery in search of a better job; thus, that capital becomes a "job leaver." The owner of physical capital has to bear the consequences of capital unemployment in the same way that individual employees have to bear the cost of labor unemployment. The same analysis applies to land, with farmers having to make decisions on crop rotation and letting land lie fallow (Is it unemployed or out of the land "force"?) in some growing seasons.

In any given month, the flow between these three pools of employed, unemployed, and out of the labor force creates the "measured unemployment rate." By the BLS definition, the unemployment rate in percentage terms is the ratio of the number of unemployed divided by the labor force times 100.

$$\text{Unemployment rate} = (\text{\# unemployed}/\text{entire labor force}) \times 100$$

Thus, if there were 100 people in the labor force with 90 being employed and 10 unemployed, the resulting unemployment rate would be $(10/100) \times 100 = 10\%$ for that month. Critics have pointed out that this measure, in addition to treating all employment as full employment, also ignores the discouraged worker, those persons who have withdrawn from the labor force after futile search for employment. Thus, the measured unemployment rate may well understate the true unemployment rate. Using the example from above, if there were two people who had exited the labor force due to becoming discouraged, then the measured unemployment rate of 10% would understate the true unemployment rate of $(12/102) \times 100 = 11.76\%$. The BLS also does supplementary surveys that attempt to capture this effect.

To examine, albeit briefly, the impact of changing flows from category to category on the unemployment rate, return to the original example. If two employed individuals flow to unemployed status the measured unemployment rate rises from 10% to $(12/100) \times 100 = 12\%$. Of course, if that flow were reversed the measured unemployment rate would decline. If workers flow from employed to out of the labor force, then the unemployment rate rises and vice versa. Finally, if individuals flow from unemployed to out of the labor force, the measured unemployment rate declines and vice versa.

Thus, mere observation of the unemployment rate does not always give one a good indication of the state of the economy, and the measured unemployment rate must be used with care if interpreted in this way. If one takes the position that less unemployment is better than more, one would view a declining unemployment rate as always being good. However, as outlined above, a declining measured unemployment rate may be consistent with a falling level of employment (e.g., if it is also accompanied by an increase in the discouraged workers exiting the labor force). One must look at the underlying flows to gauge the economic condition of a country.

Causes of Unemployment

There are four main causes of unemployment: cyclical, frictional, seasonal, and structural unemployment. These are associated with different economic situations and different economic concepts.

Cyclical unemployment is that unemployment that arises due to changes in the level of macroeconomic activity—termed *the business cycle*—because economic activity tends to rise and fall, not change in one direction only. When macroeconomic activity slows, we are said to be entering a recession, and unemployment results. This type of unemployment is most often viewed as being involuntary in that employers, in times of a recession (meaning lower sales and profits), are forced to lay off employees. So the flow from employed to unemployed rises, and the unemployment rate also rises. However, the process is probably better understood as one of lower sales in firms leading to layoffs that go into making the business cycle, which is an epiphenomenon of these individual results.

When macroeconomic activity increases, we enter the expansionary phase of the business cycle and unemployment tends to drop as firms, selling more than anticipated, now hire more employees. This process of firms responding in recessions (expansions) to lower (raise) employment lowers (raises) sales of other firms and creates more layoffs (hiring). This process is sometimes referred to as the multiplier process.

These adjustments are also known as quantity-adjustment processes, where the volume of employment of resources adjusts to cyclical conditions, in contrast to a price-adjustment process, whereby employment may stay relatively stable if the prices of resources (in labor's case, the real wage) were immediately fully flexible downward and upward. Reasons for inflexible or sticky prices abound and may not be inconsistent with individual choice. Thus, changing employment and unemployment may represent an optimal response given the underlying constraints on the costs of price changing, information, and other economic considerations.

The issue of whether or not cycles have to occur or what causes (and what ameliorates) cycles is still a hotly debated topic in economics. The idea of underconsumption as a cause of cyclical downturn, thus leading to unemployment, is associated first with Thomas Robert Malthus; it was further stressed by Marx, and the thread was later picked up by John Maynard

Keynes. It is not clear that Malthus had a recurring cycle in mind, but both Marxian and Keynesian analysis is the analysis of cycles, with Marxian cycles becoming ever greater and more destructive. Keynesian cycles can be either explosive or convergent depending on values of the multiplier and the investment accelerator and admit a role for government stabilization of the economy.

Frictional unemployment is that unemployment associated with the "frictions" in an economy analogous to the frictions in the physical world (e.g., air resistance, friction when surfaces move across one another) that lead to deviations from the theoretically predicted result. For example, in the physical world, air resistance causes a feather to fall slower than a bowling ball, though in a perfect vacuum they fall at the same rate. In the same way, in an economy, if there were no economic frictions, the unemployment rate would be lower.

What are these economic "frictions"? Perhaps the most serious is trying to match the skills and number of employees across jobs and the requirements of employers. While in the frictionless state there may be the perfect employee and the perfect job for everyone, it takes time in the real world for these employees and employers to find each other, if in fact they ever do. This search process takes time, and over that time period frictional unemployment results. As employees leave jobs in search of better opportunities, and as employers lay off one employee in search of a better one, the coefficient of "labor friction" or imperfections in information causes the unemployment rate to be greater than zero. Frictional unemployment may always be a feature of the economic landscape, though policies that encourage the production and dissemination of labor market information certainly lower these frictions.

Structural unemployment deals with those causes of unemployment relating to the changing structure of the economy. As the business mix of an economy changes, so too does the mix of skills and abilities required from resource markets. The information "revolution" is rewarding those with skills in information generation, manipulation, dissemination, and interpretation. Those with skill sets that do not match these changing requirements are relatively disadvantaged, reflected in the falling numbers of jobs (this may be either relative to the size of the economy, or in absolute terms, or both) and/or falling real wages.

While changing real wages may address this structural unemployment problem over time, it has been noted, at least since David Ricardo made the argument (stimulated by his correspondence with Malthus), that technological change may lead to unemployment, and in the case of older, less flexible workers, this may cause earlier labor market separation through early retirements.

Seasonal unemployment is that unemployment associated with jobs that are highly dependent on weather or other seasonal considerations. Agriculture, mining, forestry, fishing, even construction are examples of industries that tend to have a strong seasonal component, or what Adam Smith referred to as constancy or inconstancy, and the real wage adjusts to reflect this pattern.

Voluntary Versus Involuntary Unemployment

From Smithian, classical economic theory through the early 1800s, unemployment was viewed as a matter of individual choice. From that perspective, it may not always be preferable to be fully employed constantly. For example, the wage might be too low for the effort required, or at times, other alternatives such as schooling (a form of investment) might be more attractive. As people make these decisions based on a life cycle or intertemporal trajectory, and conditioned by their alternatives, wages would adjust to provide the signals guiding labor and other resources to their highest valued uses. Therefore, the observance of unemployment is not necessarily viewed as suboptimal or inefficient.

Adam Smith wrote famously of the wage or expected wage as a compensating differential that gave a tendency for all jobs to be similar when adjusted for their different requirements of innate ability, risk tolerance, tolerance for drudgery, specialization, constancy or inconstancy, luck, and so forth. Smith did not consider unemployment a social problem in the sense that workers might be involuntarily unemployed. The observed pattern of employment or unemployment was caused by individuals making their choices given the conditions, real wages and requirements of labor, in the markets. If there were an imbalance, say, not enough bakers and too many brewers, real wages would adjust to cause workers to flow from brewing to baking. Thus, in this view, unemployment is always voluntary and markets could be relied on to create incentives to balance workers with jobs.

This view from classical economics has many adherents today in the form of new classical economics (NCE) that embodies the "rational expectations" view. Though, it should be noted that there are several variants of NCE with differing ideas of how fast markets adjust, most NCE models yield results that indicate the observed level of unemployment is optimal.

In NCE, the existence of measured unemployment is not denied, but its involuntary nature or disequilibrium cause is. That is, given the NCE assumption that markets are always in equilibrium given our state of knowledge allows for no involuntary unemployment. Then, what is it that we observe? Only unemployment that is too costly to avoid given the frictions and changing nature (structure, seasons, and cycle) of the economy. Cyclical unemployment is the result of errors, realized ex post but not ex ante, that are caused by "mistakes" made by labor and employers in forecasting price levels and inflation or deflation rates when setting wage bargains denominated in nominal terms that span more than one period.

If the price level falls over the period that nominal wages are fixed by contract, the real wage rises and unemployment results. Had labor known about the falling price level before it occurred it might have agreed to lower nominal wages to keep employment constant, but the price level fluctuates in ways that are not perfectly predictable. Thus, observed unemployment may result.

Only when the anticipated inflation rate is actualized will cyclical unemployment vanish. This level of unemployment, termed infelicitously the *nonaccelerating inflation rate of unemployment* (or NAIRU), would be consistent with that level derived from the combination of frictional, seasonal, and structural factors prevailing at any given time. These factors, however, are considered givens in the short run, therefore outside the control of individual decision makers.

It is in the writings of later classical writers, for example, Malthus and Ricardo, that the idea of involuntary unemployment is introduced. John Stuart Mill also developed these lines of reasoning. Yet even in the writings of Malthus, Ricardo, and Mill, the persistence of involuntary unemployment is questioned.

Of course, Karl Marx most famously argued against the classical notion of a stable, classical, equilibrium (or equilibrium process) that always led to (or at least pointed in the direction of) full employment of resources. Marx's critique relied on class differences and imbalances in power relations that disadvantaged labor relative to capital leading to labor's residual status in the production process resulting in capricious unemployment of labor for reasons beyond its control.

Keynes, picking up on the classical economists' reasoning more than Marx's, brought back the underconsumptionist ideas of Malthus and added informational gaps (Keynesian uncertainty) that resulted in coordination failures in markets. Keynes oriented his critique at those classicists, for example, A. C. Pigou, who argued in the late 1920s and early 1930s along Smithian lines that labor markets were best left to themselves to solve unemployment through changing real wages.

Keynes did not question that markets would clear, but he questioned the speed at which this would take place, answering the long-run results promised by the classical model with the famous retort that in the long run, we will all be dead. Involuntary unemployment, in Keynes's view, results from coordination failures (e.g., "sticky" prices and wages) that prevent markets from continuously clearing at full employment.

Keynes's analysis has been added to and extended, and Keynesian interpretations of labor markets abound. "New Keynesians," "neo-Keynesians," "post-Keynesians," and many more groups or schools based (sometimes only very loosely) on Keynes's ideas are extant. Macroeconomics, influenced by both classical and Keynesian ideas, remains a very vibrant area within the mainstream of economics.

Policy Responses to Unemployment

If one believes, as most Keynesian-influenced economists do, that unemployment can be involuntary, and that involuntary unemployment is a social problem or burden (i.e., inefficient or suboptimal), then any number of government policy responses are deemed appropriate depending on the sources and types of unemployment existing. For cyclical unemployment, Keynes called famously for governments to act to overcome market uncertainty and pessimism through aggregate demand management policies, altering government spending and taxation, to boost sales and profits and thus encourage firms to hire more labor. Aggregate demand management is aimed at smoothing or eliminating the business cycle.

Structural unemployment calls for policies that provide information on the changing labor market, providing incentives to labor to make the transition from one skill set to another (e.g., education, retraining, reskilling) and in general trying to make labor markets more efficient through time. Notably, some commentators have argued that maintaining a given industrial structure may be the best response to forces creating structural change, for example, preventing or slowing firms from closing down plants or from laying off workers.

These policies, however, may have unintended and negative consequences for employment in that firms will be less likely to form and less likely to hire in the first place in the face of higher, governmentally imposed, costs of responding to changing economic circumstances. Some have argued that these types of polices, which are more prevalent in Western European countries such as France and Germany, explain some of the differences in the unemployment rates in those European countries versus the U.S. economy.

Classically oriented economists, who believe that markets generate the optimal pattern of resource use both at a point in time and through time, are less likely to call on governments to do anything other than allow markets to work more "freely" through enhancing price and wage flexibility, encouraging voluntary exchanges, and protecting property rights. These goals would be consistent with lowering frictional unemployment. Classically oriented economists are especially scathing of government policies that are seen to introduce or reinforce market inflexibilities, for example, wage and price controls and/or minimum wage laws.

Policies aimed at ameliorating the consequences of unemployment, for example, unemployment insurance programs, may have inbuilt moral hazard problems that encourage behavior that creates some unemployment (e.g., through reducing the incentive to finding a job thus lengthening the average duration of unemployment), but provides assistance through periods when wage income falls to zero. Differences in the design of these programs across countries have been shown to explain some differences in countries' unemployment rates.

Unfair Competition

Unfair competition refers to a wide range of laws dealing with economic injury to a business due to the wrongful actions of a competitor. For example, a competitor using another business's trademark for the purpose of deceiving customers would violate unfair competition laws. These wrongful acts include common-law causes of action (e.g., disparagement), as well as state (e.g., the Uniform Deceptive Trade Practices Act) and federal (e.g., the Lanham [Trademark] Act) regulation. This entry provides a brief overview of some of the different types of unfair competition claims.

Some of the most common unfair competition claims involve intellectual property. Intellectual property refers to the creations that flow from a person's mind, such as an invention or a fictional novel. The law grants the creator rights over the use of certain types of intellectual property, such as trademarks, trade secrets, copyrights, and patents. For instance, the example given above of a competitor using another business's trademark involved the intellectual property claim of trademark infringement. Trademarks (including trade dress and service marks) are the unique words and symbols that a business uses to distinguish its products in the marketplace (e.g., its brand name or product packing design). A business establishes its right to a trademark simply through its use in commerce, but registering it with the Patent and Trademark Office grants additional protections. The law grants a business the exclusive use of a trademark to allow customers to easily determine the party responsible for a product and to allow businesses to build goodwill (i.e., customers recognize the level of quality behind the trademark over time). A trademark holder has an unfair competition claim when another party infringes on his or her trademark. That is, the other party creates confusion in the minds of consumers as to the source of a product by using a confusingly similar trademark. Even if there is no customer confusion, a trademark infringement claim may be based on "dilution." Dilution is the use of another's trademark in a way that lessens the ability of the trademark holder to identify and distinguish goods through the use of that trademark.

A second unfair competition claim involving intellectual property is the misappropriation of trade secrets. A trade secret is any compilation of information (e.g., a formula or manufacturing process) that provides a business with a competitive advantage by virtue of the fact that it is not generally known and is not readily ascertainable by others. Perhaps the most famous trade secret is the recipe for Coca-Cola. As long as a business takes reasonable steps to protect its trade secret, it is misappropriation (and thereby unlawful) for another to use that information if it was gained through improper means (e.g., industrial espionage or the breach of a confidentiality agreement). A typical example of trade secret misappropriation would involve an employee leaving his or her current employer to go to work for a competitor and taking a list of clients with him or her. The list of clients is a trade secret of the employer that the ex-employee has misappropriated.

Several unfair competition claims fall in the area of law known as torts, which includes any interference with the rights or interests of another. One tort claim is disparagement that involves a defendant knowingly (or recklessly) making a false statement about the quality of another's product or services. A truthful comparison of the parties' products or services does not give rise to an unfair competition claim. To establish this claim, the plaintiff must also show that he suffered actual harm from the false statements (e.g., lost costumers). Related to disparagement is false advertising. This involves an actor making false statements about his own product, as opposed to false statements about his competitor's products. False advertising is typically regulated by state law, such as under the Uniform Deceptive Trade Practices Act.

A second tort claim is intentional interference with economic (or contractual) relations. A plaintiff has an unfair competition claim when he or she can show that the defendant intentionally induced a third party to breach a contract with the plaintiff. A key aspect to this claim is "inducing" the breach, as opposed to simply providing an opportunity for the third party to breach the contract. Thus, in some jurisdictions, the plaintiff must also show that the defendant acted "improperly" or "maliciously." A typical example of this claim would be a defendant inducing a third party to breach a confidentiality agreement with the plaintiff. The most famous case involving intentional interference with economic relations resulted from a 1983 merger agreement between Pennzoil and the Getty Oil Company that Getty later breached to merge with Texaco, based on Texaco's inducement. A jury held Texaco liable for intentional interference with economic relations and awarded Pennzoil $10.5 billion in damages (the case was settled out of court for $3 billion).

Finally, certain antitrust violations also give rise to unfair competition claims, under either federal or state antitrust laws. Examples of unfair competition claims under antitrust laws include predatory pricing, tying agreements, and price discrimination. Predatory pricing involves a firm charging below-cost prices for its products for the purpose of driving its competitors out of business. Tying agreements involve a business using its strong market position in one product area to force customers to buy a separate product—customers cannot buy the desired product without also purchasing the additional product. For example, in the 1990s, Microsoft was accused of tying its Internet explorer Web browser to the company's operating system software. Because the company had a strong market position in operating software, the act of tying the products together allegedly created unfair competition in the market for Web browsers. Price discrimination involves a seller using different prices for the same product in different locations for the sole purpose of injuring local competition (e.g., the price differential is not based on a cost justification or meeting the competition's prices).

Unintended Consequences, Law of

It is a truism that human actions have unintended consequences. The sociologist Robert K. Merton, who authored a classic statement of the phenomenon in 1936, noted that the subject has been treated by virtually every substantial contributor to the long history of social thought. The "law of unintended consequences" quickly passed into public discourse. The concept continues to exert a fascination for social theorists, perhaps because it defines the province and basis for social scientific inquiry. Even though it is noncontroversial, its implications are not obvious, and this entry tries to elucidate some of them.

Sources of Unintended Consequences

Merton's article categorizes some of the principal sources of unintended consequences. They include ignorance, error, "imperious immediacy of interest" whose urgency crowds out consideration of other consequences, and "basic values" that mandate particular actions irrespective of their consequences. Last—and most interesting—is the reflexive nature of predictions about social conduct. The prediction itself may affect behavior in such a way as to make the prediction self-defeating or self-fulfilling. (Here, Merton anticipates his own subsequent work on the self-fulfilling prophecy.) As Merton says, every prediction includes a tacit "other-things-equal" clause, but, in the case of a prediction about social conduct, other things won't be equal because the actor has introduced a new "other thing"—his prediction. This is not true of prediction in fields that do not pertain to human conduct; the prediction of the return of Halley's Comet does not in any way influence its orbit.

Unintended Consequences and the Domain of the Social Sciences

If unintended consequences have been enshrined as a "law" of social science, it is because they define the agenda or subject matter or inquiry at the heart of the social sciences. Karl Popper has argued that the characteristic problems of the social sciences arise only out of our wish to know the unintended consequences, and more especially the unwanted consequences, which may arise if we do certain things. Likewise, Friedrich Hayek has contended that the function of social science is to explain how conscious, purposeful human action can generate unintended consequences through social interaction.

In economics, the law of unintended consequences is ubiquitous. It is exemplified by concepts like Adam Smith's invisible hand and moral hazard (the fact that insuring against an undesired event may make it more likely). In sociology, it is illustrated by Robert Michels's "iron law of oligarchy," Max Weber's account of how Protestant thrift and industry were self-defeating because they resulted in the accumulation of wealth that, in turn, corroded those same virtues, and Karl Marx's account of how the bourgeoisie inevitably produces its own gravediggers.

Without unintended consequences, the social sciences as we know them would be inconceivable. In their place there would be psychology. If outcomes were always intended, then intentions (and the needs, hopes, and motives that underlie them) would be the only object of social scientific interest because they would entirely explain social phenomena. Popper calls this the error of "psychologism"—namely, the view that social laws must ultimately be reducible to psychological laws, since the events of social life, including its conventions, must be the outcome of motives springing from the minds of individual men and women.

Social Engineering

Merton notes that unintended consequences "stand in the way of successful social prediction and planning." The law of unintended consequences suggests that social planning is likely to be self-defeating because it is difficult to predict how citizens will react to the new incentives created by the plan. Halley's Comet may not deviate from its orbit, but taxpayers will devise ingenious ways to circumvent or take advantage of a new tax law or regulation.

Michael Oakeshott, Friedrich Hayek, and Karl Popper are among the theorists who have been suspicious of the idea that society can be redesigned from scratch by the application of general, abstract principles. Oakeshott attacked "the assimilation of politics to engineering." Hayek assailed what he called the "fatal conceit"—the view that "all social institutions are, or ought to be, the product of deliberate design." Popper, too, eschewed what he called "utopian engineering." In its place, he favored "piecemeal engineering"—that is, incremental or gradualist social reforms that permitted learning from and adjusting or correcting reforms on a trial-and-error basis.

Even limited government interventions are subject to unintended consequences (though their damage may be more confined). More than 60 years ago, Ludwig von Mises pointed out that government regulations have a tendency to breed more government regulations. That is because the first round of regulations has unintended consequences that necessitate a second round of regulations, and so on. Any student in introductory economics can cite numerous examples of this process at work.

Conspiracy Theories of History

The law of unintended consequences also teaches skepticism of conspiracy theories of history. If unintended consequences doom the grandiose plans of social planners, so too must they frustrate the plots of conspirators to seize power and exercise it clandestinely. Popper used the concept of unintended consequences to denounce what he called the "conspiracy theory of history"—the mistaken theory that whatever happens in society—especially happenings like war, unemployment, poverty, shortages, which people as a rule dislike—is the result of direct design by some powerful individuals and groups. Popper acknowledged that conspiracies happen—and occasionally meet with some success. What he rejected was the idea that *history* is a conspiracy manipulated by the Learned Elders of Zion, or the monopolists, or the capitalists, or the imperialists. Conspirators rarely consummate their conspiracy because they are no more exempt from unintended consequences than are social planners.

Spontaneous Order

Merton notes that undesired effects are not always *undesirable* consequences. One of the central insights of social theory, originating in the Scottish Enlightenment, is that unintended consequences do not necessarily lead to disorder but are in fact the principal source of social order. Adam Smith said that

> every individual is continually exerting himself to find out the most advantageous employment for whatever capital he can command. It is his own advantage, indeed, and not that of the society, which he has in view. But the study of his own advantage naturally, or rather necessarily, leads him to prefer that employment which is most advantageous to the society. (*Wealth of Nations,* Book IV, Chapter 3)

Adam Ferguson observed that human action produced a form of social order superior to that conceived by human design. This insight is echoed in Hayek's concept of "spontaneous order." Examples of spontaneous order include language, common law, and our customs and mores rules. Obviously, society would be unthinkable without these institutions, but they were the result of human action, not of human design.

The idea that order is spontaneous—that it is an unintended consequence of human action—is congenial to both conservatives and liberals. It vindicates conservatives' confidence in traditional social rules. These rules are epistemologically superior to "artificial" rules because they are less vulnerable to subversion by unintended consequences. That is because they transmit knowledge that has stood the test of time. Such rules are, so to speak, "hypotheses" that have withstood repeated attempts to disconfirm them. Groups that adopt the successful rules prosper from having done so without necessarily knowing why.

However, traditional rules won't be adaptive in all future states of society, so spontaneous order also depends on society's capacity to renew its rules. Liberty is essential to this process. It disperses power among citizens, as opposed to concentrating power in the hands of the state. As a result, the process of trial and error permits much greater experimentation, and the impact of mistakes is limited in scope. Successful experiments gradually diffuse, while unsuccessful ones are discarded.

Unintended Consequences and Business Regulation

Perhaps nowhere do unintended consequences have sharper teeth than in the regulation of economic activity. It is now commonplace that many New Deal Era regulatory agencies were "captured" by the industries they were supposed to regulate in the public interest. The Endangered Species Act has created perverse incentives for landlords to destroy species or habitat out of fear of a government taking of their property. If the government tries to protect the domestic steel industry by means of quotas or tariffs on steel imports, it raises the costs of making cars in the United States, and soon automobile executives are clamoring for protection.

In 1993, Congress limited the tax deductibility of pay for the five highest paid executives in each public corporation to $1 million unless it was performance based. In response, corporations switched to granting executives stock options. These changes helped to set the stage for the scandals of the following decade.

United Nations

The United Nations is a forum where countries may discuss common problems and strive for peaceful solutions. It was born after the experience of World War II. The headquarters are located in New York City. The organization is the pivotal international body in the world today to address concerns of the nations of the world: security, social justice, public health, and international business. It is difficult to ascertain who first conceived of the concept of an international body of independent states that used diplomacy first and submitted some national sovereignty for the purpose of world peace. Before the United Nations, various regional alliances and mutual defense pacts were created to assist international diplomacy. The modern United Nations offers the world's first fully operational attempt at international cooperation and offers the possibility of working for positive peace—not just the absence of violence (negative peace), but the promotion of economic development and social justice leading to a positive sense of peace.

The current United Nations charter was signed on June 26, 1945, and the United States Senate approved the treaty on July 28. The need for the United Nations became clear because of the two World Wars of the 20th century. After World War I, a League of Nations was established, but it lacked power to act because member nations refused to cede it real power. As a result, the League was powerless to meet the needs of the emerging threats during the late 1920s. Yielding sovereignty to international organizations still remains as the leading obstacle to success.

To improve on the flaws of the League of Nations, the modern United Nations began with three principal organizational units to promote its mission of securing negative peace (the absence of armed conflict) and the promotion of positive peace (economic development and justice). To secure negative peace, the Security Council was founded with the power to send United Nations troops to a region to quell unrest or to stop aggression. The Security Council was originally formed with 11 members (five permanent and six rotating). The first real test of this came during the Korean crisis in which the northern parts of the country attacked the south. The UN Security Council stepped in and sent troops to the region (thanks largely to the USSR's boycott of the vote). Over time, the Security Council has intervened many times since its inception.

The one major difficulty of the Security Council is that the five permanent members (the Republic of China, France, the USSR [now the Russian Federation], Great Britain, and the United States) all have vetoes. This makes controversial action difficult. For example, during the Cold War, it would have been very hard to authorize an action that either the United States or the Soviet Union opposed (unless one party absented itself from the voting). Since these two superpowers seemed to have contradictory stands on most issues, it created stumbling blocks for action. In the future, the success of the Security Council will lie in its ability to be able to act quickly to use force when necessary to promote the absence of armed conflict (negative peace).

The second major arm of the United Nations concerns economic development and social justice. There are 14 major subunits of the Economic and Social Council. The most important of these for development are the International Monetary Fund (IMF) (which works in concert with the World Bank) and the World Health Organization (WHO). The theory behind this section of the UN is that without the basics of life, namely, food, clothing, shelter, and protection from unwarranted bodily harm (including medical care), there cannot be a lasting positive peace. The IMF along with the World Bank lends money to poor countries so that they might build up the infrastructure of the nation and make it ready to be a member of the economic community. They support projects such as the construction of roads, schools, hospitals, and irrigation projects. The WHO works at eliminating infectious diseases that threaten economic development and the basic well-being of the citizens. While this is a most worthwhile goal, the history of these organizations has been mixed with some real successes and some instances of graft and corruption. The present mood is toward transparency so that nongovernmental organizations (NGOs) might act as watchdogs to lessen the amount of graft and corruption.

The third major arm of the United Nations is the International Court of Justice. This was formed in the wake of the Nazi atrocities that had prompted the Nuremberg Trials. The modern court meets in The Hague in the Netherlands and consists of 15 judges who serve 9-year terms (five being elected every 3 years). In principle, they are the judicial arm of the UN, with power to enforce sanctions against member nations for violations of international law (trade disputes and the like) and for crimes against humanity (such as genocide). In principle, the International Court of Justice might be able to adjudicate international problems that would punish those who violated the rules of war or who violated economic or health policies of the UN. At the writing of this entry, the International Court was trying various individuals for war crimes connected to the Serbia, Bosnia, and Kosovo theater of conflict.

Of course, the short side to the United Nations lies in the willingness of member nations to cede sovereignty to the UN. For powerful countries, such as the G7, the United States, Britain, France, Germany, Japan, Canada, and Italy, there is little self-interested incentive to do so. There is little to promote their concern with ceding power to others. They are content with the status quo. For the rest of the world, it is in their self-interest to belong to a multinational diplomatic forum that seeks to promote their economic, just, and peaceful future. Perhaps the real road to peace will lie with the commitment of nations to such cooperative ends. It will not be easy but such is the ultimate mission of the United Nations.

—Michael Boylan

United Nations Environment Programme (UNEP)

The United Nations Environment Programme (UNEP) was created in 1972 by the UN General Assembly. The UNEP functions as the designated authority of the United Nations system in environmental issues at the global and regional level. Its mandate is to coordinate the development of environmental policy consensus by keeping the global environment under review and bringing emerging issues to the attention of governments and the international community for action.

The UNEP states that its mission is to serve as an advocate, educator, catalyst, and facilitator in promoting wise use of Earth's natural assets for sustainable development. Its activities cover a wide range of topics, including the promotion of environmental science and information and environmental law, to an early warning and emergency response capacity to deal with environmental disasters and emergencies.

The UNEP is headquartered in Nairobi, Kenya, and has six regional offices throughout the world: Africa, Asia and the Pacific, Europe, Latin America and the Caribbean, North America, and West Asia. The work of the UNEP is organized through eight divisions: Division of Early Warning and Assessment; Division of Policy Development and Law; Division of Environmental Policy Implementation; Division of Technology, Industry, and Economics; Division of Regional Cooperation; Division of Environmental Conventions; Division of Communications and Public Information; and Division of Global Environment Facility Coordination.

Two of the UNEPs most well-known accomplishments were the special report from the Brundtland Commission, *Our Common Future,* and the 1992 conference it hosted in Rio de Janeiro: the 1992 UN Conference on Environment and Development (known as "Earth Summit"). The Brundtland report introduced the now widespread understanding of sustainable development: development that meets the need of the present without compromising the ability of future generations to meet their own needs. The Earth Summit's purpose was to reconcile worldwide economic development with protection of the environment. *Agenda 21*, a blueprint for sustainable development, was one of the most popular documents created in that conference.

Because environmental sustainability is one of the eight "Millennium Goals" (priorities for international development) declared by the United Nations in 2000, the UNEP continues as a highly visible program with the United Nations. A variety of publications, awards, research projects, and advisory committees help the UNEP to carry out its mission.

Each year, the UNEP publishes approximately 100 books. Through its Web site, the UNEP reaches over 2 million readers each year. One of the UNEPs major reporting activities is the Global Environmental Outlook that tracks environmental change and notes significant trends and emerging issues. Periodic world summits and annual reports on the environment help to create and build on public support.

A conspicuous impediment to the UNEPs effectiveness is the continued lack of support from the United States for the Kyoto Protocol. While other major signatories—like Canada and Russia—have ratified this effort to reduce harmful emissions, the United States still considers the treaty too harmful for its economic growth. Furthermore, UNEPs assertion that humans are responsible for climate change (and, therefore, can positively affect climate change by reducing global warming) continues to be challenged by some members of the scientific community, especially in the United States. Nonetheless, the Kyoto Protocol is advancing and is now entering the compliance stage, even without complete support.

As the United Nations began to change from being the peacekeeper between two superpowers, it began to address more social and economic goals and began to work more with "civil society"—nongovernmental agencies and citizens. So, too, the UNEP began to seek out partnerships with the private sector for funding and management of its strategic goals.

The UNEP works with business and industry to promote basic human rights, labor, and environmental values and has encouraged companies to use Global Reporting Initiative (GRI) indicators in annual reports. In 2004, the UNEP launched the Responsible Investment Initiative to encourage the global investment community to adopt principles of sustainability. The UNEP has also partnered with the International Olympic Committee to safeguard the environment during Olympic Games. Increasingly, the UNEP asserts that environmental degradation and resulting poverty must be recognized as important sources of global conflict, while a sustainable environment would help create a more secure future for humanity.

United Nations Global Compact

The United Nations Global Compact is an initiative to create general principles of voluntary responsible business behavior. In 1999, the UN secretary-general Kofi Annan called on corporations to help make economic globalization beneficial for all in a speech at the World Economic Forum in Davos, Switzerland. A year later he introduced the original nine Global Compact Principles, in the three categories of human rights, labor standards, and protection of the environment. The tenth principle, on corruption and bribery, was added in 2004.

The 10 principles are the following:

Human rights

1. Businesses should support and respect the protection of internationally proclaimed human rights.
2. They should ensure that they are not complicit in human rights abuses.

Labor

3. Businesses should uphold the freedom of association and the effective recognition of the right to collective bargaining,
4. They should ensure the elimination of all forms of forced and compulsory labor.
5. They should ensure the effective abolition of child labor.
6. They should effect the elimination of discrimination in respect to employment and occupation.

Environment

7. Businesses should support a precautionary approach to environmental challenges.
8. They should undertake initiatives to promote greater environmental responsibility.
9. They should encourage the development and diffusion of environmental-friendly technologies.

Anticorruption

10. Businesses should work against all forms of corruption, including extortion and bribery.

These principles are based on widely accepted international documents, including the Universal Declaration of Human Rights (1948), the Declaration on Fundamental Principles and Rights at Work (1998), the Rio Declaration on Environment and Development (1992), and the UN Convention against Corruption (2003). The small UN Global Compact Office partners with six UN agencies that provide expertise and resources in support of business involvement to achieve the 10 principles. The UN agencies are the Office of the High Commissioner for Human Rights, International Labour Organization, UN Environment Programme, UN Development Programme, UN Industrial Development Organization, and UN Office on Drugs and Crime.

Secretary-General Kofi Annan appealed to business executives to join the Compact because it was in their interest to strengthen public support for economic globalization. He argued that responsible business behavior would reduce fears that globalization would endanger vulnerable parties, especially the poor.

Approximately 50 organizations signed up to support the Global Compact when it was officially launched in July 2000. Corporate participation grew rapidly to more than 700 in 2002 and increased to 2,100 in 2004. By 2006, more than 2,700 corporations, based in more than 90 countries, were active participants of the Global Compact. Participation simply requires a letter declaring commitment from the organization's CEO and a report posted on the Global Compact Web site on how the company is meeting one or more of the principles. Early reports were typically single cases demonstrating responsible corporate performance. Annual updates are necessary to maintain active participation status. Information on participation by country, industry, company, and issue can be found in the UN Global Compact database at www.unglobalcompact.org.

About 25 NGOs representing labor, human rights, and environmental concerns are also affiliated with the Global Compact. Early critics of the Compact included NGOs that were concerned that corporations were not sincere in their commitment to the principles but rather would use the Compact for public relations purposes only. While endorsing the concept of specific common standards for business behavior around the globe, they cautioned Annan not to permit corporations to use the stature of the United Nations as a way to improve business reputations without improving their actions. Later, NGO critics accused Annan of focusing on increasing corporate participation rather than on increasing accountability. They recommended that monitoring be instituted to ensure that companies were reporting their cases accurately and continuing to conform to the principles.

In response to this criticism, Global Compact officials and member companies supported the addition of integrity measures that required companies to provide an annual communication on progress to maintain active status as a participant. Companies that missed two annual deadlines were moved to "inactive" status. In October 2006, more than 300 companies were declared inactive because progress reports had not been submitted.

The Global Compact has recently accelerated the creation of country networks of members to provide greater opportunities for sharing best practices in dealing with common and collective issues. By late 2006, Global Compact Local Networks were developing in 60 countries. The emphasis is on creating "learning communities" that use both information and peer pressure to expand voluntary policies and programs.

The Global Compact is also creating formal partnerships with other corporate social responsibility initiatives. One is with the GRI, which is a voluntary effort to design reporting guidelines for sustainability reporting. The two organizations are integrating the voluntary social responsibility implementation focus of the Global Compact with the GRIs reporting framework. The Compact is encouraging its business participants to use the GRI framework to meet its annual requirement for communication on progress.

A second partnership is with the International Organization for Standardization (ISO), which is formulating ISO 26000, a set of voluntary social responsibility guidelines to be released in early 2009. A memorandum of understanding has been signed between the two groups to ensure that ISO guidelines will be compatible with the 10 Global Compact principles.

Such collaboration among organizations working to enhance corporate social responsibility reduces fragmentation that occurs with multiple partial approaches to influencing business practices. Integration and harmonization are expected to help corporations and their stakeholders in formulating and implementing standards for global corporate social responsibility, accountability, and transparency.

Universalizability, Principle of

The *principle of universalizability* is a form of a moral test that invites us to imagine a world in which any proposed action is also adopted by everyone else. Most notably, it is the foundational principle for deontological, or duty-based, ethics. For example, if we are tempted to lie, then we have to think what the world would be like if everyone lied, or in a similar vein, if we consider donating to charity, what would it be like if everyone made the same choice. The principle acts like a litmus test by indicating whether acts are morally acceptable or not. Universalizing some actions will lead to a self-contradiction, indicating that they are morally unacceptable. For example, if everyone lied, the notion of truth telling would cease to have meaning, and human community would become impossible. Likewise, universal theft would undermine our fundamental beliefs in property rights. Universalizing other acts, such as charitable giving, will not lead to a contradiction and thus will pass the benchmark of morally acceptability. Using the test, we can determine a set of general moral principles, sometimes referred to as maxims. Business could not take place without some overarching ideas of universal right and wrong, including a general acceptance of keeping our word and fair dealing, and the intuitive appeal of universalizability suggests that such ideas are derived from a shared notion among all humans about the general principles concerning the way that one should behave.

The principle is based on the idea that moral equality demands equal treatment. It has often been crudely captured in the directive "Do unto others as you would have them do unto you." It presumes that all moral actors are equal and that we cannot favor ourselves by appealing to the particular facts of a situation. Thus, we have to ask what anyone would do when faced with this moral quandary, rather than what *I* would do individually granted my specific situation. We cannot develop a principle by saying that anyone from my background with my desires and tastes would act similarly, since with sufficient qualification that would lead to a test where only someone with my exact qualities would act in a given way, leading to individualized results for everyone who asks the question. Instead, we have to look to what a more abstract moral agent would do absent the context of the issue. For example, we cannot ask whether a manager who grew up in a country where women are not active in the workforce may discriminate on the basis of gender, but more what a neutral moral agent should do when faced with that situation, based on our best projection of the result of universal adoption of his views. It would not matter, for instance, if we believed that the other party in a negotiation was bluffing or that there would be a significant payoff if we could persuade the other party of something that was not true; the principle demands that we have to go to the root issue of whether lying is ever morally acceptable.

The principle of universalizability is the foundation of a formalist moral theory, as opposed to a contextualist moral theory. Formalist ethics takes human reason as its starting point; whereas contextualism holds that the starting point for ethical or moral evaluation of an action or course of action is the context in which it takes place. Context includes, but is not limited to, the particularities of the agent, the circumstances surrounding the actions, and the consequences of actions. Essentially, the principle of universalizability requires that we imagine the world in which the maxim behind action governing all humans operates like a law of nature, for example, the law of gravity. The principle is powerful since it is not dependent on circumstances and so serves to defeat moral relativism, which relies on the particular context of a decision.

A moral theory using the principle of universalizability must accept a conception of human reason wherein reason can determine infallibly a moral course of action. This requires that moral principles be determined a priori, or prior to experience. The principle requires this conception of human reason because it ultimately requires all ethical agents to abstract from personal and particular experience to imagine the "moral world" in which their actions operate like natural laws. The contextualist ethics, on the contrary, would admit that moral principles be determined a posteriori, or arising from experience, or out of reflection on experience. As experience cannot be admitted into moral reasoning, we have to depend on reason alone to produce moral directives.

A maxim is typically defined as a freely chosen action determined by human reason using the universalizability test. The freedom of this will is understood in terms of the autonomy of the will. In this moral framework, autonomy is not understood as the human being's freedom from laws or moral principles, but rather, the human being is subject to moral laws, principles, or directives because they are a product of one's own reason.

The force of moral requirements or prohibitions resides in the all encompassing nature of morality that the principle assumes. In essence, we must imagine that our actions be added to the repertoire of the natural laws that govern human life. A simple example of such a law is the law of gravity that governs the movement of bodies in space. The law of gravity is universal in that all bodies are subject to it, but as a law of nature, it exists outside of natural bodies. The task of the principle of universalizability is to imagine all our acts taking place in a world in which all rational beings would always act according to that maxim whenever the possibility were open. The maxim then takes on the force of a natural law, so that good actions are not merely allowed, but required and conversely, bad acts are absolutely prohibited.

There are two criteria for determining the universalizability of an action: consistency and reciprocity. The criterion of consistency states that the nature of reason itself is to resist inconsistency. There are two ways of viewing the consistency requirement of the principle of universalizability. First, there must be internal consistency, or rational consistency. For instance, one cannot rationally will the maxim "Do *x*, but do not do *x*," or "Preserve life, destroy human beings." It is rationally inconsistent to will to do and not do the same thing at the same time, just as it is logically inconsistent to hold both *x* and not *x* at the same time. In addition to this rational or internal consistency that must be met, there is external consistency that looks to the practical outcome of universalizing. For instance, to will "Always receive gifts but never give them" is inconsistent when universalized because it is impossible for everyone to receive gifts if no one is giving them. In the same way, "Make promises but never keep them" is inconsistent because the very meaning of the term *promise* breaks down if no one is required to keep one.

The second criterion for universalizability is reciprocity. Whatever one wills as an action for oneself, one must also be willing to receive that same action from another. To will "Kill all human beings," one must at the same time be willing to be killed by another. To escape this, one might will "I may kill a human being, but no one can kill me." However, this defies the test of universalizability in that one is making an exception of oneself, analogous to willing that "The law of gravity does not apply to me."

Historically, the primary defender of the principle of universalizability has been Immanuel Kant. The principle forms the cornerstone of his moral theory, captured in the categorical imperative: "I ought never to act except in such a way that I could also will that my maxim become a universal law of nature." For Kant, once the criteria of consistency and reversibility are met, and the maxim can be universalized, it becomes one's *duty* to act in such a way as to fulfill that maxim. At this point, actions are not merely permitted, but are required, or conversely, forbidden. In accordance with the principle of universalizability, actions done *from duty,* that is, because it is required are moral actions and those that are done *in spite of duty* are immoral actions. Only those actions done from duty, in accordance with the principle of universalizability, have worth. If it is one's duty to "always tell the truth," because one would not will to live in a world where this was not the moral law, to do it only because one fears repercussions or shame does not satisfy the moral requirement to act solely out of duty. The result of the principle of universalizability on this level is the requirement of certain actions, "Always tell the truth," or the prohibition of certain actions, "Never lie."

There are two clear benefits in employing the principle of universalizability in moral deliberation. First, moral laws, directives, or principles take on a decidedly objective character. In the process of universalization, the moral agent strips away particularities of time and place, individual circumstances, and emotive or desirous motivations for action. Thus, the moral law that results are required (or forbidden) of *all* moral agents, whomever and wherever they may be. This grounds the claim that certain actions are objectively right or wrong, moral or immoral. The second benefit of using this principle is that the test of universalizability provides a motivating force for moral action. The result of this process *categorically*, or absolutely, requires that a moral agent act in a certain way. Thus, the moral law does not merely suggest specific actions or courses of action but requires that certain actions be done or not be done.

There are also disadvantages to using the principle of universalizability and, more broadly, the formalist ethics that may result. For instance, the principle of universalizability strips away the particularities of agents, leaving no room for human emotion or desire to play a role in moral deliberation. Insofar as emotion and desire are uniquely and essentially human, moral deliberation using the principle of universalizability restricts full expression of one's humanity in moral exercise. Also, in decontextualizing moral reasoning, the principle of universalizability may also remove morally relevant or salient features of situations and other human beings. We often face moral questions where those involved are partial, owe special duties, or have extenuating circumstances that may color our intuitions. For instance, a corporation may hold that safe working conditions ought to apply universally. On the other hand, a foreign subcontractor may want to use much lower standards, and this sets up a conflict with business maxims such as "Operate in such a way that results in maximum returns to investors." The Kantian approach does not in itself tell us which maxim should have priority or how we go about judging between them. Examples like this show there may be times where moral principles clash—such as the corporation's duty to maximize returns to investors and maintain safe working conditions. In this particular situation, the corporation may be forced to rely on the situational context to develop moral priorities.

Another limit of the principle of universalizability and formalist ethics, in general, is the scope of moral concern. The principle is generally limited to other rational agents just like us, and thus may preclude consideration of other objects of moral concern, such as animals, plants, or the environment at large. The claim that we should not be unnecessarily cruel to animals, for example, appears to have moral force, but is not obviously condemned by the universalizability test alone. Some modern formulations of the principle have sought to modify it by incorporating a hierarchy of duties to deal with potential conflicts (suggesting, perhaps that life matters more than property and property matters more than convenience).

USA PATRIOT Act

The USA PATRIOT Act (Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act) of 2001 is an act of federal legislation in the United States. It was signed into law by President George W. Bush on October 26, 2001.

The PATRIOT Act governs the authority of the federal government to fight espionage and terrorism and is divided along two areas: domestic law enforcement and foreign intelligence surveillance. The broad nature of the act has also allowed federal agencies to prosecute money laundering and computer fraud, even in situations that did not directly involve terrorism. The act has profound effects on Internet service providers (ISPs), telecommunications providers, banks, financial services companies, and immigration.

The original version of the act included a sunset provision. Several of the section powers defined in the act were due to expire on December 31, 2005. This date was extended to March 2006 as lawmakers argued over which sections would be retained. Legislation passed by the U.S. Congress in July 2005 in HR 3199 repealed this expiration date for certain provisions. A renewal of the act was passed by Congress and signed by President George W. Bush on March 9, 2006. The renewal makes all but two provisions of this version of the act permanent. While several of the original sections were not included in the renewal, the act still retains its broad scope over law enforcement, financial transactions, and surveillance.

Origins

The USA PATRIOT Act had already been proposed in the Congress before the events of September 11, 2001 (9/11). In the following days, President Bush called on the U.S. Congress to provide the federal government with sweeping law enforcement powers to better identify and prosecute terrorists. The executive branch and the congressional leadership centered its legislative efforts on this bill.

The act is an extension of the Foreign Intelligence Surveillance Act (FISA) of 1978 and the Computer Fraud and Abuse Act (CFAA) of 1986. The primary means of extension was the inclusion of terrorism. Terrorism itself was defined in the act as an activity that meets all three of the following criteria: the intimidation or coercion of the government or civilian population, the violation of criminal laws, and the endangerment of human life.

Scope of the Act

The act is divided into 10 sections or titles. Each section addresses specific issues, remedies, and agencies. Section 106 of Title I defines the president's powers regarding international financial transactions within the U.S. jurisdiction. This was a response to the finding that the alleged 9/11 terrorists had received significant funding from outside the country. As a result of this redefinition, it has become more difficult for anyone to transfer funds across the country's borders. Banks and financial institutions must collect, retain, and report more detailed information about each transaction and its participants. These efforts have been criticized by privacy advocates and international groups as a fundamental, and possibly illegal, erosion of the privacy rights of non-U.S. citizens.

Section 104 describes another expansion of governmental authority. The attorney general may request military assistance when weapons of mass destruction (WMDs) are used within U.S. territory or against U.S. facilities. This section weakens the separation between civilian and military authority in law enforcement, as a means of improving communication and coordination between these two institutions. Similar tactics were employed during the Civil War, resulting in the Posse Comitatus Act of 1878. This measure attempted to ban the use of military forces in a civilian capacity. Section 104 appears to be one of several legislative exceptions to the 1878 act.

Discrimination

Title I of the act also addresses discrimination against ethnic and religious groups. After the 9/11 attacks, some lawmakers and citizens were concerned that law-abiding Arab Americans, Muslim citizens, and others might be targets in a "rush to judgment." Section 102 recognizes this issue and states that the civil rights and safety of all American citizens must be maintained.

Racial and religious discrimination are long-standing issues in the United States. During World War II, President Franklin Roosevelt signed the Executive Order 9066 that allowed the civilian government to relocate approximately 120,000 individuals of Japanese ancestry to internment camps. More than 60% of these internees were American citizens. Relatively few internees were of German or Italian descent. The stated purposes of internment were to protect these individuals and to curb sabotage, in a utilitarian effort to preserve safety by denying the rights of an ethnic minority. While the Supreme Court upheld the executive order in 1944, President Ronald Reagan signed legislation in 1988 that provided a formal apology for the government's actions and established a system of monetary reparations to survivors.

Section 102 of the act does not specifically address internment. There are more than 5 million Arab Americans living in the United States. Internment, or any effort to restrict the movements of specific groups, would be difficult and expensive, even if these efforts involved voluntary or electronic tracking schemes.

Immigration

Title IV of the act represents a reform of national immigration laws, with a specific focus on the Immigration and Nationality Act (INA) of 1952. Immigration and Customs Enforcement (ICE), an agency formed in the Homeland Security Act of 2002 from the combined Immigration and Naturalization Service (INS) and the U.S. Customs Service, was given additional flexibility to staff and monitor the country's border with Canada. Immigrants who were members of an international organization that endorsed terrorist acts could be denied entry into the United States. Family members and associates could also be denied entry. The secretary of state and attorney general were given broad powers to investigate and designate any immigrant as a potential threat.

The attorney general was required under Section 416 to establish a computerized system for monitoring foreign students registered in U.S. colleges and universities. Academic administrators at each school are required to enter and update information about foreign students with the Student and Exchange Visitor Information System (SEVIS). The federal government can level substantial penalties against universities if they fail to participate in SEVIS and the associate Student and Exchange Visitor Program (SEVP). The U.S. universities have seen a marked decline in international student enrollment, as the revised student visa policies and procedures, including mandatory visa interviews and processing fees, served as a disincentive for potential students to consider U.S. schools.

Search and Seizure

FISA provides for the Foreign Intelligence Surveillance Court, which operates without public record. FISA also permits the delayed notice of a warrant in specific situations, which are commonly referred to as "sneak and peek." Under this doctrine, a property owner does not have to be informed prior to search. Probable cause is not a requirement for a FISA investigation.

Section 203 of the act allows "foreign intelligence information" to be gathered during criminal investigations by domestic law enforcement and then shared with the intelligence community. Section 218 added a single word to the 1978 requirements for launching a FISA investigation. Government officials could now show that a "significant," rather than sole, purpose of a FISA investigation involved the collection of foreign intelligence information.

The act further allowed the director of the FBI to request a person's telephone records without any notification to that individual. The federal government has argued that the transactional data for Web surfing consist of a list of the URLs or Web site addresses that a person visits. However, server addresses can have meaning in and of themselves. Web server addresses are almost always based on domain names, which are often associated with certain products services, trademarks, or other information that another person may use to either correctly or incorrectly identify a Web site without visiting any of its pages.

Web addresses can also have data embedded within them, through the use of the HTTP GET method. This is a common practice on search engines such as Google and Yahoo. Web developers sometimes use the URL to embed information that has been entered into forms. Web sites that follow this practice include bibliographic databases and some e-commerce sites.

Section 211 of the 2006 version of the act overrides the privacy provisions of the Cable TV Privacy Act of 1984. Subscribers' viewing records are protected, but records of telecommunications activity, including cable modem usage, wireless network transmissions, and telephone calls, are subject to the PATRIOT Act's provisions.

Section 216 of the act allows law enforcement agencies to conduct "roving" surveillance. This provision is one of two sections of the 2006 version of the act that will expire in 2010.

Money Laundering

Section 311 of the act authorized the U.S. Department of the Treasury to require regular reports of international financial transactions conducted through domestic financial institutions. Banks were also required to train employees on specific procedures and responsibilities for these financial transactions. Thus, a significant burden was placed on financial professionals, who must now assume that any international transaction must be reported, and may be perceived, as possible evidence of money laundering by the federal government.

Section 215 of the act gives law enforcement the authority to request business records under FISA. This is the second temporary provision of the 2006 version of the act. It is scheduled to expire in 2010.

Computer Fraud

The act amended the CFAA so that it includes the aiding or harboring of terrorists and perpetrating or assisting attacks on the defense contractors or the government. However, the act also extends its authority to situations in which individuals are harmed or killed. Unauthorized access to or transmission of government computer systems or national security information is prohibited. The unauthorized transmission or possession of computer passwords also qualifies as offense.

Sections 206 and 217 of the act amended the CFAA so that it applies involving computer fraud in cases where at least $5,000 of damages or lost revenues can be claimed. The act has been used in cases such as abuse, Web site defacement, spamming, file sharing, piracy, and theft involving ISPs, music and film publishers, and other organizations. Most of these cases were within the bounds of the act, although only a few of the defendants in these cases were implicated in terrorist activities.

An 8-year statute of limitations exists, and Racketeer Influenced and Corrupt Organizations Act (RICO) procedures can be used to confiscate assets from the accused. This expansion of the federal government's powers allows investigators to monitor an individual's telecommunications without their knowledge or consent.

State and Local Governments

Since its original enactment in 2001, eight states and almost 400 local governments passed resolutions and measures that condemned the act. These measures have little real power, but they do suggest that the PATRIOT Act remains a controversial subject in the United States. Public opinion polls suggest that many voters are poorly informed about the act's purpose and scope.

Effects on the Internet

The act presents several ethical challenges for companies, employees, and government officials. The intent of the act was to provide the federal government with enhanced powers to identify and prosecute terrorists.

In practice, the act has become a valuable tool for the prosecution of Internet-based crime. Law enforcement agencies are better able to work with ISPs, telecommunications firms, and other companies to respond as criminals change and adapt their practices in "Internet time." Legislators and the courts may react after the fact, but the Internet's pervasive influence over society means that the criminals can create much greater damage now than they could in the past. Government has turned telecommunications into a surveillance tool as a means of protecting society in a utilitarian fashion, where the good of the many outweighs the erosion of personal privacy and liberty.

At the same time, some Internet users tend to believe that the Internet is an anonymous marketplace for the exchange of ideas. The act has made this assumption a dangerous one. Telecommunications providers tout the power of their services to rapidly connect users to each other and to information sources. However, U.S. telecommunications providers have, in most cases, been willing to cooperate with the act's broad mandate, sometimes to the detriment of individual privacy.

In the first decade of the 21st century, mobile telephone carriers have extended the Internet's reach to the mobile handset. It is commonly believed that, at some point in the next 10 years, more users will access the Internet through a mobile phone handset than through a personal computer.

In the United States, these carriers archive and store text messages, record data transmissions and telephone calls, and are required by the act to produce this information at the government's demand, and sometimes without the user's knowledge. It has become a trivial pursuit to analyze the pattern of one or more user's mobile phone usage to determine where they were, when they accessed services, and what they accessed. The mobile phone and the personal computer have become, by their very nature as telecommunications devices, instruments of finely detailed surveillance. In the United States, the act means that a vast majority of the population is subject to greater government scrutiny now than at any point in the history of the Republic.

U.S. Bureau of Economic Analysis

The Bureau of Economic Analysis (BEA) is an agency in the Economics and Statistics Administration of the U.S. Department of Commerce. Although established in its current form in January, 1972, the BEA actually traces its functional origin back to February 1820, when the Department of the Treasury was directed to provide annual statistics on U.S. foreign commerce. The contemporary mission of the BEA is to promote understanding of the U.S. economy through the provision of the most timely, relevant, and accurate economics account data in an objective and cost-effective manner. The BEA accomplishes its mission through the collection and research of source data, the development and implementation of estimation methodologies, and the dissemination of its reports to the public.

The BEA produces more than 15,000 economic data series each month. It is the source for the National Income and Product Accounts. These accounts feature several widely followed measures of economic activity: gross domestic product, input-output accounts, balance of payments, direct investment estimates, and state personal income. These and other economic statistics are used by businesses, governments, and individuals to understand the U.S. economy. The White House and Congress use the GDP and national account reports in the process of determining budget estimations and projections. The Federal Reserve Board uses information from these accounts when setting interest rates. Businesses, households, and individuals use these statistics to guide financial and investment decisions. International trade officials and businesses use BEA statistics to inform negotiations on trade agreements; to assess international markets for size, direction, and share; and to measure the economic impact of trade policy. State governments and development officials use BEA statistics to better understand state spending, state revenue projections, and business growth.

The BEA follows five core values: integrity, quality, excellence, responsiveness, and innovation. The BEA strives to be the premier trusted source for reliable and consistent information about the performance of the U.S. economy. The BEA also promotes staff excellence and values providing its constituents with the programs and services they need. The BEA is committed to using cutting-edge technology and generating better methodologies to meet the considerable challenge of timely, relevant, and accurate economic measures.

In its FY 2005 to FY 2009 Strategic Plan, the BEA identified three significant challenges. First, it is challenged to understand the structural changes in the U.S. economy and its international interactions. To meet this challenge, the BEA will have to adapt its measures to characterize the structural changes in the economy and to locate quality sources to fill gaps in the BEA accounts. Second, the growing demand for economic analysis requires that the BEA and other agencies (BLS, the Federal Reserve, and the Census Bureau) provide consistent and integrated statistical foundations for account reporting. To meet this integration challenge, the BEA will have to agree on guidelines and timetables with the other agencies to create consistency. Third, the BEA is challenged to build a human capital strategy. To meet this challenge, the BEA will have to focus on its workforce recruitment, selection, training, development, and retention.

Accurate, reliable, and timely measures of economic activity are important to a variety of constituencies and stakeholders in any modern economy. Although the market economy of the United States may be guided by Adam Smith's *Invisible Hand,* agencies such as the BEA provide valuable economic insight regarding whether, where, when, and how policy makers and businesses allocate resources. Policy makers at both the state and federal levels rely on economic measures determined by the BEA in determining tax, fiscal, and trade policies. Businesses rely on economic measures determined by the BEA to analyze and contrast productivity; research and development expenditures; and wages and salaries to their industry sector, their region, and the economy as a whole.

U.S. Bureau of the Census

Article 1, Section 2 of the U.S. Constitution states that the population of the United States be counted every 10 years for the purposes of apportioning members of Congress and direct taxes to the states. From the first census in 1790 until the census of 1880, the federal judiciary, through the U.S. Marshals Service, was responsible for the census. In 1880, Congress established a separate census office in the Department of the Interior and in 1902 established the U.S. Census Bureau as a division of the Department of Commerce. The sole purpose of the Census Bureau is to collect data and compile statistical analyses about the people and other select entities of the United States. In addition to the decennial population census, the Census Bureau also performs a Census of Governments every 5 years (covering government organization, government finances, and public employment in every state), as well as more than 100 annual surveys in areas as diverse as unemployment and housing. It is the job of the Census Bureau to collect and store these data, analyze them, and make them publicly available in both raw and analyzed form. It is also the Census Bureau's responsibility to protect the confidentiality of all data collected. The data on individuals are never reported, and raw census data can only be examined by the public after 72 years have passed.

Since its inception, the targets and questions of the census have reflected the political and social characteristics of the day. The first census in 1790 collected the names of every household head, counted the number of people in the household, including 3/5 of a person for each slave in the household, and specifically excluded American Indians. Collecting and tabulating the data on 3.8 million Americans took 18 months. By 1880, the number questions regarding social conditions and demographics had increased, the "3/5 rule" for African Americans had been eliminated, and the census included American Indians and Chinese. This census, the last to be done by hand, counted 50 million Americans and took 8 years to tabulate. It was barely completed by the time the 1890 census was ready to be taken. (In preparation for the 1890 census, a competition to create a tabulating machine was won by Herman Hollerith, and the company he founded to produce the tabulating machines eventually became the beginnings of the IBM Corporation.) By 2000, the census counted 281 million Americans, most census forms were mailed by citizens to the Census Bureau, and the data were made available on the Internet by the middle of 2001.

Since 1790, the census has changed from a simple counting of households to a mechanism for collecting an extremely wide range of demographic and economic data about the United States and its citizens. In the same time, the uses of the data have changed significantly, expanding from its original purpose of assigning congressional representatives to include such things as social service resources allocation, public policy planning, and economic analyses. Finally, access to the data has changed since the inception of the census and the Census Bureau, from data being available to a small number of elected officials and government bureaucrats to today's Internet-based access to every citizen and organization in the country.

Because of these changes, and the evolving demographics and economic dynamics of the United States, the Census Bureau has become a critical component of public policy debate as well as a key actor in political processes. Politically, the decennial census data are used not only to reapportion to states seats in the U.S. House of Representatives but also is the basis for redrawing congressional districts within each state. Economically, many social programs and federal dollars are allocated to states based on Census Bureau data, such data including not only the decennial population data but also more frequent unemployment figures, family income estimates, regional demographics, and household composition analyses. From a social perspective, the equations are simple: More people in a state means greater representation; more people qualifying for services in a state means more federal dollars. For the public to feel that the political processes are working fairly, and for policy makers to feel confident in their decisions, the census bureau must provide data that are viewed by all as objective, accurate, and complete.

The Census Bureau does receive criticism for possibly undercounting some classes of citizens, especially transients, the homeless, and people living in remote areas. The 1990 census was claimed to have missed almost 5 million Americans, many of them children, and mostly the urban poor, ethnic minorities, and the poor in very remote rural areas. Such undercounting has a direct impact on federal funding for social programs and can impact government social service policy for the following decade. With the information so critical to program funding, the undercount has become a social justice issue as well as a quality control question for accurate counting and reporting.

For the 2000 census, the Census Bureau combined mail-in surveys for most households, field workers for those not responding to mailed surveys, and teams of census workers specifically targeted at transient and urban and rural poor people. This good-faith effort to count all Americans was then augmented with a statistical correction to adjust the census numbers to account for those likely missed by those methods. This too proved controversial, as the decennial census is a zero-sum game to some degree. As congressional representation is fixed, gains in one region may require a reduction in other regions. In addition, social programs targeted at one segment of society may require reallocating resources from other programs. Estimating and thus increasing the number of minorities and poor can cast suspicion on the political motivations of the Census Bureau, as well as the numbers themselves. Court cases have affirmed the methods but have split the application of census numbers by collections method. Congressional representation, reapportionment, and redistricting must be based on actual counts. The corrected numbers may then be used for all other governmental purposes.

