An objection against both act-consequentialism and rule-consequentialism challenges consequentialism's assumption that the value of states of affairs is independent of moral considerations. Consequentialism must make this assumption, because it takes the moral status of actions or rules to be determined by the value of the resulting states of affairs. A supposedly uncontroversial example of a valuable state of affairs is someone's being happy. If, however, the value of someone's being happy were itself to be dependent on moral considerations, then it could not function as the "independent variable" that consequentialism takes it to be. Immanual Kant famously held that nothing is always good except the will to do right. The value of a particular person's being happy, for example, cannot be assessed independently of moral considerations. A person's happiness could be rendered morally inappropriate by that person's wickedness and, in such a case, the person's being happy would not be good. So consequentialists are misguided to suppose that the value of states of affairs can function as independent variables in determining the rightness of actions. In response to this objection, consequentialists must maintain that, contrary to Kant, there is always positive value in people being happy. In the case of wicked people, this positive value may be outweighed by further bad effects, but the value of states of affairs can nevertheless be assessed independently of moral considerations.

Conspicuous Consumption

Thorstein Veblen coined the term *conspicuous consumption* around the turn of the 20th century. If you have ever wondered why someone drives a Cadillac when a Hyundai will get you where you want to go, then you understand the basic concept of conspicuous consumption. Any make of car may get you to your destination, but driving a Cadillac will get you noticed by others. Economists postulate that consumers derive "utility" from the consumption of goods. Veblen would say that this utility comes from two distinct characteristics of goods. The first is what he called the serviceability of the good. This basically means that the good gets the job done. Both the Cadillac and the Hyundai will get you from New York to Boston. The other characteristic of a good is what Veblen called its honorific aspect. Driving a Cadillac provides evidence that you can afford to drive a car that others will admire not primarily because it gets the job done, but rather because it provides visible evidence you have enough wealth to own a Cadillac. The Cadillac is thus an outward display of your status in society. Barbarian societies might display gold captured from enemies as evidence of prowess in warfare. In modern society, people drive Cadillacs.

A corollary of these dual characteristics of goods is that such conspicuous consumption is waste. In using this term, Veblen is not making a judgment that the good is unneeded by society, but rather uses *waste* as a technical term indicating that the production of a Cadillac requires more resources than the production of an Hyundai. A Cadillac may have leather seats; a Hyundai has vinyl seats. The difference Veblen would label *waste*, but this does not mean that Cadillacs should not be produced.

The core of Veblen's analysis of modern society was the fact that, on the one hand, there is enormous technological potential to produce goods. On the other hand, business enterprise constrains the amount produced to that which can be profitably sold. One way to think of this is that if all one needed to do is get from New York to Boston, then that could be satisfied by Hyundais. To sell more cars, wants must be continually expanded. In Veblen's view, the function of advertising was to ensure that people want a Cadillac. The gulf between the wants of consumers and the technological potential is reduced through advertising. It is for this reason that Veblen viewed advertising as waste, but one that is intrinsic to a modern economy based on the principles of profit-making business enterprises.

An important point in Veblen's analysis is the recognition that all goods have elements of serviceability and waste. The typical textbook example of conspicuous consumption cites fur coats, diamonds, or expensive cars. These are examples everyone would recognize. However, the dichotomy that Veblen draws between the "honorific" aspects of a good and those that further the "life process" implies that all goods possess these dual characteristics. This means that both the Hyundai and the Cadillac have both serviceable and honorific elements. The fact that one drives a car implies that you are wealthy enough that you do not have to take public transportation, but the Cadillac conveys still higher status in society because you do not have to take public transportation or drive a Hyundai.

Consumer Activism

Consumer activism is a term that describes a variety of disparate movements that seek to influence the behavior of companies through activities ranging from providing information to boycotts, pickets, and litigation, with the aim of forcing companies to act in a way that benefits the perceived interests of consumers. Underlying the unifying idea of consumer activism is the belief that consumers can and should exercise their market power to improve not only the quality of products but also the conditions under which they are made, distributed, advertised, and sold. Consumer activism takes Adam Smith's dictate that the consumer is king to mean not only that the market responds to consumer demand for products but also that consumers can translate that demand into power for the sake of social transformation.

Consumer activism has played a role in debates on many important issues in the past several decades, from environmental activism and workers rights to antiglobalization and fair trade movements. In mobilizing consumer power on behalf of these issues, activists have occasionally been able to effect changes more quickly and more effectively than they would have by going through governmental or regulatory institutions (although these institutions have also been affected by consumer activist movements).

Early consumer activism movements included the work of the National Consumer's league, which worked in the first half of the 20th century to improve the labor conditions of workers through the promotion of "ethical consumption." In using consumer power to create pressure for social change, this organization had some success in the 1930s in bringing about better labor standards for American workers.

The contemporary period in consumer activism may be said to have begun with the publication of Ralph Nader's *Unsafe at Any Speed* in 1965. As an exposé of the American automobile industry, this book revealed a number of the hazardous practices that were common among car manufacturers. He subsequently founded the group Public Citizen, through which he continued to work on consumer issues.

In the 1990s and into the 21st century, consumer activism has become much more closely involved in movements critical of the phenomenon of globalization and the concentration of corporate power. Activists such as David Korten have written critiques of the global economy, not on anticapitalist grounds, but on the ground that an unregulated global economy creates the conditions for an unhindered expansion of corporate power, the degradation of democracy, and the inability of consumers to control key aspects of their lives as both citizens and as participants in the market. Such critiques are also often tied to environmental concerns about the effects of particular patterns of production and consumption that become more difficult to control in a global economy.

Moral Foundations of Consumer Activism

The moral basis of consumer activism is rooted in the morality of the act of consumption itself. Capitalism rests on the premise that in a free market consumers are free to make choices with regard to what they consume and how. The market itself cannot be an arbiter of the morality of any particular transaction. Demand can produce a supply, whether the demand be for solar energy or illicit drugs. The moral character of the market is ultimately determined by the morality of the consumers who inhabit it. As such, it is the responsibility of the consumer to demand those products that most fully conform to his or her core moral convictions.

In addition, consumers may take responsibility not only for the particular products they consume but also for the manner in which those products are manufactured and supplied. Consumers as well as manufacturers are responsible for products that are produced in ways that are harmful to workers or to the environment or use unethical or illegal production methods.

The reverse side of this is the responsibility of the producer to the consumer. The producer is obliged to provide the consumer a safe and reliable product that is produced using morally acceptable methods. *Caveat Emptor* ("let the buyer beware!") does not absolve the producer or seller of a product from the need for scrupulousness in ensuring that products meet minimal standards of quality and morality.

This view rejects the idea that buyer and seller exist as isolated individuals engaged in a decontextualized commercial transaction. Rather, it recognizes both the consumer and the producer as part of a capitalist economic and social system. The consumer and producer are morally bound together as members of this system and bear moral responsibility for the results that they jointly bring about—the producer through his methods of production and the consumer through his demand for the product.

However, this moral analysis assumes that the consumer has knowledge of all the morally relevant aspects of production. Without such knowledge, the consumer cannot be held responsible. Thus, a key issue in consumer activism is that of transparency, the idea that consumers must have adequate information to make informed choices with regard to the products they purchase. In the absence of informed consent or the threat of exposure, it is argued, companies have no incentive to make safe products. Consumer activists seek to create conditions of transparency either by exposing unsafe or unethical business practices or by advocating for regulations that would either require that companies meet particular standards or inform consumers of information relevant to their purchasing decisions.

Types of Consumer Activism

Many consumer activists are primarily concerned with protecting consumers from unethical or fraudulent business practices. Through use of legislation and litigation, as well as through raising public awareness, they attempt to identify and target particular companies or particular practices that they view as being unethical. Often, their work is aided through cooperation with state or local consumers affairs departments or with the Better Business Bureau, an organization of businesspeople that aims at holding businesses to high ethical standards.

This brand of consumer activism operates by providing a forum through which consumers can make one another aware of those businesses they should patronize and those they should avoid. By providing such forums, consumers thus cooperate in enforcing high ethical standards among competing businesses. Consumers given a choice between two companies offering the same product can be expected to prefer a company with a better reputation for good customer service and ethical behavior to one with a number of negative reports.

The moral presupposition of this brand of consumer activism is that it is in a company's self-interest to act ethically when it is held publicly accountable for its actions. Absent such public accountability, companies may lack sufficient incentive to moral behavior.

Another approach to consumer activism seeks to evaluate companies' claims about their products, comparing them to similar products on the market. This approach is typified by the magazine *Consumer Reports*, which evaluates and rates products to enable consumers to make informed choices among competing brands. This approach to consumer activism does not seek to make any direct moral claims but rather seeks simply to inform consumers of their available options.

Other approaches to consumer activism concern themselves with how companies treat their employees. These approaches seek to publicize companies that either violate labor laws or take advantages of gaps in the law that allow them to treat their workers in ways that are viewed by activists as failing to uphold an adequate moral standard. One case of consumer activism of this kind was the attempt made by consumer activists in the United States to raise awareness of the treatment by the manufacturer of Nike athletic shoes of many of its workers in Vietnam and Indonesia, where people were being paid low wages and were working in poor conditions. By raising this issue in a way that garnered a great deal of publicity, these activists succeeded in forcing Nike to address the issue of their treatment of workers and, in some cases, to improve working conditions.

Another, though similar approach, is one in which a company is targeted due to the treatment of workers by its subcontractors. This strategy is frequently used in the apparel industry, where well-known companies will often farm out much of their work to low-wage, and sometimes illegal, "sweatshops." Because of the difficulty of targeting these sweatshops individually, activists will often seek to exert pressure on their contract partners, who have more at stake in preserving a good reputation.

It is not clear how effective these strategies are. In the case of Nike, although the company launched a public relations campaign to restore its image, it is unclear that they made any substantial changes to their business practices in either of the countries in question. In addition, although activists tried to enlist the support of Nike's chief spokesperson, Michael Jordan, they failed to do so. In the end the campaign may have succeeded in raising the consciousness of U.S. consumers about the issue of low-wage foreign workers, but it is not clear that it did much to resolve the underlying issue. Similarly, although pressure on companies that employ sweatshop labor may have some limited effect, it does not appear to have done much to change the overall practices of the apparel industry.

Another approach to consumer activism relies on giving consumers a choice between products that meet certain ethical standards and those that do not. The "fair trade" movement, particularly in the coffee industry, has had some success in providing consumers alternatives to coffee that is grown on large plantations under exploitative conditions. Through certification and inspection programs, some brands of coffee have been recognized as "fair trade" coffees. Consumers can purchase these brands for the sake of supporting better conditions for workers in the coffee industry.

A variation on this theme involves the labeling of products to allow for informed consumer choices, for example, labeling genetically modified foods on the one hand, or labeling television programming content on the other. In each case, by allowing the consumer to know in advance what they are consuming allows them to make an informed decision as to whether or not to consume.

Yet another form of consumer activism can be seen in movements for socially responsible investing and shareholder activism. Both these strategies rely on the role of the stockholder as a form of consumer as well as an owner. Socially responsible investing involves choosing stocks on the basis of criteria of moral acceptability. For example, an investor might choose, either individually or through a mutual fund, to avoid investing in military contractors or tobacco companies. Alternatively, they might choose to invest in companies that promote particular social goods, for example, companies that promote sustainable agriculture or renewable energy. Either or both of these strategies may be used by a given investor, though the particular social screens might vary from investor to investor, or from mutual fund to mutual fund.

Shareholder activism could be thought of as the opposite strategy. Instead of avoiding investment in morally problematic companies, consumer activists might try to change a company's behavior from within, either by buying a relatively small number of shares to have the right to speak at shareholder meetings or by seeking to influence the attitudes of other shareholders with the objective of altering a company's policies.

By operating from within a company's structure, these approaches have the advantage of being perceived as coming from those having a vested interest in the financial good of the company. However, it is once again not clear whether this has been a particularly effective strategy in altering corporate policies.

Consumer activism, as the Nike example above may indicate, also has global implications. As markets become more flexible, and both labor and materials are increasingly able to transcend national boundaries, and thus the legal and regulatory oversight of particular nations, it becomes more difficult for consumers to know the conditions under which products are made, or to control those conditions. If national governments are unable or unwilling to institute or enforce labor or product safety laws, it becomes more and more necessary for activists to appeal directly to the companies themselves, either via moral suasion or via the use of bad publicity. If these appeals have the effect of eroding a company's consumer base, then the company becomes more likely to institute desired change. In the absence of a strong set of legal protections within a global economy, consumer activism becomes a more viable strategy to achieve desired aims.

Tactics of Consumer Activism

The various approaches to consumer activism discussed above each represent a strategic choice as to how they affect change in the behavior of companies. In addition, there are various tactics that can be brought to bear in consumer activist movements. Some of these tactics are relatively nonconfrontational, while others are more so.

Consciousness-raising is a large part of the work of consumer activism. Through raising the public's awareness of particular issues, activists have a greater likelihood of success at mobilizing consumer sentiment in a way that will affect company policies. Such consciousness-raising can take place on many different levels. Books, such as Nader's *Unsafe at Any Speed* or Rachel Carson's *Silent Spring*, can have a galvanizing effect on both movements and governments, but smaller efforts can include picketing, letter-writing campaigns, newspaper editorials, or exposés. These tactics can be particularly effective when companies are unable to mount a successful campaign to counter the bad publicity.

Beyond consciousness-raising, however, is the active effort to change corporate policy. A variety of tactics may be used with relatively open and cooperative companies to seek to create changes. For example, activists may seek to secure a meeting with corporate leaders to air their grievances and seek policy changes for the sake of consumers. This tactic tends to be very effective in those circumstances where activists can demonstrate that they represent a relatively broad constituency and where the issue in question is one that affects the consumer directly. In the case of many product safety and labeling issues, this tactic may prove to be quite effective, since companies are unlikely to take actions that risk alienating a significant portion of their customer base.

Activists can also turn to the courts in those cases where informal attempts at mediation fail. Class action suits can sometimes be an effective tool in addressing consumer grievances, particularly where it can be shown that a company or industry acted in a corrupt way. As a tactic to achieve change, such lawsuits can be effective, though as a means of compensating victims they may often produce limited results.

Legislation is another tactic that can be an effective tool for consumer activism. By convincing lawmakers of the need for some form of regulation or remedy, consumer activists can succeed in affecting corporate behavior precisely by making such behavior illegal or by regulating the behavior in question.

From a product safety perspective, regulation is an important tool of consumer activism. By creating legislation that created agencies such as the Food and Drug Administration, the Consumer Product Safety Administration, the Environmental Protection Agency, and the Occupational Health and Safety Administration, the U.S. Congress created a web of institutions the task of which was to ensure that consumers were provided information necessary to make informed decisions. The Securities and Exchange Commission can also be considered a consumer protection agency, insofar as its mandate is to ensure that stock transactions take place in a maximally fair and open manner.

A tactic associated, in particular, with shareholder activism involves the use of shareholder resolutions to affect company policies. Activists may seek to bring issues of concern to a company's shareholders, in an effort to mobilize them to vote in favor of changes in corporate policies. Although not frequently successful, this tactic does have the benefit of raising consciousness if done well.

Another very common technique in consumer activism is the boycott. Boycotts have been used in numerous situations, with mixed success, to affect the policies of particular companies or entire industries. The California grape boycott in the 1970s aided the worker of the United Farmworkers Union to secure the right to organize California's produce workers, while a boycott of Nestlé products had the effect of changing corporate policies regarding the marketing of baby formula in underdeveloped countries.

Boycotts are not always so successful however. When, in the 1990s, the Southern Baptist Convention urged Christians to avoid Disney World because of Disney's perceived toleration of homosexuality, the boycott fell flat, as have some other boycotts of supposedly gay friendly companies. The practice of boycotting itself has recently become less prevalent as well, in part perhaps because it sometimes seems to have the effect of harming workers while not noticeably altering corporate policies.

These tactics are among the most common, but the particular tactics used will depend on the circumstances in question, the goals sought by activists, and the receptivity of the company. If activists are perceived to represent a large movement, then these tactics may prove to be quite effective, while activists who are perceived to have an insignificant constituency may not be effective no matter what tactics they attempt. However, a movement is not always necessary for successful consumer activism. The advantage of litigation and legislation is that they do not necessarily rely on popular movements if it can be demonstrated that they are responses to violations of existing laws or deeply held moral or civic ideals. In any consumer activism campaign, however, it will be the abilities of the activists to effectively mobilize their constituency and properly choose tactics that will do much to determine the outcome of the campaign.

Conclusion

Although not all activism is consumer activism, consumer activism plays at least some part in a wide variety of movements that involve the interaction of social questions with market forces. As part of an overall strategy for social change, consumer activism has the potential to be an effective tool. By attempting to affect companies at the level of the individual purchase, consumer activism can succeed in ways that litigation or appeals to government may not. It is effective because it relies on the freedom of the consumer in a capitalist economy to buy or not buy that which he or she desires and on the ability of social movements to affect the moral sensibilities of consumers in such a way that they choose to refrain from consumption rather than lend support to an institution they deem to be acting immorally.

Consumer Federation of America

The Consumer Federation of America (CFA), based in Washington, D.C., is the nation's largest consumer advocacy group. It is an umbrella of organizations and includes labor unions; state and local consumer organizations; and senior citizen, low-income, labor, farm, public power, and cooperative organizations. The initiative for founding the CFA in late 1967 came from a small group of consumer activists primarily from the labor unions, the President's Consumer Advisory Council, and the Consumers Union. At the time of its founding, it reported having 140 affiliates. By 2005 that number had climbed to 300. The CFA claims to indirectly have some 50 million members, a number that permits it to be a "voice for virtually all consumers."

The CFA was originally intended to be an information clearinghouse for its members. Lobbying was to be left to individual members. However, while CFA still has a substantial fact-finding role, it has evolved into a major lobbying force on Capitol Hill. Its staff members frequently testify before Congress on consumer-related matters. Today, its mission explicitly includes representing consumer interests before Congress and federal agencies as well as assisting its state and local members in their activities in their local jurisdictions. Other activities include commissioning surveys on consumer attitudes and product safety. The CFA also analyzes the voting records of members of Congress and produces voter guides at election time.

According to economic analysis, a genuine mass-based consumer organization cannot exist. That is because the benefits it provides are public goods. Since, by definition, public goods are available to all members of the group (here consumers) irrespective of whether they contribute to providing them, it is in the rational self-interest of all consumers to free ride. But if all members of the group free ride, then the public goods won't be supplied at all. This is the problem of collective action identified by Mancur Olson: Unless the number of individuals in a group is quite small, or unless there is coercion or some other special device to make individuals act in their common interest, rational, self-interested individuals will not act to achieve their common or group interests. It is not simply a question of organizing for political activity. Individual consumers remain rationally ignorant of the policies and programs that exploit them because it is not in the self-interest of any consumer to expend the resources to obtain such information.

Thus, the CFA provides a natural experiment for testing Olson's theory of collective action. How has the CFA overcome Olson's free rider problem? First, the CFA does not organize dispersed consumers. Its membership doesn't consist of 300 million consumers but consists of some 300-odd organizations. Second, the CFA is a service organization that provides selective incentives to its members in the form of lobbying and technical expertise.

For these reasons, the free rider problem is greatly reduced—but at a potential cost. The interests of CFA's membership may diverge from the interests of consumers. In case of conflicts, where do CFA's loyalties lie? These potential or actual conflicts of interest have provoked conservative criticisms that public interest groups such as the CFA are in reality lobbies for economic and ideological special interests.

There is evidence that the CFA can go toe to toe with other powerful Washington lobbies on behalf of consumers. This is illustrated by some of CFA's recent interests, which include consumer credit scores, USDA meat testing, credit life policies, hidden finance charges, homeowners' insurance, beanbag-type infant pillows, children's playgrounds, heating costs, home phone bills, cable TV charges, gasoline price, privacy protection, and much more. These are fairly classic consumer protection issues. The CFA is particularly alert to scams and rip-offs and hazardous products. It has been very successful at using surveys and exposes to generate free media.

On the other hand, there have also been cases where the CFA has taken stands that apparently conflict with consumer interests. Thus, the CFA has been noticeably reticent about removing trade barriers, despite the benefits for consumers of doing so, presumably out of deference to organized labor. In 1981, President Reagan fired more than 11,000 striking air traffic controllers who defied his order to return to work under the terms of the Taft-Hartley Act. The CFA supported the rehiring of the fired air traffic controllers despite its questionable link to consumer interests.

Another potential conflict of interest is ideological. The CFA has been a reliable member of the liberal coalition in Washington. It has supported the assault weapon ban and opposed the line item veto. It has also lined up in opposition to tort reform, medical malpractice reform, and class action reform. CFA's voting ratings of members of Congress have consistently favored Democrats, and its scores are highly correlated with the ratings of other liberal groups such as ADA and COPE. These positions reflect the philosophy of CFA's constituent organizations rather than that of consumers who, of course, split their votes pretty evenly between the two major parties.

Substantively, the CFA has shared liberals' traditional suspicion of market forces. Its policy positions have tended to follow a predictable pattern—prices are invariably too high. High prices, in turn, are always caused by scams, profiteering, price-gouging, windfall profits, monopoly, cartels, market power, and other predatory and anticompetitive practices. Consumers are unsophisticated and no match for powerful businesses. Therefore, government's thumb (or visible hand) is necessary to tip the scales in favor of consumers. As a result, the CFA has tended to call for more regulation, price controls, product recalls, and tougher enforcement of consumer protection laws.

CFA's critics (particularly economists) have charged it with trying to protect consumers from the scourge of lower prices. The CFA has allegedly ignored the costs to consumers of increased government regulation. Another charge is that the CFA takes away from consumers the right to determine how much safety to buy. According to the pro–free enterprise Competitive Enterprise Institute, consumer groups think they know better than consumers what consumers want. Another criticism is that the CFA hypes dangers associated with products.

Over time CFA's views have evolved. Today, the CFA is readier than it was to accept market forces as part of the solution. This pragmatism is evident in its positions on energy markets. In the 1970s and 1980s, the CFA was adamantly opposed to the deregulation of the prices of oil and gas. The CFA denounced President Carter's plan to gradually decontrol oil prices. Today, the CFA still maintains that energy markets are being manipulated and that oil companies purposely minimize their inventories to create artificial shortages and higher prices. However, while the CFA still endorses a windfall profit tax, it soft-pedals the tax and (rhetorically at least) embraces increased competition. In recent congressional testimony, the CFA has said, "Our preferred approach is to find ways to introduce more competition. . . ." "No amount of consumer protection . . . can make up for a market that suffers from fundamental competitive flaws." The CFA now sees regulation as a second-best solution. But the CFA is still quick to conclude that market forces have failed consumers.

Consumer Fraud

Fraud is a purposeful, unlawful act to deceive, manipulate, or provide false statements to damage others. In general, fraud is viewed as false communication that conceals or contains a scheme to create a materially false statement or representation. Often, fraud is associated with documents that are transmitted by mail, wire, or through any type of electronic signal to a receiver. Statements that a court determines as false or fictitious or that have the intent to deceive constitute a crime and are subject to a fine or imprisonment or both. In 2005, fraud cost U.S. organizations more than $600 billion annually, and consumers lose more than $30 billion annually from fraud. The U.S. Department of Justice has identified major categories of consumer fraud including identity theft and fraud, solicitation of donations for victims of terrorist attacks, Internet fraud, telemarketing fraud, bank fraud, and mortgage scams. Mail and wire fraud is a broad category that captures many consumer and business fraudulent activities.

Types of Fraud

The *mail fraud* statute, first enacted in 1872, enabled the government to prosecute undesirable activity (e.g., securities fraud, real estate scams, etc.) years before such behavior was specifically outlawed by other laws. In 1994, Congress amended the mail fraud statute by adding the words "any private or commercial interstate carrier" to the mail fraud statute. As a result, delivering communications or merchandise via carriers such as FedEx and UPS as part of their fraudulent scheme will now violate the law.

The *wire fraud* statute was patterned after the mail fraud statute, and judicial analysis of one applies with equal force to both. When combined with wording in the mail fraud statute that prohibits fraudulent schemes involving interstate transmission of "wire, radio, or television communication . . . writings, signs, signals, pictures, or sounds," these provisions give the federal government virtually unlimited jurisdiction to regulate direct marketing activity through mail and wire fraud legislation.

Telemarketing fraud is a term that refers generally to any scheme in which the persons carrying out the scheme use false statements carried over the telephone. Most typically, fraudulent telemarketers will include current business trends or widely publicized news events as references in their attempts to solicit victims. Types of telemarketing schemes include charity schemes, credit cards, investment schemes, lottery schemes, office supply schemes, prize promotion schemes, and so on. The Federal Trade Commission (FTC) indicates that sweepstakes and lottery fraud were among the top 10 complaints filed in 2004. An AARP study, based on a survey, indicates that lottery victims are likely to be older, with an average age of 74.5 years, and more likely to be women living alone.

Internet fraud refers to any type of scheme involving the Internet, such as chat rooms, e-mail, message boards, or Web sites, to present fraudulent solicitations to perspective victims, to conduct fraudulent transactions, or to transmit proceeds of fraud to financial institutions or to others connected with the scheme. Consumers are increasingly worried about becoming victims of online fraud. Among the complaints and accusations is "shell bidding" in online auctions, which involves sellers bidding on their own items to heighten interest and competitive bidding. Another problem is sellers not delivering promised items after receiving the buyers' funds. *Phishing* is a general term for criminals' creation and use of e-mails and Web sites that are designed to look legitimate but deceive Internet users into providing personal data.

Identity theft and *identity fraud* are crimes in which someone obtains and uses another person's personal information in some way that involves fraud or deception, typically for economic gain. In 2005, more than 40 million credit card holders were susceptible to the loss of personal information and identity theft when their Visa, MasterCard, and other credit card data were compromised. In 2006, the number of identity theft complaints increased 5% over the previous year; however, the annual losses increased much more rapidly reaching $680 million. Credit card fraud loss has been slowed by corporate investment in antifraud technologies and risk management systems. Visa USA reports its fraud losses at 6 cents out of every $100 processed, down from 12 cents a decade ago. Child identity theft also increased steadily.

A growing area of identity theft is the theft of employee records. In 2006, the personal information of more than 26.5 million U.S. veterans was stolen. As the top consumer fraud complaint filed with the FTC, identity theft is becoming an increasingly important risk area for companies to manage. Often, personnel identity theft occurs as an "inside job." A disgruntled, departing, or opportunistic employee sees the revenue potential from selling personal data of employees. Companies and employees are working to control notebooks and hard drives that contain sensitive employee data. Employers who exhibit negligence in this area can be susceptible to civil lawsuits from employees who have been affected.

In response to the September 11, 2001, terrorist attacks on the United States, *terrorist attack fraud schemes* have become a major concern. Consumer groups and members of the public have reported receiving unsolicited e-mail messages that urge people to donate money to the Red Cross or to funds for victims of the attacks and their families. Some of these e-mails are sincere and reputable; others try to encourage donors to leave valuable personal and financial data, such as credit card numbers at Internet Web sites not affiliated with legitimate charitable organizations. Fraudulent telemarketers have been involved in suggesting that a portion of magazine subscriptions will be used to provide disaster recovery and relief.

Mortgage scams use taglines such as "trouble making your home mortgage," "are you facing foreclosure," and so on. Fraudulent assistance with mortgages and false mortgage rates with fees are a growing category of consumer fraud.

The FTC enters Internet, telemarketing, identify theft, and other fraud-related complaints into *Consumer Sentinel*, an online database made available to civil and criminal law enforcement agencies worldwide. In 2005, the most prevalent form of fraud, based on complaints, was identity theft (37%); Internet auctions (12%); foreign money offers (8%); shop-at-home and catalog sales (8%); prizes, sweepstakes, and lotteries (7%); Internet services and computer complaints (5%); business opportunities and work-at-home plans (2%); advance loan and credit protection (2%); and others (17%). The total consumer fraud complaints in 2005 totaled 686,683, up slightly from the previous year.

Fraud Perpetrated by Consumers

Consumer fraud involves intentional deception to derive an unfair economic advantage by an individual or group over an organization. Examples of fraudulent activities include shoplifting, collusion or duplicity, and guile. Collusion typically involves an employee who assists the consumer in fraud. For example, a cashier may not ring up all merchandise or may give an unwarranted discount. Duplicity may involve a consumer staging an accident in a grocery store and then seeking damages against the store for its lack of attention to safety. A consumer may purchase, wear, and then return an item of clothing for a full refund. In other situations, the consumer may ask for a refund by claiming a defect. Although some of these acts warrant legal prosecution, they can be very difficult to prove, and many companies are reluctant to accuse patrons of a crime when there is no way to verify it. Businesses that operate with the "customer is always right" philosophy have found that some consumers will take advantage of this promise and have, therefore, modified return policies to curb unfair use.

Fraud Perpetrated by Organizations

If a consumer believes that a product is not worth the price paid for one reason or another or perhaps because he or she believes the product's benefits have been exaggerated by the seller, there may be reason to investigate the possibility of fraud. For example, although some marketers claim that their creams, pills, special massages, and other techniques can reduce or even eliminate cellulite, most medical experts and dermatologists believe that only exercise and weight loss can reduce the appearance of this undesirable condition. If consumers believe that a firm has not fulfilled its basic economic responsibilities, they may ask for a refund, tell others about their bad experience, discontinue their patronage, contact a consumer agency, and even seek legal redress. Many consumer and government agencies keep track of consumer complaints.

To protect consumers and provide businesses with guidance, a number of laws and regulations have been enacted to ensure that economic responsibility is met in accordance with institutionalized standards. The FTC works to stem unfair and deceptive trade practices through both law enforcement and consumer education. The FTC tries to alert as many consumers as possible to telltale signs of fraud. Working with a variety of partners (e.g., other federal agencies, state and local consumer protection agencies, trade associations, professional organizations, volunteer groups, corporations, the Better Business Bureau, the military, and extension agencies), the FTC's goal is to disseminate information to consumers and businesses to prevent fraud.

Consumer Goods

Consumer goods is a generalized term for any product or service purchased primarily for personal, family, or household uses. Consumer goods such as clothing, foodstuffs, or toys are intended to satisfy human wants and needs through their direct consumption or use. Capital goods, in contrast to consumer goods, are purchased by individuals or organizations to produce other products and services that are sold to or provided for other individuals or organizations. According to their usage, many goods (e.g., cars, telephones, or personal computers) can be categorized either as consumer goods or as capital goods.

The term *consumer* traditionally refers to the ultimate user of products, ideas, and services. Beyond that, the term is also used to characterize the buyer or decision maker. A mother buying semolina pudding for consumption by a small child is often called the consumer although she is not the ultimate user.

Categories of Consumer Goods

Consumer goods can be classified in different ways. Depending on the *frequency and duration of their usage,* the following categories can be distinguished:

- *Durable goods* can be used repeatedly or continuously for an extended period of time. This category comprises, for example, furniture, bicycles, and major household appliances.
- *Semidurable goods* can be used on multiple occasions and have an expected lifetime of about 1 year, such as clothing and footwear.
- *Nondurable goods* are normally consumed in one or a few uses. Groceries, gasoline, and tobacco products belong to this category. In practice, nondurable goods also include a few goods of little value that are used more than once, such as household supplies.

Marketers usually classify consumer goods on the basis of the *type of the buying decision process*. Varying marketing strategies and instruments are used to market products and services belonging to the different classes of goods:

- *Convenience goods* are those that the consumer usually purchases frequently, often on impulse, with little time and effort spent on the buying process. Examples include toothpaste, newspapers, and candy bars. Convenience products usually are low-priced, and marketers place them in many locations to make them readily available for customers.
- *Shopping goods* are less frequently bought consumer products and services that the consumer, in the process of selection and purchase, usually compares carefully on bases such as suitability, quality, price, and style. Examples include furniture, a used car, a better dress, or hair treatment for which the consumer is willing to spend considerable time and effort in gathering information on relevant product attributes. Several retail outlets are customarily visited. Marketers usually distribute their products through fewer outlets but provide deeper sales support to help customers in their comparison efforts.
- *Specialty goods* are high-risk, expensive, and very infrequently bought consumer products and services. They have unique attributes or other characteristics that make them singularly important to the buyer and require an extensive problem-solving decision process. Consumers make a special purchasing effort to buy products such as specific brands and types of cars, designer clothes, and the services of legal specialists. The products in this category need very specialist retailing that will provide a high level of augmented product services, both before and after sale.
- *Unsought goods* are consumer products and services that the consumer either does not know about or knows about but does not normally think of buying. Most major product innovations are unsought until the consumer becomes aware of them through advertising. Examples of unsought goods are life insurance, gravestones, and encyclopedias. To sell these goods, marketers make a lot of advertising, personal selling, and other marketing efforts.

Consumers' Perceptions of Products and Services

Consumers have different *types of product knowledge* that they can use to make purchase decisions. When developing marketing strategies, marketers analyze and focus on different levels of consumers' product knowledge. Consumers can think about *products as bundles of attributes.* Even the simplest products have several attributes (e.g., pencils have varying lead densities, softness of erasers, shapes, and colors). More complex products such as cars and DVD players have many attributes. When deciding which products to buy, consumers usually consider only a few selected product attributes. Consumers often think about *products as bundles of benefits.* Benefits are the desirable consequences consumers seek when buying and using products and brands (e.g., Consumer A wants a toothpaste that whitens the teeth; Consumer B wants a toothpaste that prevents tooth decay). Consumers also assess the personal, symbolic *values* that goods help them to satisfy or achieve.

Consumers can also be aware of a variety of *negative consequences* that might occur when they buy and use products. Several consumers worry about negative ecological consequences such as air pollution of a sporty car with fast acceleration. More and more consumers also are aware of negative social and ethical issues that are related to the production and consumption of many consumer goods such as textiles, footwear, or toys. They have heard, for example, about child labor or other insufficient or even dangerous working conditions in textile factories in the Far East or in Central and South America. Because consumers hesitate to purchase products they associate with negative social performance, firms try to behave in an ethical manner and communicate their ethical conduct to their stakeholders to positively affect product sales and the image of the company. This is one of the reasons for the rise of marketing ethics and the corporate social responsibility or "corporate citizenship" movement. However, although a number of surveys show that consumers care about the ethical performance of a company, only a few consumers actually place ethics at the top of their list in making purchasing decisions. At present, price, quality, and value outweigh ethical criteria in shaping consumer purchase behavior.

CONSUMERISM

The term *consumerism* may be understood using four distinct interpretations. These interpretations are as follows: (1) the movement within society and government to protect consumers from defective or otherwise unsafe products; (2) the demand-side economic theory (usually associated with Keynesian economics), which states that increasing consumption of consumer goods drives economic growth as opposed to encouraging higher rates of saving as a national economic policy; (3) a societal state in which happiness or success is somehow equated with increased consumption and a concomitant creation of limitless demand; and (4) a combination of the second and third meanings in which an emphasis of advertising and marketing is concentrated on the creation of consumers within a culture that embody limitless demand. Each of these meanings of consumerism has specific and important application in the understanding of business and society and, ultimately, in our collective ability to pursue sustainability.

The first meaning of consumerism can be traced to the Latin maxim *caveat emptor* (buyer beware). In the United States, government and societal actions to protect consumers predate the creation of a consumer protection agency within the Department of Agriculture in 1862. As more citizens became dependent on others for food and essential materials for daily life, consumers of these products began to demand standards of quality and a mechanism for the assurance of the safety and wholesomeness of these products. It was not until 1906 that legislation was passed to create the first version of the Food and Drug Administration (FDA). This government agency has grown in importance and purview as the variety of products and dependence on commercial sources for these products has increased. However, the FDA covers a bounded spectrum of consumer goods; in 1914, the Federal Trade Commission was created to regulate other types of goods and services. Still, for many, the true start of modern consumerism dates to the 1960s when consumer activists such as Ralph Nader began to influence public perception, culminating in legislation of, for example, the Consumer Products Safety Act of 1972 and the earlier Motor Safety Act of 1966. Since that time, there have been many other actions to protect consumer interests; for example, producers and service providers have lobbied Congress to reduce restrictions and liability standards on the grounds that it reduces competition and it restricts consumer choice.

The second way that the word consumerism is used is to express the idea that increasing consumer demand can be the engine that drives a healthy national economy. While this is an oversimplification of one element of Keynesian economic theory, it is sufficient for our purpose of understanding this usage of consumerism. The important contrast of this usage of the term *consumerism* with the first usage is that there is a shift away *from* saving money in banks as a national priority, which is an important element of capital formation in early capitalism, *to* an emphasis on consumer spending as a means of economic stimulus and continued economic growth. This manifestation of consumerism as put into national policy is exemplified by the exhortation of President George W. Bush for consumers/citizens to spend the tax surplus that he rebated and/or cut for some taxpayers. The idea was to spend our way out of an economic slowdown after the revaluation of stocks and resultant portfolio deflation of 2000 and in the wake of national trauma in 2001.

The third way that the word consumerism is used expresses the idea that increasing material consumption increases personal and societal well-being. As with the first meaning, this definition reframes an age-old debate stretching back to early Buddhism and Christianity. In both these traditions, material wealth is presented as an obstacle to true happiness and contentedness. In contemporary society, we are confronted with a confluence of issues as we are encouraged to tie happiness and status to ownership of material goods thus creating the pressure for cheap consumer goods. As a result, contemporary societies can experience internal conflict, as, for example, when premium priced goods are marketed to populations that often exist below or at the poverty line. Societies that experience this conflict are then forced to consider the consequences of the demand for cheap and abundant consumer goods in terms of the need for sustainable practices and fair hourly wage rates. The consumer society in the United States of America is confronted with declining employment in the manufacturing sector, including substantial losses of market share in entire industries, such as textiles and consumer electronics, and huge workforce reductions by major companies in the automotive sector (once a bellwether for the health of the entire U.S. economy). In addition, there is a growing national trade imbalance with foreign trading partners, most notably China. Finally, in terms of national and global *sustainability,* some would argue that any practice that advocates unexamined consumption of goods and services renders the concept of sustainability unattainable.

The fourth way that the word consumerism is used embodies the combined mechanism to achieve both the economic goal of fueling growth by ever-increasing demand as well as the cultural state of equating self-worth and happiness with consumption. For some believers of this type of consumerism, sometimes presented as an implied state of grace, goodness is tied to limitless consumption and the ability to practice this behavior. Advertising and marketing executives are assigned the task of quantifying and qualifying the desires of target markets and packaging consumer goods in ways that fit those needs. However, after generations of improved marketing and advertising techniques, some scholars would argue that demand is being created for consumer goods and not actually serving real needs. In this fourth understanding of consumerism, it has been suggested that creating unlimited and diverse demand through media campaigns has made *the act of consumption* the product, instead of providing knowledge about items people need.

Consumer Preferences

Consumer preferences represent the building block for assessing the value of any good or service relative to another. Once determined, a consumer may or may not wish to reveal a willingness to pay for an item given the asking price. Of course, assessing value is not always straightforward for the consumer. It can be an amalgamation of economic, aesthetic, and moral characteristics that are uniquely determined and weighted by each individual consumer. Of course, there may be a tension among those characteristics. As a result, a consumer's preferences could be highly flexible given changes in both his or her and society's outlooks. For example, the thought of purchasing a large sport utility vehicle may satisfy a personal preference for a powerful and spacious vehicle; but, at the same time, it may have to be reconciled with a social preference for reduced petroleum dependency and carbon dioxide emissions.

By reconciling the inherent tension, the consumer could assign a level of satisfaction (technically called marginal utility, *MU*) derived from owning a unit of the item in question. The way these marginal utilities change over different units of an item, as well as across units of other items, establishes the profile of the consumer's preferences. When an item is preferred over others, it is useful to consider this in terms of a range of purchasable items constrained by their prices (*P*) and the purchasing power of the consumer. After all, possessing a preference for an item that is not affordable does not say much about a consumer's actual purchasing patterns.

To understand and model consumer preferences, certain assumptions must be made. An important one is to assume that consumers behave rationally. For example, the assumption of consistency means that if one unit of Item A is preferred to one of B, then the opposite cannot be true at the same point in time. The assumption of transitivity means that if one unit of B is preferred to one unit of C, then the latter could not have been preferred to one unit of A. It is also useful to assume that marginal utility diminishes and the consumer can become satiated as more units of a particular item are purchased. In that case, one cannot say that Item A is *always* preferred to B because it depends on how many units of each the consumer possesses or has consumed. For example, consider a thirsty consumer on a hot day. Given a choice, he or she will likely use a vending machine dispensing sodas before one dispensing candy bars. Being thirsty the consumer will pay for any successive sodas he or she can afford up to and until the thirst is quenched. In effect, the consumer is trading off candy bars for sodas, but this trade-off is becoming less and less pronounced because of diminishing marginal utility for sodas. The first soda to a parched consumer is the one giving the greatest satisfaction and, therefore, worthy of foregoing the greatest amount of candy bars. But as the consumer's thirst is quenched a candy bar will become worthy of foregoing sodas. Of course, preferences for something habitual or compulsive may take a lot of purchases before satiation is reached. This helps explain the behavior of compulsive gamblers, alcoholics, and consumers with large credit card debts.

Since prices are assigned to goods and services, consumers face limits on their purchasing power. Thus, another useful assumption is that consumers wish to spend their disposable income so as to maximize their total satisfaction (technically called total utility) over the range of purchasable items they desire. In this context, it is the marginal utility per dollar spent on the item (i.e., MU/P) that is important because it shows the cost of achieving a level of satisfaction. A consumer will have maximized his or her total utility when the following occurs: $MU_A/P_A = MU_B/P_B = MU_C/P_C = \ldots = MU_n/P_n$. If this were not true, the consumer could reallocate \$1 from one item to another and increase the total utility. In reality, consumers cannot always satisfy the above equation because indivisible units of A, B, C, and so on cannot be broken down into fractions of a unit. However, it should be noticed that by satisfying the equation the consumer is in equilibrium whereby the relative cost of acquiring an extra level of satisfaction for any of the items is equal. For example, consider a consumer at a baseball game who can simultaneously purchase sodas, candy bars, and bags of peanuts over the duration of the game. He or she would first purchase the item providing the highest marginal utility per dollar, then the next, and so on. Because of diminishing marginal utility, the ratio for each item falls as more of it is purchased; and the ratios begin to align according to the equation.

Note that prices indicate a cost for consumption. So if the price of an item were high enough a consumer's preference is constrained. But in terms of the habitual and compulsive items noted above, could price be irrelevant to the decision process? Possibly so, to the extent that disposable income is being spent (or debt is accumulated) to satisfy a preference at the expense of items that would add to one's physical health, family stability, and so on. This raises the question as to when the government ought to intervene and attempt to constrain one's freedom of choice. Certainly, illicit drugs are a case in point.

Since consumer preferences are individualized and subjective, it is controversial to compare levels of satisfaction across consumers. A unit of satisfaction to one consumer cannot readily be compared with that of another. Of course, such comparisons are often made in the political arena; for example, taxing one group to redistribute wealth to another. Does the gain in satisfaction by the subsidized group outweigh the loss in satisfaction by the taxed group? It is hard to say.

Also in the realm of government action and consumer preferences is the concept of a pure public good. In terms of consumption such goods are nonrival and nonexcludible. This means that one person's use in no way affects another's; and it is very costly to try to exclude someone else from enjoying the good if it is already provided to another. The classic example is national defense since all citizens can feel equally protected by the armed forces while it makes no sense to exclude a citizen from protection if thousands around him want the protection. Of course, pure public goods cannot be provided in the marketplace because of the incentive the consumer has to free ride. A free rider could choose not to reveal a true preference for the good knowing that the others will and, in effect, pay for the joint consumption of the public good. Of course, if enough consumers decide to free ride the good may not be provided at all. To overcome this problem, the government simply provides the good to all and taxes all consumers using some politically agreed-to tax formula.

Do consumers compare their levels of satisfaction to others? Such interpersonal utility comparisons do take place in the real world but they are difficult to model. For example, Consumer 1 may feel better-off with a $10 prize; but he may feel less so (possibly worse off) if those close to him won prizes of, say, $100. Consumer 1's preferences are dependent in some way on others whose are, in turn, dependent on his. An example of such interdependence is the phenomenon that Thorstein Veblen called conspicuous consumption. The consumer's preference for an item is determined not just in its personal use but in how its ownership is perceived by others.

Also difficult is an attempt to aggregate preferences in some way so as to derive a representation of the collective preferences of all consumers. The result, if achieved, is called a social welfare function. Such a construct would be useful in political decision making (but its existence is tenuous). In fact, Kenneth Arrow developed a theorem showing the impossibility of constructing a social welfare function short of all consumers being identical or having them acquiesce their preferences to an authority figure who would make their decisions for them.

Aggregating preferences assumes that levels of satisfaction can be examined in a cardinal sense; that is, a unit of satisfaction for Consumer 1 always equals a certain number of units for Consumer 2. But even ordinal problems can arise. For example, rational voters each having transitivity across their preference ordering can, under real circumstances, exhibit collective intransitivity that leads to uncertain collective choices. This so-called voters' paradox, as noted by Arrow, makes for an unstable environment for politicians when they try to assess the needs of consumers in their jurisdiction.

Consumer preferences represent an attitude while actually making a choice involves an action. Preferences may be honed over time while, often times, choices have to be made quickly. As such, seemingly irrational decision making may simply reflect the constraints the consumer faces. Preferences, in that context, are taken as intrinsic but they are subject to further learning and evolution.

Consumer Product Safety Commission

The Consumer Product Safety Commission (CPSC) was created by the Consumer Product Safety Act of 1972 to protect the public against unreasonable risks of injury associated with a wide range of consumer products. The rationale for this act came from a national commission study on product safety, which found that 20 million Americans were injured severely enough each year because of product-related accidents to require medical treatment. Some 110,000 of these people were permanently disabled and 30,000 were killed at a cost to the country of more than $5.5 billion annually. Thus, a crisis situation was believed to exist that demanded government attention, and the solution was direct regulation.

From an ethical point of view, it was believed that market forces alone did not assure that the public was protected adequately from unsafe and dangerous products. Under competitive pressures, business was likely to slight safety concerns and lessen its adherence to the principle of "do no harm" with regard to the products it put on the market. As products grew more sophisticated, consumers were less likely to know about the risks these products might pose to their health and welfare. Private organizations, such as Consumer Reports, which tested products, were not able to provide enough protection, and thus, it is was believed necessary to create a government agency with the expertise to fulfill this function.

The CPSC is a five-member commission headquartered in Washington, D.C., with several field offices and testing laboratories around the country. The commission has jurisdiction over some 15,000 types of consumer products ranging from automatic-drip coffee makers to toys to lawn mowers. The only consumer products not covered by the act are foods, drugs, cosmetics, automobiles, firearms, tobacco, boats, pesticides, and aircraft, all of which are regulated by other agencies. The CPSC was also given responsibility for enforcing specific consumer legislation including the Flammable Fabrics Act, the Refrigerator Safety Act, the Hazardous Substances Act, and the Poison Prevention Packaging Act.

The CPSC has the authority and responsibility to (1) develop and enforce uniform safety standards governing the design, construction, contents, performance, and labeling of consumer products under its jurisdiction; (2) develop voluntary standards with industry cooperation; (3) ban products if no feasible standard would adequately protect the public; (4) initiate the recall of products deemed to be hazardous or arranging for their repair; (5) conduct research on potential product hazards; and (6) inform and educate consumers through the media, state and local governments, and private organizations and by responding to consumer inquiries.

Regarding its enforcement powers, the commission can order a manufacturer, wholesaler, distributor, or retailer to recall, repair, or replace any product that it determines to be unreasonably risky in the course of its research. Where the action is deemed to be justified because of the hazard involved, the commission can simply ban the product from the market. In addition, the act also requires manufacturers, wholesalers, distributors, or retailers to report the existence of any substantial hazard that is known within 24 hours of discovery. The commission can then demand corrective action including refunds, recalls, public hearings, and reimbursement of buyers for expenses they incur in the process.

The Consumer Product Safety Amendments of 1981 changed the rule-making procedures of the commission by placing more emphasis on voluntary standards. An advanced notice of proposed rule making has to invite the development of a voluntary standard. The commission must then assist industry in developing a voluntary standard, and if it appears likely that this standard will eliminate or adequately reduce the risk of injury, and it is likely that there will be substantial compliance with the standard, the CPSC must terminate its mandatory rule-making effort and defer to the voluntary standard. This provision, along with other provisions in the amendments, severely restricted the agency's rule-making authority.

In creating the agency, Congress emphasized the importance of information sharing; thus, the agency maintains a National Injury Information Clearinghouse that provides injury data from electronic data sources and disseminates statistics and information related to the prevention of death and injury associated with consumer products. The Clearinghouse responds to 6,000 requests for information of this nature from the American public each year, and information specialists search agency databases to tailor responses to each customer's needs.

The CPSC gathers data about product-related injuries through a National Electronic Injury Surveillance System (NEISS). This system consists of a sample of hospitals that are statistically representative of hospital emergency rooms nationwide. Data are collected on a broad range of injury-related issues, covering hundreds of product categories. From these data, estimates can be made of the numbers of injuries associated with consumer products, and national estimates of the number and severity of product-related injuries can be provided. In 1966, the CPSC introduced a publication called the *Consumer Product Safety Review,* which includes national injury data from NEISS hospitals, studies of emerging and continuing hazards, and important recall and correction action activities.

During his first term of office, President George W. Bush asked all federal agencies to give a high priority to their communications with the public and improve the ability of agencies to share information with each other to enhance public security. To comply with this request and provide better service in alerting the American people to unsafe, hazardous, or defective products, six federal agencies with vastly different jurisdictions joined together to create www.recalls.gov, a Web site that provides links to all federal agencies with statutory authority to issue recalls. This includes the CPSC, the Food and Drug Administration, the Environmental Protection Agency, the U.S. Coast Guard, the National Highway Traffic Safety Administration, and the U.S. Department of Agriculture.

In 2005, the CPSC announced an agreement with the Canadian government aimed at further improving consumer safety in both U.S. and Canadian marketplaces. The agreement calls for both countries to share inspection and laboratory results when it is appropriate and for increased harmonization of both existing and prospective safety standards and the exchange of more information related to safety research and other findings. When a product violates a Canadian safety standard or poses a danger to Canadian consumers, Health Canada agreed to provide advance notification to the CPSC if the product is intended for export to the United States. Canadian officials will inform the CPSC of the content of the shipment and intended importer so the agency can take appropriate steps to ensure protection of American consumers.

Consumer Protection Legislation

Consumer protection regulation refers to government involvement in the marketplace to protect consumers in commercial transactions from potential harm caused by businesses. The potential harm may arise from the use of unreliable or unsafe products, deceptive advertising, asymmetry of knowledge of products and services, and privacy intrusion in the Internet age. In the United States, the federal and state governments took important steps in consumer protection, especially in the late 1960s and 1970s. Before this, the ancient rule of *caveat emptor*, or "let the buyer beware," generally guided consumer transactions. Although consumer protection regulation did exist (e.g., the 1906 Food and Drug Act, the creation of Federal Trade Commission [FTC] in 1914), it was limited and weakly enforced.

The surge of government protection regulation in the 1960s and 1970s derives from a strong consumer movement and the general politics of the time. The 1980s, however, saw a decrease in support for consumer protection regulation. The Reagan administration cut budgets and staffing sharply and was later forced to restore much of the cuts in support for consumer protection regulation due to regulatory failures. Although the Clinton administration was more aggressively involved in consumer regulation in the 1990s, there have been very sharp cuts during the Bush years in the 2000s. The current consumer protection regulation has addressed issues related to the digital age as well, such as consumer privacy.