U.S. Department of Justice

The Department of Justice (DOJ) was created as an executive department by the U.S. Congress in 1870 (chap. 150, 16 Stat. 162). While the Judiciary Act of 1789 (chap. 20, sec. 35, 1 Stat. 73, 92–93) had originally created the Office of the Attorney General, the legal workload quickly became problematic, requiring the use of private attorneys to work on cases. The use of private attorneys led to heavy expenditures by the government due to ever-increasing amounts of litigation as the country grew. In an effort to control expenses, Congress created the DOJ with the attorney general as its head to handle the legal workload. The 1870 Act specified that the department was to handle the legal business of the United States and put control over federal law enforcement under the attorney general and the DOJ. The contemporary mission of the DOJ has five charges: (1) "to enforce the law and defend the interests of the United States," (2) "to ensure public safety against threats foreign and domestic," (3) "to provide federal leadership in preventing and controlling crime," (4) "to seek just punishment for those guilty of unlawful behavior," and (5) "to ensure fair and impartial administration of justice for all Americans."

Over the years, the DOJ has added deputy attorney generals and structured itself around 39 separate organizations consisting of some 60 specialized offices, agencies, bureaus, programs, and divisions, becoming effectively the world's largest legal office. Many, but not all, of these operational units are of particular interest to businesses and are briefly described.

The Antitrust Division

The Antitrust Division is charged to promote, protect, and preserve the competitive process in the American economy for the benefit of consumers and businesses. The Antitrust Division accomplishes its mission through guidance statements of policy to the business community and, when necessary, the criminal and civil enforcement of the U.S. antitrust laws.

The Asset Forfeiture Program

The Asset Forfeiture Program employs asset forfeiture powers to enhance public safety and security by removing the proceeds of crime and other assets from criminals and criminal organizations. The program manages and disposes of property seized while satisfying valid liens, mortgages, and other innocent owner claims.

The Attorney General

The attorney general is responsible for representing the United States in legal matters generally and providing the president and heads of executive branch departments with legal advice and opinions when requested to do so.

The Bureau of Alcohol, Tobacco, Firearms, and Explosives

The Bureau of Alcohol, Tobacco, Firearms, and Explosives (ATF) enforces federal firearms laws (including firearms commerce conducted by the approximately 106,000 federal licensees), ensures the lawful storage of explosive materials (among some 1,640+ licensees), and investigates arsons and explosions. The ATF also enforces federal criminal statutes that concern the diversion and trafficking of alcohol and tobacco taxes among multiple jurisdictions.

The Civil Division

The Civil Division is the largest legal division in the DOJ. It represents the people of the United States, federal agencies and their employees, members of Congress, and the federal judiciary in a broad range of claims. The Civil Division defends the United States in actions regarding the constitutionality, lawfulness, or propriety of programs and actions by the constituent entities of the federal government. It litigates in areas regarding consumer protection, immigration, international trade, patents, bankruptcies, foreign litigation, and general tort claims involving admiralty, aviation, toxic substances, and the commercial activities of the government.

The Civil Rights Division

The Civil Rights Division works toward ensuring that residents of the United States are not discriminated against on the basis of sex, national origin, language barrier, religion, or disabilities. The Civil Rights Division accomplishes its mission through a combination of certification, coordination, enforcement, mediation, and technical assistance activities. The criminal section of the civil rights division prosecutes violations of federal criminal civil rights laws, such as hate crimes, official misconduct, involuntary servitude, interference with access to reproductive health care, and interference with the exercise of religious beliefs.

The Criminal Division

The Criminal Division of the DOJ prosecutes violations of federal criminal law that involve a wide array of activities: terrorism, drug trafficking, intellectual property theft, commercial distribution of pornographic and obscene material, large-scale Internet fraud, alien smuggling, organized crime, violent crime, and corruption and fraud by corporations and public officials.

The Drug Enforcement Administration

The Drug Enforcement Administration enforces the controlled substances laws and regulations of the United States to prevent the growing, manufacture, distribution, dispensing, or trafficking of illegally produced controlled substances and illicit drugs.

The Environment and Natural Resources Division

The Environment and Natural Resources Division handles all cases concerning the enforcement of federal law related to public lands. The division is responsible for laws pertaining to the prevention and cleanup of pollution; the stewardship of public lands, wildlife, and the nation's natural resources; the acquisition of real property for the federal government through eminent domain; and Indian and Tribal rights, claims, land, and resources.

The Federal Bureau of Investigation

The Federal Bureau of Investigation investigates various forms of fraud, defined as deliberate deception for gain. The FBI has major fraud program initiatives targeted at white-collar crime, corporate fraud, health care fraud, mortgage fraud, identity theft, insurance fraud, telemarketing fraud, and money laundering. It also investigates cases involving antitrust, bank fraud, securities scams and investment fraud, moving company fraud, Spanish lottery fraud, celebrity memorabilia fraud, staged auto accident fraud, Internet fraud, and other areas. The broader mission of the FBI includes protecting the United States against terrorist and foreign threats, enforcing criminal laws, and providing leadership and support services to various governmental partners from the local to the international level.

The Tax Division

The Tax Division, created in 1934, is responsible for civil and criminal matters that pertain to federal tax compliance litigation to promote the fair and uniform enforcement of the tax laws. The Tax Division attorneys work closely with the Internal Revenue Service (IRS) to develop tax administration policies and handle civil and criminal litigation and appeals. The Tax Division has several significant areas of operation: corporate tax fraud, terrorist financing, abusive and fraudulent tax promotions, corporate tax shelters, and foreign bank accounts and offshore credit card transactions.

The U.S. Trustee Program

The U.S. Trustee Program provides oversight and supervision of the nation's bankruptcy system of laws and procedures (chaps. 7, 11, 12, and 13) to promote the just, timely, and economically efficient resolution of cases. The program enforces U.S. bankruptcy laws and monitors the conduct of private trustees and bankrupt parties. Interestingly, bankruptcy cases in the states of Alabama and North Carolina are not within the jurisdiction of the program but rather within the jurisdiction of the Bankruptcy Judges Division of the Administrative Office of the U.S. Courts.

Other DOJ Components

There are a number of other components of the DOJ that have not been covered in this brief overview. They include, but are not limited to, the following: the Office of the Solicitor General, the Federal Bureau of Prisons, the United States Marshals Service, the Executive Office for Immigration Review, the Office of Dispute Resolution, and the Office of Justice Programs.

Summary

The DOJ represents the interests of the United States in legal suits; enforces federal, criminal, and civil laws; encourages and enhances business competition; and investigates, apprehends, prosecutes, and confines criminals, drug traffickers, and terrorists. For the fiscal year 2005, the DOJ employed more than 112,550 persons with an estimated total budget of $23.7 billion.

U.S. Food and Drug Administration (FDA)

The Food and Drug Administration (FDA) is a scientific, regulatory, and public health agency of the U.S. government, responsible for ensuring the safety of foods (except meat and poultry), human and veterinary drugs, biological products, medical devices, cosmetics, and radiation-emitting electronic products. The FDA covers all food products including bottled water, with the exception of meat and poultry, which are regulated by the United States Department of Agriculture. The FDA is responsible for ensuring that the products under their jurisdiction are honestly, accurately, and informatively represented to the public. The FDA also helps speed up innovations that make medicines and foods more effective, safer, and more affordable and helps the public get the information they need regarding the use of medicines and foods. The FDA works with numerous federal, state, and local governments and agencies to carry out its duties, including the consumer product safety commission to enforce the Poison Prevention Packaging Act, the FBI to enforce the Federal Anti-Tampering Act, the Department of Transportation to enforce the Sanitary Food Transportation Act, and the U.S. Postal Service to enforce laws against mail fraud.

The FDA employs more than 9,000 people who work in locations around the country. The FDA staff who work in the Washington, D.C, area focus on product review and regulatory policy. The employees who work in the network of field offices are generally the first point of contact for the public and manufacturers. These employees focus on inspection and surveillance, laboratory work, and public and industry education.

FDA-regulated products play a large role in the lives of Americans, accounting for about 25 cents of every consumer dollar spent. The FDA monitors the manufacture, import, transport, storage, and sale of

$1 trillion worth of products annually, at a cost to taxpayers of about $3 per person. The agency has existed in its present form since 1931, after some reorganization and shifting of duties from other federal agencies.

Overview of the FDA's Product Responsibilities

The FDA is responsible for ensuring that ingredients used in foods are safe and that food is free from contaminants. The FDA approves new food additives and regulates and monitors food labeling to ensure accurate information to consumers. The FDA monitors cosmetic products to ensure they are safe and properly labeled but does not require safety testing of cosmetics.

The FDA requires manufacturers to undergo extensive testing and get preapproval for medicines and medical devices to ensure product safety for both human and animal drugs and devices. The FDA sets drug manufacturing standards, inspects manufacturing facilities, and regulates over-the-counter (OTC) and prescription drug labeling. Medical devices ranging from thermometers to heart pacemakers must receive premarket approval. The FDA sets manufacturing and performance standards and tracks reports of device malfunctioning and serious adverse reactions. The FDA is responsible for the safety of the nation's blood supply and for regulating biologics, which include vaccines, blood products, biotechnology products, and gene therapy.

The FDA sets radiation safety performance standards for microwave ovens, television receivers, diagnostic x-ray equipment, cabinet x-ray systems (such as baggage X-rays at airports), laser products, ultrasonic therapy equipment, mercury vapor lamps, and sunlamps. The FDA accredits and inspects mammography facilities.

If a problem arises, the FDA can take a variety of actions. Usually, they work with the manufacturer to correct the problem voluntarily. Failing that, legal remedies include asking the manufacturer to recall the product, having federal marshals seize products, and detaining imports. The FDA can ask the courts to issue injunctions or prosecute those who deliberately violate the law.

History

Prior to the passage of a food and drug safety law in the United States, unethical companies used fake ingredients and adulterated foods to save money. Patent medicine companies sold medicines containing opium, morphine, heroin, and cocaine without restriction. Drug labels did not list ingredients. On reading of filthy conditions in Chicago's meatpacking plants in Upton Sinclair's novel *The Jungle,* President Theodore Roosevelt in 1905 urged Congress to pass the first food and drug law. In 1938, a new Federal Food, Drug and Cosmetic Act was passed. This modern law has been amended numerous times since 1938 to account for improvements in food and drug safety.

Challenges and Issues for the FDA

The FDA has identified several important challenges and issues for the near future. These are keeping up with advancements in scientific breakthroughs, dealing with more sophisticated products, new public health threats such as terrorism, tougher strains of antibiotic-resistant bacteria, more dangerous foodborne illnesses, international commerce, and providing sufficient consumer information.

The FDA has also been the subject of controversy over the years with regard to various areas under its charge. Among these are issues pertaining to drug safety monitoring, the drug approval process, and broader issues pertaining to the responsibilities of the FDA. The former FDA commissioner Donald Kennedy has blamed Congress for not providing adequate resources to the agency, claiming that the organization is limited in its ability to do its job given the amount of resources allocated to it. The FDA regulates more than $1 trillion worth of products, almost 10% of the country's GDP.

The Cato Institute, a nonprofit, public policy research organization, criticizes the FDA on another matter. The organization calls for an end to the FDA's monopoly on drug approval and advocates for alternative certification organizations. An example of such an organization is the Underwriters Laboratory, which basically sells its reputation for products they certify. The Cato Institute says that because the cost of bringing a new drug to market with all the required testing is so expensive, companies develop only drugs that are likely to be blockbusters and can treat large numbers of patients. The organization believes that allowing alternative certification organizations would speed up the process of drug approval and thus improve the quality of health care.

Marcia Angell, the author of *The Truth About the Drug Companies: How They Deceive Us and What to*

Do About It, criticizes the FDA's safety monitoring. MedWatch was created by the FDA in 1993 to help track serious side effects of drugs and other medical products. She claims that only a small percentage of adverse events are reported to the FDA and that the safety monitoring is limited.

Recently, the FDA has come under intense scrutiny by legislators. David Graham, a medical scientist who conducts drug safety research for the FDA, testified at Senate hearings on concerns about the drug Vioxx and others that the FDA was not capable of protecting America. The issue is a broader societal one, in that drug therapy involves trade-offs. There are risks in taking a drug to treat a medical condition, and there are benefits from taking the drug to treat the condition. Some argue that it is the responsibility of pharmaceutical companies and the FDA to ensure that no harm comes to consumers from any pharmaceutical products. Others argue that the benefits of certain drugs, such as Vioxx, to consumers outweighs the risk and that providing adequate information on the benefits and risks enables a physician and patient to make the best decision for the individual patient. Given the importance of the duty that has been assigned to the FDA, it is likely to remain the subject of controversy and criticism.

Utilitarianism

Utilitarianism represents an old and distinguished tradition in moral philosophy, the influence of which extends to law, economics, public policy, and other realms and is evident in much of our everyday moral thinking. Two fundamental ideas underlie utilitarianism: first, that the results of our actions are the key to their moral evaluation and, second, that one should assess and compare those results in terms of the happiness or unhappiness they cause (or, more broadly, in terms of their impact on people's well-being). Both these ideas have been around for a long time; one can glimpse hints of them in philosophical and religious writings going back thousands of years. However, as an explicitly and self-consciously formulated ethical theory, utilitarianism is just over 200 years old.

By the 18th century, several philosophers were promulgating an essentially utilitarian approach to ethics. However, the English philosopher Jeremy Bentham (1748–1832) is generally considered the founder or at least the first systematic expounder of utilitarianism. In politics and ethics, Bentham and his followers saw themselves as fighting on behalf of reason against dogmatism, blind adherence to tradition, and conservative social and economic interests. They were social reformers who used the utilitarian standard as a yardstick for assessing and criticizing social and economic policies and the political and legal institutions of their day. Among Bentham's backers were his friends James Mill and Mill's son, John Stuart Mill (1806–1873), who went on to become the most important English philosopher of the 19th century. Ardently interested in economics and public affairs, Mill was an articulate defender of utilitarianism and used the doctrine to champion individual liberty and to urge the emancipation of women. Mill, in turn, was followed by Henry Sidgwick (1838–1900), the last of the great 19th-century utilitarians. Unlike Bentham and Mill, Sidgwick was a university professor with a strong interest in the history of ethics. His writings developed and refined utilitarianism as a moral philosophy, bringing it to its full intellectual maturity.

Today, the utilitarian tradition is as alive as ever. Although many contemporary philosophers believe that utilitarianism is profoundly flawed, over the years a number of able thinkers have expounded and defended the theory, honing and elaborating it in surprisingly subtle ways. Nevertheless, utilitarianism's guiding impulse is simple and transparent: Human well-being is what really matters and, accordingly, the promotion of well-being is what morality is, or ought to be, all about.

Basic Utilitarianism

In its most basic and familiar form, utilitarianism holds that an action is right if and only if it brings about at least as much net happiness as any other action the agent could have performed; otherwise, it is wrong. Philosophers generally call this act *utilitarianism,* but the basic utilitarian standard can be used to assess not only actions but also rules, laws, policies, and institutions as well as people's motivations and character traits.

When we are deciding how to act, utilitarianism instructs us to assess the consequences not just for ourselves, but for everyone, of each of the actions we could perform at any given time. In addition to their immediate results, we must bear in mind any long-term consequences and any indirect repercussions that these alternative actions may have. Although we mustn't ignore our own happiness, neither are we to give it more weight than the happiness of anyone else. Utilitarianism, then, tells us to sum the various good and bad consequences for everyone of each possible action and to choose the action that will produce the greatest net happiness. In this way, the theory requires us to strive always to promote as much good as possible.

Welfarism and Consequentialism

Utilitarianism has two distinct philosophical components. The first of these is *welfarism,* the value thesis that welfare or well-being is all that ultimately matters. It is the sole good, the only thing that is intrinsically valuable or valuable for its own sake. Anything else that we think of as good for people—say, friendship, or individual freedom—is good only because, and to the extent that, it contributes to their well-being. Nothing is good unless it is good for individual people, and the supreme utilitarian goal is that people's lives go as well as possible.

Bentham, Mill, and Sidgwick focused on happiness, which they equated with pleasure and the absence of pain. Because of this, their utilitarianism is called *hedonistic.* But these three writers were concerned with happiness only because they identified it with well-being, that is, with what is good for people. In their view, our lives go well just to the extent that they are pleasurable or happy. Happiness, however, is not the only way to spell out the idea of well-being, and not all contemporary utilitarians understand welfare as happiness (and still fewer equate either concept with pleasure). For example, economists, who tend to be utilitarian in their outlook, typically identify well-being with the satisfaction of one's desires or preferences. In keeping with utilitarian tradition, this entry uses *happiness* interchangeably with *well-being*. But it is the latter concept that is the focus of utilitarianism, whether one understands it as happiness or in some other way.

The second philosophical component of utilitarianism is its consequentialist or teleological (goal-oriented) approach to right and wrong. *Consequentialism* is the thesis that actions are right or wrong because, and only because, of the goodness or badness of their outcomes. It is not an action's intrinsic nature or whether it is an instance of a certain type of act (e.g., the telling of a lie) that determines its rightness or wrongness, but rather its specific consequences in a given situation. Utilitarianism differs from other possible consequentialist theories by being welfarist, universalistic (because it takes everyone's interests into account equally), aggregative (because it sums the happiness or unhappiness of everyone to determine the overall value of an action's consequences), and maximizing (because it requires us to produce as much well-being as possible).

Future Consequences

In trying to produce the best outcome, an agent can be unlucky. A conscientious utilitarian might carefully choose the course of action that anyone in those circumstances would have judged conducive to the best result, and yet the outcome might turn out to be terrible. Alternatively, a malicious person might plot harm to a neighbor only to have the plan backfire and produce optimal results. Utilitarians divide about what to say about these cases.

"Actual-outcome utilitarianism" affirms that the unlucky utilitarian acted wrongly and the malicious person acted rightly. We should not, however, blame the unlucky person for acting as a reasonable and well-informed utilitarian would have acted in the circumstances, and we should criticize the malicious agent for seeking to cause harm. In contrast, "expected-outcome utilitarianism" asserts that the correct standard is not the actual consequences of our actions, but rather their probable, foreseeable, or expected results. Hence, the unlucky utilitarian acted rightly and the malicious person wrongly. In practice, however, the difference between the two positions vanishes because, given that the future is uncertain, the most one can ever do is to act so as to produce the greatest expected well-being.

Critics of utilitarianism emphasize that we never know all the consequences of the things we do, still less the future results of every possible action we might have performed. Indeed, the causal ramifications of our actions extend indefinitely into the future. Talking in terms of probabilities does not eliminate this problem. We can rarely do more than guess at comparative likelihoods, and we are always liable to miss some possible outcomes and to overlook some alternative courses of action. Furthermore, comparing people's levels of well-being is tricky and imprecise at best. Finally, even if we were armed with all the relevant information, we would lack time to perform the necessary calculations before having to act.

Utilitarians concede these points and yet argue that they do not impugn the utilitarian goal of maximizing well-being. The correctness of that goal is not undermined by shortfalls in our knowledge of how best to attain it. Well-being is still what we should aim at, however difficult it may be to see the best way to bring it about. Utilitarians also point out that human beings are already well acquainted with the nature and typical causes of happiness and unhappiness. Based on thousands of years of collective experience, we are far from being in the dark about what promotes human well-being and what does not, and that knowledge will frequently suffice to justify our acting one way rather than another.

This response also addresses the complaint that we generally lack time, before acting, to perform the necessary utilitarian calculation. In ordinary circumstances, we can and should follow certain well-established rules or guidelines that can generally be relied on to produce good results. We can, for example, make it a practice to tell the truth and keep our promises, rather than try to calculate possible pleasures and pains in every routine case, because we know that, in general, telling the truth and keeping promises result in more happiness than lying and breaking promises. In this vein, many utilitarians have emphasized the practical necessity of following secondary moral principles. Relying on subordinate moral rules also alleviates the problem that even conscientious agents can suffer from bias or make mistakes in their calculations. In normal circumstances, one is less likely to err and more likely to promote happiness by sticking to certain settled guidelines than by trying to calculate afresh the consequences of various courses of action.

Does Utilitarianism Require Immoral Conduct?

For utilitarians, rightness and wrongness turn on the specific, comparative consequences of the various courses of action available to us. Without knowing something about the particular situation, we cannot judge ahead of time whether acting in a certain way will be right or wrong. We cannot say that actions of a certain type will always be right or always wrong. Utilitarians see this flexibility as a strong point of their normative standard, but their critics view it as a fatal flaw: The utilitarian goal of maximizing welfare, they argue, can sometimes necessitate the agent's acting immorally. The critics concede that it generally conduces to total well-being for people to tell the truth, keep their promises, and refrain from killing or injuring other people, from damaging their property, or from violating their rights. But there can be exceptions, and in unusual circumstances, promoting overall welfare might call for the agent to do something normally considered perfectly immoral—for example, supporting slavery, violating someone's rights, or framing an innocent person for a crime. Many philosophers repudiate utilitarianism because of this possibility.

Utilitarians typically respond by arguing that their theory does not mandate the conduct the critic says it does. Faced with hypothetical examples of detestable actions, policies, or institutions that supposedly maximize well-being, they challenge the imagined facts, arguing, for example, that slavery will not in fact promote overall well-being or that abridging someone's right to free speech to pacify the majority or torturing suspects to obtain confessions will have negative long-term repercussions. And even if it really would maximize well-being, say, to frame an innocent person to forestall a riot, one could never judge with sufficient confidence that this is how things would play out. In response, the critic is unlikely to permit the hypothesized facts to be challenged but, rather, to insist that in the imagined circumstances we really do know that an action or policy we normally consider morally wrong will maximize total welfare. At this point, utilitarians have no choice but to concede that the apparently immoral thing really is the right course of action. But they will deny that this fact provides a compelling reason for rejecting their theory. Ordinary morality is not sacrosanct. If its rules sometimes conflict with utilitarianism, then so much the worse for ordinary morality. We should revise it, not abandon utilitarianism.

Consistent with their own standard of right, however, utilitarians can often endorse the ordinary moral sentiments to which the critic appeals. Although in the far-fetched set of circumstances hypothesized by the critic, slavery or torture maximizes well-being, these are not the circumstances real people ever encounter.

In the world as it actually is, we do much better if people are dead set against doing those things we would normally consider atrocious—that is, if they instinctively reject slavery or refuse even to consider the possibility that framing an innocent person or torturing a suspect might be the right course of action. People who feel this way will do the nonutilitarian thing in the fanciful circumstances imagined by the critic. But they will act better in the world we actually live in, a world in which such dreadful actions will almost certainly diminish net happiness, than will someone who lacked these convictions. In line with this, utilitarianism can underwrite a strong commitment to respecting certain individual rights even if cases are possible in which people will fail to act in a welfare-maximizing way because of this commitment.

Deeper Into Utilitarianism

For utilitarians, whether an agent acted wrongly is distinct from the question whether the agent should be blamed or criticized for so acting (and, if so, how severely). Utilitarians apply their normative standard to questions of praise and blame just as they do to questions of right and wrong. In particular, they will ask whether it will best promote happiness to criticize someone for failing to maximize happiness. Suppose that a well-intentioned agent acted in a welfare-promoting way but that the person could have produced even more good by acting in some other way instead. Should utilitarians criticize this person? Depending on the circumstances, the answer may well be "No." Indeed, praising agents for actions that fail to fulfill the utilitarian standard can sometimes be right. This is because utilitarians applaud instances of act types they want to encourage, and they commend those motivations, dispositions, and character traits they want to reinforce.

Utilitarians take an instrumental approach to motives. Good motives are those that tend to produce right conduct whereas bad motives are those that tend to produce wrongful conduct. And they assess habits, dispositions, attitudes, behavioral patterns, and character traits in the same instrumental way: One determines which ones are good, and how good they are, by looking at the typical results of the actions they lead to. It doesn't follow from this, however, that utilitarians believe that a moral agent's only motivation or sole concern ought to be the impartial maximization of happiness. Indeed, utilitarian writers have long urged that more good may come from people acting from other, more particular motivations, commitments, and dispositions than from their acting only and always on a desire to promote the general good.

Utilitarianism thus implies that one should not always reason as a utilitarian or, at least, that one should not always reason in a fully and directly utilitarian way. Better results may come from our acting from principles, procedures, or motives other than the basic utilitarian one. This last statement may sound paradoxical, but the utilitarian standard itself determines in what circumstances we should employ that standard as our direct guide to acting. The proper criterion for assessing actions is one matter; in what ways we should deliberate, reason, or otherwise decide what to do (so as to meet that criterion as best we can) is another issue altogether.

Utilitarians will naturally want to guide their lives, make decisions, and base their actions on those principles, motives, and habits that produce the best results over the long run. Which principles, motives, and habits these are is a contingent matter, but utilitarians believe that we often do best to focus on the welfare of those relatively few people with whom our lives are intertwined and whose good we can directly affect, rather than on happiness in general. Nor should we forget that our own happiness is also part of the general good; indeed, it will usually be the part that we have the greatest power to affect, one way or another.

Rule Utilitarianism

Although utilitarianism rests on one fundamental principle, it also stresses the importance of following rules, guidelines, or secondary principles that can generally be relied on to produce good results. We should, for instance, make it an instinctive practice to tell the truth and keep our promises, except in very unusual circumstances, because doing so produces better results than does case-by-case calculation. As previously mentioned, relying on such secondary rules counteracts the fact that we can easily err in estimating the value and likelihood of particular results. In general and over the long haul, we are less likely to go wrong and more likely to promote good by cleaving to well-established, welfare-promoting rules—including those rules that identify certain individual rights—than by trying to maximize happiness in each and every action we perform. Moreover, when secondary rules are well known and generally followed, people know what others are going to do in routine and easily recognizable situations, and they can rely on this knowledge when acting. This improves social coordination and makes society more stable and secure.

These considerations have led some utilitarians to adopt a theory called *rule utilitarianism.* It maintains that the utilitarian standard should not be applied to individual actions at all but only to society's moral code as a whole. The rule utilitarian asks what moral code (i.e., what set of rules) a society should adopt so as to maximize well-being in the long run. The principles that make up that code then provide the basis for distinguishing right actions from wrong. An action is not necessarily wrong if it fails to maximize well-being; it is wrong only if it conflicts with the optimal moral code. What is the optimal code for a society to adopt? Rule utilitarians believe that it will not be a one-rule code, commanding us always to bring about as much happiness as we can. Rather, more happiness will come from people following a pluralistic moral code, one with a number of principles of different moral weight.

Utility

Utility is a term of art employed by philosophers and social scientists to denote what is of value to or what is good for human beings (or, sometimes, sentient beings, more generally). "Utility" is synonymous with "welfare" and "well-being," so to speak of the utility of decisions, actions, or policies is to refer to their impact on the welfare or well-being of people. The specific meaning of the term differs widely, since the notion of human welfare is contentious. Economists, for the most part, share a common understanding of utility, meaning by the term the satisfaction of desires and preferences through the use or consumption of commodities (goods and services). So the terms *utility, welfare, and satisfaction* tend to be used interchangeably in economics. Economists often assume that utility can be represented in monetary terms. While economists usually identify utility with material well-being, philosophers typically have in mind a broader notion of well-being—where material well-being is one part of this broader notion. In the first instance, "utility" refers to individual welfare, but it is also often used to refer to social welfare.

Proponents of the market system see it as a powerful mechanism for promoting utility. In a competitive market system, consumers aim to maximize their own personal utility by purchasing the commodities they want at the lowest prices available. Firms, aiming to maximize their own utility, will produce and sell the commodities that consumers want at the lowest possible prices for fear that consumers will make their purchases from competitors. To produce and sell commodities at the lowest prices possible, firms must employ the most efficient processes and make optimal use of resources. The market system, then, guarantees that firms are producing those goods and services that consumers want in the most efficient way possible and selling them for the lowest prices possible. Hence, the market system maximizes the economic utility of society in general. This line of analysis, developed in *The Wealth of Nations* of 1776 by the classical economist Adam Smith (1723–1790), calls attention to the link between the pursuit of personal utility and the pursuit of social utility. To the extent that individual consumers and firms aim first and foremost to maximize their own personal utility, their behavior can be characterized as egoistic. But competition and market forces ensure that this egoistic behavior inevitably maximizes social utility. The participants in a market economy are led by an "invisible hand," to use Smith's phrase, to promote a goal (the maximization of social utility) that they do not intend to pursue in the first instance. Although this explanation and defense of the market's workings have been sharply challenged, they continue to exert a tremendous influence over many theorists' and practitioners' fundamental understanding of the market system.

A wide variety of contemporary business practices that aim to maximize utility for the firm have the added (intended or unintended) effect of promoting utility for society in general. Environmentally friendly practices, such as reducing packaging material and energy consumption and cutting the firm's production costs, make it more competitive. Society, in general, benefits not only from lower-priced goods but also from the reduced need for waste disposal and from the conservation of natural resources. Practices intended to improve the quality of employees' lives—both in and out of the workplace—also advance the well-being of the firm and society at large. For example, a firm that makes wellness programs available to its employees sees increased productivity as employees take fewer sick days. The firm also avoids the high costs associated with the more serious health care problems that wellness programs help avert. Society as a whole benefits from these programs to the extent that they encourage the more efficient use of health care resources and health in general. Finally, practices involving community investment, philanthropy, and volunteerism also promote utility for both the firm and society at large. For example, a firm that invests in the cultural and educational institutions in its local community benefits by being able to recruit new employees to a thriving community, and the community as a whole obviously benefits when these institutions are flourishing. A concrete example of strategic philanthropy is a computer manufacturer that donates its products to schools. The firm promotes future sales by introducing students to its products early on, and in doing this, it provides significant educational resources to the community. All these business practices improve the reputation of the firm in the eyes of its various stakeholders, and the firm profits from the loyalty and goodwill of these constituencies.

Certain normative views see utility as *the* basic moral concept. This is the case with ethical egoism and utilitarianism. Both these consequentialist views see morality fundamentally as a matter of maximizing utility, though the two views disagree about *whose* utility ought to be maximized. According to ethical egoism, one ought to maximize one's own utility, and, according to utilitarianism, one ought to maximize the utility of all people (or, sometimes, all sentient beings). The moral status (rightness or wrongness) of decisions, actions, and policies is, on these views, exclusively a function of their effect on utility. But concerns about utility are often present in nonconsequentialist views as well, and most plausible deontological approaches recognize a moral duty to promote utility even while denying that morality is *essentially* a matter of maximizing utility.

The notion of utility played an important role in the development of modern microeconomics. Modern value theory considers prices to be determined simultaneously by factors on both the supply side (e.g., production costs) and the demand side. The development of "utility theory" in the 19th century made possible the analysis of consumer demand. Consumers' purchasing decisions (and, in turn, the effects of these decisions on prices) could be explained on the assumption that consumers are rational and will, therefore, purchase bundles of commodities that maximize their utility. The concept of utility was also important to the growth of welfare economics, providing a normative standard by which resource allocations and economic policies could be evaluated. The notion is also employed in development economics.

Utility is a foundational concept in the interdisciplinary fields of decision theory and game theory, which involve the formal (mathematical) study of rational decision making. Decision theory studies decision making in cases where an individual's choice neither affects nor is affected by the choices of others; game theory studies choices involving a strategic component—that is, cases where individuals' decisions do affect one another. The theory of expected utility associated with these fields is regarded by many as offering the most compelling account of practical reasoning available. This theory defines rational action as an action that maximizes expected utility.

Different Conceptions of Utility

This section reviews the main historical and contemporary approaches to understanding utility, identifying the main attractions and drawbacks of each approach.

Hedonism: A Mental-State Approach to Utility

Hedonism is the view that pleasure is the only thing that is good in and of itself and pain the only thing that is bad in and of itself. The most famous defender of this view in the ancient world was

Epicurus (ca. 341–270 BCE). Hedonism was revived in the modern period by Claude-Adrien Helvétius (1715–1771) and was advanced by the classical utilitarians—Jeremy Bentham (1748–1832), James Mill (1773–1836), John Stuart Mill (1806–1873), and Henry Sidgwick (1838–1900). (It should be noted, however, that several different approaches to utility are discernible in Mill's writings, and Sidgwick's account of utility as "desirable consciousness" suggests a hybrid of a hedonistic and desire-satisfaction approach, which is discussed in the following section.)

Hedonism is a *mental-state account* of welfare. According to such an account, an individual's welfare is exclusively a function of the quality of his or her mental states (conscious experiences). The hedonist maintains that an individual's welfare consists solely in his or her having pleasant experiences. (Note that hedonism implies that we can speak meaningfully about the welfare of sentient nonhuman beings.) Mental-state accounts of welfare other than hedonism are possible: These accounts would identify welfare with experiencing mental states other than, or in addition to, pleasure. Hedonism itself can be developed in different ways depending on how "pleasure" is understood. Some hedonists think of pleasure as a sensation that has an agreeable or pleasant quality ("feeling tone") to it and that all pleasures have this same quality. Other hedonists deny that there is any such homogeneous quality; there is, they argue, no feeling in common between, say, the pleasure of eating ice cream and the pleasure of reading a good book. These hedonists understand pleasures to be those sensations that one likes to have and that one wants to continue having just for their qualities as sensations.

Mental-state accounts of welfare are attractive because they straightforwardly reflect the very plausible idea that things have no value to us unless they enter into our conscious experience. (This idea is sometimes referred to as the "experience requirement.") Hedonism, more specifically, is attractive because introspection confirms that pleasure is good and pain is bad. But the stronger claim that pleasure and pain are the *only* things that are of value and disvalue to us has met with numerous objections. One of the most compelling objections to hedonism, and mental-state accounts of welfare more generally, was offered by Robert Nozick (1938–2002). He argued that if the only thing that matters to us is how our experiences feel "from the inside," as the hedonist contends, then we should willingly plug into an "experience machine" that is capable of producing in us any pleasurable experience that we desire. But the idea of plugging into such a machine is unattractive, Nozick claims, and this is because there are things in addition to our experiences that matter to us. It matters to us that we *actually do* certain things and that we *actually are* certain ways, not just that we have the experience of doing these things and being these ways. It matters to us that our experience is based on reality and not illusion. Those who share Nozick's intuition that a life spent plugged into an experience machine would lack something deeply valuable—despite the continuous stream of pleasurable mental states that one would experience—will reject hedonism and mental-state accounts of welfare more generally.

Desire (Preference) Satisfaction Theories

Today, the predominant approach to the idea of utility is to see it as the satisfaction of individual desires (or, as economists say, "preferences"). On this view, a person's welfare is a function of his getting what he wants. People often do desire pleasure, and to this extent the implications of desire-satisfaction and hedonistic theories converge; but people also sometimes forgo pleasure to satisfy other desires, and in these cases the theories diverge. While the satisfaction of any desire typically brings some pleasure, this feeling of satisfaction is not essential according to desire-satisfaction views: What is crucial is that the desired state of affairs has in fact been obtained.

This approach to utility is popular among philosophers and social scientists for various reasons. Because desire-satisfaction theories maintain that the welfare of a person is to be judged from his or her own point of view—that is, what is good for a person is the person's getting what *he or she* wants, not what *someone else* thinks is good for him or her—these theories are democratic, nonpaternalistic, and respect the diversity of individuals' wants. Desire-satisfaction theories also reflect a naturalistic (scientific) approach to value. On this view, values are not mysterious entities; they are the straightforward product of human desires, which are relatively easy to identify and measure. If we want to know what things are good, we can simply ask people what they desire. If we want to know how good a thing is, we can measure the intensity of people's desires by asking them to rank their preferences or by asking them what things they would be willing to trade to get something else. *Revealed preference theory,* developed by the economist Paul Samuelson (1915–), identifies consumers' preferences as they are revealed by purchasing habits.

Despite its widespread appeal, there are problems with treating welfare as desire-satisfaction. Economists tend to identify welfare with the satisfaction of an individual's *actual* desires, largely because they assume that people always have correct beliefs and seek to maximize their own self-interest. This assumption is dubious. A person's desires may be based on false beliefs, or they may be formed without an adequate understanding of relevant facts. Also, troublesome are "adaptive preferences" that are the product of one's social conditioning. For example, a woman living in a patriarchal society may limit her aspirations and desires, believing that it is unnatural for her to want the same sorts of things that her male counterparts do. While her actual (adapted) desires may be satisfied, her welfare may be poor nonetheless. For these reasons and others, it is natural to think that people will sometimes (perhaps often) actually want things that are in fact bad for them.

The most plausible desire-satisfaction theories, such as those offered by Richard Brandt (1910–1997) and James Griffin (1933–), define welfare in terms of *ideal* desires rather than actual ones. (Mill's appeal in *Utilitarianism* to the desires of competent judges to identify "higher" pleasures suggests an ideal-desire view.) On this approach, welfare is identified with the satisfaction of those desires that a person would hypothetically have under ideal conditions—that is, where the person is fully informed, wholly rational, and not subject to any problematic forms of psychological conditioning. While ideal-desire theories avoid many of the pitfalls of actual-desire theories, they also appear to undermine the very features of the desire-satisfaction approach that made it attractive in the first place. It is not clear how we are to know and measure individuals' hypothetical desires. Moreover, to the extent that ideal-desire theories encourage us to consider what people *should* want, rather than what they *actually do* want, this account risks slipping into an objective theory of welfare, which holds that certain things are valuable in themselves regardless of whether they are desired. What really seems to matter on ideal-desire theories is not simply that a person's desire is fulfilled but rather that what the person desires is itself good.

Objective Theories

Objective accounts of welfare maintain that there are certain human states and activities that are good or bad for us apart from any pleasure or pain that they may bring or whether they are (actually or hypothetically) desired. Things that are frequently regarded as objectively valuable include knowledge, physical and mental health, moral virtue, personal and social relationships, the development of one's talents, and the successful pursuit of one's personal projects. On this approach, a person's welfare is a function of his or her possessing these sorts of goods.

Objective accounts of welfare take several different forms, though they often have similar implications. *Objective List (Indexical) Theories,* such as those defended by G. E. Moore (1873–1958) and W. D. Ross (1877–1971), simply catalog goods that are thought to be components of welfare. *Perfectionist Theories* are teleological: They understand welfare as being constituted of those things that are necessary to perfect one's uniquely human nature. This is the approach of Aristotle (384–322 BCE), Thomas Aquinas (ca. 1224–1274), Friedrich Nietzsche (1844–1900), and, recently, Thomas Hurka (1952–). (Mill's chapter on individuality in *On Liberty* also suggests perfectionism.) *Primary (Basic) Goods Theories,* associated with John Rawls (1921–2002), are similar to perfectionist theories in so far as they too understand welfare as involving those things that are necessary to pursuing one's life plan; but, unlike perfectionist theories, they do not posit a unique human *telos*—that is, they do not presume that all rational humans should pursue *the same* life plan. Primary goods are those things that are necessary to achieve whatever rational ends different individuals may choose. Amartya Sen's (1933–) *Capability Approach* assesses individual welfare in terms of a person's capabilities. A capability is the capacity or potential to do or be something, or, as Sen puts it, to achieve certain "functionings." Sen recognizes strong conceptual connections between his approach and Aristotle's, and he acknowledges the important influence of Rawls. But he argues that the capability approach is more sensitive than other objective theories to individual circumstances, such as having physical disabilities, which can significantly affect welfare.

These objective approaches to welfare accord well with many of our commonsense beliefs about welfare. It makes sense to say that we are doing well when we are healthy, when our lives contain things like knowledge and love, when our projects are going well, and so forth. Many of the standard criticisms of subjective accounts of welfare straightforwardly reflect objectivist intuitions. Nozick's thought experiment shows that we want actually to possess and engage in those things that are regarded as objectively valuable, not just have the pleasant experiences associated with them. Furthermore, we tend to think that these are things that people should desire regardless of what they in fact do desire. Of course, subjectivists' intuitions run just as deep and in the opposite direction. They think that it is strange to insist that things have value even if they bring no enjoyment whatsoever and are not desired at all. If we remove these subjective elements, they maintain, what is left has no value.

Measuring Utility

This section considers two basic issues related to the measurement of utility. The first issue is whether utility can be measured cardinally or only ordinally. The second issue is whether interpersonal comparisons of utility are possible, in principle and in practice. These issues obviously have implications for both positive (explanatory) and normative theory: Can the notion of utility really serve the theoretical purposes credited to it? Different conceptions of utility imply different answers to these questions, and this must certainly be taken into account when considering which of these conceptions offers the best understanding of utility. (One could, of course, argue that there is no single "best" understanding of the notion and that different conceptions of utility are appropriate for different theoretical contexts.)

Cardinal and Ordinal Utility

Utility is said to be *cardinal* if it can be measured in terms of its magnitude—that is, if it can be measured on either an interval or ratio scale. Those who regard utility as being cardinal think that expressions such as "*A* produces four units of utility more than *B*" or "*A* produces twice as much utility as *B*" are meaningful. (Units of utility are referred to as *utils.*) Those who regard utility as being *ordinal* think that utility cannot be measured in terms of its magnitude, and, hence, these statements are meaningless. If utility is ordinal, then we can only say things like, "*A* is more valuable than *B,*" but this tells us nothing about the degree of *A*'s value relative to *B.*

Bentham thought that utility, understood in hedonistic terms, is cardinal, and he proposed the development of a "felicific calculus." He believed that all pleasures are intrinsically the same, and, hence, measurable on a single scale. The value of any given pleasure, he believed, can be quantified in terms of its intensity, duration, certainty of obtaining, nearness in time, fecundity, and purity. Bentham's view exercised considerable influence on economists' understanding of utility through the 19th century. Hedonism reached its apex in economics with the work of W. S. Jevons (1835–1882) and F. Y. Edgeworth (1845–1926). Edgeworth envisioned the development of a "hedonimeter" that would measure the pleasures actually experienced by people. (Units of utility, or utils, are commonly referred to as *hedons* within the context of hedonistic theories.) Edgeworth's explanation of consumer behavior assumed that utility is cardinally measurable. At any moment, a consumer has available to him or her all those bundles of goods whose cost does not exceed his or her income. Edgeworth assumed that the consumer could assign a numerical value to each bundle representing its utility (expressed in a *utility function*) and that the consumer would choose the bundle with the highest utility.

By the early 20th century, worries about the difficulty (if not impossibility) of quantifying subjective mental states led economists such as Vilfredo Pareto (1848–1923) and Irving Fisher (1867–1947) to question the assumption that utility must be cardinally measurable to explain consumer demand. Pareto showed that choices could be analyzed simply in terms of the consumer's ordering of (or indifference toward) different bundles of commodities. Thus, only an ordinal ranking of preferences is necessary to analyze consumer demand. This line of analysis was further developed by Eugen Slutsky (1880–1948), J. R. Hicks (1904–1989), and R. G. D. Allen (1906–1983). While Pareto established that cardinal utility is superfluous for economic theory, he did allow that it is useful for explanatory purposes to assume that utility is cardinally measurable, and this assumption continues to be employed as an explanatory device in most introductory-level microeconomics courses.

Interpersonal Comparisons of Utility

Different conceptions of utility have different implications for our ability to make interpersonal comparisons of welfare and, hence, to aggregate (or average, depending on one's approach) individual utilities. All subjective theories—mental-state theories and desire-satisfaction theories—face a common problem, namely, the inscrutability of other minds. If Bentham's claim that all pleasures are measurable on a single scale is true, then it is possible in principle to compare and aggregate individual utilities, as his utilitarianism requires. However, since we do not have direct access to the mental states of others, direct comparisons of individuals' utilities are not possible in practice. Bentham conceded as much in private, and Jevons was explicit on this point, though he did not refrain from comparing and aggregating individual utilities.

Our inability to know the content of other minds is a problem for desire-satisfaction theories, too, since we cannot directly know the strength of one another's desires. But desire-satisfaction theories face a more fundamental problem since they deny that there is an interpersonally valid scale in terms of which we can measure and compare one another's desires and preferences. As the economist Lionel Robbins (1898–1984) argued, because our individual preferences are wholly subjective, there is no way to compare the utility of two (or more) individuals. (Indeed, it is not even clear how to account for *intrapersonal* comparisons of utility across time on the desire-satisfaction approach, given that individuals' preferences change over time.) Robbins concluded, based on the positivist doctrine that all scientific claims must be empirically verifiable, that interpersonal comparisons of utility involve nonscientific ethical and political judgments that fall outside the scope of economics. This opinion dominated economic thought in the 20th century.

The works of Pareto and Robbins invited the development of a new approach to welfare economics. The so-called *old* welfare economics constructed by Alfred Marshall (1842–1924) and his student A. C. Pigou (1877–1959) assumed that utility is cardinal, that interpersonal comparisons of utility are possible, and, hence, that a social welfare function can be constructed simply by summing individual utilities. (Marshall and Pigou measured social welfare in terms of the national dividend or aggregate income.) Marshall and Pigou did not do much by way of elucidating or justifying these foundational assumptions, which were rejected by the proponents of "new" welfare economics. This approach is based on the work of Pareto, Hicks, and Nicholas Kaldor (1908–1986). The dismissal of cardinal utility implied that the traditional understanding of social welfare is untenable: If individual utility is not measurable, then social welfare simply cannot be a function of adding together or averaging the utilities of different individuals. Pareto introduced a purely ordinal criterion for ordering social decisions that did not require interpersonal comparisons of utility. A state of the world S_1 is *Pareto superior* to another state S_2 just in case no one prefers S_2 to S_1 and at least one person prefers S_1 to S_2. In other words, S_1 is Pareto superior to S_2 if and only if no one is better off (in terms of preference satisfaction) in S_2 than in S_1 and at least one person is better off in S_1 than in S_2. A state of the world is *Pareto optimal* if there is no alternative state that is Pareto superior to it. Because most social and economic policy changes benefit some at the expense of others, Pareto superiority is very rarely satisfied in reality. This fact led to the introduction of less restrictive criteria of evaluation, the most famous of which is the Kaldor-Hicks criterion: A state of the world S_1 is *Kaldor-Hicks superior* to another state S_2 just in case those who are made better off in going from S_1 to S_2 could hypothetically compensate those who are made worse off in such a way that, were compensation actually to occur, S_1 would be Pareto superior to S_2. The Kaldor-Hicks criterion (sometimes called the Potential Pareto Test) allows us to consider whether a change from one policy to another that produces winners *and* losers will increase overall utility, but the Kaldor-Hicks criterion yields intransitive rankings (S_1 may be a Kaldor-Hicks improvement over S_2, and S_2 may be an improvement over S_3, yet S_1 may not be an improvement over S_3). Hence, the Kaldor-Hicks criterion cannot be employed to judge the utilitarian merits of alternative social and economic policies. Moreover, because the Kaldor-Hicks criterion considers only the absolute level of utility and wholly disregards how utility is distributed, the fact that S_1 is an improvement over S_2 does not entail that the move from S_1 to S_2 is morally desirable.

If welfare economics remains tenable without interpersonal comparisons of utility, utilitarianism does not. Its application requires such comparisons—as does any moral theory requiring comparisons of persons' welfare. Most contemporary utilitarians believe that the economists and philosophers influenced by logical positivism have greatly exaggerated the difficulties of making interpersonal comparisons of utility. They argue that although we do not have *direct* insight into other minds, we do nonetheless have very reliable *indirect* evidence about the mental states and desires of others. Recent developments in neuroscience encourage some to believe that the objective measurement and comparison of mental states may one day be possible. Edgeworth's hedonimeter may be realized yet. Some utilitarians have argued, contrary to Robbins, that we actually can generate meaningful interpersonal comparisons based solely on preferences. John Harsanyi (1920–2000), for example, argues that we can derive interpersonal comparisons from "extended preferences" expressed in judgments of the form: "I would prefer to be in person *P*'s state rather than in person *Q*'s state." Other utilitarians, such as David Brink (1958–), adopt an objective understanding of utility that avoids the problems associated with subjective approaches altogether. Indeed, this is one of the main attractions of objective conceptions of welfare.

Once a list of objective values or primary goods is articulated, we can simply compare the extent to which two (or more) individuals realize these values or possess these goods. However, it is very difficult to see how these objective values are to be combined so as to yield an indicator of overall welfare. This is because these objective values are incommensurable—they are good in different ways and for different reasons. Jack has more knowledge than Jill, but Jill has deeper and more meaningful personal relationships. Who is better off overall?

Related Topics

The first part of this final section introduces the distinction between total and marginal utility and explains how this distinction has been used in positive and normative theory. The second part introduces the notion of expected utility and the theory of practical reasoning based on that concept.

Total and Marginal Utility

In *The Wealth of Nations,* Adam Smith observed that, although water is essential to life and diamonds are not, the market value of diamonds is far greater than the market value of water. This apparent inconsistency, known as the paradox of value or the water-diamond paradox, was eventually resolved by distinguishing between total and marginal utility. *Total utility* refers to the aggregate sum of utility that an individual obtains from consuming a given amount of a commodity. *Marginal* (or *incremental*) *utility* refers to the additional amount of utility that an individual derives from consuming an additional unit of a commodity. The *law of diminishing marginal utility* states that marginal utility decreases with each additional unit of a commodity that is consumed—that is, each additional unit that is consumed produces less utility than the last. These ideas are illustrated in Table 1, which shows the total and marginal utility that a hypothetical consumer might derive from drinking various amounts of coffee on any given morning.

The development of these ideas in the late 19th century by Jevons, Carl Menger (1840–1921), and Léon Walras (1834–1910) initiated the "marginal revolution" that gave rise to neoclassical economics. Marginalism provided a simple explanation of the law of demand that entails that the demand curve will have a negative slope. Because each additional unit of a commodity produces less utility than the preceding unit, a consumer will pay less for a commodity as its quantity increases. The law of demand, then, is a straightforward implication of the law of diminishing marginal utility. Marginalism also provided a simple resolution of the paradox of value. While water undoubtedly has a higher total utility than diamonds, the relevant comparison is between the marginal utility of water and the marginal utility of diamonds. Since the marginal utility of scarce goods is higher than the marginal utility of abundant goods, consumers are willing to pay higher prices for scarce goods like diamonds than they are for abundant goods like water.

Marginalism also yielded important moral conclusions regarding the distribution of wealth and resources. Pigou argued that, ceteris paribus, a more equal income distribution will increase overall social welfare. This is because the law of diminishing marginal utility implies that additional income will produce more utility for a poor person than for a rich person. (Note how this argument employs interpersonal utility comparisons.) Pigou concluded that progressive income taxation improves social welfare, so long as this redistributive policy does not reduce aggregate income by decreasing incentives to work or save. Brandt, Peter Singer (1946–), and many other utilitarian philosophers have employed similar reasoning to show that utilitarianism supports egalitarian distributions.

Table 1 Total and Marginal Utility

Cups of Coffee Consumed per Morning	*Marginal Utility*	*Total Utility*
0	0	0
1	75	75
2	50	125
3	10	135
4	0	135
5	−15	120

Expected Utility Theory

Expected utility theory studies choices in situations where the decision maker is not certain what the actual outcome of alternative courses of action will be. On this theory, the rational decision maker will maximize *expected utility,* where the expected utility of an action is determined by measuring the utility of each possible outcome of the action, multiplying the utility of each possible outcome by the probability that the outcome will occur, and then summing together the results for all possible outcomes. A simple example involving a lottery illustrates the idea. Suppose that you are considering whether or not to buy a lottery ticket that costs \$5. The payoff in the lottery is \$1 million, and the probability of winning is .00001. There are two possible outcomes if you buy a ticket: Either you will win and collect \$1 million, or you will lose and be out \$5. The expected utility of buying a lottery ticket then is

$$(1{,}000{,}000 \times .00001) + (-5 \times .99999) = 5.00005.$$

Since it is certain that you will not win or lose anything if you do not buy a ticket, the expected utility of not buying a ticket is

$$(0 \times 1) = 0.$$

Because the expected utility of buying a ticket (5.00005) is greater than the expected utility of not buying a ticket (0), it is rational for you to buy the ticket, despite the likelihood of your losing.

The notion of expected utility was introduced by Daniel Bernoulli (1700–1782), who was also one of the first to postulate the law of diminishing marginal utility. However, expected utility theory was not developed in a systematic fashion until the mid-20th century. The approach developed by John von Neumann (1903–1957) and Oskar Morgenstern (1902–1977) applied to decisions made under conditions of "risk"—that is, in situations like our lottery case where the probabilities of the various outcomes occurring are known. Leonard Savage (1917–1971), drawing from ideas developed by Frank Ramsey (1903–1930), extended the scope of expected utility theory by applying it to decisions made under conditions of "uncertainty"—that is, in situations where the probabilities of various outcomes occurring are completely unknown and therefore based on the decision maker's subjective judgment. Today, expected utility theory is employed for both positive and normative purposes. Many utilitarians now understand the theory to require the maximization of expected utility as opposed to actual utility.

Although expected utility theory offers a powerful account of practical reasoning, the theory has been contested. Some have challenged the theory's fundamental assumption that rational action aims to *maximize* utility. For example, Herbert Simon (1916–2001) has argued that it is often rational to engage in "satisficing" behavior—that is, to pursue a course of action that achieves a satisfactory, but less than maximal, result, and Rawls has defended the rationality of employing a "maximin" strategy—choosing the action or policy that maximizes the minimum payoff—in some situations involving uncertainty.

Utility, Principle of

The principle of utility, also known as the greatest happiness principle, is associated with Jeremy Bentham (1748–1832), the first of the great 19th-century utilitarians. As Bentham and later John Stuart Mill (1806–1873) expounded it, the principle approves or disapproves of actions based on whether they increase or decrease the happiness of everyone affected by the action. The principle of utility constitutes the standard of right and wrong, in terms of which human conduct is to be assessed.

Bentham identified happiness and unhappiness with pleasure and pain, affirming the hedonistic doctrine that pleasure is the only thing that is good in itself. He cataloged different pleasures and pains and described their various sources and the factors influencing our experience of them. The value of any given pleasure or pain is a function of its intensity, duration, certainty, and "propinquity" (or nearness). We must also consider the likelihood that the pleasure (or pain) will be followed by other pleasures (or pains) of the same kind (its "fecundity") and not followed by sensations of the opposite kind (its "purity"). In this way, we can estimate, first, the goodness or badness of an action for any given individual and, then, by taking into account all individuals affected by the action, its overall goodness or badness.

Critics of Bentham have long characterized his theory as crude and lampooned the whole idea of a hedonic calculus by means of which the pleasures and pains of individuals are to be weighed and summed. Bentham, however, was concerned not only with sensory or bodily pleasures and pains, but also with various other forms of satisfaction, enjoyment, and fulfillment—for example, the pleasures of memory or religion and the pain of a bad reputation or of knowing that another is suffering. Still, Bentham held that all pleasures are intrinsically equal, famously remarking that if the amount of pleasure is the same, then the game of "push-pin" is of equal value with poetry. Bentham certainly thought that pleasures involving intellect, imagination, and deep human emotion are, as a rule, superior to simple physical pleasures. But this is because higher pleasures tend to be more pleasurable than lower ones.

Like Bentham, Mill associated happiness with pleasure, but he thought that one could compare and rank pleasures, not just quantitatively but also qualitatively. In other words, some kinds of pleasure are better than others, not because they are more pleasurable, but because they represent pleasures of a higher or more valuable kind. Thus, even though two activities involve equal amounts of pleasure as measured by Bentham, one of the pleasures might be qualitatively superior to the other. We know that one pleasure is qualitatively higher than another, Mill thought, if, putting aside the issue of intensity and duration, those who have experienced both judge the one to be preferable in kind to the other.

Applying the Principle

In applying the principle of utility, one must bear in mind that an action can have both good and bad effects. Accordingly, the principle tells us to choose that action the net outcome of which, taking into account all its consequences, both positive and negative, produces the greatest amount of pleasure. Although the principle of utility is sometimes identified with the slogan "the greatest happiness of the greatest number," this formulation can be misleading. Because actions affect people to different degrees, the action that makes the most people happy may not bring about the greatest happiness. The principle of utility tells us to add up the various pleasures and pains, however large or small, of the courses of action open to us and to select the one that results in the greatest net amount of happiness. Depending on the circumstances, this action may or may not bring happiness to more people than other actions would have.

The principle of utility is often interpreted as equivalent to act utilitarianism, which is the theory that an action is right if and only if it brings about at least as much happiness as any other action the agent could have performed at the time; otherwise, it is wrong. But it is debatable whether either Bentham or Mill subscribed to this view. Their formulations of the principle don't entail it, and it is doubtful that they would have judged a happiness-producing action to be morally wrong just because it failed to maximize happiness. Rather, they may have intended their principle to supply a standard for comparing actions along a continuum of better and worse.

Moreover, neither Bentham nor Mill restricted application of the principle of utility to individual actions. They and the other early utilitarians were social reformers who used the principle as the basis for assessing and criticizing the social, political, and legal institutions of their day. Bentham was particularly interested in penal and legal reform, and the early utilitarians sought to promote social and economic policies, such as free trade, that they saw as tending to bring the greatest benefit to society. In fact, many commentators believe that Bentham, in particular, intended the principle to apply primarily to legislation, administration, public policy, and institutional reform, and not to individual conduct. Mill, too, probably thought that in many contexts the primary focus of the principle of utility should be the rules, policies, or institutions that govern or set the framework in which, say, firms pursue profit or businesspeople act, rather than on the particular decisions they make.

In line with this, some commentators have argued that Bentham and Mill were rule utilitarians. Rule utilitarianism is the theory that the principle of utility should be used not to assess individual actions but rather to select the moral rules that individuals or a society should follow. But both men clearly wanted to apply the principle of utility, at least sometimes, to individual actions. Because of this, classifying them as rule utilitarians is problematic, too.

V

Value-Added Tax (VAT)

A value-added tax (VAT) is a sales tax levied at every step in a production process. The VAT is collected when goods or services are purchased throughout the production process, from the initial purchase of raw materials to the sale of the final product at a retail outlet. In some countries VAT is known as "goods and services" tax (GST).

Consumption Versus Saving

Individuals can do two things with their income: They can consume (spend) it, or they can save it. In an income-based tax system, both consumption and savings are taxed; in a consumption-based tax system, only consumption (income minus savings) is taxed. Consumption taxes are very popular with governments around the globe; the United States is the only developed nation without a broad-based consumption tax at the national level. Some tax reformers want to replace the current income-based tax system in the United States with a consumption-based tax system.

A consumption tax can be levied at either the individual level or the retail level. When it is levied at the individual level, taxpayers add up all income and subtract net savings (saving minus borrowing). The resulting figure is the consumption base on which a tax is levied. When a consumption tax is levied at the retail level, it takes the form of a sales tax or a VAT. A sales tax is collected from the ultimate consumers. A VAT is collected from sellers at each stage of production. Regardless of which level the tax is levied at, and regardless of the point of collection, the consumption tax is ultimately paid for by the consumers.

Consumption taxes can be direct or indirect. The "consumed income tax" is a direct consumption tax because it is levied at the individual level. Such taxes can be personalized through exemptions, deductions, and progressive rates. Both the national sales tax and the VAT are indirect consumption taxes because they are levied at the retail level. Such taxes cannot be personalized.

Methods of Calculation

Two basic methods have been established for computing the VAT: the credit method and the subtraction method. The credit method is used in the European community and Canada, while the subtraction method is used in Japan.

Under the credit-invoice method (the most widely used credit method), an invoice is issued for each sale. The amount of VAT included in the invoice price is separately stated at each stage of the production process, except at the final stage when the product is sold to the consumer. At the end of a designated period (monthly, quarterly, or yearly, depending on the country), the business pays the total tax shown on all sales invoices, reduced by the total tax shown on all purchases invoices. Under the subtraction method, a tax computation at the time of sale is not required. The tax is computed each period by subtracting total purchases from sales and applying the tax rate.

In its purest form, a VAT would be levied, under either of the above methods, on all goods and services at one standard rate. However, this has not been the case in most countries. When an item is exempt from the VAT, no tax is levied on that item. There may be several reasons for exempting an item. First, an item may be exempt to reduce the tax burden on lower-income individuals. For example, most VAT systems currently exempt necessities such as food, health care, and housing. Exemptions can also be granted if the cost of compliance is too high in relation to the revenues generated. Many countries exempt small businesses from the VAT for this reason. When a VAT system has several exemptions, the VAT computation can become quite complex for those businesses that deal in both exempt and nonexempt items.

Zero rating occurs when the rate applied to a particular good or service is zero. This is different from an exemption since the good or service is still included in the VAT system and computation but is taxed at a zero rate. A tax return must be filed for zero-rated items. Zero rating occurs throughout the production process. Multiple rates can be used to further reduce regressiveness of the tax. The VAT systems in some countries apply different rates on items such as candy, consumer electronics, furs, jewelry, advertising, entertainment, hotels, and other luxury goods and services. The political motive for multiple VAT rates is tax equity to mitigate the regressive pattern of the VAT, since poorer individuals often find a higher proportion of their income consumed by the VAT due to its regressiveness.

Under a VAT, exporters are able to obtain credits for the tax, since exports are exempt from this tax, thereby strengthening the competitiveness of exports. Tourists are eligible for rebates of VATs charged on purchases. However, since the tax is often included in the sticker price of the item, visitors may not even realize they are being charged a VAT. Furthermore, VAT claim rules differ from country to country, and claiming refunds can be difficult.