Both the federal and state governments are responsible for consumer protection regulation. The key federal agencies involved in consumer regulation include cross-industry regulatory agencies, such as the FTC and the Consumer Product Safety Commission (CPSC), and industry-specific agencies, such as the Food and Drug Administration (FDA), the National Highway Traffic Safety Administration (NHTSA), and the U.S. Department of Agriculture (USDA). At the state level, regulatory responsibilities reside with the state attorney general and a number of state agencies that promulgate regulations. However, for reasons such as politics of the state and budget constraints, all states are not equally forceful in consumer regulation. In some states, the attorney general actively defends consumer interests; in others, she of he protects local industries, often accepting political contributions from them. In other words, state laws place different burdens on the state attorney general to act as a defender of consumer interests, investigating and bringing cases against firms under state consumer protection statues. In states that lack effective state enforcement of consumer laws, consumers often act as "a private attorney general" by resorting to tort laws and suing businesses for incurring harms or injuries. Although state regulation remains crucial, the focus here is on consumer protection regulation at the federal level. The following part discusses the two aspects of consumer protection regulation: the need for consumer protection and the areas of consumer protection.

The Need for Consumer Protection

The Argument Against Government Regulation

Though consumer protection regulation is widely regarded as necessary for the well-being of consumers, some scholars take a different stance. Milton Friedman, for example, argues that government legislation on consumer protection is, in general, an intervention in the free market system and that an efficient market system without fraud, deceit, or coercion will take care of consumer interests. He maintains that government regulation on consumer protection disrupts the free market system in various ways: suppressing innovation, limiting consumer choices, and raising product prices. Such intervention, according to Friedman, can only result in market inefficiency. For example, the FDA, a government regulatory agency, Friedman maintains, does more harm than good. Friedman asserts that the FDA can make two types of errors: (1) approves a drug that has harmful effects on patients and (2) refuses or delays approving a drug that can save the lives of millions of people. While the first error, according to Friedman, is traceable and can be documented, the second worries him the most. Friedman warns that the nature of the bureaucracy is such that even the best-intentioned and most benevolent individuals are led to reject a drug that has the slightest possibility of harmful side effects.

The Argument for Government Regulation

Friedman's arguments against government regulation derive from his faith in an efficient market system. With the tremendous power that corporations hold today, critics challenge the efficiency of the marketplace. Stone, for instance, argues that although the market generally allocates resources efficiently, it does not solve all the problems in the system. Very often, the consumer does not have perfect information to determine whether she of he may be injured by a product. Elbing and Elbing, for another example, also point out that the marketplace is dominated by business; consequently, consumer power is weak, compared with the power of business. The following demonstrates some of the issues in the marketplace that call for consumer protection.

Unsafe Products

The issue of product safety involves a wide range of industries. For example, Ralph Nader's exposure of the unsafe features of the Corvair in 1965 illustrates the need for government to regulate the automobile industry for safety reasons. In addition, the extensive use of food additives and preservatives has created potential public health hazards. The risk of pesticide residues is another source of concern. Recently, biotechnological companies, such as Monsanto, have introduced genetically modified foods to developing countries before thorough knowledge of their side effects has been established. In short, the hazards that a wide range of consumer products pose to human safety and health compel government regulation.

Deceptive Advertising

A deceptive advertisement is one that includes a distortion or omission about a product or service that misleads a consumer. Deceptive advertising causes consumers to make purchasing decisions based on false beliefs about the nature of the products. It hinders the flow of information in the marketplace. For example, in the 1940s, R. J. Reynolds, a tobacco company, with the knowledge of harmful effects of smoking on health, declared to consumers that "More Doctors Smoke Camels." In the 1950s, Lorillard Tobacco Company claimed that the micronite filter in Kent Cigarettes was so safe and effective that it had been selected to help filter the air in hospital operating rooms. The deceptive advertising misled people to consume a hazardous product that often resulted in diseases and deaths.

Asymmetry of Information

In light of modern technology, many products are becoming highly complex. Some products, such as Intel processing chips, are hidden inside already complex products such as computers so that consumers cannot even see them. Consumers, no matter how technologically savvy they are, have difficulty judging the merit of some products in today's high-tech society. In other words, the complexity of products also obscures adequate information in the marketplace. This asymmetry of information can play into the hands of opportunistic sellers. In addition, the specialization of services also hinders consumers from being clearly informed about the services they receive. The specialized knowledge of professions, such as attorneys, dentists, and financial and insurance brokers, can baffle a consumer seeking services in these areas.

Privacy Intrusion

In the Internet age, consumer privacy has become more vulnerable. Whenever one uses a credit card online or surfs or shops on the Internet, one risks revealing unique personal information—credit card numbers, birth date, hobbies, and purchasing characteristics and preferences. New technology allows businesses to gather personal data about their customers; however, people, in general, are not comfortable with this information collection, especially when they do not know who is collecting the information and what they are going to do with it.

Areas of Consumer Protection

Consumer protection regulation seeks to fulfill several goals. Owing to the potential existence of unsafe products, one area of consumer protection is *hazard avoidance.* The major method of regulating potential hazardous products has been the issuance of standards, which are typically used to provide necessary information to consumers. The CPSC plays a key role in protecting consumers from harms caused by unsafe products. It regulates the manufacture and sale of more than 15,000 types of products, including toys, swimming pools, and consumer electronic products. Furthermore, individual industry agencies are also responsible for setting industry-specific safety standards. For example, the NHTSA sets motor vehicle standards; the FDA sets safety standards for food, drugs, food additives, cosmetics, and medical devices; and the USDA sets guidelines regarding the labeling of genetically modified foods.

To redress harms that have been caused, consumers most often resort to product-liability torts for cases involving personal injury or death from product use. Product liability refers to burden of responsibility on the supplier side for damage caused through consumers' use of a product. Damage is attributed to any or all parties throughout the manufacturing and the distribution chain. Strict liability is sometimes at work when it comes to product liability: The manufacturer or supplier is held solely responsible for harm done to a consumer through the use of a product, even if the consumer was negligent in using the product. For example, McDonald's huge settlement with an elderly New Mexico woman in 1994, who spilled McDonald's hot coffee in her lap and was severely burned, exemplifies the extent of strict liability. In the late 1990s, about 20% of noncriminal cases in the United States were product liability cases. The average settlement in these cases was $141,000.

The second area of government regulation is *information disclosure*, addressing problems raised by deceptive advertising and information asymmetry, as mentioned in the previous section. Business can lure consumers using false advertising, bait-and-switch tactics, and breaches of warranty claims. The FTC was created, in part, to halt such practices. The Truth in Lending Act of 1968, for example, specifies conditions for advertising credit plans. In addition to creating laws against deceptive advertising, the FTC seeks remedies against violators through measures such as cease-and-desist orders, temporary restraining orders, or civil action suits, depending on how public interest is best served.

Furthermore, industry-specific agencies also set standards for information disclosure for products within a particular industry. For example, the FDA requires that food and beverage labels show more complete information. In 2003, the FDA required that all food items list the amount of trans fat, a potential contributor to heart disease. Also, manufacturers of tobacco products and alcoholic beverages are required to display health-warning labels. Automobiles are required to display a breakdown of price, and potentially hazardous home appliances and toys are required to carry a warning label. Although consumers today in some areas are far from having access to perfect information, government intervention in information disclosure has, in general, enabled consumers to make more informed purchasing decisions.

The third area of government regulation is *consumer privacy protection*. Privacy is a constitutional right protected by the Fourteenth Amendment. The FTC plays the role of enforcing privacy laws in the marketplace. Privacy laws include the Privacy Act of 1974, the Gramm-Leach-Bliley Act of 1999, the Fair Credit Reporting Act of 1970, and the Children's Online Privacy Protection Act of 1998.

The Privacy Act of 1974 prevents personal information held by the federal government from unauthorized disclosure. The Gramm-Leach-Bliley Act of 1999 (also known as Financial Modernization Act of 1999) protects consumers' personal financial information from misuse by financial institutions. The Fair Credit Reporting Act of 1970 limits access of personal financial information collected by consumer reporting agencies. A recent amendment in 2003 to the Federal Fair Credit Reporting Act has provided consumers access to a free copy of a credit report from each of the nationwide consumer reporting companies once every 12 months. Finally, The Children's Online Privacy Protection Act of 1998 places limits on information collection of children under 13 years of age. Although laws exist that protects children's privacy, online consumer privacy is generally inadequately protected. Consumer information, such as age, name, demographics, e-mail address, and financial information, can easily be collected through computer cookies.

Other privacy regulations include the national "do-not-call" registry and the Can-Spam Act of 2003. The FTC's do-not-call registry, established in 2003, was designed to put a stop to the bombardment of unsolicited telemarketing calls to households. The Can-Spam Act of 2003 (Controlling the Assault of Non-Solicited Pornography and Marketing Act) addressed the issue of unsolicited bulk e-mails. The act specified certain accountability on commercial senders. For example, it requires that the header information and the subject line cannot be misleading and that the subject line must match the content of the message. The Can-Spam Act also prescribed opt-out methods for receivers. Violators of the provisions can be fined up to $11,000 per violation. The FTC and the Department of Justice are the federal agencies that enforce this law.

In sum, consumer protection regulation is generally grounded in issues related to hazard avoidance, information disclosure, and privacy protection. Consumer protection regulation is an ongoing process and evolves over time; it adapts to the economic, technological, political, and social forces.

Consumer Rights

The subject of consumer rights historically covers two related areas: issues related to the actual products and services that a company sells to consumers and corporate business practices that directly affect consumers. As part of the evolution of consumer rights and concerns, a third area, spawned in large part by the growth in information processing industries and integrated computing networks, has emerged. This area concerns the use of information *about* the consumer, including privacy and security of that information. While there is little legislation establishing actual rights of consumers, there is a large body of law dealing with a range of consumer issues, which taken together are often referred to as "consumer protection."

At its core, a discussion of consumer rights implies that the interactions between consumers and corporations will naturally tend to be to the advantage of the corporation (due not only to size but also due to political, economic, and social influence) and so legal and political means should be used to equalize any imbalance of power. (More bluntly, many laws passed to protect consumers assume that the consumer is either unable or incapable of protecting himself or herself, due to the complex nature of business or products, and must be protected in the most basic sense of the word.) The key assumption of most consumer rights initiatives is that, absent any restraining influences, corporations will make decisions that ignore the welfare of consumers and maximize the assumed advantages of the supplier. A secondary assumption is that the consumer will (1) usually have less information than a business and (2) will be more easily confused by business complexities and, therefore, must be protected from businesses that will take advantage of these informational or experiential asymmetries. (Note that the advent of the Internet has greatly reduced the information disparity between consumers and suppliers, as well as offering a significant increase in resources that consumers can use to defend their rights. Consumer rights advocates believe information is power and that information transparency is critical to producing informed consumers.)

Most of the societal and legislative initiatives over the years either prohibit what is considered to be anticonsumer behavior or provide tools to consumers by which they may force companies to address individual (or sometimes group) grievances related to products or business practices. Anticonsumer behavior has historically included clear-cut examples such as price-fixing and price-gouging, deceptive marketing and sales practices, production and distribution of dangerous products (including pharmaceuticals and medical devices), and failure to deliver promised products or services. Less obvious but no less critical to the consumer are more recent developments in the consumer-business relationship, such as information privacy (especially in health care matters), unsolicited sales and marketing, and refusal to provide services or nondiscriminatory prices to a particular class of consumer.

While there is a case to be made that the Hippocratic Oath (the traditional oath that physicians take that binds them to keep the best interests of the patient uppermost in their considerations) embodied the first consumer protection principles in history, arguably the first U.S. legislation intended to protect the consumer was the Sherman Antitrust Act, signed by President Benjamin Harrison in 1890. The act declared that "Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is declared to be illegal." Often assumed to restrict monopolies, the act was targeted not at the size or form of corporations or trusts but at "restraint of trade," which would ultimately lead to artificially high prices for the consumer. Free markets were deemed better for the consumer; anything that prevented free markets was, therefore, bad and should be outlawed.

Following the enactment of the Sherman Antitrust Act, just what was allowed and forbidden by the law remained open to interpretation, as the U.S. economy evolved and the size of corporations allowed greater market control by a few companies or individuals. Such questions were debated and refined over the ensuing 24 years, particularly during President Theodore Roosevelt's administration. Roosevelt believed the solution lay in a commission that would regulate business practices and established the Bureau of Corporations in 1903. In 1914, Woodrow Wilson signed the Federal Trade Commission and Clayton acts. These acts established the Federal Trade Commission (FTC) as an investigative and enforcement body, creating the first government agency with the power to protect consumers, and explicitly outlawed monopolies, respectively. Since 1914, Congress has continued to expand the reach and powers of the FTC, allowing the FTC to address consumer issues as diverse as defining deceptive or unfair practices, establishing rules for granting credit, and regulating telemarketing practices.

The modern era of consumer rights traces to March 15, 1962, when President John F. Kennedy sent a special message to Congress containing his statement of the four basic consumer rights that the government should work to protect and promote:

1. *The right to safety:* protection against hazardous goods
2. *The right to be informed:* the right to access information the consumer needs to make an informed choice and protection against fraud and deceit
3. *The right to choose:* access to a variety of products and fair prices and protection against business practices that reduce competition
4. *The right to be heard:* the guarantee that consumer concerns will be heard and fully considered by the government

Since Kennedy's message, these rights have been added to by various groups worldwide, most notably the United Nations, to include the following:

- *The right to consumer education:* early and lifelong education about the consumer marketplace and the laws supporting consumer rights

- *The right to consumer redress:* the right to be compensated for misrepresented or unacceptable goods and services and the responsibility to actively pursue such redress
- *The right to a healthy and sustainable environment:* the right to live and work in a safe and healthy environment that supports a life of dignity
- *The right to basic needs:* access to goods and services necessary for survival throughout societies
- *The right to access:* fair and equitable distribution of goods and services throughout society

Kennedy's main point was clear and has been echoed by many others: From an ethical perspective, consumers have certain rights that exist outside of government policy and law, and it is the government's job to ensure these rights are not infringed on in the marketplace. In the ensuing years, the federal government and state legislatures worked to implement laws and policies that institutionalized those rights.

Inherent in Kennedy's message is a more subtle requirement that the consumer, and the public as a whole, have a responsibility to *proactively* use consumer information, education, and rights to not only make informed decisions but also to actively work to be sure that government and industry act in the consumer's interest. The classic example of citizen responsibility in this regard is Ralph Nader and his group of young activists known as Nader's Raiders. Arguably the beginning of the modern consumer rights movement, Nader began in 1965 by taking on the auto industry over the alleged safety problems of GM's Corvair automobile. His activities soon expanded to include waste in government, including monitoring and exposing government agencies who were failing to effectively perform their duties to protect consumers.

While there are many laws at the federal and state levels aimed at protecting consumers by legislating against harmful business practices, a few are worthy of special note as examples of the philosophy of the government's role in protecting consumers. The Truth in Lending Act was originally enacted in 1968 and revised in 1980. It requires complete disclosure to consumers of all costs involved during the life of a credit transaction, including loans and leases, and demands explicit and clear statement of the conditions under which credit is granted. In addition, the law provides legal recourse for consumers against lenders who violate the terms of the act. The act was in response to predatory lending and leasing arrangements, deceptive credit marketing, and discriminatory practices in granting credit based on nonfinancial factors.

The Fair Credit Reporting Act (FCRA) passed in 1970 regulates the way that consumer credit information is collected, distributed, and reported. Prior to the passage of this law, major credit bureaus operated largely independently of oversight or even cursory review as regards to accuracy, privacy, security, use, and dissemination of consumer's credit information. Consumers for their part had no recourse against incorrect information provided by credit unions or the resulting burdens on their financial dealings. In the most egregious cases, consumers could be denied credit based on credit reports to which they had no access and were not even aware were the basis for the denial. In response to growing evidence of incorrect credit reporting, information and privacy abuses, and pressure from consumer advocates, Congress passed the FCRA to provide tools to consumers for dealing with credit reporting issues and to legislate how credit bureaus would conduct their businesses relative to consumers. The FCRA requires credit bureaus to provide consumers with the information in their files and to take all reasonable steps to be sure the information is complete and accurate. It also requires that credit bureaus undertake "reasonable investigations" of any information disputed by a consumer and inform the consumer of the disposition of that dispute.

In 2003, the FCRA was updated through the Fair and Accurate Credit Transaction Act (FACTA). As part of the FACTA, consumers are entitled to a free credit report every 12 months, from each of the three major credit reporting agencies (Equifax, Experian, and Transunion), available through an FTC Web site established for that purpose. In addition, consumers are entitled to notification when credit is denied based on negative information in a credit report and at that point are also entitled to a free credit report. FACTA also required the FTC create a "Summary of Rights for Consumers," which would be supplied with any credit report provided to a consumer, detailing the specific consumer rights and credit bureau responsibilities provided by FACTA.

Combined with the FCRA, the Fair Debt Collection Practices Act (FDCPA) provides the major portion of consumer credit rights. Passed in 1978, the FDCPA was in response to serious abuses by the debt collection industry that included home and workplace harassment by phone, misrepresentation, threats of arrest or legal action that are outside the scope of debt collection and therefore not credible, and reporting false information to credit bureaus. The FDCPA regulates the means by which third-party debt collectors may do business, details the rights of consumers when dealing with such agencies, and provides legal recourse for consumers against abusive or non-FDCPA-compliant debt collectors.

The Telephone Consumer Protection Act of 1991 was passed to limit the number of unsolicited phone calls consumers receive at their homes. Congress recognized that as well as being a nuisance to consumers, such calls were often the vehicle by which unscrupulous business operators and fraudsters preyed on the public. The act limits the entities that may call a consumer's house to those with which the consumer has an existing business relationship (although "existing" is loosely defined) and also prohibits calls from entities with an existing business relationship whom the consumer has specifically asked to cease calling. The act also required the FTC and the Federal Communications Commission to establish a National Do-Not-Call registry, containing the numbers of all consumers who do not wish to be subject to uninvited telephone solicitations. The registry requires consumers to proactively register phone numbers and is one of the laws that provides the tools for consumers to use to protect themselves.

The Health Insurance Portability and Accountability Act of 1996 (HIPAA) is intended to do for a consumer's health information what other laws have done for financial information.

HIPAA specifies a set of "patient rights" regarding access and dissemination of medical and health information and, in many ways, parallels the protections of financial data provided by the FCRA and the FACTA. As with the other laws, it also provides for consumer redress in cases where the law is violated.

HIPAA also signaled a fundamental shift in how personal data of all kinds, not just financial data, is to be considered by businesses. HIPAA established the rights of people to control access to information about themselves and placed the burden of information security and protecting confidentiality of personal information clearly on those who store and access it. Personal information is now a "thing," associated with a person, to be protected rather than information to be collected and used for the benefit of the business.

All these laws serve to protect consumers by leveling the playing field in complementary ways. It is clearly the intent of the government to force businesses to become more transparent in their dealings with consumers, as well as allowing consumers to dictate how they will interact with businesses. In addition, the government has chosen to specify what kinds of information must be given to the consumer, how it is to be presented, and how information about the consumer may or may not be disseminated. Perhaps most critically, these laws provide specific redress for the consumer when businesses violate the laws. Again, the assumption is that information is power, if put in the hands of the consumer, and short of being forced to act in a fair manner, businesses will withhold, misuse, or misrepresent information. The new assumption in these laws, though, is that given the proper tools, consumers can protect themselves, as well as other consumers, through penalties and processes specified by these laws.

While the aforementioned laws deal with protecting consumers from harmful business practices, there is also a "right" or expectation that businesses will not sell *products* that are harmful to consumers. Toward this end, Congress established the Consumer Product Safety Commission (CPSC) by passing the Consumer Product Safety Act of 1972. Again, Congress posited a fundamental inability of the consumer to understand the implications of using a product, finding that "complexities of consumer products and the diverse nature and abilities of consumers using them frequently result in an inability of users to anticipate risks and to safeguard themselves adequately." In the language of the act, the CPSC exists

1. to protect the public against unreasonable risks of injury associated with consumer products;
2. to assist consumers in evaluating the comparative safety of consumer products;
3. to develop uniform safety standards for consumer products and to minimize conflicting state and local regulations; and
4. to promote research and investigation into the causes and prevention of product-related deaths, illnesses, and injuries.

The other laws mentioned previously are somewhat passive in their protections, establishing guidelines for businesses and providing tools for consumers. The CPSC, however, was established as an active agency, charged with "protecting the public," "assisting consumers," and "investigating causes and prevention of injuries." When commerce and business practices are concerned, the consumer is given assistance in protecting his or her "rights." When injury and death are possible, the government is expected to not only assist but also to proactively work to protect the consumer.

Consumer's Bill of Rights

The idea of a Consumer Bill of Rights grew out of the consumer movement that began in the 1960s as a protest movement of consumers and their advocates against what they saw as unfair, discriminatory, and arbitrary treatment by business organizations. This movement involved a number of activities that were designed to protect consumers from a wide range of practices that infringed on the rights that consumers were believed to possess in the marketplace. The time was ripe for a new consumer movement that was concerned with a range of issues that grew out of a highly affluent population, a technologically sophisticated marketplace, and a society that in general had high expectations and aspirations for the fulfillment of human needs.

This modern consumer movement had no particular focus as did previous movements of this kind, but was concerned about a variety of issues related to the marketplace including product safety, quality of products, reliability and product obsolescence, truth in advertising and packaging, uses of credit, completeness of information, product warranties, product liability, and other issues.

Eight Consumer Rights

Former President John F. Kennedy was the first president to enunciate four rights of consumers that he believed needed protection in the marketplace: the right to safety, the right to a choice, the right to know, and the right to be heard. These rights were supported by other presidents. To these four several other rights of later vintage were added by consumer advocates to make a complete consumer bill of rights.

- *The right to safety:* The consumer has a right to be protected from dangerous products that might cause injury of illness as well as from the thoughtless actions of other consumers.
- *The right to a choice:* The consumer has the right to be able to select products from a range of alternatives offered by competing firms.
- *The right to know:* The consumer must have access to readily available, relevant, and accurate information to use in making purchase decisions.
- *The right to be heard:* The consumer must be able to find someone who will respond to legitimate complaints about abuses taking place in the market and products that do not meet expectations.
- *The right to recourse and redress:* The consumer has a right to full compensation for injuries or damages suffered as a result of unsafe products or abuses in the marketplace.
- *The right to full value:* The consumer has a right to expect a product to perform as advertised and meet the expectations that were created so that the consumer is getting full value for the money spent.
- *The right to education:* Consumers must have access to educational programs that help them understand and use the information available in the marketplace to make rational purchase decisions.
- *The right to representation and participation:* Consumer interests must be represented on policy-making bodies that deal with issues related to the marketplace.

These rights were believed to need government legislation and regulation to be protected adequately as the marketplace itself did not provide enough incentives for business to respect these rights in all their actions related to consumers. Congress responded with a host of legislation in the 1960s and 1970s that was directed at one or more of these rights of consumers. New regulatory agencies such as the Consumer Products Commission were created and new powers given to existing agencies such as the Food and Drug Administration and the Federal Trade Commission. These rights have been of continuing concern in government as new issues related to secondhand smoke and safety issues about drugs and other products surfaced.

Expanding the Idea of Consumer Rights

The idea of a consumer bill of rights caught on in other areas over the years as many organizations formulated such a set of rights in relation to specific areas of concern. For example, in 1997, then President Bill Clinton appointed an Advisory Commission on Consumer Protection and Quality in the Health Care Industry that as part of its work drafted a consumer bill of rights to protect consumers and workers in the health care system. This bill of rights covered eight areas of consumer rights and responsibilities including information disclosure, choice of providers and plans, access to emergency services, participation in treatment decisions, respect and nondiscrimination, confidentiality of health information, complaints and appeals, and consumer responsibilities.

In 1999, the Federal Communication Commission launched a campaign for a Cable Consumer Bill of Rights to let consumers know that even though the agency's direct role in regulating cable rates was ending consumers still had a number of rights regarding their cable service. This campaign was designed to educate consumers about their options after direct regulation ended. The proposal covered what consumers should expect from their cable company, local government, and the Federal Communications Commission itself, along with additional expectations. This Bill of Rights was expected to help consumers protect their rights in a deregulated environment.

An organization called Digital Consumer proposed a Consumer Technology Bill of Rights to what they believed was an erosion of the rights of consumers to use digital content that was becoming more and more available. The California Department of Consumer Affairs proposed a Bill of Rights for consumers of certain types of telephone services within the state. Finally, in January 2000, Fannie Mae announced a "Mortgage Consumer Bill of Rights" to help advance consumer protections for more home buyers in America. This bill of rights was touted as the cornerstone of the agency's American Dream Commitment, which was meant to increase homeownership rates by lowering costs, removing barriers to homeownership, and serving families that are overcharged, underserved, and overlooked by mainstream housing finance. Thus, the idea of a consumer bill of rights thus seems to be alive and well in American society.

—Rogene A. Buchholz

Consumer Sovereignty

Consumer sovereignty is an economic concept with roots in classical economics that argues that consumers are the primary force for determining the scale and scope for the production of goods and the provision of services in the economy, through their power to choose whether or not to consume goods and services.

Theoretical Background

Consumer sovereignty is a classical economic concept that appears at least as early as Adam Smith's *An Inquiry Into the Nature and Causes of the Wealth of Nations.* It imputes to consumers the primary, if not sole, discretion for assessing the marginal costs and benefits of their prospective consumption of goods and services. This decision-making role determines the scale and scope of the production and provision of these goods and services, respectively. The concept continues in the neoclassical economic tradition, with both descriptive and prescriptive dimensions. In its descriptive dimension, consumer sovereignty refers to the capacity for consumers to discern and to maximize their own preferences without interference and to drive the resulting production and provision of goods and services in the economy. It joins with the following propositions to form a theoretical matrix in support of the free market:

- Producers are profit maximizers.
- There are no barriers to entry and exit from the market.
- There is perfect information, that is, true information about market conditions is available without limitation to direct and indirect market participants.
- Economic agents act atomistically, that is, as individuals and not in coordination with one another.

In its prescriptive dimension, the concept of consumer sovereignty is the economic analog to the political principle of noninterference, which John Stuart Mill defends in *On Liberty.* Because in the eyes of some supporters of the free market the concept of consumer sovereignty descriptively is foundational for the logic and operational viability of markets, it has been an accessible and attractive concept for prescriptive arguments in favor of market allocations that involve consumers and consumer choice.

Criticisms of the Concept of Consumer Sovereignty

However, the concept has faced challenges in the recent evolution of economic theory and policy, even from successors to the classical and neoclassical traditions out of which it arose. One criticism is that the conflation of the political concept of sovereignty into an economic concept is logically defective, in that it supports the problematic position that consumers can or should impose preferences in a market that ostensibly is free of coercion. The concept of consumer sovereignty as a principle for socioeconomic policy lacks a satisfactory account of why other market actors—or other stakeholders in general—would or should be less sovereign than consumers.

A second criticism has to do with the ethical vindication of the concept in its ostensible prescriptive dimension, that is, whether it is capable of sustaining a valid moral claim—or policy argument—on its own. To the extent that one invokes the concept of consumer sovereignty normatively, that is, to justify an ethical claim, it functions as a minor premise that furnishes factual or technical content. For consumer sovereignty to be normatively intelligible and viable as a principle for action requires that one underwrite it with a substantive and distinct *moral* principle as a major premise, for example, the principle of utility or an articulable account of a moral right. Otherwise, the argument dissipates into a purely descriptive (economic) construct and falls short of an authentic ethical justification.

The economic concept of consumer sovereignty bears a superficial similarity to the normative concept of moral autonomy, though it remains logically distinct from it. Without an independent ethical justification for consumer sovereignty, the normative claims for the concept would rest merely on appeals to the *preferences* of consumers themselves and, by extension, of producers and providers of goods and services. This would leave open the question of whether these preferences otherwise would be consistent with *moral* principles that most members of society share, including justice, rights, respect for persons, and autonomy itself. The absence of such normative grounding would call into question the justifiability and intelligibility of ethical guidelines and policies that ostensibly safeguard consumer interests, for example, product safety, truth in advertising, and product warranty and support.

A third criticism of the concept of consumer sovereignty emerges when one considers the effects of market failure or preemption. For example, consumers simply may not have accurate or sufficient information to form their preferences, or they might be liable to form different preferences with additional information. These failures may be due to breakdowns in communication of information through market processes ("signaling problems"). Such market dysfunctions may reflect (1) limitations in the ability of consumers to perceive, absorb, and analyze information ("bounded rationality"); (2) constraints on consumers' responses to changing market conditions due to their relatively fixed investments in skills, relationships, and infrastructure ("asset specificity"); and/or (3) deceptive, manipulative behavior by other market participants ("opportunism").

Even when consumers possess sufficient information to form preferences, and face few proximate barriers to acting on them, public policies may preempt their capacity to express these preferences in their consumption behavior. Such preemptive conditions are characteristic of a merit good, a concept that Richard A. Musgrave elaborated in 1957, and that inherently involves *interference* with the choice of consumers and, in a derivative sense, producers. A merit good is one for which society determines the levels of production and consumption as a matter of public policy rather than through market allocations. An example of a merit good is education, which many jurisdictions require every capable person to consume through a certain age. Examples of "demerit" goods include highly addictive nonmedicinal drugs and child pornography, which are forbidden, regardless of the willingness of consumers and producers to trade in them. In these examples, the determination of levels of production and consumption does not rest with economic agents *qua* economic agents (including prospective consumers).

Although there is no consensus regarding the wisdom of constraining consumer choice through such policies, these limits are abiding features of all economically advanced societies. To the extent that such interference with consumer choice rests on moral appeals, there arises a salient challenge to the normative claims of the concept of consumer sovereignty and to the sovereignty of economic agents in general. Moreover, modern mainstream economic theories and policies recognize the relevant influences of multiple factors in addition to consumer demand when it comes to the scale and scope for economic performance, for example, productive capacity; markets for labor, capital, commodities, and organizational leadership; the regulatory environment; and the infrastructural apparatus, including telecommunications, roads, education, venues for dispute resolution, and an enduring ethical climate conducive to trust and transparency.

Consumption Taxes

Consumption tax is also known as an expenditures tax, a consumed-income tax, or a cash flow tax. It is a tax on the monies spent as opposed to the income tax, which is a tax on the amount of money earned. Consumption tax applies only to income spent and can be broadly explained as an income tax with unlimited deductions for savings and taxes on savings withdrawn and spent. If there is no savings or capital income, a consumption tax is equal to an income tax, assuming equivalent tax rates. Although it can be applied to firms, the consumption tax is usually discussed in terms of taxation of individuals.

Current, but not pure, examples are the European value-added tax (VAT) and the Australian goods and services tax (GST). Certain goods and services are exempt from the VAT and GST. The United States is the only Organisation for Economic Co-operation and Development (OECD) country that does not have a VAT on consumer expenditures, although sales taxes in some state and local communities in the United States are akin to a consumption tax.

The rate of taxation can be flat (i.e., equal for everyone) or progressive, with higher rates for more affluent taxpayers in an effort to achieve "distributive justice." It even can be modified to have different rates for different products to achieve social objectives, somewhat akin to the "sin tax" on alcohol and tobacco or the "gas guzzler" tax on some large cars in the United States. Arguments for and against the use of consumption taxes appeal to economic, social, environmental, and political objectives in terms of what consumer behavior is encouraged or discouraged, the differential impact based on wealth and spending/saving patterns, and the potential impact on international trade.

Arguments for a Consumption Tax

Supporters argue that the consumption tax encourages savings as it discourages spending and consumerism. With decreased spending and consumerism, there would be less waste of resources, less material produced, and an overall improvement in the natural environment as fewer demands are placed on it. In this way, the consumption tax would promote efficient use of resources and protects the environment. However, for the same reason it is also seen as a hindrance to the growth of the consumption or consumer-based economy. Business interests are placed at the opposite end of environmental protection. Proponents of the consumption tax also argue that an income tax encourages spending and consumption while penalizing savings, investments, and innovation, thereby damaging the economy in the long term. Finally, proponents of the consumption tax argue that the income tax taxes what people contribute to society in terms of work, while a consumption tax taxes what people take from or what resources people use in a society. Therefore, a consumption tax is just in that it distributes or places the burden (tax) on those that benefit (use the resources).

Arguments Against a Consumption Tax

Opponents argue that a consumption tax would require a higher tax rate to raise the same amount of revenue and so there may be an adverse impact on the balance of work and leisure. Opponents also argue that a nominally flat consumption tax can be regressive, shifting the greater burden on the working class, because returns to savings and investments would not be taxed, which constitutes a greater percentage of wealthier people's incomes. Another objection to the consumption tax used to be that it is difficult to monitor how much people save. However, in practical terms, a consumption tax would essentially be the equivalent to unlimited access to tax-deferred individual retirement accounts, with no penalty for early withdrawal except for payment of taxes on the withdrawn savings.

While consumption in the environmental community usually refers to the use of resources (such as the global commons of air and water or scarce natural resources such as fossil fuels, virgin forest, and biodiversity), consumption in the case of consumption taxes refers to goods and services used, regardless of their impact on natural resources. Because there is no distinction between resources used and what is taxed, there is no clear environmental benefit of the consumption tax. However, a consumption tax can also be used differentially as a means of influencing consumer behavior. Variations of a consumption tax include taxation of goods made from scarce natural resources or energy-intensive items. One example is a proposed "carbon" tax in Japan on energy resources, with the tax rate proportional to the amount of carbon released on utilization.

Globalization and changes in international trade continue to challenge governments to adapt tax systems that are perceived as both socially fair and economically efficient. This requires balancing demands for distributive justice with the need to minimize the cost of compliance for business, and distortion of market forces in a competitive environment, so as to provide a level playing field for business operations.

Contingent Valuation

Contingent valuation is a survey-based method of determining the economic value of a nonmarket resource. It is used to estimate the value of resources and goods not typically traded in the economic markets. It is most commonly related to natural and environmental resources.

Contingent valuation is employed to assess environmental resources, goods, and services. Government agencies apply the technique to estimate use and nonuse values of environmental resources that it oversees and manages, and to make decisions regarding environmental policy and lawsuits, and to assess damages. For example, the government employed this methodology to estimate the environmental damage of the *Exxon Valdez* oil spill in 1989. Businesses use this technique to estimate cost-benefit values on environmental projects.

Contingent Valuation Survey Methods

Contingent valuation surveys are administered using a variety of methods to select respondents and to develop survey questionnaires. Respondent selection is at the discretion of the survey administrator. Respondents are always individuals and the survey samplings may range in size. In addition, they may be chosen randomly or selected using other approaches such as geographic specifications or database segmentation.

Survey questions are based on hypothetical scenarios. Respondents are asked to estimate what they would be willing to pay to sustain, improve, maintain, prevent loss, or repair natural and environmental resources. For example, the government may want to ascertain the cost-benefit value of a future project of the Bureau of Reclamation to repair water storage facilities. It may use contingent valuation to answer the question, "What would be the environmental cost of this project if it affected the water supply of nearby cities and farms and also disrupted the ecosystem of an endangered species?" Survey recipients may be asked to comment on their willingness to pay $10, $20, or $30 more in utilities per year to improve water storage and pay environmental conservation costs.

Views on Contingent Valuation

Contingent valuation is a disputed method of estimating natural and environmental impact. Opponents argue that the technique is not empirical enough to accurately estimate financial data and to encompass the complexities of natural resources management. Unlike other methods of economical valuation, survey responses are not based on an individual's behavioral choice, nor are they based on a person's actual conduct. Therefore, survey responses are subjective and uninformed, creating a high likelihood of "hypothetical bias." There have been many attempts to improve survey controls, but opponents argue that these improvements are not sufficient to minimize the inaccuracies. Contingent valuation is also criticized for being expensive and time-consuming.

Proponents of the methodology claim that it is the most flexible option and is, therefore, suitable to environmental concerns. The technique also accounts for costs that more traditional methods do not, and it adds a critical consumer perspective. Proponents also state that the technique is reliable, as it has been refined and improved over a long period of time—it was first proposed as a theory in 1947.

Conclusion

As global environmental issues gain increased attention and concern, there is and will be more focus on the accuracy of estimating nonmarket values for natural and environmental resources. Environmental issues are extraordinarily complex and require sophisticated methods of analysis. Contingent valuation is the most widely used method for estimating nonmarket values, yet it is unclear as to whether it is an appropriate and reliable method. Contingent valuation methods present an ethical challenge to those who use them to make significant decisions about the future of the environment.

Contracts

A contract is one of the basic social and legal institutions in modern society. A contract frames and coordinates human interactions. It is an agreement that creates, assigns, delegates, and transfers rights and obligations, tangible and intangible goods, services, and entitlements between the contracting parties, relying on their voluntary, rational, and deliberate consent. Today, contractual relationships among persons, communities, organizations, and states emerge as an alternative or at least as an amendatory legal instrument of market coordination and state regulation. A contract binds person to person, person to organization, organization to organization, person to society, person to state, and state to state in private, social, economic, and political affairs.

Since contracts embrace almost all aspects of human affairs from business to marriage, it is difficult to develop a general theory of contract that could provide a normative framework for all human interactions based on various macro- and micro-level, formal and informal, and written and unwritten agreements. Since the theoretical diversities of the notion of contract are rooted in different legal and philosophical traditions, they offer different accounts of its philosophical origin, moral motivations, and practical justification for its prevalence in modern society. Conflicting assessments cause theoretical, doctrinal, and practical tensions and incoherencies in contract law, adjudication, and contractual settlement. Therefore, despite the long and rich intellectual history of philosophical, moral, legal, economic, and political reflections on contract, many contemporary scholars hold that contracts still lack any clear and consistent theoretical foundation. The critical remarks about differing assumptions and interpretations apply equally in civil law countries, where contracts are often justified on moral grounds and given a certain kind of redemptive power in the implementation of a just and well-ordered society, and in common-law countries, where the economic analysis of contracts seems to be too narrow in its philosophical and moral foundation.

This entry presents an overview of the basic theoretical concepts of contract from contractarian rights-based to consequentialist perspectives (explained hereafter). Instead of making a futile attempt to outline a general theory of contract, this entry will focus instead on how competing approaches and theories endeavor to conceive and explain the basic philosophical ideas underlying contract.

Rights-Based Contract Theory

Contemporary social contract theorists emphasize that the myriads of contracts performed by individual and institutional contractors should be considered as the everyday manifestations of a social contract that binds people together in a politically constituted society on the basis of a fair and impartial distribution of rights and obligations. This social contract has priority over common contracts in which individual rights and obligations are specified in various forms of private agreements, trade and exchange of tangible and intangible goods, services, and entitlements among members of society.

Because classical social contract theorists derived the social contract from a prepolitical state of nature and presocial forms of human behavior, opponents of a contractarian view traditionally have questioned using a social contract of specious origins as the philosophical justification for the basic institutions of a fair society. Some contemporary contractarians draw the normative principles of social interactions from a hypothetical social contract that avoids the question of historical origins and presocial forms of human behavior. Other contemporary contractarians think that binding contracts cannot be traced to a hypothetical social contract and individual rights originating from philosophical ideas; they believe that a social contract originates in a rational agreement by members of society. In other words, the normative principles of interpersonal relationships conceptually emerge from the practical procedures of political dialogues that assign individual rights and obligations to promote individual cooperative interactions and set legal and moral constraints on the pursuit of personal interests. Rights-based contract theorists emphasize that the most important principles of the formation of contractual arrangements among individual and institutional contractors are freedom and equity, moral autonomy, fairness, individual well-being, and social utility. They believe that rights should entail these moral and legal constraints on the pursuit of each individual's economic and social interests to motivate and frame all the contractual relationships among members of society. These normative principles are implicitly present in our public morality, legal and political culture providing the legal justification for contract formation, contract law, and adjudication. Should contracts and contract law fail to meet these principles, their justification could be suspect from moral and legal points of view. The rights-based contract theorists generally emphasize that among the principles of contract and contract law, freedom and autonomy have priorities over other concerns, especially efficiency, utility, or general welfare maximization. This contractarian view represents a rights-based theoretical approach to contract and contract law and regards contracts as creating and transferring rights and entitlements in correlation to self-imposed and legally enforceable obligations. The second-order rights arising from the particular contractual relationships are corollaries of individual inherent rights of freedom and autonomy. Preexisting individual rights justify the legal protection of a party's legitimate expectations and the enforcement of obligations in case of legal dispute, breach, or infringement of contract. The sole basis for adjudication and legal enforcement of a contract is the preexisting and correlative rights and obligations of the parties at the time of contract formation. Therefore, rights-based contract theorists consider that in the case of a contractual dispute a court is required to discover the rights of the contracting parties exchanged at the time of contract formation and to resolve ambiguities through the interpretation of their intentions. Since there is a right answer for all contractual disputes, a court must invent new rules of prospective reason to fill gaps in contracts to point to future efficient behavior or to grant disputed rights and entitlements in the interest of efficient outcome of contracts. The retrospective and prospective views of adjudication are the main sources of conceptual and methodological disagreement between rights-based contract theorists and law and economics scholars. While rights-based contract theorists think that a court has to take the retrospective view of adjudication in every contract case, law and economics scholars emphasize the prospective view of adjudication, especially, if a contractual gap exists. Of course, rights-based contract theorists do not refute the importance of the efficiency criterion in contractual arrangements and contract law, but they think that the enforcement of the obligations of the parties should be based not on welfare maximization but on their rights, the respect of their freedom, and individual autonomy. They think that the voluntary, rational, and deliberate consent of free and autonomous parties in contractual arrangements logically advances social welfare and produces the best economic outcomes. They believe that if a court prospectively defines the welfare-enhancing preferences for the parties to settle contractual disputes and to steer them toward efficient outcome, judicial paternalism is likely to occur.

Economic Analysis of Contract

In the late 20th century, the economic analysis of contracts has gained ascendancy in American academic and judicial discourse. Its impact as a normative theory of contract law, adjudication, and contractual settlement on the European legal systems is quite moderate because the role of the European judges is primarily limited to the interpretation and enforcement of contract in the context of the civil and business code provisions enacted by the legislature. In continental Europe, the judges are bound to apply and enforce the law and have less room to exercise judicial discretion by referring to external economic criteria, uncodified commercial norms, or private orderings. The success of economic analysis of contract in the United States attests not only to the country's common-law tradition but also to the pervasiveness of legal pragmatism in jurisprudence.

In a perfect world, where transaction costs are zero; unforeseen contingencies never happen; opportunistic behavior, asymmetric information, and bargaining power disparities are unknown phenomena;

and the parties voluntarily and deliberately perform their contractual obligations for the benefit of mutual welfare, legal intervention may be unnecessary. Nevertheless, in our less perfect world all these phenomena and anomalies quite frequently occur when the parties enter into contracts. Economic analysis attempts to provide an alternative theoretical approach to contracts. Law and economics scholars apply economic concepts and theories to the analysis of contracts to settle contractual disputes resulting from incompleteness, nonperformance, impossibility to comply, contract breach, and other damages. Besides offering practical guidance about the economic analysis of contracts in contract formation, contractual settlements, and adjudication, economic analysis also endeavors to provide a solid normative foundation for contract law. The system of contract law—the set of optional and mandatory rules—is tested in accordance with external economic criteria as well. As indicated frequently, the use of external economic criteria in legal arguments and adjudication contradicts the concept of justice and makes the legal system inconsistent and nontransparent, especially when infringements of rights, legal entitlements, and deliberate breaches of contract are at issue. The use of economic criteria in adjudication is external to law. If a judicial decision is based not on the examination and upholding of preexisting contractual rights and obligations but on the measurement of the prospective welfare effects of the enforcement of contract, adjudication becomes uncertain. Law and economics scholars contest this objection, alleging that economic analysis of law does not intend to change the principles of the legal system but rather to explain legal rules and to shed light on efficient outcomes.

Since law and economics scholars assume that rights-based theories of contract cannot give a reasonable explanation of why promises and contract terms are binding, they seek to justify contract and contract law by reference to economic outcomes. In analyzing contract disputes, law and economics scholars, in contrast to rights-based contract theorists, tend to emphasize consequences rather than intentions. The economic elements of this legal doctrine mainly come from mainstream economic theories and concepts such as cost-benefit analysis, the Pareto and Kaldor-Hicks concepts on efficiency, the Coase theorem, the theory of transaction costs, the problem of market externalities, rational choice theory, and so forth. In theorizing about contracts in accordance with these economic theories and concepts, law and economics scholars place particular emphasis on efficiency and welfare maximization. The concept of human rationality in law and economics also recalls the great narrative of the liberal tradition on *Homo economicus,* which considers human beings as free, rational, and self-interested agents whose main goal is welfare maximization defined in terms of individual preference satisfaction. Law and economics scholars presume that the application of these simple normative economic criteria liberates us from endless moral debates on the keeping or breaching of contracts and about most of the hard philosophical questions related to freedom and equity, fairness, and justice in cases of contractual arrangements. Thus, law and economics can be characterized as representing an instrumentalist view in jurisprudence, namely, that contracts and contract law should create incentives for the contracting parties to maximize individual and/or social welfare measured in terms of individual preference satisfaction. Law and economics definitely takes a consequentialist stand on the economic analysis of contract and the definition of legal rules even if it also appeals for moral theory to provide philosophical justification and a constitutional foundation for the freedom of contract. Law and economics is firmly rooted in the utilitarian tradition of moral philosophy despite superficial reconciliation of the deontological moral claim of freedom and autonomy and the prospective view of efficiency of contract. It follows that efficiency and welfare maximization criteria may override some original claims and rights that the parties initially brought to the bargaining table. These two rival moral theories of justification of contract can hardly be brought together unless we give priority to some basic rights—such as freedom, autonomy, equity, fairness, justice, and so on—over efficiency and welfare maximization. Law and economics scholars seem to eschew the acceptance of such reconciliation. A quite recent opposing argument in law and economics literature is that because fairness diminishes welfare, the pursuit of fairness makes individuals worse off. From the consequentialist point of view, the trade-off between the efficiency and moral autonomy considerations of contracts is fully justified by the efficiency advantages if they outweigh the consequences of the insistence of the parties on their original claims, rights, and entitlements. Consequentialists do not rule out the possibility that welfare maximization may result in the denial of some rights, while deontologists do not allow any concession about individual rights and legal entitlements on behalf of efficiency advantages. To sum up, law and economics represents an efficiency-based approach to contract and contract law and draws on utilitarian moral philosophy.

For law and economics scholars, the Pareto principle of efficiency serves as a normative criterion for the moral justification of contracts. Nevertheless, when contracts equally increase the welfare of symmetrically situated and empowered, informed and rational parties in comparison to their original positions, the argument is weak, merely reflecting the commonsense wisdom that contracts based on voluntary, informed, and deliberate consent are likely to improve the overall welfare of all involved parties. In such a case, contract law facilitates contracting and creates additional incentives for the parties to complete their contractual obligations efficiently. If contracts improve at least one party's welfare and do not make any other parties worse off in comparison to their original positions, the transaction is Pareto superior. Though this strong version of the Pareto principle provides a more adequate tool for the prospective analysis of the efficiency of voluntary exchange, it is thought to be too strong to be applied to real-world situations where the outcomes of contracts and the costs and benefits of the parties are rarely distributed according to the Pareto superior state. In spite of the transparent intentions and benevolence of the contracting parties at the time of contract formation, transactions sometimes have losers and gainers. But the Pareto criterion of efficiency does not allow trade-offs between one party's gains and another party's losses; it permits aggregation only in a narrow sense. As it is also frequently stressed, further problems of Pareto efficiency arise from the fact that contracts between two parties usually entail externalities for a third party, which are either marginalized or not noted at all. Third-party externalities are frequently considered as trifles, nonmeasurable, or insignificant so that the legal protection of third-party interests leads to marginal social utility. Nevertheless, third-party externalities sometimes provide a rationale for the judicial overriding of contracts. Since the Pareto principle of efficiency focuses on the model of a two-party sitatuation—one party and the rest of the world—it is difficult to apply the principle to sophisticated and typical multiparty problems such as the preservation of natural environment, the interests of future generations, and the assignment of property rights in case of public domain and intangible commons. Without calculating the impact of a contract imposed on the welfare of a third party, it is hard to judge whether that contract brings about a Pareto inferior, optimal, or superior state of the contracting parties and other constituencies. As critics contend, the Pareto criterion of efficiency is indeterminate in serving as a solid foundation for measuring efficiency and welfare due to its limited focus, competing conceptions of individual preferences and welfare, the problems of externalities, imperfect information, and limited rationality. In the last resort, the prospective view of efficiency of contracts weakens its very foundation, namely, the expressed intentions of the parties laid down in legally binding contractual terms that constituted a contract at the time of contract formation.

Most law and economics scholars prefer to use the Kaldor-Hicks principle of efficiency—sometimes called "potential Pareto improvements"—which is less controversial and more realistic at least from the point of view of welfare economics. According to this principle, contracts meet the Kaldor-Hicks efficiency principle if the aggregate gain exceeds the aggregate loss including externalities. The Kaldor-Hicks principle does not require the gainers either to compensate the losers or to internalize the externalities of the third-party losers. However, law and economics attributes intrinsic moral significance to individual welfare maximization and uses individual preference satisfaction as the metric of welfare. Therefore, sometimes it is hard to accept the economic outcomes of the Kaldor-Hicks principle of efficiency, which is indifferent to some individuals' actual welfare losses. The so-called efficient breach theory of contract and the prospective view of breach in adjudication are cases in point. Law and economics scholars do not regard contracts and contract law as appropriate legal institutions to bring about the redistributive aims in society. Any kind of compensation to mitigate the distributional inequalities caused by the economic outcomes of contracts would evidently contradict the Kaldor-Hicks efficiency norm. As its advocates allege, if contract and contract law require redistributive rules and terms, the better-off parties will never be interested in entering into contractual relationships. At least, the better-off parties will attempt to contract out of the rules, which they assume to be inefficient. Law and economics theorists neglect other welfare theories that—beyond efficiency norms—take rights-based compensation, distributional inequalities, or distributive justice into account because it regards them to be creating disincentives for contracting and efficient behavior.

Copyrights

A copyright is a set of exclusive, time-limited rights granted by a government to regulate the use of a particular form, way, or manner in which an idea or information is expressed. Copyright may be claimed for a wide range of creative or artistic works. These include literary works; motion pictures; music, audio, and video recordings; paintings; photographs; software; and industrial designs.

Copyrights are a type of intellectual property. Copyright law only addresses the rendering, manner, or form in which creative thought, ideas, or other information has been depicted, implemented, or manifested. These laws are not designed or intended to cover the actual facts or concepts included in the work, nor the styles or techniques that are used or represented by the copyrighted work.

The term *exclusive right* means that the copyright holder is the only party that may exercise the attendant rights and privileges of registration. Anyone else who wishes to use the copyrighted work must gain the consent of the copyright holder. This consent may be tacit or explicit, depending on the relevant legal interpretation, the medium, and the terms of the copyright.

Copyright is often called a "negative right," as it serves to restrict the users or viewers of a work from taking certain actions rather than permitting creators or owners to take specific actions beyond the registration, performance, and distribution of a creative work.

The Value of Copyright

The doctrine of copyright protects the reputation of the creator or rights holder in several ways. *Reputation* is a key attribute of any creative endeavor, as it can directly influence the financial value of a work. Copyright may be used to protect a work even when the author wishes to remain anonymous or uses a pen name.

Copyright also strengthens the *archiving* and *integrity* of content, so that the owner and the works have legal protections against unintended changes, uses, or alterations of a copyrighted work. Publishers provide *surety* through the persistence, preservation, and distribution of creative works.

Copyright is also of great utility in the growing use of the Internet and computer technology to deliver personalized selections of media to users. This is a powerful example of how a networked economy can use existing social practices and laws to develop robust new business models. Applications such as Web portals, blogging, RSS feeds, and digital media distribution rely on the power of copyright to support the reputation, financial value, archiving, integrity, and surety.

Relevant Legislation

The U.S. Constitution does not specifically mention copyright. However, Article 1, Section 8 specifically gives the U.S. Congress the authority "[t]o promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries."

Congress has passed and amended various laws pertaining to copyright. With each change, the duration of copyright was increased and additional rights were awarded to copyright owners. The United States became a signatory to the Berne Convention for the Protection of Literary and Artistic Works in 1988. This international agreement was first promulgated in 1886 and allows national copyrights to be claimed and enforced among all member nations. The convention also specifies the minimum term of copyright protection, which is 50 years after the creator's death, except for photographs (25 years minimum) and cinematographic works (50 years after the first showing or the creation of the work). The convention does not extend the term beyond that provided by the country of record for a specific copyright claim, even when other nations provide longer terms of protection.

Even so, the United States does not recognize certain moral rights of creators. For example, a creator who does not wish to attach his name to a work may use a pseudonym, but she will abandon her moral rights to the work in the process. If the work is unfinished, and copyrighted without the creator's true name, it is assumed that the copyright owner has the right to complete the work.

U.S. courts have been reluctant to enforce this level of moral rights, even though Section 6bis of the Berne Convention gives authors the right to claim ownership of their works and publicly object to the distortion, mutilation, or any other derogatory action taken on the work that might be detrimental to the author's reputation. In the case *Gilliam v. ABC*, Terry Gilliam successfully sued a U.S. television network that had edited episodes of a British television show, *Monty Python's Flying Circus*, for standards and content prior to their transmission on late-night U.S. television. Gilliam is a member of the *Python* troupe, which wrote and performed its own works. The group had never been asked nor had granted permission to the network to modify the content.

Technological Issues

In 1998, the Congress amended the existing copyright laws by enacting the Digital Millennium Copyright Act (DMCA). The legislation was, in part, required by the United States' ongoing participation in the World Intellectual Property Organization (WIPO). The DMCA enacts elements of two different treaties that the United States signed in 1996: the WIPO Copyright Treaty and the WIPO Performances and Phonograms Treaty.

During the negotiations that led to the 1996 WIPO treaties, Bruce Lehman, the U.S. patent commissioner, advocated the principle that "any licensable act should be licensed." As old and new content is distributed in digital formats, digital rights management (DRM) should support the power of publishers to license content to users. Opponents noted that a market-based approach, in which the government refrained from banning technologies, might be prudent during the development of digital copyright law. By allowing the development of technology and societal norms, it would be possible for markets, including publishers and consumers, to adapt.

Professional organizations have objected to the DMCA on the grounds that the act is too broad. The DMCA includes anticircumvention provisions that prohibit the users of a technology to defeat or work around the rights management tools included in that technology. This restriction prevents security specialists and forensic scientists from reverse engineering the security measures contained in DRM implementations and from reporting the results of their efforts. The DMCA, in effect, prevents skilled professionals from performing the kinds of research necessary to test and improve DRM policies. The responsible improvement and progress of knowledge are key parts of the scientific method. Thus, the Association for Computing Machinery (ACM), the Institute for Electrical and Electronics Engineers (IEEE), and other groups have suggested that the anticircumvention restrictions be reinterpreted so that they apply only to cases involving copyright infringement.

Alternatives

Alternatives to copyright law have been proposed throughout the history of copyright law. The copyleft and Creative Commons movements are both responses to current implementations of digital copyright law. These doctrines use existing national and international copyright law to present a variety of licensing schemes that allow users to modify and distribute a creative work, but only in a manner that the original creator permits. The original creator can also allow commercial and noncommercial derivations of their work and choose to retain their payment or credit rights for any user-modified works.

The Creative Commons framework, developed by Lawrence Lessig and others, extends copyleft by allowing creators to tag or electronically mark their works with a standard, machine-readable license agreement that is freely available on the World Wide Web in several file formats. This system allows creators to claim ownership for their works in an efficient manner that acknowledges the rapid nature of electronic publishing and distribution. Creative Commons licenses are based on U.S. interpretations of international copyright law. However, the distributed nature of the movement has allowed professionals to harmonize the license so that it may be applicable and useful in their own countries.

The Creative Commons system also supports the assignment of works to the public domain and to open source licenses. An open source license allows other users to view and modify the text, images, underlying source code, or programming instructions of a creative work as long as their modifications are also released to the public. Various forms of open source licensing have been used to develop computer operating systems such as GNU/Linux that may be distributed free of charge. It is possible to commercially distribute open source works but the modifications must be made available to the public, usually through the World Wide Web or another electronic medium.

Customers and Copyright Holders

Over the last decade, copyright has come under attack as users have attempted to circumvent the doctrine's rules. One common example is the distribution of music over the Internet, through the use of peer-to-peer networking services. These services, such as BitTorrent, the original version of Napster, and others allow computer users to connect with each other and share specific files and folders. The MP3 file format allows digital music to be downsampled and converted to a much smaller format than that provided on a compact disc, with an acceptable loss in signal quality. There are widely accepted Internet conventions for scanning and sharing books, movies, and other works in compressed digital formats.

The creators of these file-sharing systems usually did not consider the restrictions of copyright or the moral rights of creators. The implementation of these systems is more focused on their speed and accuracy than on intellectual property law. In the United States, various industry groups, including the Recording Industry Association of America and the Motion Picture Association of America, have identified and sued Internet users who allegedly used their home or corporate Internet service to exchange copyrighted music and videos.

Recently, there has been a rise in the use of Web-based video sharing sites to post and distribute videos. In some cases, the creator of the video posted the work themselves. However, it has become easier to use a computer to capture or record a television broadcast or the playback from a DVD. Thus, television networks, movie and video production firms, and copyright holders have sued these sites or licensed their copyrighted works for limited distribution. In some cases, television networks have posted their own content on their own sites in an effort to control the digital distribution of these works.

User Rights and Electronic Distribution

Consumer/users often assume that they "own" the recorded and printed works that they have purchased. Copyright, however, provides users with a limited license to use these works. This license does allow users to sell their copy to another user, as long as the original user does not retain a copy of the work. Because it is easier than ever to copy and store digitized works, users are tempted to "have their cake and eat it too." Users often justify or rationalize their actions by citing the high price they paid for their license to use a creative work.

Authors, creators, and copyright holders have countered this trend by citing the significant costs and risks they face in developing and distributing creative works. The musical group Metallica stated publicly that file-sharing services harmed their livelihood, for example. Musicians do need to universally agree on the harm or value of electronic distribution, however. The growing use of electronic audio players such as Apple Computer's iPod, together with the popularity of online music stores that allow users to purchase and download licensed digital copies of recorded works, has fundamentally changed the economics of retail distribution.

Some users have responded by developing their own original creative works. In some cases, these works are a melding or "mashup" of two or more existing properties. This format was previous used in collages of printed media and the "sampling" of brief sections of recorded songs for inclusion in another performance. Again, computer technology allows users to combine two seemingly different songs into a new song that may strongly or vaguely resemble the original sources. It is also possible to edit the existing video so that actors are placed in different environments or a different audio is heard.

The popularity of Web logs or "blogs" also relies on the electronic distribution of original works. A text-based blog may be nothing more than a user's diary, posted to the Internet. Some bloggers link to newspaper and magazine articles, as well as other blog postings, and provide their own comments or interpretation of events. Many blogs allow users to read these postings and upload their own comments, thus creating a multitude of narrowly defined creative communities that work at a much faster pace than the traditional media.

Corporate Accountability

Corporate accountability is a foundation of corporate social responsibility. Corporate social responsibilities, at the most general level, include economic duties, legal and regulatory compliance, responsiveness to ethical norms, and discretionary social welfare contributions. In addition, one of the most basic of all corporate social responsibilities is corporate accountability. It is defined as the continuous, systematic, and public communication of information and reasons designed to justify an organization's decisions, actions, and outputs to various stakeholders. According to this definition, corporate accountability is primarily a form of ethical communication directed toward those parties who are affected by corporate activities and effects.

Corporate accountability represents a corporation's social responsibility to explain its actions (past, present, and future) in an accessible, reasonable, and meaningful way to the society in which it operates. In a democratic society dependent on informed political discourse and deliberations, corporate accountability is a necessary foundation for the system of free enterprise. The appropriate level of corporate accountability underpins the legitimacy of corporate autonomy and decision making in a system of democratic capitalism. In such a system, business enterprises enjoy a high degree of economic freedom of choice and are expected to engage in activities that promote the interests of the business. This economic freedom, however, is contingent on the existence of strong accountability mechanisms.

There are various traditional institutional mechanisms, both external and internal to the corporation, designed to enhance and strengthen accountability to stakeholders. These well-known mechanisms include the annual report to shareholders, corporate governance, government regulations, corporate codes and credos, and various forms of corporate communications.

The Annual Report to Shareholders

The single most important component of corporate accountability is the annual report to shareholders. It includes three important financial statements: the balance sheet, the income statement, and the statement of cash flows.

The balance sheet provides a detailed list of corporate resources (assets) and claims to those resources (liabilities and equity). It can be compared with a photograph that summarizes the financial condition of a business entity at a *fixed point in time.* The income statement provides detailed information about revenues, expenses, gains, and losses. It is like a movie in that it explains what happened *over a period of time.*

The statement of cash flows provides information about the sources and uses of cash. It consists of three categories: operating, investing, and financing. The financial statements gain credibility because they are audited by certified public accountants. According to the Financial Accounting Standards Board, the three main objectives of financial accounting are to provide information that is useful to those making investment and credit decisions; helpful to present and potential investors and creditors in assessing the amounts, timing, and uncertainty of future cash flows; and about economic resources, the claims to those resources, and the changes in them.

Corporate Governance

Corporate governance is essential to corporate accountability and without which no corporation can exist. State laws demand that corporations are to be managed and directed by a board of directors. This board acts as a surrogate for the shareholders of the corporation and its primary role is to oversee management's performance in terms of increasing profits and meeting social responsibilities. As such, corporate governance is a fundamental component to corporate accountability as defined above because it provides a strong institutional forum for communication between managers and shareholders' representatives.

Corporate Regulations

In 2002, the U.S. Congress overwhelmingly passed one of the most significant pieces of securities legislation in U.S. history, the Sarbanes-Oxley Act. One of the main purposes of passing the Sarbanes-Oxley legislation was to reestablish the credibility of the financial markets by strengthening corporate accountability. This purpose is in line with the goals of previous federal and state legislation in the United States and across the world.

Sarbanes-Oxley contains several important features relevant to corporate accountability. It established the Public Company Accounting Oversight Board to oversee the accounting profession, thus radically limiting the profession's traditional autonomy. It requires chief executive officers and chief financial officers to certify all financial statements and assigns criminal responsibility to those executives who knowingly make a false certification while demanding enhanced corporate disclosures concerning off-balance-sheet financing. Sarbanes-Oxley contains several provisions to enhance auditor independence. It also requires corporate boards to establish independent audit boards.

Corporate Credos and Codes of Conduct

Credos and codes can potentially serve an important role in strengthening corporate accountability. By carefully defining its own ethical aspirations, a corporation can helpfully communicate the criteria by which it wants to be held and judged. While critics are quick to note the self-serving nature of many corporate credos and ethical codes, these kinds of documents often provide both outsiders and insiders specific and clear statements to use in evaluating the credibility of corporate management. Johnson & Johnson's corporate credo, for example, establishes customers as the primary stakeholder of the corporation. This credo is often cited as an exemplar.

Increasing Demand for Corporate Accountability

In recent years, the demand for corporate accountability has increased dramatically. This demand has been spurred by the sheer growth of corporate power and by corporate environmental disasters such as the *Exxon Valdez* oil spill of 1989 and the Union Carbide and the Bhopal, India, tragedy. Corporate ethics and audit failures such as those at Enron, WorldCom, and many other U.S. and global corporations have also contributed to the increased demand for more and better accountability. Globalization, the Internet, the greenhouse effect, the increased interconnection of the world economy, and the rising power of institutional investors have also contributed to this change. Finally, changes in ethical values, especially an expanded conception of corporate social responsibility, have altered expectations surrounding the need for a broadened conception of corporate accountability.

Limitations of the Financial Statements as an Accountability Mechanism

At the same time that the demand for accountability has increased, the usefulness of traditional financial statements is being questioned. While financial statements remain as an important source of reliable and relevant information about corporate activities, they have come under intense scrutiny in recent years. There are several limitations associated the traditional financial statements.

First, many items are omitted from the balance sheet. These include intangible assets, the value of human resources, and many liabilities such as pension and health care obligations. Second, investors and other interested parties question the use of historical cost as the predominant method of valuing assets. Third, there is a lack of forward-looking information in the annual report such as management's forecast of earnings per share. Fourth, the traditional annual report focuses exclusively on the financial performance of corporations and excludes information about environmental and social performance. Finally, annual reports, especially income statements, are subject to questionable accounting manipulations such as earnings management, a process whereby managers alter the timing of revenues and expenses to change investors' perceptions.

There is now convincing statistical evidence that earnings management is a frequent management technique used to make a company look better than it otherwise would have. These manipulations occur despite the requirement that all financial statements are audited by certified public accountants. Each of these limitations diminishes the usefulness of the financial statements as an accountability mechanism.

Corporate governance has also come under intense scrutiny in recent years. This criticism of corporate governance reached a climax in the wake of ethics failures, including earnings management, at Enron and Andersen.

The Broadening Scope of Corporate Accountability

In response to the increasing demand for corporate accountability and the limited ability of traditional solutions to the meet this need, the scope of corporate accountability has broadened considerably in at least four distinct ways.

Backward-Looking Information Versus Forward-Looking Information

At the heart of the traditional accounting model was the historical cost principle, which states that the original cost of an asset is the most reliable valuation basis. It has long been argued that the best way to measure assets, liabilities, equities, revenues, and expenses is through the use of historical cost. The primary justification for this has been reliability. Simply put, historical cost can be documented and verified by auditors with a high degree of confidence and certainty.

Although historical cost accounting scores high in terms of reliability, it scores much lower in terms of relevance. Investors and creditors trying to predict future performance are more interested in forward-looking information such as managers' forecast of future earnings per share than backward-looking information (such as last year's earning per share).

In the United States, the Securities and Exchange Commission has taken a major step forward in this area by requiring publicly traded companies to publish a management discussion and analysis section in their annual reports. These reports, as has been documented, contain valuable information not only about past decisions but also about future events and trends. In short, corporations are being asked by regulators and other stakeholders not only to reasonably justify *past* actions, but they must now also disclose and explain anticipated *future* actions.

Hard Versus Soft Data

The second change in broadening the scope of corporate accountability is related to the first. There is an ever-increasing flow of financial data carefully audited by outside accountants. This is the hard data. But, at the same time, there is an increasing demand for soft data, that is, information that cannot necessarily be quantified in a precise and exact way but nonetheless is important for decision making. Soft data include descriptions of new products, emerging markets, anticipated layoffs, planned capital expenditures, joint ventures, research and development projects, advertising campaigns, and many other items.

Consider the recent controversy over the disclosure of stock options as just one important example. Many companies argued with some justification that there is simply no known and noncontroversial way to value these options in a reasonable manner. These companies argued that assigning a dollar value to stock options would provide misleading and unreliable information to shareholders and creditors. Despite these arguments, however, the demand for additional disclosure concerning stock options is unabated.

Although at one time it was possible for companies to legitimately meet the obligation of corporate accountability by publishing a set of numbers with almost no description accompanying the financial statements, today this is no longer the case. Justification now requires accurate verbal disclosures and descriptions as well.

The Bottom Line Versus Multiple Bottom Lines

Third, can corporate performance be measured with a single number? Is it conceivable that all of a corporation's thousands of decisions, actions, and outcomes can be summarized and evaluated through net income? Although some companies and many short-term investors continue to act as if the answer to both these questions is yes, other companies have now learned through experience that even if it was once true, it is certainly no longer the case.

Perhaps the most important of the changes that we have documented so far is the increasing recognition that corporate accountability now requires managers to justify not only purely financial outcomes but also environmental and social outcomes. Connected to this change, the list of legitimate stakeholders has also expanded to include employees, customers, local and global communities, and others. This means there is no longer such a thing as the bottom line. Today, there are multiple bottom lines. In a sense, there are as many bottom lines as there are stakeholders.

While just a few years ago the phrase multiple bottom line was more metaphor than reality, today it is more reality than metaphor. The Global Reporting Initiative (GRI) was established in 1997 as a joint venture between the Coalition for Environmentally Responsible Economies and the United Nations Environment Program. In June 2000, GRI published a set of guidelines to help companies improve on their environmental and social reporting. These guidelines were revised in 2002. One thousand global companies now use some form of triple-bottom-line accounting in line with GRI guidelines—reporting on economic, environmental, and social behaviors and outcomes. Among these companies are 3M, AT&T, General Motors, Ford, Shell, McDonald's, Dupont, Dow Chemical, Nike, Canon, Electrolux, Ericsson, France Telecom, and some other smaller companies as well.

Monologue Versus Dialogue

Finally, careful examination of a set of recently issued sustainability reports demonstrates the most radical change of all. To legitimately justify an organization's decisions and actions, corporate accountability is now viewed and described by many as a dialogue between the corporation and its stakeholders and not as a monologue on the part of management. For example, see especially AccountAbility 1000's AA1000—Principles and Measurement Standards and a U.K. company law reform proposal that would require the dialogue between corporations and their shareholders to be published online. This means that corporate accountability requires listening to a company's diverse stakeholders as well as responding to them. It also means that many companies now openly recognize that corporate accountability is an evolving and contested concept.

There is a growing awareness of dialogue as a formal component of corporate accountability. Dialogue is emerging as one of its central and most innovative aspects. Dialogue does not imply that organizations are abdicating their responsibility for decision making. But it does imply a recognition that organizations are embedded in society and rely on it for legitimacy.

Conclusion

Those managers committed to the capitalistic system realize that it is in their own self-interest to enhance corporate accountability. In a world of instant communication, those corporations that can justify their actions in a clear and sensible way may possess a strong competitive advantage over rivals who maintain a policy of secrecy. It makes good business sense to enhance corporate transparency.

Corporate accountability, however, should not be conceived of as a kind of game. Rather, it is a form of ethical communication among human beings on which the future growth and legitimacy of business depends. As globalization spreads, corporate accountability is becoming the linchpin of the worldwide economic system. As the notion of corporate social responsibility gains credence across the globe, corporate accountability is increasingly viewed as a crucial task for boards of directors, corporate management, business consultants, and accountants. Corporate accountability has always played an important role in the financial markets, but as the concept of corporate accountability broadens, its role in society will gain in importance.

Corporate Average Fuel Economy (CAFE) Standards

In 1975, in response to an energy crisis in the United States, Congress enacted the Energy Policy and Conservation Act, which included the Corporate Average Fuel Economy (CAFE) Standards. Initially, CAFE standards were part of an effort to reduce U.S. dependence on foreign oil. Today, these standards are part of the debate surrounding global climate change, as vehicles are one of the major emitters of greenhouse gases.

CAFE standards require automobile manufacturers to meet certain miles per gallon (mpg) standards for their fleet of vehicles. In 1974, the average U.S. passenger car had an mpg of less than 13, which was less than the average mpg of just a few years earlier. The CAFE standards required all new automobiles to have an average mpg of 27.5 by 1985. Although there have been numerous proposals to raise mpg requirements, as of 2005, the 27.5-mpg standard remains unchanged for passenger cars (although it was temporarily lowered from 1987 to 1989). Light trucks and SUVs, however, are held to a lower standard. Those vehicles must meet a standard of 22.2 mpg by 2007.

A manufacturer's CAFE is the average fuel economy of the manufacturer's fleet of vehicles for that model year weighted by the production volume of each model of car. Passenger cars and light trucks/SUVs are calculated separately. In addition, a manufacturer's fleet of passenger cars is divided into domestics and imports, as determined by the percentage of components manufactured outside the United States and Canada. The manufacturer must meet CAFE standards for both its domestic and import fleets separately. Failure to meet the standard results in a penalty of $5.50 for each one-tenth mpg the manufacturer is below the standard multiplied by the number of vehicles in manufacturer's fleet for that model year. If a manufacturer exceeds the CAFE standard in any year, the manufacturer is granted excess credits that may be used against past or future shortfalls (up to 3 years in either direction). Manufacturers may also receive credits through the use of alternative fuels (e.g., natural gas, ethanol) under the Alternative Motor Fuels Act of 1988. The National Highway Traffic Safety Administration, which is the agency with responsibility for CAFE standards, reports that manufacturers have paid more than $500 million in fines since 1983.

Opponents of raising CAFE standards claim that requiring automobile manufacturers to increase the mpg of their vehicles causes greater harm to society than benefits. The primary concern of opponents is that manufacturers meet mpg standards by reducing the size and weight of their vehicles, which leads directly to more deaths from automobile accidents. Others, however, claim that new lightweight materials can allow manufacturers to build higher fuel economy vehicles without a negative impact on safety. Opponents also argue that a higher fuel economy will lead to higher prices for consumers and to more traffic congestion and automobile accidents due to an increase in driving (assuming that individuals will drive more as the costs of driving a mile will be reduced with a higher automobile mpg). Finally, opponents claim that CAFE standards are unnecessary as technology development, and not regulation, drives improvements in fuel economy. Proponents of CAFE standards argue that those technologies already exist and manufacturers simply need the financial incentive to make the use of those technologies cost-effective.

Corporate Citizenship

Corporate citizenship, sometimes called corporate responsibility, can be defined as the ways in which a company's strategies and operating practices affect its stakeholders, the natural environment, and the societies where the business operates. In this definition, corporate citizenship encompasses the concept of corporate social responsibility (CSR), which involves companies' explicit and mainly discretionary efforts to improve society in some way, but is also directly linked to the company's business model in that it requires companies to pay attention to all their impacts on stakeholders, nature, and society. Corporate citizenship is, in this definition, integrally linked to the social, ecological, political, and economic impacts that derive from the company's business model; how the company actually does business in the societies where it operates; and how it handles its responsibilities to stakeholders and the natural environment. Corporate citizenship is also associated with the rights and responsibilities granted to a company or organization by governments where the enterprise operates; just as individual citizenship carries rights and responsibilities, however, companies have considerably more resources and power than do most individuals and do not have the right to vote.

While CSR has historically referred to a company's economic, legal, ethical, and discretionary responsibilities, corporate citizenship emphasizes the integral responsibilities attendant to a company's strategies and practices. There are other definitions of corporate citizenship, but they are generally consistent with the theme of integrating social, ecological, and stakeholder responsibilities into the companies' business strategies and practices. For example, the United Nations' definition states that corporate citizenship is the integration of social and environmental concerns into business policies and operations. The U.S. association Business for Social Responsibility defines it as operating a business in a manner that meets or exceeds the legal, ethical, commercial, and public expectations that society has of business. The definition of the Center for Corporate Citizenship at Boston College requires that a good corporate citizen integrate basic social values with everyday business practices, operations, and policies so that these values influence daily decision making across all aspects of the business and takes into account its impact on all stakeholders, including employees, customers, communities, suppliers, and the natural environment.

The definition of the Corporate Citizenship Unit at Great Britain's University of Warwick Business School indicates that corporate citizenship involves the study of a broad range of issues, including community investment, human rights, corporate governance, environmental policy and practice, social and environmental reporting, social auditing, stakeholder consultation, and responsible supply chain management. Australia's Deakin University's Corporate Citizenship Research claims that corporate citizenship recognizes business's social, cultural, and environmental responsibilities to the community in which the business seeks a license to operate and recognizes economic and financial obligations to shareholders and stakeholders.

Background

The term *corporate citizenship* as applied to companies' core business practices, strategies, and impacts became popular particularly in the European Union in the mid-1990s but has been in use at least since the 1950s. The terminology evolved from earlier conceptions of business in society, particularly from the concept of CSR, which connotes doing explicit good for society mainly through philanthropy and is considered voluntary on the part of companies. Although some scholars and practicing managers do define corporate citizenship more narrowly than the definitions above, believing that discretionary activities on the part of companies to deliberately improve societies constitute corporate citizenship initiatives, most of the business associations and centers in academic environments have developed the more broad-based conception accepted here.

Typical manifestations of CSR occur through philanthropic programs, volunteer activities, in-kind giving, and community relations. In contrast, the dominant conception of corporate citizenship applies to the ways a company operates, that is, its fundamental business model, and the stakeholder, societal, and nature-related impacts that derive from the way the company does business. Although some definitions of corporate citizenship do focus more narrowly on social good activities of companies, the more business-model-based definition related to overall corporate responsibilities is widely accepted, as the definitions given above indicate.

In the 1960s, U.S. legal scholar Dow Votaw noted that companies needed to be understood not just as economic actors in society but also as political actors. Votaw focused on specific issues related to a company's corporate citizenship that retain currency today, particularly in light of the vast size and economic clout of many large multinational corporations. The issues that concerned Votaw included companies' influence and power, which are derived from a company's size and control of economic and other resources; questions about the legitimacy of firms in society and how they are to be made accountable to broader societal interests; and how companies could be sanctioned when wrongdoing occurs. Thus, deeply embedded in the notion of corporate citizenship is the idea that companies gain legitimacy through a form of social contract granted by societies typically in the form of incorporation papers. With legitimacy comes a set of rights and also responsibilities. Corporate citizenship highlights the specific arenas in which those responsibilities apply, encompassing relationships with stakeholders and impacts on the natural environment and societies.

The reach, scope, and size of many large companies have created significant pressures from different groups in society for better corporate citizenship and greater attention to the ethical values that underpin it. These pressures are highlighted by the fact that, by 2002, 51 of the world's largest economies were said not to be countries but companies. In part, it is this spectacular size and attendant power that have created much of the attention to corporate citizenship, fueled further by concerns about globalization's impacts; management practices of outsourcing key functions to developing nations to reduce costs; ethical and accounting scandals; and corporate influence on governments, communities, and whole societies.

Corporate leaders began paying significant attention to issues of corporate citizenship during the late 1990s and early 2000s, following waves of antiglobalization protests; critiques of corporate outsourcing practices; fears about climate change and other serious environmental problems said to be at least partially created by businesses; and the rise of anticorporate activism sometimes directed at specific companies and sometimes at policies of powerful global institutions such as the World Trade Organization, the World Bank, and the International Monetary Fund. Advanced communication technologies fueled the ability of activists and other critics to question corporate activities and create increasing demands for responsibility, transparency, and accountability by companies.

On the business side, numerous new activities and organizations designed to highlight good corporate citizenship emerged during the 1990s and early 2000s. At least partially in response to vocal activism about supply chain practices, many multinational corporations developed and implemented internal codes of conduct during the 1990s. Some of these companies also asked their supply chain partners to implement the codes in their operations as well. In addition to internal codes, a number of codes and sets of principles, frequently generated by multisector coalitions that included companies, governmental representatives, activists, and nongovernmental organizations (NGOs), also emerged. These codes represent what their developers consider to be a baseline or floor of ethical conduct that serves as the foundation of corporate citizenship. Prominent business ethicists Thomas Donaldson and Thomas Dunfee have labeled such foundational values hypernorms. Although still somewhat controversial as to whether they exist, hypernorms identified by Donaldson and Dunfee include basics such as respect for human dignity, basic rights, good citizenship, and, similarly, fundamental values. Such hypernorms serve as a foundation for all human values and also as a basis for good corporate citizenship. They are built on three principles, including the respect for core human values that determine a floor of practice and behavior below which it is ethically problematic, respect for local traditions, and respect for the context in which decisions are made.

During the 1990s and into the 2000s, there was a great deal of activism against certain corporate practices such as outsourcing, which frequently involved contracting with manufacturers in developing nations whose workers were subjected to abusive conditions, ecological deterioration, and poor labor standards, as well as the impact of globalization. This activism generated a flurry of development of codes of conduct that attempted to codify how such basic principles could be put into practice in companies. As the codes developed, many companies, particularly large multinational firms with brand names to protect, began demanding that their suppliers live up to the standards articulated in the codes.

Many companies developed their own codes of conduct; in addition, a number of codes emerged that were developed by multisector coalitions working from internationally agreed documents or core ethical standards. Among the most prominent, although not without its critics, was the United Nations' Global Compact's set of 10 (originally nine) principles, which were drawn from internationally agreed declarations and treaties. The Global Compact, which had nearly 2,000 members by 2005, was established in 1999 by UN Secretary-General Kofi Annan to "initiate a global compact of shared values and principles, which will give a human face to the global market." In signing onto the Global Compact, companies agree to uphold 10 fundamental principles on human rights, labor rights, environment, and anticorruption.

The Global Compact's 10 principles focus on core or foundational principles and are drawn from major UN declarations and documents that have been signed by most of the countries of the world. Documents from which the principles are drawn include the Universal Declaration of Human Rights, the International Labour Organization's Declaration on Fundamental Principles and Rights at Work, the Rio Declaration on Environment and Development, and the United Nations Convention Against Corruption. The two human rights principles require companies to support and respect the protection of internationally proclaimed human rights and make sure that they are not complicit in any human rights abuses. The four labor standards require companies to uphold the freedom of association and the effective recognition of the right to collective bargaining, eliminate all forms of forced and compulsory labor, effectively abolish child labor, and eliminate discrimination in employment. The three environmental principles require companies to support a precautionary approach to environmental challenges, undertake initiatives to promote greater environmental responsibility, and encourage the development and diffusion of environmentally friendly technologies. The corruption principle, added in 2004, requires companies to work against all forms of corruption, including bribery and extortion.

There are other important codes and principles aimed at putting corporate citizenship efforts into operating practices and strategies. These codes include the Guidelines for Multinational Enterprises of the Organisation for Economic Co-operation and Development, the Global Sullivan Principles of Corporate Social Responsibility, the Marine Stewardship Council's Principles and Guidelines for Sustainable Fishing, the Natural Step's Sustainability Principles, the UN's Norms on the Responsibilities of Transnational Corporations and Other Enterprises with regard to Human Rights, the Equator Principles (for the financial services industry), the Sustainable Forestry Principles, the Caux Principles, the Business Principles for Countering Bribery, the CERES (Coalition for Environmentally Responsible Economies) Principles, the Clean Clothes Campaign model code, the Workplace Code of Conduct of the Fair Labor Association, the Keidanren Charter for Good Corporate Behavior and the Keidanren Environment Charter, the Canadian Business for Social Responsibility Guidelines, the World Federation of the Sporting Goods Industry Model Code, and numerous others.

One observer at the International Labour Organization, a division of the United Nations, counted more than 400 such principles and codes including individual company codes. Many, although certainly not all, of the core issues embedded in these codes are similar, despite differences in wording and specific focus.

These codes and principles evolved, in part, because of societal concerns about corporate practices and impacts. For example, the practice of outsourcing operations including manufacturing and production of many goods and services to low-wage developing nations became very popular among large companies starting in the 1990s and continuing to the present. This practice drew attention to the companies' corporate citizenship because many of the facilities in the developing nations were exposed in media reports as having sweatshop working conditions, abusing the human rights of workers, having poor safety standards, or employing weak environmental management. The practice of outsourcing continued into the 2000s and expanded to call and support centers, programming, and other technologically sophisticated services, which shifted from the developed nations to the developing nations. Concerns about domestic job loss for communities where the outsourcing company had facilities combined with low wages and poor conditions in some developing nations created a public focus on the implications of this type of practice for different groups of stakeholders.

Other factors fueling attention to corporate citizenship include the array of ethical scandals, accounting misrepresentations, and frauds that were uncovered in the United States in the early 2000s, as well as in Europe and elsewhere. Accompanied by accusations of corruption and undue influence in the political affairs of nations, and participation by companies in abusive regimes in certain countries, these scandals drew attention to corporate citizenship or what some believed to be lack thereof. Chief executive compensation, estimated to be on the order of 450 times that of the average worker in the early 2000s, and a wave of consolidations through mergers and acquisitions that created huge oligopolies and even near monopolies in many industries, further fanned the desire for better corporate citizenship and also fanned the flames of attention to corporate citizenship.

Pressures for ever-increasing short-term financial performance from financial markets beginning in the 1980s and continuing to the present have focused many corporate leaders' attention on short-term share prices. The attention to share price caused some observers and critics to believe that companies were failing to pay sufficient attention to other stakeholders, that is, those affected by and able to affect the company's activities. Corporate citizenship thus evolved during the 1990s and 2000s in part as a voluntary effort by many large, and therefore highly visible, transnational corporations as well as numerous smaller ones, to demonstrate their goodwill in the face of concerns about their size, short-term decision-making orientation, their power accrued through control of financial and other resources, and not always positive impacts on stakeholders, societies, and the natural environment.

Criticisms of Corporate Citizenship and Responses

Criticism of a company's corporate citizenship can come from many sources, including activists, the media, local communities affected by company activities, customers, and sometimes nations. Some activists set up Web sites that attempt to foster action against a company, such as a boycott. Wal-Mart, for example, has faced significant problems in some communities because of the company's impact on local shopping districts, low wages, and discrimination against women. Some investors are also concerned about corporate responsibility or citizenship and choose their investments at least in part on the basis of how they perceive the company's corporate citizenship through what is called socially responsible investing. The Social Investment Forum in the United States estimated in 2003 that some $2.16 trillion or more than one of every nine equity investment dollars in the United States was invested in assets that employed at least one of the three main responsible investment strategies—screening investments, shareholder advocacy, and community investment. Screening investments means paying attention to particular negative practices, including poor supply chain management practices such as child labor or abusive working conditions, poor environmental practices, or harmful products such as cigarettes, which some investors wish to avoid. Some investors look for positive practices that they wish to encourage. Returns for investments in screened funds as compared with traditional funds are roughly comparable.

Shareholder advocates focus on changing corporate practices by submitting shareholder resolutions.

Shareholder resolutions are aimed at changing matters of concern to activist investors and are directed to the board of directors through the annual meeting process. Shareholder resolutions can focus on a wide range of issues of concern, including environmental policies and practices, labor standards, wages, harmful products, and excessive executive compensation, to name a few areas of criticism. Some chief executives engage in dialogue with the shareholder activists and promise changes, resulting in the resolutions being withdrawn, while others come to a vote during the annual meeting process. Community investors sometimes put their money into projects that are aimed specifically at helping to improve communities, such as housing developments, retail establishments, and similar projects. They may carry a somewhat lower rate of return than traditional investments, but social investors are willing to make that trade-off when necessary.

Defining corporate citizenship as the contributions of businesses to society through the combination of core business activities, social investment and philanthropy, and participation in the public policy process, the World Economic Forum created a framework for action signed by 40 multinational companies' CEOs in 2002. This framework for action focuses on three key elements that help flesh out what corporate citizenship means in practice: the companies' commitment to being global corporate citizens as part of the way that they operate their businesses; the relationships that companies have with key stakeholders, which are fundamental to the company's success internally and externally; and the need for leadership on issues of corporate citizenship by the CEOs and boards of directors of those companies. This statement also points out the array of terminology used to signify corporate citizenship activities: triple bottom line or sustainable development, ethics, corporate responsibility, and corporate social responsibility. The statement also emphasizes key elements of managing responsibility: leadership that defines what corporate citizenship means to a company, integration into corporate strategies and practices, implementation, and transparency.

Evidence of growing interest on the part of companies in corporate citizenship can be found not only in their joining organizations such as the UN Global Compact, the World Business Council for Sustainable Development (WBCSD), and similar organizations but also in a growing acceptance of the need to manage their responsibilities explicitly. The WBCSD focuses on three pillars of corporate citizenship that have come to be called the triple bottom line—economic growth, ecological balance, and social progress through the lens of sustainable development. For example, many transnational firms with long supply chains have been exposed to criticisms by activists that practices in supply chain companies, which may not actually belong to the multinational company, are problematic, with poor labor standards, working conditions, and environmental standards.

Some companies have actively begun to manage their supply chain relationships by asking suppliers to live up to the multinational's own code of conduct and standards of practice, as well as ensuring that conditions in their own operations are managed responsibly. Such responsibility management approaches are aimed at helping companies protect their reputations for good citizenship by establishing global standards throughout their supply chain. They are supplemented by an emerging institutional framework aimed at assuring that stated and implicit corporate responsibilities are actually met.

Stakeholders and Corporate Citizenship

The definition of corporate citizenship as having to do with the impacts of corporate practices and strategies on stakeholders, nature, and the natural environment links corporate citizenship integrally to the relationships that companies develop with their stakeholders. In the classic definition offered by R. Edward Freeman, stakeholders are said to be those who are affected by or who can affect a company. Stakeholders can be classified into two categories—primary and secondary. Primary stakeholders are those groups and individuals without whom the company cannot exist and typically are said to include owners or shareholders, employees, customers, and suppliers, particularly in companies with extended supply chain. Secondary stakeholders are those affected by or can affect the company's practices and strategies, but who are not essential to its existence. Secondary stakeholders typically include governments, communities where the company has facilities and operations, and activists interested in the company's activities, among numerous others. Sometimes governments or communities can be considered primary stakeholders, as when a company is in a regulated industry or when its business directly serves a given community. The environment is not a person but because all companies and indeed all of human civilization depend on its resources, it is frequently treated as if it were a stakeholder; hence, environmental management and related issues of ecological sustainability are tightly linked to concepts of corporate citizenship.

Each stakeholder group either takes some sort of risk with respect to the company, makes an investment of some sort in it, or is tied through some sort of emotional, reputational, or other means into the company's performance. Shareholders or owners, for example, invest their money in the company's shares and rightfully expect a fair return on that investment. Employees invest their knowledge, physical strength and abilities, skills, intellectual resources, and frequently also some of their emotions in the firm, and the firm invests in training and developing employees. Employees are repaid through their salaries and wages. A significant body of research exists that suggests that when employees are treated well by a company through progressive employee practices that are representative of good corporate citizenship, their productivity will be better and the company will benefit financially and in other ways. Customers trust that the products or services that they purchase will serve the purposes for which they are designed and add appropriate value. Good corporate citizenship with respect to customers, therefore, involves the creation of value-adding products and services. Problems with suppliers can result in numerous issues for companies relating to product quality, delivery, and customer service, not to mention the fact that if the supplier itself uses problematic practices, such as sweatshops or poor labor standards, the company purchasing its products will suffer from a degraded reputation. Hence, it is important for companies to manage their relationships with suppliers and distributors well, particularly because many external observers fail to differentiate between the corporate citizenship of the main company and its supply and distribution chain.

Communities are important to companies because they create local infrastructure, such as sewers, communications connections, roadways, building permits, and the like that companies need. Many companies that view themselves as good corporate citizens have extensive corporate community relations programs, including philanthropic programs, volunteer initiatives, and community-based events intended to enhance their local reputation as a neighbor of choice and sustain what is called their license to operate. Governments are important stakeholders, too, and most large companies have developed significant public affairs functions to deal with governmental relations. They also participate in the political processes of countries where they are located to the extent permissible locally, including contributing to campaigns and working through lobbyists to influence legislation.

Environmental management and sustainability have become important elements of good corporate citizenship as worries about the long-term sustainability of human civilization in nature have become more common. Many large companies have implemented environmental management programs in which they attempt to monitor and control the ways in which environmental resources are used so that they are not wasted through programs that encompass resource reduction, reuse, and recycling. A few progressive firms have begun to focus on issues of long-term ecological sustainability as well.

Responsibility Management and Assurance

Most large corporations today have developed specific functions to deal with these different stakeholder groups in what are called boundary-spanning functions. Because the quality of the relationship between a company and its stakeholders is an important manifestation of the company's corporate citizenship, these boundary-spanning functions, which include position titles such as employee relations, community relations, public affairs, shareholder relations, supplier relations, customer relations, are increasingly important.

In most large companies today there is still no one particular job title or function in which all the corporate citizenship activities reside, though some corporate community relations officers have assumed a great many of these responsibilities. A few companies have appointed individuals to positions with titles such as corporate social responsibility officer, vice president of corporate responsibility, or director of corporate citizenship. These jobs, however, are still far from common as of 2005.

In response to criticisms about their negative impacts on society, stakeholders, and nature, and questions about the credibility of their corporate citizenship, many large companies have developed corporate citizenship statements and strategies; some have even appointed managers to positions with titles such as corporate citizenship, corporate social responsibility, or corporate responsibility officer. By the early 2000s, many large corporations voluntarily began to issue social, ecological, or so-called triple-bottom-line reports, which encompass all three elements of corporate citizenship, aimed at economic, social, and ecological impacts.

Responsibility Management

Responsibility management and reporting in the early 2000s consisted of voluntary efforts on the part of companies to be more transparent about some of their practices and impacts. Because companies were able to report how, when, and what they wanted to, however, many critics still found problems with their corporate citizenship. In response, what can be called a responsibility assurance system, consisting of principles and codes of conduct, credible monitoring, verification, and certification systems to ensure that those principles were being met, and consistent reporting mechanisms began to evolve in the early 2000s.

A given company's corporate citizenship is guided by the company's vision and underpinned by its values. Responsibility management approaches begin with vision and values and are reinforced by stakeholder engagement, which helps companies to determine the concerns and interests of both internal and external stakeholders and make appropriate changes. Unlike CSR, which focuses on discretionary activities, corporate citizenship in its broadest sense represents a more integrated approach to the broad responsibilities of companies that is increasingly being accepted by leaders of global enterprises. When a company adopts a responsibility management approach as part of its corporate citizenship agenda, it also focuses on integrating the vision and values into the operating practices and strategies of the firm, typically by focusing on human resource practices and the array of management systems, corporate culture, and strategic decisions that constitute the firm. Another important aspect of responsibility management, which can be compared in its major elements to quality management, is developing an appropriate measurement and feedback system so that improvements can be made as necessary. A final element is that of transparency, as many companies managing corporate citizenship explicitly publish some sort of report that focuses on their social, ecological, and economic performance. Such reports have come to be called triple-bottom-line reports.

Responsibility Assurance

Skeptical stakeholders need reassurance that companies actually manage their stakeholder, societal, and ecological responsibilities well and were unsatisfied with voluntary internal responsibility management approaches, particularly since such approaches were still mostly in use by large branded companies concerned about their reputation, leaving most business-to-business companies and small and medium-sized enterprises to their own devices. Such critics need reassurance that stated standards are actually being met and that statements about corporate citizenship made by companies are accurate. As a result, in addition to internal and voluntary responsibility management approaches, during the early 2000s some large multinational companies began participating in an emerging and still voluntary responsibility assurance system. Responsibility assurance attempted to provide some external credibility to what companies were doing internally to manage their corporate citizenship. Responsibility assurance involves three major elements: principles and foundational values; credible monitoring, verification, and certification systems that help ensure that a company is living up to its stated values; and globally accepted standards for transparently reporting on corporate citizenship and responsibility activities.

Principles and Foundation Values

Principles and foundation values can be found in documents such as the UN Global Compact, OECD Guidelines for Multinational Corporations, and similar codes of conduct as discussed above. They provide guidance to companies about a floor of practice below which it is morally problematic to go and typically rest on core ethical principles or, as noted above, internationally agreed documents and treaties.

Credible Monitoring, Certification, and Verification Approaches

The second aspect of responsibility assurance encompasses credible monitoring, certification, and verification approaches. Because there is a great deal of skepticism about companies' actual corporate citizenship practice, many critics are unwilling to believe companies when they state that they are ensuring that their codes of conduct are actually being implemented. This skepticism increases in long global supply chains, where companies outsource manufacturing, assembly, and related low-skill work to facilities in developing nations; the outsourced work is granted to suppliers who are not actually owned by the customer or sourcing company. Although the supplier facilities are not actually part of the sourcing company, some multinationals' reputations have nonetheless been tainted when activists have uncovered problems in the suppliers' operations related to human and labor rights, environment, safety, working conditions, abuses that involve poor pay even by local standards or failure to pay overtime, and related problems. Child labor is another serious concern for some activists. It turned out that the media, activists, and ultimately the general public did not make a distinction between the supplying company manufacturing in developing nations and the customer company that was purchasing those goods—both were blamed for the use of child labor, but the multinationals were the nearer and more familiar target, so they bore the brunt of the blame. Even when the multinationals implemented their codes of conduct and asked their suppliers to live up to those codes, problems persisted.

As a result, some footwear, clothing, toy, and sports equipment multinationals and some large retailers, who were among the first companies targeted by activists for poor sourcing practices, not only asked their suppliers to implement a code of conduct but began hiring external verifiers to go into those companies and ensure that standards were actually being met. These verifiers are mostly independent agents; they include both NGOs and sometimes accounting firms attempting to develop an expertise in social, labor, and ecological monitoring. The verifiers perform three main functions in supplying companies, wherever they are found: verification that the standards of the sourcing firm are being met; monitoring of working conditions, pay, labor standards, and health, safety, and environmental standards; and certification to the external world that conditions are what the company says they are. Major companies such as Nike, Reebok, Levi Strauss, The Gap, Disney, and Mattel, and numerous others who have been spotlighted in the past, now employ external verifiers in addition to having their own codes of conduct and internal management systems.

Among the many organizations involved in the verification or social audit process are the Fair Labor Association; SAI International, which offers a set of standards called SA 8000; and the British firm AccountAbility, which offers a set of standards called AA 1000. Others include the Clean Clothes Campaign, the Worldwide Responsible Apparel Production program, the Ethical Trading Initiative, Verité, the Fairwear Foundation of the Netherlands, and the Worker Rights Consortium. Many of these independent monitoring and verification organizations are NGOs, while some social auditors are for-profit enterprises. In addition, some represent women's rights groups, some are focused on labor and human rights, and others are backed by religious groups. Some are local in scope and use local parties to actually conduct the monitoring, while the larger ones are international in scope. Concerns about this type of monitoring or responsibility audit, according to the U.S. association Business for Social Responsibility (BSR), range from issues about the effectiveness of monitors in actually uncovering abuses; lack of resolution of issues uncovered in reports by corporate headquarters; and opinions that other means of reducing poverty, corruption, and related systemic problems will be more effective than verification processes. BSR also suggests several positive reasons why companies wish to employ social auditors and verifiers, including cost reduction by using local monitors rather than in-house monitors especially when facilities are globally distributed, benefits to corporate reputation, better compliance both with the code and legal requirements, enhanced productivity and quality brought about by better working conditions, and greater transparency and related credibility with the public.

Globally Accepted Reporting Standards

The third important element of responsibility assurance is having globally accepted reporting standards that ensure that real transparency exists about corporate practices and impacts. Here, the analogy needs to be made to financial auditing and reporting. The auditing and accounting industry, at least within each nation, has long established standard practices, formats, and criteria for reporting corporate financial performance. Such standardization is important so that investors can compare one company's performance against others in the same industry or across different industries. Currently, the same cannot be said for corporate reporting about social and ecological matters, yet there are increasing demands on companies for greater transparency about their practices and impacts.

Although many companies issue triple- or multiple-bottom-line reports that focus not only on economic and financial matters but also on social and environmental ones, there is still no fully accepted reporting procedure that details what, how, and when different aspects of performance are to be reported. As a result, comparing the social or ecological performance of one company with that of others even within the same industry can be problematic. Restoring public trust in corporate citizenship ultimately will require standardization of social reports and even potentially some legal requirements that all companies issue such reports.

There are a number of initiatives aimed at developing globally accepted reporting standards that ensure social and ecological transparency, including a major initiative by the European Union to standardize CSR reporting. Indeed, the ISO organization, which sets quality and environmental standards, began to develop a set of corporate responsibility standards in 2004, which will be voluntary for companies once completed. A company called One Report helps multinationals and other companies gather and report on issues related to sustainability, which include both social and ecological elements, in a standardized format. Perhaps the most prominent of the initiatives around standardized triple-bottom-line reporting, sometimes called sustainability, reporting is that of the Global Reporting Initiative or GRI.

The GRI began in 1997 as an initiative of the CERES and became independent in 2002. Its mission is to develop globally standardized guidelines for sustainability reporting. Formed by a multistakeholder coalition, the GRI regularly gets input from businesses, accounting firms, and investment, environmental, research, human rights, and labor organizations to ensure that its standards are comprehensive, correct, and appropriate to the situation of different businesses. Linked cooperatively with the UN Global Compact, the GRI has developed specific reporting guidelines, principles for determining what to report and how, and content indicators that guide organizations in developing their own reports. In addition, because industries differ dramatically in the characteristics of what needs to be reported, the GRI also has begun developing industry-specific standards.

The GRI attempts to help companies integrate a number of complex attributes related to their corporate citizenship. These include their code of conduct, international conventions and performance standards, management systems standards, accounting for intangibles, assurance standards, and specific standards related to the company's industry. Sometimes criticized for its complexity, the GRI represents the most recognized approach to date of standardized triple-bottom-line or sustainability reporting.

Criticisms of Corporate Citizenship

Some observers believe that corporate citizenship merely represents an effort on the part of companies to create a positive public image rather than substantive change within the corporation. Particularly when corporate citizenship is treated as discretionary or voluntary activities designed to improve aspects of society, critics believe that it does not go deep enough. Others point out that while the United Nations estimates that there are approximately 70,000 multinational corporations in the world with hundreds of thousands of subsidiaries, only a few highly visible, mostly brand-name companies are actively engaged in explicitly forwarding themselves as good corporate citizens. For example, as of 2005, about 2,000 companies had joined the UN Global Compact, while about 350, many of which had joined the Global Compact, had completed triple-bottom-line audits following the procedures of the GRI.

Another criticism of the concept of corporate citizenship focuses on the fact that citizenship is an individual responsibility involving a corresponding set of rights that relate to membership in a political entity, typically a nation-state, that involve civil, social, and political rights and responsibilities, while companies are not people. Companies, however, do bear responsibilities for their societal and ecological impacts, because they command significantly more resources than do most individuals, because they can influence the public policy process in many nations, and because when they participate in civil society or the political process, they carry more weight than do most individual citizens.

Corporate Democracy Act

The Corporate Democracy Act of 1980 was a bill introduced on April 2 to the 96th Congress by Representative Benjamin S. Rosenthal. The bill had eight cosponsors and was promoted by an alliance of consumer, labor, religious, and environment groups, most prominently, Ralph Nader, a lawyer and consumer advocate. It would have established additional federal standards for the internal governance and conduct of large nonfinancial corporations with more than 5,000 employees or $250 million in total assets. Although the bill was never passed, its introduction had lingering effects.

The sponsors of the bill and its advocates wanted to promote ethical business practices through broader public participation in and greater transparency of corporate activities, as well as increased rights for employees and penalties for corporate leaders who violated the new rules. Most significantly, the bill sought to democratize corporate governance by requiring that the majority of board members be independent from management and directors or officers serve no more than two corporations. The bill also mandated corporate disclosure of particulars, such as employee diversity, compliance with environmental regulations, and political activities. Furthermore, through community impact studies and corporate and federal assistance to employees and local governments, it sought to minimize the incident and impact of corporate relocations and closings. Last, it would have prevented corporations from dismissing or otherwise punishing employees for refusing to submit to a search or a polygraph test or for exercising legal rights in the workplace.

The debates that ensued over the bill centered on the question of whether management-dominated profit-seeking behavior was at odds with or in favor of the public interest. Proponents of the Corporate Democracy Act argued that corporations had become too powerful and secretive and that concentrated leadership led to business practices detrimental to the well-being of employees, communities, and the environment. Opponents of the bill countered that profit-maximizing behavior, regardless of who makes the decisions, benefits shareholders, through increased share prices, and the public, through the assurance of low prices and responsiveness to consumer demands. Sharing corporate decision making with countervailing groups, such as labor unions, environmental organizations, and consumer advocates, opponents claimed, would politicize board members and reduce efficiency, thereby harming shareholders and the public.