Since its introduction, the VAT has become an important source of budget revenue internationally, which has been a major factor in its success and popularity. The VAT's raw power to raise revenues has been cited as one reason the United States has thus far rejected it as part of tax reform, because of fear it could become a blank check for future tax increases, thus detracting from the need to cut spending.

VAT Evasion

Often, taxpayers are able to evade the VAT. Some of the most common methods for doing so are as follows:

- Understating sales, especially at the retail level and with services such as construction and consulting, where the self-enforcing properties of the VAT break down.
- Inflating claims for VAT paid on inputs.
- Claiming credit for tax paid on inputs used in producing goods that are exempt from the VAT. This is possible if a firm sells both exempt and nonexempt goods and services and can be difficult to detect, since it is not always possible to link specific inputs with specific outputs.
- Collection of VAT by a firm, which does not remit it to the proper authorities and then disappears.
- Claiming VAT credit for noncreditable purchases, such as a car used for nonbusiness purposes.
- Nonregistration for the VAT.
- Diverting zero-rated exports to the domestic market. Here, the producer obtains export papers, claims a refund, and then sells the goods locally.
- Claiming that the transaction is not a taxable event and that it is a gift rather than a sale or that there was an absence of consideration.

The increasing recognition of the difficulties involved in collecting the correct amount of VAT may explain the marked tendency for VATs to get simpler with time. With multiple-rate VAT systems comes the greater ease of fraud, and compliance costs rise as the tax forms become more complex and accounting records need to be more complete. Consequently, a higher average VAT rate is associated with lower compliance. Administrative expenditures by taxing authorities seeking enforcement have a clear effect on compliance.

Values, Personal

Personal values are those values that people adopt as principles that guide their life. They are values precisely because they are valuable to the person. The person freely chooses to give them "value" for guiding behaviors and actions in all aspects of his or her life, from family life to working and social life.

If, for instance, a person plays a sport such as tennis, his or her personal sports values will be reflected on the court. Something similar happens at home or at work. "Fair play," for instance, as a personal value, may be as important on the tennis court, at work, or with friends. The person, although having different dimensions, such as social, interpersonal, communicative, financial, or spiritual, is one and unique. Therefore, if an individual wants to be coherent and consistent with what he or she thinks, says, and does, the person must also show this coherence of values in all levels of life. In this way, the personal values should cover in a transverse way the different fields of personal conduct, from sports to professional life.

Personal values help the person at the moment of choosing, distinguishing the decisions, or actions to be undertaken. Personal values are determining factors when deciding whether to go in one direction or another. For instance, a person who decides not to join a company because it would involve certain dishonest actions has honesty as an action criterion and personal value when doing business. Joining such a company would contradict the individual's personal value.

Development and Cohesiveness of Values

Personal values are one of the points of cohesion between the different facets of the person. Just as cement is necessary to join one brick to another and build a solid building, personal values are the cement of our life. Without them, the personal building can be built but the risk of collapse is much greater.

Everyone has values, including those who deny having them. The denial of personal values—explicit or not—is also a choice. The person is free to be able to state: "I do not have personal values. I do not believe in them." Another very different question is that people are very aware of their personal values and put them into day-to-day practice. In fact, the important thing is that their personal values are shown in their actions, that the level of awareness of personal values is present in daily life. But it is also true that there are people who are not entirely aware of the relevance of personal values.

All effort directed toward placing emphasis on the discovery, development, and consolidation of personal values is not in vain. In this respect, childhood and adolescence are key stages of development in the formation of personal values, particularly through the family and school, although other social factors may be crucial in this formation. Personal values are present, in one way or another, in a person's actions and behaviors. In other words, people show certain values through their actions or omissions of what they do or do not do, and always from the freedom inherent to everyone. It is in this way, through the actions or omissions that are freely chosen, that people build their personal values. What people indeed do indicates what their personal values are. The actions, freely chosen, gradually build them as people.

The personal values that people choose, materialized in actions, have consequences not only for the more immediate environment of the person but also for the person. Personal values, if they are more than just good intentions and are indeed embodied in the person, make the person. Therefore, personal values become significant in that they are materialized in our daily work and life. The person is closely tied to personal values. In the heart of the person we find the values that give sense to the person. Therefore, personal values are also tied to the sense that the person wants to give to his or her life and aims. It is like this because personal values guide the behavior and actions of the person. We must not forget that sense is also orientation and direction.

Deep down is the desire of each person to lead a full life. Personal values help the person to live life to the fullest, with sense, and according to the aims that he or she pursues. The daily fulfillment of these will give the person a calm spirit due to the coherence between his or her personal values and actions to be undertaken and, when faced with adversities, the necessary calmness to face difficulties that may arise.

Personal values are essential elements that a person uses to act with a certain amount of coherence in the different areas of life. For instance, if one has loyalty as a personal value, it will be carried over to the personal, social, and professional areas, by being loyal to one's wife, friends, or work team. If one acts in this way, coherently, with this value that is freely chosen, one will be able to walk with one's head held high.

Values and Decision Making

In the course of any day, people make a series of decisions, although some of these are "automatic" and others very well prepared. People are constantly choosing and deciding: what clothes to wear for the day, which route to take to work, to have a cup of tea or coffee, with or without milk. Each of these decisions requires a different set of assessments, such as whether to drink coffee for its taste or not drink it for health reasons. A person could say, "I like having a coffee very much, but it makes me feel terrible." In this situation, the person chooses between "taste" and "health." The option may appear to be simple, but without doubt the actual choice will be unique to each person. The person decides at that moment whether to drink coffee or not.

Different people choose different options in similar circumstances. The range of possibilities is very high but in the coffee example there are two clear facts: First, the person likes coffee a lot; second, drinking coffee has a negative effect on the person's body. Which option should the person choose? Personal values help the person make the decision. If the personal value is health, the option is clear: Do not drink coffee. If the personal value is taste, it is also clear: Drink coffee. But this decision might not be reached in every circumstance. If someone strongly values preserving his or her health, in 99% of circumstances the person will not drink coffee. In 1% of cases, the person might choose to drink coffee because of its taste or a specific social circumstance. This 1% could increase according to the person. This decision varies a great deal from one person to another.

Drinking coffee or not does not appear to be an excessively important daily decision. The complexity of making the decision would clearly increase if a more important decision had to be made. The assessments made would be very different as would the personal values. What appears to be beyond all doubt is that throughout a day many decisions are made of varied relevance for the person and his or her more immediate environment. Considering the personal values associated with each step, until reaching the final decision, can be very beneficial to the person.

Values and Behavior

The decisions that a person makes gradually shape the person's behavior. The decisions embodied in actions make the person. In other words, they have consequences in the person as well as in people that are affected by the decision. There is a close connection between values and behavior. Behavior is a reflection of how a person positions himself or herself with regard to certain situations in life. It indicates the habitual way the person has of behaving. Therefore, actions allow one to reveal a person's values. Personal values are very tied to the conduct of the person, to how the person really acts. If, for instance, a person is said to be "committed" to his or her work, it refers to a series of values of that person concerning devotion, dedication, motivation, and enthusiasm with regard to the work performed.

Values and Character

Personal values, on the one hand, result in specific attitudes, frames of mind that people show in the face of life events and circumstances in which they are involved. On the other hand, personal values are explicit manifestations of a person's character. The values that each person consolidates throughout life are forged in the background of his or her character. Character, in its Greek etymology, means mark or stamp. Personal values, attitude, and character are three decisive pillars in the configuration of the behavior of a person. For instance, a person exploring processes of personal improvement must first systematically examine his or her habitual behavior. The person can examine and assess this behavior himself or herself or with the help of a trustworthy person who can suggest ways to improve. In the case of companies, managers usually turn to highly qualified consultants to introduce processes of improvement in the performance of professionals.

Any person who thinks that in life one has to try to grow both personally and professionally has to pay a lot of attention to personal values because they can be an excellent way to constantly improve behavior, attitudes, and habits. A change in habits may help to modify, in part, the character of the person. New habits may produce improvements in all areas of the person's behavior.

Company Values

At present, there are many companies that, through different documents, make their company values public. Companies can express their values through several methods. We find them in statements of mission and beliefs, in manifestos of values, in codes of conduct, in "who we are." But strictly speaking, only people have values. Company values only exist through the people of that company. It is the people of the company that make the values of that company a reality or not.

Company values are rooted in the culture of the company. The etymology of the word *culture*, in its Latin origin, also means "care" or "cultivation." "Care" refers to prudence, the tact with which certain actions are carried out or specific decisions are made. "Cultivation" refers to growth and development, making an effort and taking the necessary care so that the tasks or projects at hand go ahead and bear fruit. In the selection process, companies tend to hire people who best fit their values. It also happens the other way round. Good professionals try to work for those companies that best fit their personal values.

Aligning company values with personal values can help people develop more fully within the company. If personal values contradict company values, a conflict of interests between the person and the company can easily occur. It is complicated for a person to work for a company where his or her personal values contradict the company's values. Similarly, companies tend not to hire people whose values differ substantially from the values of the company. Essentially, personal values help a person find balance in all aspects of his or her life, including both work and professional life.

Vatican Bank

The official name of the Vatican bank is the Istituto per le Opere di Religione (I.O.R.), or the Institute for Religious Works. It has been called one of the most secretive financial institutions in the world. The bank is known to manage contributions such as the annual worldwide Peter's Pence collection, used for religious, humanitarian, and social development work, and to support activities of the Holy See, the central administration governing the Roman Catholic Church. The bank also manages funds entrusted to it by religious orders and individuals associated with the Vatican. The nature and extent of its holdings and specific transactions, however, are not disclosed.

In contrast to this lack of official information, the bank often found itself the subject of unflattering publicity under its former president, Archbishop Paul C. Marcinkus, who headed the bank from 1971 to 1989. A native of Cicero, Illinois, he was one of the highest-ranking Americans in the Vatican, serving Popes John XXIII, Paul VI, John Paul I, and John Paul II. Initially charged with papal travel arrangements and security, he was appointed to head the Vatican bank despite a lack of financial experience.

In the mid-1970s, an Italian banking scandal linked the bank with Sicilian financier Michele Sindona. Sindona had advised the Holy See and Marcinkus on handling assets and investments. When Sindona's financial empire collapsed, the Vatican experienced losses estimated to be in the tens of millions of dollars. Sindona later died in a Milan prison after his coffee was laced with cyanide.

The next decade brought another scandal, more Vatican losses, and the death of another former financial adviser. Italy's largest investment bank, Banco Ambrosiano, failed in 1982. At the time, the Vatican bank owned a share in the bank and partnered in many deals with its president, Roberto Calvi. The Vatican denied any wrongdoing but agreed to pay $244 million to creditors of Banco Ambrosiano as recognition of moral involvement in the collapse. Archbishop

Marcinkus avoided arrest and standing trial by claiming diplomatic immunity, with which the Italian high court concurred. Calvi was found hanged in London under mysterious circumstances in 1982. At first ruled a suicide, five people went on trial in 2006 charged with his alleged murder.

Marcinkus was also mentioned in a controversy involving the Vatican and millions in Nazi gold purportedly laundered from Germany after World War II. A U.S. State department report implicated the Vatican in the scheme, and investigators tried to question Marcinkus, who again successfully claimed diplomatic immunity. The issue was recently revived in a lawsuit filed against the Vatican bank by Holocaust survivors claiming the bank profited from assets seized by Nazi leaders from prisoners in World War II prison camps. The bank claimed the matter was outside the jurisdiction of federal courts because it involved foreign policy issues. In January 2006, the U.S. Supreme Court allowed the lawsuit to proceed.

Marcinkus served as governor of Vatican City for a year after he left the bank presidency in 1989. He then retired to Arizona, where he died on February 20, 2006. After Marcinkus retired, the Vatican turned over management of the bank to a board of lay financial experts (i.e., not priests or members of a religious order). The finances of both the bank and Vatican City are now overseen by an economic commission of 15 cardinals.

Veblen, Thorstein (1857–1929)

Thorstein Bunde Veblen, the son of Norwegian immigrants, was an iconoclastic economist, sociologist, historian, and philosopher whose astute analysis and biting satire on the tide of business enterprise in the latter part of the 19th century and early 20th century has endured to this day. He coined terms such as *conspicuous consumption* and *vested interests*, which remain in the popular lexicon. His fundamental insight was that the "state of the industrial arts" (technology) was a dynamic force in societal change that was often retarded by what he termed *imbecile institutions*. In making this dichotomy between technology and institutions, Veblen was not merely a one-sided technological determinist. Instead, he pointed out that in modern capitalist economies, there is often a conflict between making money and making goods. Where Adam Smith described humans' propensity to truck, barter, and exchange, Veblen spoke of the instincts of workmanship and salesmanship. This dichotomy was carried through in his analysis of the "serviceablility" or intrinsically useful characteristics of goods versus the component of "waste" or merely how they were outward displays of status in society.

Veblen delighted in pointing out what he termed *the barbarian origins of modern society*. The Vikings conquered through war and theft, and Veblen saw elements of this in modern society. Unlike Marx, he did not see the conflict between the workers and capitalists to be the essence of capitalism; rather, a race for reputability on the basis of invidious comparison was, for him, a driving force in the evolution of a modern business economy. If there was an ultimate goal for workers, Veblen would say it was not to own the means of production but rather to achieve a level of leisure enjoyed by only a few. This conflict was played out in a society where the technological potential to produce goods was hamstrung by the demands of business enterprise that goods be sold profitably.

Veblen had a checkered academic career. After graduating from Carleton College, he began graduate school at Johns Hopkins, but then switched to Yale for a doctorate in philosophy. Failing to find an academic appointment, he enrolled at Cornell but then went with J. Laurence Laughlin to the new University of Chicago, where he became an instructor and an editor of the *Journal of Political Economy.* After periods at Stanford and the University of Missouri, his last job was at the New School for Social Research. He never rose above the rank of assistant professor. Veblen spent time as an editor of the liberal periodical *The Dial* and worked for the Food Administration during World War I. While there, he suggested that prosecution of the Industrial Workers of the World, a radical labor union, cease to help with food harvesting. This suggestion was not well received by the vested interests.

Veblen's most famous work was *The Theory of the Leisure Class*. In this work, he discussed things such as dress as an expression of the pecuniary culture, pecuniary canons of taste, devout observances, and higher learning. His second book, *The Theory of Business Enterprise*, was more to the point in the analysis of modern-day capitalism. In this book, he analyzed the role of loan credit in the boom-bust cycle of the economy.

Veblen's fundamental criticism of orthodox economics was that it was pre-Darwinian and hence did not have an evolutionary view of society. Understanding the evolution of institutions and the dynamic role of technological change (in its broadest sense) was essential in making economics evolutionary. Veblen's influence remains today in the economics profession through the Association for Evolutionary Economics, founded by some of his followers in 1967.

Vice

A vice is a serious moral flaw in a person's character. Thus, vices are not trivial personal failings, or minor personality defects, or occasional lapses in behavior, but enduring traits that cause people repeatedly to act in morally deplorable ways. Examples of vice include intemperance, ungratefulness, dishonesty, cowardice, disloyalty, greed, unfairness, and malice.

Yet if vices are serious flaws, and so, one would think, to be avoided if at all possible, why does vice seem so common? One possibility is that vice is a part of human nature. We are, regrettably, morally flawed beings, and though we may resist, in the end vice is an inevitable part of human behavior. It is just a part of who we are.

Although this possibility has the apparent advantage of explaining the prevalence of vice, it suffers from the disadvantage of having no ready account of the presence of virtue. Vice may be common, but so is moral virtue. We often see acts of kindness, courage, generosity, and so on, and for the most part such acts do not require resistance to an underlying tendency toward vice but are instead undertaken willingly, as expressions of the true character of the person who does them. Should we say, then, that both vice and virtue are parts of human nature?

At first glance this may seem right. Were it not, vice and virtue in human behavior would be something of a mystery. On closer inspection, however, it is an empty explanation. It tells us nothing about why some people are virtuous and others vicious, or about how these traits arise from some alleged underlying common human nature, or about how some people are able to change their vices to virtues while others fail. For a better explanation we need to turn to Aristotle, who gave one of the first, and one of the best, accounts of vice and virtue.

Vice as a Lack of Knowledge

Aristotle discussed vice in the context of his lengthy analysis of virtue. Briefly, Aristotle argued that virtue is developed through proper education and practice. For example, people learn to be honest by being taught to behave honestly and by imitating the behavior of honest people. Thus, for Aristotle, a person with vices was uneducated, or had received an incomplete education, in morally correct behavior. Hence, vice is a form of ignorance, and people with vices act as they do because they know no better.

People ignorant of virtue, and so susceptible to vice, do not have a kind of practical knowledge that shows itself in two ways. First, a person might not know how to behave in morally fitting ways in specific contexts. Thus, the person lacks the moral virtue appropriate for that context. Second, and more generally, a person might not know how to read contexts and pick the right behavior for each context. Using Aristotelian terminology, the person in the second case lacks a specific intellectual virtue that is a precondition for the exercise of moral virtues—*phronesis*, or practical wisdom. *Phronesis* is akin to "good sense."

As an example of the first kind of ignorance, consider a situation that requires courageous behavior. Suppose that acting courageously implies understanding the true extent of danger in the situation, having a degree of fear that is appropriate to that danger, and acting to achieve a goal in a way that fully recognizes the danger present and the fear the person feels. Aristotle argued that related to the virtue of courage are two vices: rashness and cowardice. The rash person underestimates the danger present and so has too little fear. Consequently, he tends to be overconfident and to overreact, to go beyond what is prudent or reasonable in the circumstances. The coward overestimates the danger and so has too much fear. Hence, he lacks confidence and does not do enough to accomplish the goal. What the rash person and the coward have in common is inadequate or incomplete knowledge. Neither of them knows the real extent of danger, so neither feels the appropriate amount of fear. Thus, unlike the courageous person, neither of them responds correctly.

Aristotle repeats this kind of analysis for other virtues and the vices associated with virtues. In each case, virtue is displayed by the person who acts optimally in a particular context, given what the context is about and what it requires as a response. Responses that deviate from the optimal point are instances of vice that display excess (e.g., too much fear) or deficiency (e.g., too little fear) relative to the right and virtuous response in a particular context. In each case, virtue depends on knowledge of the situation, while vice demonstrates a lack of knowledge.

In the second kind of ignorance—an absence of what Aristotle called *phronesis*—a person lacks virtue if he does not understand what the situation is about and what it demands. In this case, the person gets neither the situation nor the response right. Someone like this displays a more fundamental want of knowledge. Not only can he not ascertain, for example, the right amount of fear; he cannot even figure out that this is an instance in which fear is the determining variable and courage the correct response. A person without this kind of knowledge might think that the situation requires benevolence, or magnanimity, or trust, or some other virtue, or the person might simply have no idea whatsoever of what the situation is about and what it might require of him.

People lacking *phronesis* are cognitively deficient in a specific way, either by nature or by nurture. If by nature, they are the type of persons who accumulate experiences but somehow do not acquire the knowledge and insight usually associated with experience. Thus, they may never develop practical wisdom. On the other hand, if it is by nurture, the cognitive deficiency indicates that they have received no training or that they have received training that was incomplete or ineffective.

It must be noted that even though, analytically speaking, *phronesis* is a precondition to the exercise of the moral virtues, functionally speaking, the intellectual virtue of *phronesis* and the moral virtues together form a unity whose function and development is dialectically linked. Each occurs with the other, and one cannot occur without the other.

Vice and Weakness of Will

A problem with Aristotle's understanding of vice and virtue, one he discussed himself, is that even if education is necessary for virtue, it is not always sufficient. People educated in virtue can still fail to act virtuously because, to put it simply, knowing what is virtuous does not automatically lead to virtuous behavior. There are big gaps between (1) knowing that x is the virtuous thing to do, (2) knowing how to do x, and (3) doing x. With regard to virtue, it is the kind of gap that occurs when one says to oneself or others, "I know what I should do. I know how to do it. I just do not seem to be able to do it."

Aristotle argued that not doing the virtuous thing when one knows the virtuous thing to do is not quite the same as vice because vice implies ignorance of virtue. Instead, the difficulty is a failure of will—a weakness of will. Fundamentally, it boils down to the fact that the rational will—the wish to do good—is weaker than some desire arising independently of reason. Persons exhibiting this behavior are of one mind but not of one heart. What they lack is self-mastery over their nonrationally generated desires—the capacity to make their rational willing sovereign over all other willing. They may behave in ways that are indistinguishable from those with genuine vices, but the source of their conduct is a weak will, not ignorance.

Here again the problem is due to nature or nurture. By nature, some people might have too strong nonrational desires or too weak a rational will to ever be able to achieve rational self-mastery and, consequently, harmony within themselves. Thus, they are doomed to be conflicted slaves of their nonrational desires. Other people might be able to achieve considerably higher levels of rational self-mastery and inner harmony through self-discipline and training. And some people, by nature, have an extremely strong rational will and thus require little or no training in self-mastery. Most people, however, lie somewhere between the unfortunate slave of his or her appetites and the natural master of himself or herself.

Vice as a Perversion of Knowledge

A different sort of vice is exhibited by people who know what is virtuous, know how to do it, could do it, but nonetheless deliberately choose not to do it. This is the vice of malevolence, or even evil: a conscious, rational, well-orchestrated effort at doing bad. In its most extreme form, malevolence itself becomes the ultimate goal for these people. They have deep insight into the psychological and moral dimensions of the human condition and a high degree of self-mastery, but they invest all that knowledge and power of rational will in a project of immoral behavior, in an attempt to instantiate a complete inversion of the moral universe. In literature, Milton's Satan is a prime example of this kind of vice, but long and bitter human experience shows that there are real people with vices so similar to Satan's that the differences hardly matter.

Vice as Emotional Deficiency

Last, two other vices worth exploring are brutishness and cruelty. These vices are characterized not so much by a lack of knowledge as by a lack of appropriate emotions, or a distortion of appropriate emotions.

Brutishness is an absence of sympathy, a lack of consciousness of other people as creatures of feeling, and a lack of access to their feelings. This lack of feeling for others is an emotional inadequacy, a moral dullness, that can be caused by nature, such as color blindness, or by nurture, such as a lack of aesthetic sensibility due to an upbringing devoid of beauty. When it is caused by nature, people with this incapacity are doomed to stay at a premoral level. They never achieve the emotional sensitivity necessary for moral life. When the lack is caused by nurture, however, training might lead to considerably higher levels of moral sensibility. This latter case has been characterized in literature as the Pygmalion type.

Cruelty is an inversion of the normal human response to the pain of others. Cruel people are conscious of others as creatures of feeling and have access to their feeling. What they do not have is a capacity to get pleasure from someone else's pleasure, like normal people do. Instead, they obtain pleasure from the emotional or physical pain of others. Unlike the brutish person, who is fundamentally insensitive and indifferent to the pain of others, the cruel person is sensitive to others and guiltlessly enjoys deriving pleasure from their pain. Again, cruelty can be the product of nature or nurture. When it is by nature, the person might have very little chance of reform. When it is by nurture, there might be a possibility of improvement through a retraining of their habitual responses to pleasure and pain in others. The classic example of this comes from the psychotherapy of abuse, where it is assumed that most abusers were themselves abused as children and through therapy can come to terms with their abuse and so end the cycle of abuse.

Vice in Business

Every few decades there seems to be an outbreak of bad behavior in business, almost an epidemic of vice. The most recent, exemplified in companies such as Enron and WorldCom, appears to be motivated by the vice of insatiable greed and enabled by other vices such as dishonesty and arrogance. In response, legislation has been passed—for example, the Sarbanes-Oxley Act—corporate codes of conduct have been dusted off and posted in prominent places, and many companies have followed Aristotle's advice and begun ethics-training programs. Whether these efforts will be successful remains to be seen. The pessimist points to human history and argues that, although vice in business may be suppressed for a time, it can never be eliminated, especially when powerful corporate executives have easy access to seemingly endless amounts of money. The optimist, on the other hand, denies that vice is an inherent part of a universal human nature and argues that it is largely a consequence of how we are raised and educated.

If the optimist is right, if education in virtue improves, vice in business will gradually diminish, even in the face of obstacles such as weakness of will. If the pessimist is right, education will at best keep vice at bay, but will never be able to eradicate it.

—Ivan Marquez and Robert Frederick

Violence in the Workplace

Workplace violence is one of the most important security issues faced by companies today, as these activities span a lengthy continuum from coworker bullying and intimidation to verbal threats to homicide. According to the Occupational Safety and Health Administration (OSHA), approximately 1.5 million workers are assaulted and more than 500 people are murdered in the workplace every year in the United States. Despite the dramatic headlines that accompany workplace fatalities, they represented only 0.1% of all violent work incidents in the 1990s. More than three quarters of the incidents involved simple assaults, which are typically attempts to commit an injury or acts that place another in fear of receiving a violent injury.

The U.S. Department of Justice identifies four types of workplace violence, including (1) violent acts by criminals who have no other connection with the workplace but enter to commit robbery or another crime; (2) violence directed at employees by customers, clients, patients, students, inmates, or any others for whom an organization provides services; (3) violence against coworkers, supervisors, or managers by a present or former employee; and (4) violence committed in the workplace by someone who doesn't work there but has a personal relationship with an employee.

Taxi drivers and clerks working late-night shifts at convenience stores are often subject to the first type of violence. These employees may be injured or further harmed when confronted by criminal activity on the job. The first type of violence is more prevalent in industries where employees work alone or at night, are extensively involved with the public, are located in dangerous neighborhoods, carry or have access to cash, and have a greater likelihood of coming into contact with criminals. Approximately 80% of workplace homicides are the result of this type of violence.

Airline attendants are increasingly experiencing the second category of workplace violence when passengers become unruly, drunk, or otherwise violent while in flight. Airline employees across the United States, Australia, and Switzerland staged a campaign to combat "air rage," the uncivil and dangerous acts of passengers that are not only punishable by large fines but can also threaten the safety of everyone aboard the aircraft. Health care workers are also subject to high rates of workplace violence, with nurses the most frequent target of assaults by patients or a patient's friends or family. Emergency rooms, psychiatric wards, acute care facilities, and crisis units are especially dangerous.

Third, disagreements and stress in the workplace may escalate into employee-on-employee violence. For example, a Xerox Corporation warehouse employee opened fire during a team meeting at a facility in Honolulu, killing seven coworkers. The employee was eventually convicted of murder and sentenced to life in prison without parole for the shooting, which was described as the worst tragedy in the company's history. The Hawaii Occupational Safety and Health Division later cited Xerox for failing to enforce workplace violence policies that might have prevented the deaths. In many of these cases, the perpetrator has been recently reprimanded, dismissed, or given other negative feedback that prompted the violent attack.

Finally, some violence in the workplace is the result of domestic disturbances or stalking behaviors.

In these situations, an employee is confronted at work by someone whom he or she knows, such as an abusive spouse or domestic partner. This partner may be highly jealous, fearful, emotionally unstable, fueled by drugs or alcohol, or unable to accept a divorce or the end of a relationship.

Although the U.S. federal government has not issued formal regulations on workplace violence, there are several general statutes and OSHA directives to provide guidance. All employers are subject to the General Duty Clause that requires employers to provide a place of employment free from recognized hazards that cause or are likely to cause death or serious physical harm to employees. To violate this clause, four elements must be present: (1) The employer failed to keep his workplace free of a "hazard," (2) the hazard was "recognized" either by the cited employer individually or by the employer's industry generally, (3) the recognized hazard was causing or was likely to cause death or serious physical harm, and (4) there was a feasible means available that would have eliminated or materially reduced the hazard. OSHA officials have also noted that some workplace violence is the result of random and haphazard events that could not have been foreseen or predicted by management.

In addition to this general duty, OSHA has rules that employers must follow in reporting workplace injuries and illnesses, which could include episodes or the results of violence. OSHA has also issued best practices and educational information for industries where trends and operating conditions seem to increase the risk of violence. For example, best practices for night retail establishments and for social service and health care employers are available. The U.S. Department of Justice has also convened conferences and issued reports for the purpose of curbing workplace violence.

Violence in the workplace became a more prominent issue with the September 11, 2001, terrorist attacks. Until these events, workplace violence was primarily considered in the context of disgruntled employees, dissatisfied customers, and domestic disturbances that moved into the workplace. Today, workplace violence is understood and managed from both an internal and external perspective. Although workplace crimes are often a reflection of general problems in society, employers have a responsibility to be proactive. Specifically, an organization should assess its unique risks, develop a workplace violence policy, implement a prevention program, provide security and monitoring devices, use training to reinforce workplace standards, seek outside assistance from law enforcement, social service agencies, and other groups when necessary, and install safeguards to protect employees and stakeholders from such acts. Companies should also purchase insurance policies to cover the costs of workplace violence, including business interruption, psychological counseling, informant rewards, and medical claims related to injuries.

VIRTUAL CORPORATION

Virtual companies or corporations are networked businesses characterized by the linking of people and business partners via electronic information and communication systems. Increased globalization, coupled with the widespread application of various technologies, has led to shifts in organizational structures and operating methods. These changes in business strategy have given rise to the innovative notion of the virtual organization, while raising some ethical concerns. As exemplified by such companies as eBay and Dell, Inc., this concept is now considered a standard business model.

During the mid-1990s, when dot-com businesses were flourishing, the virtual organization was understood as a business venture that produced a product or provided a service by electronically networking disparate employees and/or organizations. One individual or core team oversaw the company, often working out of a home or a small office. Usually, there was no single business location or product inventory held by the company. Though the core constituents, workforce, suppliers, manufacturing units, and marketing services that composed the company were geographically dispersed, the company was perceived by customers as a single entity with an actual location. Later, this business approach was expanded and became a business principle promoting the operational and economic value of internal organizational networks and external business partnerships. The application of this principle is best exemplified by the notion of the virtual company or corporation.

Virtual in this case does not mean pseudo or temporary. It refers to a company's intrinsic sociotechnical and dispersed nature; that is, its weaving together of discrete human resources and technology into a unified system, as well as its reliance on the Internet and computer-based systems for information sharing, communication, and interactive networking. Vital work relationships and business partnerships form and dissolve as needed, enabling work activities to be accomplished regardless of where employees reside and businesses are located.

Many medium to large businesses function in a global arena, drawing on a worldwide workforce. Such companies are dispersed organizations neither confined by traditional organizational boundaries nor limited by time and distance. Though usually having a central or home office location, a core management team, and full-time employees, they partner with external constituents to provide functions and services that once were part of a company's internal operations. In essence, they are virtual corporations, enterprises that are a structured system of business components operating in different locations characterized by a web of in-house work relationships and contracted partnerships with external businesses. Many employees are teleworkers because they are not confined to doing work on-site or collaborating with coworkers who reside nearby. Teams are often virtual, being composed of globally dispersed members who collaborate and are managed via technology. The organization is understood as the sum total of all the networked components—internal and external.

There are different types of virtual corporations. Some are consortiums of businesses where each constituent contributes equal resources, practical knowledge, professional expertise, and so on, while others are an e-marketplace where several companies collaborate in promoting and distributing various goods or services. Others consist of a core company strategically aligned with satellite organizations. Still others are a group of companies that form a single, coordinated value or supply chain that services customers. Central to each of these corporations is the electronic networking of business units, work teams, production components, suppliers, service providers, logistics companies, customer service staff, and so on, that are dispersed nationally or worldwide.

These organizational networks are established and supported by various forms of information and communication technologies, particularly enterprise resource planning systems, intranets, extranets, e-mail, knowledge and content management systems, collaborative meeting platforms, and supply chain management systems. High-speed or real-time digital systems enable information to be rapidly shared, project teams to be composed of the best talent, work activities to be coordinated and completed in a timely fashion, materials to be delivered in a just-in-time fashion, and customers to be served in a customized manner.

Such corporations handle large volumes of information, relying heavily on electronic forms for its transmission, processing, and storage. The glut of information has become overwhelming, at times hindering productivity and creating debilitating workplace stress. The utilizing and processing of proprietary information, as well as sensitive business and customer data, requires attention to data quality and security. Therefore, it is important that corporations have procedures in place that ensure that data is accurate and that customer or client information is secure from hackers and identity thieves.

The virtual workplace is often described as a 24/7 work environment. Reasons include the significant amount of work time required to deploy business strategies and meet economic goals, increased workload due to limited human resources, and the continuous availability needed to lead or participate in projects. Continuous workplace connectivity, and the stressfulness of working across cultures and time zones, has become a concern because of its impact on employee well-being. The 24/7 virtual work environment has blurred the line between personal and work time and is more impersonal due to the lessened social contact. Staff members often work long hours, and managers routinely take work home or work weekends. Many employees are not taking sick days or vacation time due to heavy workloads and the pressures of processing information. Some employees are beginning to feel that work is dehumanizing and less meaningful.

Last, virtual corporations strive to be agile, fast-paced organizations that readily respond to market shifts and retain competitive advantage, while operating in an efficient, cost-effective manner. This motivates them to seek out the most talented human resources wherever they exist, outsource business functions that are not their core competency, and take advantage of the cost reduction of operating company components in foreign countries. Outsourcing efforts have created anxiety among U.S. workers regarding job security, while offshoring practices, the relocating of production or services overseas, has caused them to question the availability of enough future U.S. employment opportunities. These practices have also raised concern about the exploitation of foreign workers who are willing to work for low wages and in sweatshop-like conditions.

For these reasons, it is important for virtual corporations to be conscious of the work ethic their culture fosters, ensuring that organizational practices fairly compensate employees and respect cultural differences, managers and project leaders have reasonable work expectations, and employees are enabled to effectively handle the information glut, reduce work stress, and maintain a balanced work life.

VIRTUE

The Latin word *virtus* means strength, power. It is the translation of the Greek word *areté*. Broadly speaking, virtue is the excellence or perfection of any being. It is the good and settled disposition of anything appropriate to itself. Every virtue or excellence both brings into good condition the thing of which it is the excellence and causes the work of that thing to be done well. More specifically, virtue applies to people and designates those habits that facilitate good actions. Virtue may refer to a person, a character, a habit, an action, or a tendency.

Virtues and Business

Business ethics relates the concept of virtues to business activities. Sherwin Klein proposes the application of Platonic cardinal virtues to business. Robert Solomon bears an Aristotelian approach to business. In an Aristotelian vein, businesses are a part of the Aristotelian good life, and a business organization is a community, or *polis.* Thus, it is coherent to apply Aristotelian virtues to business. Solomon proposes six essential parameters that circumscribe and define virtues in business ethics. These are (1) community (goals are not only personal but also common), (2) the search for excellence, (3) membership (we define our character within community), (4) integrity (virtues work together to shape a coherent character), (5) judgment (the relevance of prudence in business), and (6) holism (that overcomes the dialectic stakeholders–stockholders). Corporate life within this frame is determined by the character of its members. If we want a good corporation, one that functions well, we need virtues that shape a good character. Aristotelian virtues applicable to business include courage, temperance, friendliness, liberality, magnificence, honesty, fairness, trustworthiness, toughness, justice, honor, loyalty, fidelity, sincerity, reliability, cooperativeness, tactfulness, reasonableness, and openness. If these virtues are practiced, businesses will necessarily work well.

Greek Conception of Virtue

Virtue was a relevant concept for the Greeks. For them, virtue applied to everything; primarily, however, it referred to human beings. It was used to express a quality, an ability, excellence, honor, and nobility. The Greek ideal was a virtuous human being. The Greek *paideia* (education) was the creation of virtuous habits. Courage, moderation, justice, and prudence were highly esteemed virtues for them.

Consequently, early Greek philosophers dealt with virtue. Socrates is widely known for his intellectualism, that is, the idea that nobody acts badly knowingly. According to Socrates, a bad action stems from wrong knowledge. Thus, for Socrates, virtue is mainly intellectual. According to him, virtue is the most appreciated good for humans. His behavior concerning justice is very well known through Plato's *Apology of Socrates:* He prefers to accept being unfairly sentenced to death rather than committing injustice. Plato presents the four main virtues related to the city and the soul: practical wisdom, courage, moderation, and justice. For Plato, the aim of education is virtue.

Aristotle's *Nicomachean Ethics* is a treatise on virtues, where practical wisdom, justice, and friendship occupy a privileged place. According to Aristotle, the virtue of a good eye is to make us see well, and the virtue of a horse is to be good in itself and to win horse races, be useful to riders, and so on. When applied to human beings, virtue is the state of character that makes humans good and do their work well. Human beings have a calling or a task to do, the vital development of their very being. Their excellence or virtue lies in doing this. Happiness, a self-fulfilling activity, consists in a life of virtues. Virtues are the means for happiness.

Nature and Necessity of Virtue

Aquinas defines virtue as a good operative habit. Habits are lasting dispositions. Habits and dispositions are qualities, a way of being of things. Habits are stable in that they are something we have and that we do not lose easily. Virtues are qualities of our faculties: intelligence, will, and passions. They are operative in that they help the capacity to act. They are good in that they help us to act in a right way. They are also good in a broader sense than the moral one. They improve human faculties, enabling people to act according to their very nature. Thanks to virtues, human beings act easily, quickly, pleasantly, and naturally in the right way. Life runs fast and we do not have time to decide or to consider the best process of knowledge in each case. It would be psychologically unbearable to spend the whole day deliberating. We need some habits that facilitate rather automatic reactions. If we want these reactions to be right, we need virtues. In sum, virtues are the excellence of everything and they facilitate the corresponding way of acting of everything, especially human beings.

Intellectual Virtues

Aristotle distinguishes two kinds of virtues, intellectual and moral. The former help the intelligence achieve its goals and the latter help the will to intend what it ought to want. Intellectual virtues grant the intelligence the facility of performing its acts rightly—that is, to achieve truth, in the case of theoretical intellect, and to direct human free actions toward practical truth, in the case of practical intellect.

According to Aristotle there are five virtues: (1) intuitive reason, (2) philosophical wisdom, (3) scientific knowledge, (4) practical wisdom, and (5) art. Intuitive reason is the habit that facilitates the knowledge of the principles from which science proceeds. Philosophical wisdom is an intuitive and scientific knowledge of the highest objects. Scientific knowledge is the habit of deductive reasoning beginning with some given principles. Practical wisdom (or prudence) is the habit of doing well. Art (or technique) is the habit of producing well. Equipped with this constellation of virtues, people can more easily achieve one of their defining natural ends: to know. People need knowledge for theoretical and practical aims. The first three intellectual virtues give support to theoretical knowledge, and the last two (prudence and technique) assist practical knowledge.

Moral Virtues

Moral virtues facilitate the good acts of the will and passions so far as they are ruled by the will and the intelligence. Aristotle considers virtue as a state of character concerned with choice, lying on a mean, that is, the mean relative to us, this being determined by a rational principle. The word *choice* means that the main act of moral virtue is the right decision: The decision to do here and now what is needed for a good conduct. This right decision presupposes a good discernment on means and ways of acting. This is the role of practical wisdom. "Choice" also indicates that the good action is wanted and elected in itself: Intention matters. Virtues facilitate good acts without annulling freedom; on the contrary, they presuppose a constant free conduct.

The most important moral virtues are called "cardinal" (from the Latin *cardo*, "hinge") because all the other good habits hinge on them. They are practical wisdom or prudence, justice, temperance, and fortitude. Prudence is the guide of other virtues. Justice rules social order. Fortitude and temperance harmonize the person's inner order, as he or she is affected by the dictates of the will and passions. Thanks to prudence, human beings can know and judge what they should do. The function of prudence is to apply right reason to action, and this requires a right will. Hence, prudence is not only an intellectual virtue but also a moral virtue. The acts of prudence are three. The first is to take counsel. The second act is to judge. The third act is to command: to apply to action the things counseled and judged. Experience, memory, acuteness, intuition, and caution are other habits related with prudence.

Traditionally, commutative and distributive forms of justice are distinguished from one another. The task of virtue is to make a person good, and to bring his or her actions into line with reason. For Aquinas, this happens in three ways: first, rectifying reason itself, and this belongs to intellectual virtues; second, setting the rectitude of reason in human affairs, and this is done by justice; and third, removing the obstacles to the establishment of this rectitude in human affairs, and this is the task of fortitude.

Temperance helps sustain certain moderation that reason points out as ordered to human actions. Human pleasures are not bad in themselves, but people may long for them in a disordered way. Temperance guides passions to obey reason and will and directs them toward good. The word *fortitude* comes from the Latin word *fortis*, which means strength. Fortitude is the virtue that strengthens people to do good constantly and patiently despite difficulties that may arise. Fortitude is a condition to be prudent, temperate, and just, because whoever wants to act correctly will be confronted with difficulties. There are other moral virtues among the cardinal virtues: They constitute an exhaustive system.

Characteristics of Moral Virtues

Acquisition of Moral Virtues

How do we acquire moral virtues? Aristotle thinks that we are equipped by nature with the ability to receive virtues and that habits bring this ability to completion and fulfillment. He wrote that virtues are good habits, and these are firmly fixed possessions. The way of fixing habits is by repeating the corresponding actions. Thus, people acquire virtues through practice. In his *Nicomachean Ethics,* Aristotle argues that the main methods to foster these practices are education and law. First, education, in the broad Greek sense of *paideia,* shapes personal character. This is the reason why Aristotle says that it is not a small question whether one habit or another is inculcated in us from early childhood. Second, laws have a pedagogical objective. According to Aristotle, a set of concrete virtues leads humans to their natural excellence; this process of virtue building begins with education and is consolidated through laws.

A Mean

Virtue, for Aristotle, is a mean between two vices: one of excess and the other of defect. Aristotle points out that not every action admits a mean: Some have names that already imply badness, such as adultery, theft, and murder. Virtue is not the mean as the middle of a line but as the top of an arch. Aristotle defines virtue as a state of character concerned with choice, lying on a mean relative to us. Practical wisdom is the virtue that determines in each case the point where the virtuous mean lies.

Connection

Virtues are not isolated. They are part of a system, connected to each other through prudence. For Aristotle, the work of prudence is personal, essentially free and variable according to circumstances. What is prudent for one person may not be so for another. The coordination of free prudent actions leads to social coordination. Human beings cannot flourish in isolation. Our fulfillment demands a life with others. Prudence is the axis of connection among the virtues.

Virtue Ethics

Virtue ethics is currently one of the most widespread ethical theories. Deontological ethics focuses on duties, consequentialism on consequences, and virtue ethics on virtues and personal character. Some authors maintain that virtue ethics is unilateral because of its emphasis on the subjective aspect of the ethical relation (an "agent-centered" ethics). However, the Aristotelian virtue ethics also considers the goodness of the act itself and its consequences.

Virtue and Leadership

Virtue as Excellence of Character

Virtue is excellence of character, the possession of habits appropriate for a human being within a particular sociocultural context. Used as a synonym of "integrity," virtue suggests wholeness and stability in a person. Virtue is a form of capital, moral capital, because it is a productive capacity that accumulates and develops through investments of time and effort. Virtue is unique because it perfects the human being as a whole and not just in a limited aspect. It may not make a person strong, smart, or successful, but it makes him good as a human being.

Excellence of character depends on cultivating the right habits. Aristotle explains that virtuous habits result from the repetition of virtuous actions, and virtuous actions spring from the nurture of suitable inclinations in accordance with one's nature. There is a feedback mechanism among character, habits, and actions. Actions arise from a person's inclinations, yet actions may also weaken or reinforce inclinations. Similarly, not only do habits forge character; character likewise predisposes or disengages a person from certain habits. Let us now consider the three main analogues of virtue: actions, habits, and character.

Actions that arise from a person's inclinations are the building blocks of moral life. Virtue lies in good voluntary actions, and its goodness springs from three sources: the object or the action itself, the agent's end or intention, and the circumstances in which the act is carried out. The object refers to what the agent does as a humanly meaningful whole and not the mere series of movements he or she goes through: homicide and not simply aiming a gun and pulling the trigger, for example. The object principally determines whether an action is good or evil. Certain actions are evil by their very object and are prohibited without exception: lying, theft, murder, and so forth.

The second criterion examines the agent's intention, whether it is oriented toward his final end. At times, an action choiceworthy in its object becomes ethically flawed due to the agent's intention. To be virtuous, an action has to be performed with a noble end. For instance, it is not enough to give alms; one should also wish to help the poor rather than do it merely for show.

Finally, we have the circumstances surrounding actions. Seemingly "favorable" circumstances cannot change the moral quality of an action from evil to good. For example, no act of torture could be justified even if the fate of a hundred people depended on it. Circumstances affect the degree to which actions are good or evil, making them better or worse.

Every voluntary act leaves a trace in the agent. This by-product is called "habit": a stable disposition or manner of being and doing. Habits vest human nature with a new, improved, and reinforced tendency, a "second nature." After good actions, good habits are the next analogue of virtue.

As habits, virtues and vices arise from the repetition of actions. But not any sort of action, for good actions alone produce virtues. First, to acquire proper habits, actions should express correct reason in practice, as expert doctors or navigators know in each particular case. Second, right habituation equally shuns excess and defect, and third, proper habits come from experiencing appropriate pleasure or pain. For example, a generous person is not only one who normally gives alms but also one who is happy in doing so.

Character describes an individual's personality. It results from the combination of different habits that a person develops. How do we acquire virtue of character? Since it lies in the mean, Aristotle admonishes us to avoid the more opposed extreme. Regarding courage, for example, it would be better to err on the side of rashness than on cowardice, the more contrary extreme. Second, one should avoid the easier extreme depending on one's natural drift. Aristotle also warns that we be careful with pleasures, to which we are already favorably biased. Finally, Aristotle tells us that the rules do not give exact and detailed guidance for action. Virtues of character deal with concrete, contingent actions and feelings beyond the scope of general, theoretical accounts. We are remitted, in the end, to the perception of an already virtuous person who alone is the competent judge in concrete situations.

Leadership as a Character Trait

Joseph Rost defines leadership as an influence relationship that brings about changes reflecting the mutual purposes of leaders and followers. He is right in characterizing leadership as a reciprocal relationship and in affirming that goals have to be agreed on voluntarily by leader and followers. Leadership does not develop merely as the result of pressure or coercion. Its converse, followership, has to spring naturally from the minds and hearts of people who feel respected and valued. Leadership thus becomes a moral relationship based on trust, obligation, commitment, emotion, and a common vision of the good.

Leadership consists in exerting moral influence. A leader earns authority and legitimacy when he seeks the good of followers. Moral influence, in turn, could be understood in a double direction. First, followers demand moral behavior—honesty, integrity, credibility, and trustworthiness—from leaders. Second, leaders shape the choices of their followers, promoting their personal growth. As the leadership theorist James MacGregor Burns commented, leadership is a two-way transformative and intrinsically moral relationship between leader and followers. Thus, leadership becomes a major driving force for people and organizations to become ethical.

Stewardship and servant-leadership stem from this assumption. According to the organizational consultant Peter Block, stewardship underscores a leader's accountability to the organization and its workers. A steward-leader recognizes the power of workers to make decisions and to influence the organization's goals, systems, and structures. He empowers workers so that they can become leaders themselves. For the management theorist Robert Greenleaf, servant-leadership is even more revolutionary in that it shuns high-profile figures. A servant-leader commits himself or herself in the first place to serve the interests of others, providing them with a chance to grow and develop, materially and morally. The integral fulfillment of everyone in the organization is his aim.

Many construe ethical leadership as an emotional relationship based on charisma, that mysterious power possessed by people who are good at influencing others. As a nonrational characteristic, charisma is difficult to define. It has to do with a leader's message, how he says it, and the whole gamut of emotions he evokes. Charm, intelligence, and sincerity also contribute. For this reason, the business and philosophy scholar Robert Solomon opines that charisma is more of a distraction than a help.

In place of charisma, Solomon proposes trust as the basis of ethical leadership. An ethical leader establishes and sustains a framework of trust between himself or herself and followers. Without trust, no dialogue, understanding, cooperation, commerce, or community would be possible. Furthermore, trust lowers transaction costs, facilitates entrepreneurial initiatives, and boosts economic competitiveness. But what is the source of trust? It is none other than virtue.

Rhetoric as the Art of Virtue-Based Leadership

The art of leadership is what was known in the classical world as rhetoric. Aristotle defines rhetoric as an ability, in each case, to see the available means of persuasion. Barring force, the only instrument available to the potential leader is reason. A leader has to persuade his audience through words. However, words alone do not move; they require the complicity of feelings and emotions.

Today, as in Aristotle's time, there are people with a gift for persuasion and others who seem bereft of it. Nevertheless, both types stand to gain by studying the principles of speech and composition. Aristotle was aware of the controversy surrounding rhetoric. Socrates and Plato both thought that Sophist rhetoric was mere flattery, the use of empty words and misleading arguments to one's advantage, an appeal to emotions without regard for truth. In contrast, Plato's ideal rhetorician in the *Phaedrus* was a virtuous person with firm knowledge: rhetoric-wedded persuasive skills with personal virtue and a love of truth.

Aristotle held that rhetoric as a communication art was morally neutral; it could be used for good or evil. He was careful, however, not to separate rhetoric from ethics; rather, he insisted on its subordination to the architectonic discipline of politics. Aristotle argues that the study of rhetoric is useful for three main reasons. First, without rhetoric, the truth can be easily defeated, for true knowledge may not be enough to persuade audiences reliant on feelings and opinions. Second, rhetoric helps the speaker understand an issue by giving him a chance to consider both sides. And third, rhetoric permits one to defend himself without recourse to violence.

According to Aristotle, three instruments are available to the speaker or leader in persuading his followers: the speech or argument itself (*logos*), the speaker's character (*ethos*), and his listeners' emotional disposition (*pathos*). Speech persuades when it shows the truth in a particular case. The truth, however, may prove insufficient for those unable to follow complicated reasoning and dependent on hearsay. Yet this does not mean that true reasoning has to be abandoned. Persuasion also occurs when the public is led by speech to experience appropriate emotions. These emotions become the triggers of action. Those who hold a purely technical view of rhetoric focus exclusively on listeners' emotions. Yet it is also relevant to consider to whom a particular emotion is directed and for what purpose. Insofar as human judgment is affected by emotions, it is not an entirely rational act, but neither should the influence of emotions be exaggerated. Aristotle considers the character of the speaker as the controlling factor in persuasion, because we believe fair-minded people to a greater extent and more quickly. Listeners are convinced mainly by the image of trustworthiness that a speaker or leader projects. And what better way to ensure an image of trustworthiness than by being trustworthy in fact?

Aristotle lists three personal qualities that an aspiring leader should possess: practical wisdom (*phronesis*), virtue (*areté*), and goodwill (*eunoia*). Practical wisdom permits one to form correct opinions over concrete, contingent issues; virtue prods him to express his views justly and fairly; and goodwill ensures that he give the best advice. A person with these characteristics becomes not only a persuasive speaker but an effective leader also.

Whatever a leader's purpose, it would be helpful to learn to present one's arguments well and thus elicit the audience's sympathy. For this, one must turn to rhetoric. But these techniques alone would not work if one lacked virtue, and hence the need for ethics.

—Alejo José G. Sison

Virtue Ethics

Virtue is a condition of a person's character. Having virtue makes doing the right thing the obvious choice among options. Having virtue means that immoral courses of action are ruled out, and this quickens decision making. Virtuous persons would have already determined that they ought to do only whatever is right in a situation. If a person has virtue, this means that he or she does not merely have good intentions but has the ability to act on them. People who manage to be consistently ethical are likely to have virtue to some degree. Those who knowingly act immorally lack virtue. And those who cannot tell the difference between wrong and right lack virtue.

Whether virtue is a set of qualities or just one; whether virtue is a permanent state of character or a temporary condition; whether virtue is the result of a conscious or unconscious process of development, inborn or merely a matter of culture—these are matters for the various authors of virtue ethics to determine. Authors must also decide how virtue relates to an account of right action. Either a description of virtue serves as an addendum to other ethical approaches, and the moral psychology required for virtue is not invoked in a determination of right and wrong, or the requirements of virtue alone determine what right action is. Virtue ethics may be more or less theoretical. The more theoretical accounts revise our commonsense opinions on good character. The less theoretical accounts endorse commonsense notions. Though every contemporary account of virtue derives some inspiration from the ancient accounts, most contemporary accounts are less theoretical than these and more dependent on the criteria of ethics and justice offered by alternative approaches.

There are particular challenges to determining the morality of business decisions and policies with an account of virtue. The description of a virtuous businessperson has utility, of course. The qualities that contribute to a company's success are not always recognized or well understood. Companies may be encouraged to foster or better reward these traits. Yet specific guidelines for business decisions and policies have not, thus far, been traced back to compatibility with a recommended moral psychology. This means that most often virtue serves only as an addendum to other determinations of what is ethical in business. Whatever the role of virtue in ethical theory, further empirical research into the connections between institutional practice and good behavior is sure to be a boon to the study of virtue.

Ancient Accounts of Virtue

The ancient tradition in ethics was committed to an understanding of happiness (*eudaimonia*) as our highest good. Today, we tend to think of happiness as something fleeting, as something we can experience in an afternoon. The ancients meant, by *eudaimonia*, something more like the subjective experience of leading a good life. We are, the ancients explained, tempted to organize our lives around goals that seem immediately good to us: power, pleasure, wealth, and fame. There is, of course, some good in all these, but to pursue them all is problematic since they involve contradictory requirements. To attain great power, you may need to sacrifice pleasure. This may not seem to be a practical impediment, and indeed the ancients would not argue that it was. Many unvirtuous people attain great power. We all trade off various goals for others at any time. The common temptation, warned the ancients, was to pursue these goals in a single-minded or unreflective fashion. In either case, we are failing to reflect on why we pursue what we do. Such reflection, according to the ancients, can be fruitful. Our psychology, the ancients argued, will not find itself satisfied until we come to understand and implement an understanding of the ultimate point of our lives. And the ultimate point of our lives will not be to accumulate goods or accomplishments that can easily be taken away. It will not be to possess things whose care can so easily consume us with worry and attention. The ultimate point of our lives will not, once understood, leave us feeling that we have not had enough no matter how much we have got. The ancients argued that the ultimate goal in our lives would have to be of a different sort of nature than the goods and goals we tend to think make us happy.

The most likely candidate for an ultimate goal would be psychological in nature, since the above requirements would be met only by a change within one's self. Pursuing this goal would transform our pursuit of less long-term goods in our lives. Professional goals, for example, would be put into their proper context within a life. This would make them less likely to disappoint and more likely to be pursued responsibly. Once we discover for ourselves this most final end, we will come to understand what true happiness is, and commonsense accounts of happiness can be abandoned, recognized to be poorly developed. What remains to be explained is how morality fits into this description of an ultimate goal capable of organizing our lives.

Morality

The ancients determined that all our immoral impulses were the result of having goals other than the sort of long-term happiness just described. Whether we lie to our boss, steal from the company, or betray colleagues, we have often calculated the benefits of doing these things from a less than comprehensive perspective on our lives.

The major schools of ancient ethics came to the conclusion that a life lived for the sake of being moral was the best candidate for our most comprehensive and long-term goal, happiness. This is, of course, a striking and bold claim. Some contemporary ethicists reject it as ridiculous on its face. A virtue ethicist will not recognize, for example, that a corrupt businessperson can be happy or that a deceitful person can actually benefit from deceitful practice. The assumptions that underlie these claims are as follows. True value is not as obvious as we think it is (it is not reducible, e.g., to a promotion or a raise). Our psychologies are of such a nature that they can function unimpeded only when moral precepts have been internalized. The consequence of committing one's self to such a life would be the development of the virtues.

It is not helpful to describe ancient descriptions of virtue by listing the terms we use for moral qualities we admire. The ancients, after all, developed the theory described above. Their proposal that we focus on some ultimate, final end is hardly what we would expect to find confirmed by our commonsense judgments about people and their qualities. Commonsense judgments involve all sorts of puzzles. For example, why might a "moral" quality like courage sometimes contribute to bad action? Such puzzles do not exist when the standard for virtue is the ancient one. Clear criteria for virtue are offered by the ancients—it is the psychological condition we develop and require to make moral choices regularly, without tension or weakness of will.

To give a simple example, think of being left alone before the petty cash box in your office. Imagine that it is obvious that you could grab a handful of bills without anyone being the wiser. Many of us might consider taking the money and begin to weigh the consequences of doing so (perhaps double-checking to make sure no cameras are on, that no one is actually nearby, etc.). Others would not even consider taking the money. Those who would not consider taking the money have attained something of virtue. Evidence that considerations of virtue outweigh monetary value comes from thinking about what would happen if your reimbursement from the company for some legitimate expense was short. Even a virtuous person would then ask for the correct amount back. This shows that money has not lost value for the virtuous. Indeed, a dispute about a short reimbursement might happen in front of the very petty cash box that did not tempt the virtuous. For the virtuous, money they deserve has one sort of value; money they do not deserve does not have this same value. This is the effect of committing to a longer-term goal than the simple accumulation of money.

If we practice our commitment to our longest-term goal, we will get better at recognizing which norms apply in a moral situation. There are, of course, all sorts of norms that support not taking the money. A person who refrained from taking could easily recall any one of these ("Do not steal"). To develop virtue requires that the inappropriate and irrelevant norms are not regarded as applicable. ("Jane took from petty cash last month, so I can too.") Think of how common it is for the cost of taxi fares to be misrepresented on an expense report. Those who engage in this practice know, at a very conscious level, that this behavior is wrong, dishonest, and inappropriate. But some other norm encourages the behavior. Likely, it is something like "Everyone else does this" or "Don't be a sucker" or, perhaps, "Do what you can get away with."

In addition, the process of becoming good gets easier as a person's motivation set gets less complicated. To develop virtue requires that your motivations not include contradictions that you may not even be aware of, for example. Those who struggle not to steal, though they desperately want to avoid doing so, have an overly complicated set of motivations with which to contend. Virtue is not assisted by such a condition. To function as a virtuous person, you have to figure out which motivations interfere with doing what you have been able to determine you should do ("Am I too much of a people pleaser? Is that why I gave in to the pressure?").

According to the ancient account, virtue has an intellectual, a dispositional, and an affective component. When these components are described separately, virtue can seem an abstract and theoretical ideal, but we can recognize the effect of the conjunction of these components in the example the author has just given. The intellectual component of virtue is a matter of knowing the money is not yours, that you do not yourself expect to be taken advantage of, and perhaps that the economic system as it exists tends to function well enough for all involved, warranting your endorsement. You would, in other words, be able to explain why stealing is wrong. Virtue ethics does not require that your explanation be technical. Instead, it could be just as the author has described it.

The dispositional component of virtue is a matter of how this propensity not to steal has become second nature to you. You tend not to steal. If you steal in other contexts, and not taking the money in this case was an exception, then your character is not virtuous. To develop a virtuous disposition, you must work on developing the intellectual and affective components of virtue. You must attempt to relate your beliefs about theft, for example, to your understanding of ethics. To find yourself no longer attracted to bad behavior, you must work at internalizing, and truly coming to accept, the coherent account you develop on the topic.

The affective component of virtue is a matter of experiencing pleasure in acting right. People who have made themselves good do not regret money they have not stolen, for example, and they do not see vicious people as having made choices of which they could be envious. This condition comes about only because when we pursue virtue, we become transformed. It is this element that is most frequently left out of contemporary accounts of virtue, even those that hark back to the theory of the ancients.

Virtue Transforms Us

The process of becoming virtuous is much like getting used to being healthy. You must begin by garnering an understanding of what weight loss and health require. If you are misled about this, you are bound to fail. As you start out, you may likely have to reckon with having a taste for donuts and potato chips. This may seem insurmountable, as the donuts and potato chips taste so good and have always proven irresistible in the past. But, perhaps to your surprise, after forcing yourself to exercise for months, you find that not only the exercise itself has gotten easier to do and to include in your day, but eating healthier has gotten easier as well. You no longer even have the taste for junk food and now wonder how anyone could. You have begun to associate junk food with its bad effects: sluggishness and extra weight. Exercise has begun to pay off, and the rewards of it now seem obvious.

This description matches much of how virtue is supposed to work to integrate all our ends: by making what satisfies us fit what is actually good. A junk food fan is not getting optimal feedback from his or her body, and happily, we can transform our tastes. When we act immorally, we are not getting optimal feedback either, and happily, there is, according to virtue ethics, a way to stop ourselves from acting in such an undisciplined fashion. Once we become acclimated to good behavior, perhaps to our surprise, we will recognize that we have come to enjoy and prefer moral to immoral behavior. The temptations of immoral behavior no longer have their allure because the long-term negative consequences of it can be seen as part and parcel of the seeming gains it brings.

Of the ancients, only the Stoics understand our ethical transformation as going so far that we can come to care about virtue to the exclusion of any particular commonsense goods. If we cannot conceivably do this (if even an idealized conception of the human cannot do this) then the Stoics will be wrong about virtue being sufficient for happiness. Other ancient ethicists, such as Aristotle and the Epicureans, are reconciled to the idea that some commonsense goods need only be understood in relation to virtue in order to be properly pursued. To continue the analogy, some ice cream, at some times, might still be perfectly acceptable to the healthy person's system, given that the healthy person is aware of the amount he or she may have and the effects on his or her health.