The bill did not succeed, but the political goals continue to be pursued by Nader and others. The original bill was referred to the House Committees of Interstate and Foreign Commerce, Energy and Commerce, Judiciary, and, last, to the House Committee of Education and Labor, where no further action was taken. However, components of the act have emerged as principles of U.S. political parties, such as the Green Party and the New Party, and a retitled version of the Corporate Democracy Act, called the Corporate Decency Act, continues to be promoted by Nader through the Center for Study of Responsive Law as a "Model Law."

In the Model Law version of the Corporate Decency Act, some changes have been made to the original act, including greater emphases on penalties for corporate crimes. However, it preserves the general intent of the Corporate Democracy Act—the protection of the public and employees through proposed changes to the corporate governance. Some key aspects of the Corporate Decency Act are as follows:

- The majority of the board will be comprised of independent directors.
- Unlawful corporate behavior will result in more stringent penalties.
- Notification and, in some circumstances, compensation to local governments and former employees for large industrial plant closings or relocations will be required.
- Employees' rights of speech, especially employee "whistleblower" rights, will be protected.
- Information, such as that related to the largest shareholders, company performance, political action committee contributions, health and safety, and criminal convictions will be disclosed.

Corporate Ecology

Corporate ecology is a term used to describe the process through which resources are collected and transformed by corporate entities for use by citizens in modern, free market societies. Influenced by systems theory, corporate ecology seeks to achieve a deeper understanding and appreciation of the dynamic processes through which resources are concentrated and redistributed throughout interlinked elements including living organisms, naturally occurring physical cycles, and corporate activities. More specifically, as corporations act in pursuit of their missions, they have direct and indirect impacts on a variety of people, communities, governments, and natural environmental systems (e.g., air, water, soil, and biodiversity). From this perspective, scholars have found it important to reenvision business as a system nested within, and therefore dependent on, other larger systems, including the social, economic, and natural environments. Since corporate ecology conveys the nature of these systems' interdependencies, it does not imply that corporate activity is good or bad per se. Rather, the idea is that corporate activity has interconnected and multilayered influences and, therefore, must be studied in a multidimensional manner to more completely understand its importance in society.

This understanding has become more significant as members of modern society have become more dependent on corporate production for essential resources required to sustain life. While this may seem like a statement of the obvious, the near total dependence on corporate products to sustain human life is a relatively new development. A mere century ago, for example, nearly 90% of the U.S. population was able to get some proportion of their sustenance from noncorporate sources or self-production. The concomitant changes in resource acquisition and distribution have required new language to allow for proper discussion and analysis of the ecological dimensions of business. Such new language was first introduced to corporate social performance (CSP) modeling by David Saiia when he added corporate ecology to the economic, legal, and ethical responsibilities of Archie Carroll's CSP model to more fully explore these responsibilities as multidimensional, multilayered, and interdependent. Corporate ecology suggests that in some cases activities once deemed acceptable are actually in violation of some aspect of corporate social responsibility or corporate citizenship. For instance, Hooker Chemical exceeded the letter of the law in the disposal of highly toxic waste at Love Canal, but internal documents indicate that some members of the organization voiced doubts about the safety of chemical waste disposal practices at Hooker Chemical. These doubts foreshadowed the terrible consequences that occurred at Love Canal and inspired the Superfund legislation. Love Canal also captures the need and possibility of understanding corporate actions as ecological events. As a first step, William Frederick provided an overarching definition of ecologizing as the ability of business to forge cooperative, collaborative linkages with society that function adaptively to sustain life, which he contrasts to economizing as a process that efficiently converts inputs to outputs through competitive behaviors. Diane Swanson made further contributions to ecologizing by cautioning against reducing business activity to simple categories without reintegrating concepts back into a representation of the whole, including assessing the complementary relationships and dynamic tensions that can exist between ecologizing and economizing.

Along these lines, economizing and ecologizing might be complementary, as when business collaborates with consumers and government regulators to design products that are both safe and profitable. In contrast, trade-offs between ecologizing and economizing can pose social problems, especially since many corporate leaders have been trained to externalize all organizational costs that society will allow and then disregard what has been successfully put outside the boundaries of the corporation. For instance, in an attempt to economize or reduce costs, a firm may pollute the environment instead of internalizing the cleanup costs. However, as in any ecological system, checks and balances may eventually emerge to address such problems, as when a concern for pollution gave rise to the federal Environmental Protection Agency in the 1970s as well as state agencies that help regulate waste and its disposal. Some business firms, in turn, have responded by finding cheaper solutions to waste disposal, thus mitigating the tension between ecologizing and economizing. Since corporate ecology involves processes that are typically beyond organizational mission statements, it necessitates a larger, systematic grasp of organizational activities and reactions to their impacts. Advocates claim that this type of revisioning of corporate organizations and their activities is essential if executives, policy makers, management scholars, and students are to address adequately holistic concepts such as environmental sustainability, which argue for corporations to build more fuel-efficient cars or for power plants to adopt technologies that drastically reduce greenhouse gas emissions.

Despite calls for such reenvisioning, corporate ecology is still far from the mainstream view of business. Jerry Taylor of the Cato Institute dismisses concern about sustainability as corrosive to the global economy at worst and misguided at best. He argues that the sum total of the societal good corporations have done in raising the quality of the human condition far outweighs any environmental damage done incidentally through their activities. He rightly points out that dire poverty is often the proximate cause of environmental degradation in less economically developed countries. Moreover, Julian Simon famously challenged Paul Ehrlich's neo-Malthusian hypothesis that population growth would overshoot the world's resource supply by postulating that since the ultimate resource-creating capacity is human ingenuity, that people would actually be able to add more to the wealth of future generations than they would extract from it. Finally, some neoclassical economists, including Milton Friedman, have argued that corporate social responsibility or the idea of mandating that business organizations account for more than wealth creation for shareholders is inefficient and uneconomical. A closer reading of Friedman, however, reveals an important caveat—he expressly states that wealth creation is bounded by the legal and ethical standards of society. It logically follows that if corporate activity leads to environmental damage that adversely affects the social well-being, then that activity, while it might be economical, is not ethical. Indeed, there is mounting evidence that some corporate activity can have measurable negative impacts on societal well-being and ecological systems.

For instance, perfluorooctane sulfonate, the primary precursor to the popular Scotchguard product, has been found in tissue samples of animals in remote wilderness areas, including penguins in Antarctica, as well as in people worldwide. While there is some evidence that this chemical may be a carcinogen, another disturbing question is, "How does an industrial chemical used in relatively small amounts make its way to the most remote corners of our planet when no direct vectors are present?" As another example, high levels of dioxin, an unintended by-product of plastic incineration and other industrial chemical processes, have been found in whale and fish fat providing evidence of industrial ocean pollution. And global warming is at least partially a product of industrial power generation; and one indication of its impact is that the Arctic ice cover has been decreasing at a rate of 9% per decade since the 1970s. These issues are but a few among numerous scientific findings of detrimental social and environmental harms stemming from industrial activities. Some corporations have taken steps to adopt more ecologically friendly practices by issuing sustainability reports. And a number of management tools and approaches have been suggested for helping business organizations improve their ecological performance, including triple-bottom-line accounting, balanced scorecard, the natural step, the Zero Emissions Research Initiative, ecological footprint, and eco-effectiveness, all of which represent an opportunity for management and governments to recognize that ecologizing and economizing are not necessarily in conflict.

As important as these environmental initiatives are, it is important to remember that there are also distinctly human costs associated with corporate activity, such as low wages and bad work conditions that raise the specter of employee exploitation and alienation. More generally, the pressures and demands of modern employment often leave little time for family and parental duties, which can also cause alienation of employees from employers, the things being made, and the society that consumes them. That these outcomes are seen as direct and indirect consequences of corporate activity is an insight rooted in the late 1800s when society began to recognize the resource, product, and social alienation problems stemming from "industrial man" in isolation from the natural and social environment. Hence, corporate ecology encompasses intergenerational issues of justice, such as the rights of employees and consumers to a certain quality of life as well as the intergenerational rights of species to share a habitable planet.

Historically, management thinking and scholarship has preferred a compartmentalized vision of business in society. As an alternative, corporate ecology offers a way of understanding business as part of larger interactions and interdependencies, the goal being to sustain and enhance the benefits of business activity while reducing or eliminating their negative consequences.

Corporate Ethics and Compliance Programs

Corporate ethics and legal compliance programs are formal programs aimed at managing the ethical and legal conduct of a company's employees. Although companies such as J.C. Penney have had codes of conduct since the early 1900s, the history of more complex ethics and legal compliance programs can be traced to the 1980s and the Defense Industry Initiative on Business Conduct and Ethics (DII). The DII is a consortium of U.S.-based defense industry contractors that subscribes to shared principles and standards of business ethics and conduct (see www.dii.org). The DII developed out of the U.S. president's Blue Ribbon Commission on Defense Management that was convened following a number of defense-industry scandals in the early 1980s. The Commission was asked to develop proposals to guide future defense contractor behavior. A number of companies voluntarily joined together to promote ethical business conduct. As of July 2004, 60 companies were DII members, including a number of smaller companies and companies that supply the defense industry. Members agree to live according to the following obligations:

- Adopt a written code of conduct.
- Conduct employees' orientation and training with respect to the code.

- Provide employees a mechanism to express concerns about corporate compliance with procurement laws and regulations.
- Adopt procedures for voluntary disclosure of violations of federal procurement laws.
- Participate in Best Practices Forums.
- Publish information that shows each signatory's commitment to the above.

The organization hosts a 2-day Best Practices Forum each year, with participation from member organizations and the Department of Defense. It also conducts workshops on specific topics, including yearly 1-day training for ethics/legal compliance professionals, and publishes an annual report to the public and government summarizing DII activities. Information about all these activities can be found on the DII Web site referenced above.

The DII obligations listed above contributed to the development of corporate ethics and compliance programs in these firms because they mandate a number of formal organizational programs, structures, and actions that member companies must undertake to avoid problems such as conflicts of interest and fraudulent time reporting in defense contracting work. For example, companies must have a written code of conduct, they must conduct orientation and training sessions, and they must provide a system for employees to report misconduct or express concerns. Organizations are also required to participate in best practices forums, meaning that they must have personnel who are responsible for managing ethics and legal conduct within the firm.

Shortly after the DII was established, in 1991, the U.S. Sentencing Commission guidelines for organizations were adopted to assess culpability and guide the sentencing of all organizations found guilty of corporate crimes (see www.ussc.gov). Since then, many companies have attended to these guidelines in an attempt to avoid serious sanctions that might be brought against the organization in any future legal proceeding. The guidelines were developed based, in part, on the DII principles and the assumption that the organization should not necessarily be held responsible for a single employee's illegal conduct if the court determined that the organization had made a good faith effort to avoid such misconduct on the part of its employees. In the case of conviction and sentencing, sanctions meted out to the organization by the court would be less severe if it found evidence of such good faith efforts to avoid illegal behavior. To provide organizations with some guidance regarding what the court would be looking for, the U.S. Sentencing Commission offered seven guidelines organizations should follow to be dealt with more leniently. These guidelines included features such as assigning responsibility for legal compliance at high organizational levels, development and distribution of conduct standards (e.g., a code of conduct), training on those standards, discipline for misconduct when it occurs, and an advice and reporting system that would catch problem behavior early and deal with it effectively. As a result, many organizations implemented formal ethics or compliance "programs" that included these elements and they assigned high-level personnel (often the legal counsel or someone in that office) to lead the effort.

With the establishment of this new formal role and structure in many organizations, the Ethics & Compliance Officers Association (www.theecoa.org) was formed, and as of 2006, it had grown to include more than 1,000 members from all kinds of organizations in 160 countries. Members serve as ethics or compliance officers (part-time or full-time) for their organizations and they meet regularly to share best practices regarding areas such as code development, training, hotline use, and conducting investigations. All these activities suggest that formal corporate ethics and compliance programs have become institutionalized, at least in larger U.S. firms. These formal programs generally include the following key elements: written standards of conduct that are communicated and disseminated to all employees; ethics training; and systems for anonymous reporting of misconduct, sometimes combined with telephone or Web-based advice lines. Since the Sarbanes-Oxley law was passed in 2002, organizations have paid even more attention to establishing anonymous reporting systems because these are now required by law.

In 2004, the U.S. Sentencing Commission revised its guidelines for sentencing organizational defendants after receiving input from companies, consultants, academics, and other interested parties. Among other changes, these revised guidelines call for more attention to "ethics" as well as legal compliance and attention to the ethical "culture" of the organization. These changes were thought to be necessary because observers had noted that a large number of organizations were engaging in a kind of "check-off" approach to the guidelines. These organizations conformed to the letter of the guidelines by assigning responsibility for the program to a high-level executive, and they developed codes of conduct, training programs, and reporting systems. But many of these formal programs were either unknown to employees or they were decoupled from everyday organizational activities. In other words, the organization might have a code of conduct, conduct perfunctory training on it, and post a free telephone number that employees could call to report problems. But, if the code was not widely distributed or used in daily decision making, training was ridiculed, or the telephone line was not trusted, organization members would see the formal program as inconsistent with the broader organizational culture, resulting in employee cynicism and program ineffectiveness. More and more, the commission recognized that formal programs must be consistent with the organizational culture to be effective.

It is important to note that a January 2005 U.S. Supreme Court decision (referred to as the Booker/Fanfan decision) has raised questions about the future role of all sentencing guidelines in the United States (organizational and individual). Although the guidelines are now considered advisory, they and the Commission remain in place and studies suggest that the large majority of sentences continue to conform to the guidelines. Therefore, companies that are engaged in these activities largely because of the U.S. Sentencing Guidelines will likely continue to pursue corporate ethics and compliance programs.

The ethics and compliance infrastructure in an organization generally includes some kind of office devoted to these issues. But how these offices and their activities are organized varies widely. Some organizations have large professional ethics and/or compliance staffs while others manage with just a few people at corporate headquarters and then delegate much of the work to line managers. Some structures are highly centralized while others are more decentralized, with business units having their own ethics/compliance officers. In public companies, oversight is generally provided by a committee of the board, such as the audit committee, that receives reports from executives who are responsible for these activities. Given their increased accountability, boards of directors have become more interested in the activities of ethics and compliance offices. However, little, if any, research has been conducted to investigate the effectiveness of different infrastructures.

Organizations communicate their policies to employees in a variety of ways, but most large organizations now have codes of conduct that are distributed to employees and taught about in training programs. Beyond that, organizations use mission statements, newsletters, Web sites, and other communication vehicles to remind employees of their obligations and commitments.

Training programs also vary widely from organization to organization. For some, training is designed by external consultants. Other organizations have in-house staffs that design and deliver their own training. Training is also delivered in a wide variety of formats from Web-based training to small group exercises and case discussions that may be led by ethics office staff, line managers, or consultants. Finally, training is offered at different times to different groups. Most organizations provide some training to new employees and annual training thereafter. Others also offer more specialized training for employees with particular needs. Sometimes, this training is voluntary. Again, we know little about the effectiveness of these various approaches to ethics and compliance training or the circumstances under which some approaches are more effective than others.

Organizations have also established telephone call-in lines. As suggested earlier, at a minimum, most organizations have such a line for the purpose of reporting observed illegal conduct. These are sometimes run by outside vendors who can answer the phone at all times of day and in different languages (for multinational firms with employees in different countries). Others are answered in the organization's ethics or compliance office and some encourage employees to call with questions and concerns, not just to report misconduct. Many organizations scrutinize these calls as part of their evaluation of program success. For example, an increase in calls that ask for guidance before taking action is generally considered to be a good sign that employees are using the hotline for its intended purpose. However, most organizations find that employees are reluctant to use the hotline to report misconduct because of concerns about confidentiality and associated fears of retaliation or because of feelings of futility (that nothing will be done).

Research does suggest that formal ethics and legal compliance programs are somewhat effective in reducing misconduct such as employee theft and increasing other types of behaviors such as reporting. The National Business Ethics Survey (NBES) of the U.S. population, conducted in 2003 by the Ethics Resource Center (www.ethics.org), reported that employees who work in organizations that have all four program elements (standards, training, advice lines, and reporting systems) observe less misconduct and are more likely to report such observed misconduct to management.

However, certain kinds of formal programs appear to be more effective than others. Researchers have characterized differences in the control orientations of such programs. For example, some programs are more "compliance" oriented, meaning that they are focused on adherence to rules, monitoring employee behavior, and discipline for misconduct. Compliance-oriented programs are designed to work by teaching employees about rules and policies and then holding them accountable for departures from the rules. They are likely to work largely by influencing employees' calculus about the likelihood of getting caught and the severity of penalties for misconduct. Other programs are more "values" oriented, meaning that they focus more on creating and appealing to shared aspirations, ideals, and values. As such, they tap into employees' ethical identity and create expectations for the kind of behavior that is appropriate within the organization. These two types of programs are not mutually exclusive and employees may perceive different emphases within a single organization's program. For example, a values-based program can create shared aspirations, but be backed up with accountability mechanisms and discipline for misconduct. Although both types of programs have been associated with positive effects, such as reduced misconduct, employees do respond more positively to values-based programs.

Furthermore, formal programs can be ineffective if employees see them as "window dressing" only (such as with Enron's famous ethics code). For example, the NBES reports that when employees perceive that executives and supervisors emphasize ethics, keep promises, and model ethical conduct, observed misconduct is significantly lower than when employees do not hold such perceptions. Similarly, another study found that informal cultural characteristics such as messages from leaders, daily discussion of ethics and legal compliance issues, and perceived ethics program follow-through (detecting misconduct, following up on concerns raised by employees, behaving consistently with policies) were found to be more important than the existence of a formal program for outcomes such as observed misconduct and willingness to report misconduct. These findings are consistent with the notion that formal programs work best when they are consistent with the broader ethical climate and culture of the firm. However, additional research will be required if we are to answer the many remaining questions about ethics and compliance program effectiveness.

Corporate Governance

In its essence, corporate governance refers to the organization of the relationships between shareholders, board of directors, management, and other stakeholders in a corporation. According to the Cadbury Committee, corporate governance is concerned with the processes by which corporations are directed and controlled. Corporate governance especially deals with exercise of authority over the directions of the company, the supervision of actions of top management, the acceptance of accountability, and the compliance with legal and regulatory frameworks in which the company operates. The term *corporate governance* is not easy to define, as it can be used differently in different contexts. Several academic disciplines that study corporate governance bring their own distinctive meaning of the term. For example, economic theory emphasizes the mechanisms used by financial suppliers of corporations to assure themselves of getting returns on their investment. The study of law examines the power and duties of various corporate governance actors and discusses the legal instruments by which property rights are organized. The authors from the management and business administration focus on internal governance mechanisms that enhance decision making and improve performance.

Definitions of corporate governance have also changed over time to reflect the shift of the purpose and roles of corporations in modern society. In the 1960s, the main purpose of corporate governance was control of business power and authority. Therefore, corporate governance was dominated by investor predisposed definitions supported by agency theory. The corporate discussion was primarily about the control of managerial self-interest and a board of directors' monitoring role. More recent definitions adopt a much broader view, contemplating the whole complexity of corporate life. Margaret M. Blair offers one such definition, according to which corporate governance refers to the whole set of legal, cultural, and institutional arrangements that determine what publicly traded corporations can do, who controls them, how that control is exercised, and how the risks and returns from the activities they undertake are located.

National Governance Systems

Although the conceptualization of national differences in corporate governance is often debated, most comparisons categorize countries into three groups: Anglo-American, continental European, and Japanese–East Asian models. The Anglo-American model is characterized in terms of dispersed ownership and corporate financing through equity or short-term debt markets and active markets for corporate control. It is shareholder oriented and perceives the firm as the private property of its owners. This model is prevalent in the United States and the United Kingdom. The continental European model is stylized by concentrated ownership (usually by large blockholders, such as banks and families), long-term debt finance, and underdeveloped market for corporate control. Although it primarily emphasizes the interests of shareholders, it also takes into account the interests of employees. This model is widely adopted in Germany and to a smaller extent in Continental Europe. Japan and East Asian countries follow a model that emphasizes development of long-term relationships among various stakeholders—the main bank, major suppliers, distributors, owners, and employees. In this pluralist framework, employees' interests take priority. Such an inward-oriented and employee-centered environment of strong and long-term internal relationships, which dominates the firm's governance structure, also diminishes most chances for hostile takeover.

Differences in national patterns of corporate governance are shaped by a plethora of historical, political, institutional, economic, and social influences and determinants. A large number of studies have shown how historical conditions and political institutions influence certain features of property rights and financial markets and, consequently, ownership concentration and company's access to external finance in different countries. Furthermore, some authors argue that one of the main political and social factors relevant to understanding corporate governance is the conflict between owners, managers, and workers. For example, where owners and managers have more power, corporate governance institutions tend to favor shareholders over stakeholders. Property rights, financial systems, and network structures are among the major factors accounting for these national differences.

Property rights define mechanisms through which different groups of shareholders exercise their control and how this control corresponds to managerial discretion. Shareholders rights vary internationally. The outcomes of such a divergence are complex legal and economic arrangements that shape the different mechanisms of corporate control. The Anglo-American system incorporates a liberal market approach. Here, market-oriented mechanisms of control are used to reinforce shareholder rights. Liberal property rights, which postulate relatively high disclosure of company information and establish a one-share–one-vote norm, provide strong protection of minority shareholders. Therefore, this system discourages disproportional control through blocks and favors different dominant interests within corporate governance. The continental European system exemplifies a constitutional model of shareholder control. In this model, shareholders delegate substantial control rights from the general shareholder meeting to a supervisory board. This approach tends to contribute to disproportionate power effects by large blockholders (families, banks, or other corporations). Given the ability of blockholders to secure greater control, they are able to pursue their strategic interests within corporate governance. Empirical research has supported the idea that concentrated ownership increases the external influence over management, whereas in the case of dispersed ownership the shareholders are largely separated from the firm. The Japanese system conforms to a shareholder authority model in which large shareholders hold broad powers. Cross-corporate shareholdings and weak information disclosure predominately protect property rights of majority shareholders and disable minority shareholders from having any influence over the firm.

The second major determinant of governance patterns is the type of financial system on the supply side of the capital market. Financial systems are usually divided into market-based and bank-based systems. The former has greater importance in the United States and the United Kingdom (Anglo-American model). This system promotes equity finance through active capital markets, where suppliers of capital (individuals or institutions) directly or indirectly invest in equity (shares) that is publicly issued by companies. Individual shareholders have little direct influence on management. If dissatisfied with management decision, shareholders have the ability to sell their equity holdings in the firm. In the United States and the United Kingdom, banks typically do not hold company equity and their representatives do not sit as bank representatives on the board, although bank directors as individuals are represented. The bank-based financial system is found to be a dominant investment pattern in Continental Europe and Japan. Banks are the key financial institutions and are closely involved in ownership of the corporate sector. Banks hold shares either in their own right or collect deposits and invest them into companies for others. Their double role as lenders and important shareholders has often been stressed. It has been a historical tradition for this financial system to mobilize capital to the industry. In doing so, it has contributed to the growth of strong relationships between banks, industrial corporations, and other business partners. Dominance of debt finance, through the bank-based financial system, has caused in Germany, for example, the equity market to be relatively undeveloped when compared with equity markets within the Anglo-American system. The German banks have a mechanism for evaluating companies that is not practiced in the banks of the Anglo-American system. In Japan, the same function is covered by large and powerful planning departments of the *keiretsu's* main bank and trading company. The differences between these two financial systems are evident in several measures—share market capitalization, the distribution of financial assets, and firm debt/equity ratios. Even though a large number of countries occupy a position between the two opposing models, financial systems have significant impact on corporate governance. This grip is based on their ability to provide different sources of finance and via their capacity to influence relationships between different shareholders.

Variations in governance systems are also a consequence of interorganizational arrangements or network structures. A network structure refers to the quality and quantity of direct and indirect relationships between companies. Research on social networks has shown that the company's position within the network determines its access to critical resources, diffusion of practices across the companies, and overall power of the company within the network. Interorganizational arrangements of firms that belong to the Anglo-American system of corporate governance are characterized by loosely coupled connections. Their network structure is usually not based on ownership arrangements. Such weak ownership ties, fostered by financial interests of companies, facilitate market-like behavior in their mutual relations. Corporate networks in countries of the continental European system of corporate governance often involve vertical ownership arrangements with various suppliers and the board, thereby interlocking directorates among critical shareholders and creditors. These interorganizational networks are characterized by a high degree of intercorporate cooperation, which strategically promotes long-term relationships between various stakeholders. Codetermination policies in the German model of corporate governance, for example, see large companies as informal partnerships between labor and capital. At the center of the Japanese corporate grouping is a powerful bank or a financially strong company that can provide the other members of the group with capital at low cost. Reciprocal cross-shareholding in the Japanese system strengthens the commitments of organizations within the corporate network/group and weakens the influence of outside entities. This is why hostile takeovers in Japan are virtually unknown. Companies are acquired by other companies only through mutual consent.

The Shareholder Wealth Maximization Model of Corporate Governance

Given an assumed separation of ownership and control in the modern corporation, the shareholder wealth maximization model regards the firm as a nexus of contracts through which various participants arrange their transactions. This theoretical perspective received the strongest support from the "Chicago School" of law and economics. Relationships between shareholders and managers are seen as classical principal-agent relationships with all the difficulties of enforcement associated with such contractual arrangements. The primary responsibility of management is to maximize the value of shareholders' investment via dividends and market prices of the company's shares. Thus, according to this model, the major concern of good corporate governance is how to control the behavior of top management and get them to run the company in the interest of shareholders.

There are at least four mechanisms by which shareholders can induce management to adopt an orientation toward shareholder value: (1) a relatively large ownership position, (2) compensation linked to shareholder return performance, (3) threat of takeover by another company, and (4) competitive labor markets for corporate executives. It is expected that a management share ownership option will motivate managers to identify more closely with the shareholders' economic interest. Though many top executives own a relatively large percentage of shares in their companies, their perspective on risk may differ from that of shareholders. It can be expected that managers have a lower acceptance of risk than shareholders. Where a company makes risky investments, shareholders can always balance this risk against other risks in their portfolio. Managers, however, can only balance an investment failure against the other activities of the company and are, therefore, more affected by investment risk.

The second mechanism that aligns managers' with shareholders' interests refers to compensation tied to shareholder return performance. This is the most direct means of influencing management behavior. Here, a variable portion of managers' compensation is linked to the shareholders' realized market returns. However, this mechanism is not without limitations. For example, an increase in the price of market share may be the consequence of factors beyond management control, regardless of whether they have worked hard or made good decisions.

The third mechanism is the threat of takeover by another company. Any extensive exploitation of shareholders' or maximization of managers' self-interest should be reflected in low share prices. A lower share price provides a takeover opportunity for another company or investors. The new owners will usually replace existing management. Where such a circumstance is plausible, an active market for corporate control proves to be both an external and ultimate mechanism that has the ability to create a convergence of interests between managers and shareholders.

The fourth and last mechanism of aligning managers' self-interest with those of shareholders is the competitive labor market for corporate executives. Managers compete for positions within and outside the company. Within this market they are evaluated on corporate performance, both in terms of accounting-based and share market–based measures. As a result, executives leading poorly performing companies will be offered fewer top executive positions within and outside the company.

The shareholder value perspective was dominant both in U.S. and U.K. companies in the 1970s and 1980s. An emphasis on sustaining share price and dividend payments at all costs encouraged the use of mergers and takeovers as mechanisms of corporate control to punish managers who were unsuccessful in improving shareholder value. Such an approach created economic instability and insecurity and was widely criticized by various economic and strategic analysts.

Throughout the years proponents of the shareholder value perspective have become more tolerant toward the interests of other stakeholders. Nevertheless, the main principles, which claim the supremacy of the ultimate owner, have remained the same. Consequently, the focus on shareholder value and stakeholder interests has become a foundation of good corporate governance.

The Stakeholder Value Perspective on Corporate Governance

The stakeholder view of corporate governance argues that all groups and/or individuals with legitimate interests in the company have the right to participate in the company's activities and gain a share of its economic success. There is no distinct priority of one set of interests and benefits over another. Therefore, a company should be seen as an organizational coalition between numerous and heterogeneous groups who provide their resources (i.e., capital, labor, management, loans, expertise, material, and service) to accomplish multiple, and not always congruent, goals through the company's activities.

Primary stakeholders are considered to be those with a legitimate claim to participate in the company's affairs, that is, those who directly participate in the economic-value-creation process and who are directly affected by the company's policies (e.g., employees, specific customer segments, key suppliers, certain financial institutions, and key governmental agencies). Other interest groups such as local communities, trade associations, and consumer groups, which are indirectly affected by the company's actions, are regarded as the secondary stakeholders.

According to the stakeholder perspective, the major concern of corporate governance is how to balance the interests of different stakeholders. Shareholders' legitimate emphasis on share prices and dividends must be balanced against the legitimate demands of other groups. However, these demands are not only financial. Different groups have different values. For example, employees might highly regard education and training support, suppliers of materials might prefer secure demand, and the local community might appreciate minimal air pollution. The balancing of these interests requires constant negotiation and compromise between inside and outside stakeholders and between directors and managers.

The trend toward the stakeholder perspective of the corporate governance is reflected in existing and emerging regulations of many developed countries. The codetermination laws in Germany, which require employee representation on the supervisory board; harmonization of the rules relating to company law and corporate governance in the European Union, which will take into account interests of employees, creditors, and customers; the Japanese well-known legal and customary model of corporations with its interrelated stakeholders including customers, suppliers, financial institutions, and other business partners; and the campaign toward stakeholder law in the United States all demonstrate demand for formal instruments to democratize the governance of corporations.

Board of Directors

The board of directors is a governing body elected by shareholders to direct and supervise the management of the company. The board establishes the strategic direction and objectives of the company and sets the policy framework within which the company operates.

Different countries have different governance practices in terms of the board composition and its functioning. However, in general, members of the board of directors can be grouped into two main categories: (1) executive directors, who also have a management function in the company; and (2) nonexecutive (outside) directors, who have no managerial responsibilities. Nevertheless, they can have executive functions in other companies. Nonexecutive directors are selected to ensure that a broad range of skills and experience is available. In addition, a nonexecutive director can be formally classified as "independent." An "independent director" has no direct or indirect, current or previous, professional or personal interest or relationship in the company. It is believed that independent directors will empower the board with their ability to exercise independent judgment and effectively monitor management. Increasingly, the corporate governance practice of some countries has required or encouraged representation of formally independent directors on the board.

Within the tradition of the companies that originate in the Anglo-American system of corporate governance, boards can delegate some of their functions to various committees of the board. The purpose of a committee is to address certain issues in a more detailed manner than is possible at board meetings. The board as a whole, however, retains full responsibility. It is a standard practice for nonexecutive directors to establish the audit committee and remuneration committee. The audit committee oversees compliance with statutory responsibilities, thus ensuring that adequate internal controls are in place, advises the board regarding accounting policies and practices, and reviews the scope and outcome of the external audit. The remuneration committee deals with remuneration packages of the executive and nonexecutive directors and other groups of key executive managers. It may also consider succession issues.

Roles of the Board

Board roles can be generally categorized into three groups—control, service, and resource provision roles. The control roles involve the directors' fiduciary duties of monitoring management on behalf of shareholders. Directors' responsibilities in this role include appointing and dismissing the chief executive officer (CEO)/president and other top executives, deciding executive remuneration, and monitoring managers to ensure that shareholders' interests are protected. The services roles consider directors' advisory functions in formulating strategy and providing guidance to the CEO and top managers in other managerial and administrative issues. The resource roles refer to directors' assistance in the acquisition of critical resources for the company.

From a legal perspective, the control role is the primary purpose of the board of directors. Directors owe fiduciary responsibility to the corporation and shareholders. Fiduciary duties include the duty of care and duty of loyalty. Essentially, fiduciary duties call on directors to make every attempt to be well-informed before they make decisions, to act in good faith and the best interest of the shareholders, and to be independent in their decisions. From a financial perspective, directors' control role is primarily grounded in agency theory. That is, directors' source of power is derived from shareholders. Board members are selected by principals (shareholders) to monitor managerial behavior (agents). By actively monitoring management actions and firm performance, the board can reduce agency costs and maximize shareholder value.

One of the most prevalent roles of the board is its service role, that is, provision of advice and support to the CEO. It is argued that this role is most visible in organizations that experience external monitoring mechanisms, such as product and managerial labor markets. The service role is also stressed in the companies with major institutional shareholders, which decrease the need for active board control. Directors' involvement in the determination of corporate strategy is an important aspect of their advisory role. A number of studies have shown that directors engage in various stages of the strategic planning process, from the review of strategic initiatives to active involvement in strategy formulation.

The board is often seen as a key organizational body that could provide critical resources for the company, protect the company from environmental uncertainties, and reduce transaction costs in managing external relationships. Nonexecutive, outside directors, in particular, play an important role in providing (1) specific resources otherwise unavailable to management (e.g., financial funds, information), (2) access to external institutions and influential organizations (e.g., regulatory bodies, consulting firms, and international organizations), and (3) legitimacy. Resource scarcity prompts corporate boards to engage in interorganizational relationships in an attempt to moderate influences of external pressures on their companies. As capital is one of the key resources, companies often use interlocking directorates with financial institutions as a tool to facilitate access to cash. Contextual factors may moderate the importance of the resource role of the board. For example, small and entrepreneurial companies in which access to critical resources is problematic will benefit from the appointment of a reputable and influential director on their board.

Different Board Structures

In the Anglo-American system, boards of directors are usually unified bodies dominated by management. In a great number of large corporations in the United States and the United Kingdom, the CEO is also the chairperson of the board of directors. CEO duality is often criticized as an undesirable feature of this system, as it may limit the board's independent decision making. A typical board has between 9 and 15 members, most of whom are nonexecutive, outside directors. All directors are elected by shareholders in a general annual meeting. It is common for many individual shareholders not to attend these meetings. Most shareholders will vote on the election of directors and important policy proposals by "proxy," that is, by mailing election forms. There is no legal requirement for any specific stakeholder or interest group to be represented on the board. To achieve a greater accountability of directors to shareholders, an attempt is made to restructure the traditional board composition and introduce a majority of nonexecutive directors (i.e., directors not employed by the firm).

The continental European system of corporate governance functions on a two-tier board structure. This model is practiced in Germany, Austria, Holland, France, and Finland. The functions of the board are performed and split between a supervisory board or council and a management or executive board. The supervisory board has three core roles. First, it approves and evaluates the company's strategy and policies proposed by the management board. Second, it monitors the company's performance and accounts. Third, it appoints and dismisses members of the management board and monitors and evaluates the performance of the board itself. All members of the supervisory board are nonexecutives and no common membership is allowed between the boards. The supervisory board is headed by a chairperson, whereas the management board is headed by the CEO. The members of the supervisory council are elected at the general shareholders meeting. The management board is responsible for the day-to-day operations and running of the company. A two-tier board structure may work better where shareholdings are not as diversified as in the Anglo-American system and where there is a strong stakeholder concept, as in Germany.

In the German model, which is the most distinctive in this system, the supervisory council (*Aufsichtsrat*) consists of both employee representatives, appointed through trade unions, and capital representatives, appointed by shareholders. Members of the management board (*Vorstand*) are professional managers. Although all directors in the supervisory council are nonexecutives, they are seldom truly independent of the company. In enterprises with more than 500 employees, employees are represented in the supervisory council. In such cases, the council can have up to one third of employee representatives.

In the Japanese system, the formal corporate structure is that of a unitary board. Japanese boards are usually very large, with sometimes more than 30 members. Some researchers consider the *keiretsu* of cross-shareholdings as an informal governing body. It is a common practice that corporate governance takes place behind the scenes, between the corporate executives and representatives of major institutional shareholders. In general, the board of directors does not have external representatives of shareholders (outside directors). The only external person on the board may be a representative of the main bank. The board is composed of the corporation's own executives and former executives. The majority of directors within Japanese corporations are promoted from within the company and the rest are appointed from parent or affiliated companies. This internal promotion practice is an important component of the lifetime employment policies in Japanese corporations. The advancement to board membership is awarded to employees at the end of their working career for excellent performance during their professional employment. In this way, the boards of Japanese corporations represent the collective interests of the company and its employees rather than its shareholders.

Relations Between the Board and Management

The quality of board-management relationships is an ongoing issue for every board, regardless of the national setting. Both management and the board are responsible for the well-being of a corporation. The main question is how do the board and corporate management strike a balance for sharing these responsibilities?

The CEO is responsible for the day-to-day company operations and is expected to be the best-informed individual and most committed to the company. The directors are usually not involved in the operational affairs of the company and rely on the information provided by the CEO. In general, the directors should give an overall direction to the company, approve strategic decisions, and propose structural changes. It is believed that the separation of the role of the CEO from that of the chairperson enables a greater balance in board functioning, by way of limiting the power of the CEO to dominate the board.

However, many scholars and corporate governance experts also believe that effective functioning of the board depends on the quality of individuals and their ability to interact among themselves, and with the CEO and other managers, rather than only on the structural composition of the board. The fact that shareholders, management, and other stakeholders have changing expectations about the directors' knowledge and contribution to and involvement in the company's strategic affairs have led boards around the world to redesign themselves and their relationships within and outside corporations. Boards are expected to be more proactive in seeking information, in challenging the CEO in a constructive manner, in working together as a team, and in getting a deeper understanding of the company's business.

Some proponents of board redesign emphasize the importance of the dynamic balance between control and collaboration approaches in the board-management relationship. According to this view, a control approach protects a corporation from self-serving behavior and reduces goal conflict, whereas a collaborative approach encourages cooperation between the board and management and fosters trust and goal alignment. Acceptance, understanding, and management of control-collaboration tensions promote learning and improve governance. Other authors stress the role of the CEO and called to attention the evolution of the CEO-board relationship. Following the evolutionary perspective, these authors argue how the advisory role of board has a relatively higher significance in the early period of CEO tenure while the control-focused approach is emphasized more in the later CEO tenure.

The Changing World of Corporate Governance

The emerging research on corporate governance has extensively considered new developments in national corporate governance systems, the increase of institutional shareholders activism, and the changing role of boards in knowledge-based organizations.

Changes in National Governance Systems

The Asian financial crises in the late 1990s and the U.S. corporate scandals at the beginning of this century have fuelled debate concerning the current models of corporate governance. Market failures and corporate collapses have urged the need for radical reforms in corporate governance and regulation. In the last decade, corporate governance transformation has become a major concern of national governments, stock exchanges, international organizations, and corporations themselves. More than 40 countries published corporate governance codes; the OECD has issued the principles and World Bank and IMF released the guidelines. In the United Kingdom, Sir Adrian Cadbury's final report on "The Financial Aspects of Corporate Governance" in 1992 and the final Hampel Report in 1998 were influential in setting in motion corporate governance reforms in the United States and in the United Kingdom. The Cadbury Code became a framework for international standards of governance. The main recommendations related to (1) the clear separation of responsibility at the corporate level, (2) involvement of nonexecutive directors, (3) the role of committees formed by nonexecutive directors, and (4) the formation and functions of audit and remuneration committees.

The most current major initiative to radically improve the corporate governance system in the United States came in the form of the Sarbanes-Oxley Act of 2002. The act was formed in response to a series of corporate collapses, including the Enron, WorldCom, and Tyco International financial scandals. It is designed to protect shareholder value and the general public from corporate wrongdoing. The Sarbanes-Oxley Act dealt with four major issues in corporate governance of public corporations. First, the act created an oversight board to set and enforce auditing standards and discipline public company auditors. Second, the act intended to foster auditor independence. For example, the corporate members with a financial reporting supervision role should not be employed by the external auditor. Third, the act increased corporate responsibility, by requiring that CEOs and CFOs certify all periodic reports containing the company's financial results. Having knowledge of the certification of false statements is subject to criminal liability. Finally, the act enhanced financial disclosure with regard to the off-balance-sheet transactions and obligations with consolidated entities and individuals. These key provisions of the Sarbanes-Oxley Act have significantly strengthened the role of the board of directors and have made managements more accountable.

The cooperative, inward-oriented and employee-centered model of the Japanese corporate governance system was usually portrayed as a source of competitive strength for the Japanese economy. However, since the beginning of the Japanese recession in the 1990s, many studies have shown that some of the reasons for the economic downturn in large Japanese companies originated due to a lack of effective monitoring of managers by shareholders and weak accurate disclosure of companies' financial conditions and business performance. To improve the state of the economy, Japan has embarked on the modernization of the corporate governance system emphasizing better protection of shareholders rights, increased responsibilities of directors, and regular disclosure of information. In 2003, the Corporate Governance Forum in Japan established guidelines and defined best-practice corporate governance principles. The forum proposed the adoption of specific elements of the Anglo-American system. These included appointment of nonexecutive directors on the board, introduction of an executive officer system, and enforcement of auditor power.

The German model of corporate governance has also been pressured to undertake reformative changes. The publication of the official "German Corporate Governance Code" in early 2002 marked a milestone in the development of good governance in Germany. The code addresses all major criticisms, especially from international investors, that point against German corporate governance—namely, inadequate focus on shareholder interests, insufficient independence of supervisory boards, the two-tier board structure, the limited independence of financial statement auditors, and inadequate transparency of the German corporate governance system. The main purpose of the code is to make Germany's corporate governance rules transparent for both national and international investors.

In Europe, the EU Commission's role in corporate governance has increased in recent years but is limited due to major differences in national and company laws. In May 2003, the EU Action Plan was set up to define minimum governance standards for European companies. The idea of the EU Action Plan is not to legislate for all EU member states but to achieve convergence of the many different governance regimes within a well-defined timeframe.

The Rise of Power of Institutional Shareholders

In the 1970s, individual shareholders held almost 80% of the equity in the United States. By the end of the 1990s, however, their holdings had decreased below 45% while institutional shareholding had increased to 53%. In 2002, individual ownership declined further to just over 37% while institutional ownership reached over 55%. Corporate governance is highly affected by changes in power of different categories of shareholders. Controlling shareholders, such as families, individuals, or other corporations, can have significant influence over corporate strategic behavior. Small individual shareholders, on the other hand, do not exercise governance rights as they usually do not have knowledge, power, and incentive to control corporations. However, they are concerned about fair treatment from majority shareholders and management. Institutional shareholders have emerged as a distinctive and demanding voice in corporate governance within the Anglo-American system. Institutional investors, such as large pension and mutual funds, have the power to directly influence managerial decisions in many corporations. Their activism has led to a greater emphasis on shareholder value and directed management to place greater priority on their interests rather than those of stakeholders. The board of directors meets regularly with representatives of institutional and large investor groups to actively communicate corporate developmental strategies. It is expected that such groups have higher knowledge and long-term interest in the company. In this situation, management interests are more likely to be aligned with those of shareholders. Some observers of institutional investor activism assume that this development is bringing the Anglo-American model of corporate governance closer to those of the continental European and Japanese models.

Corporate Governance in Knowledge-Intensive Firms

The context of increasing technological intensity creates additional challenges for corporate governance. A boards' legal and moral authority has always been derived from their representation of shareholders of the firm. This authority, legally translated into accountability for the key strategic assets of the firm, guides deployment of these assets toward the most productive and shareholder-approved uses. However, the nature of strategic assets that needs to be accounted for in a knowledge- or technology-intensive company is significantly different. It is not only that these assets are intangible but also there is difficulty in agreement over who owns them and who is responsible for them. Specific assets, such as human capital, producer's tacit learning, or complex networks of interorganizational interactions, create a governance problem that standard models of control in corporations do not explicitly address. Due to lack of knowledge and inability to evaluate information, a traditional board of directors, for example, may be an ineffective governance mechanism.

The competitive advantage of knowledge-intensive firms comes mainly from nonphysical and nonfinancial assets, which can include employee know-what and know-how, training and development processes, and intellectual property. These companies offer different organizational cultures that thrive on ambiguity and offer an antithesis to control approaches that are more amenable to traditional industries. Such cultures reflect changes in power relations between financial and human capital. In these organizational environments, greater attention is paid to human resource issues because of an increased importance of technical and scientific personnel. As some authors suggest, human capital—the assets that each day go home and which are readily moveable—should be treated with care. Therefore, corporate governors should more explicitly affirm the rights of nonshareholders by allowing them formal involvement in governance processes. This formalization may be initiated through special compensation schemes or other arrangements that align the employees' interests with those of shareholders. Thus, if knowledge is the immanent resource and a critical asset of new companies, are individual employees becoming residual claimants in the changing world of corporate governance?

Conclusion

The topic of corporate governance has attracted a lot of attention and has become a subject of enormous debates in the recent years. Corporate scandals and collapses taking place in most countries have prompted regulatory reforms in all national governance systems. The issues of corporate governance are complex and deeply embedded in specific historical conditions and economic and political circumstances. Corporate governance researchers and professionals all agree that there is no one best way to design a governance system. In the modern world, an emerging perspective on corporate governance goes beyond the conventional emphasis on financial aspects of corporate control and takes into account interests, constraints, actions, resources, and influences of all constituencies in the corporate governance system. This entry has attempted to present some of the key building blocks, major perspectives, and the most recent developments and challenges of corporate governance.

Corporate Issues Management

Corporate issues management is the internal process by which a firm attempts to assess potential and future threats from unfolding events, situations, and interactions that either arise from organizational actions and past history or are externally driven. Issues that arise externally can be a result of nongovernmental organizations' activities; from events outside the organization's control, as a result of legislation and regulation; and as a consequence of changing societal mores. Issues management is the long-range planning tool of the corporation (and its public affairs department) to assess potential areas of concern and prepare the organization to lead the issue development or to respond in a reactive manner to the issue that is led by others.

What Is an Issue?

Some have defined an issue as any major environmental trend and possible events that might have a significant impact on the firm. There are other definitions that use "impact" as a way to define issues. But this is insufficient to define an issue in a manner that any organization can act on it. Others tie in the notion of impact with the timing of the issues likely to emerge as shown in Figure 1 (the comments in parentheses are examples of types of issues that could appear or have appeared in the quadrant). The argument is that issues with a high impact on the organization and with a high likelihood of actually occurring are dangerous and should be attended to with great care. Issues of medium impact and moderate likelihood should be monitored for developments, and issues of low impact and low likelihood, while not ignored, should be watched for future developments. This is the most simplistic view of issues but has appeal, as it is a visual way of capturing the complex interactions that occur. Issues are not simple—consider genetically modified organisms. What is the issue here? Is it a trade issue and as such should be resolved by the rules of international trade? Or is it a public health issue and therefore resolvable in regulatory and legislative hearings? Or is it an issue of prevention of starvation of large segments of society?

A crisis is not an issue, but it can be a trigger for an issue to emerge after the crisis is resolved in some manner. Consider the explosion of a Union Carbide plant in Bhopal, India; the sudden collapse of Enron; or the enormous oil spill of the *Exxon Valdez* in Valdez Alaska. All these events occurred with blinding speed; engaged and affected large segments of society; and

	Likelihood of Issue Emerging/Occurring		
Impact	**High**	**Medium**	**Low**
High	Dangerous (terrorism)	Concern	Closely monitor (increasing trade barriers)
Medium	Potentially dangerous (energy shortages, data security)	Monitor (immigration reform)	Occasional monitoring
Low	Monitor (rising energy costs)	Occasional monitoring	Infrequent monitoring

Figure 1 Severity and Likelihood of Occurrence of Various Corporate Issues

demanded immediate responses to limit further damage to the environment, human life, and investors. Issues do not always emerge with such speed and/or breadth of impact. But as noted, the explosion in Bhopal led to interest in legislative measures in plant safety worldwide—and that was an issue for the chemical industry to deal with as a whole. In a similar fashion, the collapse of Enron led to new legislation for the regulation of accounting and reporting and continued interest in corporate governance that goes far beyond the accounting industry. Finally, the oil spill in Alaska led to increased interest in tanker safety and in how organizations respond to such crises.

It should become readily apparent that an "issue" is not what it always appears to be and that part of understanding issues is to be aware of the complexities and dynamics involved in defining what the issue is and how other players (stakeholders) will attempt to define an issue and place it on a specific agenda for resolution.

Another way of looking at issues is to consider them as a disagreement between one or more parties over facts (what is), values (what is or ought to be), and/or policies (how shall we deal with the problems raised by the issue). Note that policies can be developed even if there is no agreement on facts and/or on values. Further building on this theme, one can argue that an issue can be seen as a conflict between one or more actors over procedure (how will decisions to pursue a solution and its implementation be undertaken) or substantive matters relating to the distribution of positions or resources. The controversy approach implies contestability among key stakeholders of the organization as a key dimension of change that underlies an organization (or corporate) issue.

A final approach to defining an issue is to consider an issue as an expectational gap between society's (or a key stakeholder's) expectation of social conditions or what the organization should be doing and the actual behavior of the organization. If we put these three approaches together, we get a complicated but useful definition of an issue. A *corporate issue* is a controversial inconsistency based on one or more expectational gaps involving management perceptions of changing legitimacy and other stakeholder perceptions of changing cost/benefit positions that occur within or between views of what is and/or what ought to be corporate performance or stakeholder perceptions of corporate performance and imply an actual or anticipated resolution that creates significant, identifiable present or future impact on the organization. This is a long definition, but it captures the dynamics and complexities of unfolding corporate issues.

Techniques for Dealing With Issues

Issues seek an arena for resolution—that is, when an issue arises the organization and the stakeholders involved seek to have the issue "resolved" in a specific arena. The legislature, the judiciary, and the regulatory agency are examples of specific arenas. Please note that organizations (and stakeholders) seek to choose an arena in which they have an advantage over other actors. However, the first approach to dealing with an issue is to prevent it from achieving visibility and building momentum. If an issue can be blocked, diverted, and postponed such that it does not require action, then the organization does not have to expend resources and attention on the issue. One technique for doing this is to refuse to recognize that an issue exists. This has been used by many in arguing against global warming. The argument is simple—this is not a problem and it does not deserve our attention. Another approach is to argue that the issue or problem is an isolated event and not worth the effort to develop policy to deal with it. Initial arguments on AIDS indicated that it was isolated to a limited few and not worth further effort (and clearly this was wrong). Finally, an organization can refuse to recognize the groups or stakeholders attempting to advance the issue or problem for resolution. This is a favorite tactic of governments, to deny groups (e.g., civil rights groups, environmental groups) access and ignore them. Note how these techniques are linked—they involve nonconfrontation with those advancing the issue. The media plays an enormously important role in raising the visibility of an issue. If an issue has villains, visuals, and victims, it stands a very good chance of being picked up by the media and becoming more visible.

No matter how good an organization is, it cannot prevent an issue from arising and gaining attention and adherents. This process occurs via what some have called naming, blaming, and claiming. An issue gains visibility when it is named and causes separation between actors in the process of resolution. For example, is world trade an economic issue of global trade or is it an issue of imperialism and discrimination against Third World countries? Note that how an issue is named has powerful consequences on how the issue unfolds and "who" is for or against the issue.

Once an issue is named, then blaming can occur—whose fault is this? Blaming is about assigning responsibility for the consequences/effects of the issue. Blaming also provides strong suggestions about where (arena) the issue will be resolved. Is mad cow disease a problem of governmental oversight of the beef industry or the result of unscrupulous farmers? If it is a problem of government oversight, the arena for resolution might be a legislature or a regulatory hearing. If it is unscrupulous farmers, then lawsuits might be the preferred arena choice. After blaming, claiming occurs. This is where specific claims are made on the organization responsible for the issue/problem.

If an organization fails to contain an issue, it emerges and gains visibility. The approach here would be to select an arena where the organization might have an advantage. This would require the organization to frame the issue (name and blame) in such a manner that the issue would go, say, to a legislative solution instead of a legal battle.

If others dictate the arena in which an issue might be resolved then the organization can pursue other techniques. At this point, the organization needs to decide if it wants to attack the group advocating the issue or attack the issue itself. Actions here involve questioning the legitimacy of opposing groups (attack their credibility, their skills, their knowledge, their history, etc.) or attacking the issue directly—for example, this is an issue, but it is too complex for resolution and understanding by nonexperts (global warming is an example here as is nuclear power). A final approach is to raise the fears of the general public and divert attention to other issues away from the specific issues being addressed (e.g., raise issues of terrorism, homeland security).

If these approaches and techniques fail, then the organization can recognize the existence of the problem and undertake actions that can be seen as coping with the issue. Arguments center around mutual interests, cost-benefits (costs exceed benefits), setting up committees, co-opting the leadership of opposing parties by bringing them inside the focal organization (e.g., appointing them to committees), postponing action (would like to but can't for a variety of reasons), and pointing out the past accomplishments/successes of the organization.

A careful reading of the techniques discussed thus far would demonstrate that they increase in cost and effort to the organization. Clearly, if an issue can be denied access and does not arise, the amount of time, effort, and resources involved can be minimal. Once an issue achieves a threshold of visibility, the cost and effort dynamics change. As the issue continues to grow, building adherents and opponents and entering a specific arena, even more costs and effort is involved in dealing with the issue.

Issues Linked to Stakeholders

Issues management is about identifying issues of import to the organization and prioritizing them. Once the issues are prioritized, then policy development occurs. Policy development is where the organization decides what exactly its position is on a given issue (and what arena an issue should be placed in). Only after policy development can an organization (normally its public affairs department) engage in public advocacy on the issue. Organizations are very adept at identifying and prioritizing issues but lose precious time and advantage in delays associated with policy development. Organizations frequently find themselves in a reactive mode because an issue that was identified and properly prioritized emerges faster than planned and led by others. Why? Because the organization is unable to develop its own internal position on the issue in a reasonable timeframe.

Issues are, as noted, a long-range planning tool and process for organizations, but issues do not exist in isolation. Organizations do not "manage issues," they plan for issues, much like a coach plans for an athletic contest. But nothing happens without the other players—generally termed stakeholders. Superlative corporate issues management not only identifies and prioritizes issues but also clearly identifies likely stakeholders, their positions on the issue, and their likely level of involvement and then suggests courses of action the organization can take.

Once an issue achieves some threshold of visibility, actors (stakeholders) take positions on issues. These positions may represent interests that they have in the issue and its resolution. Other stakeholders may have no interest whatsoever in the issue and its resolution—they are kibitzers or commentators. Their "stake" in the issue is one of being asked to comment on the issue, to offer suggestions for the issue, to assess proposed solutions, and the like. Simply put, these stakeholders are not substantive ones but on the fringes of the issue. There are also zealots that surround issues—zealots are those individuals and groups that have the *one and only* *solution to the issue.* They are quite willing to destroy the organization in the process of seeking a resolution and will not compromise. Finally, there are stakeholders who get involved in an issue because of prior commitments. These stakeholders may "owe" other stakeholders involved with the issue and get involved to pay a debt or a commitment made, but their degree of commitment to a resolution is modest at best.

The challenge for any organization is to clearly identify the substantive stakeholders from the kibitzers, the zealots, and those stakeholders who are involved because of prior commitments. Stakeholders form alliances and a first-rate organization recognizes the potential patterns in those alliances and moves to prevent the most threatening ones from ever forming around the issue of interest. In short, not all stakeholders are equal nor are they all interested in the resolution of the issue. This is where the techniques for dealing with issues come into clear relief. The process of issue identification, specific tactics, arena selection all can impact on stakeholders and their continued involvement in the issue. Issues management well executed can (1) prevent an issue from emerging, (2) place the issue in an arena of the organization's choosing, (3) prevent or discourage selected stakeholders from engaging on the issue, and/or (4) prevent threatening stakeholder alliances on a given issue from ever forming.

Issues management is a sophisticated, ever-evolving organizational skill to deal with complex problems and can be used by private organizations, nongovernmental organizations, and governments.

CORPORATE MORAL AGENCY

Insofar as they are capable of exhibiting intentional action, corporations may be regarded as moral agents. Agents reflectively endorse specific ends and shape the world by imposing those ends on the world. Because agents have this sort of intentional capacity, they are properly characterized as responsible for the actions they impose on the world. Persons are prototypical examples of agents and the class of persons is properly understood as subset of the class of moral agents. In U.S. law, the class "persons" includes entities other than human beings such as corporations. The courts attribute personhood to corporations on pragmatic grounds, finding this a useful convention for the purposes of corporate law. The question of whether or not there are grounds for thinking that, from a metaphysical standpoint, corporations are properly understood as moral agents is a separate matter.

French's View

A quarter-century ago, Peter French published an influential essay on the metaphysical status of the corporation. He has subsequently defended the core of that view in a series of books and essays. Despite its many critics, French's theory of corporate personhood remains the single most influential account of the metaphysical status of corporations. Corporations, as French noted, are of particular interest in comparison to other sorts of collectives or organizations because of their distinct rules of governance and hierarchical structure. In his early work on the metaphysical status of corporations, French reached three main conclusions. First, corporations exhibit intentionality. Second, corporations are capable of exhibiting rationality regarding their intentions. Third, corporations are capable of altering their intentions and patterns of behavior. As a result, he concluded that corporations are full-fledged moral persons and have the privileges, rights, and duties that are, in the normal course of affairs, accorded to moral persons. This claim received sustained criticism over the years. In particular, critics have argued that French's position is illegitimately anthropomorphic. For example, Richard De George has argued that, unlike human beings, corporations are not ends in themselves. Other critics have argued that it is absurd to suggest that corporate persons have the same emotional status as human persons. Still others have argued that corporations cannot be persons, since all persons have a soul and no corporation has a soul.

Intentionality

In his early defense of corporate personhood, French grounded his arguments in the belief-desire theory of intentionality. He argued that when the corporate act is consistent with an instantiation of established corporate policy, then it is proper to describe it as having been done by a corporate desire coupled with a corporate belief and so as a corporate intention. Critics seized on French's use of the belief-desire theory, arguing that, since he wrongly attributed distinctly human intentionality to corporations, his defense or corporate intentionality failed. For example, Manuel Velasquez argues that all attributions of intentions to corporations must be understood as metaphorical since they are not literal mental states. He denies the possibility of such an argument because he stipulates that intentions must be understood as mental states identical to those present in individual human minds. However, this is not the only way of understanding intentionality. One alternative way of understanding intentions is as commitments to future action. Such a characterization of intentions leaves open the possibility that entities other than conscious biological beings may be properly understood as intentional.

Central to the claim that corporations are moral agents is the claim that corporations have intentions. Prosecutors and judges routinely attribute intentionality to corporations. Nonetheless, the attribution of intentions to corporations has been rejected by many theorists as an untenable hypothesis. Partly in response to such criticism, French has modified his view of the metaphysical status of the corporation in two significant ways. First, French has abandoned the idea of corporate "persons" in favor of a defense of corporate "actors" or agents. This move allows French to avoid the criticism that his view is illegitimately anthropomorphic. Second, French now rejects the belief-desire theory of intentionality that he had previously embraced in favor of Michael Bratman's planning theory of intentionality. This allows him to avoid criticisms associated with the belief-desire theory of intentions.

Corporate Intentions

Bratman's account of intentions emphasizes their future-directed nature. On his account, intentions are typically elements of plans. Bratman argues that as rational agents with complex goals most of our intentional actions will stem from deliberation and reflection prior to the time of action, that is, from planning. The plans characteristic of human agents have two essential features. First, plans are typically partial or incomplete. They need to be filled in over time. Second, plans typically have a hierarchical structure. Bratman has extended his analysis of the intentions of individuals to shared intentions of a certain type—namely, the intentions shared by two individuals who plan to engage in a joint activity. Consider two individuals who plan to take a trip together. What roles do their shared intention to take a trip together play? First, their shared intention allows for the coordination of planning. Second, their shared intentions structure relevant bargaining. Third, their shared intentions allow for the coordination of activities. On this account, shared intention is a state of affairs that consists of a web of attitudes of the individual participants. Shared intentions are not, then, mere mental states.

French has suggested that Bratman's account of intentionality will provide an adequate basis for a theory of corporate intentionality, yet French has not developed a sustained argument for that conclusion. However, Bratman's analysis of shared intentions has recently been extended to corporations by Denis Arnold. He argues that the state of affairs characteristic of shared intentions is also characteristic of corporations. Typically, corporate decisions are made in accordance with the structure previously characterized by French as a corporate internal decision (CID) structure. This well-known and essential feature of French's account of corporate moral agency includes hierarchical lines of organizational responsibility, rules of procedure, and corporate policies. A CID structure performs a normative function, that is, it tells members of the corporation how they ought to behave. When employees act in a manner consistent with the CID structure they instantiate corporate intentions. Corporate intentions are states of affairs consisting of both the intersecting attitudes of the class of agents comprising the corporation and the internal decision structure of the organization. The CID structure serves as the frame on which the attitudes of board members, executives, managers, and employees are interwoven to form corporate intentions.

Praiseworthy corporate intentions include value creation, the development of innovative technology, and respectful regard for stakeholders. Blameworthy corporate intentions include deceptive marketing, systematic dumping of toxic chemicals into pristine natural environments, and theft from shareholders.

Arnold argues that since corporations are properly understood to have intentions, there is a basis for thinking that corporations are properly understood as agents. However, he points out that for corporations to be properly regarded as moral agents, a further condition must also be satisfied. Corporations must be capable of reflectively endorsing corporate intentions. Corporations that are capable of evaluating past decisions and existing plans, of determining whether those intentions ought to remain in place, or whether they should be modified or eliminated in favor of alternative intentions are capable of the requisite reflective endorsement and are properly understood as moral agents.

Conclusion

The idea that corporations are properly understood as moral agents remains unpersuasive to many theorists. First, some critics maintain that all agents must be understood as having souls. Since it is implausible to attribute a soul to a corporation, some theorists conclude that corporations cannot be understood as agents. Second, the idea that corporations are capable of reflectively endorsing intentions strikes some theorists as implausible. They argue that reflective endorsement is a quality of human persons and one that cannot reasonably be attributed to organizations.

Defenders of the view that corporations are properly understood as moral agents point out that this view has important implications regarding moral responsibility. For example, if a corporation is properly understood as a moral agent, then it is possible to praise or blame corporations and not just the directors, executives, managers, and workers of a corporation at a particular time. Punishment of the corporation, and not just corporate personnel, is thereby justified when corporate intentions are morally objectionable. In cases where corporation actions are especially pernicious as a result of corporate intentions, corporate capital punishment in the form of the dissolution of the corporation may be justified. So too, corporations that exhibit consistently praiseworthy behavior as a result of corporate intentions are justifiably rewarded independently of corporate personnel.

Corporate Philanthropy

Corporate philanthropy is the practice by companies of giving charitable donations to a wide range of societal institutions, especially nonprofit or nongovernmental organizations (NGOs), including social service agencies, environmental groups, housing and poverty agencies, schools and universities, hospitals, and other organizations, whose goals are to benefit society in some way. Sometimes termed *corporate social investment*, *corporate philanthropy* can be considered part of companies' overall approach to corporate community relations and to the somewhat broader concept of corporate social responsibility (CSR). CSR is defined as the direct attempt by companies to contribute to the betterment of society. CSR with its elements of philanthropy is part of the larger picture of companies' corporate citizenship, which is defined as the ways in which a company's strategies and practices, that is, the business model, affect its stakeholders, society, and the natural environment.

Corporate philanthropy takes a number of forms including direct monetary donations and grants to not-for-profit organizations; in-kind donations, such as product and service donations; employee volunteer programs; technical support; and the deployment of skilled managers into social enterprises on a volunteer or advisory basis, including sometimes as members of boards of directors of nonprofit organizations. In the most progressive firms, managers and sometimes employees are evaluated partially on their contribution to the community, which is seen as an important element of a company's philanthropic endeavors. In addition, multisector or public-private collaborations are frequently considered to be part of a company's philanthropic program or CSR. These types of contribution will be discussed in more detail below.

Companies in the United States are estimated by associations such as the Conference Board and the American Association of Fundraising Counsel to give between 0.7% and 1.3% of pretax profits in philanthropic contributions, according to Business for Social Responsibility. The American Association of Fundraising Counsel estimates that about 5% or about $13.5 billion of the total amount of charitable gifts of nearly $251 billion in the United States in 2000 was donated by corporations. The use of corporate philanthropy is most prevalent in the United States, where the practice began, though multinational corporations from other nations are increasingly developing giving programs as well. Some NGOs are skeptical of strategic philanthropy programs because they believe that there should be an intrinsic value to philanthropy that is diminished when the company benefits and because only those interests that benefit the corporation will receive philanthropy; however, there is also evidence that strategic philanthropy approaches are becoming increasingly popular.

Rationales for Corporate Philanthropy

There are numerous reasons why companies engage in philanthropy. Some of them have to do with improving their relationships with important stakeholders such as employees and customers. In surveys, many employees claim that they will make decisions about employment partially on the basis of a company's reputation for CSR. Similarly, some customers claim that, assuming quality and price are comparable, they will take a company's reputation for corporate responsibility, of which philanthropy and community relations is an important aspect, into account in their purchasing decision.

A survey by the Center for Corporate Citizenship at Boston College and the Points of Light Foundation found in 2003 that 52% of companies incorporate a commitment to their local communities into their mission statements. Thus, in some respects corporate philanthropy serves as a public relations vehicle for improving a company's image and, more important, its reputation with important stakeholders, though other uses are more strategic. Companies, of course, also hope that their philanthropy will engender greater loyalty from stakeholders, leading to reduced employee turnover and greater retention and repeat purchases on the part of customers.

In the early days of corporate philanthropy, much of the giving centered on societal issues and organizations that drew the attention and interest of the chief executive officer. By the early 2000s, most large companies had moved beyond giving donations simply on the basis of the chief executive's and other top managers' interests toward more structured programs of giving, some of which can be characterized as strategic philanthropy, in which donations are directly linked to business goals. Of course, one important reason for corporate philanthropy's existence is that of altruism, a desire on the part of company executives to do explicit good for society, which can be characterized as a normative or ethics-based rationale. The second major rationale for philanthropy is called enlightened self-interest and argues that there is a business case to be made for companies giving away money in ways intended to do social good. While there is a trend toward more strategic giving, which will be discussed below in more detail, usually both motives are embedded in philanthropy programs.

Companies that attempt to use philanthropy simply as a public relations activity rather than actually improving on their actual stakeholder-related practices subject themselves to criticism. Such companies are attempting to create a good public image for the firm just by giving corporate donations. The criticism focuses on the fact that philanthropy alone cannot make up for bad practices elsewhere in the firm. Still others, particularly people coming from the perspective of neoclassical economics, criticize corporate philanthropy as giving away shareholders money and suggest that only individuals should be allowed to give money away. The courts, however, have agreed with the philanthropists that companies can engage in corporate philanthropy as part of their practice of good corporate citizenship.

Methods of Corporate Philanthropy

Companies direct their giving efforts in a number of ways. These methods include direct grants, gifts, and donations; cause-related marketing; in-kind donations; community investment and economic development activities; and volunteerism, which are discussed in the sections below.

Grants, Gifts, and Donations

Many companies have direct giving programs to which charitable organizations or NGO can apply directly for grants, which can range from very small to quite substantial amounts of money. Most of these grants go to the nearly 800,000 nonprofit organizations estimated to be in the United States, as well as to other socially beneficial programs around the world. The U.S.-based Foundation Center estimates that corporate foundation giving decreased by about 2% in 2003, following a significant gain in 2002, which was partially attributable to giving related to the terrorist attack on New York's World Trade Centers in 2001. Some of the decline is attributable to declines in the stock market. The overall amount of corporate cash donations is generally relatively stable though was decreasing somewhat during the early 2000s, with other kinds of corporate philanthropy assuming a bigger proportion of giving. Processes for nongovernmental or nonprofit organizations receiving grants from companies or their foundations range from quite informal, for example, the submission of a letter explaining the purposes to which the grant will be put, to formalized application processes with extensive internal review and monitoring of outcomes and results.

Cause-Related Marketing

Cause-related marketing, which falls between philanthropy and marketing, occurs when a company links the level of sales or use of its products or services to donations to specific charities, often those whose interests are aligned with those of the company. Pioneered by American Express in the 1980s, when use of the company's credit card was tied to charitable donations, cause-related or cause marketing has become quite common. Types of cause marketing include corporate sponsorships of events, partnerships with NGOs for specific fundraising purposes for the NGO, and campaigns aimed at developing new business for the company while the NGO receives funding.

In-Kind Donations

Many companies provide in-kind donations, that is, donations of their particular products or services, to NGOs as part of their philanthropy programs. Such donations are termed *noncash* donations by the U.S.-based Conference Board and can include products manufactured by the firm; the donation of services for which customers usually pay; technical support that can be offered as a result of a company's expertise; and sometimes recycling and reuse of outdated equipment, which is given to NGOs. Loaned executives or other employees who use their skills to help NGOs by working for them part of the time—for instance, helping with strategic planning or day-to-day operations; making organizational changes; or improving operations, marketing, accounting, finance, or other functions—can also be considered as performing a type of in-kind giving. In-kind donations are estimated by the Conference Board to be on the order of 25% of total contributions, as measured through tax valuation or fair market value. Because companies draw resources from society, many people in society expect that the company will be involved in helping communities and society more generally to thrive, hence the growth in in-kind and charitable contributions.

Community Investment and Economic Development Activities

Some companies' managers believe that it is important to help the communities in which they have operations to thrive for a number of important reasons and do so through their community relations programs using community investment strategies. One reason is to build local communities that are healthy, have good amenities such as arts and culture, and good educational programs so that employees will want to live in those communities. Many companies donate to local schools and youth organizations because they recognize that having a well-educated workforce in the future will be critical to their long-term success. In addition, local communities provide much of the infrastructure, including telecommunications, sewers, roads, and public services of all sorts, on which companies' facilities rely, and establishing good relationships with local community officials, often done through the charitable donations to local service agencies and NGOs, helps ensure their success. Corporate philanthropy is directed at a number of types of causes, including local arts and cultural organizations, schools and universities, community development and housing programs, mentoring and job training programs for youth, children's organizations, environmental organizations, sports leagues and events, local economic development including both inner city and rural.

Community investment is an important form of philanthropy for many companies, although it can generate free rider problems when one company contributes and others simply benefit from the community improvements derived from those contributions. Typically run through the community relations program, community investment focuses on assuring the sustainability of local communities where a company has operations and is frequently most focused on the locale where the company is headquartered. A number of the donation strategies listed above are used to implement community investment locally. In addition, when some company leaders become actively involved in local civic and political life, the community relations program can invest in local businesses or create local investment opportunities and source at least some supplies locally to support the community. Sometimes corporate facilities are used for local events. Managers and other employees can sometimes get release time—paid time away from work—to volunteer in community-based organizations, participate in civic events and policy dialogues, and otherwise engage in activities that support a thriving community.

Volunteerism

Another aspect of corporate philanthropy is company support of employee volunteerism. Again, as with other forms of philanthropy, volunteering is more popular in the United States than in the other parts of the world, though it is increasing globally. Some companies encourage their employees to volunteer and some even provide paid leave for volunteer activities in the recognition that local communities will benefit directly from employee volunteer time and the company itself may well benefit indirectly. Some companies recognize employees who volunteer on their own time through awards ceremonies and publicity about their activities; others provide matching grants for volunteer services.

Some companies' leaders believe that there are direct and indirect benefits to the firm when employees volunteer. For example, when employee volunteers work in teams at a nonprofit organization, they can gain useful team-based skills that translate back to their work situations. In addition, employee volunteers make local connections with community and civic organizations and their leaders, providing better links between the company and its community-based stakeholders. Occasionally, companies find that good business data, new contacts, and even new markets can evolve from information and new insights brought back by employees from volunteer experiences. Thus, some of the benefits to the company and employees from volunteering can be enhanced skills, leadership opportunities that might not happen within the work setting, and better teamwork, particularly when teams of employees volunteer together. Business for Social Responsibility suggests that other benefits may also inspire volunteer programs, for example, the ability to develop a local labor pool, improve the company's reputation with the community, create connections that help communities when there is a crisis or problem, and leverage other philanthropic resources better. Companies that have volunteer programs, in turn, may find it easier to recruit employees because they find the company to be a better employer, easier to create satisfying relationships with local officials in the community, and easier to work with public officials when the company needs new infrastructure or community support for a new facility.

Multisector Collaboration/ Social Partnerships

In addition to giving away money, products and services, and employee time, some companies find that their corporate philanthropy involves establishing ongoing partnerships or collaborations with NGOs, including schools, local social service and health agencies, and sometimes governmental organizations. Partnerships and collaborations can involve monetary donations, but they are more interactive, in that they also require ongoing involvement in whatever the focal activity of the partnership is. For example, many companies become involved in partnerships to improve local schools in communities where they have facilities because they recognize the importance, on a long-term basis, of a well-educated and highly skilled workforce. Other companies become involved in collaborative efforts to improve the community through community development activities that can include improved housing, better community policing and safety standards, and the creation of economic opportunity through improving access to local jobs and higher education for all.

Strategic Philanthropy

Companies increasingly view their philanthropy activities through a strategic lens, in what has come to be called strategic philanthropy, although some observers are skeptical about how strategic much philanthropy actually is. In strategic philanthropy, the company attempts to link its own mission, or particular products and services, with the charitable activities it funds, so that the society, through the social mission of the NGO, and the business benefit simultaneously.

In developing a strategic philanthropy program, a company takes into account its own strategic objectives, the interests of its stakeholders, the issue area in which it wants to make contributions, and what the company and the NGO with whom it will link do best—that is, what are both organizations' core competences. When there is alignment between the missions of the two organizations, then philanthropic activities can be considered strategic in nature. For example, a sports equipment or gear manufacturer might associate some of its philanthropy with sporting events, perhaps aimed at youth, the disadvantaged, or people with disabilities, so that the company generates goodwill with a specific target market potentially interested in the use of its products. These events carry the company's name and have the potential to enhance its image and reputation with a group of actual or potential customers.

Harvard Business School economist Michael Porter suggests that corporate philanthropy can actually be strategic when it is somehow used to improve the competitive context—that is, the quality of the business environment where businesses operate. By improving local education, providing individuals with training in skills that the company needs, or improving the community in significant ways, the company can actually reap long-term benefits. Porter identifies four elements of the competitive context that can be enhanced by strategic philanthropy. One element is the availability of high-quality, specialized inputs, such as human and capital resources, physical and administrative infrastructure, scientific and technological infrastructure, and natural resources. A second aspect of the competitive context is the status of local policies and incentives that either help or hinder businesses and vigorous local competition. A third element is the presence of sophisticated and demanding customers, who create specialized local demand that also reaches far beyond the community. The fourth aspect is strong local suppliers and related companies clustered within a given region or community. Porter advises investment in strengthening these aspects of the environment through strategic donations to key organizations within the community that can help strengthen these elements.

Corporate Philanthropy Programs

Philanthropy programs in companies can take three general forms, although numerous variations of these are possible. The least formalized programs simply allocate some money for donations, often based on the charitable interests of the chief executive officer. Most large U.S. companies today, however, have gone beyond such informal programs and established formally structured giving programs. Within the corporation, these programs are typically housed within the corporate community relations department, the public affairs unit, or in a similar function within the company. Alternatively, they are sometimes set up as separate corporate foundations, which receive money from the corporation or its founder but are managed independently of the firm.

Corporate philanthropy is more prevalent in the United States than in other parts of the world, because there is a long history of individual philanthropy in the United States that has translated to corporations. Most large corporations have some sort of giving program established; however, the tendency seems to be to allocate most of the giving domestically with smaller proportions going to international divisions. Among the major targets of overall philanthropy at about $251 billion in 2003, according to the Giving USA Foundation, are educational organizations (about 13% of total giving); religious institutions (about 36%); foundations (about 9%); international affairs (about 2%); environment and animals (about 3%); public-society benefits (about 5%); arts, culture, and humanities (about 5%); human services (about 8%); and health (about 9%), with the rest unallocated.

In 2003, *BusinessWeek* published its first annual ranking of the most philanthropic companies in the United States, citing retail giant Wal-Mart stores as the most philanthropic company in its study for donating $156 million in cash, although the company did not make the top 10 in terms of contributions compared with total sales. The company topping the list in terms of both cash and in-kind gifts compared with total sales was Freeport-McMorRan Copper & Gold at 0.879% of sales, followed by Corning at 0.787%, and Computer Associates at 0.640% of sales. Critics sometimes charge that companies give away money to burnish their images through what is called greenwashing, that is, trying to look environmentally or socially friendly when they actually are not. Others, however, believe that there are both sound business reasons and altruism for companies working directly to improve society. Despite the conflicts, what is clear is that many companies do give substantial amounts of money, products and services, employee time, management assistance through collaborations of various sorts, and other forms of giving.

Corporate Political Advocacy

Corporate political advocacy addresses a firm's participation in the formulation of public policy at various levels of government. As the regulatory environment has become more intense and complex and as other changes have taken place in society, firms have had little choice but to become more politically active. Attempts by firms to influence government are a major and accepted part of the public policy process in the United States. The U.S. political system is driven by the fervent participation of interest groups striving to achieve their own objectives. The business sector is, therefore, behaving in a normal and expected fashion when it assumes an advocacy role for its interests. As decisions about the current and future shape of society and the role of the private sector shift from the marketplace to the political arena, firms, like all interest groups, find it imperative to increase their level of political advocacy.

Historically, firms engaged in vigorous debates in Washington, D.C., only on an issue-by-issue basis and with no overall sense of a purpose, goal, or strategy. Also, firms tended to be reactive; that is, they dealt with issues only after the issues had become threats. Today, success in Washington is just as important as success in the marketplace. Just as business has learned that it must develop competitive strategies if it is to succeed, it has learned that political strategies are essential as well. The firm engages in this activity by using techniques such as having a political strategy, lobbying, political action committees, and coalition building through organizations to influence rules, regulations, and laws enacted by government that affects its environment. One of the things that the firm has to manage in its environment is the government's actions and its effect on the market. The U.S. government abides by a stringent privatization model for the business market. The government frowns on owning and operating businesses in the United States. Instead, it monitors the firm's activities in the market to ensure that on balance efficiency and fairness are practiced throughout. The government, through its complex rule-making process, attempts to ensure that the market is fair, a firm does not have an unfair advantage, and the resources in the environment are not abused. At any point in time, the government can veer the market's direction by using controls that impact the business and consumers. Over the past 100 years, firms have been very successful in acquiring a coveted status in the market similar to that of a person. Today, firms are beheld as a legal "fictitious person" and are afforded the same rights, privileges, and protections as individuals. Thus, firms are able to use constitutional safeguards identical to what individuals exercise when their rights are abridged. More specifically, numerous clauses in the constitution including the First, Fourth, Fifth, and Fourteenth Amendments grant enormous rights to firms against government actions. With the advent of these new rights, firms have taken the liberty of using its influence to affect the actions implemented by government.

Under Articles 1, 2, and 3, the government may delegate some of its duties for rule making, enforcing rules, and interpreting the laws to the legislative, executive, and judicial branches. Accordingly, the legislative branch has established federal agencies to monitor the activities taking place in the market. Some of these agencies report directly to the executive branch while others are independent from both the legislative and executive branches. Some examples of executive branch agencies are the Department of Commerce, the Department of Agriculture, and the Department of Transportation. These agencies report directly to the president of the United States. Conversely, independent administrative agencies operate on an autonomous basis from the president. Examples of these agencies include the Federal Trade Commission, the Federal Communications Commission, and the Securities and Exchange Commission. Executive branch agencies function under a concerted policy orchestrated by the president of the United States. These branches venture to provide a certain type of structured environment for firms to operate in. Each branch has a specific role in the process of establishing policy for the government.

The legislative and executive branches of government are easier for firms to influence. There are specific parts of the rule-making process that afford firms the ability to intercede and influence the policy before it is developed. Conversely, it is more arduous for the firm to influence the judicial process because most federal judges are appointed for life, although some federal judges, who are appointed by the president, serve for a limited term in office. Federal judges who are appointed to preside on the tax court, bankruptcy court, or international trade commission serve for limited terms. However, they can be subsequently reappointed to successive terms. So the vast majority of a firm's resources are headed for the political advocacy arena and used to influence the legislative and executive rule-making process.

Special interest politics have become a way in which most legislation is passed in the United States. Subsequently, most firms have come to recognize that to endure it one must be an active and effective player in the process. One telling example of not being involved in the process demonstrates what can happen to firms that take an isolationist policy toward the rule-making process. Microsoft used a superficial presence in Washington, D.C., prior to the Justice Department bringing an antitrust case against it for monopolistic competition. Before the suit was brought, Microsoft used one lobbyist and its office was in the Microsoft federal sales office. The lobbyist had no secretary and no relevant lobbying experience in Washington. Microsoft had no real savvy in understanding how the lobbying system worked in Washington. Microsoft transposed its isolationist strategy for political advocacy as a result of being sued by the Justice Department. Microsoft began to increase its level of political giving to both parties. It retained an impressive cadre of well-connected lobbyists and public relations officials to adduce its case to legislators and the public. The in-house staff swelled from one person to 14, and it used a multitude of high-powered help on retainer.

Microsoft contributed millions to both political parties in the 2000 presidential election, hired both Bush and Gore advisers as lobbyists, and became the ninth largest "soft money" corporate donor in the United States. Microsoft ran a national ad campaign featuring a "warm and fuzzy" Bill Gates, while simultaneously touting the multimillion-dollar charity campaign contributions it made to various organizations. Think tanks that supported Microsoft interests received major donations; those that espoused views contrary to it were abdicated. Microsoft even hired almost entirely all the law firms in Washington, D.C., so that nearly all the lawyers in town would be unable to work for its competition. In 2004, after years of struggling with antitrust cases, both domestic and abroad, Microsoft situated one of its best lawyers to chair the American Bar Association's antitrust section, a group that has significant influence over the expatiation of antitrust policy and law.

Political Strategy

As illustrated from the example concerned with Microsoft, it is fatuous for a firm to engage in the political activism process without a sound strategy. The firm should have a goal of what it wants to accomplish and specific objectives for how it is going to get there. Befittingly, the impetus for developing a comprehensive strategy for engaging in the political process is to alter legislation. As firms devise and execute political strategies, it is useful to see their initiatives as factors in their development of stakeholder management capabilities. Unlike actual persons, corporations antithetic to actual persons cannot be imprisoned or suffer "capital punishment" by being forced out of business by the judicial system.

The firm has a multitude of objectives that it wants to pursue in developing a political strategy. First, it will attempt to limit the issue from taking a prominent position on the policy stage. Second, if the firm can't limit the initiative from moving into the limelight, it will attempt to define the public issue. Third, if the firm can't shape the issue, it will find a coalition to limit the impact on the industry. So the firm has to proceed in a manner that will yield the greatest results. The firm has to develop an approach to this process that allows it to engage the decision makers in a manner that focuses on outcomes. So the firm must determine how best to advocate its concern either for or against a proposed rule. The firm can influence the process at different stages and affect the ultimate policy that is created. Given the extreme nature of our competitive environment today, most firms find themselves working with other firms to develop a national agenda with a focus on a more progressive role in the public policy process. With so much pressure coming from foreign markets, firms are forced to band together to find workable solutions that benefit its industries. This mode does not require a recusant departure from traditional goals and strategies but is more biddable and adaptive to a changing political environment and structure.

Lobbying

The business community engages in lobbying at several different organizational levels. At the broadest level are umbrella organizations, which represent the collective business interests of the United States. The best examples of umbrella organizations are the Chamber of Commerce of the United States, the National Association of Manufacturers, State Chambers of Commerce, and City Chambers of Commerce. Out of these groups have grown organizations that represent some subset of business in general, such as the Business Roundtable, which was organized to represent the largest firms in America, and the National Federation of Independent Businesses, which represents smaller firms.

At the next level are trade associations, which are composed of many firms in a given industry or line of business. Examples include the National Automobile Dealers Association, the National Association of Home Builders, the National Association of Realtors, and the National Association of Medical Equipment Suppliers. Firms that are actively involved with an association do so by preference. They usually pay some type of member fee to be affiliated with the association. Also, they are in league with other firms that they compete directly against on a day-to-day basis.

Another tier of coalitions constructed to confront political issues are international associations. Examples of these organizations include the World Trade Organization, the International Chamber of Commerce, the International Fair Trade Association, and the United States Council on International Business (this is a U.S. group dealing with international business). These organizations work to provide a basis for firms to influence the foreign government's policy-making process.

Finally, there are the individual company's lobbying efforts. Here, firms such as IBM, BellSouth, Time Warner, Viacom, and Chase Manhattan Bank lobby on their own behalf. Typically, companies use their own personnel, establish lobbying offices for the sole purpose of lobbying, or hire professional lobbying firms or consultants located in Washington or a state capital. The business lobbyist plays a significant role in assisting firms in achieving their political strategy. The business lobbyist engages in the following activities for its clients including getting access to key legislators, monitoring legislation, establishing communication channels with regulatory bodies, protecting firms against surprise legislation, drafting legislation, communicating sentiments of association or company on key issues, influencing the outcome of legislation, assisting companies in coalition building around issues that various groups may have in common, helping members of Congress get reelected, and organizing grassroots efforts. Lobbyists also play the important role of showing busy legislators the virtues and pitfalls of complex legislation.

Political Action Committees

Political action committees (PACs) have been around for years, but their influence has been most profoundly felt in the past two decades. This is perhaps because the bottom line in politics, as well as in business, is often measured in terms of money—who has it, how much they have, and how much power they are able to bring to bear as a result. Business PACs appeared on the scene in the early 1970s as a direct result of the 1974 amendments to the Federal Election Campaign Act. Under this law, organizations of like-minded individuals formed together and created a PAC for the purpose of raising money and donating it to candidates for public office. Under the law, PACs may contribute $5,000 per candidate per election including primary, runoff, general, or special. There are no aggregate limits on how much a PAC may contribute to numerous candidates. The $5,000 limit is less restricting than that placed on individuals, who are limited to donating $2,000 per federal candidate per election.

At the start of 2004, 3,868 PACs were officially registered with the Federal Election Commission. This represents a decline from more than 4,000 PACs that were registered in 2001. Corporate PACs were the largest subgroup with 1,538 committees. In the 2000 elections, PAC contributions to the House and Senate totaled $200 million, with another $200 million going to national parties as well as candidates for local and state offices.

In addition, firms have used a loophole in the PAC legislation to donate what is called soft money directly to political parties instead of political candidates. The Bipartisan Campaign Reform Act (BCRA) of 2002 attempted to limit the use of soft money and curtail the use of certain political ads. BCRA bans national parties from raising and spending soft money. In addition, BCRA prohibits federal officeholders and candidates from raising soft money for political parties at the federal, state, and local levels and, likewise, from soliciting or raising soft money in connection with federal or nonfederal elections. Shortly after passage, certain special interest groups challenged the law's constitutionality in court. In May 2003, a federal court held the soft money ban to be unconstitutional and allowed political parties to raise soft money again while setting restrictions on the airing of issue ads. This was immediately appealed to the U.S. Supreme Court. On September 8, 2003, the Supreme Court upheld the soft money and issue ad restriction of the BCRA in a five to four ruling. This legislation did not stop firms from finding other mechanisms to pour soft money into political campaigns. Despite all efforts to limit the amount of soft money contributions, other strategies are being deployed to continue raising significant sums of capital for political campaigns. For instance, nonprofit organizations know as 527s are allowed to raise and spend soft money on campaigns. Some are concerned that these groups will be less accountable than the political parties were prior to the law's inception. In the 2004 elections, Democrats made particularly strong use of 527s to create a shadow Democratic Party that could circumvent campaign financing restrictions.

Yet another means by which firms are able to get around campaign financing reform is the act of bundling. Bundling is the collection of individual donations, with a limit of $2,000, that are then delivered in bulk to the candidate. Typically, a senior executive will host a fund-raising event and invite high-level employees to attend and donate up to the $2,000 threshold. Clearly, one unintended consequence of campaign financing reform has been to shift the burden for political contributions from firms to their employees. Furthermore, firms can abuse this legislation by discretely pressuring employees to support one particular political party or candidate and not another. These tactics undermine the integrity of the legislation and work to deteriorate the objective nature of the political process.

Coalition Building

Another technique that seems to be growing in popularity is the use of coalitions to influence the government process. A coalition is formed when distinct groups or parties realize they have something in common that might warrant joining forces to combat a specific issue. More often than not, an issue that various groups share similar views about something creates the opportunity for a coalition. In recent years, coalition formation has become a common practice for firms interested in achieving political goals or influencing public policy. The isolationist approach to confronting the political system is not as effective in today's business climate. If a firm or an association wants to pass or defeat specific legislation, it needs to mobilize the support of any firm that shares the same position on the issue. The greatest benefit to the firm in using coalitions is that they diversify the exposure and impact on the firm. Clearly, the petition resonates louder if many firms object or applaud the virtues of the legislation. Coalitions allow firms to spread limited resources in a more efficient manner. Firms can avoid overextending resources while trying to represent their interest. This allows them to fight or support the legislation on many different fronts. Coalitions allow the firms to be zealous about representing their interest while taking a lesser lead position in the process. Coalitions provide a very effective way for firms to gather support for their issues and protect the interest of the market at the same time. Coalitions allow firms to be involved without necessarily having their name attached to the issue. One high-profile example of coalition building around a specific issue is the Coalition for Economic Growth and American Jobs. Backers of this coalition included the U.S. Chamber of Commerce, the Business Roundtable, the American Bankers Association, the National Association of Manufacturers, and scores of other trade groups and individual companies. Recognizing that the issue of business outsourcing was evolving into a hot button for the 2004 election, they joined to fight the growing number of state and federal initiatives aimed at keeping jobs at home and restraining globalization.

Conclusion

Corporate political advocacy is an essential part of our system in the United States. Thus, lobbying, corporate political contributions, and coalition building will likely remain a permanent part of the political landscape in the United States. Unlike what firms considered involvement to be in the past, for the most part they are required to take an active role in the political process today. So firms should have a good idea of what their interests are and how certain activities occurring in the environment will affect those interests. As new regulations evolve and the environment changes, firms must be poised to modify their strategies for implementing new innovative programs that offer meaningful benefits to the firm. Ultimately, firms negotiate with political officials for the best arrangement that in some way promotes their interests. Similarly, firms have to advocate their positions and pursue a structured strategy to achieve that end through the political process. Firms can develop a proactive approach to managing this process without appearing to be hostile toward the government. In most instances, firms that have developed constructive relationships with government institutions are better suited to be in a position to address proposed changes that potentially could affect the environment. In this regard, it is necessary for firms to have a flexible plan of action in place that anticipates the actions of governmental institutions.

Corporate Public Affairs

Corporate public affairs is that arm of the organization that deals with interactions of the organization in the nonmarketplace arena of action. The external environment in which organizations operate today is becoming increasingly intrusive and active in attempts to influence and shape organizational actions and decisions. Public affairs is the center of the organization's actions to anticipate, plan, and respond in a thoughtful and articulated manner to issues, problems, and situations.

These problems/situations can arise as a result of corporate and industry action or inaction, regulatory proposals, legislative actions, media and special interest actions, and so on. This can involve then dealing with regulatory agencies at all levels, with governmental bodies of all kinds and types, with the media, with the general public, and with nongovernmental entities either individually or simultaneously. This nonmarketplace arena is often referred to as the marketplace of ideas (as opposed to the marketplace for goods and services). Both for-profit and not-for-profit organizations have public affairs departments. The existence of these departments recognizes the critical role the marketplace of ideas plays in setting the rules and regulations under which competition is conducted and the costs that actions in this arena can impose on organizations. In addition, organizations have now recognized that their legitimacy as a societal actor is related to how they are perceived by society and government.

The Development of Public Affairs

Modern-day public affairs activities and organization can trace its roots back to three streams of development starting in the 1920s. These three areas—corporate philanthropy, urban and community affairs, and public relations—each contained elements of what was to emerge as today's public affairs department. Corporate philanthropy (financial contributions to not-for-profit and other socially oriented organizations) arose out of stormy relationships between and among businesses, governments, and society. In many ways the interest in philanthropy arose out of prior corporate excesses and this was the response to those poor behaviors. Although this was meant to demonstrate "corporate" charity, it too has become embroiled in controversy (most notably in charges by shareholders that this is not what they want done with their monies and by external groups who today see this as a skeptical and cynical approach to influence external actors to the corporation).

As urbanization occurred worldwide, with ever more numerous cities of ever larger size, unique problems arose (racial strife and tensions, slums, education, etc.), and the focus of organizations shifted to what was termed urban affairs. Although this could also be considered philanthropy, it was not focused solely on giving of funds for broad general purposes but the giving of funds, talents, and organizing skills to improve urban life. It should be noted that both corporate philanthropy and urban affairs activities were often pursued for self-interest motives by the organizations involved.

The final "root" of public affairs lies in public relations as corporate philanthropy and urban affairs were not sufficiently broad enough in focus for the organization and the increasingly complex environment it found itself embedded in. Originally, public relations were focused on struggles the organization had with regulatory agencies, politicians, and leaders of organized labor. Although this was a more thoughtful advance on the organization's relationship with the larger environment, it was limited in its role and impact. Many viewed public relations as the organization's attempt to spin an issue or problem after the fact. That is, public relations was *not* about preparedness and foresight but instead was focused on damage control once an issue, problem, or situation achieved visibility. It was recognized that public relations, corporate philanthropy, and urban affairs were simply not enough for the modern-day organization in dealing with a growing variety and sophistication of external actors all demanding that the organization respond to them and their issues and concerns.

But how do organizations respond to such concerns? They responded with the development of public affairs departments to deal with the breadth and depth of external issues and actors. Despite the documented growth in public affairs, corporations still use different names for this function. The most popular names are governmental affairs/relations, public affairs, corporate relations/affairs, corporate communications, and external affairs/relations. The key point is that whatever the name of the department, its focus has to be broad, on the interpretation and monitoring of the marketplace of ideas and on the prioritization of those external concerns, developing policy to reply to those concerns, and then advocacy for the corporation's position with external actors and agencies. Finally, the activities and focus of public affairs should be carefully aligned with the strategy and strategic plan of the corporation as a whole.

Tools and Techniques of Public Affairs

To be effective and to aid the organization in pursuit of its objectives, public affairs have developed a set of activities, tools, and techniques for dealing with these external groups and pressures. A modern-day public affairs department can encapsulate the following types of activities: lobbying (at all levels), political action committees, issues management, stakeholder management, trade association involvement, coalition building (both within the industry and with diverse external groups), grassroots activities, philanthropy, community relations, crisis management, regulatory affairs, media relations, environmental affairs, institutional investor relations, stockholder relations, educational relations, corporate social responsibility, employee communications, and nongovernmental organization relationships.

This is an impressive list, but what fundamentally defines a public affairs department is not the list of activities it engages in but the orientation to serving as a window into the organization for non-market-based challenges and organizations (e.g., nongovernmental organizations) and as a window out for the organization to those external players. The core of activities in public affairs are oriented to assessing the future risks to the organization of issues (in any forum—legislative, judicial, regulatory, general public), trends, situations, and stakeholders that challenge or limit the legitimacy of the organization or its ability to operate in a discretionary fashion.

Although the activities noted above are lengthy, they can be organized into larger categories of tools and techniques. One useful organizing tool is to consider short- and long-term time frames. In the area of strategy one thinks of a strategic plan as the organization's long-term response to its environment and tactics as the plan to achieve the short time frame operational choices to achieve the long-term goals. In a similar fashion, we can look at issues management and stakeholder management as reflective of long- and short-term considerations.

Issues Management

Organizations looking toward the future attempt to assess which issues (differences in facts, values, or policies) are likely to gain traction in the marketplace of ideas and which issues have an impact on the organization and therefore require planning and action. This action can range from attempts to block the emergence of an issue in a given arena (e.g., prevent global warming becoming a legislative or regulatory issue) to altering the definition of an issue after it has appeared and is being actively discussed (e.g., a discussion of immigration could be in the context of opening a country's borders to the oppressed or it could be couched in terms of blocking terrorism). Such definitional manipulation can impact on how stakeholders become energized to act or not and also impact on the arena where the issue might be resolved (e.g., in a regulatory hearing as opposed to legislative action). Issues management, therefore, is the tool of public affairs that allows the organization to think about the longer-term horizon of issues, problems, and/or situation that might arise; have an impact on the organization; and demand some sort of planned response.

Tools and techniques within issues management can include media relations, lobbying, grassroots campaigns, coalition building (within an industry, with other industries, and with outside actors), political action committees (organized fund-raising for politicians and their election efforts), Web activism, employee communications, and community relations. The goals are straightforward, to prevent the issue from arising and if that fails to amend, alter, and shape the issue in ways favorable to the organization and/or to place the issue in a specific area of resolution (legislative, judicial, regulatory) where the organization believes it has an advantage over other stakeholders on this issue.

Stakeholder Management

Issues management is simply not specific enough for an organization to act on in any meaningful manner. Although issues management can focus the organization's attention on a specific topic—global warming as an example—the next logical question is what do we do with this issue. This requires an exploration of who the likely "stakeholders" are with regard to this issue. Stakeholders, as might be easily surmised, are those individuals, groups, and organizations who have a "stake" in an issue and how it is resolved. Usually, this stake or level of interest and involvement is significant; otherwise, the organization will see no reason to become engaged in the issue. In global warming, for example, oil and energy companies have a stake in how that issue is discussed, debated, and ultimately resolved. The resolution of this issue might impose additional costs, threaten the legitimacy and survival of the firm, and/or limit the ability of the organization to make discretionary choices. Other stakeholders in this issue can include environmental and regulatory organizations, alternative fuel manufactures (e.g., nuclear power), and other related industries and individuals. The specific constellation of stakeholders will have major impacts on how an issue is resolved and *where* it is resolved.

It should be very clear that lobbying; coalition building; community, regulatory, and external affairs; and other techniques and tools noted above can be brought to focus when dealing with stakeholders. To be very clear, public affairs is about positioning the organization in such a way that it can deal with external pressures, groups, and situations in a thoughtful manner that meets organizational objectives. Although not widely considered, public affairs is also about advising the organization on issues and situations where it cannot "win" and that fighting the specific issue or situation at hand is unlikely to yield positive responses and is more likely to cost the organization (both in terms of finances and image/reputation/credibility/legitimacy).

International Public Affairs

The growth of the Internet and other forms of communications, along with global trade, poses new problems for corporate public affairs. In years past, geographical distances, cultural differences, and language meant that issues, problems, and situations would not easily migrate across geographic borders. This meant that a problem in China might not become a concern in Europe until years after it arose in China. This afforded organizations the "luxury" of following these new problems and how they arose and were treated. The organization could learn from this problem and be better prepared to treat it when it arose in a different area. It also allowed the organization to experiment with approaches to the problem, with the crafting of specific messages in predetermined arenas, and in interactions with stakeholders.

The luxury of time and geographical space no longer exists; an issue or problem (such as global warming) can arise simultaneously in multiple areas of the world, with different stakeholders involved, who define and conceptualize the problem or issue differently. Further, these problems can be defined and conceptualized differently, with the problems having highly different impacts on various societies, and might be addressed in different forums (e.g., legislative, judicial, regulatory).

In essence, the organization is compelled to fight a "multifront" situation, with all the attendant complexities such a multifront battle entails. One aspect that should not be underestimated is the impact of different cultural milieus on the identification, shaping, evaluation, and response of external national groups to an organization's actions.

Now an organization's response to a situation can become known worldwide in moments to a much larger audience and the response can be analyzed by external actors in different locales that can then shape their subsequent actions. As a result, there has been, over the last decade, an increase in outsourcing of public affairs activities. Clearly, the outsourcing of activities in international venues makes great practical and strategic sense.

Assessment of Public Affairs

No discussion of public affairs would be complete without addressing assessment. As in any area of organizational activity, the age-old question of value received in relationship to resources expended can and must be asked with regard to public affairs. In asking any such question, however, it must be remembered that using traditional corporate measures (profitability, costs, return on investments, etc.) may have little relevance to public affairs.

Consider the marketplace of ideas in which public affairs operates—a highly fluid and dynamic environment where losing a specific battle may be the best strategic and tactical choice available to the firm. The suggestion here is that the measurement and assessment of public affairs is difficult and is clearly both quantitative and qualitative in nature. Adding to the complexity of measurement is that a public affairs campaign on a specific issue with multiple stakeholders in different geographical locales might take years before a resolution is achieved—yet the time delay in the resolution of the problem might in itself provide advantages to the organization.

In addition, the public affairs department is constrained in being too public (either internally or externally) about its successes. A frequent "success" story for public affairs is that it successfully manages an issue in the legislative or regulatory arena that prevents the imposition of additional costs on the firm or preserves discretion for the firm to act. It might be unwise for the department or for the firm to tout its successes here.

However, there are broad areas in which public affairs can be assessed. Such areas would deal with the following: (1) Do public affairs actions preserve markets for the organization? (2) Do public affairs actions control and/or reduce risk for the organization? (3) Do public affairs actions afford the organization access to key decision makers on issues of import to the firm? (4) Do public affairs successfully prioritize and inform key organizational leadership of changes and issues arising in the marketplace of ideas with sufficient time to take action? (5) Do public affairs actions advance the organization's image and reputation with key stakeholders? (6) Do public affairs activities reduce the instances of crises for the organization and/or help the organization manage a crisis successfully?

The Foundation for Public Affairs in Washington, D.C., recently surveyed corporations on their assessment of public affairs. They found that performance assessment of public affairs was improving—with more than 50% of their respondents noting that they had a highly developed performance measurement capacity (only 42% answered this way in the previous survey). Fifty-six percent of the firms have a formalized process for measuring and evaluating public affairs performance. It is clear that measurement of public affairs performance is becoming increasingly sophisticated and formalized. In their survey, the tools and techniques for the assessment of performance fell into two major areas—outcomes and processes. In the category of outcomes, they found that corporations use three tools/techniques most often—objectives achieved, legislative wins/losses, and costs reduced/avoided. In the category of processes, the most used measure was internal customer satisfaction, followed by external customer perception/attitude. Notice the balance here between external-focused activities and internal-focused activities (the window in, window out phenomena) and the use of both quantitative and qualitative assessments.

No matter what the approach, there is agreement that measurement and assessment of public affairs leads to improved public affairs performance. Since a key aspect of the public affairs department is to maintain relationships outside the boundaries of the corporation, a key assessment approach to use is focus groups with external entities. In this manner the organization can set up a baseline comparator to use in unfolding assessments. Although objectives achieved is a primary measurement tool, one must be careful in its application.

Although organizational objectives can be easily specified, the marketplace of ideas in which the organization operates must be assessed. Reasoned objectives might be unachievable in a given ideas marketplace. The reasons for being unachievable might range from the timing of an issue (the marketplace is not ready to deal with this issue at this time) to the organization's poor reputation on this issue that precludes them from achieving success on the issue. Simply put, the tools of assessment for public affairs departments must be constructed not only with normal corporate procedures and objectives but also in light of the larger external marketplace of ideas.