In contrast to contemporary virtue ethics, however, what matters is that ancient virtue ethics recognizes that virtue involves transformation, and this transformation results from our committing to an accurate understanding of our most final end. This, among other things, makes a eudaimonist account of virtue differ vastly from most modern-day accounts of virtue. Ancient-based accounts of virtue are kept, by their theoretical structure, from having to rely on (or recommend that we follow) a commonsense understanding of the virtues. This is not to say that common sense does not already itself endorse some of ancient virtue theory's insights. We do not, after all, count it as generous when someone gives a gift merely for the sake of impressing someone. Many of the problems associated with the use of virtue ethics come from the invocation of common sense to settle matters that may be better handled by a theoretical standard.

Contemporary Variants of Virtue Ethics

Contemporary accounts of virtue ethics always refer back to ancient accounts, and careful authors highlight both the similarities and differences. Three modifications of the traditional approach are most common in contemporary virtue ethics. The first is that ancient theory is replaced with more commonsense notions about virtue. The second is that the notion of a final end is dropped. The third is, as mentioned, that right and wrong are determined in other ways than through a description of virtue.

Common Sense and Virtue

Often, contemporary accounts of virtue are updated by inserting a commonsense conception of virtue in place of the theoretically defined one. What bravery is, for example, is taken to be obvious, and descriptions of bravery are culled from literature and life experience and used to describe the virtue. Rather than looking to what common sense takes to be virtue, the traditional virtue theories determine what virtue is by seeing what will result from a commitment to morality.

Contemporary accounts of virtue are most often more modest about the effects of attaining virtue. According to traditional accounts of virtue, aspects of ourselves under our conscious control (our emotions, our desires) will be transformed as we become virtuous. Contemporary descriptions of virtue are not this spectacular. Very rarely is a virtuous life described as one that has been transformed.

Contemporary accounts of virtue are also more likely to describe virtue as something some people just have. Role models are often given credit. The ancient schools were, in contrast, convinced that the process of developing virtue would have to be active and acutely conscious. This means that the ancient theories of virtue would not recognize as virtues character traits one attains without effort. According to ancient virtue theory, no one is surprised by the sudden discovery that they are virtuous. It is not the sort of thing you could attain without being aware that doing so was your primary agenda.

There are two possible unanticipated consequences to these modifications of traditional virtue theory in contemporary accounts. One is that virtue may be described in a fashion that is not realistic because of the self-sacrifice required. The other is that virtue may be regarded as something that cannot be attained because it is always fleeting and competing with other types of good qualities.

If common sense is our guide to what is a virtue, feelings such as "compassion" will be considered virtues. This, when associated with the traditional recommendation that one should always act out of virtue, brings us the expectation that one be compassionate all the time. And such a thing, of course, is not possible. Something like compassion could not be a virtue on the traditional account precisely because it could not be something one exhibited all the time. The modernized account leads to a pessimistic take on our natures.

The second possible unintended result of invoking common sense in an account of virtue is that virtue is not associated with a lasting transformation of one's character but with certain habits one could give up or start at will. The problem with this is that virtue talk may become nearly meaningless. Helping someone once might make you "kind," at least that day, and speaking this way will be possible despite how mean you may be most of the time. The traditional accounts can explain why someone may display courage yet be dangerous or be honest yet be untrustworthy. If we are all considered to have a profusion of virtue, we are afforded no clarity when it comes to the nature of good qualities.

No Final End

A second common modification is that the intellectual component of virtue is dropped. This allows us to recognize that we can be inadvertently compassionate and that this counts toward our goodness. The traditional requirement is that one be perfectly conscious of why and that one is acting well. Far more behavior is counted as virtuous, and new standards for such behavior (even consequentialist ones) can be used to assess virtue if the traditional requirement is dropped. The notion that virtue must be developed through a focus on one's final end is abandoned. Sometimes, there is talk of the need to be habituated to virtue, but this is usually taken to be the result of practice encouraged through external incentives, or, if self-directed, the practice is a matter of discipline rather than philosophical exploration of the point of one's life.

The Supplement of Other Criteria for Right Action

A final common change from traditional accounts comes from regarding considerations of virtue to be a sort of addition or supplement to other means of establishing what is right and wrong (e.g., the invocation of a theory such as Rawls's or consequentialism). This is, of course, only to consider character in relation to other ethical approaches. Though such considerations can be referred to as a virtue-based approach and even at times as virtue ethics, there is no serious connection between this focus on character and the ancient accounts of virtue.

Criticisms of Virtue Ethics

Criticisms of virtue ethics abound. All to often criticisms of virtue ethics are made secondhand and without reference to either the ancient texts or the contemporary works of theory. Frequently, a commonsense conception of the virtues is inserted into an interpretation of a theorist's proposals, and as a result, the proposal seems unsound. For example, ancient accounts of the unity of the virtues are frequently dismissed as implausible because it is difficult to imagine our commonsense conception of virtue requiring that to be brave we must also be kind. But given the brief description just offered, it is clear that being naturally brave, or doing some brave action, is not the same as having consciously committed one's self to morality. On the ancient account, bravery requires awareness of the point of your activity. Without this, your actions (which may, of course, in many ways be laudable) are still not virtuous, as they do not meet the intellectual criteria for this type of behavior. And to meet these criteria in the case of courage (you understand why and when it is appropriate) means that you will surely also have an understanding of when, for example, kindness would be required.

Virtue Ethics Is Not Applicable

One objection is that virtue ethics can offer only extremely general advice and role models but no objective guidelines. (Indeed, at times this is claimed of virtue ethics to argue for imprecision in ethics.) This may be the result of Aristotle being more widely known than the other ancient ethicists who shared the structure of his ethical theory. Yet even Aristotle, in Book 9 of the *Nicomachean Ethics,* uses his ethical theory to assess very particular guidelines for behavior. We have evidence of the Stoics doing this far more commonly, however, as they worried very much about the justification of particular prohibitions. Cicero records debates about the type of information one must reveal before a sale. Stoics disagreed, for example, on whether you could profit as much as possible from bringing the first ship of grain to a famine-torn island (the issue concerning whether you should reveal that more ships are imminent), but they were not seeking to recommend only to "be virtuous." The two sides argued over whether it was necessary to endorse the proposition "reveal information about other sellers when the buyer's situation is dire," given a good person's overriding commitment to morality.

One reason critics assert that virtue ethics is applicable in the way an ethical theory needs to be is that virtue ethics provides a different type of standard for rightness than that to which most contemporary ethicists are accustomed. In the traditional accounts, for example, what determines whether an action is right or not is whether the actor is capable of justifying it. We, of course, function as the judges of whether the justification stands or not. But virtue ethics neither offers an abstract and rationalistic justification for a list of right actions nor recommends a set of principles that, if applied, are supposed to clarify which courses of action are right. The criteria of rightness offered by traditional virtue ethics can frustrate philosophers and applied ethicists who are used to handier means of assessing right and wrong. But what is handy to writers is not always what can be invoked by the public at large, and the assessments virtue ethics makes are clearly a refinement of the type of judgments we make in our personal lives all the time. We are not impressed, for example, by a generous gift if it comes from a person giving it just to seek favor.

The Empirical Challenge to Virtue

The most recent challenge to virtue ethics has been leveled by philosophers looking to research in social psychology that suggests human behavior is far more variable than we commonly assume. Gilbert Harman and John Doris are leaders of a movement in philosophy known as situationism or, more generally, empirical ethics. This movement looks to verify the claims of ethical theorists through surveys and experimentation. Past experiments by social psychologists have been used by these philosophers to challenge the moral psychology assumed by any account of virtue. Several of these experiments have found that a large percentage of subjects can be found to be kept from small acts of kindness by minor and irrelevant changes in their environment (their "situation"). A memorable example is that of an experiment that found certain smells can encourage or discourage minor altruistic behavior. The current reasoning of the situationists goes like this: The moral psychology required for virtue is unrealistic since experiments have shown that the majority of us act in ways that are susceptible to small changes in environment. People cannot, they argue, be assumed capable of acting morally regardless of the situation.

The difficulty in accepting this criticism of virtue ethics may be obvious. Virtue ethics of any sort is unlikely to regard the majority of the population as virtuous. Even when virtue is not described as the result of the taxing and lengthy process the ancients describe, it is considered a rare and unique condition. The experiments situationists cite give evidence of some people acting morally, regardless of situational input. This may indeed be a sign of these subjects having virtue. A final obstacle to the situationist critique of virtue is that right action is something virtue ethicists define for themselves. It is difficult to test an ethical theory by using a standard for right action other than the one the theory itself offers. The behaviors social psychologists count as minimally moral (e.g., helping a person to pick up papers) are not necessarily required by virtue. Aristotle's "great man" is described as concerning himself with serious and not trivial moral matters, for example. The conclusions of the psychologists who conduct the experiments are far more limited than the philosophers reporting on these experiments suggest. Social psychologists do not regard themselves as targeting character traits and are certainly not taking aim at an Aristotelian conception of virtue. Experiments would have to be designed around these proposals for them to be tested.

To the extent situationists are requesting empirical verification of the moral psychology associated with a virtue ethic, their influence can be a positive one. Virtue ethics has always been dependent on an accurate description of our moral psychology for its recommendations. It happens to be the case that the results of experiments in social psychology, as the psychologists themselves describe them, can be welcomed by virtue ethics. Indeed, some of the conclusions (e.g., that some of us can be easily swayed by others to change our stated opinion) are what the ancient texts would lead one to suspect is the case. Research could help us settle not only what moral psychology ought to be associated with virtue but also what business environments, policies, and decisions are compatible with virtue. Empirical methods may someday reveal to us both what the virtuous person in business would be capable of recommending and what recommendations would promote virtue.

Other criticisms about the approach are likely to be outdated. It can no longer be said, for example, that virtue ethics cannot be said to describe only right agency and not right action. It cannot be said that virtue ethics involves an opposition to rule-based thinking, to the recommendation of principles, or to more than very general advice about how to live. And it is also no longer considered helpful to merely oppose virtue ethics to two other dominant approaches in the field of ethics: consequentialism and Kantianism. Virtue ethics has had such an impact on the field of ethics that distinctions that had been assumed to be obvious are now difficult to find. Kantians now emphasize Kant's account of virtue, and consequentialists do not shy from discussions of agency.

A Future Role for Virtue in Business Ethics

Virtue ethics has received a great deal of attention in the field of business ethics, though the promises that its entry would transform the field have not been fulfilled. There are two reasons why those interested in virtue still have cause for hope that business ethics can be further refined (and not merely broadened) by discussion of virtue. One is because a traditionally styled virtue ethic has not yet been developed for use in the field of business ethics. Articles have, of course, suggested that such a thing could be valuable, and some article authors have begun work in this direction. The possibility of being able to assess the output of a company according to a virtue ethic's value scheme ought to be attractive to those business ethicists looking to capture the public's imagination and attention. A second reason is due to the possibilities of empirical research supporting some of the ancient claims of virtue ethicists. If social scientists begin to test for the account of moral psychology required for virtue, they may find that certain classes of policies are more conducive to the encouragement of virtue and that certain institutional designs attract the virtuous.

VOLUNTARISM

Voluntarism is a term associated with theories that emphasize the primacy of the force of will in contrast to rationalistic or intellectual explanations of God, reality, human nature, or morality. Theological and metaphysical theories of voluntarism have influenced evolving moral, psychological, and political thought.

Theological voluntarism is often traced to the medieval writing of John Duns Scotus, William of Ockham, and those who stressed the importance of the divine will of God. Scotus claimed that God's will determines what is reasonable or right and that God is free to act on this will. Ockham believed that divine will, rather than any form of pure or human reasoning, mandates whether human activities are sinful or good. He claimed that God's freedom is absolutely unlimited and that nature itself is subject to divine will and has no causal or logical inevitability. Divine command theory is associated with the views of Ockham and others who grounded theology and morality in God's will and commands. God was seen as radically free and could have willed other than any reasonable moral order. Theological voluntarists challenged the influential views of Aristotle and Aquinas, who stressed that reason or rationality is critical in trying to understand an ordered, logical universe in which human beings are part of this whole. Heaven, or a final state of fulfillment, was associated with contemplation in the Aristotelian tradition, while voluntarists believed that fulfillment or happiness comes through acts of love and fidelity to God's will. The priorities that earlier Greek and scholastic Christian thinkers had placed on form or matter, rationality, order, and hierarchies were replaced in theological voluntarism with contrasting concerns.

A focus on the will of God, as expressed by theological voluntarists, shifted with the Enlightenment and later philosophical conceptions of the will. These metaphysical conceptions of nature or reality held implications for politics, psychology, and morality. For example, Thomas Hobbes had a bleak view of the consequences of unconstrained human will or desire, and he proposed political remedies such as the power of a strong sovereign state and its regulations and controls to harness human willfulness and excesses. David Hume thought that moral sentiment directed human behavior, and he dismissed reason as influencing human behavior or having a role even in opposing or controlling a powerful will. Metaphysical voluntarism had some of its origin in Immanuel Kant's denial of a capacity for pure reasoning by human beings, but those later advocating forms of metaphysical voluntarism had very different perspectives from those of Kant, or often from one another. Three prominent examples of metaphysical voluntarism can be found in the work of Arthur Schopenhauer, J. G. Fichte, and Friedrich Nietzsche.

Schopenhauer viewed universal will as the ultimate reality, and he insisted that all things are the expression of or are determined by this overarching and powerful will. He found the objectification of this essential will in forces of nature and inanimate matter as well as within all living things. For Schopenhauer, this essential will, as expressed in the human will to live, desire, procreate, and consume, could not be controlled by any final goal or purpose. Such human will and desires could never be fully satisfied and, thus, only led to human frustration and suffering. Even knowledge concerning this dominating will, according to Schopenhauer, only leads to greater pain associated with increasing awareness of vast human egoism and deficiency. For this desperate human condition, Schopenhauer suggested asceticism and available forms of negation of desire, as extreme as starvation and death.

Fichte did not draw as sharp a division or opposition between the human will and human reasoning, nor did he view the consequences of will for human welfare as pessimistically as Schopenhauer did. Fichte conceived of an absolute and incomprehensible ego, of which will was an important part, as an ultimate reality. This ego, however, was an informed and creative force. In contrast, Nietzsche was obviously influenced by Schopenhauer and described a will-to-power. Like Schopenhauer, Nietzsche viewed the will as a force driving all natural phenomena, including human and social potentials. Yet Nietzsche denied a strong link between his conception of a will-to-power and Schopenhauer's more pessimistic version and explanations of will. For Nietzcshe, such will was to be embraced and celebrated, rather than to be denied or struggled against.

Metaphysical voluntarism describes an essential and transcendental will that underlies all phenomena. In contrast, psychological voluntarism and ethical voluntarism consider acts of will and the perceptions, cognitions, value judgments, and other responses associated with this willfulness. Judgment of the goodness or badness of an act depends on that will, and certain standards, those chosen by the actor or by others, should be directed in judgment of that will. Consequences of the focal act are, thus, irrelevant to judgments of an individual's having done right or wrong. While bearing a few similarities to Kantian ethics, and contrary to consequentialist ethical theories, ethical voluntarism differs from an emphasis in Kantian ethics on universal principles or imperatives. Ethical voluntarism is found in the work of William James along with his concern that actions actually produce desired ethical outcomes. James declared that things or acts are good simply because these are desired or willed. Will and self-interests in his view have primacy over knowledge, and knowledge has merely an instrumental role in obtaining human will. Ethical voluntarism, according to James, means acting on multiple desires so as to obtain the most benefits and least frustrations. Josiah Royce, a protégé of William James, is another example of an American theorist who had a voluntarist orientation. According to Royce, we know or interpret reality as an act of will. In contrast to a blind or consuming will, described by Schopenhauer and others, Royce characterized this will as loyalty toward that which we love.

Aspects of voluntarism, as priority placed on individual freedom of action and related ethical judgment with regard to these actions, led some 20th-century theorists in the direction of anarchist proposals as a remedy for avoiding forms of political or authoritarian compulsion. At least some affinities with aspects of ethical voluntarism can be found in theories such as existentialism or the radical, subjective, and individual freedom advocated by Jean-Paul Sartre and certain postmodern theories focusing on individual appropriation of meaning and direction.

VOLUNTEERISM

Volunteerism refers to the practice of volunteering one's time or talents for charitable, educational, or other worthwhile activities such as working to preserve the natural environment, organic farming, conservation education, health care for children in orphanages, local activities in one's community, or military service. Volunteers perform a service willingly and without pay.

In the United States, nonprofit organizations serve a critical role in a society that is mostly made up of immigrants seeking to better their lives and the lives of those around them. In other countries, local and national governments often fulfill the functions that volunteers in the United States provide.

According to the Bureau of Labor Statistics of the U.S. Department of Labor, 65.4 million people volunteered for an organization at least once between September 2004 and September 2005. One fourth of men and about one third of women performed a median of 1 hour per week of volunteer work and were involved with one or two organizations during this same time period.

Volunteerism provides considerable social benefits, as volunteers say they gain more than they give as they learn new skills, gain experience, make friends, enjoy their work, and are generally satisfied with their lives. Most volunteers say that they feel a sense of belonging or connectedness in their community as a result of donating their time. Other volunteers say that community service provides a meaningful structure to their lives. Oftentimes, volunteers find a new job or transition to a completely different career through volunteering.

Success Factors

Volunteers are not born; they are cultivated. Organizations that depend on volunteers should strive to create a culture that honors, provides structure for, and recognizes their contributions.

There are several key areas that are critical to the success of both the volunteer and the organization:

- Organizations depending on the critical skills of volunteers need to articulate their vision, mission, and objectives for volunteers to understand their impact on the community in which the organization serves. A clear mission allows the organization to focus on its core competencies and not get sidetracked by attempting to be all things for everyone. This also aids volunteers in understanding what skills they need to possess or be willing to develop.
- It is important that the leadership of the organization provide open lines of communication and the ability to articulate the value and significance of the volunteer's contribution. Volunteers want to feel that they are making a positive impact on others' lives, and it can be very encouraging to know this.
- Volunteers need a passionate supervisor who will provide structure and accountability. Supervisors must be trained in volunteer management and given the necessary tools and resources to carry out the task or service they are responsible for coordinating.
- There is a fine line between micromanagement and careful oversight. Every volunteer must understand his or her role and responsibilities, and this starts with a clear description of the duties and responsibilities that each volunteer is expected to carry out. Oversight can be conducted formally or informally, depending on the individuals or the tasks involved, but it must be done. In addition, oversight of volunteer activities can give team members the feeling that someone cares about their overall success.
- Clear levels of authority are necessary to ensure volunteers are working within the parameters of the job function. It is important for volunteers to feel empowered and creative to solve business issues. However, clearly defined levels of authority help keep a budget, deadlines, deliverables, and results within the bounds of acceptability.
- Necessary training should be provided at the appropriate time. It can make a world of difference for a volunteer who is striving for excellence in his or her service to know how experts in the field carry out similar responsibilities. Training can be provided in the form of books, manuals, films, external seminars, or in-house training events tailored to the volunteers' level of commitment or experience. For those individuals volunteering their services on an ongoing basis, updated training with new materials and information should be available every year.
- If an organization is asking volunteers to undertake specific responsibilities or services, the organization must be serious about the importance of any mandate. There are many organizations needing volunteers, and the daily demands on our time should convince us to respect each other's time. By not providing the necessary tools and resources to get the job done, an organization is wasting precious time and energy and possibly losing the interest of the volunteer.
- Because we are all human, nothing motivates involved individuals and potential volunteers as much as regular public recognition. The impact of public recognition can be both powerful and inspiring as the organization shows its appreciation in honoring individual volunteers. Rewards, unlike recognition, should be private and do not need to be extravagant. Often, taking the time to say thank you or to acknowledge a job well done can create an appreciative culture. Such organizational cultures can in turn allow for strong team environments to flourish.

The most common reason for not volunteering one's time is the "lack of time." We live in a society where daily demands are enormous, and for many in the United States, the abundance of material goods is overwhelming. However, volunteering one's time, talent, or money can range anywhere from 1 hour per month to several hours per day. Helping to reaffirm the dignity of humanity can be reflected by many simple forms of kindness such as providing a meal to the homeless, donating a coat to a child in need, or visiting a forgotten someone in a nursing home. Simply being observant of the needs of people around us can be a great starting place to volunteer. Random acts of kindness can be inspiring and uplifting, and they may just motivate other people to give and help others out of their own creative resources.

Von Neumann-Morgenstern Utility Function

John von Neumann and Oskar Morgenstern extended the theory of consumer preferences by incorporating a theory of behavior toward risk variance. The utility function that bears their names arises from the expected utility hypothesis. Basically, when a consumer is faced with a choice of items or outcomes subject to various levels of chance, the optimal decision will be the one that maximizes the expected value of the utility (i.e., satisfaction) derived from the choice made. Expected value is the sum of the products of the various utilities and their associated probabilities. The consumer is expected to be able to rank the items or outcomes in terms of preference; but the expected value will be conditioned by their probability of occurrence.

The von Neumann-Morgenstern utility function can be used to explain risk-averse, risk-neutral, and risk-loving behavior. For example, consider a project a firm undertook last year having particular probabilities for three possible payoffs. These payoffs were \$10, \$20, or \$30. The respective probabilities of receiving them were 20%, 50%, and 30%. Thus, expected payoff from the project was \$10(0.2) + \$20(0.5) + \$30(0.3) = \$21. This year, the firm will again undertake the project, but this time, the respective probabilities for the payoffs have changed to 25%, 40%, and 35%. It is easy to verify that the expected payoff is still \$21. In other words, mathematically speaking, nothing has changed. It is also true that the probabilities of the lowest and highest payoffs rose at the expense of the middle one, which means there is more variance (or risk) associated with the possible payoffs. The question to pose to the firm is whether or not it will adjust its utility derived from the project despite the project's having the same expected value from one year to the next. If the firm values both years equally, it is said to be risk neutral. The implication is that it equally values a guaranteed payoff of \$21 with any set of probabilistic payoffs whose expected value is also \$21.

If the firm preferred last year's project environment to this year's, it places higher value on less variability in payoffs. In that regard, by preferring more certainty, the firm is risk averse. Finally, if the increase in variability is actually preferred by the firm, it is said to be risk loving. In a gambling context, a risk averter puts higher utility on the expected value of the gamble than on taking the gamble itself. Conversely, a risk lover prefers to take the gamble rather than settle for a payoff equal to the expected value of that gamble. The implication of the expected utility hypothesis, therefore, is that consumers and firms seek to maximize the expectation of utility rather than monetary values alone. Since utility functions are subjective, different firms and people can approach any given risky event with quite different valuations. For example, the agency problem recognizes that a corporation's board of directors may be more risk loving than its shareholders and, therefore, would evaluate the choice of corporate transactions and investments quite differently even when all monetary values are known by all parties.

Preferences may also be affected by the status of an item. Consider the difference between something possessed (i.e., with certainty) and something sought out (i.e., subject to uncertainty). Sellers may overvalue items relative to their potential buyers. This endowment effect, first noted by Richard Thaler, is also predicted by the prospect theory of Daniel Kahneman and Amos Tversky. Risk aversion may be explained in the sense that the disutility of risking the loss of \$1 is higher than the utility of winning \$1. A classic example of this risk aversion comes from the famous St. Petersburg Paradox that offers a person a series of possible payoffs starting with a 50% chance to win \$1, a 25% chance to win \$2, a 12.5% chance to win \$4, and so on. The expected value of this gamble is infinitely large. But how much money would someone pay for the privilege to take this gamble? The fact that the payment (if any) would obviously be very small relative to the expected payoff shows that individuals do account for risk and evaluate the utility derived from accepting or rejecting it. Risk loving may also be explained in terms of status. Individuals may be more apt to take a risk if they see no other way to improve a given situation. For example, patients risking their lives with experimental drugs demonstrate a choice likely to be positively correlated with the gravity of their illnesses.

In summary, the von Neumann-Morgenstern utility function adds the dimension of risk assessment to the valuation of goods, services, and outcomes. As such, utility maximization is necessarily more subjective than when choices are subject to certainty.

Wage-and-Price Controls

Wage Controls

Wage controls refer to a form of government intervention where a minimum or a maximum is imposed on wages. Imposing a minimum, or a floor, is aimed at securing a living wage for labor. Imposing a maximum, or a ceiling, on the other hand, is directed at curbing inflation. Wage controls are also considered as a social measure to prevent exploitation of labor. Wage controls are usually used in times of economic instability. Minimum wage, which was first introduced in the United States after the Great Depression, is an example of wage floors.

Some economists argue against wage floors. They contend that wage floors would create surpluses. Since wage floors cause wages to be higher than they would be under free market, employers would not have the incentive to hire as much labor. Thus, wage floors, while providing a living wage for those who have a job, would increase unemployment.

Price Controls

Price controls refer to a form of government intervention where a minimum or a maximum is imposed on the prices of some goods and services. Imposing a maximum, or a ceiling, is aimed at reducing inflation and keeping prices of these goods and services from increasing dramatically. Usually, price ceilings are used in times of economic instability resulting from wars or natural disasters. The prices of goods and services under a price ceiling would be less than their prices under free market. For example, during the 1970s the U.S. government used price controls to prevent the prices of gasoline from increasing; a price ceiling was imposed. Price controls were also imposed during World War II, the Vietnam War, and the Korean War.

Most economists do not favor the use of price controls, at least not for long periods of time. The argument is that the use of price ceilings produces shortages since the demand for the products or services would be much higher than the supply. Supply would not increase to meet the higher demand due to the imposed price ceiling. The price ceiling would make it not profitable for producers to increase supply. The shortages would thus be seen in the form of waiting lines and deteriorating quality. In addition, price ceilings may create black markets where price-controlled goods and service would be traded.

At present, the use of price controls in the pharmaceuticals industry to regulate the prices of prescription drugs is debated. On the one hand, imposing price ceilings on prescription drugs would make them more affordable to patients. On the other hand, price ceilings would have a negative impact on research and development in the pharmaceuticals industry, as investment capital would seek opportunities that yield higher returns.

Wages for Housework

Wages for housework is a proposal to compensate for work done in the private or domestic sphere. Such work includes, but is not limited to, providing household services that facilitate the laborer's entry into the public workplace (cooking, cleaning, etc.), reproductive activities such as bearing and rearing children, and caring for elderly parents and other dependent persons. The wages-for-housework campaign is usually rooted in the Marxist critique of capitalism; it was advanced by numerous social activists, anticapitalists, and feminists dating back at least as far as the mid-1800s.

Prior to the age of industrialism, the domestic sphere was not sharply split from the productive sphere. Textiles and agricultural products were created within domestic units. With the rise of industrialism, the public workplace replaced the private home for the creation of products. Disproportionately, women were excluded from industry. Those tasks left to women to perform in the home such as child care, laundry, and meal preparation were viewed as nonproductive because they did not earn a wage.

In the late 1800s, Friedrich Engels's *The Origin of the Family, Private Property, and the State* and August Bebel's *Women and Socialism* brought into stark relief the historical development of woman's social confinement within the home as well as the circumstances accounting for the devaluation of domestic labor under capitalism. Their arguments set the foundation for subsequent developments in the campaign to obtain wages for housework.

With the influx of women into the workforce in the 1970s and 1980s, the argument in favor of compensation for domestic labor shifted slightly to acknowledge the hazards of the double workweek on women: Women who entered the labor market were often expected to continue to fulfill all the household duties once they returned home. Middle- and upper-class women could employ domestic labor but, more often than not, poor and minority women were recruited to fill the space left in the home when women joined the public workforce. Usually, those hired to perform domestic duties were paid at wages far below what might be expected in the public sphere.

Proponents of the wages-for-housework campaign are not in agreement over the justification or means of a wages-for-housework program, but in general they argue that women's domestic work creates *use-value* (a Marxist term that means the value of products for immediate consumption that satisfy human desires). The work to care for a family and home provides the conditions for all other labor not only because capitalism needs women to produce excess labor power in the form of children but also because the work women do in private provides the necessary conditions for paid laborers to work in the productive sphere.

An alternative to paying wages for housework is to convert work performed in the home to public economy work through the socialization of domestic labor. That is, the implementation of state-supported services could replace much of the cooking, child care, and even cleaning that constitutes housework. Margaret Benston noted that unless the women were freed from the traditional work they performed in the home, their participation in the nondomestic workforce would be a step back. She argued that the socialization of housework was the single most important factor to end the oppression of women as a group and to give individual women their due respect.

Capitalism, according to advocates of the wages-for-housework campaign, undervalues all caregiving work thereby subjecting women to economic inequality and poverty regardless of whether that caregiving is in the labor market or outside the labor market. Wages for housework would alter social perceptions of caregiving work by attaching a value to that work in the home and closing the division between public and private (domestic sphere) production. A wages-for-housework program could be paid for by the state with money garnered through universal taxes or family-specific taxes.

Contemporary articulations of the wages-for-housework argument compare it with survivor's insurance or social security. The government would disburse regular payments to primary caregivers—male or female—based on total household income and with no restrictions on use of funds. Caregivers could elect to use the financial assistance to purchase quality child care or household assistance, or even to further education or job-training for parents.

Opponents of the wages-for-housework campaign argue that it would entrench a system of gendered division of labor, keep women in the home, and devalue reproductive activity. By receiving a wage for work that they already do or are expected to do, women would be less inclined to develop their talents for service in the public sphere. To encourage men to assume responsibility for housework, wages would have to compete with market wages. In addition, paying a wage for caregiving, opponents argue, turns loving relations or loving activity into commodities thereby transforming familial relations into exchange relations within a capitalist system.

Other objections focus on the feasibility of wages for housework or the infringement on personal liberty that would be required in such a program. Opponents argue that taxing single people to pay for a service they do not directly use is unjust. The distribution of the wages poses additional problems in that a system of accountability is necessary to ensure that job requirements are fulfilled. Opponents fear that if the state pays for domestic labor, privacy and personal liberty would be sacrificed.

Although no thorough system of wages for housework exists in the United States, certain social programs have contributed to changing social perceptions about the value of work performed in the domestic sphere. The work that goes into child care, care of elderly parents, and other adults in need, as well as day-to-day family and household maintenance have captured the attention of social policy, ceasing to be solely private family matters. The wages-for-housework campaigns played an important role in insisting that domestic laborers receive some level of social protection.

Warranties

Warranties are promises or guarantees made by a seller or lessor about the characteristics or quality of property, goods, or services, on which the purchaser or lessee relies. Warranties are either "express" (i.e., explicit oral or written representations about the quality or identity of the item) or "implied" (i.e., inferred into the contract in accordance with legal requirements). Statements of general opinion or clearly exaggerated claims (called puffery) are not considered warranties. In the event that a warranty is breached, the law usually provides the injured party with the right to monetary damages, repair of the original good, or replacement with substitute goods.

The Uniform Commercial Code (UCC), with its warranty provisions for the sale and lease of goods contained in Articles 2 and 2A, respectively, serves as the primary authoritative law on warranties in the United States. The United Nations Convention on Contracts for the International Sale of Goods (CISG) provides similar warranty rights and duties for certain buyers and sellers involved in global commerce. The CISG's warranty provisions (Articles 35–44) are tailored after the UCC, but contain some important distinctions. This entry looks at the warranty of title, the implied warranties of merchantability and of fitness for a particular purpose, and at express warranties (especially in general as to consumer goods).

Brief History of Warranties

The freedom to contract as desired was a much protected legal principle under early common law, and still is in many ways. Caveat emptor, let the buyer beware, was a natural consequence of such a principle since each party was entitled to enter into a contract as they chose. However, the freedom was not so absolute as to ignore how fraud or duress would impair said freedom and the resultant contract. In that same vein, failure to satisfy a promise about the good as to quality or type would also invalidate a contract as failing to meet its warranty. But it had to be a very specific warranty and expressly communicated as being a warranty to qualify. Not until the late 1800s was the warranty doctrine expanded to include positive affirmations or representations about the character or quality of an article sold. The common law continued to develop warranty law so that an implied warranty of safety for food and drink began in the early 1900s and was then expanded to include consumer products in the 1960s.

Originally, warranties also contained a privity requirement (i.e., any duties or protections imposed by warranty or other legal doctrine extended only to those directly involved in the sales transaction). To protect the consumer, the privity requirement was slowly reduced and then completely discarded as industrialized society, and its chain of distribution caused the relationship between manufacturer and the ultimate consumer to become more distant and thus devoid of the built-in safeguards of face-to-face contracts. Thus, manufacturers, sellers, and lessors became responsible for the ultimate consumer under warranty, negligence, and strict liability theories for the quality and safety of their goods and services. Horizontal privity was also relaxed so as to extend warranty coverage to the buyer's family, household, guests, and even to bystanders in some states.

But it was the UCC, first written in the 1940s, which would expand, standardize, and stabilize sales law (the Uniform Sales Act of 1906 was the precursor to Article 2 of the UCC, although not as widely adopted). The official text of the UCC was dated 1962 and included both express and implied warranties, and since then has been adopted in some form by the entire United States. Also, the federal Magnuson-Moss Warranty Act was passed in 1975 to ensure that sellers of consumer products clearly state the coverage of warranties. Furthermore, the United Nations Convention on CISG was originally passed in 1980 and has been adopted by approximately 68 countries, including the United States (as of 2006).

During this same period, tort law was also addressing product safety through the theories of negligence and then strict liability. Although there is some convergence in the coverage, warranties are based in contract, not in tort, and are a bit more limited in the amount of damages available as a remedy. Yet torts are mentioned very briefly in a few places below to better demonstrate the dimensions of warranty law.

Social and Ethical Implications

The issue surrounding warranties is to what degree should manufacturers, sellers, and lessors be responsible for the risk of defects and nonconformity in goods that they distribute. The ethical basis for warranties is basic fairness in commercial dealings. The risk in commercial dealings has over time shifted from the buyer, under the theory of caveat emptor, to the seller, under warranty and other theories. The consumer protection movement and related legislation of the 1960s was the highpoint in that shift of responsibilities and duties. Since the seller usually has more information, expertise, and control over the item in question, the law has deemed it fair and just to shift the risk. The consumer's vulnerability and dependence supports this approach. And even when the seller may be unaware of certain defects, the risk is still weighted toward the seller because they are believed to be more capable of absorbing the costs than the consumer, and in a better position to protect against it. Thus, they are encouraged to do so by the law of warranties. Some think that warranty laws are still lacking since they can be explicitly waived in the contract. Plus, consumers usually lack the bargaining power to push for better warranties.

The three primary theories protecting consumers and imposing greater duties on sellers are contractual theory, due care theory, and strict liability theory. Each essentially attaches a guarantee to the product intended to promote product safety, quality, and conformity. Although not technically a warranty, the duty imposed by the due care theory on manufacturers to avoid negligence and act as a reasonable person to protect consumers as to the design, materials, production, control, packaging, and information basically extends a promise of product safety and compliance to consumers in these related areas. However, the imprecision of measuring due care and the possibility of unknown dangers render it, like warranty theory, less than perfect.

Under the contractual theory, the duties of the sellers to consumers are contained implicitly or explicitly in the sales contract, which are the basis of the warranties addressed in this entry. Warranties were designed in part to remedy the imbalance of power between buyers and sellers in commercial transactions. Warranties also hoped to provide some stability, regularity, and reliability in contractual relationships.

However, the imperfection inherent in sales contracts and their guarantees, the continuing unequal bargaining and evaluative power between buyers and sellers (especially where there is lack of contract privity), and the ability of sellers to waive such warranties raised serious reservations about the adequacy of the contractual theory, especially as to product safety. These concerns in consumer protection contributed to the law of strict liability in tort, which holds manufacturers responsible for almost any injury resulting from defects in their products, even if they used reasonable care in all aspects of the production and distribution process. This presumably motivates the manufacturer to ensure product safety and consumer protection in ways that warranty law is unable.

These risks are even greater when international sales are involved. When dealing in overseas commerce, businesses must address the diversity in language, standards, and law among various countries. The CISG tries to provide some guidance for such sales agreements, including the expectation of warranties. Yet the parties must still take the time to address the social and ethical challenges created by these cultural differences between nations (especially since many countries have yet to adopt the CISG).

One ethical issue raised by these different international standards involves the requirement to give notice for nonconforming goods. Most economically and technologically advanced countries legally require notice to be given rather quickly (within a year at most), while developing countries find such short time periods very challenging, even unrealistic. The CISG addresses this difficulty by allowing examination of the goods for defects to occur within a period that is “practicable under the circumstances” and notice of nonconformity to be given within “a reasonable time” (not to exceed 2 years). This entry looks at the warranty of title, the implied warranties of merchantability and of fitness for a particular purpose, and at express warranties in general, especially as to consumer goods.

Warranty of Title

The sale of real property such as land, buildings, and other types of real estate generally comes with a warranty of title (leases come with a warranty for possession and use). A general warranty deed guarantees that the title to the property is free from any claims. If another party such as a bank has a lien against the property, then the seller will offer a quitclaim deed, which makes no assurances as to the title of the property and protects the seller from potential liability to the buyer if a claim is made on the property. Otherwise, the seller is liable as guaranteeing transfer of title free from any encumbrances. A special warranty deed ensures that no claims were made against the property while in the possession of the current owner. As to buildings, warranties may be made about the quality of materials, the adherence to building codes, and its ability to accommodate residents. The latter is an implied warranty of habitability that exists with any lease of residential property. The landlord is responsible for providing conditions necessary for living (e.g., water, heat, electricity, and safety requirements). Tenants usually withhold rent if said warranty is breached.

A warranty of title similarly exists under Section 2-312 of the UCC for the sale of goods (or a warranty for use and possession when a lease under Section 2A-211). Although the warranty is implicitly conveyed with the sale of the good, it is not identified as an implied warranty. The warranty may be disclaimed by a clearly communicated writing. However, a sheriff’s sale is an example when the events surrounding the purchase eliminate the warranty since title is known not to be guaranteed under such circumstances. A related warranty against infringement exists when a merchant who regularly deals in patents or types of intellectual property at issue sells such goods. Said merchant warrants that the goods are passed without any claim of a third person as to infringement on the property rights. For example, the seller of compact discs or of computer software warrants, unless otherwise disclaimed, that said goods are not violating copyright laws or rights of a third party.

Express Warranties

Section 2-313 of the UCC indicates that the seller creates an express warranty by any affirmation of fact or promise, description, or use of sample or model that relates to the goods and becomes part of the basis of the bargain. Therefore, the seller’s (or lessor’s) representations about the quality of a product, its uses, and whether it is new or used are all warranties. For example, representations about gas mileage create a warranty about a car’s performance in the sale of that good. Software licenses commonly contain express warranties about the software’s material conformity to certain specifications. However, the licensor often limits the warranty with problems surrounding installation, operation, transit, modification, and hardware.

Advertisements, free samples, models, and other sales materials may create express warranties. Samples come directly from the group of products to be purchased, while a model is a representation of the product when a specific sample is unavailable. International companies need to pay closer attention to their use of samples, models, and the like because they play a significant role in international sales and are given special recognition under the CISG (since communication challenges frequently exist when dealing with different countries and languages).

The specificity of the claim made is a major factor in determining if a warranty has in fact been manifested. Opinions, unless by an expert, do not create a warranty. Usually, express warranties reduced to writing cannot be waived by a contradictory disclaimer. The courts will try to read the express warranty and the disclaimer together so as to provide reasonable protection. Any inconsistency between the two is construed in favor of warranty protection. However, oral warranties may be waived by clear and conspicuous language under the UCC, and by less formal methods under the CISG.

Interestingly, insurance policies include important warranties and assurances made by purchaser (the insured) that serve as the basis of the contractual policy. For example, an insured makes promises about his age and prior medical conditions in connection with a health insurance policy or about the number of drivers and accident history in a car insurance policy. Insurance warranties are "affirmative" (representations about conditions at the time the contract was executed) or "promissory" (about anticipated events for the duration of the policy). Misrepresentations by the insured may allow the seller (insurer) to cancel the policy or to deny coverage, depending on the relevant laws protecting the insured's interest.

Implied Warranties

As stated earlier, implied warranties are not expressly represented in the written or oral sales agreement, but are created and imposed through application of law, usually the UCC. The two primary implied warranties that accompany the sale or lease of goods are the *implied warranty of merchantability* and the *implied warranty of fitness for particular purpose.* They do not apply to finance leases. As its name denotes, the warranty of merchantability, Section 2-314 of the UCC for sales and 2A-212 for leases, imposes on a *merchant* (someone who ordinarily deals in goods of the kind sold) the obligation to sell or lease goods that pass without objection, are of average quality, fit for the ordinary purpose of such goods, are of uniform quality, are adequately packaged and labeled, and conform to promises made on the label. Merchantable goods are of the type that are "honestly resalable in the normal course of business" (Comment 8 for 2-314(2)). The warranty occurs automatically on the sale, and need not be the basis for the bargain. Other implied warranties may arise from course of dealing or trade usage (under Section 2-314(3)(a)).

Most implied warranties can be waived orally or in writing, but must specify the word "merchantability" (and conspicuously) when disclaiming that specific warranty. Other warranties may also be waived by "as is" language or by a course of dealing that has usually disallowed said warranty. For instance, most directly downloadable software license agreements contain a warranty waiver or disclaimer that must be agreed to (by checking and clicking the box) before the software can in fact be downloaded.

The implied warranty for *fitness for a particular purpose* (which obviously differs from the *ordinary purpose* standard of the warranty of merchantability) applies when a buyer relies on the seller's skill or judgment in choosing a product for a particular purpose, and when the seller knows or should know the buyer's purpose. For example, a bike buyer explains how he needs a bike that can handle a certain type of mountain terrain. In recommending a certain type of bike, the store owner (whether or not he or she is a merchant) is held to an implied warranty of fitness for a particular purpose (of the bike's ability to handle mountain terrain). If the bike cannot actually perform as expected, the implied warranty for fitness for a particular purpose has been breached and the bike buyer could most likely return the bike.

This warranty may also be waived by a writing that says "as is" or "with all faults." However, an oral waiver is insufficient. Yet it is very important to remember that other countries and the CISG allow waivers, disclaimers, or limitations of warranties without the same formality of language and conspicuousness required by the UCC. Refusal (to a request from the seller), but not a unilateral failure, to examine the goods for defects waives implied warranties as to the defects that would have been observable on said inspection. Furthermore, a buyer who assumes a discovered and known risk is precluded from recovering damages resulting from such use. Although the seller may also limit certain remedies that the buyer has for breach of warranty, the seller may not limit or exclude the buyer's right to damages from injury or try to shorten the statute of limitations.

To avoid some of the problems of disclaimers, waivers, and misunderstood or deceptive warranties, the federal Magnuson-Moss Warranty Act of 1975 requires sellers of consumer products to articulate clearly and simply the coverage of the warranty, to identify it as full (guarantees repair or replacement) or limited, and to retain all implied warranties when providing a written warranty of any sort. For example, if a company provides a written warranty for its toys, the company cannot disclaim the implied warranties.

Internationally, the CISG, Article 35, contains similar warranty provisions: The seller must provide goods that are (1) fit for the ordinary purpose of such goods, (2) fit for any particular purpose made known, (3) possess the same qualities of a model or sample, and (4) packaged in the normal manner for such goods. The packaging is especially important in light of international deliveries. However, to find a breach, the CISG demands a more substantial deviation than what the UCC requires.

Conclusion

Express or implied warranties are promises about the characteristics or quality of property, goods, or services, on which the purchaser or lessee relies to secure receipt of conforming goods or to provide a remedy for breach of the agreement by the seller. Warranties, which exist under the UCC, CISG, and similar laws in other countries, combine with negligence and strict liability to provide protection to consumers as to product safety and contractual integrity.

Wealth

Wealth is everything that can be exchanged for money, goods, or services. Originally meaning a state of well-being, it has come to signify material comfort. Thus, it includes material goods and rights to material goods or services represented by money or other financial assets. An individual's or a family's wealth is the dollar value of its assets minus its liabilities at any point in time. Income, on the other hand, is a flow of money. Thus, wealth can be thought of as accumulated income.

The oldest source of wealth was land, which for centuries was the basis of the great European estates. Because of its solidity and permanence, land can be handed down through generations and kept in a family more easily than other forms of wealth. The other great sources of wealth have been trade and manufacture. Today, wealth is generally represented not by land or other hard assets but by financial assets—the stocks, bonds, and other financial instruments that represent an individual's claim on society's resources.

Societal resources consist of anything that can be used to produce goods or services, including land and other natural resources such as minerals and forests; the talents and skills of the population, or human resources; and capital, or man-made resources such as factories and warehouses. Society employs these resources to create wealth; the more efficiently and fully a society uses its resources the more wealth it will create. Because human wants exceed available resources, however, every society must decide what goods and services to produce and how to distribute the production among its members. Therefore, societal well-being may depend as much on the distribution of wealth as on its production.

Historical Attitudes Toward Wealth

The ancient world considered wealth both necessary and good. It was necessary for independence and leisure and thus for freedom. Wealth signified heroism and virtue; the Greek poet Homer depicted the wealthy as deserving their riches through divine right or courage in battle. The poor aroused little sympathy. Their lack of wealth signified their inferiority and lack of virtue.

As men began to accumulate wealth through trade rather than through birth, the view arose that wealth corrupted, at least in the hands of the wrong people. The Bible condemned the greed and vanity of the rich and held that those who gave of their wealth to the poor would be rewarded in the hereafter. Yet the Bible also says that riches are a sign of God's blessing.

Such ambivalent attitudes toward wealth have endured in the modern world. With the rise of capitalism, wealth became a sign of industriousness. The early church disapproved of the business spirit and of profit as the goal of a vocation. This disapproval was overcome by Calvinism, at least in its later stages, which approved of acquisitiveness and the capitalist ethic. In 1899, Thorstein Veblen wrote that the possession of wealth confers honor and that what previously had been evidence of efficiency had become a meritorious thing in itself. Today's society maintains this schizophrenic view of wealth, viewing it alternatively as a sign of honor, virtue, and good breeding and as an unjustified hoarding of society's resources.

Distributive Justice

According to Aristotle all men agreed that in a just society the distribution of wealth must be based on desert. They disagreed on what constituted desert: Criteria included free birth, noble birth, and virtue. The debate continues today, although some now deny that desert is even relevant.

Many observers believe that ideally society's resources should be distributed equally. They argue that since people are morally equal and entitled to equal political rights, they should also receive equal economic shares. But even these observers recognize that enforcing an equal distribution of wealth would require constant and overbearing state intervention. Therefore, they assert that inequalities must be based on some relevant ethical principle and that, whichever principle society adopts, every citizen is entitled to a minimum share of society's wealth sufficient to ensure his or her health and welfare.

Some argue that a market economy results in a just distribution because it allocates wealth according to ability and effort. Thus, a person's wealth is determined by his or her contribution to society. Since in a market economy the value of one's contribution is the price paid by a willing buyer, people's material rewards are based on their value to others.

Yet all people depend on the vast societal infrastructure that is often taken for granted—security, roads, education, and more. Many observers believe that it is impossible to isolate the contribution of any individual; society's resources are a product of a complex and interdependent economic system. Moreover, they add, in the absence of the community, the welfare of all would be so low that no individual has a moral claim to a substantial portion of those resources. Given this reality, the very notion of an individual's "property" is a societal construct, and no one can legitimately be said to "deserve" his or her share.

Still others, notably John Rawls, argue that, because people have done nothing to earn the natural capacities they are born with, distribution based on ability has no moral basis. Moreover, effort is influenced by one's natural abilities and the alternatives open to him or her, which are not distributed equally. The more able are also more likely to pursue success. Consequently, effort is also a morally insufficient basis on which to distribute society's wealth. Rawls, for one, ultimately rejects the notion of desert. He argues that, if people formed a society without knowing their place in it, they would be risk averse: They would create a society in which the poorest people (which could include them) were better off than in any alternative society. Rawls therefore concludes that departures from equality in the distribution of resources are justified only if they help the least well-off.

Libertarians, most prominently Robert Nozick, also deny the relevance of desert, but from a much different perspective. They reject any theory of distribution that relies on a particular end state; that is, that bases the justness of a distribution on a given allocation. Instead, they focus on process: A distribution is just if it arises from another just distribution by legitimate means. Therefore, the possession of wealth is just if the wealth was acquired originally by just means or, after a just acquisition, by one or more voluntary transfers.

Others deny that it can be demonstrated that any wealth was originally acquired by just means. Writing in the 17th century, John Locke based the right to property on the mixing of one's labor with the land. Today, some argue that this conception, though appropriate for a simple agrarian society, does not hold in a complex modern economy in which the value added by any individual's labor cannot be isolated. Others argue that, if property is traced back far enough, it will be discovered that almost all property rights originated through force. Therefore, voluntary transfer cannot serve as a moral basis for the possession of wealth.

Inequality

Capitalist economies generate great disparities of wealth. Although wealth was distributed fairly evenly in early America, with the rise of industrial capitalism in the 19th and early 20th centuries, inequality increased dramatically. After a decline from about 1930 to 1950, inequality began to rise again and increased steeply during the 1980s and 1990s. In 1976, the wealthiest 1% of the population owned 20% of the nation's wealth. By 1999, the top 1% had doubled its share to 40% and owned more wealth than the bottom 95%. In 1997, the top 10% of the population owned 73% of the wealth. The United States had changed from one of the most egalitarian countries in the industrialized world to the most unequal.

Many observers believe that inequality has value because it provides an incentive to produce. If differences in contribution did not result in differences in reward, people would have little reason to assume risk or to put forth exceptional effort. Inequality, therefore, benefits everyone by increasing growth and economic output.

Others argue that inequality denies the moral equivalence of people and leads to the breakdown of social order if too many people believe they have not received their fair share and therefore believe they have little stake in society. Although some assert that moral equality requires only equal opportunity, others argue that extreme inequality makes it impossible to sustain the belief that equal opportunity exists. They argue that extreme inequality destroys incentive because people believe that regardless of their efforts they will not prosper.

Inheritance

Inheritance poses the starkest contrast to an ethic of desert and the greatest challenge to an ethic of equality. Critics of inheritance argue that because the recipients have done nothing to earn their bequests, they have no moral claim to them. Since inheritance is unrelated to contribution it also does not create incentives. Even those who believe that society's wealth is distributed according to individual contribution acknowledge that inheritance is the great exception. Therefore, many believe that the state has a greater right to seize inherited wealth through confiscatory estate taxes than to redistribute wealth through an income tax and social programs. These same critics assert that inheritance bears more responsibility for the unequal distribution of wealth than any other institution. According to this view, inheritance of great wealth provides an unfair advantage to a small number of individuals and perpetuates the concentration of wealth through generations.

Others argue, however, that the right to property necessarily implies the right to direct its disposition after one's death. The libertarian view emphasizes that since inheritance is the result of a voluntary transfer of assets, the concentration of wealth that results from inheritance is just. Because libertarians deny the ethical relevance of any particular distribution, they deny that inheritance presents a special case.

John Stuart Mill charted a middle course. Like today's libertarians, he believed that the essence of property was the right to exclusive possession of anything a person either produced or received by gift or fair agreement from others. He argued that without the power of bequest ownership was incomplete. Yet Mill believed that by permanently concentrating fortunes in few hands, inheritance conflicted with the interests of society. Therefore, he proposed that people should have the power to dispose of all their property by will but that the state should limit the amount any individual could inherit.

Wealth and Democracy

Inequality poses particular challenges in a democracy, in which political power is dispersed among the people rather than concentrated in an individual or a small group. Ideally, all citizens in a democracy are equally able to influence decisions that affect their lives. The wider the distribution of wealth, the greater the number of people who believe they have a stake in their society and the broader the political base for democratic institutions. Great concentration of wealth challenges the belief that people have a real say over the affairs of state and that democracy exists to serve the broader populace.

James Madison wrote that the unequal distribution of property was the greatest source of faction and animosity in politics and that the most important element of a well-constructed union was its tendency to control the violence of faction. Many believe that the great power of concentrated wealth puts today's democracy at risk. In 2000, the average winner of a U.S. Senate election spent almost $8 million. The expense of campaigning requires politicians to solicit funds from and therefore become beholden to wealthy donors; fewer than 1% of the population donates more than $200 to political candidates, while half of donors have incomes of at least a quarter million dollars per year.

This system leaves many citizens believing their interests are not represented. Nevertheless, some argue that the relationship between democracy and wealth is uncertain. They note that some relatively egalitarian societies have been undemocratic, while some democratic regimes have withstood even significant concentration of wealth.

The Responsibilities of Wealth

Because the community plays a vital role in the accumulation of wealth, some argue that those of great wealth owe society a special responsibility. American industrialist Andrew Carnegie was the most prominent spokesman for the view that, after providing moderately for themselves and their families, the wealthy should consider all additional wealth to be held in trust for the benefit of the community. Carnegie further held that the wealthy must devote their wealth to the community during their lifetimes, since it was no sacrifice to bequeath wealth at death.

Others do not begrudge the rich their wealth during their lifetimes, but argue in favor of high or even confiscatory estate taxes to ensure that great wealth is ultimately used to benefit the community. The appropriate level of the estate tax has been a perennial political issue in the United States. Not all the wealthy oppose high taxes; some of the country's richest individuals have lobbied to keep the estate tax in place.

Wealth Creation

Wealth is the ownership of assets that are valuable to satisfy human needs and wants. To create wealth is to produce or to cause an increase in these valuable assets, so that the original value is sustained, the factors of production continue in existence, and there is a surplus left over.

The complex and dynamic nature of human needs means that there are many forms of wealth that may be created. To facilitate communication and decision making about wealth creation, therefore, wealth is usually measured in terms of money. Monetary units and currency, however, are not themselves wealth. They represent claims on the things of value that may be owned in exchange for money. This difference between money and wealth is experienced by people who may hold a constant amount of money in an economy that goes through an inflationary period. Their wealth erodes because they can buy fewer items of value as prices increase, although they may have the same amount of money over the inflationary times.

Wealth creation is a rational activity when the benefits of increasing valuable assets exceed the costs of doing so, a condition that takes into account the life of the assets and the time value of wealth discounted at an appropriate interest rate. Typical activities that may satisfy this condition include search, discovery, and exploitation of new productive resources and innovative processes. A society that enables these entrepreneurial activities creates wealth and improves the quality of human life.

Wealth Creation as Rational Economic Action

Valuable assets may be consumed in the present, or they may be stored for future consumption, or they may be invested to create an additional quantity of valuable assets called wealth. Wealth creation is a rational economic activity when the benefits of increasing valuable assets exceed the costs of doing so. This approach to wealth creation implies a choice, and the most often used economic method to make this choice is a cost-benefit analysis that compares the investment costs with the value of wealth likely to be created.

Cost-benefit analysis only gives incomplete guidance, though, because benefits and costs may not be distributed fairly, and the ethical dimensions of wealth creation are not likely to be captured in its measurement techniques. More than 2,000 years ago, for example, the Greek philosopher Aristotle distinguished between pecuniary and socially desirable goals of wealth creation and warned that if money and profit are the only goals then there is no natural limit on greed and corruption.

Important considerations for the ethics of wealth creation include the economic system with which a society creates wealth, the sustainability of these activities for use by future generations, and the justice in the distribution of the wealth that is created.

Economic Systems for Wealth Creation

One reason that productive assets are valued is that they are scarce, and people who believe they can create the most value from them have an incentive to bid up their value until the cost absorbs all the wealth that can be created from them. A system of voluntary exchange contracts between self-interested buyers and sellers informed by market prices is one economic system that enables this wealth-creation process. This market system to create wealth depends, in part, on the trustworthiness of the exchange parties, on government regulations to maintain stable market functions, and on judicial protection for contracting. Advocates of market systems argue that over the long term it is the most efficient path to wealth creation. The failures of the market system to create sufficient wealth in all sectors of society, however, have led some to seek alternative economic systems.

Socialism is an alternative system of wealth creation based on public policy control of productive assets. Rational decision making for wealth creation under central planning forms of socialism, however, is hindered by the planners' deficiency of requisite information about value preferences and prices. In addition, socialism limits individual freedom to pursue a personal path to create wealth. Market socialism proposes to remedy these deficiencies by preserving competitive enterprises empowered to negotiate and enter into voluntary market exchanges, and combining the incentives and information of this marketplace with a socialist system of banking and capital allocation driven by public policy choices for investment.

Issues of Sustainability of Wealth Creation Activities

Some argue that current wealth creation activities are justified only when they do not exhaust the productive resources for future generations. For example, wealth creation activities that require petroleum products ought to consider the rate at which the world's supply of oil is being used up. An economist might argue that the rate of change in the price of exhaustible resources relative to the cost of usage is all the information needed to determine the appropriate rate of depletion. In this economic analysis, if the value of the exhaustible resource over time is rising more quickly than the cost to put it into use, then holding the resource "in the ground" can be an excellent way to create future wealth. Conversely, it may be best to exploit them quickly if the usage cost is rising at a faster rate. In this latter case, the economist notes that the faster depletion increases the resource scarcity, and the laws of supply and demand lead to higher prices offered by buyers that induce more supply than would be economically feasible at the lower price.

This economic analysis of prices and costs for exhaustible resources over time assumes that the appropriate values placed on them by future generations can be accurately forecast by current decision makers. This assumption may be optimistic at best and self-serving at worst. Accordingly, some suggest that the fair way to create wealth today from exhaustible resources is to deplete them at a constant and sustainable rate over time. This approach may substitute one type of myopia for another, however, because we cannot know today what innovations, changes in taste, demographic conditions, and resource discoveries will prevail in the future. For example, we have the English expression "not worth his salt," and the word "salary," because in the past edible salt was a valuable, scarce, nonrenewable resource and a form of wealth.

Issues of Justice in the Distribution of New Wealth

Pareto equilibrium and Rawls's theory of justice are two philosophical approaches to determine the fair distribution of wealth. A Pareto equilibrium framework identifies fairness in terms of three distributive consequences of wealth-creating activities—positive consequences that improve wealth, negative consequences that harm wealth, and neutral consequences with no meaningful impact. In this framework, an unfair action is one that has a negative consequence for some who cannot be compensated to at least a level of neutrality.

Rawls's theory of justice refines this formulation to impose a veil of ignorance over the decision to act so that a just wealth creation activity is one that is approved by someone who does not know place in the outcome. Such a condition of ignorance does not by itself define the moral rules that guide decisions to create wealth. For example, a free decision maker under a veil of ignorance may reasonably define ethical wealth creation as using assets as efficiently as possible, or creating the most wealth possible for the greatest number of people, or distributing newly created wealth as evenly as possible across all members of society. In fact, the freedom to choose how to pursue wealth creation is itself a form of liberty, a moral good that is valued by many.

The pursuit of wealth creation has not always been a freedom available to all. Historical institutions and old laws, though they may no longer govern society today, may in the past have served to either enable or hinder wealth creation and keep certain populations "in their social place." For example, the rate of wealth creation within minority populations of some societies today, such as African Americans in the United States or the Chinese in Indonesia, may be a function of past discrimination and institutional biases that affect historical paths of creation, distribution, investment, and inheritance. To address these historical obstacles to fair and just wealth creation today, some public policy programs to redistribute wealth may be appropriate, such as affirmative action programs in the United States.

Redistributive public policy is a form of social engineering, an intentional intervention in social processes to bring about patterns of activity and wealth creation preferred by public policy on behalf of the society. Social engineering gives all members of society who are interested in protecting and creating their wealth a stake in the public policy process. In political systems with social engineering, powerful stakeholders usually attempt to capture the public policy process for their own advantage. Diligent monitoring is required to avoid corruption as well as tyrannies of the majority or the wealthy.

Just as some minorities have been disadvantaged in the wealth-creation activities within their societies, so too some countries are disadvantaged in the global economy's dominant institutions that create wealth through world trade. For example, many governmental ministers of developing countries, as well as many spokespersons for nongovernmental organizations (NGOs), have criticized the World Trade Organization (WTO) for using tariffs, subsidies, and regulations that protect the wealth of developed countries by creating obstacles to exports from developing countries. Some who protest that wealth creation in a global economy threatens wealth creation in local economies have used civic disruption, mayhem, and violence to stop the activities of the WTO. In response, the WTO, whose professed mission is to lower barriers to trade and facilitate a global economic approach to wealth creation, often meets in remote locations that are not easily accessible to protestors.

Noneconomic Views of Ethical Wealth Creation

There is robust guidance, conversation, and debate within religious and faith-based institutions seeking to add to our understanding of the ethics of wealth creation. According to one popular English translation of the Koran, "The semblance of those who expend their wealth in the way of God is that of a grain of corn from which grow seven ears, each ear containing a hundred grains." One thread from Western religious thought is that for human beings to fully realize that they are created in the image of God implies that they are meant to be virtuous creators from the fruits of God's creations. Criticism of wealth creation as a myopic pursuit of profit is also reflected in modern spiritual or religious definitions of wealth creation. One important outcome from these discussions is the idea of social entrepreneurship, the creation of new business activity to direct our passions to serve and transform society.

Conclusion

A largely economic understanding of wealth creation has been influential in business and society. Our understanding of the ethics and morality of wealth creation arguably is well developed but less influential. If religious injunction or common fear of a future world of depleted resources can lead managers to cooperate with sincere integrity and social responsibility, then moral as well as economic wealth is more likely to be created.

Weber, M. (2002). *The Protestant ethic and the spirit of capitalism.* Los Angeles: Roxbury.