The external environment in which organizations operate today continues to grow in complexity. Time in no longer an ally for an organization in decision making. Corporations are facing an increasing number of well-financed and organized nongovernmental organizations around the world. Public affairs management is and will continue to be a major organizational capability to represent the firm in the marketplace of ideas.

—John F. Mahon

Corporate Rights and Personhood

Discussions of the rights of corporations can be divided into two overlapping topics—discussion of the current legal rights of corporations and discussion of what rights corporations ought to have. The latter is an ethical debate, the former legal and constitutional. After brief comments on the current legal situation, this entry will concentrate on ethical issues. Theoretical defenses of corporate moral rights will be outlined and comments made on current discussions of several possible corporate rights. However, the application of the theoretical defenses to possible rights is far too large a topic to be properly discussed here. Furthermore, it is an area that currently requires much more research and discussion.

Personhood and the Legal Rights of Corporations

The legal rights of corporations are whatever the law says they are. This varies from country to country, but the central principle in countries influenced by the Anglo-American legal tradition is that corporations are persons for legal purposes. This legal fiction derives originally from common law, but has received constitutional recognition in numerous countries. The framers of the American Constitution intentionally avoided giving the federal government the right to charter corporations, but later court decisions have extended constitutional protections to corporations. The most important and most cited case is the Supreme Court decision in 1886 in *Santa Clara County v. Southern Pacific Railroad Company.* This ruling had the effect of recognizing corporations as persons and of extending constitutional protection to them. In many subsequent cases, lawyers have successfully argued that as persons corporations should receive equal protection under the Fourteenth Amendment. However, critics of corporate personhood have pointed out that recognition of corporations as persons was not actually an explicit ruling of the Supreme Court in the *Santa Clara County* case; reference to personhood appears only in the preamble. The decision itself concerned taxing fences along railroads.

If corporations are persons, then what rights they have is fairly clear; they have the same rights that people have. This is not entirely true, especially for political rights, such as the right to vote or run for office, but U.S. courts have upheld the same-rights-as-people principle in many other instances. Stoll has collected a list of court-recognized legal rights of corporations that includes due process, the right to a jury trial, the right to avoid double jeopardy, and several others. The right of corporations to freedom of speech is debatable, as will be discussed later.

The Moral Rights of Corporations

Ethical debate about the rights of corporations centers on whether corporations have any rights that the law and the rest of society ought to recognize. Such rights are variously known as corporate moral rights, inherent rights, or prelegal rights. The language of corporate moral rights resembles that of human rights; if the law contradicts human rights or corporate moral rights, we do not say the rights do not exist, we say they have been violated. Corporate moral rights and human rights tend to be dissimilar in most other respects but there is some overlap in their justifications.

Justifications for Corporate Moral Rights

There are at least five types of arguments for corporate moral rights. Which rights corporations ought to have varies by the justification used and, in fact, is not always clear. However, none of these justifications should be taken as justifying the same-rights-as-people principle that is the basis of current law. The transfer argument might be interpreted as justifying something like that principle; the other arguments appear not to justify it. The status of various rights is discussed in the next section.

The first argument for corporate moral rights is the property rights argument that was used by lawyers in *Santa Clara County v. Southern Pacific Railroad.* This claims that violations of a corporation's rights are ethically equivalent to violating the rights of the corporation's owners. The problem with this argument is that it is severely limited. Since it relies on the concept of ownership, it seems to establish only that corporations have property rights that ought not to be violated. The argument seems to say nothing about any other rights corporations often claim, such as the rights to secrecy, to freedom of speech, to bear arms, and so on. The argument can also be criticized for lack of coherence. Why does the fact that a person owns something create any rights for that thing? What rights does one's lawnmower have? The argument also involves legal contradictions; if corporations are the property of their shareholders, and corporations are persons, then the shareholders own a person, which is prohibited by laws against slavery. The property right of the owners of corporations seems a confusing way of determining the rights that their property ought to have and certainly does not establish corporate personhood.

The second argument is the transfer argument. The creators of a corporation are thought to transfer to the corporation their own rights. If they transfer all their rights, this might justify the same-rights-as-people principle. This argument also can be criticized for lack of coherence. Is the transfer an actual action or a legal fiction? Do the corporation's owners keep their rights after they have been transferred? What right do people have to transfer their rights and why should anyone else recognize that right? The transfer argument seems to beg the question.

Utilitarianism underlies the third sort of argument. Utilitarian arguments for the rights of corporations are very powerful and have been developed at great length by the law and economics movement. The gist of these arguments is that recognizing the rights of corporations encourages investment, innovation, efficiency of production, and capital accumulation and concentration. The result will be a dynamic, thriving, growing economy from which everyone can benefit. These utilitarian arguments may not establish exactly the same-rights-as-people principle, but they tend to defend a large suite of rights for corporations. Critical concerns about the utilitarian approach include fears that it privileges people's economic goods over other goods such as social, family, public, and political goods and even over justice. Utilitarian theory should require that economic growth be balanced with other sources of human happiness. Second, economic theory ignores desires for economic processes as it includes only economic outcomes. And it ignores the issue of metadesires. Third, not all corporate investments tend toward the good of people. Investments in lobbying, market dominance, secrecy of harmful information, and some sorts of lawsuits (such as lawsuits that have the sole purpose of intimidating and bankrupting critics of corporations) may cause more harm than good. Perhaps corporations ought not to have the right to invest in these sorts of things even if recognizing such rights promotes economic growth.

Fourth, the idea of a social contract is sometimes used to establish the moral rights of corporations. When social contract arguments are mentioned in this context, most people think of a contract between society and corporations in which corporations are granted rights in exchange for promoting society's interests. There are two problems with this idea. First, although historically corporations had social obligations as part of their charters, the law has long recognized that corporations can be established to serve only private goals such as making a profit. To return to chartering corporations only if they pursue social goals would be such a radical departure from current practice that very few people defend it. Second, this social contract approach cannot establish the moral rights of corporations because any negotiations with corporations presuppose their rights to exist, to pursue their own interests, and to negotiate with society. These sorts of rights are precisely what the debate over corporate moral rights is trying to consider.

Another social contract approach is to advocate that people negotiate a social contract with each other that recognizes the rights of corporations but without corporations being party to the contract. This approach could advocate an actual social contract discussed in legislatures. The problem with this is that historically most corporate rights, including personhood, were not democratically discussed but decided by courts. Trying to start such a discussion now would encounter the political power of corporations to become involved in the debate, which undermines its social contract justification.

Instead of an actual social contract debate, one could argue for a hypothetical Rawlsian-style social contract. What rights this would imply for corporations is not clear, and this is an idea that requires further research.

Fifth, a deontological argument for the rights of corporations has also been advanced. This argues that corporations are, in fact, existing agents that have interests and autonomy that the law ought to recognize and protect. The problem with this is that the interests and autonomy of corporations may not be of the sort that makes them moral agents with rights.

The Right to Exist

The right of corporations to exist covers two issues—charter versus registration and forced dissolution. Governments originally chartered corporations for specific purposes. Charters were only granted after consideration of the social good that would result. Often, there were time limits on the corporation's existence. Now corporations are registered; anyone can create a corporation by registering it, and most corporations serve only private purposes. Morally, should society have the right to issue conditional charters, or should people have the right to create corporations for any legal purpose? Also, should the life of corporations be indefinite or have a time limit on them? In defense of registration, it has been pointed out that giving governments the right to accept or deny charters has generally led to government corruption.

The right to exist also raises the question of whether courts should be able to forcibly dissolve corporations, especially for criminal actions. Some people have argued that dissolution should be automatic if a corporation has a third criminal conviction; this they view as equivalent to life imprisonment for people with three convictions (or as close to equivalent as possible since corporations cannot be imprisoned). Others view dissolution as equivalent to capital punishment and think it should only be used for the worst sorts of corporate crimes. There are also people, including many American prosecutors, who hold that corporations should not be charged with crimes at all on the grounds that conviction would require criminal intent, and corporations cannot have intentions in the relevant sense. This view seems to undermine the whole concept of corporate personhood.

The Right to Own Property

All the theoretical justifications of corporate moral rights justify the rights of corporations to own property, to sign contracts, and to sue and be sued. These rights are basic to corporations being able to conduct business. Guaranteeing these rights is the origin, in common law, of the doctrine that corporations are persons. However, the right of corporations to own other corporations or their shares was a later development, and it is a right that some people question. They argue that not allowing cascading acquisitions and ownership of corporations by corporations would force businesses to compete on customer service rather than trying to gain market dominance or control by acquisitions. In the United States, the Sherman Act of 1890 prohibited pursuit of monopolies by acquisition, but this does not constitute a complete prohibition on corporations owning other corporations or their shares, and the enforcement of such antitrust legislation depends on the political will to do so.

The Right to Bear Arms

If corporations are persons, then the American Constitution may extend to them the right to bear arms. This would include the right to hire armed security guards to protect their property and to supply armed security services to other companies. Most people admit the need for corporations to protect their property, including cash, securities, chemicals, and explosives from criminals and terrorists, but in jurisdictions without the constitutional right to bear arms some people suggest that the police should have a monopoly on guns and that corporations should hire the police when they need security services. A more modest suggestion is that armed corporate security personnel should be trained, licensed, and monitored.

The size, wealth, and organization of corporations can raise issues not usual with individuals carrying guns. Large corporations can afford and can organize what amounts to private armies equipped with armored vehicles, helicopters, and heavy weapons. Some multinationals have done so, usually to protect assets and employees in countries where they cannot rely on the government for such protection. Multinational oil corporations operating in parts of Africa have done this directly or by contracts with suppliers. Ethical objections to this include the principle that armed forces should be a government monopoly; that corporate armies have been used to support government corruption and oppression; that corporate armies have taken on political and offensive roles beyond securing corporate property; and that there is a potential for corporate armies to overthrow governments, especially ones that might nationalize corporate property or rights to natural resources. In defense of corporate armies is the fact that the only alternative in some countries is to withdraw from the country. Also, most accusations of corporate support for oppressive governments involve financial support for corrupt government armies or paramilitary groups, not the use of the corporation's own security forces.

Recently, there has also been discussion of the ethics of private security firms offering protection services in active combat zones, especially Iraq. Such corporations have been actively involved in armed combat. Ethical concerns include lack of monitoring and accountability, lack of international law similar to the laws that apply to armies, fears that innocent bystanders may be harmed, and the possibility that these corporations may be run by or hire psychologically disturbed people. Although these companies claim they supply only security services, there is concern that security companies might be used as a cover for mercenaries (which would violate international law as well as ethics). The right to bear arms is a good example of a rights issue in which the personhood of corporations can distort discussion of the ethical issues that arise when individuals and corporations have the same rights.

The Right to Freedom of Speech

Should corporations enjoy the right to freedom of speech and expression? The U.S. Supreme Court in *Kaski v. Nike* has recently looked at this issue, but ruled on a technicality leaving the issue of free speech unresolved. Nike was claiming that it had the right to issue false press releases on the grounds that press releases are a form of political speech protected by the right to freedom of speech. Kaski's lawyers argued that since Nike was a for-profit corporation, all of its public pronouncements had a commercial intent and, therefore, should be covered by laws that prohibit false advertising. If corporations are viewed as entirely commercial entities, this would severely limit their political rights, including the right to free speech and other rights such as the right to lobby governments. Corporations do not have the right to vote or run for office, but their other political rights, especially the right to donate money to political parties and candidates, is greatly debated and litigated. Corporate political donations are banned in some countries; for example, donations by corporations to candidates for public office are banned in the United States.

The Right to Secrecy

As a final example of a debated corporate right, consider the claim of corporations that they are entitled to keep all their affairs secret. This right is voluntarily suspended for financial data when a corporation lists its shares on a stock exchange, but otherwise the right is jealously guarded. The argument that corporations have a right to secrecy simply because they are private should be rejected because it is based on the equivocation of two meanings of the word *private*—private as opposed to government and private as in the right to privacy. Under the doctrine of corporate personhood, corporations have argued, sometimes successfully in court, that protection against unreasonable search and seizure prohibits laws mandating government safety and environmental inspection of their industrial plants. The law and economics movement argues that the right to secrecy is justified because it encourages or is vital to investment in corporate enterprises. Critics argue that corporations ought to be transparent because industrial plants are not private in the sense that a family's living room or bedrooms are. Critics also argue that public safety requires transparency, that people have a right to know how society's resources are being used, and that consumer choice and the fee market depend on the availability of information. Suggestions for transparency include freedom of information statutes that cover corporations; making all contracts, or at least contracts between corporations, public; making all out-of-court settlements of litigation public; and requiring the publication of all safety-related research and information.

Contesting Corporate Personhood

Corporate personhood and the rights of corporations are currently being contested in three arenas. Corporations are defending and trying to expand their rights through litigation, often arguing for constitutional protections as far as the Supreme Court. Academics are discussing the moral issues surrounding rights and personhood, mostly in legal journals, but there is also some discussion in philosophy and business ethics journals. This is an area that needs a great deal more research. Finally, there is a movement in the United States to legally remove personhood from corporations. This movement has had some symbolic success passing local ordinances abolishing corporate personhood, but it is a long way from the constitutional amendment that is required to make any real difference.

The personhood of corporations has two significant effects on business ethics. First, it determines much of the legal environment of corporations and, thus, provides a framework in which the ethics of corporate actions and policies must be discussed. Second, it provides a frame for seeing corporations in a certain way, which leads many ethicists to argue that corporations have moral responsibilities similar to those that people have. For example, if corporations are persons, then we can talk about corporate social responsibilities or about corporate citizenship. Other people argue that the legal fiction of personhood should determine neither the moral rights nor the responsibilities of corporations.

Corporate Social Financial Performance

The relationship between corporate social performance and corporate financial performance is a topic that "business and society" scholars have been debating for several decades. This entry will focus on the empirical evidence that point to complementarities and, thus, a positive correlation between corporate social and financial performance. However, different scholars have also portrayed social and financial performance as two contradictory or independent concepts. Before the arguments for each position are summarized, the definition and consequences of "social responsibility" and "social performance" must be specified a bit more clearly.

Corporate social performance can be defined as an organization's configuration of principles of social responsibility, processes of social responsiveness, and observable outcomes as they relate to the organization's societal relationships. In other words, a socially responsible organization evaluates its impact on society comprehensively and acts on certain principles to protect and improve its social and natural environments. Consequently, such a responsible firm will develop internal structures and processes to respond constructively to concerns ranging from product safety to pollution prevention to employee work-life balance. As such, high corporate social performance is the outcome of a relationship-building process between the organization and all its internal and external stakeholders. Organizational stakeholders include, among others, employees, customers, suppliers, partners, social and environmental activists, governments, local communities, and other groups. It is important to keep these specific, technical definitions of "social responsibility" and "social performance" in mind throughout this entry. (Contrary to this usage of the term in this entry, some economists redefine "business social responsibility" as "profit maximization.")

A Complementary Relationship?

According to instrumental stakeholder theory, an organization will be more likely to achieve its economic goals if it tries to satisfy its various stakeholders' needs in a balanced way. Through social performance, an organization may enhance its economic effectiveness because it may have developed a favorable reputation for fair business dealings, which may attract more customers (increase sales revenues) or better and more committed employees (increase labor productivity). Simultaneously, balanced stakeholder management can either reflect organizational learning or build up managerial skills, which can translate into higher financial performance. In turn, higher financial performance may allow organizations to spend more money on social or environmental causes. Such complementarities may result in self-reinforcing cycles of social and financial performance in which both variables are positively correlated.

A Contradictory Relationship?

Some economists and ethicists regard the complementary vision of social and financial performance as utopian and idealistic. For example, economists such as Nobel Prize winner Milton Friedman argue that, by definition, corporate social performance is an altruistic, sacrificial strategy that expends financial and other organizational resources at the expense of the organization's owners. A social responsibility strategy, according to this view, is particularly harmful to a firm's market performance because stakeholder management is performed by executives that have not been elected by the public and generally do not possess the skills (especially compared with the government) to make informed decisions about stakeholders in social and environmental arenas. Overall, advocates of this perspective argue that social performance is a waste of shareholder funds and, thus, hinders rather than enhances an organization's economic performance, which explains and predicts a negative relationship between the two variables.

Are These Two Concepts Independent, and Thus the Relationship Null?

A third strand of theorizing postulates a null relationship between social and financial performance. More recently, economists have argued that corporate social responsibility was a normal good whose provision would be determined by the forces of supply and demand. Overall, market forces will cause the overall relationship to be zero, or null, although a number of contingencies (e.g., firm size or innovation) may also cause it to be positive or negative. Furthermore, some business and society scholars postulate that the principles driving instrumental market activities and duty-bound ethical activities are, in fact, very different. These normative incompatibilities may explain why many studies have indicated a null correlation between social and financial performance.

Overarching Empirical Evidence to Date

The Meta-Analytic Technique

Meta-analysis is the way most quantitative sciences (e.g., medicine, physics, psychology) take stock and reach overall conclusions about a research area. It represents an empirical quantitative integration of the findings of previous research and corrects for certain study artifacts that affect any primary study (e.g., sampling error, measurement error, and a few other possible study artifacts). Thus, for reaching conclusions about an entire research program spanning several decades, meta-analysis is a more valid research tool than narrative reviews, which in this research area have typically concluded that there does not appear to be any relationship between the two variables. However, four meta-analyses in this area have shown that overall social performance and financial performance are most likely complementary.

Interpretation of Results

Overall, the award-winning meta-analysis by Orlitzky, Schmidt, and Rynes supports the hypothesis of a positive relationship between social and financial performance. A lot of the variability in findings across studies seems to be due to statistical study artifacts and different research strategies. According to this meta-analysis, sampling and measurement errors accounted, on average, for 24% of the variance across studies; reputation measures of social performance were better predictors of financial performance than social-audit disclosures; and the economic impact of social performance was stronger on accounting measures than market measures of economic return. Orlitzky and his colleagues also addressed concerns regarding availability bias—the possibility that studies that fail to show a relationship between social and financial performance are unlikely to be published. File drawer analysis is a technique useful for assessing this concern. The file drawer analysis indicated that more than 1,000 such unpublished studies excluded from the meta-analysis would be needed to change their overall conclusions.

In addition, according to evidence provided by meta-analysis, corporate social performance and financial performance tend to be mutually reinforcing organizational activities. Through the use of time lags, Orlitzky and his colleagues found that financial performance is a positive predictor of future social performance and that social performance also predicts financial performance. In other words, the meta-analytic findings suggest that a business can develop mutually beneficial relations with stakeholder groups, which can actually pay off surprisingly quickly for the socially responsible firm.

Social performance and financial performance are most likely positively correlated because social performance helps improve managerial competencies and enhance corporate reputations. Through a company's positively constructive (rather than adversarial) relations with stakeholders, its stakeholders may perceive that company favorably. For example, internal stakeholders, such as employees, may become more committed, or external stakeholders, such as customers, may become more willing to buy the company's products or pay a premium for the goods from socially responsible firms. Although the meta-analysis suggested that competency building was a less important factor in the economic-performance-enhancing effects of social responsibility than corporate reputation, corporate social performance might also help organizations develop internal organizational learning mechanisms to deal with the uncertainties presented by its stakeholders.

Social performance may also reduce business risk. Again, these effects are most likely mediated by organizational reputation, as the meta-analytic findings by Orlitzky and Benjamin suggest. By balancing a multitude of stakeholder interests, a firm may increase various stakeholder groups' confidence that the firm will be understanding and nonadversarial in resolving future stakeholder conflicts. In turn, this may reduce the variability of accounting rates of return and share prices because the investment community will not respond to temporary company setbacks by panic selling of its shares, for example.

Organization size does not appear to confound the relationship between social and financial performance. That is, large and—quite unexpectedly—even small companies can reap economic rewards from balanced stakeholder analysis and management. The logic could be illustrated as follows: Small companies that are high in social performance may infuse greater trust into their relationships with allies and reach economically beneficial supply agreements because the company is seen as a more trustworthy and honest partner.

Predating but also narrower in scope than these meta-analyses by Orlitzky and his colleagues, Frooman had shown, in a meta-analysis of event studies only, that irresponsible and illicit corporate actions generally reduced shareholder wealth. This earlier meta-analysis by Frooman is another piece of evidence that suggests that building constructive stakeholder relations serves the enlightened self-interest of companies, their managers, and owners.

Implications for Management

The empirical research accumulated and meta-analytically integrated to date supports the view that, conceptually, corporate social and financial performance are not only compatible with each other in many cases but may also manifest, in tandem, the elusive construct of overall organizational effectiveness. This research program also supports the convictions of some practitioners that a business can maximize its performance when its executives are aware of the multitude of business opportunities that exist in its daily interactions with *all* its stakeholders. A narrow corporate orientation centered *only* on shareholder wealth maximization may miss these societal and environmental opportunities and cause the organization to be out of touch with developments in broader society. Ultimately, such an isolation from trends that are broader than market forces and from stakeholder concerns more generally may harm the corporation economically because it may lead to a reactive, rather than proactive, strategic stance.

The promotion of social performance can reflect enlightened self-interest because it may preempt costly defensive actions in lawsuits. By being socially responsible, an organization could be attuned to stakeholder concerns long before they become legal problems. More positively, quantitative literature reviews of this long stream of research on social and financial performance suggest that corporate social performance can be an investment in the long-term economic sustainability of the organization.

The finding that social performance is likely to be a lever of financial performance is not only reassuring, though. It also raises the important point of the effective and efficient *implementation* of this more value- and stakeholder-based management style. For example, there is a dearth of research in human resource management on the type of organizational staffing, pay, or performance-appraisal practices that are most suitable for maximizing social performance while enhancing financial performance. It is important to stress that the economic pay-offs from high social performance are not automatic. Therefore, business managers and researchers must understand in much greater depth how this potential synergy between social and financial performance can be cultivated in practice. This cultivation may be affected by, and indeed depend on, executives' value orientations and decision making, for example.

The meta-analyses by Orlitzky and colleagues also pointed to a number of challenges in this research area. First, both social performance and financial performance need to be measured with greater reliability. Second, more contingency factors must be considered because, overall, the meta-analysis showed that about 76% of the variability in past findings is *not* explained by the two statistical artifacts of sampling error and measurement error. With respect to several subdimensions of social and financial performance, the relationships were weak, partly due to stakeholder mismatching in prior studies. Stakeholder mismatching occurs when individual studies correlate specific social and financial performance measures that should, in fact, not be correlated (e.g., because researchers provide no theoretical rationale). In addition to these primary-study problems, theoretical contingencies may apply as well. For instance, in empirical research conducted between the late 1960s and the late 1990s, environmental performance was only a weak positive predictor of economic performance, and 60% of its cross-study variance remained unexplained. This finding points to moderators, or contingencies, that future research could explore.

—Marc Orlitzky

Corporate Social Responsibility (CSR) and Corporate Social Performance (CSP)

The concept of corporate social responsibility (CSR) refers to the general belief held by many that modern businesses have a responsibility to society that extends beyond the stockholders or investors in the firm. That responsibility, of course, is to make money or profits for the owners. These other societal stakeholders typically include consumers, employees, the community at large, government, and the natural environment. The CSR concept applies to organizations of all sizes, but discussions tend to focus on large organizations because they tend to be more visible and have more power. And, as many have observed, with power comes responsibility.

A related concept is that of corporate social performance (CSP). For the most part, CSP is an extension of the concept of CSR that focuses on actual results achieved rather than the general notion of businesses' accountability or responsibility to society. Thus, CSP is a natural consequence or follow-on to CSR. In fact, it could well be argued that if CSR does not lead to CSP then it is vacuous or powerless. Interestingly, many advocates of CSR naturally assume that an assumption of responsibility will lead to results or outcomes. Thus, the distinction between the two is often a matter of semantics that is of more interest to academics than to practitioners. Most of our discussion will be focused on CSR with the general assumption that CSP is a vital and logical consequence.

Development of the CSR Concept

The concept of CSR has a long and varied history. It is possible to trace evidences of the business community's concern for society for centuries. Formal writings on CSR, or social responsibility (SR), however, are largely a product of the 20th century, especially the past 50 years. In addition, though it is possible to see footprints of CSR thought and practice throughout the world, mostly in developed countries, formal writings have been most evident in the United States, where a sizable body of literature has accumulated. In recent years, the continent of Europe has been captivated with CSR and has been strongly supporting the idea.

A significant challenge is to decide how far back in time we should go to begin discussing the concept of CSR. A good case could be made for about 50 years because so much has occurred during that time that has shaped theory, research, and practice. Using this as a general guideline, it should be noted that references to a concern for SR appeared earlier than this, and especially during the 1930s and 1940s. References from this earlier period worth noting included Chester Barnard's 1938 publication, *The Functions of the Executive,* J. M. Clark's *Social Control of Business* from 1939, and Theodore Kreps's *Measurement of the Social Performance of Business* from 1940, just to mention a few. From a more practical point of view, it should be noted that as far back as 1946 business executives (the literature called them businessmen in those days) were polled by *Fortune* magazine asking them about their social responsibilities.

In the early writings on CSR, the concept was referred to more often as just SR rather than CSR. This may have been because the age of the modern corporation's prominence and dominance in the business sector had not yet occurred or been noted. The 1953 publication by Howard R. Bowen of his landmark book *Social Responsibilities of the Businessman* is argued by many to mark the beginnings of the modern period of CSR. As the title of Bowen's book suggests, there apparently were no *businesswomen* during this period, or at least they were not acknowledged in formal writings.

Bowen's work proceeded from the belief that the several hundred largest businesses at that time were vital centers of power and decision making and that the actions of these firms touched the lives of citizens at many points. Among the many questions raised by Bowen, one is of special note here. Bowen asked, what responsibilities to society may businessmen reasonably be expected to assume? This question drove much subsequent thought and is still relevant today. Bowen's answer to the question was that businesspeople should assume the responsibility that is desirable in terms of the objectives and values of society. In other words, he was arguing that it is society's expectations that drive the idea of SR.

Bowen went on to argue that CSR or the "social consciousness" of managers implied that businesspeople were responsible for the consequences of their actions in a sphere somewhat wider than that covered by their profit-and-loss statements. It is fascinating to note that when Bowen referenced the *Fortune* article cited earlier, it reported that 93.5% of the businessmen agreed with this idea of a wider SR. Because of his early and seminal work, Bowen might be called the "father of corporate social responsibility."

If there was scant evidence of CSR definitions in the literature in the 1950s and before, the decade of the 1960s marked a significant growth in attempts to formalize or more accurately state what CSR means. One of the first and most prominent writers in this period to define CSR was Keith Davis, then a professor at Arizona State University, who later extensively wrote about the topic in his business and society textbook, later revisions, and articles. Davis argued that SR refers to the decisions and actions that businesspeople take for reasons that are at least partially beyond the direct economic or technical interest of the firm.

Davis argued that SR is a nebulous idea that needs to be seen in a managerial context. Furthermore, he asserted that some socially responsible business decisions can be justified by a long, complicated process of reasoning as having a good chance of bringing long-run economic gain to the firm, thus paying it back for its socially responsible outlook. This has often been referred to as the enlightened self-interest justification for CSR. This view became commonly accepted in the late 1970s and 1980s.

Davis became well known for his views on the relationship between SR and business power. He set forth his now-famous *Iron Law of Responsibility,* which held that the social responsibilities of businesspeople needed to be commensurate with their social power. Davis's contributions to early definitions of CSR were so significant that he could well be argued to be the runner-up to Bowen for the "father of CSR" designation.

The CSR concept became a favorite topic in management discussions during the 1970s. One reason for this is because the respected economist Milton Friedman came out against the concept. In a 1970 article for the *New York Times Magazine*, Friedman summarized his position well with its title—"The Social Responsibility of Business Is to Increase Its Profits." For many years since and continuing today, Friedman has maintained his position. In spite of Friedman's classic opposition, the CSR concept has continued to be accepted and has continued to grow.

A landmark contribution to the concept of CSR came from the Committee for Economic Development (CED) in its 1971 publication *Social Responsibilities of Business Corporations.* The CED got into this topic by observing that business functions by public consent, and its basic purpose is to serve constructively the needs of society to the satisfaction of society. The CED noted that the social contract between business and society was changing in substantial and important ways. It noted that business is being asked to assume broader responsibilities to society than ever before. Furthermore, the CED noted that business assumes a role in contributing to the quality of life and that this role is more than just providing goods and services. Noting that business, as an institution, exists to serve society, the future of business will be a direct result of how effectively managements of businesses respond to the expectations of the public, which are always changing. Public opinion polls taken during this early period by Opinion Research Corporation found that about two thirds of the respondents thought business had a moral obligation with respect to achieving social progress in society, even at the possible expense of profitability.

The CED went on to articulate a three-concentric-circles definition of SR that included an inner, an intermediate, and an outer circle. The *inner circle* focused on the basic responsibility business had for its economic function—that is, providing products, services, jobs, and economic growth. The *intermediate circle* focused on responsibilities business had to exercise its economic activities in a sensitive way by always being alert to society's changing social values and priorities. Some early arenas in which this sensitivity were to be expressed included environmental conservation; relationships with employees; and meeting the expectations of consumers for information, fair treatment, and protection from harm. The CED's *outer circle* referred to newly emerging and still ambiguous responsibilities that business should be involved in to help address problems in society, such as urban blight and poverty.

What made the CED's views on CSR especially noteworthy was that the CED was composed of businesspeople and educators and, thus, reflected an important practitioner view of the changing social contract between business and society and businesses' newly emerging social responsibilities. It is helpful to note that the CED may have been responding to the times in that the late 1960s and early 1970s was a period during which social movements with respect to the environment, worker safety, consumers, and employees were poised to transition from special interest status to government regulation. In the early 1970s, we saw the creation of the Environmental Protection Agency, the Consumer Product Safety Commission, and the Equal Employment Opportunity Commission. Thus, it can be seen that the major initiatives of government social regulation grew out of the changing climate with respect to CSR.

Another significant contributor to the development of CSR in the 1970s was George Steiner, then a professor at UCLA. In 1971, in the first edition of his textbook, *Business and Society,* Steiner wrote extensively on the subject. Steiner continued to emphasize that business is fundamentally an economic institution in society but that it does have responsibilities to help society achieve its basic goals. Thus, SR goes beyond just profit making. Steiner also noted that as companies became larger their social responsibilities grew as well. Steiner thought the assumption of social responsibilities was more of an attitude, of the way a manager approaches his or her decision-making task, than a great shift in the economics of decision making. He held that CSR was a philosophy that looks at the social interest and the enlightened self-interest of business over the long-run rather than just the old narrow, unrestrained short-run self-interest of the past.

Though Richard Eells and Clarence Walton addressed the CSR concept in the first edition of their book *Conceptual Foundations of Business* (1961), they elaborated on the concept at length in their third edition, which was published in 1974. In this book they dedicated a whole chapter to recent trends in corporate social responsibilities. Like Steiner, they did not focus on definitions, per se, but rather took a broader perspective on what CSR meant and how it evolved. Eels and Walton continued to argue that CSR is more concerned with the needs and goals of society and that these extend beyond the economic interest of the business firm. They believed that CSR was a concept that permits business to survive and function effectively in a free society and that the CSR movement is concerned with business's role in supporting and improving the social order.

In the 1970s, we initially found mention increasingly being made to CSP as well as CSR. One major writer to make this distinction was S. Prakash Sethi. In a classic 1975 article, Sethi identified what he called dimensions of CSP and, in the process, distinguished between corporate behavior that might be called social obligation, SR, or social responsiveness. In Sethi's schema, social obligation was corporate behavior in response to market forces or legal constraints. The criteria here were economic and legal only. SR, in contrast, went beyond social obligation. He argued that SR implied bringing corporate behavior up to a level where it is congruent with the prevailing social norms, values, and expectations of society. Sethi went on to say that while social obligation is proscriptive in nature, SR is prescriptive in nature. The third stage in Sethi's model was social responsiveness. He regarded this as the *adaptation* of corporate behavior to social needs. Thus, anticipatory and preventive action is implied.

Some of the earliest empirical research on CSR was published in the mid-1970s. First, in 1975, Bowman and Haire conducted a survey striving to understand CSR and to ascertain the extent to which companies were engaging in CSR. Though they never really defined CSR in the sense we have been discussing, the researchers chose to measure CSR by counting the proportion of lines devoted to SR in the annual reports of the companies they studied. While not providing a formal definition of CSR, they illustrated the kinds of topics that represented CSR as opposed to those that were strictly business in nature. The topics they used were usually subheads to sections in the annual report. Some of these subheads were as follows: corporate responsibility, SR, social action, public service, corporate citizenship, public responsibility, and social responsiveness. A review of their topical approach indicates that they had a good idea of what CSR generally meant, given the kinds of definitions we saw developing in the 1970s.

Another research study in the mid-1970s was conducted by Sandra Holmes in which she sought to determine executive perceptions of CSR. Like Bowman and Haire, Holmes had no clear definition of CSR. Rather, she chose to present executives with a set of statements about CSR, seeking to find out how many of them agreed or disagreed with the statements. Like the Bowman and Haire list of "topics," Holmes's statements addressed the issues that were generally believed to be what CSR was all about during this time period. For example, she sought executive opinions on businesses' responsibilities for making a profit, abiding by regulations, helping to solve social problems, and the short-run and long-run impacts on profits of such activities. Holmes further added to the body of knowledge about CSR by identifying the outcomes that executives expected from their firms' social involvement and the factors executives used in selecting areas of social involvement.

In 1979, Archie B. Carroll proposed a four-part definition of CSR, which was embedded in a conceptual model of CSP. Like Sethi's earlier article, Carroll sought to differentiate between CSR and CSP. His basic argument was that for managers or firms to engage in CSP they needed to have (1) a basic *definition* of CSR, (2) an understanding/enumeration of the *issues* for which a SR existed (or, in modern terms, stakeholders to whom the firm had a responsibility, relationship, or dependency), and (3) a specification of the *philosophy or pattern of responsiveness* to the issues.

At that time, Carroll noted that previous definitions had alluded to businesses' responsibility to make a profit, obey the law, and to go beyond these activities. Also, he observed that, to be complete, the concept of CSR had to embrace a full range of responsibilities of business to society. In addition, some clarification was needed regarding that component of CSR that extended beyond making a profit and obeying the law. Therefore, Carroll proposed that the SR of business encompassed the economic, legal, ethical, and discretionary expectations that society had of organizations at a given point in time.

A brief elaboration of this definition is useful. First, and foremost, Carroll argued that business has a responsibility that is *economic* in nature or kind. Before anything else, the business institution is the basic economic unit in society. As such it has a responsibility to produce goods and services that society wants and to sell them at a profit. All other business roles are predicated on this fundamental assumption. The economic component of the definition suggests that society *expects* business to produce goods and services and sell them at a profit. This is how the capitalistic economic system is designed and functions.

He also noted that just as society expects business to make a profit (as an incentive and reward) for its efficiency and effectiveness, society expects business to obey the law. The law, in its most rudimentary form, represents the basic rules of the game by which business is expected to function. Society expects business to fulfill its economic mission within the framework of legal requirements set forth by the society's legal system. Thus, the *legal* responsibility is the second part of Carroll's definition.

The next two responsibilities represented Carroll's attempt to specify the nature or character of the responsibilities that extended beyond obedience to the law. The *ethical* responsibility was claimed to represent the kinds of behaviors and ethical norms that society expected business to follow. These ethical responsibilities extended to actions, decisions, and practices that are beyond what is required by the law. Though they seem to be always expanding, they nevertheless exist as expectations over and beyond legal requirements.

Finally, he argued there are *discretionary* responsibilities. These represent voluntary roles and practices that business assumes but for which society does not provide as clear cut an expectation as in the ethical responsibility. These are left to individual managers' and corporations' judgment and choice; therefore, they were referred to as discretionary. Regardless of their voluntary nature, the expectation that business perform these was still held by society. This expectation was driven by social norms. The specific activities were guided by businesses' desire to engage in social roles not mandated, not required by law, and not expected of businesses in an ethical sense, but which were becoming increasingly strategic. Examples of these voluntary activities, during the time in which it was written, included making philanthropic contributions, conducting in-house programs for drug abusers, training the hard-core unemployed, or providing day care centers for working mothers. These discretionary activities were analogous to the CED's third circle (helping society). Later, Carroll began calling this fourth category *philanthropic*, because the best examples of it were charitable, humanistic activities business undertook to help society along with its own interests.

Though Carroll's 1979 definition included an economic responsibility, many today still think of the economic component as what the business firm *does for itself* and the legal, ethical, and discretionary (or philanthropic) components as what business *does for others.* While this distinction represents the more commonly held view of CSR, Carroll continued to argue that economic performance is something business does for society as well, though society seldom looks at it in this way.

Corporate Social Performance

As suggested earlier, the concept of CSP is an extension of the CSR concept that places more of an emphasis on *results achieved.* The development of the CSP concept has occurred somewhat in parallel with the CSR concept, but with a slightly different emphasis. The *performance* focus in CSP is intended to suggest that what really matters is what companies are able to accomplish, that is, the results or outcomes of their CSR initiatives and the adoption of a responsiveness strategy or posture. Many of the writers on CSR would argue that results were implied in their concepts and discussions of CSR, but the literature added a branch in the 1970s when writers began emphasizing the "performance" aspect rather than the "responsibility" aspect. Obviously, the two go hand in hand.

Actually, many of the earlier discussions of CSR transitioned to an emphasis on corporate social *responsiveness* before the performance focus became common. Brief mention should be made of this in the discussion on CSP. William Frederick is often credited with best describing the difference between responsibility and responsiveness when he dubbed them CSR_1 and CSR_2. With CSR_1, he was referring to the concept of CSR that we discussed in the previous section. The emphasis there is on accountability. CSR_2, in contrast, was intended to reflect the emphasis on responsiveness, or action. In the responsiveness focus, attention turned to the mechanisms, procedures, arrangements, and patterns by which business actually responds to social expectations and pressures in society. The responsiveness focus, therefore, turned the attention from responsibility (business taking on accountability) to responsiveness (business actually responding to social expectations).

In many respects, the emphasis on performance in CSP continues to carry this line of thought forward. That is, the term implies the field has transitioned from *accountability* to *responding* to *results* achieved.

The concept of CSP began appearing in the literature in the mid-1970s. Writers such as Lee Preston, S. Prakash Sethi, and Archie Carroll were among the early authors to speak of the importance of CSP. As mentioned earlier, Carroll presented a conceptual "model" of CSP that motivated a series of improvements and refinements to the concept. Steven Wartick and Philip Cochran took Carroll's three dimensions and broadened them into more encompassing concepts. Wartick and Cochran proposed that the social issues dimension had matured into a new management field known as social issues in management. They extended the model further by proposing that the three dimensions be viewed as depicting *principles* (corporate social responsibilities, reflecting a *philosophical* orientation), *processes* (corporate social responsiveness, reflecting an *institutional* orientation), and *policies* (social issues management, reflecting an *organizational* dimension). In short, Wartick and Cochran updated and extended the three dimensions of the model.

The CSP model was further developed by Donna Wood in her reformulation of the model. Wood expanded and elaborated Carroll's model and Wartick and Cochran's extensions and set forth a reformulated model that went into further detail emphasizing the *outcomes* aspect of the model. Wood argued that CSP was a business organization's configuration of principles of SR; processes of social responsiveness; and policies, programs, and other observable outcomes related to the firm's relationship with society. More than previous conceptualizations, she emphasized the importance of the *outcomes* of corporate efforts.

Diane Swanson extended Wood's model by elaborating on the *dynamic nature* of the principles, processes, and outcomes reformulated by Wood. Relying on research from corporate culture, Swanson's reoriented model linked CSP to the personally held values and ethics of executive managers and other employees. She proposed that the executive's sense of morality highly influences such policies and programs of environmental assessment, stakeholder management, and issues management carried out by employees. One of Swanson's major contributions, therefore, was to integrate business ethics into the implementation of the CSP focus.

Other concepts have developed in recent years that have embraced a concern for CSR and CSP. They are mentioned here but not developed because they get somewhat outside the traditional boundaries of these concepts. *Corporate citizenship* is a concept that must be mentioned because in the minds of many it is synonymous with CSR/CSP. The entire *business ethics movement* of the past 20 years has significantly overlapped these topics. The *stakeholder concept* has fully embraced and expanded on these concepts. The concept of the "triple bottom line," a concern for economic, social, and environmental performance, has embraced the CSR/CSP literature. The concept of "sustainability" has also embraced CSR/CSP thinking. Corporate sustainability is the goal of the triple-bottom-line and CSR/CSP initiatives—to create long-term shareholder value by taking advantage of opportunities and managing risks related to economic, social, and environmental developments.

Business's Interest in CSR and CSP

To this point, we have been discussing primarily the contributions of academics to the development of the concepts of CSR and CSR. To be sure, the business community has had a parallel development of its interest in the concepts as well. The business community, however, has been less interested in academic refinements of the concept and more interested in what all this means for them, in practice. Prominent business organizations have developed specialized awards for firms' social performance. One example of this would be *Fortune* magazine's "most admired" and "least admired" categories of performance. Among *Fortune*'s eight attributes of reputation, one will find the category of performance titled "social responsibility." The Conference Board is another organization that has developed an award for corporate leadership in the CSR realm. The Conference Board annually gives an award titled the "Ron Brown Award for Corporate Leadership" that recognizes companies for outstanding achievements in community and employee relations. Among the core principles for this award are that the company be committed to corporate citizenship, express corporate citizenship as a shared value visible at all levels, and it must be integrated into the company's corporate strategy.

For several years now, *Business Ethics* magazine has published its list of Annual Business Ethics and Corporate Citizenship Awards. In these awards, the magazine has highlighted companies that have made stellar achievements in CSR/CSP. One of the important criterion used by the magazine in making this award is that the company have programs or initiatives in SR that demonstrate sincerity and ongoing vibrancy that reaches deep into the company. The award criteria also stipulate that the company honored must be a standout in at least one area of SR, though the recipients need not be exemplary in all areas.

Though one will always find individual businesspeople who might reject or fight the idea of CSR/CSP, for the most part today, large companies have accepted the idea and internalized it. One of the best examples of this acceptance was the creation in 1992 of the association titled Business for Social Responsibility (BSR). BSR is a national business association that helps companies seeking to implement policies and practices that contribute to the companies' sustainability and responsible success. In its statement of purpose, BSR claims to be a global organization that helps its member companies achieve success in ways that respect ethical values, people, communities, and the environment. A goal of BSR is to make CSR an integral part of business operations and strategies. An illustrative list of BSR's more than 1,000 members includes such well-known companies as ABB Inc., AstraZeneca Plc., Coca-Cola, Johnson & Johnson, Nike Inc., Office Max, GE, GM, UPS, Procter & Gamble, Sony, Staples Inc., and Wal-Mart.

The Business Case for CSR and CSP

After considering the pros and cons of CSR/CSP, most businesses today embrace the idea. In recent years, the "business case" for CSR/CSP has been unfolding. Before buying in to the idea of CSR, many business executives have wanted the "business case" for it further developed. The business case is simply the arguments or rationales as to why businesspeople believe these concepts bring distinct benefits or advantages to companies, specifically, and the business community, generally. Even the astute business guru Michael Porter, who for a long time has extolled the virtues of competitive advantage, has embraced the concept that corporate and social initiatives are intertwined. Porter has argued that companies today ought to invest in CSR as part of their business strategy to become more competitive. Of course, prior to Porter, many CSR academics had been presenting this same argument.

Simon Zadek, a European, has presented four different business rationales for being a civil corporation. These reasons form a composite justification for businesses adopting a CSR/CSP strategy. The first is the defensive approach. This approach is designed to alleviate pain. That is, companies should pursue CSR to avoid the pressures that create costs for them. The second is the cost-benefit approach. This traditional approach holds that firms will undertake those activities that yield a greater benefit than cost. The third is the strategic approach. In this approach, firms will recognize the changing environment and engage in CSR as a part of a deliberate corporate strategy. Finally, the innovation and learning approach is suggested. Here, an active engagement with CSR provides new opportunities to understand the marketplace and enhance organizational learning, which leads to competitive advantage. Most of these rationales have been around for years, but Zadek has presented them as an excellent set of business reasons for pursuing CSR.

Putting forth the business case for CSR requires a careful and comprehensive elucidation of the reasons why companies are seeing that CSR is in their best interests to pursue. Two particular studies have contributed toward building this case. One study by PricewaterhouseCoopers, presented in their 2002 Sustainability Survey Report, identifies the following top 10 reasons why companies are deciding to be more socially responsible:

1. Enhanced reputation
2. Competitive advantage
3. Cost savings
4. Industry trends
5. CEO/board commitment
6. Customer demand
7. SRI demand
8. Top-line growth
9. Shareholder demand
10. Access to capital

A survey conducted by the Aspen Institute, in their Business and Society Program, queried MBA student about attitudes regarding the question of how companies will benefit from fulfilling their social responsibilities. Their responses, in sequence of importance, included the following:

- A better public image/reputation
- Greater customer loyalty
- A more satisfied/productive workforce
- Fewer regulatory or legal problems
- Long-term viability in the marketplace
- A stronger/healthier community
- Increased revenues
- Lower cost of capital
- Easier access to foreign markets

Between these two lists, a comprehensive case for business interest in CSR/CSP is documented. It can be seen how CSR/CSP not only benefits society and stakeholders but also how it provides specific, business-related benefits for business.

Examples of CSR in Practice

There are many ways in which companies may manifest their CSR in their communities and abroad. Most of these initiatives would fall in the category of discretionary, or philanthropic, activities, but some border on improving some ethical situation for the stakeholders with whom they come into contact. Common types of CSR initiatives include corporate contributions (or philanthropy), employee volunteerism, community relations, becoming an outstanding employer for specific employee groups (such as women, older workers, or minorities), making environmental improvements that exceed what is required by law, and so on.

Among the 100 Best Corporate Citizens identified in 2005 by *Business Ethics* magazine, a number of illuminating examples of CSR in practice are provided. Cummins, Inc., of Columbus, Indiana, has reduced diesel engine emissions by 90% and expects that within 10 years the company will be at zero or close to zero emissions. In addition, the engine maker underwrites the development of schools in China, is purchasing biodiverse forest land in Mexico, and funds great architecture in its local community. Cummins also publishes a sustainability report that is available to the public.

Xerox Corporation, Stamford, Connecticut, is a multinational corporation that places high value on its communities. One of its most well-known community development traditions has been its Social Service Leave Program. Employees selected for the program may take a year off with full pay and work for a community nonprofit organization of their choice. The program was begun in 1971, and by 2005, more than 460 employees had been granted leave, translating into about half a million volunteer service hours for the program.

Green Mountain Coffee Roasters, Waterbury, Vermont, was a pioneer in an innovative program designed to help struggling coffee growers by paying them “fair trade” prices, which exceed regular market prices. The company has also been recognized for offering microloans to coffee-growing families and underwriting business ventures that diversify agricultural economies.

Another example of CSR in practice is the Chick-fil-A restaurant chain based in Atlanta, Georgia.

Founder and CEO Truett Cathy has earned an outstanding reputation as a businessman deeply concerned with his employees and communities. Through the WinShape Centre Foundation, funded by Chick-fil-A, the company operates foster homes for more than 120 children, sponsors a summer camp, and has hosted more than 21,000 children since 1985. Chick-fil-A has also sponsored major charity golf tournaments.

In the immediate aftermath of Hurricane Katrina in 2005, judged to be the worst and most expensive ever in terms of destruction, hundreds of companies made significant contributions to the victims and to the cities of New Orleans, Biloxi, Gulfport, and the entire Gulf Coast. These CSR efforts have been noted as one of the important ways by which business can help people and communities in need.

As seen in the examples presented, there are a multitude of ways that companies have manifested their corporate social responsibilities with respect to communities, employees, consumers, competitors, and the natural environment.

CSR in the New Millennium

As we think about the importance of CSR/CSP in the new millennium, it is useful to review the results of the millennium poll on CSR that was sponsored by Environics, International, the Prince of Wales Business Leaders Forum, and the Conference Board. This poll included 1,000 persons in 23 countries on six continents. The results of the poll revealed how important citizens of the world now thought CSR really was. The poll found that in the 21st century, companies would be expected to do all the following: demonstrate their commitment to society's values on social, environmental, and economic goals through their actions; fully insulate society from the negative impacts of company actions; share the benefits of company activities with key stakeholders, as well as shareholders, and demonstrate that the company can be more profitable by doing the right thing. This "doing well by doing good" approach will reassure stakeholders that new behaviors will outlast good intentions. Finally, it was made clear that CSR/CSP is now a global expectation that now requires a comprehensive, strategic response.

CORPORATE SOCIAL RESPONSIVENESS

Corporate social responsiveness refers to how business organizations and their agents actively interact with and manage their environments. In contrast, corporate social responsibility accentuates the moral obligations that business has to society. Responsiveness and responsibility can be viewed on a means-end continuum in that responsiveness can be shaped or triggered by public expectations of business responsibilities. Generally speaking, these responsibilities are implied by the terms of the social contract, which legitimizes business as an institution with the expectation that it serve the greater good by generating commerce while adhering to society's laws and ethical norms. From this perspective, corporations are in a dynamic relationship with society of which responsiveness is key.

Corporations actively interact with and manage their environments through various programs, policies, and procedures, which are formulated by top managers and carried out by other employees. Ideally, these processes of responsiveness are informed by long-term strategic planning, which starts with an assessment of the firm's external environment from which information about its constituents or stakeholders can be gleaned. To illustrate, this kind of assessment might reveal a trend that society has increased expectations that firms will enhance the quality of life in communities. A more fine-tuned analysis would identify the stakeholders who hold this expectation and the issues of importance to them. This information might prompt a bank to make a commitment to invest in community development projects aligned with the goals of local residents and aimed at generating goodwill befitting public expectations of corporate citizenship. In terms of strategic management, these projects would necessarily reflect the bank's formal policy toward community development carried out by employees in departmental programs guided by specific procedures, such as the criteria for approving loan applications. In this way, an awareness of environmental factors can prompt concrete changes in corporate responsiveness or the ways firms interact with and manage their social relationships.

While responsiveness ideally results from long-term strategic planning, it can also take the form of a more immediate reaction to a crisis. Whether a crisis results from an oil spill, product tampering, or another unexpected event, the conventional wisdom is that corporations should develop the capacity to anticipate emergencies and respond swiftly to the needs of adversely affected stakeholders. The case of Johnson & Johnson Tylenol poisonings has become a classic study of swift crisis responsiveness. In 1982, seven people died after cyanide was added to Tylenol capsules while they were on store shelves, prompting Johnson & Johnson, the maker of the product, to incur hefty expenses by voluntarily recalling and destroying remaining capsules. During this process, James Burke, the chief executive officer, made aggressive use of the media to apprise consumers of the steps that were being taken to address the crises. Shortly thereafter, Johnson & Johnson introduced tamper-resistant packaging as a preventative measure, demonstrating that crisis management involves not only swift responses and effective communication with stakeholders but also organizational learning.

Corporate social responsiveness is defined not only by a firm's policies, programs, and procedures but also by a firm's overall stance toward the environment. A constructive attitude is evident when corporate agents try proactively to anticipate stakeholder concerns and accommodate them whenever possible. That is, corporate managers can direct their firms to learn about the environment in which they operate and be attuned to it. In contrast, firms may exhibit a reactive or defensive posture toward stakeholders or may even neglect social issues altogether. Such attitude is apt to invite unwelcome criticism, unfavorable media coverage, stakeholder pressure tactics such as protests and consumer boycotts, and government intervention and oversight. In the first case, firms seeking to be attuned to stakeholder interests are fulfilling the spirit of the contract between business and society. In the second case of corporate neglect, this implicit contract is violated.

It can be seen that corporate responsiveness is not value neutral, especially since corporate actions impact society in beneficial and harmful ways. For example, benefits to society can accrue when corporations respond to the need for innovative products with research and development that leads to an enhanced quality of life for consumers. On the other hand, harmful impacts can result when corporations neglect their responsibilities, as when they fail to clean up the pollution traceable to their production facilities. The extent to which society encourages benefits and tolerates harms is reflected in the standards embodied in the law, public policy, and government regulation. In this context, business managers and public policy makers can assess or audit the impacts of corporate activity and attempt to direct firms to respond affirmatively to public expectations of responsibility. A cautionary note is that businesses are increasingly exerting influence on the government by political advocacy, which includes lobbying policy makers and contributing financially to their election campaigns. As a result, the link between responsiveness and responsibility is compromised to the extent that this influence results in legislation that favors business interests at the expense of the greater good. Under the terms of the social contract, corporate social responsiveness does not equate to corporations responding to their own rules.

Corporate social responsiveness, corporate social responsibility, and corporate social impacts are encapsulated in the phrase *corporate social performance*. Of these three concepts, responsiveness is the most forward looking, action-oriented, and malleable, since it is based on the precept that corporations have the capacity to anticipate and adapt to environmental factors. The potential is that corporate managers can learn to prevent or minimize the kind of unwelcome surprises that necessitate crisis management and government intervention while responding proactively to public expectations of how business can serve the greater good.

CORRUPTION

Corruption is dishonesty or deliberate dereliction of duty for personal gain by a government official or a private entity official. Corruption broadly includes fraud, bribery, or deliberate misreporting. In a corrupt act, a binding duty is violated by someone who receives an unwarranted personal benefit. To define corruption concretely involves specifying the duty and the personal benefit and why and how the personal benefit is a violation of the duty.

In the case of a government official, corruption is violation of a sworn duty to uphold the public interest. In the case of a private entity official, corruption is violation of a contractual duty to uphold the lawful interests of the entity or its owners. In either circumstance, corruption involves specifically an agent's violation of some duty toward a principal in exchange for private benefits (commonly but not necessarily money). Corruption is typically illegal misconduct. Such dishonesty or dereliction of duty is in any case immoral and socially illegitimate, since it involves an indefensible breach of oath or contract. Citizens and shareowners rightfully expect honest, trustworthy, and loyal agents.

Toke Aidt identifies the essential conditions for corruption as discretionary power, economic rents, and weak institutions or controls. Corruption flourishes in business or government when an actor or group of actors has some degree of monopoly power (often asymmetric information or decision discretion) due to official position to which economic rents can accrue and over which external controls are relatively weak. Asymmetric information suggests secrecy or concealment: Disclosure and transparency is the natural enemy of corruption.

In August 2005, Jack Abramoff, a leading Washington, D.C., lobbyist, and a business partner were indicted on charges of wire fraud and conspiracy in connection with allegedly fraudulent purchase of a fleet of Florida gambling boats. The seller, a Miami businessman, was later killed in a gangland-style hit. Abramoff was also under investigation in connection with political lobbying on behalf of Indian casino interests. In November 2005, Conrad Black, the Canadian former head of the Hollinger International media empire was indicted in the United States with other former officers for allegedly stealing $51.8 million from the company. There has been a lengthy investigation into corruption in the UN oil-for-food program operated as part of the international sanctions against Saddam Hussein's regime in Iraq. The policy goal was to permit Iraq to sell oil for food to be distributed to the population of the embargoed country. An apparent scheme of bribery, allegedly including some UN officials and a large number of non-Iraqi companies, facilitated diversion of funds to Hussein's regime. In November 2005, the U.S. government charged a controller/financial officer for the U.S. occupation authority in Iraq with accepting kickbacks, bribes, and gratuities of at least $200,000 a month. The indicted American, who had served felony fraud prison time, directed construction contracts to another American's three companies. That individual was indicted on various charges.

The Nature of Corruption

Corruption is an ancient and widespread problem—for example, *mordita* ("bite") in Mexico or *baksheesh* ("present") in the Middle East. Baksheesh may cover alms giving, tipping, or gift as well as bribery. Tipping is a widespread commercial practice in the United States (taxi drivers and waiters work partly for tips), but regulated in other situations (i.e., minor gifts to business or government officials). A system of bribery/extortion can be distinguished from customary gift giving well-established in some societies. Traditional business transactions and relationships sometimes involve small gifts and gratuities given or exchanged before or after business. There is, however, a thin line between reward or thanks and bribe or extortion. Each case or situation must be examined on its own merits. A $20 gift of thanks to a helpful official is one thing, a $10 "fee" extorted by a police officer is another thing, and a $1 million bribe or kickback to an individual in connection with a $50 million government contract is quite another thing.

Recent research focuses on the causes and consequences of corruption to evaluate the effectiveness of reform proposals. One can analyze corruption in terms of "supply" and "demand" in a "marketplace." A corrupt payment requires a giver and a recipient. An improper payment may originate as a bribe (offer) on the supply side of benefit (which is the demand side for favors) or as extortion (requirement) on the demand side of benefit (which is the supply side for favors).

One can find in the literature a case for minor corruption as a form of auction for scarce resources (say telephone service or irrigation water) where queuing is unsatisfactory. Corruption can be perhaps a second-best solution for real problems including low wages for officials. Such practices may well lead on to systemic corruption schemes: Officials find an opportunity for corruption rather than a solution to resource allocation and wages.

In the XYZ affair of 1797–1798, French foreign minister Talleyrand refused to receive officially a three-man commission from the United States. Relationships between France and the United States had been strained by the French Revolution and its aftermath. A friend of Talleyrand made indirect suggestions of loans and bribes as a prerequisite for negotiations; discussions were conducted by three intermediaries ("XYZ"). In 1798–1800, for a variety of reasons including the affair, there was an undeclared naval war waged between France and the United States.

Coercive monopoly is suspect in economic theorizing and is ripe for misconduct. Adam Smith's criticism of the British East India Company, in the 1776 publication *Wealth of Nations*, is a description of corruption in a company exploiting quasi-governmental powers in a distant land. Henry (Lord) Acton's 1887 theorem states that power tends to corrupt and absolute power (i.e., monopoly) absolutely. In the present context, "power" might be interpreted broadly as corresponding to the conditions for corruption. Acton focused on executive leadership (kings and popes), but the conditions facilitating corruption may be widespread. Smith commented concerning the British East India Company personnel that his criticism was not personal—virtually anyone else in the same situation likely would have been as opportunistic.

The main anticorruption focus today is on official corruption in government, but corruption occurs in business and households as well. Corruption shades into the grey or underground economy, money laundering, and tax evasion. These forms of misconduct are socially illegitimate deviations from legal or moral obligation.

Business Corruption

One can broadly characterize officer and employee misconduct for personal gain and business-to-business collusions as corruption. There is some evidence suggestive of widespread employee misconduct and also lack of confidence in top management's impartiality. The difficulties of business corruption may be deeply embedded in corporate culture and the relentless drive to make targeted and temporally rising earnings estimates. The drive to lie in business is widespread. The corporate budgetary process arguably turns all participants unavoidably into liars: Everyone learns to game and scheme the system for more compensation. In the first years of the 21st century, following the dot.com bubble bust, there was a sad litany of corporate frauds and scandals—including Nortel (Canada), Parmalat (Italy), and Royal Ahold (the Netherlands). Recent U.S. business scandals (e.g., Enron, Tyco, and WorldCom) are hardly new phenomena.

A corruption perspective on the Enron scandal suggests the following analysis. The top executives of the company were corrupt in the sense of publicly stating high ethical standards while privately lining their own pockets in various ways. This corruption became corporate fraud when the books were cooked. The effect of the scandal—in combination with scandals at other companies—was passage of a new law, the Sarbanes-Oxley Act of 2002. The surprise in the Enron story was the systematic and complete failure of all the conventional corporate watchdogs: analysts, attorneys, auditors, bankers, directors, legislators, and regulators. This situation suggests a kind of corruption machine or process, whether deliberately or inadvertently evolved, in which the watchdogs were suborned in various ways—the private watchdogs by management pressure and dependence on revenues from Enron and the public watchdogs by donations and influence peddling.

The current situation resembles the sudden collapse in 1931–1932 of Samuel Insull's electric utility holding company empire, a collapse destroying the wealth of more than 1 million investors. The debacle helped enact much of the New Deal legislation regulating securities and utilities: the 1933 and 1934 securities acts, the Public Utility Holding Company Act of 1935, and the Federal Power Act of 1935. There are similarities to Enron in the sense of a financial bubble associated with rapid growth in a network industry combined with regulatory laxness.

Developing and Transition Economies

In June 2004, the UN Global Compact added a 10th principle dealing with corruption stating that businesses should work against bribery and extortion. UN General Assembly resolution 55/61 of December 4, 2000, approved the United Nations Convention Against Corruption. UN Secretary-General Kofi Annan commenting on the adoption made the essential case against corruption. It undermines governmental performance, democracy, and citizen morale.

Empirical evidence suggests that corruption in developing and transition countries has strongly negative effects on, respectively, economic growth and foreign direct investment. The great difficulty is, "How to change the course of history?" Corruption is often well-established and conducted by strongly entrenched subsystems or networks. When corruption is widespread in a society or community, individuals do not have sufficient incentives to oppose corruption even if everybody would benefit from the suppression of corruption. This explanation is an illustration of the collective action or free rider problem in the theory of public goods. Clean transactions generate a public good; widespread corruption generates significant negative (costly) externalities.

Transparency International (TI), headquartered in Berlin, Germany, reports annually information on corruption levels by country. The TI corruption information assembles a number of opinion (perception) surveys of knowledgeable individuals from which TI generates its own summary computations. While there may be methodological objections to the TI approach, it gives a rough picture of the corruption situation worldwide. The TI report does not cover all countries: Some Middle East states in particular are generally missing. The "Corruption Perception Index" (CPI) attempts to measure "demand" for corrupt payments: the CPI scale runs from 1.0 = *dirty* to 10.0 = *clean*. There is a rough confidence range around each point-estimate. In general, developing and transition countries fair the worst. Among the 146 countries included in the 2004 CPI report, the following rated below 2.0 beginning with the worst reported and working toward 2.0: Haiti, Bangladesh, Nigeria, Myanmar, Chad, Paraguay, and Azerbaijan. Ukraine rated 2.2 and Russia 2.8 among transition economies. The report states that corruption is rampant in 60 countries (all developing or transition) and that most oil-producing countries are corrupt. There are periodic country and region reports, and in 2003, there was a "Global Corruption Barometer" survey of citizens.

Advanced Economies

There is considerable variability in corruption levels among the advanced economies holding membership in the Organisation for Economic Co-operation and Development (OECD). None reach the low levels of the worst developing and transition economies. However, Italy at 4.8 tied with Hungary and ranked below Taiwan at the 5.6 level. The cleanest countries (8.9 or above) are typically New Zealand, Singapore, Switzerland, and the Scandinavian nations. Germany at 8.2 and Hong Kong at 8.0 both ranked above the United States at 7.5, about the level of Chile. France fell lower at 7.1 and Japan at the 6.9 level.

Criticism in developing and transition economies of the CPI—as stigmatizing those countries, when bribes are paid by multinational corporations—resulted in the "Bribe Payers Index" (BPI). BPI attempts to measure the "supply" of corrupt payments. BPI addresses the propensity of companies from leading exporting countries to pay bribes to senior public officials in surveyed emerging market countries.

In Japan, *dango* is a long institutionalized post–World War II scheme of bid rigging by private companies "competing" for public works contracts and excluding foreign companies from bidding. During 2005, Tokyo prosecutors, on the initiative of the Fair Trade Commission (FTC), raided various companies suspected of collusion in a bid-rigging ring concerning bids for government steel bridge construction orders—worth an estimated $3.2 billion per annum—in violation of the antimonopoly law. More than 40 companies may be involved in a scheme alleged to have operated for over four decades. The construction industry is a strong supporter of the ruling Liberal Democratic Party (LDP). In 2004, the FTC searched offices of firms in steel and heavy machinery industries. Effective 2006, a revision of the law will increase fines and grant immunity to the first firm reporting a bid-rigging scheme. The FTC does not have the support of business or the LDP in the recent crackdown drive.

Commercial and political corruption is an old story in the United States—home of the urban political machine of the late 19th and early 20th centuries. A classic instance was the Tweed Ring in New York City. William Marcy Tweed (1823–1878) became boss of Tammany Hall, the Democratic Party for the city. In the late 1860s, Tweed marshaled city officials, party workers, and contractors into a corruption network. A new city charter (1870) gave the city control of its budget and police. Large debts for contract work marched with kickbacks to Tweed and associates who gained control of city finances. Tweed, for example, received all city printing contracts through his own company. A lavish courthouse project caught public attention. The *New York Times* conducted an investigative campaign, cartoonist Thomas Nast targeted Tweed, and good government reformers ("goos-goos") stood for city offices. Samuel J. Tilden (Democratic candidate for U.S. president in 1876) obtained the conviction of Tweed on a misdemeanor of failing to audit contractor bills for the courthouse, but Tweed actually served only 1 year. The state of New York sued Tweed for more than $6 million. Tweed escaped from jail in 1875 and fled to Cuba and then to Spain, where he was arrested. He died in jail in New York City before the state suit could be tried.

International Collaboration to Combat Corruption

There was widespread corruption in many countries in the early 1970s, despite nearly universal legal prohibition. Some 14 European countries permitted, until recently, corporate tax deductibility of bribes paid abroad. In the wake of the Watergate scandal, when President Richard M. Nixon resigned to avoid impeachment and received a pardon from his successor, there was revelation in the United States of a widespread domestic and foreign pattern of questionable payments. During the 1974 presidential campaign, Nixon campaign operatives broke into the Watergate offices of the Democratic Party in Washington, D.C., and were arrested. Nixon orchestrated an illegal cover-up effort from the White House that included use of cash traced back to U.S. corporations. The investigation discovered that hundreds of American companies had made questionable payments abroad to officials of various countries—including Belgium, Japan, and the Netherlands. The Watergate scandal brought down the administration, resulted in conviction of various individuals including the U.S. attorney general, and resulted in the passage of the Foreign Corrupt Practices Act (FCPA) of 1977. Only Sweden followed the lead of the United States with the 1978 adoption of an antibribery provision.

The 1988 FPCA amendments emphasized international cooperation. The U.S. effort coincided with anticorruption efforts of the International Chamber of Commerce (ICC) and TI. TI, founded by Peter Eigen, formerly of the World Bank, is a coalition of country chapters attempting, sometimes at personal risk, to combat government corruption. A multipronged, sustained campaign by multiple institutions and actors will be necessary, but progress suggests that global norms against bribery/extortion can emerge despite mixed motives and diverse values. There are vital roles for corporate codes of conduct; nongovernmental organizations such ICC and TI; international institutions such as the International Monetary Fund, World Bank, and World Trade Organization; and multilateral anticorruption accords such as those adopted by the Organization for American States (1996), OECD (1997), European Union (1997) (expanding to include transition countries in Central and Eastern Europe, where corruption is rampant), and the Council of Europe (1999). The World Bank pioneered a new approach to controlling corruption through design of the money handling for the Chad-Cameroon Development and Pipeline Project. Chad is one of the most corrupt countries in the TI estimates. The International Anticorruption and Good Governance Act of 2000 concerns U.S. development assistance. A periodic International Anti-Corruption Conference brings together anticorruption government agencies.

COST-BENEFIT ANALYSIS

Cost-benefit analysis (CBA) is a rational choice framework for identifying the best or most profitable option a decision maker can undertake. The decision maker may be a principal (i.e., an individual) or an agent (i.e., management or government) acting for others. The basic logic of CBA is that, for any specific course of action to be adopted, the total expected benefits should exceed the total expected costs to the principal or principals. If expected costs exceed expected benefits, the decision maker should not undertake the proposed action. If expected benefits and expected costs are equal, the principal or principals should be indifferent between the proposed action and the status quo. CBA is in the tradition of consequentialism and teleology. The logic of CBA, applicable with or without money values or other numbers, is to identify and evaluate all the consequences, positive (i.e., for) and negative (i.e., against), of a proposed course of action. The largest net positive change is superior to any alternative, consistently evaluated (qualitatively or quantitatively).

CBA justifies a specific decision computation methodology. In economic theory, reasonably competitive markets ought to lead to these superior outcomes. And these outcomes would be consistent with Pareto efficiency. CBA is a qualitative or quantitative substitute for market exchanges. CBA is, thus, used in circumstances in which markets are less than reasonably competitive, due typically to market failures or intangible considerations. An individual or management might need to weigh effects on reputation of some course of action. CBA is applicable to public goods (such as government investment projects) and setting of governmental regulatory standards. In the Flood Control Act of 1936, the U.S. Congress required for the first time the identification and quantification in dollars of *all* flood control project benefits and costs. Government CBA should maximize gross national product through the most efficient allocation of scarce resources. Government CBA is not, however, a theory of public finance. It is narrowly a public expenditure evaluation approach undertaken without considering the financing alternatives. Some business decisions such as investments in information systems or R&D and many nonprofit entity decisions are not necessarily resolved by discounted cash flow (DCF) estimates.

In a narrowly "economic" CBA, the proposed course of action is the allocation of scarce resources to one competing use rather than to the next best alternative use. The statement "there is no free lunch" expresses this underlying opportunity cost notion. The decision computation methodology estimates a money value equivalent for all the positives and negatives, which can then be summed to a net money gain or loss. This single decision criterion requires a consistent cardinal measurement of all consequences.

A broader "social" CBA decision context reflects incompleteness of cardinal measures (whether money or numbers) and also typically multiple decision criteria. Social CBA compares "apples" and "oranges" (i.e., "incommensurables"). In real decision situations, some benefits and costs may be tangible and measurable in money, while others may be intangible and not measurable in any system of cardinal units. The intangible considerations could arguably outweigh the tangible considerations. These intangible considerations might be ecological sustainability or values grounded in nonconsequentialist ethical perspectives. Social CBA is effectively multiple criteria assessment (MCA). If all relevant criteria concur, then the incommensurable decision problem is solved. Otherwise, the competing criteria must be weighted or prioritized against one another in some manner. The "triple bottom line" and corporate social performance (CSP) measurement are instances of MCA.

The Basic Arithmetic of Cost-Benefit Analysis

The fundamental rule of CBA is to select the alternative (or set of alternatives) that produces the greatest net total benefit (NTB or NB), defined as the positive difference between all benefits and all costs. The basic arithmetic is to sum together computed total benefits (TB or B) and computed total costs (TC or C). If the balance is positive (TB > TC), then the project (i.e., decision or choice) should be undertaken. Maximization of (TB − TC) occurs when marginal benefit equals marginal cost: MB = MC. If the balance is negative (TC > TB), one should stick with the prevailing status quo. If TB = TC, then one is indifferent between change and status quo. This condition is sufficient for making the change. The required condition for undertaking the project is positive net benefits computed as shown:

$$NB = TB - TC > 0 \text{ or } NB = B - C > 0.$$

It has been common practice to use an alternative criterion called the benefit-cost ratio: TB divided by TC. The required condition for undertaking the project is then that the ratio should exceed 1:

$$TB/TC > 1 \text{ or } B/C > 1.$$

In many circumstances, the net benefit criterion and the benefit-cost ratio will yield the same decision outcome and the same relative ranking of multiple projects. However, the two measures are not strictly the same. If any difference arises, then the net benefit computation is automatically correct and the benefit-cost ratio logically must be wrong. More care must be taken with a benefit-cost ratio analysis. A benefit always has a positive sign; a cost always has a negative sign. In the NB computation, one simply sums together positive and negative sign elements. An NB computation is straightforward, because signs are known and any order of considerations is irrelevant to the summation result. With respect to the B/C computation, circumstances might arise in which the sign is not a definitive guide as to whether a consideration belongs in the numerator or the denominator, and the placement of considerations in the numerator or the denominator is fundamental to the division outcome. For example, where corrective action reduces some but not all environmental damage, should one think of the remaining damage as a reduction from benefit (in the numerator) or an addition to cost (in the denominator)?

Ethical Limitations and Criticisms of CBA

Economic CBA reflects a strictly utilitarian orientation to consequentialism. Utilitarianism is the ethical doctrine of the greatest good (i.e., net benefit) for the greatest number of people. Moral objections to CBA can be aimed at consequentialism, utilitarianism, or misconduct in CBA estimations. Pareto efficiency requires that net gain to at least one person impose no uncompensated harm on any other person, as in eminent domain acquisition of private property at fair market value. The weaker Kaldor-Hicks criterion often invoked in CBA substitutes "hypothetical compensation": Net gain to one party outweighing net loss to another party is justified on the basis that the winner(s) could potentially compensate the loser(s). Economic CBA is just one approach to decision making that is narrowly suitable for tangible, objectively quantifiable parameters occurring within reasonable probability ranges.

Intangible considerations, such as risk to environment or human life, can cause significant debates. A difficult aspect of CBA is valuation of human life and limb. In the early 1970s, Ford Motor subjected its Pinto subcompact auto to a monetary CBA conducted in accord with federally approved methodology. The

CBA found that it was not socially worthwhile to fix a known design defect (costing perhaps no more than $11 a vehicle), which permitted the gas tank to explode when struck from behind. The cost of fixing the entire production run of 12.5 million vehicles would be about $137 million. Valuing a life at $200,000 (for 180 lives), each serious burn injury at $67,000 (for 180 serious injuries), and property loss in vehicles at $700 each (for 2,100 cars), the benefits to society of fixing the Pinto model weighed in at $49.53 million—less than half the cost of the fix. The defective assumption in the CBA was the low value assigned to a human life. A jury trial determined that burn injuries, under these conditions, should be valued at $6.6 million. The Pinto example reveals technical flaws in CBA (undervaluation of life and limb), underestimation of legal reaction (the jury's findings), and arguably ethical myopia.

Pankaj Ghemawat argues that a rule or principle necessarily replaces rather than supplements CBA. A CBA involves trade-offs of pro and con value considerations, whether computed quantitatively or judged qualitatively. Ghemawat argues that strategic choices (i.e., resource-intensive commitments) must always reflect CBA (i.e., consequentialism) in some form. Steven Kelman argues that, in areas such as environment or safety and health regulation, a decision may be right even if benefits do not exceed costs; and further that it is not always appropriate to place dollar values on nonmarketed benefits and costs. A rule or principle must sometimes supersede CBA calculations.

The U.S. Environmental Protection Agency has proposed a standard for permissible level of arsenic in drinking water. Cass Sunstein points out that science can presently provide only wide benefit ranges for this standard. He suggests a range of 0 to 112 lives saved, equivalent to a range of $0 to $560 million in monetized benefits. One ethical position is that a life saved cannot be subjected to money valuation. Another ethical position is that, as a hypothetical estimate for illustration, several billion dollars in costs to save 112 lives worth $560 million would be unjustifiable—even admitting the possibility of significant undervaluation of the benefits.

Ethical difficulties in CBA can arise through the decision maker taking an inappropriately narrow or self-interested focus. For example, the decision maker ignores broader considerations or shifts costs to some other party as in the "tragedy of the commons." Decision makers may manipulate various aspects of the CBA computation methodology to inflate benefits or deflate costs. Ethical issues of equity, fairness, and honesty arise in such instances. Where the decision maker is not the owner of rights to benefits and costs, moral hazards of agency can arise.

Estimation and Distribution of Consequences

A typical use of CBA addresses government budgeting for "public goods" that will not be supplied optimally by the market economy. A public good is an extreme case of externalities (i.e., noninternalized side effects), combining nonrival consumption and nonexclusion by price. The government must undertake to estimate consumers' willingness to pay and the true opportunity cost of public good provision. The rationale for CBA is economic efficiency—society should seek optimal resource allocation to maximize society's economic welfare.

The CBA rationale draws on the theory of welfare economics under perfect competition: ideal welfare pricing is P = MC = AC, or price = marginal cost = average cost, for zero economic profit (defined as any profit in excess of ordinary or competitive profit). The government should price outputs and inputs at competitive conditions and ignore monopoly pricing distortions. It also should assume full employment of resources and price all externalities and repercussions of a course of action.

CBA must properly include all social benefits and all social costs, including nonpecuniary (i.e., real) externalities translated into dollar values but excluding pecuniary externalities already occurring as dollar values. A project or decision has both direct effects—the benefits and costs—and what one can classify as indirect effects or repercussions. An externality—positive or negative—is an effect on another party. In CBA, nonpecuniary externalities must, in principle, be incorporated. For example, if a dam is constructed to provide water supply for irrigation farming, one can compute the benefits and costs of the dam. Suppose that in addition the dam endangers a unique species of fish. The dollar value of the loss of that species must be accounted for in computing the worth of the project: the loss is a negative externality that must be internalized in the decision, reducing the net worth of the project. In principle, positive externalities—such as an increase in an endangered tree species now assisted by irrigation water—must be added to the net benefit side. All nonpecuniary externalities must be identified and quantified, in principle.

A pecuniary externality—positive or negative—is a change in the nominal price of an existing asset or resource. For example, land along the lake created by the dam may rise in value; land downstream of the dam may fall in value. These price changes are not benefits or costs of the project.

Income to the farmers is not a benefit of the project. The test for social benefits is consumers' willingness to pay (i.e., demand) for the outputs of the project. Willingness to pay, in economics, is the sum of the actual price consumers must bear and what is called consumers' surplus, which is what a monopolist practicing perfect price discrimination would be able to obtain. Technically, the net benefit of a project is the consumers' surplus, in the sense that willingness to pay is the sum of benefits and actual price is the sum of costs. A cost saving can be a form of benefit—a cost reduction is the same as a benefit increase.

Distribution of wealth is a different consideration. Transfer payments merely redistribute existing output. CBA deals with generation of additional output. Output value is computed before taxes, which are simply a form of transfer payment, unless taxes are levied by an external entity, such as another country; in that instance, taxes become a reduction of net national wealth. One can address distribution issues by attachment of judgmental weights (labeled w_i below), which must be derived by political processes or by ethical judgments:

$$\mathrm{NTB} = w_1\mathrm{NB}_1 + \ldots + w_n\mathrm{NB}_n.$$

Time Stream Evaluation

The arithmetic above has proceeded as if the benefits and costs of a proposed course of action occurred within a single time period. Time stream evaluation refers to the circumstance when consequences occur over two or more time periods. Benefits and costs must be discounted to present values. The logic of CBA becomes that, over some appropriate time horizon, the sum of all relevant present value benefits should exceed or at least equal the sum of all relevant present value opportunity costs. The basics of this net present value (NPV) determination are covered in the entry on "Discounting the Future." A vital concern in discounting, covered fully in that entry, is the conservation of nonrenewable resources for future generations, to whom present generations arguably owe definable moral duties. Intergenerational equity is an important issue in time stream evaluation.

NB, B, and C can represent simple one-period estimates. Benefits and costs may have been recomputed to present values, meaning that multiple time periods have been reduced to a single time period (the present time period) through discounting. With time stream evaluation, NB becomes NPV. The mathematics for time stream evaluation takes the following general form for computation:

$$\mathrm{NPV} = -K_0 + \sum_{t=1}^{n} \frac{\mathrm{B}_t - \mathrm{C}_t}{(1+r)^t} > 0.$$

In this particular formula, NPV is the net present value; K is an initial (capital) investment (i.e., a fixed cost) occurring at the beginning of the project (time period 0 indicated by subscript), t is each specific time period, n is the number of time periods, B is the stream of benefits occurring over time, C is the stream of costs occurring over time (after the initial investment), and r is the discount (or interest) rate applied (uniformly in this example) to each time period. The formula has the effect of increasingly reducing the nominal value of B and C over time.

One can compute the internal rate of return (IRR) of a project, defined as the discount or interest rate at which the present value of benefits is precisely equal to the present value of costs: $[\mathrm{B}(r) = \mathrm{C}(r)]$. The IRR reveals the breakeven point of the project. In the case of time stream evaluation, the IRR can yield what mathematicians call multiple solutions (i.e., roots to a quadratic equation), so that it is difficult to compare competing projects.

NPV is highly sensitive to discount rate. A low rate approves more projects; a high rate approves fewer projects. There are several schools of thought on the appropriate discount rate for government projects: (1) government long-term bond rate reflecting low risk, (2) a social rate of time preference lower than social opportunity cost, (3) a social opportunity cost equal to the private sector rate of return on investment, or (4) some weighted average of the social rate of time preference and the social opportunity cost. Theoretical choice of discount rate tends to reflect liberal (low) versus conservative (high) preferences concerning size of government (large for liberals, small for conservatives).

Relationship of CBA to DCF

The NPV formula looks superficially to be the same formula as used in a DCF analysis. The general mathematical form is the same: both NPV and DCF deal with time stream evaluation problems and the mathematical formula is logically the same treatment.

CBA is a balance sheet rather than a cash flow or profit-loss framework. CBA maximizes net benefits (i.e., gain) on the balance sheet of an individual, group, or entity. Benefits are new assets. Opportunity costs are existing assets (or resources) diverted (i.e., given up) to "production" of the new assets. If the net worth of the balance sheet would increase, that diversion should occur. A cash flow analysis might reflect monopoly restrictions and/or unemployment conditions. Businesses typically use DCF because maximizing free (i.e., net positive) cash flows in markets automatically provides the balance sheet solution.

A Multiple Criteria Assessment Example

Due to rising energy demand and prices (which in fact tend to fluctuate considerably), there have been unsuccessful efforts to build a natural gas pipeline from Alaska's North Slope to the continental United States. The Alaska Natural Gas Transportation Act of 1976 established a special decision-making process involving the president and the Congress as well as the Federal Power Commission in selection of the system and routing. The act required consideration of multiple environmental, safety, diplomatic, national security, financing, competition, economic, and energy dimensions. A proposal for an LNG system (liquefying gas at Valdez, Alaska, and deliquefying gas in southern California at an earthquake-prone site) was eliminated on qualitative environmental, security, and diplomatic considerations. Two overland projects were subjected to quantitative CBA at both commercial (10%) and government (6%) discount rates. One proposal showed somewhat higher net national economic benefit on both discounting procedures. It would finish earlier, use existing utility corridors, and risk less environment damage; it would not tap another gas field in Canada. The project was never built, because private investment is highly sensitive to the projected price of gas, which declined, and to the problem of government guarantees for the risk of the investment. A presently pending proposal is another LNG system originating at Valdez.

Council of Economic Advisers

The Council of Economic Advisers (CEA) is a body within the executive branch of the United States government comprising three professional members appointed by the president with the consent of the Senate and whose duties and functions are (1) to assist and advise in the preparation of the annual Economic Report of the President; (2) to gather and analyze information concerning economic developments and economic trends and to compile and submit studies relating to these developments and trends; (3) to appraise the programs and policies of the federal government; (4) to develop and recommend national economic policies to foster and promote free market, competitive enterprise, to avoid economic fluctuations or to diminish the effects thereof, and to maintain employment, production, and purchasing power; and (5) to make and furnish such studies, reports, and recommendations with respect to matters of federal economic policy and legislation as the president may request.

The Council and its duties were created by the Employment Act of 1946, signed into law on February 20, 1946, by President Harry S. Truman, who had great hopes for the act and thought its value would be long-standing and significant. This act also created the Joint Economic Committee of the Congress. The legislation was stimulated by two major considerations. The first, a holdover from the Depression era of the 1930s, was the practical concern that a peacetime economy may not reach full employment, and the second, the influence of John Maynard Keynes's development of macroeconomic theory, which purports to show that as a matter of theory free market economies may settle at below full-employment equilibria and therefore his policy prescription that government stimulus is necessary to push the economy toward full employment.

This legislation created the CEA as a formal institution to advise the president. Prior to this time economic advice was given by different agencies, for example, the Treasury, the Department of Agriculture, and/or the Federal Reserve or individuals brought into the president's circle on an ad hoc basis.

This type of "employment" legislation, which, in earlier versions in the United States at least, contained specific targets and goals for macroeconomic variables such as the unemployment rate, was a feature of post-War Western economies, being preceded by several similar Keynesian-inspired recommendations in the United Kingdom, including the Beveridge Report (1943) advocating heavy government influence in the economy and the British government's White Paper on Employment Policy (1944), which committed the government to organize its post–World War II budget policies with a focus on Keynesian full-employment objectives.

Other Western governments brought forth similar papers, with Australia releasing its "Full Employment White Paper of 1944" and Canada its "White Paper on Employment and Income of 1945," outlining the government's intention to adopt Keynesian economic policies to maintaining a high level of employment and income.

In its early years, the CEA was staffed by economists sympathetic to the Keynesian view, such as Edwin Nourse, Leon Keyserling, and Gerhard Colm. By the 1960s and the Kennedy administration, the CEA was composed of prominent Keynesians with Walter Heller, Kermit Gordon, and James Tobin in the CEA seats and Paul Samuelson, John Kenneth Galbraith, Arthur Okun, and Seymour Harris in the background.

By design the CEA is a neutral agency without ties to a particular constituency and most often headed and staffed by economists on leave from other professional positions (usually academic). This provides an opportunity for new theoretical and applied research to be brought to bear on policy questions. The relatively short-term nature of the appointments, for example, there were four different chairs during the eight-year Clinton presidency, dissuades any particular person from empire building and becoming entrenched in an insulating bureaucracy. It is hoped that this allows the Council to impartially give the best advice of the day. However, this neutrality has not prevented controversy, for example, early on Chairman Nourse and Council member Keyserling clashed repeatedly over their view of the Council's public and private roles.

More recently, the Council has been criticized for writing on matters that may not pertain strictly to the economic. For example, in 2005, the National Security Council reportedly excised a chapter on Iraq's financial system from that year's Economic Report of the President. The CEA has also served as a seeming "testing ground" for further governmental service with, among others, Arthur Burns, Allan Greenspan, and Ben Bernanke all serving stints as chair of the CEA prior to becoming (not necessarily under the same president) chair of the board of governors of the Federal Reserve Board, a more influential and longer-term position.

Council on Foreign Relations

While a nonpartisan and independent membership organization, the Council on Foreign Relations (CFR) is one of the United States' most influential policy groups. CFR leaders have strong ties to government, business, media, military, think tanks, foundations, academia, and other key entities. Membership is invited (more than 3,000), and those active in the Council are also commonly found in other such organizations (Bildeberg Group, Bohemian Club, Trilateral Commission, Project for the New American Century, etc.).

Such interlocking membership invariably has created a powerful and intricate web of influence, cutting across both liberal and neoconservative ideologies. Generally speaking, the Council has supported international initiatives and favored globalist collaboration, as compared with noninterventionist policies and independent national sovereignty. Both supporters and critics agree that since its founding in 1921 through support of J. P. Morgan & Co., CFR members have held a succession of high-level positions in every presidential administration, irrespective of party. Founding members included Morgan, Colonel Edward M. House (adviser to President Wilson), John D. Rockefeller, Paul Warburg, Otto Kahn, Jacob Schiff, and other internationalists who had earlier worked to establish the Federal Reserve System as America's national bank. The organization grew so much in stature that dating from the Franklin D. Roosevelt era up to the present, practically every secretary of state, secretary of defense, and secretary of the treasury has been recruited from the CFR. In the 2004 election, for example, whether Bush or Kerry won did not matter in one key aspect—there would still be around 400 members of the CFR in either administration. Not surprisingly, ideas promulgated in *Foreign Affairs*, the CFR's quarterly journal of global politics, as well in its numerous reports and books often become U.S. government policy.

The CFR is headquartered in New York with an office in Washington, D.C. Throughout the year, the Council hosts a number of meetings where world leaders, government officials, scholars, journalists, and other foreign policy specialists discuss and debate the major foreign policy issues of our time. Some sessions are off-the-record, while transcripts of on-the-record events are posted on the Council's Web site.

Because of its focus and influence, the Council has been controversial. Proponents argue that through Council forums, policies that reflect public good and the public interest evolve. Opponents present a difference case—that CFR's efforts are internationalist to the point that members would prefer world government to national sovereignty. Irrespective of impact, there is no doubt that Council members do help set as well as implement the foreign policy agenda of the United States. They do not simply analyze and interpret foreign issues, they help determine what is discussed and decided.

A major ethical issue involves whether or not holding "confidential" gatherings by power wielders under the aegis of a private organization is consistent with proper conduct in a free country. Democratic accountability is not an easy process. Nevertheless, openness and transparency are generally more desirable than covert closed-door decision making from the point of view of those influenced.

Cowboy Capitalism

Cowboy capitalism is a term used, primarily by its critics, to describe the free market elements of the American (and, less often, the "Anglo-Saxon") economy. It has been contrasted both with socialism and with modern European "comfy" capitalism. An ongoing debate persists in business ethics circles concerning whether such a free market is morally good or morally bankrupt.

Cowboy capitalism has been likened to shareholder capitalism, where firms experience constant pressure from investors to maximize profits and focus on financial results. A theoretical foundation of this view is the efficient markets hypothesis, which holds that free markets are the ultimate, efficient arbiters of the economic goods in a society. This economic system is often characterized by numerous entrepreneurial startups and bankruptcies, as well as by frequent mergers, acquisitions, and leveraged buyouts. Individuals are encouraged to strive and to pursue their own self-interest, which some argue constitutes satisfying their own greed without restraint.

A hallmark of cowboy capitalism is the laissez-faire relationship between business and government. It is characterized by economic freedom and lower taxes for both businesses and individuals. The government associated with this economic system tends to remain small and noninterventionist, even in the cases of business trusts and mergers and acquisitions. However, some argue that political corruption is endemic in such systems, as businesses may bribe government officials to keep potential regulation at bay.

The long-term consequences of cowboy capitalism have proven to be very high standards of living, very low levels of unemployment, and unprecedented levels of productivity and per capita gross national product. These consequences are often claimed to be products of Adam Smith's invisible hand, which he argued enables the pursuit of individual interests to lead to the greatest macroeconomic output. Advocates argue that these gains have been made despite governmental regulation and interference. Critics, however, claim that it is precisely these regulations and social programs that have stimulated economies by putting money into consumers' pockets. They also focus on the variable distribution of wealth in such an economy, claiming that the system is morally indifferent to its less able or less fortunate members. In addition, firms have no guarantee of survival, nor workers of ongoing employment.

Opinions vary concerning the origins of the term. Some argue that it characterizes a cowboy's tendency to shoot first and think later, while others believe it symbolizes participants' thirst to win the competitive struggle presented by business. Still others go to the extreme of claiming that it means "doing in" rivals so that they can no longer compete.

Icons of cowboy capitalism differ among supporters and critics. Supporters would point to Ronald Reagan (on a horse) and to Reaganomics, as well as to the city that has been called the capital of cowboy capitalism—Houston, Texas, particularly during the 1980s' oil boom. Critics, in contrast, would focus on scandal-riddled Enron, modern Russia, and Eastern European markets after the breakup of the Soviet Union and before the rule of law. Even supporters acknowledge that the concept has sometimes been taken to extremes. Marianne Jennings has likened the Yeehaw culture of Enron and other scandal-ridden firms to distortions of cowboy capitalism.

Crisis Management

The field of crisis management (CM) attempts to mitigate the losses incurred when a crisis occurs and to prevent crises that could occur in the future. An organizational crisis is defined as a low-probability but high-impact event that threatens an organization's existence by disrupting its normal operations and its social legitimacy. An organizational crisis can be distinguished from a natural disaster in that it implies human responsibility; furthermore, it is a highly complex event, both in terms of its genesis and its consequences.

First developed in the field of political science, the theory and practice of CM is today shaped by scholars from many disciplines, as diverse as administrative sciences, systems theory, risk management, positive psychology, and ethics. Gerald Mars and David Weir have rendered a great service to CM theory with their two compilations of papers by some of the most important authors in the field. CM is traditionally divided into two schools. The first, called *high reliability theory,* argues for the feasibility of designing systems that protect against crises and ensure organizational safety through the use of mechanisms such as centralization of decision making, redundancies, and downsizing of scales. The second school of thought, called *normal accident theory,* argues that while prevention can be achieved in relatively simple environments, crises cannot be adequately prevented and controlled in other more tightly coupled and complex environments, such as in the nuclear energy industry. Thus, this theory calls for such uncontrollable activities to be banned altogether.

The Crisis Management Model

Many scholars and practitioners consider the management of the Tylenol crisis by Johnson & Johnson (J&J) to be the prototypical example of efficient and ethical CM. In 1982 and 1986, the capsules of extra-strength Tylenol had been tampered with cyanide, leading to the death of six people in the first case and one in the second case. Even though J&J was exonerated of any wrongdoings, since the products were tampered with in the market place and not in the company's facilities or its distribution network, J&J reacted quickly and responsively and recalled 31 million Tylenol bottles—a retail value of more than $100 million. This case has been extremely influential on both CM practice and theory and has led to a checklist of what to do in the case of a crisis. Many observers have praised (1) J&J's quick response and actions; (2) the company's lack of defensiveness and acknowledgment of its responsibility to protect the public; (3) its recall of enormous quantities of product at great cost; (4) its extensive public relations campaign; (5) its redesign of the product, including the tamper-resistant triple-seal now standard in the industry; and (6) its effective defence of its brand name, corporate reputation, market shares, and stock price. J&J's response certainly stands out when compared with less successful CM interventions, such as Union Carbide's Bhopal disaster, the *Exxon-Valdez* oil spill, the Perrier water contamination incident, or the Three Mile Island nuclear accident. In addition to the points mentioned above, experts often attribute J&J's effective response to the company's mission statement, which stresses its ethical responsibility toward all its stakeholders, and the efficient and caring leadership of James E. Burke, then chairman of the board of McLean, which produces Tylenol.

But while J&J's response was clearly efficient, the Tylenol case is not as positive from an ethical point of view. Inquiries have revealed, for example, that drugs similar to Tylenol, such as aspirin, had already been tampered with on several occasions using deadly substances, such as cyanide or arsenic, many decades *before* the Tylenol crises. In one case in Switzerland, a mentally disturbed nurse added poison to the drugs used at her hospital. When these past incidents are taken into account, the question is no longer whether or not J&J reacted in a responsible manner: It did. The deeper ethical question becomes, why didn't J&J better protect its Tylenol products *before* these crises?

Two frequent objections are often raised when this question is asked. The first is that these tampering incidents had been rare in the past. But this is the essential point of CM: A crisis is, by definition, a low-probability but high-impact event that necessitates action by an organization if it is to be financially and ethically responsible toward its stakeholders. The second objection is that J&J was not aware of previous tampering and thus could not have imagined such a tragic situation. As we will see later, an ethically based CM approach requires a different kind of *moral maturity*, as well as a different kind of *ethical inquiry*. There is no doubt that J&J and its affiliated companies, which together control about 32% of the market, have dedicated significant resources to the R&D of the drug, including its potential side effects, and to its promotion and distribution. However, a more ethical strategy would have included a thorough evaluation of the potential crises that could arise and the implementation of various preventive actions.

This relatively low level of moral maturity and ethical inquiry is not unique to the J&J case. The tragedy of Nestlé's commercialization of its powdered milk product in Africa, which has tarnished the company's reputation to this day, is another example. During the 1970s and 1980s, thousands of African women, charmed by this new Western product, purchased the powdered milk and mixed it with the water they had available. Unfortunately, this water was often contaminated and the product led to the deaths of several thousand infants. Nestlé claimed for years that its product was perfectly safe and not to blame; the company further insisted that it was not doing anything illegal and that its packaging indicated that potentially unsafe water should be boiled prior to use. It ultimately took an order of the World Health Organization, after much lobbying by different activist groups, for the company to withdraw its product. In this case, Nestlé lacked moral maturity: It could not understand that its *good* product could become *lethal* when used by people with little to no education or reading ability in an environment such as in Africa where clean drinking water is not universally available. Furthermore, Nestlé failed to adopt an ethical approach, that is, really empathizing with the thousands of dying children and recognizing the tragedies experienced by their families; instead, the company was blinded by other issues, including technical, financial, and legal considerations. The Nestlé case is clearly more tragic that the J&J one.

While both companies lacked moral maturity and ethical inquiry, at least J&J didn't wait for an order from an external body before modifying its strategies. In comparison with the Nestlé example, the Tylenol incident is a good example of efficient and responsible *reactive* CM. However, both companies were not able to integrate the "four families of crises," as suggested in the CM literature. If they addressed the issues of (1) economic attacks and (2) informational attacks, they were less successful at addressing the issue of (3) product breakdown (J&J had even to wait for its second 1986 crisis before abandoning the production of its capsules, which were more vulnerable to tampering than tablets) and (4) psychosocial crises, including harm to stakeholders. In a similar vein, both companies did relatively well in two of the families of CM actions, that is, (1) technical audit and (2) structural design, but did poorly in the two others, that is, (3) internal emotional preparation and (4) external communications, while J&J did better than Nestlé in this last area.

Moral Maturity and Ethical Inquiry in Crisis Management

Many ethical frameworks, theories, or traditions are ill-suited for dealing with the complexity of crises. For example, the utilitarian framework, which is widely used in organizations and favors the well-being of the greatest number of people, could have lead to the decision to keep Nestlé's powdered milk in Africa if it could have been demonstrated that more people benefited from this product than suffered from it. Likewise, the use of legal frameworks could excuse both Nestlé and J&J in these two cases, as neither company broke the law.

Recognizing the complexity of real-life situations, several philosophers and theologians have proposed that an ethical framework should reflect at least three considerations: (1) it should address the reality of a problem, conflict, or crisis, and not just follow abstract principles; (2) it should be grounded in dialogue, open to conflicting ideas and paradoxes, which requires moral maturity to look beyond conventional norms and values on the part of both individuals and communities; and (3) it should proceed by deliberate ethical inquiry, testing the decisions made and the actions taken, considering them as working hypotheses rather than firm policies.

Two ethical frameworks that adopt this type of moral maturity and spirit are the *pragmatic democracy*, developed by the philosopher John Dewey, and the *systematic theology*, developed by the theologian Paul Tillich. Dewey emphasizes the notions of democracy, constant experimentation, and testing. He wishes to bring about a "collective intelligence" through the personal development of individuals and the encouragement of moral thinking in education. Central to Dewey's ethical system is the sympathetic regard for the intelligence and personality of others, even if their views are different, as well as the testing of ideas through scientific inquiry. Dewey is particularly against the use of prejudice, partisanship, checklists, or even traditionally accepted views and practices in ethics, striving instead for what can be called a "postconventional outlook," which is always in emergence.

In similar fashion, Tillich emphasizes that a moral life requires the existential courage to profoundly come to terms with one's own self, as well as with others. For him, one must have the courage to "accept acceptance," that is, the acceptance of one's mortality, of the ambiguous nature of one's work—leading potentially to success or crises—and of the recognition of one's very small place in the cosmos. For Tillich, it is essential to realize that all the genuine religions and spiritual traditions of the world had integrated both the positive and negative sides of life, calling the latter by different names: the devil, Hecate, Kali, the false, the bad, the ugly, Satan, Rakshasa, Thanatos, the *via negativa*, and so on.

It is very probable that if Nestlé and J&J had adopted one of these two ethical frameworks (among the many others that exist as well), the handling of their crises would have been different. In the case of Nestlé, the acceptance of the fact that its product could also have negative impacts might have helped the company to overcome its defensiveness and seek some creative solutions with the local populations. In the case of J&J, this sort of acceptance could have triggered a deliberate investigation into the potential dangers of its Tylenol product *prior* to the crises, leading to the implementation of preventive strategies. Furthermore, the use of such ethical frameworks would have probably widened the range of issues and increased the number of people considered to be important in both cases. For Nestlé, the Western-oriented financial and legal approach could have been complemented with a more African-oriented social and ecological view of the problem. For J&J, the possible impact of potential saboteurs, terrorists, and psychopaths could have been better integrated into the organization's CM strategy.

Increased levels of moral maturity and ethical inquiry could also enrich the two dominant theories in CM. *High reliability theory* could gain from not only pursuing safety but also considering more profoundly the moral grounds of an organization's operations. After all, the Mafia could be made "highly reliable" but this will not increase its level of morality. Also, while the *normal accident theory* leads to the conclusion that some activities are too complex to be carried out safely, it would gain from the addition of existential considerations to the administrative, sociological, and technological factors that it traditionally takes into account. This would help employees, executives, and policy makers to adopt a "postconventional view" and to better "accept acceptance," thus adopting a more proactive and preventive approach to their activities.

Some scholars have already adopted this more dialectical and ethical view of CM by exploring two related issues: (1) the developmental nature of a crisis itself for individuals and organizations, viewing a crisis as a potential "crucible" event, triggering learning and change; and (2) the exploration of ways to develop a more mature level of morality and inquiry in organizations by means other than the experience of a major crisis. We may be witnessing today the birth of a third major theoretical foundation in the field of CM, one that is grounded in moral development, both for individuals and organizations.

Cross-Cultural Consumer Marketing

Marketing activities that originate in Western countries span the globe and reach many cultures. Questions of cross-cultural ethics arise when marketing practices that are acceptable in one country are inappropriate in another.

Consumer marketing, which is impersonal and directed at a mass audience, may be distinguished from relationship marketing, which is based on personal contacts. This is an important distinction because many of the cross-cultural problems surrounding consumer marketing arise precisely because much of the world has traditionally relied on relationship marketing.

World cultures tend to be either rule based or relationship based. Rule-based Western cultures rely on a legal or regulatory system to enforce what are seen as universal rules of fairness. Non-Western norms tend to place human relationships at the center of things. While relationship marketing developed in both kinds of cultures, consumer marketing is very much a product of the West and is an inherently foreign practice in relationship-oriented cultures. Even relationship marketing is done differently in the two kinds of cultures. These differences can present ethical challenges.

Consumer Marketing in Relationship-Oriented Societies

Impersonal consumer marketing requires consumers to trust products and believe advertisements created by strangers, which is unnatural for people who traditionally place their trust in friends and family rather than on an economic or legal system. As a result, consumers may have neither the skills necessary to identify safe and effective products nor a functional legal system that regulates them. Global firms may find it legal and possible to sell dangerous pesticides, high-tar cigarettes, unwholesome baby food, or unsafe equipment that would be unmarketable in some Western countries.

Mass marketing can also inject culturally inappropriate products, prices, and promotion into local cultures. "Morning after" pills may become available in strongly Roman Catholic countries, or the market prices of life-saving drugs may be far beyond the means of most people in economically less developed countries. Advertisements may contain sexual material or portray disrespect for parental authority that is frowned on locally. Conversely, local custom can draw multinational enterprises into supporting practices contrary to their own values. Ultrasound machines may be used locally to identify unborn female babies for abortion and donated organs may be reserved for high-status individuals.

Relationship Marketing

Even relationship marketing differs in rule-oriented and relationship-oriented cultures. Non-Western business cultures typically value loyalty to one's associates, boss, or company. Suppose, for example, that a Western purchasing agent has been interacting with Asian suppliers but changes jobs. The Asian partners may view the agent as immoral for failing to follow through on personal commitments, even though his or her departure from the company may be perfectly normal from a Western point of view.

Western business culture, on the other hand, typically values playing by the rules more highly than personal loyalty. Asian businesspeople, for example, may respect intellectual property obtained from Westerner business partners with whom they have a long-term personal relationship, but they may feel free to use it for their own purposes when there is no such relationship. To the Western mind, relationships are irrelevant when it comes to law.

Addressing Cultural Difference

One approach to accommodating cultural difference is to try to design a single product or promotion that is compatible with a wide range of markets. A growing trend, however, is to do the opposite. Although global communication and distribution technologies are often viewed as a force for homogenization, they actually reinforce regional differences. Multiple cable and satellite channels enable regionally specific programming, and direct advertising through the Internet reaches highly refined market segments. Sophisticated manufacturing plants and supply chains fill highly customized orders on a global scale. It is rapidly becoming possible for marketers to respect local cultural norms wherever they do business.