Weber, Max (1864–1920)

Max Weber was one of the leading scholars of his time in Germany and helped found modern sociology. He thought of sociology as a comprehensive science of social action, and his focus was on the subjective meaning that humans attach to their action and interactions within specific social contexts. His system of thought is one in which material interests and ideas are in constant interaction with each other. Thus, he wrote *The Protestant Ethic and the Spirit of Capitalism* in part to counter the prevailing Marxist view of dialectical materialism and wanted to show how the ideals and values of a particular religious system also entered into the shaping of history.

Weber sought to explain why the Industrial Revolution took place primarily in countries that were primarily Protestant in their religious orientation. In doing so, he was not denying material forces but only isolating the religious elements that he thought helped spur industrialization. Thus, he focused on the idea of the calling from Lutheran theology and the notion of predestination from Calvinism that he argued contributed to what he called the spirit of capitalism, the motivations and attitudes that were necessary for rapid industrialization to develop. People were called to work hard and do their best at whatever stations in life they found themselves. And to prove they were one of the elect, they were motivated to make a success of themselves by accumulating wealth and using it to create more wealth. Capitalist accumulation thus came from these aspects of the Protestant religion.

There has been much debate about this idea, but nonetheless, the Weber thesis has some explanatory power relative to the rise of capitalism. Weber also wrote extensively about the rise of modern bureaucracy in both the public and the private sectors of societies. He considered bureaucracy to be a particular case of rationalization applied to human organization. Such bureaucratic coordination of human action was the distinctive mark of modern social structures. Bureaucracies, Weber believed, are efficient goal-oriented organizations designed according to rational principles. This organizational device makes large-scale planning for the modern state and modern economy possible. The key to understanding the modern world, he argued, lies in the consequences of the growth in the power and scope of these organizations. The fact that individuals have limited responsibility and authority within an organization makes it unlikely that they will raise questions regarding the moral implications of the overall operation of the organization.

Welfare Economics

Welfare economics is the branch of economics that studies how individuals and societies exchange goods and the properties of the resulting outcomes. As such, it is concerned with the well-being of individuals and societies. Analyzing exchange and outcome is done through various means, including if the process needs to incorporate rights and duties for participants and whether or not outcomes are seen to be equitable or just.

The broad scope of the subject and the difficulties in defining concepts such as well-being and judging equity causes welfare economics to cut across several disciplines, including history, philosophy, political science, and sociology. Consequently, there is a long and rich literature associated with the topics. Moral philosophers, from Aristotle, the Scholastics, Hobbes, Nozick, and Rawls, have also focused on what constitute the properties of a "good" or just society and how such an outcome might be reached.

In economics, welfare economics originates in the claim by Adam Smith in *The Wealth of Nations* that self-interested individuals, acting in competitive markets, will reach an outcome that is a social optimum. Smith's evocative use of terms such as "the invisible hand," "natural law" and policy prescriptions of laissez-faire, and the paradoxical vision of people being led "as if" by an invisible hand to do a larger social good while they were merely trying to do well for themselves has been a cornerstone of classical and later neoclassical economics. His "invisible hand" as deus ex machina has also been mistaken by some to mean that Smith believed that there was a supraindividual purpose or design (teleogical explanation) to the individualist-based market system.

Smith's claims for markets and self-interest echoes that of the French Physiocratic school that coalesced around François Quesnay in the mid-1700s and with whom Smith had personal contact. Physiocratic doctrine stressed the interrelations of economic sectors and the self-governing and balancing flows of expenditures and resources among the sectors. The Physiocrats identified land as the source of all wealth, natural law as the source of motion in the system, and believed that governments should follow a policy of laissez-faire. This was symbolized in Quesnay's *Tableau Economique*, a circular-flow diagram anticipating the modern-day macroeconomic approach to national income and expenditure analysis.

Others have claimed that Smith's system, while conferring rights to voluntary exchange requires of us no duties (e.g., of honesty, probity). However, a reading of Smith's *Theory of Moral Sentiments* relying as it does on his *impartial spectator* representing society's interest by limiting individual's opportunistic behavior, and his view that competition among sellers would be a natural constraint on opportunism, should at least absolve Smith—if not all his later followers—of that charge.

For other schools of economic thought, for example, the Marxists, Smith's proposition has been viewed as hostilely as they view private property and the competitive process itself. The competitive exchange process, as Marx saw it, is based on asymmetric power and rights between the labor and capitalist classes. Still other schools of thought, for example, the Austrian School, have questioned the notion that there is enough knowledge available to allow individuals to home in to an end state of rest or systemic balance, called an equilibrium. Thus, in their view a social optimum, even if it exists, will not be reached in finite time. Consequently, they stress the subjective characteristics of the process individuals use to exchange and allocate goods.

Welfare economics uses microeconomic, or individual-level, techniques to determine the economic efficiency of outcomes. It seeks to find those outcomes that maximize social welfare by examining the economic activities of the individuals that comprise society. With such wide-ranging goals and scope, welfare economics includes the study of individual motivation, social goals, modes of organization, and operation that will potentially lead to coordinated social states. The field also considers the conditions under which social states might be compared and ranked in order that an optimum might be found.

Ranking criteria have been proposed by many, including the utilitarians following Bentham's principle of "the greatest happiness for the greatest number." For computation purposes, this requires making cardinally additive interpersonal utility comparisons to judge a policy change that redistributes goods. Critics of this approach attack the possibility of making interpersonal comparisons, thus attacking the idea of being able to compute a single number that represents the "greatest good." They ask, "If one person gains and another loses from a change, how can one meaningfully compare a gainer's gains with a loser's losses and sum the two effects?"

Neoclassical economists, following Pareto, relax the requirements that utility is interpersonally comparable and cardinally measurable, but claim that social optima can be found by using Pareto's efficiency criterion. A Pareto-efficient outcome is a distribution of goods such that any change away from it results in at least one person being made worse off. As highlighted by Wicksell, there are an infinite number of Pareto optima, with the social optimum being a proper subset of that set. Thus, following a search for a Pareto optimum is not the same thing as finding a social optimum.

Reflecting the broad scope of welfare economics, methodological approaches to the topic have ranged from the highly mathematically abstract to the literary and, at times, almost poetic. Meanwhile, the ends to which welfare economics has been put have ranged from using mathematical techniques to complete theoretical claims made by—or assumed to have been made by—earlier thinkers, for example, Smith, to practical issues in welfare economics dealing with assessing the outcomes of particular economic policies.

The Goal of Theoretical Welfare Economics

The goal of theoretical welfare economics initially was to formalize and examine the claims made for self-interest as the law of motion and competitive markets and as the system through which a social optimum could be reached. The focus was on answering the following three questions:

1. Under what conditions will individuals, operating in competitive markets, reach an outcome that maximizes the common good?
2. Can any desired distribution of income be reached by a competitive process?
3. Is there a way to aggregate over individual preferences to arrive at a societal preference ordering, consistent with the underlying individual preferences, assuring that a social optimum has been found?

The First Fundamental Theorem of Welfare Economics

The first theorem states that self-interested, utility-maximizing individuals operating in perfectly competitive markets will reach a Pareto optimum. The stimulus for proving this theorem lies in the writings of Smith and is referred to as the invisible hand theorem. The theorem itself was rigorously proven by Lerner, Lange, and Arrow in the 20th century using Walrasian general equilibrium techniques.

Proving the first theorem requires calculus, assuming both that all individual's preferences and all firm's profit functions are smoothly (i.e., no kinks) continuous and do not increase without bounds. Under these restrictions, which deny external effects, public goods, informational asymmetries, and any other types of market imperfections or failures, the first fundamental theorem may be proven.

The idea of searching for "common good" or a social optimum is changed to satisfying the Pareto efficiency criterion. This is not the same sense in which Smith viewed the concept of the common good. For example, Smith referred to "the annual revenue of society" as the aggregate value that competition would maximize. This is a construct closer to today's gross domestic product (GDP) than it is to Pareto efficiency. Smith's construct, and the definition of GDP, corresponds more closely to the idea of the size of the nation's output, where a larger output is preferred to a smaller one.

Pareto efficiency may hold for any given GDP, not just the largest conceivable given the available resources. As such, proving Pareto efficiency says very little about the size of the national output, only that it is being produced most (Pareto) efficiently.

Smith's invisible hand is actualized through the price system where changing prices alter incentives and coordinate self-interested behavior to bring about a state of balance or equilibrium, where the quantity supplied equals the quantity demanded, in each market. Each producer faces the same prices, hence—motivated by profit maximization—seeks to produce where marginal cost equals price, and the fact that all producers of a given good face the same price equates marginal costs across firms, thus assuring efficiency in production. Freedom of entry and exit assures that above-normal profits cannot persist in any industry in the long run.

Individual buyers face those same output prices and maximize utility subject to them, equating marginal rates of substitution across consumers. Given that producers and consumers face the same output prices, marginal rates of technical transformation in production are equated to marginal rates of substitution in consumption.

The first fundamental theorem, though mathematically true, and viewed by neoclassical economists as a tour de force, has been heavily criticized on a multitude of grounds. The criticisms include denial of obvious cases of market failure (e.g., monopoly); some of the assumed "givens," such as consumers' preference functions, may themselves be manipulable through advertising by firms or by social pressures, so individuals may not know their own self-interest; markets are not in equilibrium and a tendency toward equilibrium—if that is what real-life haggling over prices and quantities is achieving—does not imply a monotonic (i.e., always utility and/or profit improving) "march" to equilibrium, mistakes can be and are made in real-life trading and production; not only are tastes fluctuating, but technologies are not fixed; there are external effects, both in consumption and production rampant in real economies that cause observed market prices to deviate from their correct values; the existence of public goods, which even Smith recognized and argued justified a role for governments, is ignored or assumed away in the rigorous proof of the first theorem.

Some of these criticisms are well known and have been addressed. For example, the theorists who proved the first theorem did not suggest that the abstract and simplifying modeling necessary to achieve the proof described anything other than a logical construct that is distinct from and not to be confused with any real-world economy. However, some of the underlying assumptions of individual and business behavior used to prove the first theorem should still be of great interest to ethicists and social scientists. While real-world economies are unlike the theoretical construct used to prove the first theorem, claims of self-interest, profit maximization, and voluntary exchange, necessary for the proof, are also topics of broader concern in social and ethical studies.

In the case of external effects, Pigou suggested using taxes and subsidies to reflect the full social costs and benefits (the cost or benefit not just to the individual taking an action but inclusive of costs imposed or benefits conferred on others) of these activities. Thus governments might assist markets in finding the correct prices. Coase advocated use of the common law of nuisance, recourse to lawsuits, to internalize external costs, thus obviating the need for the government to play its "pricing" role; however, in such a case, government may still have a "Smithian" role to play in the provision of the legal system, as a public good defining property rights and adjudicating disputes.

Lipsey and Lancaster in a seminal paper showed that in the presence of market failure—for example, a monopoly in one industry—changes toward more competition (e.g., deregulation) in other industries may not be optimal. This is known as the theory of the "second best," which questions, at a theoretical level, the policy relevance of the first theorem when its advocates interpret it to mean that more competition is always better than less.

The First Fundamental Theorem of Welfare Economics and Fairness

However strong the above criticisms, perhaps the most significant criticism of the first theorem is that it ignores the distribution of output, the "Who gets what?" question. Competition may be shown under the restrictive assumptions given above to achieve a Pareto-efficient allocation, but there are many such allocations, each with its own size and distribution of output. The first fundamental theorem is silent about the "fairness" (equity) or unfairness of any particular allocation. Critics of the first theorem—as indeed earlier critics of classical economics—were quick to point out that any given Pareto-efficient allocation reached may imply zero (or even negative) prices for some resources (e.g., no income for some labor). Depending on one's beliefs in what constitutes fairness, one may agree that a competitive process may lead to a Pareto-efficient allocation without believing that this is a necessary virtue of competition especially if the competitive process leaves some people with nothing or next to nothing. This result clashes with many ideas of fairness, most obviously "to each according to their need" criterion.

The literature on fairness is immense, spanning almost every known field, discipline, and time period. Neoclassical economics, being a subset of positive economics (the "is" of the is-ought dichotomy), has somewhat self-consciously, but purposefully, steered clear—with John Neville Keynes early on and later Milton Friedman at the tiller—of making pronouncements about fairness almost using this as a bright-line distinction between what is and what is not to be considered "economics."

The favoring of positive economics leads many economists away from considering normative concerns about any given outcome. Positive economics would have us describe "what is" about the outcome, the technical details on marginal rates of substitution and prices, for example, but not to comment on the rightness or wrongness or fairness or unfairness of how much output each person receives. One reason for this prescription to do positive economics is to avoid the wide and deep chasm harboring the demands to discuss and define "fairness" requiring interpersonal comparisons that economic theory may not be robust enough to support.

Alternative approaches to neoclassical economics stress the issue of fairness, not only of outcomes but also of systems—including the system of private property and exchange itself, with Karl Marx and followers the obvious example. Approaches that rely on nonmarket mechanisms typically involve a command-economy approach, where a central authority makes the allocation decisions or calculates the prices at which people and firms produce and trade so that outcomes are considered to be fair under some chosen definition of fairness, for example, an equal distribution of output.

One concern with this approach is that disincentives to work and produce may cause the size of the aggregate economic output to shrink to such a degree that an equal share of a smaller output is not as large as an unequal (e.g., the smallest) share of a larger output. Should this occur it would violate the concept of fairness as developed by Rawls. Another concern with this approach is the arbitrary nature of who gets to choose what is fair and unfair.

The Second Fundamental Theorem of Welfare Economics and Fairness

Still other approaches within economics to address fairness rely on the market mechanism augmented with lump-sum transfers (or side payments), calculated and imposed by a central authority, which achieves the desired distribution of output. This approach is encapsulated in the second fundamental theorem of welfare economics stating that almost any Pareto-efficient allocation may be achieved through the competitive process after the correct lump-sum taxes and transfers have been imposed on individuals and firms. The practical basis of the second theorem has been attacked (Von Mises, Hayek) on the grounds that successfully implementing it in practice requires more information and time than any one authority is capable of acquiring and processing.

A deeper question surrounding the second theorem is which tool should we use to decide which distribution we, as a society, desire? Even if the decision is made in a democracy by a central authority/legislature or bureaucracy, voting usually plays a role in choosing who the bureaucrats and/or authorities are. The type of voting most commonly used in a democracy is majority voting. Majority voting can be inconsistent and may lead to voting cycles. This "voting-paradox" result has been well known since the late 1700s (in Condorcet), refined and generalized subsequently, and weakens any suggested political foundation for judging among different outcomes. The voting paradox may prevent agreement on a unique outcome via majority voting.

Another concern with lump-sum transfers is that while it may be possible to achieve a preferred distribution through transfers, will in fact those transfers take place? This concern highlights current debates on issues such as "free trade," where the theory of comparative advantage shows that gainers from trade can compensate losers such that no one is worse off and at least one person is better off after trade opens up. However, the theory of comparative advantage does not speak to who will be taxed and to whom the transfers will be given. The concern is that the gainers will keep their gains and the losers receive no compensation.

The Third Fundamental Theorem of Welfare Economics and Fairness

The third fundamental theorem suggests another alternative to markets, authority, and voting, and that is the construction of a social welfare function that aggregates the preferences of all individuals into a social welfare function. The social welfare function would then be used to arrive at the optimum allocation of output. This harkens back to Bentham's "greatest good" idea. In work by Bergson and Graaff, it seemed conceivably possible, but highly unlikely, that a nonarbitrary social welfare function could be found in practice that would help resolve the distribution problem.

Arrow's work then showed the logical impossibility of constructing such a social welfare function from individual preferences when the following "reasonable" conditions hold: (a) universal domain, (b) Pareto consistency, (c) independence from irrelevant alternatives, and (d) nondictatorship. Universal domain refers to the property that the social welfare function must include all the individual orderings that are logically possible; Pareto consistency says that if all individuals individually prefer alternative A to alternative B, then A must be socially preferred to B; independence requires that under two alternative preference profiles, if element A is preferred to element B in both, then A remains preferred to B no matter if the ordering of a third element (the "irrelevant" element), C, is reversed in the two preference profiles; finally, nondictatorship implies that everyone's preferences matter, but no one person's preferences can matter too much.

Since Arrow's "impossibility proof," there has been a wealth of research, but his conclusion that it is logically impossible to aggregate the preferences of heterogeneous individuals so that unique and well-ordered social preferences result, has not been reversed. From this vantage point, we reach the dismal conclusion that the attempts to compare economically the social value of different distributions of output lead to paradoxes and impossibilities that yield no clear theoretical answers on which policies necessarily improve society's lot. When everyone's preferences matter, it is impossible using economic theory alone to tell whether or not a policy change makes society better off. This result should make us suspicious of those using economic theory alone when making such claims and should also prompt us to expect the same rigor and self-examination of any social scientist or public policy advocate when making similar claims for policy changes based on their discipline.

Well-Being

There seems to be a convergence of opinion among researchers in the area of well-being that the notion of well-being can be construed in terms of happiness, life satisfaction, and absence of ill-being. *Happiness* refers to an affective state that involves positive and negative affect. This affect derives from positive and negative emotional reactions we experience from life events. Happiness researchers make the distinction between short-term happiness and long-term happiness. Short-term happiness is mostly influenced by environmental factors, whereas long-term happiness is more dispositional.

Life satisfaction involves cognitive evaluation of one's life. Life satisfaction is a result of comparison of one's current life situations or accomplishments against certain standards of comparison—one's ideal life, expectations of personal utility, individual goals, values, needs, opulence, and the lives of significant others. Also, life satisfaction is a cognitive evaluation of happiness in relation to salient life domains. For example, people may infer that they are highly satisfied with their lives if they judge themselves to be happy in work, family, and social life, and given that these life domains are important to them.

The *absence of ill-being* reflects the health perspective of well-being. This perspective posits that absence of ill-being is a necessary but not sufficient condition of subjective well-being. In other words, people cannot experience high levels of happiness and life satisfaction if they are unhappy with their health. Satisfaction with health is a prerequisite to overall happiness and satisfaction with life.

In the following section, we will focus on the effects of organizations on people's well-being. Organizations affect people's well-being (happiness, life satisfaction, and absence of ill-being) in at least two major ways, work and consumption. In other words, people assume certain jobs in organizations, and their well-being is significantly affected by these jobs and employment circumstances. Organizations also affect people's well-being by offering consumers goods and services that help consumers satisfy their needs. As such, we will describe how organizations affect well-being in relation to two important life domains, namely, work life (i.e., employee well-being) and consumer life (i.e., consumer well-being).

Employee Well-Being

Employee well-being, also called quality of work life (QWL), refers to the degree of satisfaction and contentedness an employee experiences with respect to his or her job and the overall work situation. Much research on QWL has linked specific organizational characteristics and programs to concepts such as employee life satisfaction, happiness, and absence of ill-being. We will highlight some of the important organizational characteristics and programs found to enhance employee well-being.

Employee Well-Being Can Be Enhanced Through Ethical Corporate Mission and Culture

Research has shown that the *ethical corporate mission and culture* of an organization can influence employee productivity and job satisfaction. Employees believe that being associated with an ethical organization gives them a sense of meaning and purpose in their work. Examples of organizations that contribute meaning and a sense of purpose in work include the religious-based or values-based organizations, where the founders or managers are guided by general religious or philosophical principles.

Employee Well-Being Can Be Enhanced Through Teamwork

Research has shown that *teamwork* characterized by reciprocal trust and respect among team members serve to enhance employee productivity and job satisfaction. Teamwork can be induced through role clarification (clarifying and negotiating role expectations of each team member), problem solving (educating team members on how to solve problems by first defining the problem, followed by generating possible alternatives for corrective action, selecting the best alternative, implementing the corrective action, and monitoring the outcome of the corrective action), goal clarification and prioritization (the team is instructed to develop measurable performance goals and prioritize these goals), and conflict resolution (the team is taught how to resolve conflicts through a built-in process to review decisions, team members are induced to learn more about the specialty fields of one another through planned mutual instructions, roles are clarified, and greater communication and openness are encouraged).

Employee Well-Being Can Be Enhanced Through Parallel Structures

Jobs involved in parallel structures provide members with an alternative setting to address problems and propose innovative solutions free from formal organizational structures. *Quality circles* are an example of parallel structures. Quality circles consist of small groups of 13 to 15 employees who volunteer to meet periodically, usually once a week for an hour or so, to identify and solve productivity problems. These group members make recommendations for change, but decisions about implementation of their proposals are reserved to management. Research has shown that parallel structures and quality circles do play an important role in employee productivity and job satisfaction.

Employee Well-Being Can Be Enhanced Through Participation in Decision Making

Substantial research has shown that participation in decision making and high-involvement programs contribute positively and significantly to work motivation and satisfaction. High-involvement programs are thought to be a conduit to help employees express their thoughts and feelings in important organizational decisions. As such, high-involvement programs serve to enhance person-environment fit in the work domain. Allowing employees to participate in important organizational decisions amounts to providing employees with greater work resources that help employees meet work demands more readily. For example, TQM (total quality management) also prescribes employee involvement and empowerment. Research has shown that TQM plays an important role in job performance and employee satisfaction.

Employee Well-Being Can Be Enhanced Through Alternative Work Arrangements

The goal of *alternative work arrangements* is to minimize work-family conflict and help employees balance the demands of their work and family lives. The most common type of work-family conflict is time-based conflict experienced when the time devoted to one role makes the fulfillment of the other difficult. Alternative work arrangements attempt to restructure one's job to allow for more flexibility in managing the hours devoted to work and the hours that are available for family commitments. Research has shown that matching the time preferences of employees with the time demands established by organizations is likely to enhance job performance and job satisfaction.

Employee Well-Being Can Be Enhanced by Internal Promotion

The policy to *promote from within* is yet another QWL program. Self-actualization is the desire to become anything that one is capable of becoming. Progressive firms engage in practices that aim to ensure that all employees have opportunity to self-actualize. Promotion and career advancement are important in that regard. Research has shown that companies that have policies to promote from within have employees who are more productive and satisfied with their jobs than companies that do not have such policies.

Employee Well-Being Can Be Enhanced Through Incentive Plans

There are many *incentive plans* that organizations use to reward their employees and satisfy employee needs for self-actualization, self-esteem, and social recognition. These include individual incentive programs, group incentive programs, profit-sharing plans, and gain-sharing programs. Research has shown that these programs do play a significant role in employee productivity and job satisfaction.

Employee Well-Being Can Be Enhanced by Employment Benefits and Other Ancillary Programs

With respect to e*mployment benefits*, many firms offer at least good employment benefits to their employees that play an important role in employee productivity and job satisfaction. Examples of employee benefits include health insurance, retirement or pension benefits, and supplemental pay benefits. Furthermore, there are many *ancillary programs* described in the literature designed to meet employee nonwork needs. These include child care programs, elder care programs, fitness programs, social programs and events, employee assistance programs, educational subsidies, counseling services, credit union, and others.

In sum, research has shown that programs designed to increase job and life satisfaction (i.e., QWL programs) can increase employee productivity and job performance. In turn, higher levels of productivity and performance serve to increase the organization's profitability.

Consumer Well-Being

Many confuse the concepts of consumer well-being (CWB) with that of consumer satisfaction. CWB goes beyond consumer satisfaction by linking consumer satisfaction with life satisfaction. Much research on CWB has linked specific organizational characteristics and marketing programs to concepts such as consumer life satisfaction, happiness, and absence of ill-being. We will highlight some of the important marketing programs found to enhance CWB.

CWB Can Be Enhanced Through Shopping for Needed Goods and Services

Research has shown that CWB is very much affected by the quality of the shopping experience. Consumers experience higher levels of life satisfaction given that they are satisfied with the quality of shopping facilities and amenities in their local area. Quality of shopping facilities and amenities translate into finding needed goods and services in the various retail outlets within the local area, the quality of these goods and services are deemed acceptable, the prices of these goods and services are deemed acceptable, and the services rendered at the retail outlets dispensing these goods and services are deemed acceptable. Thus, organizations can enhance CWB by making needed goods and services most accessible to consumers in different distribution venues, that these venues provide high-quality goods and services at low prices, and that these venues provide high-quality retail service to consumers.

CWB Can Be Enhanced Through Product Preparation

Research has shown that CWB can be enhanced by designing products that can be assembled easily and safely. That is, life satisfaction of consumers is influenced by the extent to which purchased goods are assembled or prepared for personal consumption. Easy and safe assembly of consumer durables serves to enhance consumer life satisfaction.

CWB Can Be Enhanced Through Product Ownership

Research has shown that ownership of certain consumer goods (e.g., car, house, furniture, and household appliances) may contribute significantly to consumers' quality of life. Here, feelings of status, pride, and security of owning consumer durables play an important part in life satisfaction—consumers who own products that make them feel secure, proud, and having special status and prestige in society tend to experience higher levels of life satisfaction than consumers who do not experience those feelings.

Furthermore, research has shown that the market value and the extent of appreciation or depreciation of owned goods do play a role in CWB—higher levels of appreciation (low level of depreciation) of these goods enhance consumer life satisfaction. Thus, organizations can enhance consumer well-being by marketing products that provide consumers with a sense of security, pride, status, and a high level of market appreciation (or low level of depreciation).

CWB Can Be Enhanced Through Product Use

Consumers experience different levels of satisfaction resulting from the actual use of goods and services, and use satisfaction plays an important role in CWB. Consumption satisfaction is closely related to but distinct from possession satisfaction, the difference being that possession satisfaction focuses on the positive affect that flows from ownership per se, whereas consumption satisfaction focuses on satisfaction that flows from the actual use or *consumption* of the product. Thus, organizations can enhance CWB by providing consumers with goods and services that have high level of consumption utility.

CWB Can Be Enhanced Through Product Maintenance

Maintaining consumer goods plays an important role in the quality of life of consumers. Research has shown that CWB is affected by maintenance satisfaction and product safety. Maintenance satisfaction is the positive affect that consumers experience when they seek to have a product repaired or serviced. Maintenance satisfaction involves satisfaction with maintenance and repairs provided by service vendors in the community (i.e., repair services), and satisfaction with services that facilitate maintenance and repair by the owners themselves (i.e., do-it-yourself support services). Thus, organizations can enhance CWB by providing consumers with quality services that allow consumers to repair their products at low prices. Organizations can also enhance CWB by providing consumers with quality do-it-yourself goods at low prices.

CWB Can Be Enhanced Through Product Disposal

High-quality services related to product disposal (including trade-ins and second-hand selling) do play an important role in CWB. CWB is affected by the degree of satisfaction consumers feel with experiences of getting rid of products (i.e., with the convenience and ease of dumping and the environmental friendliness of the product at the time of disposal). There are many consumer goods for which consumers feel dissatisfied with product disposability: oil-related products, computers, and automotive products. Furthermore, research has shown that CWB is equally affected by the adverse health effects (to consumers and the general public) of environmental pollution brought about through careless ways of disposing used products.

In sum, CWB is the sum total of satisfaction and dissatisfaction that consumers experience through shopping for goods and services, preparing consumer durables for personal use, owning those consumer durables, consuming goods and services, and repairing and maintaining their durables, and finally disposing of those durables. The greater the consumer satisfaction with these marketplace experiences the higher the consumer life satisfaction. To enhance CWB, organizations should make a concerted effort to meet consumers' needs, not only in relation to shopping but also in relation to other marketplace experiences such as product preparation, ownership, consumption, maintenance, and disposal.

Conclusion

Well-being (or life satisfaction, happiness, and absence of ill-being) is influenced by organizational internal and external efforts. Internal efforts can enhance well-being by implementing QWL programs that can enhance satisfaction in work life. Conversely, implementing marketing programs designed to increase consumers' satisfaction with shopping experiences as well as product preparation, ownership, use, maintenance, and disposal can enhance satisfaction in consumer life.

Whistle-Blowing

"Whistle-blowing" in the context of business ethics refers to a practice of informing either a superior, a compliance or regulatory agency, or the general public of some action done or about to be done by an organization or some individual in that organization that would be harmful, unjust, in violation of human rights, illegal, run counter to the defined purpose of the organization, or otherwise immoral. An alternative definition of whistle-blowing stipulates that it is a purposeful revelation made by a person who somehow has special access to information concerning the organization. This person is aware of either an actual or suspected noninconsequential wrongful action that either concerns or implicates the organization and proceeds to inform an individual in the organization or outside of the organization with the ability to rectify the situation.

An employee of a company or a member of a profession, who knowing that someone in the company or in the profession is engaged in some sort of wrongdoing reports that behavior to an appropriate person, is a whistle-blower. The appropriate party being informed may be either someone in the corporation, the professional body, some public regulatory agency, some governmental agency, or finally, the general public. For example, Sharon Watkins informed her CEO Ken Lay of perceived irregularities in the accounting practices of Enron with respect to Special Purpose entities. Members of professional organizations are often required by their code of ethics to report unethical behavior on the part of fellow professionals in order to regulate their professions.

There are two ethical questions about the activity of whistle-blowing: (a) Is it an acceptable behavior? (b) If it is acceptable, under what circumstances is it obligatory?

There are several arguments against the acceptability of whistle-blowing: First, it involves disloyalty; second, it violates obligations of confidentiality; and third, it creates a distrustful atmosphere and undermines group and corporate morale. These arguments all rest on the fact that most groups have an unspoken expectation that members of the group should be loyal to the group or at least have some obligation of fidelity to the group and hence should not blow the whistle on the group. Analyzing the word "whistle-blowing" supports this presumption. The paradigmatic instance of whistle-blowing is in the context of sports where a neutral official such as a referee blows the whistle to stop play because a foul has been committed by the player of one team against a player of the other team.

Those opposed to whistle-blowing point out the disanalogy between sports and business. In sports, the whistle-blowing is done by a neutral observer, the referee, while in business and other corporate situations, the whistle-blowing is done against one's own team or teammate. Since management technique often emphasizes the importance of "team playing," and whistle-blowing is against the team and hurts the company, whistle-blowing is undesirable. From the perspective of those who expect group loyalty, the one who blows the whistle on a fellow group member is a "stool pigeon," "rat," "fink," or some other ethically reprehensible type of character and whistle-blowing as a dissenting act of disclosure is disloyal. More formally, it is argued that whistle-blowing violates an obligation of loyalty the individual has to either the company or professional group. Defenders of whistle-blowing need to show that either it is not disloyal and is ethically permissible or even if it is disloyal, the obligation to loyalty is overridden by some stronger obligation to the general public.

An argument can be made that if every company's primary obligation is to maximize profit then companies are not the type of entities that are owed loyalty. Since the goal of maximizing profit supports practices such as employment at will that allow a company to terminate an employer for no reason, and since retaining an employee out of loyalty could jeopardize that profit, the employer has no obligation of loyalty. Furthermore, not only is loyalty not required, but it would be foolish for the employee to be loyal to a company that is not obliged to reciprocate such loyalty. Consequently, if no loyalty is owed to a company, loyalty is not an ethical consideration that prohibits an employee from blowing the whistle.

Still, opponents of whistle-blowing could argue that even if a company is not owed loyalty, certain jobs and positions involve interdependent relationships, where some degree of fidelity to one's teammates or where one's obligations of confidentiality, either contractual or professional, require a person with privileged information to avoid divulging that information. For example, an argument against the appropriateness of Mark Felt, known as "deep throat," blowing the whistle on the government to the reporters Bob Woodward and Carl Bernstein of the *Washington Post* during the Watergate scandal is that, as an FBI member with access to confidential materials, he had an obligation to keep those secrets while investigations were being carried out. It could also be argued along similar confidentiality lines that attorney-client privilege prohibits attorneys from divulging information they know about their client, even if divulging such information could prevent serious harm or even death. Hence if one's position or relationship gives one privileged access to information, confidentiality may prohibit whistle-blowing.

In either case, whistle-blowing presents an ethical dilemma where the obligations that arise from the demands of group fidelity, confidentiality requirements, or even employee contracts that expressly (or at least implicitly) prohibit making information public run counter to the permissibility and/or obligation of that employee to blow the whistle. In those cases, the conflict of obligation is between the former obligations and the permissibility or obligation to blow the whistle.

Given these facts, it seems the burden of proof or justification falls on the whistle-blower. The first question is whether whistle-blowing is permissible. Defenders of whistle-blowing maintain that if there is no obligation of loyalty, confidentiality, or fidelity, then clearly whistle-blowing is permissible in conditions where companies violate ethical and/or legal constraints. Even if there are obligations of loyalty, confidentiality, and/or fidelity, there are some cases where whistle-blowing is permissible. Still, even in those cases, leaving loyalty and confidentiality concerns aside, whistle-blowing is permissible only if a certain set of conditions is met before a whistle-blower can justifiably inform on his or her company.

- *Proper motivation:* The whistle-blowing should be done for the purpose of exposing unnecessary harm, violation of human rights, illegal activity, or conduct counter to the defined purpose of the corporation and should be done from the appropriate moral motive, that is, not from a desire to get ahead, or out of spite or some such motive. Nevertheless, whether the act of whistle-blowing is called for is not determined by the motive of the whistle-blower but by the company acting either immorally or illegally. It also needs to be noted that a beneficial act of whistle-blowing might come from purely self-interested motives, such as a reward for blowing the whistle on tax evaders.
- *Sufficient evidence:* The whistle-blower should make certain that his or her belief that inappropriate actions are ordered or have occurred is based on evidence that would persuade a reasonable person.
- *Sufficient analysis of a grave, immediate, and specific matter:* The whistle-blower should have acted only after a careful analysis of the danger: (a) How serious is the wrongdoing? (Minor moral matters need not be reported.) (b) How immediate is the wrongdoing? (The greater the time before the violation occurs, the greater the chances that internal mechanisms will prevent the anticipated violation.) (c) Is the wrongdoing an action that can be specified? (General claims about a rapacious company, obscene profits, and actions contrary to public interest are useless from a practical perspective.)
- *Appropriate channels:* Except in special circumstances, the whistle-blower should have exhausted all internal channels for dissent before informing the public, and the whistle-blower's action should be commensurate with one's responsibility for avoiding and/or exposing moral violations. In this way, the whistle-blower diminishes the concerns about disloyalty and violation of confidentiality obligations. If there are personnel in the company whose obligation it is to monitor and respond to immoral and/or illegal activities, it would be their responsibility to address those issues. Thus, the first place to which the potential whistle-blower should report the unethical activities is to the appropriate persons within the enterprise, and only if those persons do not act is it permissible to inform regulatory or government agencies or the general public. If the above conditions are met, it is permissible to blow the whistle.

When is there an obligation to blow the whistle? A further argument is needed to show that there is a moral obligation to blow the whistle, since it is possible to argue that even if the illegal or immoral behavior of the company abrogates the responsibility of loyalty or confidentiality, there is no consequent Good Samaritan obligation to the general public to blow the whistle.

Since there is no specific role obligation to blow the whistle, except in some professional codes of ethics, the moral obligation does not arise from a promise or relationship. The obligation must arise from some general ethical requirement to serve the general public or some requirement of justice. The best arguments in support of whistle-blowing rest on some tacit agreement that some sort of Good Samaritan principle needs to be applied. The strongest arguments in this case come under the rubric of the obligation to prevent harm. To make the case for the obligatory nature of whistle-blowing requires showing when there is an obligation to the general public to prevent harm.

The obligation to prevent harm rests in a continuum of increasing responsibilities, starting with avoiding harm up to doing good. Doing good is an affirmative duty, and since affirmative duties are difficult to specify, it is difficult to specify a general obligation to do good. Furthermore, the proscriptions against harming are not applicable in the case of whistle-blowing because the whistle-blower is not the individual doing the harm. The whistle-blower simply knows that harm will occur. Hence, on the continuum of obligation, the obligation to blow the whistle depends on some sort of more general obligation to prevent harm, which takes effect only under certain conditions.

The basic recognition of an obligation to prevent harm rests on the insight that there are certain situations where it is unthinkable not to intervene on behalf of a fellow human being. As an example, consider a young child who wanders off from his or her parents and falls into a wading pool and starts to drown. There is no one around except a stranger who is walking by and sees the child drowning. It would be ethically monstrous of the stranger not to save that child. All would agree that the stranger has an obligation to pull the child from the wading pool, thus preventing the child's death. This situation exemplifies the intuition behind the belief that there is an obligation to prevent harm.

What is more, an analysis of the situation will reveal four conditions under which such an obligation accrues to a person. There must be (a) a need (the child is drowning); (b) the person must be capable of preventing the harm without sacrificing something of comparable moral worth (it is a wading pool so the harm preventer is capable of saving the child without putting his or her own life in danger); (c) the person is proximate (nearby), and (d) the person is the last resort (it would be the parents' responsibility if they were there).

When these conditions of need, capability, proximity, and last resort are met, there is an obligation to prevent harm. It follows that in the case of blowing the whistle to prevent harm, similar conditions must hold. If society can be harmed, the whistle-blower is capable of preventing the harm by blowing the whistle, the whistle-blower is close to the problem and no one higher up with more authority and responsibility is responding, there is an obligation to blow the whistle to prevent the harm.

However, the condition of capability needs to be further explicated. There should be some probability that the whistle-blower will have some chance of success. If there is no hope in arousing organizational, societal, or governmental pressure to correct the wrongdoing, then the whistle-blower needlessly exposes himself or herself and his or her loved ones to hardship for no conceivable moral gain. It is important to factor in the reality that there are negative consequences to whistle-blowing that accrue to the whistle-blower, because whistle-blowers violate the spirit of group loyalty (even if not warranted). Studies show that the individual, superior, or company on whom they have blown the whistle usually punishes the whistle-blowers.

Since, in the corporate context, the whistle-blower is seen as disloyal and the whistle-blowing is seen by company loyalists as cause for punitive action, to blow the whistle in such a culture requires a certain moral heroism. Because of that and given the fact that society depends on whistle-blowers to protect it from unscrupulous operators, justified whistle-blowers need some protection. To assure the existence of necessary whistle-blowers (somebody's got to do it), sound legislation is needed to protect the whistle-blower.

In the United States, there are statutes and laws that exist to protect the whistle-blower at both the federal and the state level. In 1982, The Federal Whistleblower Statute was passed to protect employees of defense contractors who blow the whistle and reveal a violation of law by those contractors. In 1986, the federal government passed the federal False Claims Reform Act, which provided a financial reward for someone blowing the whistle on an employee who perpetrated fraud against the government. The Whistleblower Protection Act of 1989 was meant to protect government employees who justifiably blow the whistle on their employers. In 2002, a provision titled "Protection for Employees of Publicly Traded Companies Who Provide Evidence of Fraud" was included in the Sarbanes-Oxley Act, which provided whistle-blower protection for those employees.

The Sarbanes-Oxley Act (1) made it unlawful to "discharge, demote, suspend, threaten, harass, or in any manner discriminate against" one who blows the whistle; (2) established criminal penalties of up to 10 years for executives who retaliate against whistle-blowers; (3) required boards to set up procedures for hearing whistle-blower complaints; (4) gave the secretary of labor power to require a company to rehire a terminated whistle-blower even without a court hearing; and (5) gave the whistle-blower a right to trial by jury to bypass administrative hearings.

While there is evidence of whistle-blower protection in the United Kingdom with the Public Interest Disclosure Act, in the European Union with its charter for whistle-blower protection, in Australia and in countries such as Israel, Ghana, South Africa, and South Korea, more work needs to be done in the international area.

Finally, it is important to note that whistle-blowing is not restricted to corporations. The need for whistle-blowing occurs in all areas of life. Professionals who are held to the standards of their profession are sometimes required by their code of ethics to blow a whistle.

Most professionals have obligations to their profession and the public to blow the whistle on colleagues who violate certain canons of appropriate behavior and are obligated to meet that demand even if it conflicts with friendship and group loyalty. All self-regulating professions need to require whistle-blowing. For example, accountants and engineers have a dual obligation to their clients and to the public. Hence, they have a fiduciary responsibility to report certain illegal or potentially harmful activities if they encounter them in the course of their auditing or accounting or constructing. But beyond the professions, whistle-blowing is required in other walks of life: For example, the participants in an honor code have a responsibility to report violations.

Enlightened companies, aware that harmful, immoral, or illegal behavior that is likely to occur from time to time needs to be reported, have begun to make provisions for regularizing the monitoring of behavior by using ombudsmen, anonymous ethics hot lines, and/or corporate responsibility officers to facilitate whistle-blowing. Such offices provide an outlet for those who feel obliged to report the unseemly behavior of their companies, without the need to go public. These provisions are desirable because they will alleviate the necessity of violating confidentiality obligations by going public and blowing the whistle on harmful or illegal behavior. In summary, while whistle-blowing activity is often viewed unfavorably, it is also a necessary part of human activity, and when done to uphold the standards of society with honest motives, it is often morally obliged and heroic.

Wilderness

The Wilderness Act of 1964 defines wilderness as an area where the earth and its ecosystems are not subdued or harmed by man, where man is a visitor who does not remain. In the United States, and throughout the world, wilderness is important for human recreation and economic development as well as for the protection of ecological systems. In this respect, the consumption of wilderness is necessary for human progress and prosperity, but the preservation of wilderness as wilderness is also vital. The modern notion of wilderness emerged during the 18th and 19th centuries from Romantic writers and artists who were inspired by the beauty of nature and from Enlightenment writers and philosophers who contrasted the potential of rational human society with the harsh forces of the natural world. New England Transcendentalists praised nature for its profound simplicity, sustaining elegance, and its essential lessons for human life. Concurrently, the Industrial Revolution precipitated ever-increasing demands on natural resources for fuels, chemicals, and raw materials. Thus, the natural environment gradually became recognized as a valuable commodity, even while it diminished from overuse.

The History of Wilderness Protection

Wilderness protection and environmentalism in the United States are divided into three different phases or generations. The first generation, occurring at the turn of the 20th century, included components of wilderness preservation and conservation, while the second and third generations were marked by global environmentalism and resource conservation. The U.S. government first established the Department of the

Interior in 1849 to manage land, natural resources, and wildlife conservation. Although forestry management faced setbacks during the Civil War, it regained a close alliance with American industry after the war, sustaining resources for logging and mining businesses. Several decades later, to strengthen wilderness protection efforts, Congress enacted the General Revision Act of 1891, later renamed the Forest Reserve Act. This Act founded the Forest Service inside the U.S. Department of Agriculture and gave the president unilateral power to conserve wilderness through designating forest reserves. Conservationist Gifford Pinchot pioneered the creation of the Forest Service, emphasizing the importance of resource management in economic development and forestry. In 1903, President Theodore Roosevelt created the first national wildlife refuge, Pelican Island in Florida, to protect the 5-acre mangrove island as the last rookery of brown pelicans on the east coast of Florida.

Throughout the early years of wilderness policy development, American preservationists, who valued wilderness for its own sake, sought absolute protection of the land. Henry David Thoreau's *Walden Pond* offered a radical critique of civilization's destruction of nature in the mid-1800s. At the turn of the century, John Muir encouraged Theodore Roosevelt to establish Yosemite Park, arguing that nature was man's connection to God. Aldo Leopold's reflections in *Sand County Almanac* contributed to the emergence of the ecology movement and the concept of the farmer as conservationist.

Congress also demonstrated an interest in preservation, establishing the first national park in 1870, later to be renamed Yellowstone, and opened Sequoia National Park in 1890. The U.S. National Park Service was created in 1916 to oversee the increasing number of national parks, landmarks, and historic sites. In 1924, Aldo Leopold gained protection for the Gila Wilderness in New Mexico in obtaining its designation as the first official U.S. wilderness area.

In the private sector, organized interest groups directed wilderness protection projects, political lobbying, and garnered national interest for wildlife recreation. The Appalachian Mountain Club, started in 1876 in Boston by Edward Pickering, focused on the creation of national forests and outdoor education. The Audubon Society, formed in 1886 under the guidance of George Bird Grinnell, began with a mission to lobby for the protection of endangered species, particularly birds. In 1892, John Muir founded the Sierra Club to defeat a proposition to reduce the boundaries of Yosemite National Park. The Wilderness Society, founded in 1935 by Bob Marshall, became a steadfast wilderness preservation organization with a mission to halt the spread of commercialization and growth.

The advent of The New Deal, World War II, and postwar commercialization shifted American sentiment away from wilderness protection and more toward environmental concerns. What was once an elite effort to save recreational places became a pluralistic concern to better society overall. Dust bowl conditions across the Midwest and Southwest created by land-abusive intensive farming required new land and soil management techniques. Rachel Carson's research regarding the toxic effect on the environment and individual health resulting from widespread pesticide use shocked many Americans into awareness of their role in the earth's ecosystems.

Although many second-generation environmental activists focused on pesticides and nuclear energy, wilderness preservation efforts did not cease altogether. The Wilderness Act of 1964, authored by Howard Zahniser of The Wilderness Society, assigned wilderness its first legal definition and created the National Wilderness Preservation System (NWPS). At that time, the designated NWPS included 54 areas, encompassing a total of 9.1 million acres in 13 states. In signing the Wilderness Act, President Lyndon Johnson recognized the importance of securing an enduring resource of wilderness for present and future generations. Furthermore, it was deemed that congressionally designated boundaries around wilderness could only be altered by another act of Congress. In 1970, the Petrified Forest National Park and Craters of the Moon National Monument became the first national park sites to include designated wilderness areas.

In the 1970s, environmentalism emerged as a popular cause, following the antiestablishment rebellion and antiwar fury of the 1960s. Back-to-nature sentimentalists found common cause with environmental scientists in creating Earth Day, an annual celebration to heighten awareness of the man-made threats facing a broad range of natural ecosystems. Progressive theories reintroduced an older belief in the land ethic and asserted the natural rights of plants, trees, and animals. Organizations such as the National Audubon Society, the Sierra Club, and The Wilderness Society saw their memberships multiply dramatically. Courtrooms across the United States became battlegrounds for lawsuits between environmentalists and corporations, each asserting the priority of their competing interests.

Due to increasing globalization, third-generation U.S. environmentalism in the 1980s and 1990s focused primarily on the global sustainability of natural resources and climate control. In the United States, the Forest Service, the National Park Service, the Bureau of Land Management, and the Fish and Wildlife Service were instructed by Congress to recommend land for wilderness designation as they deemed appropriate. The passage of the Alaska National Interest Lands Conservation Act in 1980 added more than 56 million acres of wilderness to the NWPS. This largest single addition established 10 new national park sites, 9 wildlife refuges, and additional Bureau of Land Management conservation units.

At present, the first-generation wilderness protection organizations continue to gain support and lobby for policy-based protections. The Sierra Club directs efforts for responsible community development and has initiated campaigns to preserve endangered wildlife in Alaska and the national forests. The Appalachian Club maintains a focus on developing recreational and educational wilderness programs. The Audubon Society and the Wilderness Society uphold strict conservation agendas, working to protect species' habitats from oil drilling, suburban development, and from invasive wild species of plants and animals. Several more private organizations such as the National Resource Defense Fund, the World Wildlife Fund, and Campaign for America's Wilderness have issued strong additional support for recreational and educational purposes and contribute resources for scientific research.

The conflict between the resource conservation and wilderness preservation interests groups is ongoing and has been described as a struggle between the ghosts of Gifford Pinchot and John Muir over the future of U.S. environmentalism. However, Ramachandra Guha, an Indian environmental scholar, pointedly chided those who focus on this debate as the central dilemma of the global environmental movement. To the extent that the issues of overconsumption of natural resources by developed countries and the reliance on increasing militarization to resolve political, social, and economic challenges are overlooked, Guha argues, the real threats to environmental survival are not recognized. Military violence, resulting in widespread environmental degradation or annihilation, and social disparities, resulting in continuing exploitation of the lower classes, are problems of such magnitude that they trivialize the question of preservation versus conservation. Indeed some believe that without a radical restructuring of the goals of the environmental movement in ways that acknowledge worldwide social and political trends, the national debates over wilderness resources would be reduced to an irrelevant sibling squabble in the face of a major disaster.

Wilderness Protection and American Business

Over the 20th century, the chief concern for protecting wilderness was confronting business growth, especially mining, logging, livestock grazing, and oil drilling. Environmental organizations worked to support legislation on the local, state, and federal level to place boundaries around public land. More recently, third-generation environmentalist organizations have formed partnerships with corporations to increase preservation awareness and initiatives. Many companies respect wilderness for its own sake and contribute support for outdoor recreation for the public as well as their own employees.

Since the 1990s, many businesses have operated under conditions mandated by third-party certification systems. Logging, drilling, and mining corporations tend to be major donors to international conservationism. Chevron honors annual conservation awards; BHP Billiton and Alcoa sponsor conservation workshops for mining industry directors and managers. The World Wildlife Fund partners with Fortune 500 companies and many financial institutions to preserve wildlife and initiate educational preservation programs. The National Fish and Wildlife Foundation has worked with ExxonMobil to initiate more than 100 conservation projects worldwide.

Corporate directors and business executives are often found on the boards of leading conservation organizations, a trend that started with business tycoons such as John D. Rockefeller and Stephen Mather. Contemporary businesspeople continue this tradition, both as a means to build connections to conservation watchdogs and to further their own agendas within the conservation movement.

However, critical environmentalists argue that large corporations are too anthropomorphic and are unable to recognize the inherent value in preserving and protecting wilderness. These new partnerships are criticized for allowing corporations to hide their true environmental impact behind *greenwash* and weaken the vigor of the environmental movement overall. For example, several major oil companies have been accused of initiating massive rebranding and advertising campaigns to conceal their environmental destruction.

On the political level, individuals are generally divided between two philosophies regarding business growth and wilderness protection. While some citizens believe that protections must be enforced politically to maintain a desired amount of wilderness and wildlife, others believe that the mechanism of a free marketplace can determine environmental decisions and preserve wilderness as necessary. Environmental activists continue to fight for regulations and restrictions for business, believing that businesses consider wilderness as a resource and not necessarily a valuable entity in itself, a conflict that will continue to challenge both sides.

The Current State of Wilderness

Since 1964 when the NWPA was passed, the designated wilderness lands have been expanded nearly every year. Currently, these lands include 680 wilderness areas in 44 states, consisting of 106,619,208 acres. Wilderness designation may be initiated by a recommendation from a federal agency, a public or private organization, or even an individual. Such a recommendation must follow a route of congressional approval and obtain a signature of the U.S. president to achieve the designation. Criteria taken into account in the wilderness lands designation process include the following: The area must be largely unaffected by any presence of humans and appear as natural; the area must provide opportunities for solitude; the area must offer opportunity for primitive recreational, low-impact activities such as cross-country skiing and hiking; and the area must contain features of ecological, geological, scientific, educational, scenic, or historical significance. Furthermore, it is expected that the recommended area be a minimum of 5,000 acres or be a roadless island.

The challenge of the act is to preserve the land in its wild and natural state, relatively free of human impact and control, while at the same time providing for use and enjoyment of the designated areas. In the past 40 years, recreational use of wilderness lands has increased tenfold, and more than 12 million people now visit these areas each year. While the National Wilderness lands are designated and protected for the purpose of such visitors' enjoyment and appreciation, the impact of increased human traffic threatens the continued sustenance of the indigenous ecosystems. Despite the official expansion of acreage designated as protected wilderness, the increasing use of this land for approved purposes effectively tramples the life on it even while championing conservation. The tension between the use and protection of wilderness, apparent to participants in and observers of the environmental movement since its earliest days, continues unresolved.

Winner's Curse

The winner's curse is the unfortunate consequence of an auction in which the winning offer for an item was bid so much higher than the item's worth that the winner cannot recover enough value to justify the price paid.

A free market can function like an auction—sellers offer their goods and buyers offer their bids of the prices they are willing to pay for those goods.

Bidders, though they may be sensitive to price and prefer to pay the lowest amount possible, "win" the auction when a seller accepts the highest price offered. In a free market for scarce goods, as in an auction, buyers may willingly increase their bid to maximize the likelihood of purchasing, or winning, the goods they want. One consequence of this auction-like process is that winning buyers may come to regret the high price they willingly paid, and to feel "cursed" by their inability to recover enough value to justify it.

The winning buyer paid more for the goods than any other potential buyer was willing to pay. Perhaps the winner made an error in judgment and inaccurately assessed the value. In addition to overly optimistic forecasts, such errors also may be caused by incorrect or incomplete information about the goods. These information problems may arise when sellers bluff buyers by misrepresenting the attributes of the goods. Governments may regulate commerce to criminalize untrue statements, false appearances, and misrepresentations. This government action to interfere with a free market is justified to ensure the most efficient allocation of social resources. The market forces of supply and demand better support economic efficiency when buyer-seller decision making is based on accurate information.

The winner's curse may not be due to any misrepresentation by the seller about the features of the goods. The curse may arise from an attribute of the buyer whose winning bid was higher than all other bidders in the market. Did they all have better information about the true value of the goods than the winner had? If so, then the winner indeed bid too high based on overestimating the net benefits or utility to be had from the purchase.

Calculating utility, however, is a cost-benefit analysis, and it is often extremely difficult to do it with precision and accuracy. One important cause of such poor analyses is that the benefits are not all measured in the same units as costs, or may not be possible to quantify at all. How does one put a precise value, for example, on the pride or joy of ownership?

In addition, utility and benefits are just forecasts at the time of purchase. The purchase costs, however, must typically be committed before the benefits can be realized. The magnitude of the benefit actually realized may be less than the anticipated forecast. In short, for the winner, utility is a subjective judgment of value in an uncertain future. The winner may feel cursed by regrets if that future does not meet the relatively high expectations.

The winner is the buyer who forecast more optimistically about the future than any other bidder, but that buyer may not be likely to comprehend the error in a society characterized by closely held information and deficiencies in the distribution of knowledge about prices. Thus, the winner's curse is more likely to be observed in open societies where buyers have access to broad economic knowledge. Interestingly, such societies tend to have more productive economies that, over the long term, efficiently increase the supply of goods and drive down prices. Over the long term, one would expect that human nature would become increasingly sensitive to the winner's curse in an economy becoming more efficient—overpaying when prices are declining seems that much more unfair. In this context, the winner's curse can be viewed as the buyer's perception that distributive justice has been violated by the terms of the buyer-seller exchange.

The buyer's market savvy and sophistication may also influence the likelihood of a winner's curse. An inexperienced buyer may lack the required knowledge to value goods accurately and to make appropriate bids. Principles of commutative justice for new and inexperienced buyers suggest that neutral sources of reliable information are important means to increase fairness and reduce winner's curse.

Conversely, an experienced buyer may have established good and trusting relationships with sellers that may become entwined with the value of the goods considered in a purchase decision. In this case, the high price of a winning bid reflects the value of the goods plus the value of the relationship. Winning buyers, however, may feel "cursed" after the purchase if they attempt to justify the costs only on the benefits embedded in the features of the goods without considering the benefits of sustaining and nurturing the relationship with the seller. Such an error in evaluating benefits is likely to be found in relationships built on trust that foster purchase decisions based on reciprocity, or preferences to favor the seller even in transactions not justifiable by the economic efficiency of the exchange.

Characteristics of the seller may bring about a winner's curse. Large sellers with substantial market power may unethically manipulate the supply of goods to cause artificial shortages. In this case, the buyer's decision making would be based on disinformation, or engineered misinformation, about future availability of opportunities to purchase the goods at more reasonable prices. Recently, for example, some electric utilities in the United States were alleged to have reduced their productive capacity during peak seasonal demand, inducing customers to agree to long-term contracts at unnecessarily high prices. Governments in many societies criminalize such hoarding practices.

Even sellers intending to be ethical may cause a winner's curse by creating excitement and competitive fever among potential buyers. Advertising and promotional techniques that motivate buyers with emotional appeals may discourage rational purchase decisions and encourage impulsive buying. For this reason, governments may require sellers to offer "cooling-off" periods of several days during which a buyer may cancel a contract without penalty. Also, ethical sellers may offer generous "money-back" warranties to signal their integrity and guarantee that they will not take advantage of buyers who feel cursed by their purchase.

When potential buyers fear overpaying for goods, then they may stay away from the marketplace to reduce their exposure to the winner's curse. Their aggregated absence represents a decline in demand that may harm the economic welfare of society. Accordingly, business managers, government regulators, and advocacy groups should be alert to opportunities to reduce the likelihood of the winner's curse.

Women in the Workplace

The study of women in the workplace is the investigation of women's roles in and access to work environments beyond the home. This area of research draws on economics, social statistics, business history, feminism, and cultural history to create a narrative of how women have gradually moved into major participation in the workforce of contemporary society.

A limited way of approaching this field would be to look at the roles and numbers of women in corporate America over the decades of the 20th century. This perspective could tell the story of how U.S. women, including immigrants of all races, have moved from the factories and mills of the early 1900s to the broader range of corporate positions by the end of the century. It would necessarily incorporate the effects of the World Wars, the Great Depression, the dust bowls, the postwar social upheavals, the waves of the women's movement, and the national transition from manufacturing and agricultural jobs to service and technology that dominate corporations at the turn of the 21st century. This is an important and valuable story. But it is not the whole picture of women in the workplace.

A fuller story can be told about the roles of women in the work of exploring and settling a new nation, the roles of colonial women and slave women and of freed women and independent entrepreneurs to build a more complete understanding of American working women. European women have worked through different but parallel social and economic histories while expanding their recognized contributions to the workforce. Similarly, Asian, African, Middle Eastern, and South American women have their own complex stories to tell about women's emerging participation in the workplace. Thus, a nuanced and thorough understanding of women in the workplace could be the work of a lifetime.

This entry focuses predominately on the history of working women in the United States but also acknowledges parallel developments in other nations and regions. Social norms and laws affecting women's rights to vote, to own and inherit property, to establish businesses, to work in traditionally men's jobs are all powerful determinants of where women are in work environments. While there are unique patterns and histories in each country, there are also some common trends. These trends will be highlighted in the concluding overview of women in the workplace.

Early Roles

It is not uncommon to hear references to women entering the workforce, as if it was a new phenomenon in the latter third of the 20th century. While it is valuable to recognize the relatively recent and dramatic changes in women's access to the professions, and the great influx of middle-class women into the workplace, it is also important to fully credit the roles that women played in the economic landscapes of earlier centuries.

In America, the patterns of Elizabethan England and feudal laws came over with the early settlers. Women's roles were assumed to be those related to home and family. But in the early settlements, men's roles were also much about home and family. Homesteading meant building a home, finding a way to make a living on the land, and all family members were thoroughly involved. In addition to cooking, feeding, gardening, making clothes, doing the laundry, women tended animals, kept an eye on the crops, and often participated fully in the exchange of animals, produce, grains, and prepared goods that were common in order to acquire shoes, seeds, kitchen utensils and cookware, building supplies, and whatever else couldn't be grown on the land. Women also taught school, ran boarding houses, produced clothing for sale, opened bakeries; in short, used the traditional skills familiar to most women of that period to earn income. These occupations, rediscovered by women periodically throughout the 18th, 19th, and 20th centuries in times of economic need, became safe and recognized economic activities for women.

Native American women at this period were actively engaged in running trading businesses, selling furs, maple sugar, and wild rice to European explorers. Frequently, they provided domestic services, such as cooking and sewing to the fur trade forts. The indigenous women were valued for their translating and negotiating skills, which gave the explorers access to land, rivers, tools, canoes, blankets—all essential to survival in the wilderness. Gender divisions within the Native American tribes attributed negotiating and trading skills to women, thus women were as actively engaged as men in the economic business of the communities. However, as white women arrived in the newly opened trading posts, they brought expectations of the social and economic hierarchies of the old world. The emergent family patterns and gender roles were a mix of European standards and native practices.

Surprisingly, the gendered divisions of labor from Europe and Africa were encouraging women in particular businesses. Slave women brought to the Americas from western Africa came predominately from matrilineal tribes where it was common for women to be producers and traders. In Germany, the Netherlands, France, and England, women were often found as dealers in foods, ale, and clothing. As these traditions moved across the ocean, women settlers contributed to the building of economic bridges with Native Americans.

Civil and Common Law on Women's Economic Status

Just as numerous cultural patterns were transported to the New World with the various groups of explorer and settlers, so too multiple legal systems were imported and coexisted in the early centuries of American history. Western European countries, excluding Great Britain, followed versions of civil law derived from the Roman legal system of legislated statutes. These laws were premised on the family, meaning married partners, as the central unit of society. Laws regarding economic transactions and property rights were designed to protect the continuity of patrilineal families. However, property rights were held jointly by the husband and wife, and where civil law prevailed in the New World, wives could inherit half of the wealth, land, or personal property accumulated during her marriage, since she was a coequal owner of that property. Despite this access to property and financial resources under civil law, husbands and fathers held absolute legal authority, thereby circumscribing women's claim to resources by the family claim.

In contrast, common law evolved from British feudal privileges and followed customs, traditions, and judicial decisions. Feudal rights and privileges were granted by lords and barons, on the basis of military obligations and triumphs. Women were excluded entirely from this authority or ownership, and thus had no rights to property. Judicial decisions were premised on prior comparable cases, so that the common-law system developed according to how things had always been done. Under this system, women were allowed the use of marital property as long as the marriage lasted. If she was widowed or divorced, she might retain claim to her personal belongings, but certainly would not inherit real property.

Both legal systems created cultures that were powerfully patriarchal. Women's economic rights were severely limited, thus limiting their ability to own or run businesses, to take over the enterprise of a deceased husband, and, having little or no collateral, to take out loans for the purpose of acquiring land or opening a store. Married women were not legally independent agents.

In addition to the differing legal codes in different colonies, not all women were treated alike. White and Hispanic women had more privileges than African American or Native American women, creating class differentiations that were enforced by women and men of the dominant European cultures. Access to education, property, decent wages, as well as to the basics of food and shelter were all more limited for the poorer members of society. While slavery was a strong component of this class system, classism and racism extended well beyond slavery and served to reduce the economic freedom of many women in the colonies to a bare minimum.

Industrial Expansion of Capital Markets

As cities grew over the 18th and 19th centuries, and the Industrial Revolution got under full steam, women's role in production and trading extended as well. During the period of the American Revolution, British businesses were frequently boycotted, creating an opportunity for small businesses to offer such things as millinery, dry goods, books, and household supplies. Women entering these businesses could do so as an extension of their household roles and expertise. Young girls could be apprenticed to female artisans and storekeepers to supplement their parents' income and to learn trades that they might put to use for their own families' benefit in the future. By the end of the American Revolution, the laws of primogeniture, which prohibited women from inheriting property, were changed in every state, and women's economic status began the incremental move toward equality with men.

During the first Industrial Revolution, between 1830 and 1880, the growth of mills and factory production centers, provided manual labor for young girls and women who needed work. While the dominant business of the American colonies and territories was still agriculture, the mills introduced an alternative to the hard labor of farms. Making shoes and textiles was not pleasant work, the conditions, wages, and hours being entirely at the will of the owner, but it offered an opportunity to earn and save small sums. Entrepreneurial women were occasionally able to achieve notable success in business, particularly selling items to women—lotions, medicines, hats, small time-saving inventions for the household and were able to exploit the increasing tolerance for women's claims to conduct business independently. It was a period that saw the emergence of the women's movement following the Seneca Falls Convention in 1848, and gradually legal changes were made to enable women to enter contracts and hold property. Parallel to the abolition movement that supported economic freedom for slaves, women and men also began to consider the rights of women to achieve parity with men in the marketplace.

However, as the 19th-century industrial growth contributed to wealth accumulation, distinct social classes became apparent, with a robust classism in tow. Higher-class women did not need to work outside the home, and they imbued their domestic talents with a moral superiority. Lower-class women were forced by poverty to leave their children and homes to undertake wage labor, often in service to the higher-class families. Middle-class women were the ones most affected by the Industrial Revolution as whether and how one worked established social rank, which determined marriage prospects and one's station in life. A cult of domesticity encouraged women's roles as mothers, wives, homemakers, and for middle- and upper-class women it conveyed the message that this was truly the appropriate and ideal role for women. Men could conduct the public and economic life of the family, while genteel women were expected to defer to their husbands and maintain the harmony and order of the home. Of course, not all women were willing to conform, but those who refused to adopt the norms of the passive female, risked social scorn. Where domestic deference was touted as a virtue, nonconformance was glaring.

By the late 1800s, women engaging in businesses were less constrained by law, but were still hemmed in by custom and tradition. Women's businesses, like men's of that period, were small, usually employing fewer than five workers. Women entrepreneurs were most often older, widowed or married, and applied their domestic talents to the marketable production of clothing, foods, or related services. The most apparent differences from men's businesses were the level of capitalization and available credit: Women business owners were frequently referred to as penny capitalists.

A further area of organizational specialization emerged for women in the 19th century, that of founding and running moral reform organizations. Temperance campaigns were popular and directed largely by women. Churches were established by women often incorporating contemporary issues of moral concern, such as women's rights, rights of slaves and freed blacks, and alcoholic abstinence, along with a growing interest in spiritualism and healing. Women were not universally accepted as preachers, but many people were willing to attribute a moral superiority to women, lending strength and credibility to their role as church leaders.

Women's Role in the Incorporation of America

Dramatic changes occurred in the structure of business organizations over the 50-year period spanning roughly 1880 to 1930. Women's participation in this transitional period was essential. In the manufacturing world, women were the cogs of the massive garment and textile industries, as indicated by the individual labor rights groups that sprung up at the time: Shirtwaist Workers, United Cloth Hat and Cap Workers, Buttonhole Workers, International Glove Workers, the Boot and Shoe Union. In the service industries, women were hired as telephone operators, sales clerks, laundresses, among other roles critical to the explosive growth of industry. Women's contributions enabled the widespread success of corporate evolution, while the entrenched discrimination against women in the workplace became increasingly apparent.

At the dawn of the 20th century, small companies were being rapidly swallowed up by larger corporations dominating industrial mass production. Approximately 300 companies held 40% of the country's manufacturing assets. The economic focus of the nation shifted away from small businesses as major transportation, banking, retail, communications, manufacturing, and insurance companies emerged. Although the women's rights movement succeeded in securing women's right to vote in 1920, women in the workplace were still limited by the lack of education and professional training, little access to credit and capital, discriminatory hiring practices and protective labor legislation.

Women were in sex-segregated jobs, often those that demanded precise manual labor, such as sewing factories and assembly lines. The hiring of lower-class children, orphans, and immigrant women into factory jobs prevented them from acquiring an education that might enable them to move out of poverty. The working conditions were only minimally regulated, if at all, creating environments with significant risks to health and longevity. Searching for a forum for redress, women and girls became a significant component in the labor movement, voicing pleas for safer workplaces and staging marches and rallies to garner public support. Tragedies such as the Triangle Shirtwaist Fire served to catalyze federal regulatory efforts for factory buildings and attention to workplace safety standards. Despite the vocal role of working women in labor unions and the heavy reliance on women in the bottom of the workplace pyramid, a majority of men in union leadership and corporate management regularly announced their belief that women's rightful place was in the home, and that women should work only if their circumstances required it. These espoused beliefs enabled them to establish higher wages for men as the rightful family breadwinners.

In addition, working women were constrained by legislation from participating in many occupations that were considered too difficult or challenging for the frailer sex. As a result, women were relegated lower-paying jobs, with fewer opportunities for advancement, or for the achievement of financial independence. In 1908, the U.S. Supreme Court case *Muller v. Oregon* gave employers the right to prohibit women from working long hours, or from jobs that were deemed to be physically taxing, particularly to the reproductive function of women. Louis Brandeis, representing the state of Oregon, used traditional gender roles to successfully argue that women should be treated as a special category due to their reproductive role, thereby fostering legislation that would limit women's job rights for decades. While this is often referred to as protective labor legislation, it has been a matter of debate whether it was more protective of women's health or men's jobs.

From 1870 to 1930, women's proportional enrollment in colleges and universities more than doubled, reaching 44% of the student population. Women were increasingly able to choose jobs and aim for careers other than teaching. Despite continuing low wages and inadequate child care, some women combined motherhood with paid work. Women were achieving a new stereotype, that of being better people persons, and accordingly they were channeled into retail, service, and secretarial positions. These were more respectable than factory jobs and better working conditions certainly, but were still undoubtedly labeled as women's jobs. This period of history saw a major gain in wage work for young single women, and by the Great Depression, all those who were still employed were grateful for income, regardless of the gendered nature of the task. Women were admitted to professional schools, in small numbers, but obtaining jobs in law firms, hospitals, or management ranks was nearly impossible while companies could legally engage in discriminatory hiring and promotion practices.

The Great Depression and World War II were periods of intense social anxiety resulting partly in a return to the comforting assurance of women in traditional family roles. Although women filled in men's jobs when they were needed, due to war or hardship, these were temporary roles, with temporarily elevated earning power for women. The strain of loss, sacrifice, and violent warfare reinforced a longing for a secure family, the preserver of traditional values, among which motherhood ranked high on the list. The baby boom of the late 1940s and 1950s was the result, with a renewed cult of domesticity buoyed by postwar prosperity. Advertisements for consumer products celebrated joyous, carefully coiffed women thriving on floor waxing, the preparation of hot lunches for their children, and the achievement of brilliant white laundry. Once again, "working women" generally indicated those who could not afford to stay home.

But the new economic prosperity also created opportunities for women entrepreneurs. For example, Esther Mentzer, a working class child of Hungarian immigrants, grew up in Queens, New York above the family's hardware store, while her uncle conducted chemistry experiments in a backyard laboratory to create skin potions. From this experience, Mentzer and her husband built a small business producing facial cream in their kitchen, distributed to beauty parlors and eventually on a larger scale to New York department stores. Esther Mentzer became Estee Lauder, creating an international cosmetics company, responding to women's interest in beauty and skin care. Her knowledge and ability grew with the demands of the business, propelling her to a level of success among women in business with few peers in the world.

The Emergence of the Businesswoman

Despite the renewed enthusiasm for women as homemakers in postwar economies, it was increasingly evident across the globe that women were capable researchers, explorers, thinkers, and leaders, in addition to being mothers and wives. Marie Curie, Amelia Earhart, Eleanor Roosevelt, Elizabeth Windsor, Rachel Carson, Golda Meir, and Indira Gandhi are notable among the many accomplished women of the 20th century. If these lists didn't include women in business in the 1960s, it wasn't because they lacked the ability to lead or inspire. Although entrepreneurial women in business were visible, they were not a frequent sight, and discriminatory business practices and laws continued to work against the vast numbers of women in the workplace.

In 1963, U.S. President John F. Kennedy signed the Equal Pay Act, and it was followed closely by Title VII of the 1964 federal Civil Rights Act, which included the term *sex* as a nondiscriminatory category. Ironically, the term was inserted at the last moment by an amendment designed to ensure the defeat of the act. The passage of these acts signaled the end of advertisements for men's jobs as distinct from women's jobs and mandated equal pay for equal work. Many labor and business associations lobbied unsuccessfully against these acts in the congressional hearings stage, as burdensome, costly, and intrusive for private enterprise. Despite this opposition, the legal groundwork was laid for the efforts to achieve gender parity in workplace roles and wages. This official step was a radical departure from the legally entrenched gender-segregated workplace that had evolved from the European roots of American society and predominated for centuries.

The path of women into the mainstream workplace has never been a direct linear route, and this stage was no exception. Although increased legal rights for working women had been affirmed, there was no immediate visible effect on wages. In 1955, women's wages were 64% of men's wages, and by 1961 they had fallen to 59% and stayed close to that level through the decade. The Civil Rights Act provided for the establishment of the Equal Employment Opportunity Commission to oversee compliance, but it was quickly overwhelmed with the task and broadly considered ineffective.

The women's movement gained strength and confidence from the civil rights movement and antiwar protests of the 1960s. Each demanded social change and the righting of perceived and experienced wrongs. Widespread frustration and anger about racism and sexism in so many social institutions prompted activists to work toward increased integration of schools and workplaces. Although women and blacks faced different types of barriers and prejudices, they were often united as they had been a century earlier, to push for basic civil rights and the dismantling of the systems of privileges that enabled white men to hold all economic, political, academic, and civic authorities.

By the 1970s, increasing numbers of women and minorities were admitted into schools of law, medicine, and business. Affirmative action policies were used to recruit and admit those whose educational background or experience might not have previously gained them admittance. Similarly, businesses, along with law firms and medical practices, actively recruited women in an attempt to be seen as part of the solution rather than part of the problem. However, 10 years later, affirmative action itself was accused of being discriminatory, and the argument that women were inherently disadvantaged in the workplace was losing strength. The initial rush of women into MBA programs and managerial jobs dropped off again, as many women of the baby boom era discovered that in the absence of changes in men's attitudes toward and participation in parenting, it was extremely difficult to work full-time, raise a family, and live up to performance standards set according to the benchmarks of men who didn't have primary family responsibilities.

Women faced the conflict of the idealized worker and the idealized mother, according to Joan Williams, a researcher in the American family. The idealized worker is a male, whose life is focused on the demands of his work. While he may have a family, his commitment to them and their needs is superseded by the needs of his employer, who may insist on long hours or geographical moves. For many corporations in America, this idealized worker is still a fundamental standard against which all men and women are measured. At the same time, women are socially measured against the standard of the idealized mother—one who is willing and able to drop everything when a child needs her and who would prefer to be with her children than to be working outside the home. Obviously, women cannot be both an ideal worker and an ideal mother, according to these stereotypes. But most of our economic and welfare policies, health benefits, divorce laws, and business traditions embrace these ideals, creating an environment that makes it difficult for women to choose to work and mother at the same time. These arguments point to the need for changes in men's attitudes and roles for women's roles and achievements in the workplace to be sustainable.

Nonetheless, more women are in the workplace than ever before, and although there is significant variance by work specialization, women's wages are rising slowly to close the remaining gap to achieve parity with men's wages. By the 1990s, women outnumbered men as recipients of bachelor's and master's degrees. Historian Joan Hoff has suggested that the legal status of women changed more in the last quarter of the 20th century than in the previous 200 years. Credit, property, and capital are more readily available to women.

These remarkable achievements have not brought about true equity in the workplace. Many men and women still work in sex-segregated blue-collar jobs, and while women in executive roles are not the rarity they once were, corporate board meetings or executive gatherings are nearly always dominated by men with women playing a minor role. In 1992, 25% of working women were employed part-time, while only 11% of working men were part-time. Black women are more likely to be limited to part-time work involuntarily than white women. Latino women are more likely than whites to work in seasonal industries and, therefore, to face regular unemployment.

While women have made great strides in workplace rights and accomplishments, familiar challenges persist. In the United States as well as in most other parts of the world, women are still expected to be the primary parent, to be on call for children and aging parents. Around the globe, women are largely responsible for housework. These demands on women's time and energy place unequal burdens on women trying to compete in a marketplace with men for jobs and opportunities. Gender stereotypes in education and the workplace still linger—girls and women are often steered toward jobs requiring relational skills, while boys and men are expected to do better in mechanical and technical fields. Despite these recalcitrant attitudinal barriers to gender equality in the workplace, women now have rights and opportunities that enable them to pursue individual goals of accomplishment.

Women's Movement

The women's movement refers to the social movement by women to achieve full economic and civil rights. The beginning of this struggle in the United States is generally traced to the Seneca Falls Convention in 1848, organized by Elizabeth Cady Stanton and Lucretia Mott. An afternoon conversation between friends about women's place in society resulted in a resolution to work together for change. One week later, on July 19, 1848, these bold women launched a revolution that continues to this day, as women and men around the world strive to establish and protect equal economic, civil, legal, and social rights for all women.

In the United States and most Western nations, women have achieved the legal and economic rights defined as goals in the early stages of the movement. But these did not come without lengthy debates and challenges, and those at the forefront of the movement were often ridiculed and ostracized for advocating such things as women's right to vote, women's right to own property, women's right to child custody in a divorce, and women's right to obtain training to work in any profession. Although most of these now seem commonplace and normal, in the life of our nation and modern society, they are quite recent accomplishments.

Over seven generations, the women's movement mobilized citizens, largely women, to rally workers; to propose legislation; to picket in the streets; to write pamphlets, books, and letters; to engage in civil disobedience; and to run for office in order to persuade a majority of American voters to recognize women as full citizens, not dependent on men to formulate their opinions or exercise their rights. These activists were jailed, jeered, and booed, but they were rarely ignored. The women's movement aroused intense sentiments, both pro and con, from the outset. Stanton predicted that there would be misconception, misrepresentation, and ridicule, and she was proved right repeatedly. While media scoffing intimidated some women, a much larger number were enraged at the attempts to humiliate women and responded by further committing themselves to the cause of equal rights. The waves of support for women's rights continue through the present time and have extended to include a focus on women in developing countries and also to address issues beyond those envisioned by the early leaders, such as pornography and social security benefits allocations.

Founding Mothers

Elizabeth Cady Stanton, a social activist in the temperance and abolition movements and an experienced journalist, and Lucretia Mott, also a committed abolitionist, set the date and the tone for what became known as the Seneca Falls Convention. It was envisioned as a relatively small gathering in a local chapel to discuss the social and civil rights of women. They advertised with a small notice in the *Seneca County Courier* and invited their respected friend and orator Frederick Douglass to speak. His presence and reputation as a freed slave was indicative of the close ties between the women's movement and abolitionists. In preparation for the convention, Stanton gathered her beliefs, grievances, and goals into a Declaration of Sentiments, modeled after the U.S. Declaration of Independence, opening with the assertion that all men and women are created equal.

The 2-day conference, reportedly attended by some 300 participants, focused on debating the resolutions contained within Stanton's Declaration, the most contentious being the call for women's enfranchisement through equal voting rights. Most of the resolutions were passed unanimously and claimed equal rights in property ownership, educational access, civil and religious leadership roles, marital status, and trade and professional labor. The demand for women's vote was seen as too audacious by many within the movement and it was shocking to outside observers. Stanton saw it as absolutely foundational to all other rights, just as the American patriots had argued in their early rebellion against the rule of the British monarchy.

The Seneca Falls Convention gained unexpected and wide press coverage, nearly all of it negative, except that by Frederick Douglass's newspaper *The North Star.* While there were strong ties between the abolitionists and the women's movement, these social activists were fighting for radically different kinds of liberation. Blacks were fighting against oppression and the view that they were a race of lesser human beings, unable to excel, learn, and lead. Women were fighting against excessive protection and the view that they were delicate and should be limited to the realm of family life. Sojouner Truth's 1951 speech, "Ain't I a Woman?" was a powerful cry for equal rights for black women within the women's rights movement. While women and men of both races continued to participate within the women's movement, dissension about full participation mirrored the widespread disagreements throughout the country about the true equality of the races.

The Declaration of Sentiments had expressed the strong hope that future conventions would be held all across the country to rally broad support. Indeed the impetus created by the Seneca Falls Convention, and furthered by Quakers, abolitionists, and temperance workers, did result in a series of local gatherings. Speeches were made, petitions were circulated, and a surprising number of ordinary citizens listened carefully. As the country erupted in civil war over economic and civil rights, women took on greater responsibilities beyond the family circle, and as happened nearly a century later, many women emerged more confident of their own abilities and more ready to demand full legal rights. However, the supporters of women's suffrage were still a minority.

Working for the Vote

Over the latter half of the 19th century, women's right to vote emerged as the major focus of the women's movement. There were certainly other critical issues facing women, but it was the consensus of the activists that by obtaining the vote, they would be in a better position to determine social policies that would better their lives. Susan B. Anthony joined Stanton in 1869 in founding the National Suffrage Association. Although the right to vote was the main platform of this organization, it was also committed to other issues related to women's rights, such as workers' rights and labor unions. In the same year, the more conservative American Woman Suffrage Association was formed by Lucy Stone, Henry Blackwell, and Julia Ward Howe. The groups differed on strategies and tactics, a central question being whether to focus on a constitutional amendment or state by state referenda. By 1890, the associations merged into the National American Woman Suffrage Association (NAWSA), concentrating efforts on the passage of a constitutional amendment. In 1890, Wyoming became the first state to grant women the right to vote in all elections. However, another 30 years passed before this right was secured at the federal level.

Many arguments against women's suffrage were voiced, even by women themselves. Some claimed that women didn't want the vote, that women would only add to the number of unqualified and insufficiently educated voters, or that it would jeopardize national security. Others suggested that differences in women's biological and social nature would prohibit them from properly apprising the issues and candidates. The pro-suffrage arguments focused on principles of equality and liberty, and more pragmatically, the beneficial social changes women could make if given the vote.

The early decades of the 20th century saw intense political debate about women's suffrage as the activists regularly engaged in disruptive demonstrations and White House pickets extending for months. In 1919, the 19th amendment favoring women's suffrage obtained the necessary votes in Congress to be sent to the states for ratification. It was ratified on August 18, 1920, granting women the right to vote. Shortly thereafter, the National League of Women Voters was created from the remnants of the NAWSA as a nonpartisan organization whose goal was to help newly enfranchised women exercise their voting rights and responsibilities.

A key leader of the National Women's Party, the radical wing of the suffrage movement, Alice Paul, recognized that obtaining the vote would not entirely solve women's struggle for equal rights. By 1923, Paul had drafted an Equal Rights Amendment, proposing a broad assurance that men and women would have equal rights throughout the United States. But Congress was not willing to tackle this debate again, having weathered the suffrage issue so recently, and the proposal was sent off to congressional committee where it languished for nearly 50 years before reemerging in 1972 for reconsideration.

The Battle for Birth Control

Meanwhile, as the push for suffrage was beginning to succeed, another issue central to women's freedom gained national attention. If women were ever to be free to play a major role in politics or business, they would need to have some control over the demands of pregnancy, childbirth, and child rearing. Margaret Sanger, a public health nurse, argued vehemently that women must have the right and the opportunity to learn about and obtain birth control to control their own bodies. That a woman would publicly advocate educating women about their bodies and sexual functions was appalling to a large part of society. In the late 1800s, the Comstock Law had been passed, prohibiting transportation of obscene, lewd, or lascivious material. Contraceptive devices and contraception educational information fell into the lewd and lascivious category, prompting Sanger and her followers to consistently defy this law by publishing birth control information and distributing it broadly. In 1916, free-love advocate and anarchist Emma Goldman was arrested for distributing birth control literature in New York and successfully gained national publicity with her ensuing trial. The same year Sanger opened the first family planning clinic in New York, but it had a short life before it was shut down by police for violating the Comstock Law.

The first legal birth control clinic was established in 1921 by Sanger and two colleagues, concurrently founding the American Birth Control League. By 1936, birth control under medical supervision was legalized in many states, but Sanger recognized that this kind of access was insufficient for many of the women who needed birth control the most. Estelle Griswold and Dr. Lee Buxton opened a birth control clinic in Connecticut in the early 1960s expressly to challenge a state law banning the sale of contraceptive drugs and devices. In 1965, *Griswold v. Connecticut* was taken to the Supreme Court. The Supreme Court declared the Connecticut law unconstitutional, stating that it violated the right to marital privacy, and effectively legalizing birth control for married couples in the United States.

Margaret Sanger died a few months later at the age of 87, having devoted her life to furthering women's right to control their own sexuality and reproduction. She saw this issue in terms of a woman's right to choose the course of her life and to control her own body. Some critics of birth control saw it then as now as interference in a divine plan. Others saw it as interference in man's right to patriarchal control of his family. That women might be free to choose their livelihood and to control when and if they became mothers was startling and disorienting to many people who believed that women's essential purpose was to reproduce and raise families. As women gained the freedom to express their independent views, it was increasingly clear that not all women were willing to settle comfortably into that stereotype.

The Second Wave

What is referred to as the second wave of the women's movement, a broad collection of feminist activism, gathered momentum through the 1960s. Numerous factors contributed to this broad-based swelling of concern and interest in women's rights. In 1961, the director of the Women's Bureau of the Department of Labor urged President John Kennedy to take an active role in addressing workplace discrimination against women. Kennedy appointed Eleanor Roosevelt as chair of the newly formed Commission on the Status of Women, and their report in 1963 documented widespread gender discrimination. State and local commissions for women were promptly established and followed the federal lead in recognizing discrimination as a problem that demanded innovative solutions.

The Feminine Mystique, published by Betty Friedan in 1963, is commonly seen as an early impetus of the 1960s wave of the women's movement. Based on a survey she had conducted among fellow Smith College graduates, in anticipation of their 20-year class reunion, Friedan described the deep dissatisfaction felt by women who were trapped into homemaker roles by social expectations and limited work opportunities. It was the first book to articulate the anger and enormous frustration experienced by middle-class educated women at the widespread intellectual oppression. Friedan's book, immediately controversial, sparked an activist flame among hundreds of thousands of women who realized they could look beyond their homes to fulfill their potential.

The Equal Pay Act of 1963, signed by Kennedy, went into effect in June, 1964. It was designed to reduce the pay differential between men and women for substantially equal work within the same organization.

Title VII of the 1964 Civil Rights Act subsequently prohibited employment discrimination on the basis of race, religion, national origin, or sex. The ensuing Equal Employment Opportunity Commission (EEOC) was established to investigate the enormous number of discrimination complaints, but it was quickly apparent to watchful feminists that the EEOC was either unwilling or unable to address these complaints adequately. In response Betty Friedan joined forces with women leaders of several state Commissions on the Status of Women to form an organization that would lead the fight for women's civil rights.

The National Organization for Women (NOW) was established in 1966 for the stated purpose of bringing women into full participation in the mainstream of American society, with equal rights and privileges as men. Betty Friedan served as the first president of NOW and worked closely with Rev. Pauli Murray, the first African American woman Episcopal priest, to draft the early statements and guidelines of the organization.

In the late 1960s, NOW was sharply divided over the inclusion of lesbian feminists. Notable lesbian members complained about being marginalized, and Friedan and others admitted candidly to their discomfort with lesbianism. A group of lesbians, calling themselves the Lavender Menace, took the stage at NOW's 1970 Second Congress to Unite Women, expressing their anger at the evident homophobia. An open discussion resulted; the emergent understanding and acceptance directly shaped NOW's feminist stance and activism. By the 1971 NOW conference, a resolution was passed recognizing lesbian rights as a legitimate concern of feminism. The 2006 NOW statement of purpose makes it clear that the organization stands against all oppression, including racism, sexism, and homophobia, as well as classism and ableism.

While several of these issues have been adopted in society as appropriate targets for legal action, such as racism, and discrimination against people with disabilities, NOW's championing of the rights of the gay community and the rights of women to choose an abortion if necessary have provoked a significant backlash among more conservative citizens. Many people do not accept that gays and lesbians should be able to marry or raise children, or that they should be free from discrimination in their jobs. Many people also do not believe that abortion should be a legal right for women. Over the decades of the second wave of feminism, words such as "strident" and "aggressive" were used to characterize and denigrate NOW's style of advocating for freedom from oppression. As a result, fewer and fewer women were comfortable being characterized as feminists, although they might readily state that they were in favor of equal rights for women.

Among the opponents of NOW and liberal women's rights groups have been other activist groups identifying themselves as profamily. They argue that women's demands for equality with men, for example, in business or the military, result in higher divorce rates, a loss of reliable parenting for children, and more conflicts in the home. These activists argue that men's roles and women's roles should be distinct, that a family should have a mother and a father, preferably with the father working, and the mother focused on parenting or homemaking.

Equal Rights

From the 1960s through present day, women's groups, both local and national, have organized to protect women such as battered women's shelters and rape crises centers, while other organizations have provided women with health information, birth control, reproductive planning counseling, and abortion services. For most feminists, the availability of these services and protections are part of obtaining equal rights within society: the right to physical safety, the right to make decisions about work and family, the right to complete health care information, and the right to protect one's children. Most of these are issues that women's rights groups have addressed since the Seneca Falls Convention, more than 150 years ago.

In 1972, Title IX was included in the Education Code specifying that girls and boys should have equal access to education programs. The number of women in professional schools and the resulting professions has more than quadrupled in the past 35 years. Ultimately, "equal access" was understood to include resources for athletic and academic programs at the elementary, secondary, undergraduate, and graduate level. The inclusion of athletic resources in the Title IX mandate was fiercely debated, since the reallocation of limited resources to women's sports forced the reduction of some men's sports. As a result, girls' and women's participation in sports has seen a phenomenal increase, from high school teams through the Olympics.

Another key issue articulated by the Seneca Falls activists was women's right to own property and maintain their own financial assets. Financial independence has been one of the most recently won stages of women's social equality. Only within the last quarter of the 20th century have women been able to get a bank loan without a male cosigner. Well into the 1970s, married women were issued credit cards exclusively in their husbands' names. Women's salaries were routinely set lower than men's for comparable work. While women have not yet achieved full earning parity with men in many jobs, women in most democratic countries are now able to obtain loans, bank accounts, credit cards, make investments, and own property, without being asked questions about marital status or being given permission by men.

As women have gradually been accepted as working peers in business, government, and educational institutions, these organizations have been forced to face new questions about schedules, employee expectations, and benefits. With women working through pregnancies and child-rearing years, new policies have been articulated regarding leave for maternity, birth, and parenting responsibilities. These have now been extended to include men's parenting responsibilities as well as women's. Parenting issues have prompted a review of other related concerns such as the needs of an aging workforce to look after aging parents or parents with disabilities. These are not just the concerns of human resource departments. The traditional, that is, 1950s and 1960s, norms of the ideal worker, one who puts his or her job before any personal interests or demands, have been dismantled. While men and women in most jobs need to sacrifice many aspects of their lives to the priorities and demands of work, there is a greater tolerance for workers with whole lives. Many workplaces have created flextime for white-collar jobs, and have made adaptations to the realities of men's and women's lives outside of work, in the interest of building a loyal workforce.

However, more women working full-time has meant fewer women home with children. As a result, there has been a greater need for alternative sources of child care, full-time as well as before and after school. This need is addressed in part by many elementary schools offering extended child care to cover hours when parents are not at home. Other families have solved the gap by hiring babysitters or nannies. But millions of children are left to take care of themselves at home alone while parents work. The problems of these "latchkey" children and youth, for example, watching too much television, spending unsupervised time on the Internet, eating junk food, experimenting with alcohol and drugs, engaging in early and promiscuous sexual activities, are frequently attributed to be the fallout of increasing numbers of women working outside the home.

New Issues Emerge

Although society is still working on achieving some of the basic issues of women's rights that were recognized by the Seneca Falls Convention, contemporary discussions include a range of concerns that reflect a dramatic reshaping of our social abilities and available options. For example, should affirmative action programs seek to address and compensate for past discrimination practices in employment and education? Should a woman be free to hire out as a surrogate mother by carrying a baby to term for another woman or couple? Should women be accepted into the military service as active combatants? Whose responsibility is it to establish the boundary between flirting and sexual harassment? Should businesses be expected to accommodate women's reproductive lives by providing child care services or enabling them access to competitive jobs even after time off for motherhood? Should men have equal time off for parenting responsibilities?

Many of these questions have been successfully addressed in other countries. For example, Norway, among others, has generous parental leave policies, with little or no adverse effects on job advancement. Israel has long accepted women into military service. The professional opportunities for women also vary dramatically around the globe, from countries where women have served as prime minister or president, to countries where women have not yet achieved the vote or the right to attend school.

The women's movement in the United States has achieved significant accomplishments in women's educational, political, professional, social, and civil rights over the past 160 years since the Seneca Falls Convention. There is much to be celebrated and recognized as the work of women and men dedicated to equality in daily life. However, a great deal still remains to be done for women to be fully represented in state and federal legislatures, in all branches of the government, and in the many corporations that control much of the wealth of the country. Given the history of the women's movement, the potential for ongoing development in equality is strong.

WORK AND FAMILY

The expectations of an organization and the ability of a worker to balance professional obligations with family responsibilities is a topic of great importance to society, its organizations, and individuals. For millions of working adults, questions about how to balance the needs of their employer with the needs of their personal lives provides a daily challenge. For work organizations, the ability to develop and maintain a stable workforce capable of achieving the organization's goals is not a simple task. When employees face personal demands that conflict with work requirements, organizations can suffer. Organizations need their employees to focus on their jobs and not be distracted by competing demands on their time created by children or aging parents. The balance of work and family at the national level involves policy decisions regarding the allocation of scarce resources, as well as regulatory decisions.

From a societal perspective, current work-family balance pressures stem from a market-based economy. By their design, market-based economies are based on a structure whereby people are largely self-sufficient and are rewarded for hard work. Adults are expected to provide for themselves and their families. Increased economic pressures are pushing more people into the workforce and transforming the jobs people perform. Previously stay-at-home spouses now often work part-time or full-time to help their family financially. The increased pressures on families and the effort required to care for households place stress on our national infrastructure and support systems. Tasks once performed by a family member are now often contracted out. The increased demand for services, such as child care, has spawned a growth in service-based businesses.

From an organization's perspective, work settings require employees to trade their talent and time for compensation. Increasingly in the United States that trade-off is not a simple one. The expectations that employers place on employees are increasing. Technology, once designed to liberate people from their desks, now gives employers unlimited access to their employees regardless of time or location. Foreign and domestic competition forces employers to place greater emphasis on productivity and efficiency. In addition, organizations are challenged with the task of motivating and retaining an increasingly pressured workforce. Organizations today face more competition, and this forces them to increase their demands on employees.

The question of an appropriate work-family balance is often felt most closely at the individual level. Demands for working adults are increasing both professionally and personally. For salaried employees, the 40-hour workweek has often expanded to 50 or more hours per week. Contingent workers now face the task of working more than one job in order to maintain economic stability. Employees also have personal lives that require maintenance, and for some people, this can be a significant drain on one's time. The end result is that people are pushed to the limit.

Obviously, work-family balance issues are important for us nationally, organizationally, and personally. The issue of work-family balance involves a complicated interplay among three factors: societal issues, organizational issues, and personal issues. All these factors culminate in a network of support systems. Although the list may not be complete, these key factors provide both a context in which to become informed on the topic and serve as a mechanism for exploring solutions.

Work-life balance refers to the integration of a person's personal and work life and is particularly complex when an employee has family obligations. Some argue for a separation between these two components in one's life, others assert that the integration of one's work and personal life can be a source of synergy or stress. The three core factors, societal issues, organizational issues, and personal issues provide an interplay that profoundly affects the success with which one can live an integrated life.

Societal Issues

In a broader historical context, work-family balance issues seem to have intensified as the wealth of the community allows people more leisure time. It is true that many Americans have the wealth to live at a more leisurely pace, but our society is typically characterized by a long workweek and high-stress work environment. Four recent trends point to a far more complex set of trade-offs that confront the average worker or family: increased household hours spent outside of the home, increased dependence of families on market-based support systems, more geographically dispersed communities, and decreased national attention to potentially harmful working conditions.

Time Demands

The rising costs of housing, health care, and education are putting pressure on families to collectively work more hours, as wages fail to keep pace, particularly during cyclical economic downturns. The classification of the worker determines whether the length of the average workweek has increased in recent years. The average workweek for hourly wage earners has not changed significantly in the past 30 years; 40 hours is still the standard. For professional or salaried occupations, the workweek is often longer.

But a definite trend is the increasing number of dual-income households and single working-parent households. The number of married women participating in the workforce has increased from 35% in 1966 to 61% in 1994. Married women who were part of the workforce and who had children less than 3 years of age increased from 21% to 60% over the same period. Single-earner married couples are no longer the norm. A majority of children do not have the benefit of a stay-at-home parent. Compare this with 65 years ago when two thirds of all households consisted of a married couple with a single-income earner. From 1970 to 1993, the proportion of dual-earner couples increased from 39% to 61% of all married couples.

Furthermore, more hours are spent in transit to the office and driving to and from other non-work-related obligations, such as dropping off and picking up children at school or day care, running household errands, and visiting extended family. This means less time for leisure and domestic tasks that require routine attention. Consequently, there is a growing dependence on services to compensate for increased hours spent at work and on the road. And coordinating and managing these many services points to yet another dimension of the organization and time-management challenge that is at the heart of the work-family balance issue.

Reliance on Market-Based Support Systems

Support systems for individuals and families take four forms: personal, employer, government, and market-based. It is important to see first how the increased dependence on market-based services over the other forms of support is reshaping communities and society as a whole.

Personal support systems traditionally consisted of family members and friends are, for many demographic groups, largely disappearing, with families relying on a patchwork of costly professional services to manage home or domestic life. This phenomenon is in part due to the greater mobility of the workforce, which results in families moving away from their extended families and established communities for a better job. The increased presence of women and, more recently, retired-aged people, in the workforce also diminishes the role and availability of these traditional support systems.

Government support systems are largely aimed at families either living below the poverty line or unemployed for extended periods of time. Employer-provided support systems, in the form of services and benefits, can be fairly extensive, but are also scaled out and back as the labor force contracts and expands, respectively, and thus are not a consistent source of support.

Not surprisingly, working families have come to rely on commercial services. As an increasing number of collective family hours are spent in the workplace, and as other sources of support are either less accessible or less reliable, the demand for professional services has risen. These services include, but are certainly not limited to, laundry, house cleaning, child care, lawn care, handy work, mail order, and online retail for clothes and household goods, grocery delivery, and even dog walking. In fact, the service sector has grown to dominate the U.S. economy.

Although designed to help the full-time employee, these services are costly, and workers must weigh the costs in relation to the benefits of working full-time or more hours. For these services are costly, particularly during times of inflation, and may represent a significant share of the household budget. The amount spent on child care and education varies by household income. However, the growth in expenditures is telling. According to the U.S. Department of Agriculture, in 1995, the families in the lower third of the economic bracket spent $7,500 per year on child care. By 2005, that number had increased to $12,000 per family. For those in the upper third, the amount was $20,760 in 1995 and $36,000 in 2005. Clearly, the growth in cost has had the greatest impact on those who are least able to pay for the cost of child care.

There are real drawbacks in depending on professional services. Support systems are pieced together to bridge continuing gaps in services needed. And the quality of services is not easily ascertained as it might be when relying on personal or employer-based support systems. This means that households spend more time researching and identifying quality service providers. Fortunately, the growth in the Internet has facilitated the speed with which these assessments can be done.

Changing Geography

Community infrastructures that connect work and nonwork activities have become more geographically dispersed. The average commute-to-work time nationally is 24.4 minutes, according to the U.S. Census Bureau's 2004 American Community Survey. Many American workers also spend a considerable amount of time traveling nationally or internationally for work. Time on the road also contributes to work-family balance issues as it represents time away from family and home for which most workers are not explicitly compensated through their employer.

As metropolitan areas expand outward from the city center, people experience longer driving distances between daily destinations, whatever they may be. This work dispersal is a significant departure from the communities that existed in the mid-20th century, where families lived in closer proximity to one another, to work, and to other community commercial and public resources. Time spent in transit appears to be a significant contributing factor in the work-family balance tension. Some employers are responding to this constraint on their workforce by locating common services, such as a dry cleaning facility, child care, a post office, or a gym, on the work "campus."

Families with children face unique constraints on their time. Families are having fewer children, but the demands of keeping up with one child grow with a rise in school commitments, sports obligations, and other extracurricular activities in sprawling communities. Concern for safety means more organized, highly structured activities for adults and children. This increases the demands on people's time. The demand for time is also exacerbated with the very specific time demands for children's activities. Pick-up and drop-off from school must occur within a very narrow time window. Being 15 minutes late can have significant consequences for parent and child alike and adds to everyone's stress level.

Working Conditions

The incidence of depression and other stress-related psychological disorders are intertwined with shifts in work-family balance. Mental exhaustion is not given the same attention as physical exhaustion in the workplace. Consider the United States' many laws under the Occupational Safety and Health Administration (OSHA), designed to protect workers from physical harm while on the job. No such equivalent protections exist for mental stress due to working conditions. OSHA's laws largely resulted from union pressure for reform. But unions are, for the most part, absent in white-collar professions. Furthermore, unions do not carry the weight they once did in championing the causes of blue-collar workers. Employers also face increased competition, and their ability to respond to this challenge may be constrained by the marketplace. Persistent time constraints and work-related mental stress are as likely to affect the long-term performance and retention of workers across professions and, furthermore, the functionality of parents.

The impact of an overworked population on the long-term productivity, efficiency, and health of the nation is just beginning to be assessed. Workers are living on the edge and activities must run like clockwork to meet their conflicting demands. Pressure to perform on the job while maintaining some resemblance of a personal life further stresses individuals. One can explore the effect of exhaustion and stress on the individual. The increased potential for accidents at work, on the road, and at home due to current work patterns is an important issue.

Organizational Issues

Organizations play a pivotal role in the work and family balance of their employees with specific expectations and rewards based on market forces and individual performance. Organizations also provide workers with definite rules, policies, and norms that they establish for the work environment. Since organizations have a significant influence on their internal environment, they have real power to positively and/or negatively contribute to their employees' work-family balance. Nonetheless, organizations are influenced by many market forces that are beyond their immediate control.

Market Forces

Micro- and macroeconomic forces that influence work-family balance are interconnected. From a macroeconomic perspective, business cycles, globalization, growth in government, and inflation affect the labor market and the economy as a whole. Yet macroeconomic forces clearly affect individual job security and income potential and accommodations that employers can offer their employees.

Business cycles tend to strongly influence growth, unemployment, and price stability. When businesses are affected, so are its workers. Recessions tend to limit employment options, increase the cost of living, and increase work hours while economic expansion has the opposite effect. A second macroeconomic factor is the growing global competitive pressure on industry. The convergence of foreign and domestic markets has delivered increased financial opportunities to corporate America, but also raised the bar for U.S. companies. In the search for increased productivity, companies feel significant pressure to cut costs, boost profits, and consolidate businesses. Labor is expensive in the United States relative to other countries and, as such, companies look to technology and outsourcing to reduce costs and to distinguish themselves from their domestic and foreign counterparts. Large-scale layoffs and corporate cannibalization are common features of the current market environment and, as such, so are job and income insecurity for workers. Contributing to the problem are frequent incentives for top managers to orchestrate layoffs and implement other cost-cutting policies.

The significance of the growth in government—as an employer and contractor—should not be underestimated. U.S. federal government expenditures represent roughly 20% of the total U.S. economy. Its increased presence in the economy over the last century has both detracted from and added to work-family balance.

Government agencies are serving as testing grounds for new employment and workplace practices, such as the 9-hour workday with one day off every 2 weeks, on-site day care facilities, and job-share programs. Traditionally, the private sector lags behind in introducing such practices, but they tend to seep into the fabric of mainstream employment practices eventually. But there is some evidence that the growing size of government and its federal deficit may be crowding out other forms of investment. While federal spending for national defense and social insurance programs increases, local and state spending is shrinking, and many social service programs for families, such as support for public education systems and social services, are being downsized or eliminated. Finally, the increasing costs of health care, housing, education, child care, and elderly care are significant burdens on American households and, in part, explain why more families rely on a dual-income earner model for added financial security.

Microeconomic issues also play a role in work-family balance. Industry consolidation has meant that more and more workers are employed by mega-corporations rather than a locally owned or smaller, regional business. On the one hand, large, national and international businesses have more resources—both human and technological—at their disposal that allow them to more easily accommodate flextime, or virtualized, working arrangements. On the other hand, they are less apt to be attuned to individual employee needs. In addition, large corporations are typically public companies that are accountable to shareholders with increased pressure to cut costs and increase profits. This may detract from the flexibility of the corporation to create policies that relieve pressure on their employees.

Labor Force Supply

Whereas two-parent families once divided responsibilities so that one spouse focused on work outside of the home and the other, inside the home, today both parents typically work outside of the home. In addition, single-parent households are far more prevalent. These days, more than two thirds of U.S. households have children, with more than 25% of those households having only one parent. Because households are constrained in this way, family members must be more proactive in pursuing unique job arrangements such as job shares and contractor, consultancy, and shift or part-time work arrangements.

Job shares allow two workers seeking more flexible schedules to effectively share responsibilities that equate to a single 40-plus-hour per week job. For many jobs, part-time hours are impractical, given the nature and scope of the work involved. Two professional employees may either split the project load associated with a job in half or overlap on projects, seamlessly shifting work back and forth between them. Hourly paid work also accommodates a job share construct. The downside for employers is that they might need to cover health care and other benefits for two employees, rather than one. On the other hand, the flexibility can lead to higher retention of existing employees and a deeper and richer worker pool to draw from when looking to hire. In addition, the employer might arrange a collective 50-hour week with its job share employees, while it can contractually only require 40 hours per week from its traditional employees.

Workers wanting more control over their hours and the ability to flex their hours up and down as needed might choose to become contractors or consultants, thus allowing them to accept or reject work on a case-by-case basis at a negotiated rate per hour or flat fee. The term *contractor* was once primarily associated with the construction industry. But now it is fairly common for companies to rely on contractors and consultants offering a broad array of professional and manual services, particularly in less certain economic times. Because contractors and consultants are not employees of the company, companies can readily terminate or cut back expenses associated with this workforce, as needed. On the other hand, employers can add depth to their workforce quickly without burdening the company further with costly health care and retirement benefits associated with permanent employees.

Many workers will move in and out of the part-time workforce, accepting work only when their household is experiencing a financial crunch. For example, many stay-at-home parents will seek part-time employment or shift work when their children enter college to supplement the household income. As the rate of inflation for college tuition rises, alternative work schedules are becoming a more common scenario.

Employer Demands

Employing organizations face conflicting demands. Productivity is a serious issue for organizations because they must remain competitive to survive. Successful organizations rely on a loyal and committed workforce and must get the most from their workers on a per-hour basis to maintain their market position. Yet organizations must be concerned with the work and family balance of their employees, and pushing their people too hard can force breakdowns, resulting in medical and personal consequences for the employees and negative impacts on productivity.

Personal Issues

Demographics

The demographic issues that significantly affect work-life dynamics include age, gender, education, and family status. Because responsibilities differ by stage in life, the age of the worker profoundly affects the tension felt in work-family balance. Those with split responsibilities either for the care of children or aging parents feel the pressure most acutely.

A person's age has the potential to shape expectations for work and personal life. One's age (and life stage or career) can influence the meaning of work, expectation of employer, ability to work varied work hours, and demands outside the work environment. People early in their work life typically have high energy and are interested in quick advancement to positions of increased responsibility. Working long hours is less frequently a problem for this group, and outside interests may or may not provide a work-family balance issue. People in mid-career frequently have significant interests and demands outside work.

Individuals in the later stages of their career frequently have more difficulty working long hours and may have reached a career plateau or are preparing for retirement.

Gender can play an important role in work-family balance for several reasons. Two factors are particularly critical. The first area is equal pay and the second is sex segregation in the workplace. Although laws require equal pay for equal work, the definition of "equal work" is narrow, which means that "equal pay" is frequently not a reality. Women are often paid less than men in comparable jobs, usually justified by subjective factors such as commitment and ability to work extra hours. The practical reality of lower pay means that unless women are able to otherwise compensate for their lower pay, they will likely have a lower standard of living than men. Another more pervasive location for gender influence in the work-family balance is in the choice of careers. Although men and women are free to choose their careers based on personal interests and ability, men and women tend to cluster in different career paths. Historically, men have chosen to become physicians or engineers. Women have pursued comparably lower-paid jobs in education and nursing.

Usually, the more education people have, the more choices they have in regard to their employment. Advanced college degrees usually prepare people for professional and highly skilled jobs that require more hours than the standard 40-hour workweek. Individuals with lower degrees of education frequently get paid by the hour, and given increases in the cost of living, many hourly employees need additional work to supplement their income. Both educated and less educated workers feel pressured in balancing work and family needs; yet those who are educated usually have more options and are less likely to remain in a difficult work situation.

Family status plays an important role in work-family balance because of the importance and time commitment that family members require. Single working adults can frequently focus on their work more fully because they do not have a family that needs to be accommodated. While single people may struggle with work-family balance and avoid acute child care pressures, single people with responsibilities for aging parents may find themselves in a similar bind as their colleagues with children.

For families, the work-family balance issue is heavily weighted on two factors: Do both partners work, and are there children in the family? Increasingly today, both partners have jobs outside the home. With both partners working, much of the work previously completed by a stay-at-home spouse is either done after work or contracted out. Assuming both partners work full-time, the coordination needed to perform basic household duties can become overwhelming. Contracting others to perform some or all of these tasks can be expensive and not always a viable option, as noted previously.

Work Environment

Many of the balance issues faced by employees stem from the working environment. Specifics of the job can either make the balance between work and life easier or more difficult. The work environment falls into two categories. The first relates to income. The second relates to working conditions, and this refers to work specifics such as number of hours worked, flexibility, and ability to enter and exit the workforce.

A person's income has the potential to influence the work and family balance. Of primary concern is the level of income. Does a person make enough money to meet financial obligations to hire others to perform support services? Being able to buy a support system frees up the employee's time for other responsibilities.

An employee's working conditions also influence family balance. The number of hours worked per week is a critical factor in determining life and work balance. The more employees work, the less time they have for their personal obligations. The work-family balance issue for an employee who works 20 hours per week cannot be compared with someone working 60 hours per week. Not only does the number of hours worked count, so too does the flexibility of those hours. Does an employee have the ability to change the work schedule to accommodate personal appointments? Flexibility of hours worked can play a significant role in how people can use their time to take care of personal business.

Another issue is a person's ability to enter and exit the workforce based on personal needs. Some careers offer the ability for people to work part-time without major consequences. Other careers offer people the ability to enter and exit the workforce based on what their personal needs are. For example, some people may be able to leave work for several months to take care of personal business and then return to work without difficulty. The ability or inability to do so can go a long way in helping a person be an effective employee as well as a responsible person.

Work Location

The geography or area in which people work can influence their life's balance in a number of ways. The cost of living varies significantly across the country. How much people have to pay for rent or their mortgage determines what type of job they seek. In cities that have a high cost of living, people frequently move to the outskirts and then commute 1 or 2 hours each way to work. A high cost of living and/or high commute time can limit how one spends time away from work.

Often the type of work correlates with where people must live. Employers from one industry frequently position themselves near each other and create a synergy for employment in that field. To succeed in some fields, one must be willing to live near the key employers. Location can be a limiting factor when there are two people working in a household, each with different skills resulting in different optimum locations. The phenomenon of married professionals with competing careers has caused the number of nonmilitary couples who are temporarily separated in their marriage to rise. About 7% of married couples are temporarily separated due to the demands of their careers; this amounts to millions of couples. Care of the nuclear family becomes problematic with separated couples. The demands of caring for children with one parent who spends a great amount of time on the road increase exponentially for the parent or worker who remains in the home city.

Support Systems

Households do not exist in a vacuum. Numerous support systems for individuals and families form a network, although not a seamless one. That network is composed of four general categories: personal, employer, government, and market-based. Personal and government support systems might have represented the core support systems at one time. However, as these structures have contracted, employer- and market-based services have begun to fill the void left behind. But this trend has perhaps also led to the increased self-reliance of American households.

Family, friends, neighbors, and community groups have traditionally served as key resources for households. Even today, they offer a breadth of support in the form of social outlets and security systems, both financial and physical. Social outlets, whatever form they take, provide stress relief and a means of decompression from work. Such outlets are not something that can be readily replaced by either employers or products; yet these systems do influence the form they take. For example, people may be more socially intertwined with their work colleagues or people they've met in a personal financial management class than they are with their neighbors.

Support from friends and family might also serve as a financial safety net in the event that a person loses a job or experiences financial hardship. The government may step in, in such situations, and offer relief in the form of unemployment insurance or welfare, but there is a stigma associated with this form of assistance that is not necessarily an issue when relying on family or friends for financial support, and benefits are limited. Another component of the personal security system is physical support in the event of an illness or threat of harm to body or property. The universal time crunch has resulted in perhaps less reliance on friends and family and more dependence on contracted services. For example, people might need in-home care for a family member released from the hospital after surgery when unable to take time off from work or rely on extended family members for assistance. But whether people have the same degree of confidence in this support mechanism and can afford such contracted services, is a separate question.

The increased geographic mobility of the workforce has put significant physical distance between extended family members and lessened the degree of involvement in, and continuity of, community-based programs, such as neighborhood associations, neighborhood watch, carpools, and so on. As people spend more time outside of the home, there is less time to interface with these personal networks that are tied to one's home.

Paying for support systems is a relatively new phenomenon. An increased reliance on contracted services stems from both push and pull factors. On the one hand, technology has been a catalyst for significant growth in both the services and consumer products markets. On the other hand, the evolving demand for products and services that serve to fill the time vacuum is leading to expansion in these markets.

Employers are induced by market forces to make available and, in many cases, subsidize "concierge" services for employees, much as they are induced to provide standard benefits, such as 401K matching and stock options. Benefits of every kind increase when the labor market tightens. During the 1990s, when labor markets were extremely competitive and the technology boom was at its peak, many on-site services were born (on-site discounted vacation and theater-booking services, dry cleaning, windshield repair, banking, and limited health services). But when the economy contracts, these services may disappear and employees must turn to the other three systems of support for assistance.

Market- and employer-based support systems are explicitly a function of the market in the sense that their provision is profit driven. But personal and government support systems are implicitly a function of the market. Financial and physical support from family members and friends are likely to decrease during economic downturns due to constraints on time and money. Government support systems, which tend to be countercyclical, often expand during economic recessions to offset the impacts on the economy, but the size of government deficits limit its ability to function in this way. Efficiency and equity are, therefore, undisputable tradeoffs because the risk of not having adequate support systems is an underperforming, overburdened workforce.

Conclusion

Given this brief discussion on the issues of work and family balance, a number of issues arise. At a macrolevel is the question of whether work and family balance is important. Research that tracks the health and well-being of humans suggest that the costs of not integrating work and personal lives are significant. These costs are illustrated on a microlevel for individuals, organizations, and society.

On a personal level, as humans with intrinsic value, ethicists assert that workers deserve to be able to work with dignity and not feel that they are sacrificing their personal lives in the process. The costs of disintegration between one's work and personal life comes in the form of stress, increased costs due to contracting for personal services, and mental and physical health breakdowns.

In many ways, organizations are the center of this discussion on work and family balance. Their response to increased competition has been to expect more from employees. This expectation is not an irrational response from the organization's perspective. Their survival depends on the talents and efforts of their people. However, employees are increasingly stretched. Organizations have a responsibility to remain competitive, while also providing job opportunities that are sustainable for human and organizational life.

At a societal level, the work and family balance issue is also important. The government is responsible for distributing common resources and as such, can fund programs to ease pressures on those working. The government is also in a position to influence labor law and provide incentives to those organizations that honor those who work.

As those in the "baby bust" generation, those who are in their mid-30s, move into positions of responsibility, the conversation may change. Many fathers of this generation are unwilling to miss out on the joys of parenting. Because comparatively their numbers are small, this generation can demand flexibility where in times of a glut of labor, the negotiating power of the employee is not high. The conversation among individuals, employers, and the government will continue as we strive to both maximize productivity and assure healthy, well-balanced personal lives.

Worker Rights Consortium (WRC)

The Worker Rights Consortium (WRC) is a nonprofit watchdog organization that helps affiliated colleges and universities enforce manufacturing codes of conduct in factories that produce clothing and other goods bearing their names and logos. The WRC has authored its own model code of conduct that includes, for example, provisions requiring payment of a living wage and compliance with the Occupational Safety and Health Administration (OSHA) health and safety standards. However, while the WRC encourages affiliated schools to adopt a code as strong as the WRC code, it does not require that they do so. The WRC conducts investigations of working conditions at factories where university goods are produced. When problems are identified, the WRC works with licensees, factory managers, workers, and worker advocates to correct the problems. According to WRC's Web site, the investigations are carried out by teams comprising "knowledgeable representatives of the local community, including officials of local labor rights NGOs and/or local academic experts, and at least one member of the WRC staff or Governing Board." The WRC launches factory investigations in response to worker complaints or on a proactive basis—for example, where local nongovernmental organizations (NGOs) suspect there are problems or where there is little information about a major source of university goods. The WRC's Web site says that it is committed to "meticulous objectivity and methodological rigor." The results of these investigations are published on the group's Web site.

The WRC says that the collegiate licensing is now a $3-billion-a-year business. Schools earn 8% on the wholesale value of the apparel they sell. In 2005, the University of Texas earned $5 million in licensing revenue. The companies that pay schools these royalties in exchange for the right to use their logos on caps, sweatshirts, jackets, and other items range from Ben Silver Blazer Buttons of Charleston, SC, to Nike.

There are more than 150 colleges and universities affiliated with the WRC. Affiliates agree to adopt a manufacturing code, advise the WRC of the names and locations of factories that produce their logo goods, and pay the WRC fees that are $1,000 or 1% of gross licensing revenues (but no more than $50,000), whichever is greater. Roughly 40% of the WRC's funds come from affiliation fees. The remaining 60% is raised through grants from philanthropic foundations and the federal government. Past grantors have included the Rockefeller Foundation and the New World Foundation.

The WRC held its founding conference on April 7, 2000. The organization's Web site claims that it was created by college and university administrations, students, and labor rights experts. That may or may not be technically accurate, but the reality is that the impetus behind the WRC was student antisweatshop activists in United Students Against Sweatshops (USAS) together with UNITE (the apparel and textile workers union) and labor rights activists. USAS itself had been suckled by the AFL-CIO. USAS disrupted campuses by means of tactics such as occupying the offices of college presidents and hunger strikes to coerce their colleges into affiliating with the WRC. Few, if any, college administrations have been able to resist these tactics.

The WRC was conceived by labor and its allies as an alternative to the Fair Labor Association (FLA). The FLA grew out of a Clinton White House initiative—the Apparel Industry Partnership (AIP)—to bring together industry, labor, and consumer and human rights groups to formulate labor standards for the overseas suppliers of U.S. retailers. However, three members of the AIP (the AFL-CIO, UNITE, and the Interfaith Center on Corporate Responsibility) eventually broke with the FLA.

The main points of difference between the FLA and the supporters of the WRC concerned (1) the code's failure to include a living wage provision (FLA required for the higher of the local minimum or prevailing wages, while the WRC called for a "living wage"), (2) the identities of the investigative teams that were to monitor working conditions (WRC guidelines called for the monitors to be "local worker-allied groups"), (3) publication of the findings of investigations (the WRC committed to publishing the reports), (4) inspections (the WRC insisted on carrying out unannounced checks), (5) certification of "good" factories (the WRC's guidelines barred colleges from certifying that companies were compliant with their codes of conduct), and (6) inspection schedules (the WRC charged that FLA would certify companies as compliant based on a single inspection of 30% of a company's factories every 10 years).

Developments of note since the WRC was founded include the fact the organization has backed off mandating that affiliates include a living wage in their codes of conduct. Many economists (even ones sympathetic to the antisweatshop movement) had warned that "living wages" might price workers in poor countries out of the world market. However, the WRC is considering a proposal for "designated suppliers program" that would phase in a living wage requirement. In the 6 years since its founding, the WRC appears to have completed reports on fewer than 20 factories. Compare that with the fact that goods with the University of Michigan logo are produced in 3,866 factories.

Work Ethic

The notion of work ethic refers to the personal character attributes fundamental to an individual's attitude toward work. Two key components of this concept are the internal qualities possessed by the individual and the external qualities manifested in work behavior. While down through the ages in both the East and the West the essential characteristics of good work behavior have been discussed, it is difficult to identify one specific set of desirable qualities, because work, and the manner in which it is approached, is a multidimensional human phenomenon.

How work is understood and valued depends on personal experience, as well as the meaning society places on human labor, productivity, and work commitment. During some periods of history, work has been perceived as degrading and servile, while at other times it has been considered noble and a sign of achievement and favor. Work can be viewed as a job, a mere service for hire. It can be an occupation or career, a particular desired line of employment or profession, or it can be a vocation, a calling that provides personal fulfillment. Each of these interpretations set different work expectations and values for the individual. For these reasons, some hold that there is not a universal work ethic.

Besides social norms and interpretations, there is another reason why a single work ethic is difficult to identify. Individuals work for a variety of reasons. During hard economic times, work is motivated by the need to survive, to obtain financial resources that enable the garnering of necessities such as food, clothing, and housing. When necessities are secured, a person's desires often turn toward purchasing luxury items and engaging in entertainment. On other occasions, work is performed to express one's self, or out of a sense of generosity or charity toward a friend or a person or group in need.

Work habits, attitudes, values, and ethics are all interrelated. An individual's work ethic expresses how the person comprehends the value of work, as well as personal accountability for performing tasks in an acceptable manner. A work ethic stems from an individual's personal life experiences and is shaped by work history, professional associations, education, culture, family heritage, religious affiliation, personality, and so on. The modern Western understanding of work ethic has been significantly influenced by a conceptualization of work grounded in perfection, the goodness of labor, and the necessity of hard work. This notion, rooted in Calvinistic thought, is often referred to as the Protestant work ethic, a concept founded in Max Weber's sociological analysis of religion.

Specific religious precepts no longer are associated with the 21st-century notion of work ethic, giving rise to a secular understanding of work and the factors that motivate people to strive for work excellence. For many, employment is a crucial aspect of life that provides personal value. It is not unusual, particularly in the American society, for a person's identity and sense of purpose to be closely related to a job or chosen career path.

Having steady employment that provides a reliable source of income is a significant factor for many people. A common American belief is that there is an unwritten social contract promising that honesty and hard work performed well will result in being able to afford basic necessities, and have economic profitability, safety, and personal fulfillment. Loss of a job can have traumatic effects, including decline of self-esteem, depression, and even suicide.

Globalization and technology have shifted the nature of work. For decades in the Western world, work has customarily been categorized as manual labor and professional work and described as full-time, part-time, and temporary. These categories are now too limited to capture all forms of work. Since many business enterprises are driven by information, more and more employees focus on processing information and managing organizational knowledge. This phenomenon has created a new category of employee known as the knowledge worker. This type of work draws on employees' mental qualities and skills rather than on their physical attributes and task-processing capabilities.

Organizations strive to hire workers who are dependable, persevering, perceptive, resourceful, self-initiating, adaptable, independent, collaborative, considerate, appreciative, dedicated, and honest. These attributes are considered by some to be the core elements of the modern work ethic needed for success and employability.

There is another dramatic change occurring in the workplace. Besides employees who have steady on-site work assignments with benefits, the modern workforce consists of contingent workers, individuals who are routinely contracted only on a nonpermanent, as-needed basis, and teleworkers, employees who work off site, at times from home, via phone and computer-based technologies. Employees working in either of these ways are confronted by several challenging work ethic issues. Contingent workers are challenged to identify with the employing organization and work with a professional commitment and loyalty comparable to permanent members of the organization's community. Teleworkers are faced with the responsibility of monitoring their work hours, ensuring they reduce nonwork distractions, focus on assigned tasks, and work the contracted hours.

Inherent in an organization's culture and managerial practice is a corporate work ethic. The demands of work in a postmodern information age are different from those of the previous industrial age. Globally dispersed teams, virtual collaborative work networks, rapid response times to market changes, and advances in information and communication technology have changed the way work is conducted. Organizations operate with smaller workforces. Job security is gone. Focus on gaining market share, maintaining profitability, and having competitive advantage, have led to long workweeks, with employees often taking work home. The boundary between work time and personal time has disappeared. This 24/7 work environment has increased workplace stress and strained employees' personal and family relationships.

Numerous layoffs, downsizing practices, and outsourcing strategies have severely eroded the sense of loyalty and commitment that once existed between employer and employee. Such a work environment marked by reduced trust and respect has left many workers feeling exploited and devalued. Some even question if hard work still leads to being rewarded personally and professionally.

For these and other reasons, a growing segment of the workforce believes that work is losing meaning and personal fulfillment. They seek a new business work ethic that respects employees as valued resources, and reestablishes the boundary between work and personal time, providing a healthy work-life balance, flexibility in employment schedules, and more control over their work time and careers.

WORKING CONDITIONS

Working conditions refer to a person's job environment. These conditions encompass aspects such as hours, safety, benefits, and advancement possibilities. They have become of concern because of the extent to which satisfactory conditions are denied or abridged. Determining which employee and employer rights and responsibilities should be recognized and appreciating the nature of the employment relationship are helpful in examining working conditions and their evolution.

Rights and Responsibilities

Working conditions and other employer responsibilities depend on the perceived rights of employees. There are at least two sources of rights—natural rights and civil rights. Natural rights are those rights that are considered universal and attributable to human beings vis-à-vis their *human* status, regardless of societal norms. Civil rights, on the other hand, exist as created by a particular society's legal system. They tend to be relatively clear: They are codified and exist in writing. While there can be overlap between legal and natural rights—such as in the Bill of Rights of the U.S. Constitution—many legal rights are recognized only by particular societies and are not presumed to be natural rights. Many legal rights are, therefore, only culturally sanctioned and are thereby limited in their application.

Civil rights are central to the relationship between employees and employers. In most countries around the world today, local laws identify the legal rights of employees—some of which are positive (and therefore generally require the provision of real resources), while others are negative (and require only that others not interfere with the pursuit of a person's exercise of his or her rights). For example, in countries that require certain employee benefits (i.e., health care, vacation, etc.), the positive legal right of employees to those benefits is accompanied by the responsibility of employers to provide those benefits. Similarly, in countries where employees have a legal right to form unions, this negative right imposes on employers the obligation not to interfere with the formation of employee unions. The right to form unions can also imply a positive right, in that it can impose on employers the duty to negotiate with their employees' unions.

A significant amount of the debate surrounding working conditions stems from conflicting views on employee and employer rights and responsibilities. Do people have a right to work? What working conditions are workers entitled to? If these entitlements exist, do they derive from natural law or civil law? For example, might workers have a natural right to a workplace free of physical beatings by employers but only a legal right to sanitary facilities?

Answers to these sorts of questions determine the kinds of working conditions to which employees should reasonably be entitled. Whereas most people would likely agree that natural rights and legal rights should be respected, there is considerable disagreement as to the extent of natural and legal entitlements, particularly across cultural boundaries. While there are some bright-line distinctions, there are many areas that remain ambiguous.

Most people, for example, tend to agree that violence leading to physical harm should not be permitted in the workplace. In contrast, it is unlikely that many people—if anyone—would contend that the provision of recreational facilities is a right that employees are entitled to. There are, however, many other issues that generate considerable controversy. Day care for infants is one of these issues. More and more in the United States, day care is becoming a necessity because couples are having to rely on income from both spouses. Having children can create an impediment to both spouses working and can create additional financial burdens on the family. Day care is therefore viewed by some people as a "right," because of its practical necessity for them to be able to work. Other people nevertheless maintain that, in the absence of a legal guarantee, it remains a matter to be determined through employer-employee negotiations.

Some people contend that employee rights are only those rights that emerge as part of specific employment arrangements or agreements. Others, however, suggest that employees should enjoy the same basic rights as persons in general, such as human dignity, moral autonomy, physical safety, reasonable privacy, and due process.

Human dignity refers to respecting people's personal autonomy and personal space and not making them do things they object to doing on moral grounds. Of course, there is a meaningful distinction between a person simply not wanting to do something distasteful versus a person who opposes a request. There is obviously a distinction between simple likes and dislikes and meaningful objections. In Kantian terms, respecting dignity translates into treating people as ends in and of themselves, not merely as means to ends.

Similarly, moral autonomy refers to respecting the rights of individuals to make their own choices as to appropriate courses of behavior. In the work environment, this covers a range of situations, such as the right not to follow directives that are morally questionable or even offensive. In addition, the right to blow the whistle on inappropriate practices by reporting alleged wrongdoing to external sources could also be considered linked to moral autonomy.

Physical safety is another significant concern. The view is that a person's life and/or health should not be placed in jeopardy because he or she chooses to work. When a person goes to work, he or she relies on his or her employer to maintain reasonable safety standards. It, therefore, becomes the responsibility of the employer to maintain safe working conditions so that employees are not put at personal risk in the workplace.

Not everyone agrees—there is an argument that all that is necessary is disclosure. It then becomes the employee's choice as to the level of risk he or she is willing to accept. While there is the view that there are some risks that no one should take (voluntarily or otherwise), that view is often considered overly paternalistic. There are jobs that are necessary—or, at the very least, important—but that involve some degree of risk. Mining, for example, is notorious for physical safety issues. Perhaps the answer lies not in eliminating risky jobs but in improving and emphasizing appropriate care with regard to how laborers in those sorts of jobs are treated and protected.

One perspective is that the requisite level of safety maintained by the employer is determined through the bargaining process. The problem is that not everyone agrees that the bargaining process is effective. Employers and employees are not necessarily in equal bargaining positions. Employers are often better situated to choose among qualified candidates than employees are able to choose among possible positions, particularly if employers end up offering similar sorts of positions. In fact, the hiring/job acceptance process very rarely resembles a bargain, except at the higher levels of management. Manual laborers rarely have the opportunity to engage in meaningful bargaining for jobs.

Privacy is a much more amorphous right, particularly in the United States, where there exists a distinction between public and private workplaces vis-à-vis the Constitution and the respective guaranteed rights. Although it tends to mean different things to different people in different audiences, a right to "reasonable" privacy can be thought of as a right to personal space and ideas and the right to control knowledge about basic personal information (i.e., health).

Finally, the right to due process is a right that emerges when other rights are violated. It is the right for a person to be notified of actions taken against him or her and the corollary right to have the opportunity to be heard in his or her defense.

These rights create the fabric that holds together reasonable expectations of fair working conditions, at least in many Western societies.

Nature of the Employment Relationship

The employment relationship varies by country and by state. In many countries in Europe, local laws favor employees and protect their interests. In France, for example, employees receive liberal leave time by law. Every employee is entitled to two and a half paid vacation days per month, which amounts to five full weeks of vacation per year. Statutory provisions require good causes for terminating employees. This is true in other countries as well, such as Canada, Germany, Great Britain, Italy, Japan, and Sweden. This is not true, however, everywhere. Other countries, such as Egypt and El Salvador, do not provide explicit protection for worker rights.

Employment at Will

The United States adheres to an approach to employment that is commonly known as employment at will (EAW). This means that, in the absence of an agreement to the contrary, the relationship is considered "at will" and either the employer or the employee can alter and/or terminate that relationship at any time, for any reason—except an illegal reason. Today, the majority of jurisdictions in the United States follow EAW, and the majority of American employees are therefore at-will employees. Although employers are required to adhere to specific federal and state legislations regulating basic working conditions, they are not obligated beyond those minimum standards.

As long as legal requirements are met, employers and employees are generally considered free to set their own terms. This stems in large part from the prevalence of EAW. EAW leaves the determination of most employment terms and working conditions to the discretion of employers and employees: It is expected that the parties address their specific concerns during the negotiation process of commencing the employment relationship. The relationship that results is, therefore, assumed to be with the agreement of both employers and employees. According to this view, apart from natural law and civil law guarantees, the only working conditions to which workers are entitled are those to which employers have previously agreed, and those conditions are expected to be enforced.

Although EAW is straightforward and clear, it continues to engender considerable controversy. One argument is that in the absence of explicit legal guarantees, the doctrine of EAW possibly translates into a license for employers to treat employees arbitrarily. Private employers in the United States, for example, are not required to explain the rationale for employment-related decisions (i.e., terminations) or to offer the employee the opportunity to respond to concerns. In other words, private employers are not required to provide due process. Public workplaces, in contrast, often recognize due process as an employee right.

This distinction illustrates one of the problems with EAW. Due process, a right considered fundamental according to the U.S. Constitution, can be disregarded by private employers. The reason for this is that the guarantees of the Constitution apply only to relationships between individuals and the government. Whereas public employees are considered to have a relationship with the government, private employees do not. Even though the nature of their employment is often comparable (i.e., teachers in public and private schools perform essentially the same roles), their protected rights differ in a meaningful way.

Opponents of EAW, therefore, assert that EAW should be abandoned because it allows these sorts of disparities to exist and enables employers to disregard rights that perhaps should be considered basic, even if not explicitly guaranteed by law. The view is that employers should behave responsibly even in the absence of explicit legislation. Their view is that there should be recognition of human dignity—that is, employees are human beings, not robots. Advocates of EAW, however, argue that if employers and/or employees are dissatisfied with EAW as the doctrine governing their employment relationship, it is their responsibility to bargain for some other sort of relationship.

It is important, however, to distinguish EAW as a doctrine from its implementation in specific instances. As advocates of EAW point out, it does not identify reasonable conditions or terms—it merely lays the groundwork for employers and employees to determine for themselves the appropriate terms of employment and working conditions. In many ways, EAW is ideal for it leaves the determination of working conditions to those actually performing the work. Many people, therefore, consider EAW not only morally unproblematic but, in fact, morally superior to alternatives. In contrast with those who argue that EAW violates human dignity, it can be argued that EAW actually promotes human dignity by providing for free contracting between the parties.

Right to Work

Another point of contention has to do with the "right to work." Although international instruments such as the Universal Declaration of Human Rights assert that a right to work exists, this is not reflected in the legal systems of most countries around the world. There is no mention of such a right, for example, in the U.S. Constitution. There are those who contend, however, that such a right is implied: If work is required for a person to sustain himself or herself and/or his or her family, then the right to work is simply inherently connected to the right to life.

There is significant controversy concerning the possible existence of a right to work. Many rights theorists assert that if there were a right to work, it would impose a duty on someone else (i.e., private and or/public employers) to hire, and natural rights are not generally positive rights. Other people, however, argue that such a right is inherently implied by other rights—such as the right to sustain life, particularly in societies as they exist today, where earning a living has become a precondition for having the means to obtain basic necessities (i.e., food, shelter, etc.).

In the global arena, this becomes somewhat complicated. Common labor rights tend to be considered fundamental according to Western moral thinking and are often explicit civil rights in Western societies. Although the Universal Declaration of Human Rights is intended to identify the minimum standards for people around the world, it is generally consistent with Western moral thinking, and this is one of the greatest criticisms of it. While it remains aspirational, it does not account for cultural differences.

Evolution of Working Conditions

Concern for working conditions dates back centuries. It heightened as a result of the Industrial Revolution, in particular, as the number of jobs increased drastically. As the United States and the rest of the countries were going through the Industrial Revolution, a number of work-related problems surfaced. The harsh working conditions and job insecurities of the time made the work environment dangerous places. That fact of the matter is that the United States and the rest of the industrially developing world were proceeding through uncharted waters.

It was not necessarily the case that employers set out to violate rights but that they did not implement the necessary processes and procedures to make sure that rights were protected. Their lack of experience as they moved into this new era of industrialization and opportunity created temptations that they did not adequately resist. Countries such as the United States responded with legislation aimed at addressing problems as they were identified. At the same time, wealth also increased as a result of the increased production spurred by the Industrial Revolution. An alternative view is that civil rights emerged naturally as result of this wealth and the enhanced knowledge that accompanied it.

The Industrial Revolution refers to the era during which significant changes took place with regard to technology, innovation, social structuring, and culture. The workforce increased, and this led to an overall increase in the population as increased wages led to larger families. Both the United States and England went through these sorts of eras at roughly the same time. During this era, conditions of employment, many of which had been prevalent previously, became more visible. Child labor, for example, denounced as both a legal and a moral wrong, existed prior to the Industrial Revolution. It was during this time, however, that it became particularly noticeable. Child labor in agricultural societies, such as those that existed in the United States and England prior to the Industrial Revolution, was often obscured because of the inherent seclusion of people within these societies.

This led to the passage of significant legislation aimed at protecting workers from unreasonable conditions. In England, a series of "factory acts," for example, specifically protected categories of rights. The Factory Act of 1819, for example, limited the number of hours a child could work to 12 hours per day. Similar acts passed during following years banned children from factories and limited the number of hours women could work. The Factory Act of 1874 limited the workweek to 56.6 hours. This era was characterized by the passage of numerous, similar laws by both England and the United States as they wrestled with the arduous task of trying to find the appropriate parameters for proper working conditions.

One of the consequences of the Industrial Revolution was that it caused people to pay attention to the nature and conditions of employment. In the wake of the Industrial Revolution, the value of collective bargaining was recognized. At first, complaints were issued in localized or limited settings, which did not give workers much of a chance against their factory bosses and organized leaders of the industrial world. With no voice or power with which to negotiate with/against their bosses, a number of labor unions came into existence.

Labor Practices

Generally speaking, concern about labor practices in the United States—and many Western democracies—tends to revolve around consideration for the conditions under which people work. Concern generally targets wage laborers and blue-collar workers—that is, manual laborers, factory workers, and so on, for it is these workers who tend to be most vulnerable to mistreatment and exploitation because they often do not have a voice.

Of primary concern is forced labor, which is considered both morally reprehensible and illegal today in most Western democracies. Forced labor occurs when people are compelled to work against their will. This can happen when people do not have the means to stand up for themselves.

In spite of strong prohibitions against it, forced labor remains a problem throughout the world today. Even in the United States today, large numbers of cheap laborers are smuggled in through human trafficking from countries such as China, Mexico, and Vietnam. Many of these people are required to put in long hours in poorly maintained facilities. While these laborers are not always physically "forced" to work, they effectively have no other choice. Because these people are not given any resources (financial or otherwise), they have no option but to live and work under these conditions—often considered "sweatshops" because of the presence of physical and mental abuse, the poor safety conditions, and the typically long hours worked. If the practices are illegal, the problem is not of rights but of enforcement. If legal practices truly violate rights, then the law and its enforcement should be brought into conformity with those rights.

Compensation is another major concern. It is not just the hours worked but the wages paid for those hours that is considered significant. The United States, in addition to other countries, has legislated a "minimum wage" to guarantee a base rate. In fact, in many industries, hourly wages are significantly higher. The concern then becomes the number of hours worked. While the goal is to limit the number of hours laborers are expected to work, one way of achieving this is by requiring significantly higher pay—that is, overtime pay, when more than a certain number of hours (i.e., often 40 hours) are worked in a week. Overtime pay is often at least double regular pay.

One way blue-collar workers have found to address their concerns is through the formation of labor or trade unions. In this way, they are able to exercise more power as a group than they could separately as individuals. An important condition of work is therefore the right to engage in this sort of collective bargaining.

Labor Unions

Although many people recognize the value of collective bargaining, labor unions have proved controversial. Labor unions are organizations formed to represent the interests of workers. Different groups of workers come together to help voice their opinions/concerns in their immediate workplace arenas. The anticipated result of this is to leverage the power of an organized employee base to enact changes in working conditions, wage payments, work benefits, and so on.

While a number of benefits can be attributed to the unionization of workers throughout the United States, labor unions have suffered a controversial past. The majority of the controversy lies in the manner in which the early unions went about achieving their goals. Some of the first unions were disorderly and ostensibly corrupt. They engaged in violent activities to motivate specific companies and industries to change conditions. As part of this, they often attempted to physically prevent other laborers from working when the union workers went on strike, so as not to undermine their efforts. Instead of serving as an organization that could leverage its participants' voices to increase transparency and communication between employers and employees, these unions actually stood as an impediment to successful employer-employee relationships. Business leaders and government officials grew wary of the potential power of these organizations and sought to dismantle them. This merely increased antagonism between employers and employees.

The negative view of unions was further intensified by the opening of the global market and the increased economic competitiveness induced by the availability of cheap, capable human labor from alternative sources (i.e., developing and emerging countries). Companies in the United States are now compelled to compete in a global workplace with employers who can hire whoever they please from locations anywhere in the world without having to deal with unions. Workers who participate in unions generally receive higher wages and get a larger number of benefits. In addition, companies who hire unionized workers risk potential strikes and sudden loss of productivity. Both these conditions place the American corporations at a disadvantage as compared with other businesses around the globe.

Legislation

Around the world, many countries have responded to concerns about employee and employer rights and responsibilities through legislation. The United States, for example, has dealt with worker safety by passing the Occupational Safety and Health Act on December 29, 1970. It directly addresses the safety, health, and welfare of employees. The United States also has minimum wage laws. Other countries around the world have passed similar laws, along with many others.

While such legislation is often useful in delineating rights and responsibilities, significant concerns remain that excessive legislation can also interfere with effective bargaining opportunities. One of the primary arguments in favor of EAW in the United States is that employment is contractual, and it is important that parties be allowed to strike whatever bargain works for them. If employers and employees are not interested in negotiating specific terms, EAW provides the default terms. To overlegislate limits the ability of employers and employees to create the arrangements of their choosing.

At the same time, however, there is also the view that the bargaining positions are not equal, and employees remain vulnerable to potential abuses by employers and other employees in the absence of restrictions against such things as excessive workweeks, discrimination, and so on. For this reason, societies continue to rely on legislation to set minimum employment standards.

Conclusion

Working conditions today in the United States and other Western democracies have improved tremendously. In the 1960s and 1970s, nearly a third of all workers belonged to labor unions. More recently, there has been a sharp decline in unionization, in that only about 10% of the American workforce belongs to a union. Concern remains, however, particularly as a result of the increasing amount of time we spend in workplaces and because of the increasing industrialization and globalization of the world. As multinational corporations extend industrialization throughout developing and emerging countries, new concerns have arisen regarding those populations not yet protected by norms and legislation governing worker's rights and workplace standards. The difficult task of defining and ensuring worker's rights worldwide still remains.

Work-Life Balance

The essential issue of work-life balance is the inability of many workers to achieve parity with regard to their responsibilities to a job and/or a profession, and their obligations and commitments to their private, family, nonwork lives. Work-life balance is not a new problem. It has long been a part of everyone's work-life experience. But in the latter part of the 20th century, the accelerated pace, stress, and complexity of our jobs and our careers has placed this phenomenon at the center of every conversation about our collective work lives. Work-life balance is not a gender or family rights issue. It is a problem that touches every member of the workforce and is closely related to two fundamental questions: (1) Do we live to work or work to live? (2) Do workers' rights include the right to not always have to be working?

At the end of the 19th century, the major goal of the American labor movement was simple and distinct: 8 hours for work, 8 hours for rest, and 8 hours for what we will. For brief periods in the 20th century, for some workers in specific industries, this goal was achieved. But the 40-hour standard week is either a memory or a still-sought-after dream for most Americans. Depending on whose statistics you want to accept, as a nation we are working more now than ever.

In 1989, *Newsweek* reported that 85% of the American workforce put in more than 45 hours a week on the job. Economist Juliet Schor estimates that annual hours on the job, across all industries and occupations, have been increasing over the past 20 years, so the average employee is now on the job an additional 163 hours, or the equivalent of an extra month per year. In her 1991 best seller *The Overworked American*, she claimed that one fourth of all full-time workers spent 49 or more hours on the job each week. Of these, almost half were at work 60 hours or more. In 1997, in her important analysis on work and the family, *The Time Bind*, Arlie Russell Hochschild reported that both men and women workers average slightly more than 47 hours per week. Finally, in a 1999 study, a Cornell University research project found that on average, Americans work 350 hours more per year than Europeans—and 70 hours more a year than even the Japanese, whose language contains the word *karoshi* that means "death from overwork." If some of these figures and projections are accurate, by the year 2010, the average workweek could exceed 58 hours.

What has to be kept in mind is that these figures only reflect hours on the job and do not represent the other aspects of our workday such as getting to and from the job as well as household and family responsibilities. A 1999 survey conducted by the Families and Work Institute of New York concluded that both spouses, in a double-income household with kids, put in a minimum of 15 hours per day on work, commuting, chores, and children. These figures, based on a Monday through Friday schedule, mean that both spouses have already "logged-in" 75 hours before the weekend. Moreover, although Sundays in many households are still reserved for family outings and social events, Saturday is usually just another workday. "Honey-do-lists" are drawn-up, chores are assigned, projects attended to, and kids are schlepped to music lessons and the mall. According to a 2001 *Harvard Health Letter*, nonworking, no-chores, leisure time has eroded to 16.5 hours per week per person.

Whatever the exact amount of time each of us is putting into the job, it is both palpably and statistically clear to most of us that we are working harder and longer than ever before. And more than just the extra time we are putting in on the job, the tempo, intensity, and stresses associated with our work seems to be accelerating. We cram more and more into each day, and yet we feel that we never have enough time to do all that must be done.

Besides all this, two other factors in the work-life balance equation need to be taken into account: vacations and fatigue. A recent report from the United Nations points out that U.S. workers average 49.5 weeks of work each year. Joe Robinson, former editor of *Escape* magazine, claims that we're the most vacation-starved country in the industrial world! In this society, says Robinson, we perversely allow downtime for machinery for maintenance and repair, but we don't allow it for the employees. There is only one other country with fewer vacations days than America (10 to 13) and that is Mexico (6). And what is worse, says Robinson, is that in America these vacation days are not required by law, but rather are the result of negotiated contracts or custom and tradition. In comparison to the mandated vacation schedules of other industrialized nations, American workers are suffering from a serious leisure lag: Italy, 42 days; Germany, 35 days; Sweden, 32 days; Denmark, 30 days; Ireland, 28 days; and even the work-addicted Japanese get 25 mandated vacations days a year.

In a 1995 cover story, *Newsweek* reported that 25% of us say we're fried by our work, frazzled by the lack of time, and just plain exhausted. Symptoms of exhaustion and fatigue are now among the top five reasons why people consult their doctors. According to a survey conducted in 2001 by the National Sleep Foundation, our workaholic lifestyle is turning America into a "nodding off nation," with 40% of those surveyed reporting difficulties staying awake during the day and on the job. The poll reported that although people need between 7 and 10 hours of sleep each night, 62% of those surveyed sleep less than 8 hours per night. Sleep researchers are now in general agreement that chronic lack of sleep may be as bad for a person's health as smoking, a poor diet, and a lack of exercise. We need sleep to rest and build out brains, to heal, to clear our cobwebs, to slow aging and dementia, and to help avoid obesity, diabetes, and hypertension. We need sleep to be fully present in our own lives.

Like it or not, too many of us, out of desire or necessity, choice or chance, put too much time in on the job. We have made a fetish out of work. It's now part of our character and culture. We have become addicted to the *promise* of work. Work *promises* we will get ahead. Work *promises* power, money, and influence. Work *promises* we will be accepted, respected, and successful. And so, we work. We work because we need to, because we need money. We work out of habit and desire. We work to occupy time. We work to establish our place in the pecking order, to guarantee status and prestige. And, too often, we work because we simply don't know what else to do with ourselves, because we think we must and should. It has simply become standard to respond to the conventional salutation of "Hello, how are you?" with some version of the refrain "*I am so busy!*"

According to the Families and Work Institute 1999 study, 63% of Americans say they want to work less, up from 17% in 1994. In another 1999 study conducted by NYU and the University of Pennsylvania, it was found that 45% to 50% of workers (80% of those working more than 50 hours per week) said they would prefer to work fewer hours, and more than 25% said they would take a pay cut to make it happen. Another survey in 2000 found that even college students and recent grads place "flexible hours" at the top of the list of the job benefits they most desire—above health insurance, vacations, and stock options.

And yet the problem remains unchanged. Too many of us work more and more in the manic pursuit to maintain our lives and our lifestyles. As a society, we are suffering from the frenzy, frustration, and fatigue. To turn around the words of Thorstein Veblen, "We have become a harried working class rather than a leisure class."

Workplace Privacy

Privacy can be viewed as an entitlement, and therefore as a fundamental right, or as one interest to be balanced against others. Privacy in the workplace concerns the balance between the right of the employee to personal space and the management of his or her personal information with the right of the employer to manage that workplace and to make effective decisions. Some means of gathering information about employees may focus on inappropriate information, or the employer may use methods that are unreasonable or intrusive. Yet the employer also legitimately seeks to know as much about the employee as possible and the employee seeks to prevent unreasonable intrusions. Technology has muddied the issues involved because it allows for access to information using methods never before considered.

This discussion will first highlight the reasons why an employer may opt to collect information or otherwise monitor the workplace, as well as the concerns of employees based on this monitoring, and the resulting impact of the information-gathering processes. We will explore the nature of monitoring, the various means by which the employer is able to and does monitor the workplace (including the regulation of off-work acts as well as drug testing), and present the legal and ethical constraints in doing so.

Why Do Firms Seek Personal Information or Monitor Their Workplaces?

There are numerous bases that support the choice of a firm to monitor. One justification for an employer's choice to monitor stems from the law itself that, more and more, holds an employer liable for the acts of its employees. With this in mind, employers seek greater and greater amounts of information about possible and current employees to protect themselves from the tort of negligent hiring or vicarious liability. On the other hand, investigating areas that bear little, if any, relevance to the individual's ability to perform a job exposes the employer to liability for privacy invasions, as will be discussed below. Employers must determine whether it is appropriate to investigate an employee's driving record for a position as an accountant or to conduct a credit check for an individual who works as a delivery person. Employers also point to the proliferation of employee theft that may be uncovered through some form of surveillance or monitoring. The U.S. Department of Commerce found in 1990 that businesses lose approximately $40 billion each year to employee theft and that 75% of this theft is usually undiscovered. In addition, monitoring may uncover and thus prevent increasing employee industrial espionage.

The reasons for monitoring can, therefore, be categorized into two categories: managing the workplace and protecting against or preparing for issues involving legal liability. An employer's interest in managing the workplace may require it to ensure compliance with affirmative action by investigating the backgrounds, ethnicities, races, or other traits of its workers. In addition, to appropriately administer workplace benefits, the employer would contend that it must gather information related to employee needs. Information may also assist the employer to place workers in appropriate positions and to ensure effective, productive performance that is not lost to excessive use of technology such as the Internet. Reports evidence a rise in personal use of technology, with 86% of employees admitting sending or receiving personal e-mails at work, with 55.1% admitting to having received politically incorrect or offensive e-mails at work, and 62% of firms finding employees accessing sex sites during the workday. Though seemingly extreme, 10% of employees spend more than half the workday on e-mail or surfing nonbusiness sites.

An employer's interest in self-protection against legal liability also serves as justification for monitoring or other information-gathering techniques. More than 20% of firms have been ordered to produce employee e-mail in the midst of a legal claim as of 2004. Information regarding the following as well as other areas of compliance are well served by appropriate information collection and maintenance: hostile environment, sexual harassment, software licensing laws, proprietary information or trade secrets, competitive intelligence, financial fraud, theft, defamation/libel, and discrimination.

In the American Management Association's 2001 survey, more than two thirds reported that they engaged in monitoring as a result of their concerns for legal liability. Given the courts' focus in many cases on employer response to claims of sexual harassment or unethical behavior, among other complaints, firms believe that they need a way to uncover these inappropriate activities. More than 10% of firms have reported receiving a subpoena for employee e-mail and one third of the largest firms report firing employees for inappropriate e-mail. Without monitoring, how would they know what occurs? Moreover, as courts maintain the standard in many cases of whether the employer "knew or should have known" of wrongdoing, the state-of-the-art definition of "should have known" becomes all the more vital. If most firms use monitoring technology to uncover this wrongdoing, the definition of "should have known" will begin to include an expectation of monitoring.

Many forms of monitoring are simply made easier or more effective through technology. While in the past, employees may have been asked to insert a card into a time stamp machine to ensure for both the employee and the employer that the worker is being paid for the time they were at the workplace, they may now be asked to place their hand on a scanner to effect the same information transfer. Without more, this type of monitoring represents merely a development without necessarily greater intrusion.

Why Are Employees Concerned?

Notwithstanding these persuasive justifications for monitoring in the workplace, there also remain several reasons to limit monitoring. First, monitoring may create a suspicious and hostile workplace where work morale is affected negatively. In addition, monitoring or certain forms of information gathering may cause increased workplace stress and pressure, negatively affecting performance and having the potential to cause physical disorders such as carpal tunnel syndrome. In addition, monitoring can be perceived as constraining the right to autonomy and freedom of expression. One study found that monitored workers suffered more depression, extreme anxiety, severe fatigue or exhaustion, strain injuries, and neck problems than unmonitored workers. Finally, given the pressure on workers to be at the workplace for increased hours, it may be important to conduct some personal business at the office, when necessary.

The Impact of Monitoring

With the advent of new technology, new ethical issues emerge. That is because we consider the advances of the technology before we consider the implications. Notwithstanding issues in connection with production, marketing, finance, and other areas of a firm's operations, we now have countless issues relating to ethics with which we were never before confronted. For instance, the law has not necessarily caught up with emerging challenges such as the implications of new technology with regard to distinguishing between work use and personal use of technology, managing flextime, protecting against medical concerns for telecommuters, monitoring the use of the Web to spread information and misinformation, and managing fair use or disclosure.

Technology, however, does not present us with new value judgments but instead simply new ways to gather the information on which to base them. Sorting through these issues is challenging, nevertheless. Consider the impact of September 11, 2001, on an employer's decision to share personal employee information with law enforcement. Private firms may be more willing today to share private information than they would have been previously. Similarly, the International Labour Organization (ILO) found that a significant implication of technology is the dissolution of boundaries between leisure and work time, and the place of work and place of residence. The ILO's World Employment Report for 2001 expressed grave concerns about the resulting deterioration of the foundations of our edifice of agreements, norms, rules, laws, organizational forms, structures, and institutions, all of which have a stronger influence on our behavioral patterns and systems of values that we are aware.

Firms also experience unanticipated challenges, for which they often find themselves ill prepared. Consider one firm's lesson that problems with e-mail use and abuse might also extend beyond the end of the employment relationship. After an employee was fired by Intel Corporation, he began to air grievances about the company via e-mail. He repeatedly flooded his former employer's e-mail system with mass e-mails that its security department was unable to block. Intel sought and obtained an injunction on the theory of trespass to chattels. A California appellate court rejected the former employee's appeal that the injunction violated free speech principles.

Do we need "new ethics" for this "new economy"? Perhaps not, since the same values one held under previous circumstances should, if they are true and justified, pervade and relate to later circumstances. However, the perspective one brings to each experience is affected through the understanding and use of new technology and other advances. However, as economist Antonio Argandoña cautions, there has been a change in values that may be caused by the opportunities created by the technology. On the other hand, he points to the possibility of new technology also bringing good, development of depressed regions, increased citizenship participation, defense of human rights, and other potential gains. The industries and organizations that have spurred on this revolution are perhaps the ones most empowered to determine its direction.

Stakeholder perception is often based on the transmission of information—communication is key. If new technology is dependent on and has as its substance information and data, economist Antonio Argandoña contends that there are significant moral requirements then imposed on that information and suggests the following as necessary elements:

- *Truthfulness and accuracy:* The person providing the information must ensure that it is truthful and accurate, at least to a reasonable degree.
- *Respect for privacy:* The person receiving or accumulating information must take into account the ethical limits of individuals' (and organizations') privacy. This would include issues relating to company secrets, espionage, and intelligence gathering.
- *Respect for property and safety rights:* Areas of potential vulnerability, including network security, sabotage, theft of information, impersonation, are enhanced and must therefore be protected.
- *Accountability:* Technology allows for greater anonymity and distance, requiring a concurrent increased exigency for personal responsibility and accountability.

Firms have responded differently to this call for responsibility in the development, manufacture, marketing, and service related to new production or other corporate activities. *Reason* magazine included a customized cover on its June, 2004, issue of a satellite picture of each recipient's neighborhood with the individual's home circled. While a magazine will have its recipients' home addresses, this magazine chose to use the image to illustrate its cover article on the power and importance of databases, one type of a "we know where you live" mentality. The article focused on the balance between the possible invasions of privacy afforded by information database management and the realistic benefits the technology could bring, such as instant credit, customized advertisements, and personalized mortgage offers. Nick Gillespie, *Reason*'s editor in chief, explains that the article challenges readers to consider how they would feel if they received a magazine that only had stories and ads that pertained to themselves, quite a marketing opportunity. The ethical question is what we are willing to give up of our personal information, privacy, and autonomy in order to get those possible benefits.

How Do Firms Monitor or Otherwise Collect Information?

The American Management Association has conducted surveys of mid- to large-sized U.S. firms that evidence an increasing trend with regard to e-mail monitoring. While its 2003 survey reported that 52% of firms monitored e-mail communications, up from 47% in 2001, its 2004 survey reported that 60% engaged in monitoring. The 2004 survey also found that 10% of these firms also monitored instant messages of its employees. Much of this monitoring is on an occasional basis rather than by regular routine. The most prevalent subject of monitoring is Internet connections (74%) followed by e-mail monitoring (43%) and videotaping (18%). Of firms that monitor, 84% notify their workers that they do so. More interesting is the fact that 16% do not notify their workers of the monitoring. In actual numbers, estimates regarding the number of workers subject to surveillance are difficult to measure. One estimate contends that the e-mail and/or Internet use of 14 million U.S. workers is under constant surveillance each day, increasing to 27 million around the globe.

One's understanding of the technology or other collection processes is critical to the protection of rights. When we mistakenly believe that no one is watching, we may engage in activities that we would otherwise refrain from doing. For instance, one may believe that hitting the "delete" key does actually delete an e-mail message. However, it does not always delete that message from the server so it might have a negative impact in a lawsuit or be able to be retrieved by that person's supervisor.

Almost 80% of mid- to large-sized firms in the United States have Internet access policies, but there remains a problem. More than 60% of these companies have disciplined employees for violations of these policies (with 25% reporting that they have terminated an employee for a violation). The leading violations include access to pornography, online chat forums, gaming, investing, or shopping at work.

To address some of the issues that are presented by computers, specifically, the Computer Ethics Institute has created "The Ten Commandments of Computer Ethics." The Commandments include the following: not snooping around in other people's computer files, thinking about the social consequences of the program one is writing or the system one is designing, and always using a computer in ways that ensure consideration and respect for fellow humans.

Unfortunately, many of the ethical issues that arise in the area of managing information are not readily visible. When one does completely understand the technology, one might not understand the ethical implications of decisions. While most users may believe that others cannot read their e-mail, experts say that any system is penetrable. Employers have been known to randomly read e-mails to ensure that the system is being used for business purposes. These issues may be compounded by the fact that there exists a knowledge gap between people who do understand the technology and others who are unable to protect themselves precisely because they do not understand. One might not expect to be fired for sending out an e-mail; but if one thought about it a bit, that person might have known what to expect.

Notwithstanding the fact that many individuals actually believe they are safe from such intrusions or express no concern about the sharing of their personal information, reports of intrusion horror stories abound. James Russell Wiggins's employer conducted a background check and fired him because the report showed a prior conviction for cocaine possession. Wiggins explained that the information was patently false, but the company would hear of no reinstatement. Later it was discovered that his identity had been confused with that of James Ray Wiggins; a lawsuit ensued. Indeed, according to a congressional report, half of all credit reports and background checks contain mistakes. The American worker is becoming more aware of the possibility for intrusions or violations, as well. A survey conducted by Louis Harris & Associates and Dr. Alan Westin showed that 89% of the American public is concerned about threats to their personal privacy, with 55.5% saying that they are "very concerned."

Technology has also allowed monitoring of personnel in manners never before contemplated. In one of the first legal analyses of privacy, legal scholars Louis Brandeis and Samuel Warren warned in 1890 of numerous mechanical devices that then threatened to bring what was said in the closets to be shouted from rooftops. Consider the plight of airline reservation clerks who have telephonic headsets that monitor the length and content of all telephone calls, as well as the duration of his or her bathroom and lunch breaks. In one instance, telephone calls received by airline reservation agents were electronically monitored on a second-by-second basis; agents were allowed only 11 seconds between each call and 12 minutes of break time each day. Other airline reservationists have complained that they are evaluated regarding how many times they use a customer's name during a call or how often they try to overcome a customer's initial objections to buying a ticket. The stress is increased, as those who were monitored report, because they believe that, if one listens long enough to any customer service provider, there is likely to be a human error at some point.

Under previous circumstances, one could usually tell if someone had steamed open a letter over a teapot. However, today, one usually cannot discover if someone reads the e-mail that person sent yesterday to a friend. Access can take place unintentionally, as well. In doing a routine background check, a supervisor may unintentionally uncover information of an extremely personal nature that may bear absolutely no relevance to one's work performance. This occurs because the information, though previously unavailable or too burdensome to uncover, is now freely available from a variety of sources.

Moreover, because technology allows us to work from almost anywhere on this planet, workers are seldom out of the boundaries of their workplaces. For instance, just because an employee may opt to go to a friend's wedding, a supervisor will still be able to reach that person. The question that remains, however, is whether it is acceptable for the supervisor to try to reach the employee, just because he or she has the ability. Continuous accessibility blurs the lines between our personal and professional lives. Total accessibility creates expectations, and therefore conflicts, with which workers and employers never before had to wrestle.

Another challenge posed by the new technology accessible in the workplace is the facelessness that results from its use. If one has to face someone as he or she makes a decision, that person is more likely to care about the impact of the decision on the person involved. Conversely, when one does not get to know someone because he or she does not have to see that person in order to do business, the decision maker often does not take into account the impact of decisions on that person. They become merely a name at the other end of an e-mail correspondence rather than another human being. Given the ease and informality of electronic communications, we often "say" (write, e-mail, etc.) things to each other that we would never say to someone's face, precisely because we do not have to consider the impact of what we are saying. We are more careless with our communications because they are easier to conduct—just hit a button and it is sent.

Electronic Performance Monitoring

As introduced above, technology invades and affects the employment relationship through employee electronic performance monitoring. Considerable controversy surrounds the issue of whether it is ethical and/or legal for an employer to monitor the actions of employees through electronic surveillance. This type of monitoring may take the form of recording telephone calls of customer service representatives, electronically counting the number of keystrokes a word processor makes during the day, installing video cameras in the workplace, and so on. While the employer may argue that it has the right to monitor in order to adequately and accurately appraise its employees and maintain quality levels, employees contend that the monitoring causes undue stress, pressure, and is too invasive.

Although installing video cameras in the washrooms of the workplace may be considered extreme, the line has not yet been drawn in the more gray areas of monitoring. The questions of what extent is too great or what constitutes humane or inhumane use of this technology remain unanswered by both the courts and the ethicists. Instead, it is critical for the employer to consider how to craft a more ethical or humane practice. Due notice given to employees that they will be monitored plus the opportunity to avoid monitoring in certain situations would solve some of the ethical problems. For instance, if an employer chooses to monitor random phone calls made by its customer service representatives, it could notify the workers that certain calls may be monitored and these calls would be signified by a "beep" on the line during the monitoring. In addition, if a worker is making a personal call, they may use a "nonmonitored" phone to avoid a wrongful invasion of his or her privacy.

However, this may not solve all the concerns about monitoring. Suppose the employer seeks to ensure that its service representatives handle calls in a patient, tolerant, and affable manner. By telling the worker which calls will be monitored, the employees may be sure to be on their "best behavior" during those calls. Random, anonymous monitoring may better resolve the employer's concerns (but not those of the worker). One study found that electronic performance monitoring has significant undesirable impacts on monitored workers, such as a lower perception of the fairness of the evaluation, health problems, and increased stress, all results that could also negatively affect productivity and thus the employer's interests.

Legal Status of Employee Monitoring

Protections in this arena fall under the general heading of privacy protections and, as such, are governed by the U.S. Constitution and federal statutes, state constitutions or legislation where available, and the common law through precedent. The Constitution protects against unreasonable searches and seizures but is limited in its application to public sector workplaces. Federal statutes represent spotty protections based on tremendously specific and particular circumstances. State protections exist to a small extent, such as the California Constitution's inclusion and recognition of a right to privacy. The area of the law with the most significant impact on privacy rights in the workplace is therefore court holdings, common law through precedent.

The prohibition of intrusion into seclusion, developed on a state-by-state basis but generally considered as universally applied, would hold an employer liable when it is found to have intentionally intruded in the private affairs of an employee if that intrusion would be highly offensive to a reasonable employee. Accordingly, the gray area exists in the determination of whether an act would be highly offensive to a reasonable employee.

In the case of monitoring telephone calls, monitoring is permitted in connection with quality control. Notice to the parties to the call is often required by state law, although federal law allows employers to monitor work calls without notice. If the employer realizes that the call is personal, monitoring must cease immediately.

With regard to monitoring e-mail messages, the courts were originally divided. However, there is now general consensus that under most circumstances, employers may monitor employee e-mails. Even in situations where the employer claims that it will not, its right to monitor has been held to persist. However, where the employee's reasonable expectation of privacy is increased (such as a password-protected account), this may affect the court's decision. Although not yet completely settled, the monitoring of voice mail messages appears to be subject to a similar analysis as e-mail messages. Finally, in connection with the monitoring of an employee's use of the Internet, where the employer has provided the equipment and/or the access to the Internet, courts have confirmed that the employer may track, block, or review Internet use.

Regulation of Off-Work Acts

The regulation of off-work acts is a challenging legal arena since, in the at-will environment, employers can generally impose whatever rules they wish. However, they may then run afoul of a variety of statutes, common-law privacy protections, and even legislation protecting against discrimination on the basis of various off-work acts. For instance, New York's lifestyle discrimination statute prohibits employment decisions or actions based on four categories of off-duty activity: legal recreational activities, consumption of legal products, political activities, and membership in a union.

Across the nation, there are other less broad protections of off-work acts. A number of states have enacted protections specifically on the basis of consumption or use of legal products off the job. These statutes originated from the narrower protection for workers who smoked off-duty. Currently, abstention from smoking cannot be a condition of employment in at least 29 states and the District of Columbia (and these states provide antiretaliation provisions for employers who violate the prohibition). In fact, instead of simply identifying the right to use lawful products outside of work, Rhode Island goes further by specifically prohibiting an employer from banning the use of tobacco products while not at work.

On the other hand, employers are not prohibited from making employment decisions on the basis of weight, as long as they are not in violation of the American with Disabilities Act (ADA) when they do so. The issue depends on whether the employee's weight is evidence of or due to a disability. If so, the employer will need to explore whether the worker is otherwise qualified for the position, with or without reasonable accommodation, if necessary. If the individual cannot perform the essential functions of the position, the employer is not subject to liability for reaching an adverse employment decision. However, employers should be cautious in this regard since the ADA also protects workers who do not have disabilities but who are perceived as having disabilities, a category into which someone might fall based on their weight.

Laws that protect against discrimination based on marital status exist in just under half of the states. However, although a worker might be protected based on marital status, they are not necessarily protected against adverse action based on the identity of the person they married. For instance, some companies might have an antinepotism policy, where an employer refuses to hire or terminates a worker based on the spouse working at the same firm, or a conflict-of-interest policy, where the employer refuses to hire or terminates a worker whose spouse works at a competing firm.

Since about one third of workers have dated an office colleague, policies and attitudes on workplace dating are especially impactful. Although only about 12% of workplaces have policies prohibiting workplace dating, a New York decision reaffirms the employer's right to terminate a worker on the basis of romantic involvement. In *McCavitt v. Swiss Reinsurance America Corp.*, the court held that an employee's dating relationship with a fellow officer of the corporation was not a recreational activity, within meaning of a New York statute that prohibited employment discrimination for engaging in such recreational activities. The employee contended that although the personal relationship between the two involved had no repercussions whatever for the professional responsibilities or accomplishments of either and the employer had no written antifraternization or antinepotism policy, he was passed over for promotion and then discharged from employment largely because of his dating. The court agreed with the employer and found that dating was not a recreational activity.

The majority of states protect against discrimination on the basis of political involvement, although states vary on the type and extent of protection. Finally, lifestyle discrimination may be unlawful if the imposition of the rule treats one protected group differently than another. For instance, as discussed elsewhere, if an employer imposes a rule restricting the use of peyote in Native American rituals that take place during off-work hours, the rule may be suspect and may subject the employer to liability. Similarly, the rule may be unlawful if it has a disparate impact on a protected group.

Most statutes or common-law decisions, however, provide for employer defenses for those rules that

(a) are reasonably and rationally related to the employment activities of a particular employee, (b) constitute a bona fide occupational requirement, or (c) are necessary to avoid a conflict of interest or the appearance of a conflict of interest.

Drug Testing

With regard to drug or other substance testing, the employer has a strong argument in favor of testing based on the law. Since the employer is often responsible for legal violations of its employees committed in the course of their job, the employer's interest in retaining control over every aspect of the work environment increases. On the other hand, employees may argue that their drug usage is only relevant if it affects their job performance. Until it does, the employer should have no basis for testing.

Consider the possibilities of incorrect presumptions in connection with drug testing. For instance, in his book *Drug Abuse in the Workplace: An Employer's Guide for Prevention*, Mark de Bernardo suggests that crudely wrapped cigarettes, razor blades or eye droppers, frequent trips to the bathroom, or dressing inappropriately for the season may be warning signs of drug use. On the other hand, it does not take a great deal of imagination to come up with other, more innocuous alternative possibilities. Yet an employer may decide to test based on these "signs."

In a study examining the attitudes of college students to drug-testing programs, researchers found that virtually all aspects of drug-testing programs are strongly accepted by some individuals and strongly rejected by others. The only variable that the researchers found indicative of a student's attitude was whether the student had ever used drugs in the past. Where a student had never used drugs, he or she was more likely to find drug-testing programs acceptable. The following factors contribute to greater acceptance and approval by workers:

- Programs that use a task force made up of employees and their supervisors
- A completely random program
- Effective communication of procedures
- Programs that offer treatment other than termination for first-time offenders
- Programs with no distinction between supervisory and other workers

In *Skinner v. Railway Labor Executives' Association*, the court addressed the question of whether certain forms of drug and alcohol testing violate Fourth Amendment protections against unreasonable searches and seizures. In *Skinner*, the defendant justified testing railway workers based on safety concerns—to prevent accidents and casualties in railroad operations that result from the use of alcohol or drugs. The court held that the government's interest in regulating the conduct of railroad employees to ensure safety presents special needs beyond normal law enforcement that may justify departures from the usual legal requirements.

It was clear to the court that the governmental interest in ensuring the safety of the traveling public and of the employees themselves plainly justifies prohibiting covered employees from using alcohol or drugs on duty or while they are subject to being called for duty. The issue then for the court was whether the means by which the defendant monitored compliance with this prohibition justified the privacy intrusion absent a warrant or individualized suspicion. In reviewing the justification, the court focused on the fact that permission to dispense with warrants is strongest where the burden of obtaining the warrant is likely to frustrate the governmental purpose behind the search and recognized that alcohol and other drugs are eliminated from the bloodstream at a constant rate and blood and breath samples taken to measure whether these substances were in the bloodstream when a triggering event occurred must be obtained as soon as possible. In addition, the court noted that the railway workers' expectations of privacy in this industry are diminished given its high scrutiny through regulation to ensure safety. The court therefore concluded that the railway's compelling interests outweigh privacy concerns since the proposed testing was not an undue infringement on the justifiable expectations of privacy of covered employees.

In positions in which public safety is not at risk, the courts have generally agreed with the employers that they are justified in testing all employees and job applicants. Several major retail employers, including Home Depot, Ikea, and Wal-Mart, have comprehensive drug-testing policies for both job applicants and employees. Many stores will also promote their "drug-free" workplace policy as a marketing strategy. With just a few exceptions, such policies are legal throughout the United States.

Other Forms of Monitoring

Employers are limited in their collection of information through other various forms of testing, such as polygraphs or medical tests. Employers are constrained by a business necessity and relatedness standard or, in the case of polygraphs, by a requirement of reasonable suspicion. With regard to medical information specifically, employers' decisions are not only governed by the ADA but also restricted by the Health Insurance Portability and Accountability Act (HIPAA). HIPAA stipulates that employers cannot use protected health information in making employment decisions without prior consent. Protected health information includes all medical records or other individually identifiable health information.

Is a Balance of Interests Possible?

A balance is possible between the employer's interest in managing the workplace and the employees' privacy interest. The employer has a right to manage the workplace. In more specificity, employers want to manage the workplace so that they can place workers in the appropriate positions. They want to ensure compliance with affirmative action, administer workplace benefits. They want to ensure effective or productive performance. They need to know what their workers are doing in their workplace. The employer's perspective is as follows: "I am paying them to be there working. If they are not working, I should know that and either pay them less or hire different workers." It is a relatively understandable concern.

Employees, on the other hand, want to be treated as free, equal, capable, and rational individuals who have the ability to make their own decisions about the way their lives will unfold. They are interested in their own personal development and valued performance (the lack of privacy may prevent "flow"), conducting some personal business at the office, being free from monitoring for performance reasons (wary of increased stress or pressure from monitoring), being free from monitoring for privacy reasons, and being able to review and to correct misinformation in data collected. While workers need to be able to conduct involuntary personal matters at the office (such as scheduling a doctor's appointment), workers contend that they also have the right to conduct voluntary personal business as well (such as e-mailing friends). Perhaps the resolution lies in the precise definition of voluntary or involuntary personal matters.

It is indisputable that the Internet has certainly promoted First Amendment values of free speech and association; yet the accessibility of personal information over the Internet has also allowed employers to find employees' personal information in areas that were previously not so easily invaded. Only a few areas remain off-limits, including education records, military service records, and some medical information. In addition, technology allows individuals to engage in activities that at one time were uncomfortable or inappropriate; using new technological advances, these individuals are not allowed to remain faceless. As a result, a worker who might never have explored certain areas during working hours might feel completely comfortable exploring those same areas using the Internet with no obvious form of recognition.

There are ethical, economic, and efficiency bases for monitoring. A supervisor may have completely justifiable reasons for considering this type of monitoring or for evaluating an employee based on the information collected. In addition, the more complicated a task, the more necessary effective workplace supervision becomes. On the other hand, workers feel a lack of respect from their employers, which may in turn affect productivity or the culture of the workplace. An employer must be aware of the possible impact on the workplace culture if it chooses to monitor.

Furthermore, while the law may offer some protection in specific areas of our personal lives, it is incomplete—in part a result of the swift advance of technology, one which the law often has a hard time capturing. However, where an employer does have a policy regarding these issues, this policy is legally binding and the employer will be held to its enforcement. Many firms have now included a statement in their personnel policy manuals that explains that the Internet shall be used for business purposes only and that important company business communication may be delayed if the Internet is used for nonprofessional communications, creating a "traffic jam" on systems.

It is important to note that the increased incidence of employee monitoring has occurred simultaneously with significant institutional and structural changes in the labor market and working conditions. For example, telecommuting, flextime, and more liberal family leave policies are institutional labor market features that have become much more widespread in the past 10 years. Employers in the past were able to monitor their employees' work and productivity in person on the job. Yet in recent years, there has been an increase in the number of telecommuters from 8.5 million in 1995 to 11.1 million today.

In addition, the structure of the labor market has changed with an increase in the number of nonstandard workers. Nonstandard workers are defined as those who do not have a "regular" full-time job and include four main categories of workers: temporary help, on-call workers (such as substitute teachers), contract workers (such as those who provide cleaning, security or landscaping services), and independent contractors (individuals who obtain their own customers to whom they provide a service or product). In the 1990s, non-standard workers (including other part-time workers) comprised between 25% and 30% of the labor force. These institutional and structural changes may make it more important for employers to be able to monitor employee job performance electronically since there is less face-to-face monitoring possible in the new work environment. However, the question still remains regarding the extent of monitoring that is necessary.

Given the varied perspectives on monitoring by the employee and employer, the most effective means to achieve monitoring objectives while remaining sensitive to the concerns of employees is to strive toward a balance that respects individual dignity while also holding individuals accountable for their particular roles in the organization. Ann Svendsen, director of the Center for Innovation in Management, concluded that a company that maintains trust, a cooperative spirit, and shared understanding with its stakeholders creates greater coherence of action, better knowledge sharing, lower transaction costs, lower turnover rates, and organizational stability.

A monitoring program developed according to the mission of the organization, then implemented in a manner that remains accountable to the affected employees, approaches that balance. The following may serve as parameters for a monitoring policy that endeavors to accomplish the goals described above:

- No monitoring in private areas (i.e., restrooms)
- Limited to within the workplace
- Employees should have access to information gathered through monitoring
- No secret monitoring—advance notice required
- Should only result in attainment of some business interest
- May only collect job-related information
- Agreement regarding disclosure of information gained through monitoring
- Prohibition of discrimination by employers based on off-work activities

The above parameters allow the employer to effectively and ethically supervise the work done by his or her employees, to protect against misuse of resources, and to have an appropriate mechanism by which to evaluate each worker's performance, thus respecting the legitimate business interest of the employer. These guidelines respect the personal autonomy of the individual worker by providing for personal space within the working environment, by providing notice of where that "personal" space ends, and by allowing access to the information gathered, all designed toward achievement of a personal and professional development objective.

World Bank

The World Bank, officially the International Bank for Reconstruction and Development (IBRD), was one of the three institutions that were conceived at the 1945 Bretton Woods, New Hampshire, conference. It was to initially aid in the reconstruction of war-torn Europe following World War II but ultimately finance development in lesser-developed countries. The World Bank has expanded since its conception to include both the IBRD and the International Development Association (IDA), and it is a part of the World Bank Group, which consists of the World Bank and three other agencies: International Finance Corporation (IFC), Multilateral Investment Guarantee Agency (MIGA), and International Centre for Settlement of Investment Disputes (ICSID). The World Bank Group's mission is to fight poverty and to improve the living standards of people in the developing world, with each agency specializing in different aspects of development.

The World Bank Group interacts with both the public and the private sectors. The World Bank deals directly with the governments of developing countries: the IBRD provides low-interest rate loans, policy advice, and technical assistance to low- and middle-income countries; the IDA provides grants and interest-free loans to the world's poorest countries. The other three agencies of the World Bank Group interact with the private sector by encouraging foreign private investment in developing countries. The IFC provides financing to private corporations in countries where capital is limited; the MIGA provides guarantees to foreign investors against losses due to noncommercial risks such as war and civil disturbance; and the ICSID provides a forum for conciliation and arbitration of international investment disputes between governments and private foreign investors.

The World Bank Group commands tremendous power and influence in both the public and private domains of development around the world. Not only is it the biggest and richest development finance institution in the world, its model for development is used and imitated by developing countries and nongovernmental agencies working on development projects; and hence, the economic, social, and environmental impact of development is heavily dependent on the policies that the World Bank Group promotes.

Structure of the World Bank Group

The World Bank Group's five agencies are run by member countries and a president who presides over all of them. The IBRD membership is contingent on membership in the International Monetary Fund (IMF), and membership in the IDA, IFC, and the MIGA is conditional on membership in the IBRD. There is no formal application for membership in the ICSID; a country must simply ratify the ICSID convention, which can take place as soon as the country has become a member of the IBRD.

The agencies' member countries are represented by a board of governors. Each member country appoints a governor who serves a 5-year term. If the IBRD member country is a member of the IDA or the IFC, the IBRD governor also serves as the governor of the IDA and the IFC. The MIGA governor is appointed separately. The board of governors is the ultimate policy maker of the agency. It determines membership acceptance, the amount of authorized capital, and the distribution of income. The board of governors convenes yearly at the Bank's Annual Meeting, which is held in Washington, D.C., 2 out of every 3 years.

The board of governors elects the president of the World Bank Group to a 5-year renewable term. By tradition, the president is a citizen of the largest shareholder country, which has always been the United States, and thus, the U.S. government essentially determines who will hold the position.

The day-to-day operations of the bank are delegated to the board of executive directors who work on-site at the Bank headquarters in Washington, D.C. They decide on loans, guarantee proposals, and IDA credit; determine policies that guide the Bank's general operation; and report on operations, policies, and budgets to the board of governors. The Bank has 24 executive directors who are chosen by the member countries. The five largest member countries (the United States, Japan, the United Kingdom, Germany, and France) each appoint an executive director. The remaining member countries appoint the other 19 executive directors through an election that is held every 2 years.

World Bank

Currently, the IBRD is owned by 184 countries. It is run like a cooperative with member countries as shareholders. The number of shares a country has is based on the size of its economy, and a country's voting rights is proportional to its shareholdings. The voting power of each country has varied over time, but the United States has always held the largest share: 36% at the time of the Bank's conception and 16.4% today. The G-8 countries (the United States, Japan, Germany, the United Kingdom, France, Canada, Italy, and Russia) represent 46% of the total voting power.

The World Bank agencies, the IBRD and the IDA, have the same staff and the same policy guidelines, but their source of funds and country eligibility for loans is different. The bulk of the IBRD loanable funds is borrowed on capital markets and from governments and central banks. It can borrow at a very favorable interest rate due to the guarantee of its members' callable capital. The Bank uses its high credit rating to lend its money out to borrowing countries at rates that are considerably more favorable than what the borrower could get on the market. The loans' low fixed-interest rate and relatively long time period of maturity make them very attractive.

The Bank focuses its lending on those countries that can effectively use assistance that is determined by the comprehensiveness of the country's development strategy and the degree of the country's commitment to development. IBRD loans are generally granted to middle-income countries for a specific project that contributes to poverty reduction, delivery of social services, environmental protection, or economic growth. Over the years, the Bank has shifted its efforts from growth-oriented projects toward projects and policy advice that are more explicitly focused on poverty reduction.

The process for receiving an IBRD loan is typically initiated by the borrower who identifies and prepares a project proposal. The borrower and the Bank negotiate the various terms of the project, which include objectives, components, outputs, performance indicators, implementation plan, and schedule of disbursing the loan funds. Once the Bank approves the loan, the borrower initiates the project. The Bank supervises the project's progress and evaluates its results.

The IDA was founded in 1960 to supplement the IBRD's development aid. The less developed countries were in need of better rates than the IBRD could offer at that time, and thus, the IDA (a separate account managed by the Bank) was created to fill this gap. The largest source of the IDA's funds come from new contributions from donor countries, of which 70% comes from the G-8 countries. Additional funds come from internal resources such as repayments and investment resources, and a small portion comes from retained profits of the IBRD.

The IDA loans (typically called credits) are made with no interest charge and for a period of time that is so long, it is virtually grant aid. Because of the favorable terms of the IDA money, there is a great deal of competition for it. The eligibility criteria for IDA money are as follows: First, the country must have a per capita gross annual income of $865 or less, and second, the country must not be creditworthy for loans on IBRD terms.

History

The history of the World Bank and its strategy can best be understood by looking at the objectives and philosophy of each of its nine presidents. The first president, Eugene Meyer, formerly the publisher of the *Washington Post*, had a contentious 6-month term due to differences of opinion with the executive directors about the Bank's strategy. Contrary to the desires of the executive directors, Meyer wanted to move cautiously. Not a single loan was approved during his tenure.

In 1947, John J. McCloy, a prominent Wall Street lawyer, was selected as the second president. He accepted the position on the condition that the president has authority over the executive board; this structural hierarchy remains in place today. McCloy was concerned with winning the confidence of Wall Street and with advancing the Bank's reputation as a quality lending institution. The only reconstruction loans that were ever made by the Bank (four in 1947) were done during McCloy's reign (1947–1949).

Eugene Black (1949–1963), the third president, is credited by some as having defined the Bank's niche. Infrastructure lending (roads, railroads, electric power, ports) became the type of projects that were supported with an emphasis on gross national product growth. The IFC (1956) and the IDA (1960) were created during Black's presidency.

The fourth president, George Woods (1963–1968), started to transition the Bank to become more innovative; it began to make loans for education and agriculture rather than simply for infrastructure. But some would say it was Robert McNamara's presidency (1968–1981) that made the Bank what it is today. He brought a sense of moral mission to the Bank, with an emphasis on poverty reduction. Urban-poverty alleviation, education, and health projects were a significant part of the Bank's portfolio. McNamara also instituted an intensification of research and long-term planning. The Bank prepared 5-year country lending plans that strongly guided its actions. Near the end of McNamara's term, he launched the structural adjustment loan, which stressed macroeconomic stabilization and put the IBRD policies closely in line with the IMF.

The next three presidents each served a 5-year term: A. W. Clausen (1981–1986), Barber Conable (1986–1991), and Lewis Preston (1991–1995). During the tenure of these three presidents, the development strategy promoted privatization, deregulation, and trade liberalization. The MIGA (1988) was created during Conable's term to encourage foreign direct investment in developing countries.

James D. Wolfensohn, the ninth president, finished his second term in 2005. He made several changes to the Bank during his tenure that are of significance: decentralized management, pushed staff out into the field to developing countries, empowered developing countries to have more of a voice in their development, and increased the Bank's interaction with nongovernmental organizations. In recent years, a notion of development that is broader than economic growth has been endorsed by many in the international community. To support this end, 189 countries at the UN Millennium General Assembly in 2000 endorsed the Millennium Development Goals, and the World Bank announced that it would join the United Nations as a full partner in implementing the goals needed to have sustainable poverty reduction. These eight goals are as follows: (1) eradicate extreme poverty and hunger; (2) achieve universal primary education; (3) promote gender equality and empower women; (4) reduce child mortality; (5) improve maternal health; (6) combat HIV/AIDS, malaria, and other diseases; (7) ensure environmental sustainability; and (8) develop a global partnership for development.

The tenth president, Paul Wolfowitz, took office in June 2005. He was previously the U.S. deputy secretary of defense and the chief architect of the U.S. invasion of Iraq. Besides holding several U.S. government positions, he taught at Yale University and Johns Hopkins University. Wolfowitz's role in the controversial Iraq war and his lack of development experience made his nomination somewhat controversial. But he won support, and since his unanimous approval, he stated that sustainable development and poverty alleviation, particularly in Africa, were his primary goals for the World Bank.

World Bank and Its Critics

There has been much debate over the role of the World Bank and its competency. Because of the power and influence of the United States, some have questioned the Bank's true motives: Is it acting in the general interest of development, or is it promoting the interest of the United States? Even if the Bank could refrain from this bias, some argue that the Bank is an interest group itself that is more concerned with maintaining its position and enhancing its power than promoting the general interest of development.

Some are also concerned with the Bank's accountability and transparency to the citizens of both the borrowing countries and the lending countries. The Bank has a virtual monopoly on the services it provides, so some argue that there are no sufficient checks on its activities. In addition, the Bank defines the development policies, carries out the assessment of the state of development, and evaluates the success of its projects and programs. Few outside the organization have access to enough of the information to be able to accurately assess the soundness of its operations.

In addition to the concerns of the Bank's structure, there has been controversy over a more fundamental issue, the Bank's approach to development. While the aim of the Bank has not changed over the years, its approach to achieving it has evolved. In the past, the Bank was focused on solving technical problems using market-based reforms: planning approaches, trade liberalization and privatization, and macrostability. In the 1980s and 1990s, the Bank has directed its efforts to implementing the Washington Consensus policy, which relies on trade liberalization, deregulation, and privatization. This globalization policy, which some argue, will lead to the destruction of natural resources, social ills, and economic destabilization, particularly in developing countries, has spurred antiglobalization protests, disrupting several World Bank meetings around the world. Protestors have forced the Bank to take extra security precautions at several Washington, D.C., annual meetings, to end their 2000 Prague meeting a day early, and to cancel their 2001 Barcelona development conference. Today, the Bank prescribes broader objectives than simply increasing the gross domestic product. To truly raise the living standard of those in developing countries, the Bank emphasizes a need for democratic and sustainable development. What has been missing, according to some, is a focus on the institutional infrastructure that is required to make markets work. Others argue that the real problem is the capitalistic strategy used to solve the problem of poverty. Some claim that the poor continue to be poor, not because they have been ignored or left behind by progress, but because they are the victims of the so-called progress.

The world has seen great progress toward the World Bank's mission; the percentage of the developing world's population living in absolute poverty (less than US$1 per day) has declined from 28% in 1990 to 21% in 2001. Still, there are 1.2 billion people living in absolute poverty today, and the number of people living below $2 per day has risen in the past 25 years from 2.4 billion to 2.7 billion people. Some argue that this is an indication that the World Bank has not yet realized a winning strategy to poverty alleviation.

WorldCom

WorldCom began in 2002 as the second largest long-distance U.S. telephone service provider with operations in 100 countries, 20 million customers, and assets of $107 billion. Seven months later, the company became the largest bankruptcy in U.S. corporate history as the result of a 5-year accounting fraud that totaled more than $11 billion. WorldCom experienced a breakdown of corporate governance. The CEO handpicked new board members, controlled the board's agenda, dictated policies, and enriched directors through generous consulting contracts, stock option distributions, and perks. Employees concerned about the fraud feared questioning executive authority and had no safe outlets to report the wrongdoing.

Growth Through Acquisitions

WorldCom's rise and fall parallels that of its long-time CEO Bernie Ebbers. Ebbers, born and raised in Canada, graduated from Mississippi College with a degree in physical education. He worked as a factory manager before earning a small fortune acquiring regional motels. When the U.S. government ended AT&T's long-distance telephone monopoly in 1984, Ebbers and several other local investors funded Long Distance Discount Services (LDDS) and offered 30% discounts to small businesses in Mississippi.

Ebbers took over as CEO of the financially struggling LDDS in 1985. He quickly generated a profit by applying the management techniques that led to his motel success: offer the lowest price, cut costs, acquire a competitor, consolidate resources, and use the new cost savings to acquire another competitor. Ebbers took LDDS public in 1989 and 6 years later changed its name to WorldCom. WorldCom shocked the telecommunications market in 1997 by purchasing MCI, the second largest company in the industry and more than three times the size of WorldCom, for $37 billion, which at the time was the largest acquisition in U.S. corporate history. Under Ebbers's leadership, WorldCom's revenue jumped from $8.6 million in 1986 to $37.8 billion in 1999, aided by more than 60 acquisitions.

When WorldCom's stock peaked in June 1999, the high-profile Ebbers, who borrowed large amounts of money to buy company stock and real estate, became the 376th richest person in the world, with an economic worth of $1.4 billion. Ebbers, who maintained that a proposed code of ethics was a colossal waste of time, was also the recipient of perks from investment bankers earning large fees funding WorldCom's $70 billion worth of acquisitions. Salomon Brothers' Jack Grubman allocated Ebbers's stock in 21 initial public offerings, which Ebbers quickly sold for $11 million.

Accounting Fraud

In 1999, Ebbers instructed Scott Sullivan, WorldCom's chief financial officer, to do whatever was necessary to meet Wall Street's high quarterly expectations and pay off the company's burdensome acquisition debts. Sullivan fraudulently withdrew money from an accrual account and claimed it as revenue to meet second quarter 1999 financial projections. He continued doing so for the next six quarters, falsifying more than $3 billion in revenue.

In search of more cash to pay operational expenses, Ebbers bid $129 billion for Sprint, then the third largest telecommunications company, later that year. Combined, WorldCom-MCI and Sprint would control nearly 40% of the long-distance market, slightly less than AT&T. However, in June 2000, the U.S.

Justice Department ruled that acquiring Sprint would violate antitrust laws. Ebbers could no longer grow WorldCom by buying large competitors, causing a management crisis.

WorldCom's revenue and profits were also damaged by cutthroat competition with AT&T, the collapse of the dot.com market, and an economic recession. Ebbers received margin calls from brokers because his investments were leveraged with WorldCom's declining stock. WorldCom's board of directors eventually loaned Ebbers $400 million from the company, enabling him to pay his margin calls without dumping WorldCom stock on the already depressed stock market. Ebbers rewarded Stiles Kellett, chair of the board's Compensation Committee, by leasing him a corporate jet for a nominal price of $1 a month plus some incurred expenses.

By early 2001, Sullivan used up all the excess cash in WorldCom's accrual accounts. At the end of the first quarter of 2001, Sullivan began to illegally capitalize more than $3 billion of regular operating expenses to meet Wall Street projections by delaying the recording of daily expenses, a practice he would continue the next four quarters.

Sudden Collapse

Enron, audited by Arthur Andersen, unexpectedly declared bankruptcy at the end of 2001. In March 2002, the SEC extended its investigation to WorldCom, another major Arthur Andersen client. WorldCom's stock dropped below $5 a share, causing credit problems and more margin calls for Ebbers.

At the end of April 2002, the board of directors forced Ebbers to resign. He received a very generous severance package of $1.5 million a year for the rest of his life and other lavish perks. A week later, WorldCom's credit rating fell to junk bond status. Sullivan then drew down WorldCom's entire $2.65 billion line of credit under false pretenses, the banks not knowing about the company's fraudulent bookkeeping dating back to 1999.

In late June, Cynthia Cooper, WorldCom's internal auditor, notified the board of directors about massive accounting irregularities. The company announced a $3.8 billion accounting fraud, restated earnings, and fired Sullivan. The SEC filed charges against WorldCom for falsifying revenue by an amount that turned out to be more than $11 billion. An avalanche of lawsuits were soon filed on behalf of 2.5 million shareholders, and WorldCom filed for bankruptcy protection.

During the trial, Ebbers claimed to be ignorant of any wrongdoing. The jury disagreed, found Ebbers guilty of fraud, and he was sentenced to 25 years in jail. Sullivan's 25-year jail sentence was reduced to 5 years for cooperating with federal investigators. After filing for Chapter 11 bankruptcy in July 2002, WorldCom reorganized and changed its name to MCI. The firm has now adopted a new code of ethics, implemented an ethics hotline to report wrongdoing, and has established an ethics officer position.

World Economic Forum

The World Economic Forum (WEF) is an independent, international, not-for-profit organization based in Geneva, Switzerland. Founded in 1971 by Swiss business professor Karl M. Schwab, the WEF serves as a platform for business and political leaders from numerous countries to discuss and debate social and economic issues of global concern. According to the WEF, its mission is to improve the state of global political, economic, and social affairs in coordination with various industry and governmental partners. The core membership of the WEF consists in about a thousand corporations, most of which are among the foremost multinational corporations in the world. Member corporations must meet annual revenue requirements and pay significant annual fees in support of their membership in the WEF. The WEF's annual meeting is held in Davos, Switzerland. Along with representatives from its corporate members, assorted political leaders, academics, journalists, and leaders of nongovernmental organizations (NGOs) are invited to participate at the open sessions at the Davos meeting. Apart from the open sessions, numerous informal meetings, workshops, and assorted industry networking activities take place at the annual meetings of the WEF. Unlike the open forums, these informal sessions are generally closed off from media access. In addition to its annual meeting in Davos, a number of regional meetings are also held by the WEF in various locations around the world to further promote its mission. The WEF also funds various social and economic initiatives and publishes economic reports on different aspects of the global economy.

In recent years, a number of interest groups, including environmental, labor, and antiglobalization organizations, have held highly publicized protests during the annual meeting of the WEF in Davos. These demonstrations are indicative of the strong opposition to the WEF from certain quarters. While the WEF promotes itself as an impartial forum for the discussion of global social and economic issues, critics of the WEF accuse the organization of serving solely as a mechanism for the promotion of corporate economic interests. Such critics have argued that the WEF's activities are geared more toward securing profits for its corporate members than actually addressing global social and economic problems, that it functions largely as a political lobbying organization for corporate interests, and that its membership, largely stemming from the United States, Europe, and Japan, is not truly reflective of global demographics. In recent years, the WEF has taken several positive steps to respond to some of these criticisms, including inviting more NGOs to participate in its annual meetings, expanding its membership base from underdeveloped nations, and initiating a series of dialogues with groups traditionally critical of the organization. Despite such gestures, many critics of the WEF remain unappeased. In many ways, this ongoing debate is not surprising, as the dispute over the WEF is connected to the larger arguments about the nature and direction of globalization. As such, it is likely that the function of the WEF within the global economy will remain contested in the foreseeable future.

World Health Organization (WHO)

The World Health Organization (WHO) was established on April 7, 1948. The WHO is an agency-institution within the structure of the United Nations. It was developed through the discussions that originated in the San Francisco Conference, April to June, 1945, and the International Health Conference at New York (convened by the United Nations Economic and Social Council), June to July, 1946. Prior to the establishment of the WHO, three key dates indicate the institutionalization of health on an international scale: 1851, The First International Sanitary Conference held in Paris; 1907, the agreement setting up the Office International d'Hygiène Publique signed in Rome; 1919, Health Organisation of the League of Nations that led to the creation of the body that developed into the WHO.

The WHO is governed by 193 member states through the World Health Assembly, meeting annually in Geneva. The Assembly manages three key roles: It legitimates the varied programs initiated by the organization, it agrees on budget policies, and it decides on key policy discussions that arise within the organization.

The organization prioritizes two key activities. (1) It advises and supports health systems in a variety of countries to develop health administration, delivery, and prevention. The use of health teams to combat specific health problems such as HIV/AIDS, tuberculosis, and other communicable diseases are supported by projects that improve basic health needs such as sanitation, nutrition, and hygiene. (2) The organization has evolved into an intergovernmental negotiating body that assists a variety of governments and nongovernmental organizations (NGOs) in seeking to regulate a range of sectors that affect health. This role is supported by the publication of health statistics and wide medical information that is used by a range of agencies formulating health policies. In the global health field, key demands include the following:

- Extensive work taking place at the country level in the community and with government—capacity building for local health care systems
- Health Action in Crisis (HAC)—managing emergency situations, coordinating response of governments, NGOs, and related agencies to prevent disease
- Advocacy for health care initiatives globally—lobbying, providing literature and educational material, publicity campaigns
- Working in collaboration—globally providing technical assistance and expertise to support WHO projects

While not a regulator in the rigid rule-making sense, the WHO is an important organization in shaping the regulatory conditions in a variety of sectors and settings, a role that establishes health-related compliance procedures such as influencing food management policies through its Food Safety Department. The public relations media arm of the United Nations is well served by goodwill ambassadors who raise the profile of the organization and the health-related matters it tackles.

Health is defined in the constitution of the organization as a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity. The central aim of the institution is to promote high levels of health to all peoples. The impact and consequence of conflict should not go unnoticed. Psychological rehabilitation, mine victim support, and range of related health concerns noted in children and adults caught up in conflict between and within states proliferate in ongoing civil wars and social unrest.

The headquarters of the WHO is located in Geneva, Switzerland. Everyday operations are coordinated through the Secretariat, which is made up of staff in Geneva and in regional offices. Regional offices work alongside governments and a range of NGOs in coordinating policies and implementing programs and projects.

The global concerns of health security are represented by the Global Outbreak Alert and Response Network, which alerts the international community to outbreaks that threaten cross-border health security. The response network assists in combating international infectious outbreaks, ensuring that technical assistance and expertise are rapidly deployed to crisis zones, thus contributing to long-term epidemic preparedness and capacity building.

The WHO is split into six regions. The separation of countries into regions is based on geography and political agreement, a structure not necessarily without contention from its members. The six geographical areas within the organization are the following: The Eastern Mediterranean (HQ, Cairo), Western Pacific (HQ, Philippines), Southeast Asia (HQ, New Delhi), Europe (HQ, Copenhagen), Africa South of the Sahara (HQ, Brazzaville), and the Americas (HQ, Washington, D.C.). It should be noted that each region contains a number of diverse countries, each containing numerous nations and communities.

Each of the regional offices has relative autonomy in delivering a range of health initiatives directed to the needs of the area. The Eastern Mediterranean office focuses on four key priority programs: the Tobacco Free Initiative, Roll back Malaria, Stop Tuberculosis, and Building Community—cross-country-based health initiatives. The office has a special program in polio eradication. HIV/AIDS programs are directed to areas of need throughout the region.

The regional office for the Western Pacific has a range of activities to address health concerns related to immunization and health management. Special initiatives include the "3 by 5" response to AIDS/HIV-related health concerns, which was launched by the Joint United Nations Programme on HIV/AIDS (UNAIDS) and the WHO in 2003. The aim of the program is to provide low- and middle-income countries with life-prolonging antiretroviral treatment. The office is also active in pandemic preparedness.

Southeast Asia has evolved as a distinct area following World War II. The Southeast Asia office is responding to natural disasters such as the earthquake that struck Pakistani Kashmir. Health management programs are being implemented to check the spread of communicable diseases and improve awareness and prevention of noncommunicable diseases. Diabetes is receiving attention, its incidence resulting in particularly targeted attention.

The Regional Office for Europe focuses its attention on noncommunicable diseases such as heart disease and cancer, which are linked to alcohol misuse, obesity, and smoking. The development of health systems is a concern in countries such as Russia. Serious emergencies relating to maternal and child health, communicable diseases, and psychological rehabilitation are notable in the North Caucasus.

The Regional Office for Africa focuses on resources and programs for fighting HIV/AIDS and other communicable diseases. While other noncommunicable and prevention needs persist, resources are overwhelmingly directed to treating the HIV/AIDS crisis.

The health of the America's region is covered by the Pan American Health Organization. The Northern areas are prolific in sedentary lifestyles, which results in high treatment costs for noncommunicable diseases. In Latin America and the Caribbean, programs have been implemented to tackle reemerging diseases such as cholera and tuberculosis, transferring resources from the wider disease-prevention programs and general health improvements.

Although delivered by the regions, most of the big issues are global. The UN Millennium Development Goals have a direct impact on health in its widest sense. The eight defined goals in the program continue to be impeded by politics (obstructions in the decision-making process), culture (misunderstandings arising through language and belief systems), and resources (scarce funds), factors that frustrate the overwhelmingly positive goals of the WHO.

World Resources Institute (WRI)

The World Resources Institute (WRI), a 501(c)(3) nonprofit organization based in Washington, D.C., focuses on creating sustainable solutions for protecting and enhancing the natural environment. Founded more than 20 years ago, the WRI's mission is to move human society to live in ways that protect Earth's environment and its capacity to provide for the needs and aspirations of current and future generations.

Using innovation and research in practical ways, the WRI is a think-tank dedicated to solving seemingly intractable problems such as global climate change, greenhouse gas emissions, biodiversity, and degradation of ecosystems. By engaging with special interest groups, corporations, public advocates, and government agencies, the WRI creates extensive programs domestically and internationally to deliver both short-term results and long-term goals. In creating mutually beneficial arrangements with NGOs, corporations, and environmental organizations, the WRI seeks to improve the lives of people while promoting viable sustainable development goals. For example, the WRI supports market-based emissions trading for encouraging innovative means to reduce carbon emissions from greenhouse gases.

Active internationally, the WRI has been involved in major international negotiations such as the 1992 Rio Declaration, the 1992 UN Framework Convention on Climate Change, and the 1997 Kyoto Protocol. The WRI works with intergovernmental bodies such as the International Finance Corporation of the World Bank and the Equator Banks to encourage sustainable practices and systems worldwide.

The WRI has built a global network of international organizations, local activists, scientists, governments, entrepreneurs, and businesses throughout the world. Working closely with nearly 400 partners in more than 50 countries on a broad spectrum of sustainable development issues, they work to enhance our collective ability to catalyze permanent change.

The WRI and its president Jonathan Lash, for example, worked in 2005 with General Electric and its CEO and Chairman Jeffrey Immelt to create ecoimagination initiatives to reform business approaches with respect to the environment and development. Jonathan Lash, the only leader of a nonprofit environmental organization ever to be named one of the "100 most influential people in finance" by *Treasury and Risk Management* magazine, focuses on creating a vision for the future. The WRI's Sustainable Enterprise Program specifically targets work with businesses to create profitable solutions to environment and development challenges. The WRI brings together corporations, entrepreneurs, investors, and business schools to accelerate change in business practice. The program improves people's lives and the environment by helping business leaders and new markets thrive.

The WRI, in collaboration with The Aspen Institute, publishes a biennial report—*Beyond Grey Pinstripes*—examining the business schools' ability to prepare future managers in understanding the intersections of social, environmental, and economic perspectives in a competitive global economy. Started in the 1990s, *Beyond Grey Pinstripes* grades universities from around the world on their coursework, research, and institutional support for examining businesses' economic and social impacts. The WRI and The Aspen Institute share information on leading coursework, student opportunities, faculty pioneers, and institutional support for social, environmental, and ethical programs/curricula in business schools around the world. A searchable Web site shares ratings, criterion, syllabi, and supporting information by the participating business schools. By 2005, 54% of the participating schools required a course in ethics, CSR, sustainability, or business and society, a near 60% increase since 1991. In-depth reports from the WRI/Aspen Institute database focus specific attention on business and society topics such as activities in China, MBAs and women, CSR and finance, and corporate governance.

The WRI organizes its resources, ideas, and implementation expertise around primary program areas such as domestic and international climate change, access and information, and markets and enterprises. These program areas overlap creating a network of expertise at the local, national, and international level on specific topics (e.g., climate change) based on factual knowledge (i.e., access and information) and shared engagement among public and private enterprises. These three WRI program areas (domestic and international climate change, access and information, and markets and enterprises) are discussed below.

Climate change, a priority area for WRI, focuses on both domestic (the United States) and international policy initiatives. Since its inception, the WRI has been involved with creating policies to reduce greenhouse gas (GHG) emissions within the United States. The U.S. government's refusal to address international global climate change, with significant per capita GHG emissions and refusing to ratify the multilateral Kyoto Protocol, has encouraged the WRI to work with individual states, private enterprises, and international NGOs for climate change friendly policies in a carbon-constrained world. Engaging companies to create innovative technologies and voluntarily reduce emissions; working with individual U.S. states to pass laws limiting GHG emissions; and cocreating a Greenhouse Gas Protocol to harmonize international accounting and reporting standards with the World Business Council for Sustainable Development (WBCSD) are three examples of how the WRI creates multiparty coalitions to solve complex issues. The WRI works with private enterprises to encourage development of alternative energies such as hydrogen, renewable energy (wind, solar), market-based trading mechanisms, and procuring climate-friendly technologies.

Access and information are focused on guaranteeing public access to information, decision making, and transparency regarding natural resources and the natural environment. As codified in Principle 10 of the 1992 Rio Declaration, relevant, timely information leads to informed decision making and better choices to avoid unnecessary risks to citizens' health and well-being. While 178 governments agreed to the Rio Declaration, actual practice has lagged behind. Informed participation with transparency and accountability, the WRI believes, leads to better win-win-win opportunities and the ability to affect public policy. Dispersion of innovative technologies, meaningful public participation in environmental policies, and right-to-know initiatives are consistent with WRI's goals for its access program.

A third priority area for the WRI is focusing on markets and enterprises and their sustainable development programs, policies, and practices. Markets as institutional and governance mechanisms build incentives, systems, and appropriate reviews, oversight and expand economic opportunity, and encourage environmentally sensitive design and operations. By engaging with private enterprises, the WRI seeks to meet essential human needs, create jobs and wealth in communities and enhancing the quality of life. Engaging with institutional investors and focusing on financial flows are of particular interest since financial opinion leaders can encourage environmentally sustainable practices. The WRI works with institutions and private enterprises for adopting and advancing sustainability standards to assess environmental impacts of institutional investments. In the coming years, the WRI has identified sustainable growth via private enterprise in emerging economies as a key goal. By promoting sustainable economic growth through investment and the use of innovative technology, low-income markets are a great opportunity for private investment and sustainable development. These market opportunities can deliver social and environmental benefits.

World Trade Organization (WTO)

The World Trade Organization (WTO) is a global trade agreement with 150 member states accounting for 97% of the world trade. Currently, 30 other nations are negotiating membership. The purpose of the WTO is to promote fair competition and efficiency. Its approach is rooted in the standard classical economic theory of Adam Smith. Instead of each country producing the full range of products that its own market demands, all nations pool their resources to provide the best value for all consumers. In this way, products will tend to be produced where labor costs are cheapest, passing the savings onto consumers and helping to grow commerce on an international scale. Furthermore, lesser-developed countries also benefit as demand for their cheaper labor tends to rise, ultimately also increasing their wages. Thus, globalization tends to benefit all nations, thereby working to achieve the utilitarian ethical goal of the greatest good for all concerned.

History, Structure, and Function

The WTO was created in 1995 by the "Uruguay Round" of talks held by member nations of the General Agreement on Tariffs and Trade (GATT), which includes the United States. GATT was established by the United Nations (UN) Conference on Trade and Employment in Havana in 1948 to promote free international trade. The WTO is in effect, the long-delayed successor to the anticipated International Trade Organization (ITO), which was intended to follow GATT when its charter was agreed on at the Havana UN conference of 1948. However, creation of the ITO was subsequently blocked by the United States, in fear that such a regulating body might compromise rather than benefit American commercial interests.

The WTO is a voluminous trade pact, now totaling more than 30,000 pages. Its primary objective is to help trade flow smoothly, freely, fairly, and predictably. It does this by

- administering trade agreements;
- acting as a forum for trade negotiations;
- settling trade disputes;
- reviewing national trade policies;
- assisting developing countries in trade policy issues, through technical assistance and training programs; and
- cooperating with other international organizations.

WTO decisions are generally made by consensus. Its agreements are then ratified by all member states. Although majority vote is an option, it is rarely used. The WTO's top decision-making body is the Ministerial Conference, which meets at least once every 2 years in a given member state. Its next governing body is the General Council, which includes ambassadors and heads of delegation in the Geneva headquarters, as well as officials sent from member states to Geneva. The General Council also meets as the Trade Policy Review Body and the Dispute Settlement Body. The third governing body consists of the Goods Council, Services Council, and Intellectual Property Council (TRIPS), which all report to the General Council. Finally, numerous specialized committees, working groups, and working parties deal with individual agreements and areas such as the environment, development, membership applications, and regional trade agreements.

Originally, GATT only dealt with trade-in goods. But the WTO also facilitates trade-in services. This includes banks, insurance firms, telecommunications companies, tourist agencies, hotels, transportation companies, and so on. The rules governing such trade appear in the General Agreement on Trade in Services. WTO members have thereby made individual commitments, stating which of their services sectors they are willing to open to foreign competition, and how open those markets are.

More than 75% of WTO member states are developing countries. Thus, all WTO agreements contain special provisions for them, including extended periods for compliance, measures to increase their trading opportunities. The WTO even provides support to help them build infrastructure, handle disputes, and implement technical standards.

The WTO also includes an appellate body to resolve trade disputes between member states. Complaints are usually directed at nations erecting unilateral protectionist barriers to competition from foreign suppliers. If a complaint is upheld by the appellate body and the member nation in question continues to act in breach of the ruling, it can be subjected to severe penalties, including retaliatory import tariffs against its own goods. For example, a mid-sized American television manufacturer recently brought China before the U.S. International Trade Commission for breaching WTO rules by "dumping" televisions on the U.S. market at unfairly low prices achieved through government subsidy and an undervalued currency. The company prevailed, thereby compelling China to raise the prices of its television exports to competitive levels, thus enabling the American manufacturer to remain in business. Unfortunately, few small- to medium-sized U.S. manufacturers have been able to remain solvent long enough to bring forth such suits in the face of rapid offshore outsourcing (offshoring) trends accelerated by the WTO agreement. Most U.S. manufacturers have either gone out of business or offshored production. Whether this trend will be counterbalanced by new industries and growing foreign investment in the U.S. labor remains to be seen.

Noneconomic Concerns

Despite general agreement that the WTO has worked to the benefit of the majority, some fear that its globalized system of free trade still marginalizes the interests of large numbers of people by overlooking important noneconomic concerns. The most commonly voiced concerns can be grouped into the following three overarching categories:

1. Does the WTO marginalize the environment, animal welfare, and human rights?
2. Does the WTO increase consumption at the expense of sustainability?
3. Does the WTO erode national sovereignty, thereby enriching wealthy nations at the expense of poor nations?

Does the WTO Marginalize the Environment, Animal Welfare, and Human Rights?

To promote international trade, the WTO must repress protectionist measures. One important way in which this is accomplished is by the "product/process" distinction. This rule only permits nations to restrict imports based on the "product," that is, its quality. Thus, if it presents a danger to its consumers, its import can be restricted. But it becomes much more difficult for a nation to restrict imports of a product based on the "process" in which it is produced. This is because of the fear that if a country restricted imports merely because the exporting country had different environmental, health, and social policies from its own, the door might be opened to a flood of gratuitous protectionist abuses.

This distinction thus compelled the WTO to reject appeals by various nations including the United States and the European Union of mistreatment of animals such as dolphin kills from non-dolphin-safe tuna fishing, fur derived from animals caught in steel-jaw leghold traps, cosmetics tested on animals, beef treated with hormones, genetically modified organisms such as fruit and vegetables, and so on. In some of these cases, such as discontinuing non-dolphin-safe tuna fishing, agreements were made outside of the WTO though suspicion remains that the practice still exists. More recently, since the massive public protest that effectively canceled the 1999 WTO meeting in Seattle, the WTO has shown more willingness to take exception to the product/process distinction based on Article XX of GATT. It allows for exception necessary to protect public morals, necessary to protect human, animal, or plant life or health, and relating to the conservation of exhaustible natural resources. Thus, in 2001, the United States succeeded in maintaining its ban on imports of shrimp caught in nets dangerous to sea turtles so long as it made ongoing, serious, good-faith efforts to reach multilateral agreement on its own. Other complaints based on the process of production, such as the mistreatment of workers, child labor, or the depletion of endangered species, have not been raised before the WTO. Hence it is not yet clear how it might rule on such issues.

Does the WTO Increase Consumption at the Expense of Sustainability?

By facilitating trade across the globe, the WTO encourages nations to import myriad goods with no restriction on the distance traveled or the amount of energy and natural resources consumed. So long as the transaction costs involved in making the exchange internationally are less than the differences in production costs, trade will likely occur. But critics point out that this promotes the overconsumption of natural exhaustible resources such as petroleum needed to ship so many goods. Thus, instead of keeping production in relatively close proximity to both supply and demand, in this new paradigm a country such as the United States may ship raw materials abroad only to import the very products those materials produced. The results are often products that take much more energy and natural resources to produce than necessary.

Furthermore, since globalization promotes economic growth by giving consumers more buying power, that is, providing them with more goods at lower prices, critics argue that this fuels perilous overconsumption. In response, free-market defenders influenced by the "cornucopian" economic theory of Julian Simon point out that thanks in part to technological advances stimulated by a free market, the costs of depleting natural resources often decline as consumption increases. For example, as petroleum becomes scarce, new means of extracting it are invented. And as the resource becomes entirely depleted, research in alternative fuels is stimulated. Thus, according to this thinking, consumers never have to make sacrifices in the interest of sustainability. However, critics respond that this overlooks natural resources that are intrinsically valuable and can never be restored or replaced. Examples include old-growth rainforests, wild salmon fisheries, and global climatological stability threatened by global warming from increased fossil fuel consumption. But as mentioned above, the WTO allows for restrictions relating to the conservation of exhaustible natural resources. Thus, its member states could still achieve consensus on such issues.

Does the WTO Erode National Sovereignty, Thereby Enriching Wealthy Nations at the Expense of Poor Nations?

Once a nation joins the WTO, it undergoes considerable pressure to remain a member. As international trade industries grow, employing substantial numbers of people, the threat that such industries will collapse becomes so palpable that canceling WTO membership becomes virtually unthinkable. The WTO sees this as a positive constraint since it promotes discipline by discouraging protectionist policies that are bad for business. But this arguably creates a moral hazard in which policies that may be in the best interest of a nation's citizens are disregarded. For example, diversified local industries may be replaced by a small number of foreign-owned, large-scale suppliers. It may also become impossible for lesser-developed countries—as has been the case in Africa—to begin producing life-saving drugs and medical treatments at a price their people can afford. The preexisting intellectual property rights of the exporting nations would forbid it. What has sometimes happened instead is that after prolonged debate and litigation during which time numerous people suffer and/or die from lack of treatment, public pressure mounts to the point of compelling pharmaceutical companies to begin offering their treatments free or at greatly reduced prices.

While there is indeed pressure for lesser-developed countries to join the WTO, it is unlikely that they undertake greater risk in joining than developed countries. Indeed, the WTO has been a boon to lesser-developed counties as jobs in developed countries become offshored where they can be performed more cost-effectively. As a result, developed countries sacrifice jobs in the short term in the hopes that the added economic return of offshoring will ultimately create more jobs for their own citizens at home.

Conclusion

The WTO has undoubtedly achieved its principle goal of promoting economic growth on a global scale. Furthermore, it has recently made progress in addressing noneconomic ethical issues. Whether this progress will continue will likely depend on the general public's degree of awareness and concern. Some have argued that the WTO should be a stepping-stone toward the establishment of a bona fide global democratic governing body better able to balance economic and broader social interests, for example, a reformed United Nations. Assuming such a body would be advantageous, its major stumbling blocks would be garnering the support of multinational corporations benefiting from the status quo and the question of how to represent the citizens of nondemocratic nations.

World Wildlife Fund

The World Wildlife Fund (WWF) is a transnational conservation organization supported by 5 million members worldwide, dedicated to protecting and conserving endangered species and natural environments, and increasing awareness of threatening global issues such as climate change and overharvesting. The WWF directs conservation projects in more than 100 countries, and partners with numerous environmental and nonenvironmental groups to cosponsor initiatives in more than 30 countries, focusing on policy development, education, and advocacy.

The WWF was founded on September 11, 1961, by biologist Sir Julian Huxley, ornithologist Sir Peter Scott, director general of the British Nature Conservancy Max Nicholson, and Prince Bernhard of the Netherlands. Originally known as The World Wildlife Fund, an International Foundation for Saving the World's Wildlife and Wild Places, the fund emerged from the significant concerns of prominent members of the research-based World Conservation Union (IUCN). These scientists recognized the potential loss of wilderness and native animals in Africa, Asia, and Latin America as a disaster in the making, accompanying economic development after decolonization and World War II. It was quickly evident that major financial resources would be required to effectively protect the land and its indigenous species; hence, the WWF was initially conceived as the fund-raising arm of the IUCN. Since its genesis the fund has been dedicated to building scientific, technical, and financial resources in service of conservation activities. In addition, they have formed partnerships with major institutions worldwide, including universities, nongovernmental organizations, government agencies, lobbying groups as well as corporations. The fund's objectives promote the conservation of natural resources while paying heed to regional economic development.

Traditionally, the WWF embarked on many local area conservation projects, in which scientists were sent to developing countries to examine the endangerment of local animals and the deterioration of their habitats. Originally, the WWF sought to put a halt to development in particular wildlife areas by working with local authorities to form national parks within specified boundaries. These efforts met with limited success, because migrating animals are not easily contained within boundaries established by humans. As the indigenous people of developing countries became more empowered, the WWF made a more conscious effort to integrate the perspectives of the local populations into its conservation agenda.

Among its most celebrated breakthroughs are debt-for-nature swaps, the international ban on ivory trading, and its outreach to protect the giant panda. The swaps resulted from the recognition of the economic circumstances of developing nations and providing solutions for countries' massive accumulated debt. Thomas Lovejoy, vice president of the WWF in 1984, proposed acquiring portions of countries' debt in exchange for the conservation of their natural resources. The WWF works with major financial institutions to retire specific amounts of a developing country's debt by asking banks to sell the debt back to the country at a highly discounted rate. The bank then donates the revenue received from that sale back to the country in its local currency to fund local conservation projects. At the same time, the WWF and other land-preservation groups contribute significant funds to support these conservation projects.

In protecting African wildlife from local hunters, the fund employs wildlife trade experts through an organization called TRAFFIC to enforce international laws against illegal trade of particular wild plants and animals, including poaching and elephant hunting. In 1979, the fund hallmarked itself as the first conservation organization to enter the borders of China. The WWF partnered with the Chinese government to protect the habitat of the giant panda, from which the fund inherited its signature panda logo. The fund has also led renowned efforts to conserve the homes of endangered species such as tigers and rhinos.

Meanwhile, the WWF contributes great resources to scientific research and technological advancements. From its own "Green Building" U.S. headquarters in Washington, D.C. to the WWF's Conservation Science Program (CSP), the fund champions technology as one of the most effective approaches to preserving the health of ecological systems. The CSP, founded in 1990, assembles teams of scientists to research specific biodiversity issues, apply their expertise directly to current field projects and to publish their technological advances and findings in scientific journals.

As it has grown, the WWF has confronted critics in its policy initiatives and outreach efforts from economic, cultural, and environmental standpoints. Many radical environmentalists point to the WWF's promotion of third-wave environmentalism, a strategy that attempts to persuade corporate polluters to internalize pollution costs in their production methods. Moderates promote these efforts as pragmatic, while extreme environmentalists consider it working with the enemy, as corporations trade finances for favors and corporate directors have gained seats on the board of the WWF. The WWF has received funding from major oil corporations, including Amoco, Exxon, and Mobil, as well as chemical giants, Dow and Du Pont.

From the opposite side, proponents of economic development have attacked the WWF's fundamental perspective, arguing that "sustainable development" is infeasible and that conservation efforts directly impede economic development in Third World countries. Furthermore, some critics charge that the WWF is insufficiently concerned with the local hierarchies and power struggles within the cities and communities of developing countries, while granting recognition to political leaders and bureaucrats. The WWF's agenda of collaborative economic development is considered by some to be merely the means of attracting funds from large international development organizations.

Under its current president and CEO, Carter S. Roberts, the WWF has amplified its protection of the Amazon Rain Forest, linking up with the World Bank and the Brazilian government to establish the Amazon Region Protected Areas initiative. The fund directs additional campaigns, including partnering with the Scripps Institution of Oceanography to conserve the well-being of the oceans' ecosystems.

By the end of 2005, the WWF directed 1,200 field projects around the world. The executive board secretariat resides in Gland, Switzerland, and maintains a second central hub in the United States.

Z

ZAIBATSU

The *zaibatsu* has been central to industrialization and modernization in Japan. The word *zaibatsu* has two distinct meanings depending on the context. For journalists, it means a financial clique or a wealthy person. For academics of business, history, and management, it means huge industrial conglomerates. In Japan, the word means financial clique or a wealthy person. In the rest of the world, it refers to industrial conglomerates.

Zaibatsu is a word used mainly in Japan. The word *zaibatsu* consists of "*zai*" and "*batsu*." In Japanese, *zai* means money or possessions and *batsu* means a closely united group of people who do not allow others easily to join their group. The *zaibatsu* originated late in the Edo Period (1603–1867) and was formed early in the Meiji Period (1868–1912). The origin of the *zaibatsu* is "*gōshō*" or a wealthy merchant in the days of the Edo period. According to the history of Japan, a *gōshō* was authorized by the Tokugawa regime to buy and sell commodities on a large scale when it involved transportation from one place to another.

After the Meiji Restoration in Japan in 1868, the Meiji government adopted fundamental policies for building a modern nation: *fukoku-kyōhei* and *shokusan-kougyō*. *Fukoku-kyōhei* policies are intended to enrich the country and strengthen its military powers. *Shokusan-kougyō* policies are intended to increase production and develop industries. Early in the Meiji period, the Meiji government owned and controlled businesses to promote the industrialization of Japan. During this time, the *zaibatsu* form had been part of political merchant activities. These businessmen with political contracts were referred to as *seishō*. During the middle of the Meiji period, these businesses were disposed of for a petty sum. Thousands of government-owned businesses, including mining, trading, financing, and war industries, converted to private enterprises.

Later the phrase "from *seishō* to *zaibatsu*" or "from political merchants to *zaibatsu*" was used to mean that the *zaibatsu* developed directly from political merchants. In the late Meiji period, the Japanese economy was practically dominated by the giant, family-owned business combines, or *zaibatsu*. The four major *zaibatsu* companies were Mitsubishi, Mitsui, Sumitomo, and Yasuda. Since then, the holding companies of *zaibatsu* have functioned as "*zaibatsu-honsha*." All *zaibatsu* were groups of companies owned and entirely controlled by the *zaibatsu* family. Membership in the *zaibatsu* family was limited to a group of individuals living under one roof and usually under one head.

During World War I, the *zaibatsu* and their companies changed their strategies. First to diversify their businesses, the *zaibatsu* exploited opportunities in the new areas or actively merged and acquired nonmember companies and their subsidiaries. The diversification of the *zaibatsu* and their companies required them to use equity financing. Thus, most of the *zaibatsu* companies pushed forward with an initial public offering. Second, the *zaibatsu* and their companies established The Industry Club of Japan in 1917 to influence governmental policy or legislators in the area of economic policy. This federation promoted the *zaibatsu*-centered industrial policies to protect the interests of the *zaibatsu* and its companies against the organized labor movement.

During and following the Great Depression, the sociopolitical power of the *zaibatsu* met with severe criticism and accusation from the public. When the economic depression in Japan was serious, the *zaibatsu* formed a powerful family-controlled commercial combine; each *zaibatsu* consisted of companies to provide funds and financial services and a trading company to buy and sell goods and services on behalf of the member companies. Anti-*zaibatsu* sentiments of those days in Japan had some influence on businesses of the *zaibatsu* and its directly affiliated companies. First, the *zaibatsu-honsha* offered its securities to the public to meet the demands of the times and the public. However, the stock was not as good as it looked. The *zaibatsu* also made voluntary donations to the public, but only the Mitsui Foundation was centered on corporate philanthropy.

During the Sino-Japanese War (1937–1945) and the Pacific War (1941–1945), all the *zaibatsu* companies were of great economic importance and included heavy industry, the mining industry, the light industry, and the finance industry. When the *zaibatsu* had accumulated a huge amount of capital through its political merchant activities, a Japanese movement of militarism and ultranationalism was formed. This is one reason why the General Headquarters of the Allied Powers (GHQ) established the *zaibatsu* dissolution program and the Elimination of Excessive Concentrations of Economic Power or Antimonopoly Act.

GHQ adopted the anti-*zaibatsu* policies and legislation in hopes of eliminating the *zaibatsu* family control and the *zaibatsu*-centered financial structure. The purpose of these measures was to reform business and society in Japan and convert the *zaibatsu* companies into publicly held corporations. Several years after the *zaibatsu* were dissolved completely, some groups of businesses that once belonged to the same *zaibatsu* emerged. These groups cannot be conceptualized as *zaibatsu* companies; they are not owned exclusively by a single family or an extended family. What emerged here is the "*keiretsu*," bound neither by family ties nor by pure holding companies. The *keiretsu* are business groups bound by cross-shareholdings and dispatching of company executives. Now, these companies are generally classified as companies of *zaibatsu* descent.

Appendix: Business Ethics Periodicals

This appendix presents a selected guide to periodicals that are for researchers, practitioners, and the interested layperson. The reader seeking articles on business ethics will find a number of significant research journals and annual series. In addition, there are many trade magazines (those read by primarily businesspeople) and popular press sources. Other “born digital” resources, such as online-only journals, society newsletters, and Web sites also may be useful, peripherally. The publications discussed here are primarily English language, although their contents may be international in scope. Also highlighted are the electronic databases currently most effective for finding articles in these periodicals and the few research-related born digital resources.

Core Academic Journals

Relatively few academic journals are devoted to business ethics and cover a full range of topics and methodological approaches associated with the field. Generally, the three publications doing both are the field’s core journals *Journal of Business Ethics, Business Ethics Quarterly,* and *Business & Society.* Their readership predominantly consists of theorists and practitioners.

All three contain articles that are theoretical, empirical, or literature reviews. Other regular features include book reviews, thematic issues, conference announcements, and calls for papers. The publishers’ Web sites for these three journals offer free e-mail alerts for the tables of contents of each new issue, as do several of the other journals mentioned later in this appendix.

Journal of Business Ethics (JBE) began in 1982 as a quarterly, but has expanded to seven volumes per year (28 issues), with a circulation of approximately 7,500 institutional subscriptions worldwide. Its audience is academics and anyone else interested in business ethics topics. From 1997 to 2003, articles that focused on education were published separately in *Teaching Business Ethics* (ISSN 1382-6891, Kluwer). Currently, this topic is reincorporated into *JBE.* Similarly, the *International Journal of Value-Based Management* (ISSN 0895-8815, Kluwer, 1988–2003) became integrated into *JBE.* (ISSN 0167-4544; Springer; URL: http://springerlink.metapress.com/openurl.asp?genre=journal&issn=0167-4544)

Business Ethics Quarterly, launched in 1991, is the official publication of the Society for Business Ethics and has a paid circulation of more than 1,050. Six to twelve double-blind peer-reviewed articles appear per issue. The intended audience is researchers, teachers, and business practitioners who are interested in conceptual and methodological aspects of business ethics, especially those approaches that address international business, economics, and values. (ISSN 1052-150X, Philosophy Documentation Center; URL: www.pdcnet.org/beq.html)

Business & Society: A Journal of Interdisciplinary Exploration has appeared quarterly since 1960 and presently has a circulation of more than 700. This official publication of the International Association of Business and Society focuses on social issues in management and business ethics. The articles address ethics and values, business-government relations, corporate governance, environmental management, and international issues. In addition to research and book reviews, it provides relevant dissertation abstracts. (ISSN 0007-6503, Sage; URL: http://bas.sagepub.com)

Other Scholarly Journals

Since business ethics research is often interdisciplinary in nature, many useful articles appear in the periodicals of other fields. Also, material can be found in journals that focus entirely on a single topic within the field of business ethics. Below is a selected list of significant peer-reviewed journals of both kinds, presented in alphabetical order. Which titles among them are most important depends on the reader's focus and research interests. Some of the most highly regarded research titles among this group are *Academy of Management Review, Business & Society Review, Business Ethics: A European Review,* and *Organization Science.* Typical supplemental contents are conference announcements and book reviews.

Academy of Management Review, a highly regarded management journal, has appeared quarterly since 1976 and features a number of articles each year on ethics-related topics. In addition to research, book reviews, and announcements, there is a Publications Received list. (ISSN 0363-7425, Academy of Management; URL: http://aom.pace.edu/amr)

Business & Professional Ethics Journal, published quarterly since 1981, contains articles that compare professions or cover ethics topics in areas like marketing, health care management, human resources, and global labor. Half of the issues reprint selected papers from international conferences. More recently, the journal has appeared irregularly and incorporates the publication *Professional Ethics* (ISBN 1063-6579, 1992–2004). (ISSN 0277-2027, University of Florida Center for Applied Philosophy and Ethics in the Professions; URL: www.ethics.ufl.edu/BPEJ)

Business and Society Review: Journal of the Center for Business Ethics at Bentley College has appeared quarterly since 1972. Each issue has about a dozen articles by academics and practitioners that contain scholarly research, commentary, policy analysis, or book reviews. Some issues are thematic. (ISSN 0045-3609, Blackwell; URL: www.blackwellpublishing.com/journals/BASR)

Business Ethics: A European Review is considered a top business ethics journal by many, appearing quarterly since 1992. It covers current issues and emerging concerns, from a European perspective, on topics related to the ethical practices of corporations and individuals. The audience is academics and businesspeople. (ISSN 0962-8770, Blackwell; URL: www.blackwell-synergy.com/loi/beer)

Corporate Governance: An International Review (CGIR), produced bimonthly since 1992, publishes research on trends in the development and improvement of organizations' governance, boards, and directors. *CGIR* frequently includes articles about ethics-related issues. (ISSN 0964-8410, Blackwell; URL: www.blackwellpublishing.com/journals/CORG)

Corporate Governance: The International Journal of Business and Society, published five times a year since 2001, includes articles on real-world performances of boards and CEOs and corporate social responsibility. Articles are research, policy analysis, or case studies, occasionally gathered into thematic issues. (ISSN 1472-0701, Emerald; URL: www.emeraldinsight.com/cg.htm)

Corporate Reputation Review: An International Journal, appearing quarterly since 1996, produces articles on reputation management, highlighting best practices and current trends. Article treatments include research, case and industry studies, and policy analysis. (ISSN 1363-3589, Palgrave Macmillan; URL: www.henrystewart.com/corporate_reputation_review)

Electronic Journal of Business Ethics and Organization Studies, is an online journal published in Finland, semiannually since 1996. It contains research, primarily in English, and is open access (free to readers) online. (ISSN 1239-2685, University of Jyväskylä, Business and Organization Ethics Network, School of Business and Economics; URL: http://ejbo.jyu.fi/index.cgi?page=cover)

Ethics in Film is an online journal, begun in 2005, that focuses on using film to teach ethics, including business ethics examples. (ISSN not available, Center for Business and Society, University of Colorado; URL: www.ethicsinfilm.com)

Greener Management International: The Journal of Corporate Environmental Strategy and Practice, produced quarterly since 1993, has articles and case studies with an international scope that focus on environmentally sustainable business practice. Recent examples of thematic issues have included sustainable performance and business competitiveness, chemical risk management, and greening supply chain management. (ISSN 0966-9671, Greenleaf; URL: www.greenleaf-publishing.com)

International Journal of Business Governance and Ethics, published quarterly since 2003, focuses with interdisciplinary perspectives on aspects of corporate social responsibility and ethical decision making within organizations. (ISSN 1477-9048, Inderscience Publishers; URL: www.inderscience.com/ijbge)

Journal of Business Ethics Education (JBEE) began publishing quarterly in 2004. Currently, it is the only journal exclusively devoted to articles on teaching business ethics, since content for the former *Teaching Business Ethics* is now reincorporated into *JBE,* and the *Journal of Management Education* is more broadly focused. *JBEE* contains research articles and curriculum materials. (ISSN 1649-5195, Senate Hall and Carnegie Bosch Institute; URL: www.senatehall.com/journals.php?journal=5)

Journal of Corporate Citizenship, produced quarterly since 2001, publishes articles that link theory with practice about corporate citizenship, addressing global and local perspectives. (ISSN 1470-5001, Greenleaf; URL: www.greenleaf-publishing.com/jcc/jccframe.htm)

Journal of Management Education has appeared bimonthly since 1975 with articles on teaching business students and managers. Ethics-related items appear in nearly every issue. Articles may be theoretical and empirical research, essays, reviews of instructional materials, as well as teaching tools, such as exercises and assignments that use discussion, case method, role playing, and writing. The December issue has an annual index. (ISSN 1052-5629; URL: www.sagepub.com/journal.aspx?pid=181)

Journal of Public Policy and Marketing (JPPM) published semiannually since 1982, *JPPM* contains articles on social, ethical, public policy, and economic aspects of marketing. (ISSN 0748-6766, American Marketing Association; URL: bear.cba.ufl.edu/centers/jppm)

Organization Science, one of the top research journals in management, began publishing in 1990. Its bimonthly issues focus on systems and behavior in organizations, drawing from the fields of management, sociology, psychology, economics, and communications. Usually, there are several ethics-related articles per year. (ISSN 1047-7039, Institute for Operations Research and the Management Sciences; URL: www.marketingpower.com/content1056C342.php)

Review of Social Economy, published quarterly since 1948, is the official publication of the Association for Social Economics and concentrates on topics like the relationships between social values, economics, and ethics. Themes include social justice, poverty, income distribution, gender, environment, and humanism. (ISSN 0034-6764, Routledge; URL: www.tandf.co.uk/journals/titles/00346764.asp)

Teaching Business Ethics appeared quarterly from 1997 to 2003 and is now incorporated into *Journal of Business Ethics* (see above). (ISSN 1382-6891, Kluwer Academic)

Zeitschrift fuer Wirtschafts und Unternehmensethik (Journal of Business, Economics and Ethics), begun in 2000, is published three times per year. Theoretical and empirical articles are primarily in German, but some are in English, and all articles have English abstracts. (ISSN 1439-880x, Rainer-Hampp-Verlag; URL: www.zfwu.de)

Annual Book Series

Annual series have been a key format for distributing business ethics articles, especially before many journals published ethics-related articles regularly. Below is a selected list of the most relevant ones, presented in alphabetical order.

Annual Editions: Business Ethics has run from 1989 to present, reprinting articles from diverse academic journals and popular magazines that focus on basic concepts drawn from many perspectives. (ISSN 1055-5455, McGraw-Hill/Dushkin; URL: www.dushkin.com/annualeditions/ae-list.mhtml)

IABS Proceedings, published since 1990, includes papers presented at annual meetings of the International Association for Business and Society, the producers of *Business & Society.* (ISSN not available; URL: www.iabs.net)

International Business Ethics Review covers international aspects of corporate social responsibility. The International Business Ethics Institute of Washington, D.C., has turned out three to five academic articles annually since 1997 but began more frequent publication in 2005. The print copies are free on request. (ISSN not available; URL: www.business-ethics.org/iberpub.asp)

Issues in Business Ethics has appeared irregularly since 1990, producing single-topic volumes that are collections of previously unpublished scholarly articles on ethics in international management. (ISSN 0925-6733, Springer-Verlag Dordrecht; URL: www.springer.com/sgw/cda/frontpage/0,11855,5-40385-69-33114156-0,00.html)

JAI Press (now called JAI/Elsevier) generates several annual titles, each with original research articles. The most notable include the following:

Research in Ethical Issues in Organizations (ISSN 1529-2096, 1999 to present)

Research on Professional Responsibility and Ethics in Accounting (ISSN 1574-0765, 1995 to present; called *Research on Accounting Ethics* prior to 2004)

Research in Corporate Social Performance and Policy (ISSN 0191-1937, 1978–1998)

JAI also publishes *Advances in Bioethics, Research in Social Problems and Public Policy,* and others. (URL: www.elsevier.com/wps/find/books_browse.cws_home?pseudotype=SER)

Ruffin Series in Business Ethics, appearing biennially since the 1990s, publishes the papers delivered at the renowned lecture series at the Darden School sponsored by the University of Virginia's Olsson Center for Applied Ethics and the Ruffin Foundation. (ISSN not available, Philosophy Documentation Center; formerly published by Oxford University Press, 1998–2004; URL: www.pdcnet.org/ruffin.html)

Soundings: A Series of Books on Ethics, Economics and Business has appeared irregularly since 1987, produced by the University of Notre Dame Press. (ISSN not available; URL: www3.undpress.nd.edu/dyn/series/36)

Transparency International, based in Berlin, Germany, has two annual publications that are available free online: *Global Corruption Report,* www.globalcorruptionreport.org, and *Corruption Perceptions Index,* www.icgg.org/corruption.cpi.html (copublished with the International Center for Corruption Research).

Trade Journals, Newsletters, and the Popular Press

Some periodicals are used primarily for locating news, trends, commentary, and case study material. Below is an alphabetical list of selected publications that are geared toward researchers, businesspeople, students, and the public:

Business Ethics: The Magazine of Corporate Responsibility (BE), formerly *Business Ethics Magazine,* publishes quarterly with a circulation of about 10,000 (current issue is free online). *BE* covers trends and includes special features like reports on teaching ethics in MBA programs, interviews with corporate leaders, awards, and an annual ranking of the "100 Best Corporate Citizens." (ISSN 0894-6582, New Mountain Media; URL: www.business-ethics.com)

The Conference Board's *Research Reports* and *Executive Action Reports* frequently include publications that address ethics topics, with items such as "Why Ethical Leaders are Different," "Using Ethical Analysis to Guide Offshoring," and "Corporate Citizenship Reporting: Best Practices." (ISSN 0732-572X; URL: www.conference-board.org/publications)

Compact Quarterly: Corporate Citizenship in the World Economy is the official newsletter (free online) of the United Nations' Global Compact, which began in 1999 as an initiative promoting corporate responsibility worldwide by encouraging company participation in adhering to principles promoting human rights, labor standards, the environment, and anticorruption. (ISSN not available, United Nations; URL: www.enewsbuilder.net/globalcompact)

CQ Researcher, a weekly, frequently publishes issues on business ethics topics that are particularly good for basic overviews of subjects currently appearing in the U.S. and international news. Each issue includes a chronology of the topic, pro/con arguments, and essays. Past issues have addressed the following: "Whistleblowers," "Disabilities Act," "Religion in the Workplace," "Lobbying Boom," "Corporate Crime," "Child Labor and Sweatshops," "Drug Company Ethics," "Asbestos Litigation," "Diversity in the Workplace," and "Contingent Work Force." (ISSN 1056-2036, Congressional Quarterly; URL: www.cqpress.com/product/Researcher-Online.html)

Ethics Newsline, free online, summarizes each week's ethics-related news, and includes features like statistics, quotes, research reports, commentary, charts, and illustrations. (ISSN not available, Institute for Global Ethics; URL: www.globalethics.org/newsline/members/index.tmpl)

Ethics Today, produced by the Ethics Resource Center, Washington, D.C., is a monthly free e-mail newsletter and accompanying Web site that contains news, white papers, research reviews, and educational resources on organizational ethics (formerly *Ethics Journal,* ISSN 1060-0698, 1991–1996). (ISSN not available; URL: www.ethics.org/erc-publications/newsletter.asp)

Ethikos: Examining Ethical and Compliance Issues in Business has come out semimonthly since 1987, focusing on corporate ethics programs and reporting on experiences with corporate compliance programs (incorporates *Corporate Conduct Quarterly,* ISSN 1061-8775, 1991–1999). (ISSN 0895-5026, Ethics Partners, Inc.; URL: www.singerpubs.com/ethikos)

European Business Ethics Newsletter, biannual since 2003 (free online), publishes news and announcements related to the activities of the European Business Ethics Network. (ISSN none available; URL: www.ebenuk.org/info_resources.html)

Philosophy for Business, appearing monthly since November 2003 (free online) from the International Society for Philosophers, features articles and book reviews for a broad audience about the philosophical aspects of business. (ISSN not available; URL: www.isfp.co.uk/businesspathways)

Society for Business Ethics Newsletter has been published twice a year since 2004 (free online) by the producers of *Business Ethics Quarterly* and includes items like conference calendars, calls for papers, job announcements, and other association business. (ISSN not available; URL: www.societyforbusinessethics.org)

Research Databases

Online databases allow simultaneous searching of hundreds of periodicals, across a broad chronological range. They save the researcher time by searching widely for relevant articles, covering both the journals typically devoted to business ethics and those from allied fields that occasionally produce ethics-related articles.

More than 12 commercial services may be used effectively to locate articles on business ethics. The major, broad-based management databases are the primary choices to research business-ethics-related topics because they cover the largest range of relevant academic literature, as well as news, commentary, case studies, and policy analysis articles. The leading databases cover six or more journals that are central to business ethics, along with a significant number of other academic and trade journals of secondary importance to the field. They are as follows:

ProQuest's ABI/Inform Global

EBSCO's Business Source Premier

Another strong resource, the *Bibliography of Business Ethics Articles* (www.isbee.org/biblio/EthicsArticles.php), is available online at no charge. Created and maintained as a project of the International Society of Business, Economics, and Ethics, it contains about 4,000 citations (dating from 1992 to present) that are handpicked from nine central business-ethics-related journals. This bibliography of high-quality sources is easily accessible, although it has limitations, compared with commercial databases, in terms of the range of journals, the citation-only format, how fast new content is added, and its search engine's features.

Secondary choices for research databases on business ethics topics are the major interdisciplinary academic databases or those others that are dedicated to specific disciplines (e.g., philosophy, psychology). They contain fewer of the periodical titles that publish business ethics research. Listed in order of most-to-least coverage are

Expanded Academic,

International Bibliography of the Social Sciences,

Business Periodicals Index,

Emerald Insight,

Business and Company Resource Center,

Philosopher's Index,

PAIS International,

Social Science Index,

IBZ/Internationale Bibliographie der Geistes- und Sozialwissenschaftliche Zeitschriftenliteratur (International Bibliography of Periodical Literature in the Humanities and Social Sciences),

IBR/Internationale Bibliographie der Rezensionen Geistes- und Sozialwissenschaftliche Literatur (International Bibliography of Reviews of Scholarly Literature in the Humanities and Social Sciences),

Dietrich's Index Philosophicus, and

Social Science Citation Index.

Other highly specialized databases may be useful occasionally, depending on the research topic. Examples are *Communication Abstracts, Criminal Justice Abstracts, Environmental Science and Pollution Management, POESIS, PsycINFO, Religion Index, Risk Abstracts,* and *Worldwide Political Science Abstracts.*

A notable feature of commercial databases is that they provide a controlled vocabulary that not only assists searching by subject (e.g., corporate social responsibility) but also by specific article treatments, so that researchers can combine their subjects with keywords such as "case studies," "peer review," "editorial," or "statistical" (keywords vary by database). Free Internet search engines, even Google Scholar, currently do not offer this kind of powerful search refinement feature.

Google Scholar does outperform the commercial databases in one area: The contents published in annual book series, many of which are original research articles, currently are ignored by these commercial database sources, with the exception of the *Ruffin Series,* which is available through *ABI/Inform* and *POESIS.* Google Scholar is providing some incomplete, but promising, indexing that uncovers the material in these annual series. Comprehensive tracking of items in annuals, however, is best done from each publisher's Web site.

Obtaining the Materials

The majority of the databases and individual journal titles listed here are subscription services that typically are accessed through academic and public libraries, academic departments and research centers, corporate intranets, and other private libraries. Affiliated users of these libraries should inquire locally about what is available to them. Even when the home library does not own specific articles, users often may request them through their library's interlibrary loan service. Alternatively, individuals without a library affiliation may find pay-per-print access directly through the databases and journal publishers or via article supply vendors such as Ingenta or the British Library Document Supply Center. Online availability of older items may vary, however, and some may only be available through libraries and interlibrary borrowing.

Miscellaneous Digital Resources

Useful Web sites that support business ethics research come in a variety of forms, with links to business ethics periodicals, news, or other documents. BELL: The Business Ethics Link Library (http://libnet.colorado.edu/Bell/frontpage.htm) is a comprehensive collection of resources compiled by the business library at the Leeds School of Business, University of Colorado, that primarily provides many dozens of examples of the codes of ethics of business and organizations. BELL also serves as a useful first stop for links to ethics periodicals, education programs, and other ethics and corporate social responsibility online resources. In addition to the already-mentioned newsletters by the Ethics Resource Center, European Business Ethics Network, and the Society for Business Ethics, there presently are two well-established English language Internet sites that contain news, commentary, announcements, and the occasional case study. They are the business ethics section of Management Logs, www.managementlogs.com/business_ethics.html, a Web log by more than 12 international contributors, and *RISQ: Review of International Social Questions*, www.risq.org/category4.html, a publication by 18 international researchers, journalists, and policy makers. These sites host journalistic reporting and interviews and have supplemental features like notifications for new content, useful links, and interactive discussions. More sites such as these are likely to appear as interest in and the study of business ethics become more widespread.