Cross-Subsidization

Cross-subsidization is the organizational practice that uses a portion of revenue from some customers and applies it toward costs undertaken in activities for other customers. With cross-subsidies, a business may charge some customers more than the amount it requires to serve them so that its other customers can pay less. Managers who can subsidize across customer groups are able to achieve an overall business profitability that remains constant even while undertaking less profitable activities for some customer groups. Holding companies and diversified corporations are organizational forms that enable cross-subsidization as a path to competitive advantage.

Corporate Social Responsibility View

Government may subsidize the costs of some activities or segments in society. This often takes the form of taxation and redistribution of social wealth and resources to support public or political policies whose beneficiaries do not pay their full share of costs. Some advocates of corporate social responsibility may view cross-subsidization similarly as a means for business to finance socially desirable activities that otherwise may not be sufficiently profitable to undertake.

Cross-Subsidization Examples

A home builder may construct two types of houses—a large, finely crafted home for wealthy families and a small, basic home for low-income families—and use some of the premium price from the luxury homes toward the costs of constructing the low-end houses. This sort of cross-subsidization allows the builder to meet an overall profitability objective while simultaneously reducing the price of homes for low-income buyers.

Cross-subsidization, however, may not be the most socially effective means to respond to the housing needs of low-income families. The obstacle to effectiveness arises from the impact on the price information used for decision making. First, if people in the market for a luxury home are given a choice, then, rather than be altruistic, they may purchase from a builder who does not add a subsidy premium to their price. With buyer choice, the total amount available for a subsidy may not result in a significant reduction in housing prices for low-income families.

Second, builders who cross-subsidize may be less alert to innovative low-income housing solutions because they subsidize the status quo. Furthermore, competing builders who do not benefit from cross-subsidization are not able to introduce their own innovative solutions for low-income families unless they can beat the subsidized price. While well-off buyers may not be economically harmed to any substantial extent, the right of all people in society to have adequate housing is not effectively advanced.

Buyers who do not have choice are likely to perceive cross-subsidization as unfair. For example, customers of regulated utilities and public transportation usually do not have the ability to purchase from alternative suppliers. "Captive" consumers may think it unfair to be compelled to pay not just for their own usage but also for the usage of subsidized consumers.

Similarly, captive business customers may object if their efforts to lower internal costs are hampered by suppliers' cross-subsidy practices that result in higher prices. For example, the International Air Transport Association has made it clear that airlines, facing stiff competition and struggling to reduce operating costs, cannot afford the higher fees charged by government-owned or monopolistic airports, which then transfer these fees as a subsidy to recently privatized airports.

Deregulation and privatization often provide opportunities for a regulated business to use revenue from captive customers to fund operations in more risky or competitive markets. Beginning in the early 1970s, for example, the convergence of communications and computing technology created opportunities for phone companies to subsidize their computing ventures with the assets and profits from their noncompetitive regulated monopolies in telephone service. The new services fell outside the established accounting systems and routines and dynamic changes challenged capabilities to monitor and control the hazards of cross-subsidization.

In the 1980s, U.S. telephone companies began to enter competitive industries while simultaneously operating their regulated phone services. While telephone companies and customers for new services could benefit from the new ventures, local telephone customers were charged for more than their cost of service to subsidize the risky competitive ventures. One trade association reported an estimate for 1986 was a loss of $1 billion in unregulated ventures. In 1986, the U.S. Federal Communications Commission (FCC) decided to allow the phone companies to undertake new competitive ventures as long as they did not cross-subsidize the costs of these new ventures with their regulated monopolies and captive local phone customers. The U.S. Congress provided oversight of the FCC actions to provide cost allocation procedures to prevent such cross-subsidization. More recent examples of cross-subsidization in the United States continue to come from communications and computing technology in the provision of broadband, Internet, and cable services. In some cases, local electric utilities are subsidizing their entry into these digital businesses by significantly raising rates to their captive electricity customers.

Other U.S. industries also may have cross-subsidization opportunities created by deregulation. For example, a trade association for real estate companies expressed concern that large national banking conglomerates may be allowed to directly operate real estate ventures. The trade association fears that financial holding companies and their subsidiaries could compete unfairly with real estate companies and their affiliates by cross-subsidizing banking and financial operations. This cross-subsidization, by encouraging consolidation, could restrict consumer choice and competition. Furthermore, if banks compete in the commercial sector, there could be conflicts of interest that interfere with the banks' role as honest brokers of financial services.

The U.S. energy industry currently is undergoing deregulation as the development of a national energy policy changes the existing structure of regulatory oversight. The Public Utility Holding Company Act (PUHCA) is a depression-era law that prohibits large conglomerates from owning utilities and bars utility owners from cross-subsidizing or using secure ratepayer revenues to finance and guarantee other more risky business ventures. Big companies, such as investment banks, insurance companies, nonutility holding companies, and oil and energy companies, lobbied for PUHCA repeal to allow them to make large investments in the electric utility industry. Consumer groups contended that repeal of the depression-era law without adequate safeguards could undermine consumer interests. The law was recently repealed after congressional hearings about the impact on consumers, investors, and competitors.

Regulatory Approaches as Solutions

There are two regulatory approaches to prevent cross-subsidization—a structural approach and a nonstructural approach. In the structural approach, a business is not allowed to operate regulated, noncompetitive, or protected activities simultaneously with nonregulated, competitive, or risky business ventures within the same organizational governance structure. The structural approach prevents cross-subsidization by requiring separate subsidiaries with separate accounting systems. In the experience of breaking up AT&T and deregulating the telecommunications industry, the FCC found that the structural approach was an effective way to prevent cross-subsidization. The FCC also found, however, that the structural approach prevented management from taking some actions to increase productivity and, therefore, was not an economically efficient way to use assets. In short, the structural approach traded the costs of cross-subsidization for the costs of inefficiency, and therefore, it did not serve the public interest, nor did it serve the interests of owners or of local phone customers.

In the nonstructural approach, one organizational structure can operate in both regulated and nonregulated industries, there is no need for separate subsidiaries, but there must be separate accounting systems for the regulated and nonregulated activities. The nonstructural approach requires the separation of revenues, expenses, and asset investments among the regulated and nonregulated activities. This separation in accounting is made complicated when the separation by type of activity does not exactly match the physical separation of assets. For example, accounting is complicated if there are expenses for production or marketing activities that handle both types of products and customers, if capital is allocated across such mixed activities, or if the overhead of corporate technology and infrastructure supports both types of activities.

Allocating Costs

Cost allocation can be subjective, so regulatory oversight, annual independent audits, and cost allocation standards are essential parts of an oversight program to ensure that regulated profits do not subsidize competitive operations. This raises the issue of balancing the need to maintain the confidentiality of proprietary data versus the needs for transparency and honesty in disclosing expenses, revenues, and investments.

Determining who benefits and who is harmed from a cross-subsidy cannot be settled from theory alone, but requires specific data. If the operation is regulated, then there may be a state auditing agency that must be alert to cross-subsidization concerns. There also must be an ethic of transparency and integrity in sharing the information for these audits. As illustrated by recent auditing problems in the Enron case, the independence of auditors from potential conflict of interest is very important. Also, whistle-blowers need protection from any risk of retribution for their communications.

Cross-subsidization has significant impacts that are considered by many to be not fair for the interests of all stakeholders. Cross-subsidies link a tax or premium payment on some consumers and a subsidy to others, but they give the least help to the poorest people who do not have the means to be consumers at all. Also, if a corporation's cross-subsidies go from its business customers to its individual consumers then the businesses must pass the tax on in higher prices. Thus, cross-subsidization is not an effective remedy for issues of either commutative or distributive justice.

Cross-subsidies are not transparent, and they are difficult to coordinate. There must be regular attention to the effectiveness, fairness, and efficiency of the means put in place to mitigate harms from cross-subsidization. Because there is not one right way to do this, there must be a fair procedure for the many stakeholders to participate in decision making.

For these reasons, there are many legal limits and constraints on cross-subsidization activities between regulated and nonregulated business activities. In addition, trade associations advocate for the interests of their membership when they are placed at risk by cross-subsidization activities. Professional codes of conduct, to foster good relationships with stakeholders, also may state prohibitions against cross-subsidization activities.

Cultural Imperialism

Cultural imperialism occurs when one community imposes or exports various aspects of its own way of life onto another community. The *cultural* part of the term refers to local customs, traditions, religion, language, social and moral norms, and so on—features of a way of life that are distinct from, though often closely related to, the economic and political systems that shape a community. The *imperialism* part of the term indicates that the imposing community forcefully extends the authority of its way of life over another population by either transforming or replacing aspects of the target population's culture. That is, *cultural imperialism* does not typically refer to occasions when a population voluntarily appropriates aspects of another culture into its own. Rather, the term usually designates instances of forced acculturation of a subject population. Today, issues of cultural imperialism in business arise most commonly in the context of international business and globalization.

A Brief History of Cultural Imperialism

The Ancient World

While the term *cultural imperialism* did not emerge in scholarly or popular discourse until the 1960s, the phenomenon has a long record. Historically, practices of cultural imperialism have almost always been linked with military intervention and conquest. The rise and spread of the Roman Empire provides some of the earliest examples of cultural imperialism in the history of Western civilization and highlights both negative and positive aspects of the phenomenon. In an effort to assimilate the Etruscan people into Roman culture, the Romans replaced the Etruscan language with Latin, which led to the demise and virtual extinction of that language and many other aspects of Etruscan civilization. Rome spent the next several centuries expanding its empire, culminating in a period known as the Pax Romana. During this time, through a unified legal system, technological developments, and a well-established infrastructure, the Romans secured a fairly long period of relative peace and stability among previously war-torn territories. However, this peace was secured, in part, by the forced acculturation of the culturally diverse populations Rome had conquered.

Cultural Imperialism and Colonization

During the modern period, cultural imperialism became one of the primary instruments of colonization. Colonization is the forced extension of a nation's authority over people outside its own boundaries to expand economic domination over their labor force and resources and political control of their territory. While colonization was almost always initiated by some kind of military intervention, its full effects were achieved through practices of cultural imperialism. Fueled by a belief in the superiority of their own way of life, colonizers used law, education, and/or military force to impose various aspects of their own culture onto the target population. Motivated, in part, by a desire to purge local populations of allegedly barbaric, uncivilized customs and mores, colonizers also knew that the best way to mitigate resistance by the colonized was to eradicate as far as possible all traces of the former way of life.

One of the clearest examples of the forced acculturation of a colonized population was the Spanish influence in Latin America, beginning with the conquest of the Aztec empire by Hernan Cortes during the early 16th century. After securing their physical presence in the region, the Spanish suppressed Mesoamerican culture, forbidding the Indians to learn and transmit their culture while simultaneously requiring them to read and write Spanish and convert to Christianity. This behavior was certainly not unique to the Spanish; other examples include the British influence in India and the Dutch and French presence in the Caribbean. Today, charges of cultural imperialism often still carry this legacy of association with the historical experience of colonization.

Contemporary Understandings

During the 20th century, cultural imperialism was no longer so closely linked with military intervention but rather with the exertion of economic and political influence by some more powerful nations such as Russia and the United States on less powerful countries. Many observers view Russia's forceful attempts during the Soviet period to impose communism on neighboring countries as a form of cultural imperialism. More recently, however, charges of cultural imperialism have been aimed primarily at the United States. Critics allege that imperial control is now being sought economically by creating a demand for American goods and services in other parts of the world through aggressive marketing. This "Americanization" of other cultures occurs when the mass exportation of American films, music, clothing, and food into other countries threatens to replace local products and to alter or extinguish features of the traditional way of life. Some countries have attempted to thwart this cultural threat through various kinds of legal action. For example, during the 1950s, France attempted to ban the sale of Coca-Cola and more recently McDonald's, and Canada has required that a portion of all radio air time must be devoted to Canadian music and subject matter.

Cultural Imperialism and Business

Imperialism Versus Relativism

Issues of cultural imperialism in business arise most obviously in the context of international business, in particular regarding business ethics in an international setting. Companies operating in foreign countries often experience significant tensions between respecting cultural differences, maintaining a sense of integrity to their own moral standards, and successfully conducting business. How should companies conduct themselves when the moral values and social norms of the home country seem to conflict with, and especially when they appear higher than, the prevailing moral and social norms of the host country?

One possible response to this problem is a strict cultural imperialist stance, which contends that the home country's moral and social norms are absolute and ought to be extended to all countries within which a company does business. According to the imperialist, when values clash a company ought to follow its own standards in all contexts without any consideration of the host country's moral, social, and/or legal codes. One strength of this approach is its emphasis on maintaining integrity to a company's own code of ethics, especially in cases where the moral standards of the host country seem lower than those of the home country and when a company might benefit financially from following these norms. For example, the strict imperialist would demand that if conducting business in a county with a record of gross human rights violations, a U.S.-based company should maintain and extend Western liberal values that aim to protect the basic rights of all human beings, even if doing so would compromise the bottom line. The imperialist stance acknowledges that commitment to one's own moral standards is important.

However, the paternalism implicit in an imperialist stance clashes with the fairly widespread view that we ought to respect cultural differences, at least to some degree. Moreover, critics also point out that an imperialist stance violates a community's right to self-determination and can have disastrous consequences. For example, in his discussion of the imperialist stance, Thomas Donaldson considers a case when members of a U.S. company operating in China caught an employee stealing. Following company policy on stealing the company turned the employee over to the legal authorities, which in this context resulted in the employee's execution.

At the opposite extreme in response to questions about how companies ought to behave in an international setting is the relativist stance. In contrast to the imperialist, the relativist contends that no way of life is any better than any other; "our" moral norms are simply different, not better than "theirs." The relativist argues that when practicing business in a foreign country companies should simply follow the host country's moral, social, and legal codes. While the relativist stance avoids the imperialist problem of unfairly imposing "our" standards on others, critics argue that relativism is unacceptable because it allows or may even require a company to engage in or support practices that are harmful to members of the host country. For example, Donaldson discusses a case of a group of investors who decided to restore the *SS United States*, a former luxury cruise ship. Prior to the restoration, the asbestos lining of the ship had to be removed. While a U.S.-based company proposed to do the work at $100 million, a Ukrainian company bid for the job at less than $2 million, which they were able to do because of significantly lower health and safety standards in that country. A relativist would allow investors to accept the Ukrainian company's bid without any consideration of the potential harms to workers there. Yet critics of this approach argue that while a country has the right to develop its own health and safety standards, if those standards fail to adequately protect workers from serious risks, then companies should object.

Beyond Imperialism and Relativism

While the strict imperialist fails to respect cultural differences, the relativist fails to oppose gross injustice. Most theorists agree that the correct approach is somewhere in between these two stances. To mediate between cultural imperialism and relativism when values clash, companies need to be able to differentiate between practices that are merely different and practices that are morally wrong and intolerable. Companies should balance respect for cultural differences with a commitment to maintaining a certain moral minimum. According to Donaldson, we can construct a moral minimum by noticing a set of core values found in nearly all cultures, such as reciprocity, respect for human dignity, a decent standard of living, and so on. Collectively, these overlapping values form a moral threshold that imposes limits on the extent to which companies ought to respect cultural differences. If the host country's moral and social standards violate this moral minimum, a company should not simply capitulate to a relativist stance but is obligated to object.

Determining whether values and practices of another culture are simply different or morally intolerable is often difficult. Most actions exist in what Donaldson and Thomas Dunfee call moral free space, meaning that they are neither right nor wrong until we consider them in context. While in the United States extravagant gift giving is seen as a potential form of bribery and raises questions about conflict of interest, in Japan this practice is central to cultural understandings about loyalty and respect. Thus, a U.S.-based company might respect practices of extravagant gift giving when conducting business in Japan given the meaning these practices carry in Japanese culture coupled with the fact that they do not appear to violate any core human values. In contrast, if a country permits child labor and if employing children prevents them from receiving a basic education, this would violate the moral threshold and companies ought to object. According to Donaldson, the key to balancing respect for cultural differences and moral decency is allowing context to inform judgments about ethical behavior.

One way context can inform these judgments is by identifying the nature of the conflict when a clash in values or norms occurs. Donaldson distinguishes between two of the most common kinds of conflicts: conflicts of relative development and conflicts of cultural tradition. Conflicts of relative development occur when moral and social norms conflict because the home and host countries are at significantly different levels of economic development. For example, two countries may have considerably different views about child labor or wages, but these disparities may be due in large part to economic differences rather than a substantial clash in values. In contrast, conflicts of cultural tradition occur when moral and social norms conflict because of genuine disparity between two different value systems. For example, countries might disagree on the role of women in the workplace, which may reflect significantly dissimilar cultural understandings about equality.

To resolve conflicts of relative development, Donaldson suggests that company leaders ask themselves if the practice would be tolerated in the home country if the home country were at a similar stage of economic development as the host country. For example, some countries may permit workers to be paid extremely low wages, wages that may seem appalling in the United States. Yet if higher wages in the host country would lead to loss of jobs and investment there, and if the wage rates are sufficient for maintaining a decent standard of living in that country (i.e., if there is no violation of the moral minimum), then paying the lower wages may be permissible. However, when a conflict is due to a real clash between moral and social values, Donaldson contends that company leaders must determine whether it is possible to conduct business in that country without engaging in the practice in question and whether the practice violates a core human value. If the answer to these questions is no, then a company should object.

Social Obligations of Multinationals in Foreign Settings

Questions of cultural imperialism surface not only when values, traditions, and customs conflict but also when considering what positive moral and social responsibilities multinationals have to the host communities within which they operate. Many observers contend that multinationals have at least some obligations to be "good citizens" of the host countries where they do business, but what kinds of obligations do they have and to what extent? At minimum most agree that companies ought to behave appropriately within the customs and mores of a host community and support local social institutions, but what if these customs and institutions violate the moral minimum? What responsibilities, if any, do multinationals have to address gross human rights violations or other moral and social ills that may be occurring within the host community? Some have suggested that multinationals should use their power and influence with local governments to promote moral and social reform where needed. Other theorists are much more cautious about ascribing positive social responsibilities to multinationals in a foreign setting.

For example, Patricia Werhane argues for considerable constraints on the moral and social responsibilities of companies conducting business in a foreign country. Werhane contends that multinationals certainly have obligations not to cause more harm than is caused by the status quo in a particular country, and they should redress any harms that the company itself may have caused. However, beyond this, companies should not interfere in the political and social life of the host country. While it might seem initially plausible and admirable for a company to work toward improving the social and political environments within which they operate, Werhane worries that this kind of behavior violates a nation's right to sovereignty and self-determination.

There is a danger that companies engaging in activism will unrightfully impose their own moral and social beliefs and values within host communities. Multinationals do not have the expertise to adequately address social ills, and as Werhane points out, if a nation's sovereignty can be overridden by another nation only on the most rigorous moral grounds, the occasions when corporate interference might be justified are rare indeed. A company may be permitted to engage in "quiet cooperation" with host governments to address social ills, but beyond this, Werhane maintains that if a company cannot uphold its own moral standards while practicing business in a foreign country, then it should refrain from conducting business there.

While concern that multinationals avoid unwarranted paternalism is important, critics point out that this approach overlooks the complexity of a multinational's relationship with the host countries where it operates. For example, in 1995, Ken Saro-Wiwa was executed by the Nigerian government for protesting certain activities of Shell Oil in the region, specifically environmental degradation and the economic exploitation of the native Ogoni people living there. Many observers argued that Shell should have used its influence with the Nigerian government to intervene on behalf of Saro-Wiwa, as this was a life or death matter. In response to these criticisms, however, the company claimed that it would be wrong to intervene in the case because multinational corporations do not have the right to interfere in the political and legal affairs of sovereign states. However, some critics maintain that Shell Oil's economic presence in the region was already a form of interference that had disastrous political and social consequences for many people living in the region. Thus, while companies certainly need to avoid being unduly paternalistic, they also need to be aware of the ways in which economic relationships with foreign governments are not always morally and politically neutral.

Contemporary Approaches

The views discussed thus far explore issues of cultural imperialism as they arise in business practice within the current global economy. These approaches take a global free market system as given and then consider how, while conducting business within this economy, multinational corporations can maintain a balance between respect for cultural differences and integrity to their own moral and social standards. However, concerns about cultural imperialism also surface in discussions about the processes of globalization and development that have led to the dominance of free market capitalism on a global scale.

One stated goal of globalization is to aid and encourage the economic development of struggling, impoverished nations. One of the more popular development strategies known as catching-up development recommends that by expanding free market capitalism on a global scale poorer nations will be able to compete in the global market, increase their economic development, and eventually "catch up" to the levels of economic maturity that wealthier nations now enjoy. However, critics of this development approach worry that the extension of neoliberal economic policies on a global scale is itself a form of cultural imperialism. For example, Maria Mies contends that free market economic models and the development strategies based on them are not value neutral, but promote a particular conception of the good life—namely, one that is characterized by a consumer culture, materialism, individualism, competition, and profit maximization. Development strategies premised on the extension of free market logic take a conception of the good life popular in many Western nations as the standard to which all nations ought to aspire.

There are other possible models for economic development, such as sustainability models. The dominance of free market economic policies makes it difficult if not impossible for countries to explore other economic models that might be more compatible with their own cultural values and ideas about what constitutes a good human life. For example, Vandana Shiva argues that indigenous populations in India have been successfully conserving water and living off of the land for centuries in part because of an emphasis on communal ownership and management of natural resources. The extension of a free market economy on a global scale has fostered the privatization and commodification of water in India by large multinationals, threatening not only the livelihood of native peoples but also their traditional agricultural practices and ways of life.

The phenomenon of cultural imperialism is complex, and as we have seen, it emerges in a number of different contexts. As processes of globalization lead us to form unprecedented economic and political relationships with distant others, finding the proper balance between respect for cultural differences, moral decency, and successful business practice becomes increasingly more important and also considerably more difficult.

Dalkon Shield

The Dalkon Shield was an intrauterine birth control device (IUD) manufactured and sold from January 1971 to October 1974 by the A. H. Robins Company, maker of Robitussin cough syrup and Chapstick lip balm. Sales were suspended at the request of the Food and Drug Administration (FDA) because of a high number of reported incidents of inflammatory pelvic infections and spontaneous septic abortions as well as four deaths. Also, many children were born with defects linked to the device. In 1985, after 9,500 cases had been litigated or settled, the company filed for bankruptcy and set up a $2.3 billion fixed-asset trust fund to deal with the thousands of pending cases.

The Shield was invented by Dr. Hugh Davis and Irwin Lerner in 1968. After promoting the device at medical meetings, they named their company Dalkon Corporation. Dr. Davis published an article in the February 1, 1970, issue of the *American Journal of Obstetrics and Gynecology* that described a study of 640 women using the Dalkon Shield with a pregnancy rate of 1.1%. The article also described the device as "modern," having "superior performance," and being a "first choice method," words not normally used in a rigorous scientific study. He also neglected to say that he was the inventor. A. H. Robins bought the manufacturing rights in June 1969 for royalties and $750,000, hired Davis as a consultant, and modified the design, adding a small amount of copper and a multifilament wick. They also made a smaller version.

At the time, there were more than 70 IUDs on the market, so Robins began an aggressive marketing campaign to doctors and clinics, touting the device as safer, easier, and more painless to insert, and having the lowest pregnancy rate. They also used Davis's article as a marketing tool, without disclosing his ties to the company. Because the Shield was a device and not a drug, it was not subject to the extensive testing required by the FDA. Problems began in 1971 with patients becoming infected and/or pregnant. By June 1974, there had been four deaths linked to the Shield as well as countless spontaneous abortions and pelvic infections leading to continuous pain and sometimes sterility. Many studies showed that the pregnancy rate was much higher than originally thought, some showing it at 5.5% or even higher. The FDA requested that it be taken off the market. In the United States, 2.2 million devices had been sold; global sales were 4.5 million. Sales continued in foreign countries for another 9 months.

Court records of litigated cases showed inadequate testing, false claims about both safety and rate of pregnancy, and a high incidence of pelvic infections and other complications. Robins's first response was to blame the doctors for improper insertion. Aetna, their liability insurer, cut off coverage in February 1978. One of the cases was in 1984 in Minnesota, where Judge Miles Lord, after taking a deposition from company officials, castigated them for defending rather than recalling the Dalkon Shield. His remarks were later struck from the record, but his statements were widely publicized and encouraged more victims to sue the company. In October 1984, Robins voluntarily withdrew the Dalkon Shield from the market and, the following February, launched an advertising campaign urging women still wearing Shields to have them removed at the company's expense. By the end of March, 4,437 women had complied and filed claims for removal expenses. That year, Robins filed for Chapter 11 reorganization, which prevented more lawsuits. Part of the plan was to consolidate all future claims in a trust fund following the precedent of Johns-Manville.

It was not until December 1989, with American Home Products' acquisition of Robins and their $2.48 billion trust for claims, that the trust began to be administered. The last case was settled 10 years later. The trust, the first fixed-asset trust fund ever administered, had handled 400,000 cases from more than 100 countries and paid 170,000 claimants. All claimants had to provide medical records, and for many, this was impossible. Also, lawyers for the trust used two tactics to avoid payment: The claimant waited too long or other sexually transmitted diseases were to blame for the injuries. In foreign countries, countless women were never recompensed because of faulty records. A. H. Robins never took complete responsibility.

Darwinism and Ethics

Darwin produced two hugely influential books on the subject of evolution: *The Origin of the Species* in 1859 and *The Descent of Man* in 1851. The former belongs properly to the science of biology, whereas the latter offered more to thinkers in terms of "social theory." Darwin's writings influenced ethical thought through a biological approach to social theory, which formed the basis for the social and ethical implications of evolutionism. The social and political thought of the later 19th century drew on themes and metaphors found in Darwin's work such that its principal ideas became known as "Social Darwinism." In the 20th century, Darwinism took a new direction with the synthesis of Darwinism and Mendelian genetics or "neo-Darwinism." This development generated the disciplines of sociobiology and evolutionary psychology with corresponding influences on social and ethical thought. Moreover, Darwinian thought must be continually viewed in the context of the ongoing disputes between political conservatives and leftists as they engage with evolutionary theory through various strategies of rejection or co-option.

Historical Background

The belief in the organic evolution and the gradual transformation of organisms through history from preexisting forms through a natural law process has existed at least since the middle of the 18th century. Empirical studies at the time had made discoveries concerning the nature of organisms and their reproduction, the distribution of species, and the existence of fossilized remains of earlier and spectacular life forms. Thinkers such as Erasmus Darwin (the grandfather of Charles Darwin), and slightly later Jean Baptiste de Lamarck in France, offered an intellectual background to these empirical studies through a commitment to cultural and social progress. Evolution as a secular religion complemented utilitarianism in the belief that progress increases and maximizes happiness. Evolution and ethics become indistinguishable as the world picture that evolution conveyed also offered moral direction. This direction was interpreted to mean the increased application of industrial ideas and techniques in a market environment free of intervention. On this view, the division of labor and human-driven direction would be sufficient to ensure continuing social and economic improvement.

Charles Darwin, the grandson of Erasmus, transformed the theory of evolution from at best a pseudo science or as it was for Erasmus Darwin, a secular religion, into a genuine scientific doctrine. *The Origin of the Species* published in 1859 was an impressive empirical work. Darwin used facts from the organic world and drew on, for example, paleontology, systematics, morphology, and embryology to demonstrate his theory of natural selection. The principle of natural selection can be summarized in the following propositions. First, the populations of animals and plants manifest variations. Second, some variations provide an organism with advantages over the others in the population in the struggle for life. Third, variation will be passed on to the offspring. Fourth, because the environment may not support all the offspring produced by a given population, a greater proportion of favorable variant will survive and produce progeny than the proportion of unfavorable variants. Finally, new species, variation, genera, and populations may result from a population that suffers continuous change.

Social Darwinism: Cooperation or Survival of the Richest

Unlike Erasmus Darwin, Charles Darwin's theory was not intended to provide ethical directives. However, his later work on our own species, *The Descent of Man*, especially in the later editions expressed sentiments that had application for the Social Darwinists. There is, for example, a reference to the virtues of capitalism. It is also significant that Darwin in this second work replaces the greatest happiness principle of utilitarianism with the goal of the general good entailing biological perfection. Darwin also addressed the issue of the moral sentiments and their place in the evolutionary process. Earlier in the 18th century, the hugely influential Scottish philosophers David Hume and Adam Smith had both offered nuanced interpretations of sympathy and its role in the motivation of moral acts. For Darwin, sympathy belongs to the noblest part of our nature and has been vital in the development of the human race. He speaks of the acquisition of the habit of aiding one's fellows as originally motivated by the self-interested desire for reciprocal aid. He argues that the habit of performing benevolent actions certainly strengthened the feeling of sympathy, which gave the first impulse to benevolent actions. Thus, habits of benevolence followed during many generations tend to be inherited. But at the same time he urges that sympathy must be regulated and checked; otherwise, the weak and inferior survive and propagate to the detriment of biological perfection. Thus, for example, he urges limitations to ensure that the weak and inferior do not marry freely.

Although Darwin did make some tentative ethical conclusions from his scientific work, the so-called Social Darwinism is most famously associated with the philosopher and political activist Herbert Spencer. Spencer regarded evolution as more than a scientific theory; it was a world picture that applied throughout creation, and to a certain extent, it served as a substitute for a declining religious faith. For Spencer, evolution is a progression that begins from the simple and leads to the more complex. He believed that this process of continual development and improvement applied to the cosmological, the natural, and the social world. Spencer argued for a laissez-faire socioeconomic philosophy as he applied the natural mechanism of the "survival of the fittest" to the realm of ethics and sociology. But Spencer himself was an ardent opponent of militarism, regarding it as wasteful, and as with Thomas Hobbes, associating militarism with the disruption of trade and commerce and, therefore, the abnegation of free and open competition. Moreover, though Spencer advocated laissez-faire policies, he also held that in the struggle for survival men come to recognize that cooperation is necessary. The pleasures that derive from our natural sociability are the rewards that guarantee a continuing cooperation among members or society. Ultimately, he believed that the evolutionary process would gradually replace egoism with altruism as something similar to an inherited acquired characteristic.

On the other hand, William Graham Sumner's thought more perfectly embodies the familiar view associated with Social Darwinism that holds that the fittest must struggle to succeed at the expense of their peers if social progress is to be achieved. Promotion of the ongoing struggle for existence is necessary for the evolution of the species. Just as species are weeded out by the struggle for existence in nature, so too, the argument runs, should the weakest of humanity be weeded out by a similar process in society. Disease, poverty, and early death are the mechanism of ridding the human species of those who are the least "fit." In the natural evolutionary process, those parts of society that are least fit to survive succumb and the species gradually improves as its weaker components are eliminated. It is wrong to interfere with this process because this only prolongs the suffering of the unfit while their continued existence and proliferation retard the progress of the human species.

This belief in the close association between competition and evolution served as an apology for capitalist social relations at the end of the 19th century, because according to this interpretation of Social Darwinism self-made millionaires became viewed as the paradigm of the fittest. These views were endorsed by American industrialists such as John D. Rockefeller and Andrew

Carnegie who also saw competition as essential to capitalism and the evolutionary process. According to this interpretation of Social Darwinism, those who are the fittest will achieve high status within society and a high level of material wealth and those who are not fit for survival will languish in poverty and have no influence on the public. Ultimately, the lower levels of humanity die off and will be replaced by others more suited to survival, much as unfit organisms in nature fail to survive and are replaced by the better adapted organism. The outcome of this process will be the eradication of poverty and a human population that exhibits the superior qualities.

At the same time, however, there were American Marxists who argued for socialism as essential to human progress.

Ultimately, 19th-century Social Darwinism was often rich in variety and often used to support contradictory positions. Both the left and the right on the political spectrum accommodated Darwinian ideas to support their positions. In reality, a diversity of political positions drew on Darwinian themes and adapted them to different forms of liberalism. These Darwinian ideas were used, for example, to give ethics a scientific foundation, to argue for state intervention in the economy and social welfare programs, to defend Fabian as opposed to revolutionary socialism, and to relate liberalism with empiricism in philosophy.

Social Darwinism and Its Critics

But others began to question the association of evolution with morality. T. H. Huxley in his famous essay "Evolution and Ethics" argued that evolution that promotes competition and the survival of the fittest cannot support ethics or morality because morality requires not that people look after their own self-interests but that they look after the interests of others. It is wrong that a man seek some positive form of pleasure for himself at the expense of inflicting pain on another. As Huxley understood morality, it is essential to overcome the natural desires of the individual when they conflict with the needs of society. Huxley further objected that nature is an inappropriate model for moral behavior. He pointed out that the process of evolution is basically an a-moral force and, therefore, cannot serve as a foundation for morality. Perhaps even more significantly G. E. Moore in *Principia Ethica* criticized Spencer's form of Social Darwinism as an illegitimate form of reasoning. Moore accused Spencer of committing the naturalistic fallacy. This fallacy refers to the attempt to derive ethical imperatives through reference to nature or natural phenomena.

Darwinism and Ethics in the 20th and 21st Centuries

However, despite the critiques from T. H. Huxley and G. E. Moore, "evolutionism" continued to influence social and ethical thought in the 20th century. Julian Sorel Huxley, the grandson of Thomas Huxley, promoted the synthesis of Darwinism and Mendelian genetics or neo-Darwinism. He argued that evidence of evolution indicates a gradual improvement and progress that also applies to human development. For Julian Huxley, evolution is to be seen as a secular religion. But he envisioned natural selection operating at the group rather than at the individual level. He argued for the promotion of an evolutionary perspective in which one would promote principles and norms that would be of final benefit to the entire mankind. As against free market capitalism, he was a strong believer in central planning at the global level. He regarded the United Nations as an evolutionary success that ought to be used as a basis for world peace. As the influence of Social Darwinism continued through the 20th century, it even had an influence on nonsecular religious thought. Most significantly, the Catholic philosopher Pierre de Chardin attempted to transform evolution from a secular to a nonsecular religion.

In America, George Gaylord Simpson, a contemporary of Huxley, also believed in the importance of evolution and the evolution of the ethical faculty in the evolutionary process but held that evolution cannot function as metaethics or a normative justification. Simpson's progressivism led him to reject state-run programs and the socialist approach, preferring to emphasize the individual and his or her right to free choice. He believed that this individualist approach would best promote an intellectually dynamic society, which would ultimately enhance social progress.

In 1975, Edward O. Wilson's landmark work, *Sociobiology: The New Synthesis*, introduced neo-Darwinism to the public. Wilson's sociobiology sought to demonstrate in rigorous detail how Darwinian selection molded the various ways in which all animals—from the lowly corals to the social insects to the highest primates—compete and cooperate with others of their own species. Wilson suggested numerous analogies between animal and human societies. Others such as Aesop in his *Fables* argue along similar lines; however, Wilson's work sought to unify a vast body of knowledge of natural history and neo-Darwinian theory in a project to reduce social science to a branch of biology. Many found these ideas controversial. Left-leaning thinkers felt uncomfortable with the implication that emphasis on the individual, family, and ethnic self-interest is an innate heritage that cannot be modified through social change. This implication severely undermined the possibility of a utopian social order. In his later work, Wilson used sociobiology to promote environmental awareness if not an environmental ethic. He argues that humans have evolved a symbiotic relationship with the rest of the natural world, and because of this mutual dependency, we ought to promote biodiversity, if we are to promote the human species. In this sense, evolution, as a substitute for religion, must serve as a basis for moral action, he argues.

Ultimately, the sociobiology controversies of the 1970s transmuted into those over the rebranded sociobiology of the 1990s, with its emphasis on human "evolutionary psychology," a belief that contemporary moral behavior and value judgments are predetermined by genetic impulses created through an evolutionary process. Again, this view in many respects runs counter to the left's fundamental belief that individuals can be reconstructed through a redesign of the social order. At the same time, the view that there exist innate moral sentiments such as love, compassion, generosity, shame, and guilt militates against the metaethical doctrine of ethical relativism as it endows certain ethical attitudes with universal application.

Despite the "green" tendencies in Wilson's later work, left-leaning thinkers have remained uneasy about the implications of sociobiology and evolutionary psychology, while conservative thinkers have also been critical. In particular, the religious right objects to evolution as contrary to "creationism." Nevertheless, some conservative thinkers, such as Lawrence Arnhart, argue that evolution remains a body of empirical science and solid theory that displays and supports bedrock conservatism. These ideas include the inextricability of present and future from the past, the inevitability of variation in individuals and systems, differential survival of useful variations and the containment of damaging ones, and the omnipresent control of everything by environment, itself changing as its inhabitants change in response to itself. This is a system of thought, which is consistent with conservative thinking because it is entirely opposed to radical utopianism that the left has advocated since 1860. The utopian vision commonly assumes that the communal sharing within a single family can be extended to an entire society and so advocates the abolition of private property and private families to achieve the communal spirit. Evolutionary psychology tells us that the bond between the families is a natural disposition that has evolved and cannot be readily discarded contrary to the thinking of the utopians. At the same time, people such as Arnhart push the view that there is nothing about evolutionary biology that denies let alone disproves the Creator's role in the World. True conservatives, he argues, are committed to realism about human nature and its future.

But not all left-leaning thinkers subscribe to the view that evolutionary theory runs counter to its social program. Peter Singer, for example, argues that evolutionary theory leaves space for a Darwinian left that would focus on the importance of cooperation and altruism, matters that were not widely understood as being part of evolution when Social Darwinism first gained favor. One reason given as to why the left should use Darwinism is the focus, starting in the 1960s, on cooperation as a factor in survival and genetic success. Cooperation, Singer says, is an important part of Darwinism and it is in keeping with the values of the left, despite Social Darwinism's focus on competition, which has fueled the left's perfunctory dismissal of Darwinism. However, Singer argues that many on the left of the political spectrum have to accept that evolution has overthrown certain of their traditional leftist beliefs. For example, the Marxist belief that the individual is entirely a product of one's social environment fails to acknowledge that biological nature largely influences individual lives and the enveloping social reality. Moreover, evolution gives strong indications that humans are not, and never will be, perfect, thereby precluding the possibility of realizing the goal of a perfect society, a Marxist utopia. If one recognizes that this goal is unreachable, it is much better, he argues, to understand the inherent imperfections and try to work with them. Our ideas and politics are a product of our evolution, and we need to see how they have come about in order to properly address the problems created by them.

From the foregoing, it is obvious that Darwinism has had a profound influence on social and ethical thought through the last two centuries. On the normative level, it has promoted a range of different positions from liberal individualism and laissez-faire economics to communitarian collectivism and state-run enterprise. At the metaethical level, it has struggled to overcome the naturalistic fallacy criticism and the critical division between facts and values. But despite the logical objections, evolution is a theory that ineluctably introduces value-laden concepts such as "progress," "improvement," "development," and "sophistication," which will continue to exert an influence on ethical and social thoughts through the 21st century.

Deadweight Loss

A deadweight loss indicates the amount of economic welfare lost to the economy due to either (1) a market failure or (2) interference by government in an otherwise efficient marketplace. The deadweight loss comes at the expense of consumer or producer welfare, or both (in varying degrees).

A producer's monopolization of a market leads to a market failure when successful in restricting the quantity sold and raising the price per unit sold. This monopolization is a market failure because if the price could be lowered and the quantity sold increased this change would create a net benefit to society. In fact, the marginal (i.e., extra) benefit to consumers exceeds the marginal (i.e., extra) cost to the producer up to the point where the marginal social cost curve crosses the marginal social benefit curve. Simply put, this point is where supply equals demand. A market characterized by perfect competition would achieve that socially desirable result.

Figure 1 shows the standard model of a monopoly market. The deadweight loss from monopolization is the shaded triangle.

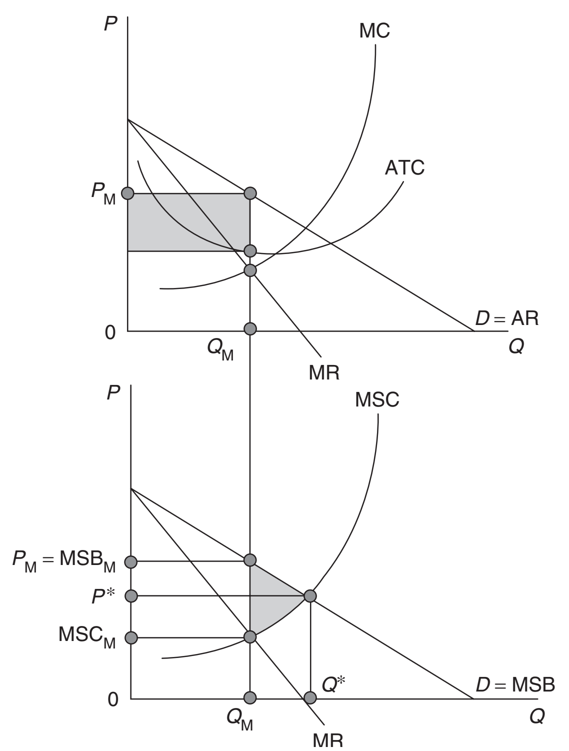

Figure 1 Deadweight Loss From Monopolization

In the upper panel, the monopolist uses the available degree of market power to set the price (P_M) and quantity to be sold (Q_M), thus securing an economic profit (defined as above the competitive outcome) as shown by the shaded rectangle. This profit arises because the average revenue (AR) exceeds the average total cost (ATC) at the quantity sold. The lower panel takes this market and redefines it in economic welfare terms. By assuming there are no spillovers of this activity (i.e., externalities) into other markets, (1) the marginal cost (MC) will equal the marginal social cost (MSC) and (2) the demand (*D*) will equal the marginal social benefit (MSB). From this perspective, it can be seen that Q_M is characterized by MSB_M exceeding MSC_M, and this condition means that society would receive a net marginal benefit if further output could be produced. Of course, the monopolist has no incentive to lower economic profits by doing so. In fact, net marginal benefits occur up to a level of output equal to Q^* (where MSB = MSC). The total of all the marginal benefits foregone because Q^* is not produced at a price of P^* is shown by the shaded deadweight loss triangle.

It may also be the case that the deadweight loss from monopolization could be significantly more than what the triangle indicates. If rent-seeking activity occurs before a producer can achieve market power, then both the monopolist and his rivals will be devoting funds to obtain a government license in order to dominate the market. Examples of this situation occur in the market for taxi medallions and television broadcasting licenses. Those rivals who spend money and yet ultimately lose the fight for the license have been encouraged by a regulatory environment in which the winning strategy is not clear. All resources spent in this inefficient process must be added to the deadweight loss triangle. In the extreme case, the entire economic profit rectangle could be dissipated because of destructive competition to achieve monopoly rights.

Deadweight losses can also occur if the government interferes in a market which is otherwise efficient; that is, there are no externalities into other markets that need to be accounted for by government action. Taxes on producers to correct for negative spillovers can add to economic welfare. For example, it makes sense to tax industrial producers whose pollution adversely affects a river and, subsequently, the market for fish. But taxes on production for their own sake, or as a simple source of revenue, can generate a deadweight loss as shown in Figure 2 for the instance sales taxes.

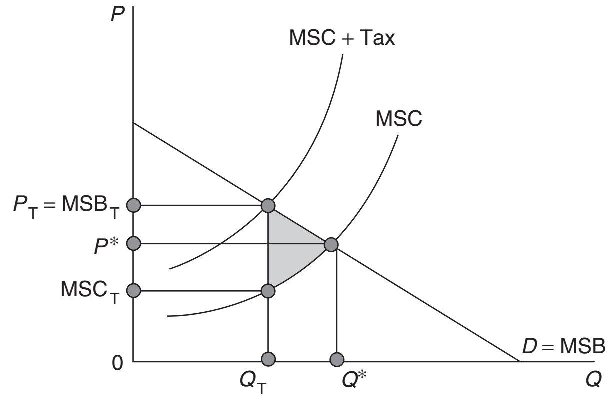

Figure 2 Deadweight Loss From Sales Taxes

The socially optimal quantity (Q^*) and price (P^*) occur where MSB = MSC. If the government decides to tax every unit sold, then producers will build the tax into their costs of production. In this way, the supply curve shifts upward by the amount of the tax. At the lesser quantity sold (Q_T) at the higher price (P_T), it can be seen that $MSB_T > MSC_T$, meaning that net marginal benefits would occur if more could be produced. In the same fashion as the monopoly market, a deadweight loss triangle is the sum of all the net marginal benefits foregone because of the sales tax. The government has the monopoly power to tax.

In the reverse case, a subsidy paid to producers can lead to a deadweight loss if it serves to increase production beyond the efficient amount indicated by the market. Only a positive spillover of the producers' activity into another market would indicate that a subsidy is necessary to improve economic welfare. A subsidy paid to beekeepers, for example, may lead to increased productivity on the part of flower gardeners because of the extra pollination taking place. In other words, the subsidy accounting for this externality provides a social gain. But when there are no such spillovers, a deadweight loss occurs as shown by the shaded triangle in Figure 3.

For the government to induce producers to sell more than Q^*, a subsidy will have to be paid to them because the cost of production (MSC_S) is higher than the price that the consumers are willing to pay (MSB_S) for the extra quantity. In other words, the subsidy paid is equal to the amount necessary to cover the premium in MSC_S over MSB_S. In this way, producers will charge a price of P_S to their consumers. But since producing units beyond Q^* have marginal social benefits less than marginal social costs, a deadweight loss

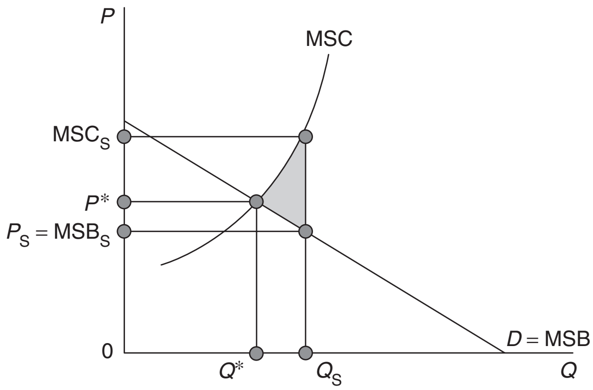

Figure 3 Deadweight Loss From Subsidies

triangle comes about. Simply put, the subsidy induces more than the efficient amount of resources to be devoted to producing the item in question.

In fact, the deadweight loss could be larger than that indicated in Figure 3 because the subsidy paid by the government may have been financed out of tax revenue gathered from other markets in such a way as to create other deadweight losses. Also, if the subsidy paid out more than covers the cost of production, an economic rent would accrue to the producers. If not all producers are subsidized, there may be rent-seeking competition for such subsidies. The deadweight loss would increase in the same way as described in the monopoly market above. Only taxes charged to correct for negative spillovers to other markets, and subsidies paid to account for positive spillovers to other markets, will eliminate any deadweight losses in those markets generating such spillovers.

Deceptive Advertising

As it is used by regulators, the courts, and social scientists, *deceptive advertising* is a technical, legal term: A deceptive advertisement is one that involves a representation, omission, or practice likely to mislead a reasonable consumer. To be regulable under the law, however, a further condition must be met: The deception must be "material," which is to say that it must be likely to detrimentally affect the consumer's purchasing decisions. While injurious effects on consumers account for much of what is objectionable about deceptive advertising from a moral and ethical point of view, deceptive advertising also harms competitors and generally weakens trust in the marketplace.

The above legal definition agrees with the one operative in European Union (EU) countries in essential respects, although the means by which many EU countries regulate deceptive advertising differs from the United States. In the United States, the Federal Trade Commission (FTC) has primary federal responsibility for preventing deceptive advertising in both broadcast and print forms, although consumer protection agencies of the various states have authority over local advertisements. The major source of industry self-regulation is the National Advertising Division (NAD) of the Council of Better Business Bureaus. Some enforcement also occurs through private lawsuits, most commonly those brought by competitors under the Lanham Trademark Act. Nonetheless, many deceptive advertisements that meet the legal standard for deception persist, either because they have not been challenged or because government agencies have limited resources. In general, the greater the amount of potential physical and economic injury to consumers, the greater is the incentive for regulators to act.

"Deception" in Its Ordinary and Legal Senses

Setting the issue of materiality aside, the sense of "deception" found in the legal notion of deceptive advertising can be usefully contrasted with our "ordinary" concept of deception in two respects. First, at least insofar as issues of moral concern are raised, the ordinary concept of deception, like that of lying, applies only to acts done intentionally and purposefully. For regulatory and legal purposes, however, an advertisement need not be *intentionally* deceptive. Rather, the legal notion focuses exclusively on false consumer beliefs caused by the advertisement. Second, deception in the ordinary sense requires a measure of success; there cannot be a deception without at least someone who is actually deceived or misled. Deception differs from lying in this respect, as one can be lied to without being taken in by the lie. The legal notion of deception is also outcome oriented, but in a special way. Since a deceptive advertisement must be likely to mislead a consumer acting reasonably under the circumstances, strictly speaking, the law does not require that anyone has actually been deceived. Consequently, one might say that the legal definition focuses on deceptiveness rather than deception—the likelihood that an advertisement will cause false beliefs rather than whether it in fact has done so.

In terms of actual regulatory practice, however, the issue is somewhat more complicated. The likelihood that an advertisement will mislead a consumer depends not only on the advertisement itself but also on the background knowledge and sophistication possessed by the consumer. For a time, backed by decisions of the U.S. Supreme Court, the FTC applied an ignorant person standard according to which an advertisement need only mislead the most gullible consumers in order to be deceptive. Invoking this criterion, the FTC once found deceptive Clairol's claim that its hair coloring would color hair permanently on the grounds that some (particularly naïve) consumers might interpret this to mean, falsely, that Clairol would color all the hair to be grown in a user's lifetime. More recently, however, the FTC has adopted a more lenient approach. Since advertisers typically dispute FTC allegations that their claims are likely to mislead, the agency often relies on extrinsic evidence, usually in the form of consumer surveys, to show that a significant percentage of consumers have formed materially false beliefs as a result of exposure to particular advertisements. Typically, the threshold percentage for FTC prohibition is in the range of 20% to 25%. In this way, regulators can be seen as attempting to strike a balance between the costs of suppressing informative claims and the benefits of suppressing deceptive claims.

In both its ordinary and legal senses, however, deception is a much broader concept than either that of lying or falsity. One can deceive without lying, because while lying necessarily involves an explicit statement by the speaker, deception can occur by variously distorting, withholding, or manipulating the truth. Deceptive advertising is, thus, often quite different from false advertising, if by "false advertising" we simply mean advertising that makes false statements, even though the two expressions are often treated colloquially as synonyms. Advertisements can be deceptive without explicit falsity, such as when they mislead by omitting crucial facts or by taking advantage of consumer ignorance. They can also make false claims without being deceptive, such as when what is literally claimed is so improbable or ridiculous that no one is likely to be deceived by it. Exxon gasoline's once-famous claim to put a tiger in your tank is a case in point.

The Variety of Deceptive Advertisements

FTC cases have involved a wide range of practices that the agency has found deceptive in particular instances, including false written and oral representations, misleading price claims, sales of dangerous or defective products without adequate disclosures, the use of bait-and-switch techniques, failure to disclose information pertaining to pyramid sales, and a failure to meet warranty obligations.

The most straightforward cases involve explicit misrepresentation of a product or service, which thanks to regulatory efforts are now relatively rare. The more common and controversial cases, however, involve claims that advertisers imply but do not explicitly state. The pain reliever Efficin, for example, was claimed to contain no aspirin. Although literally true, the FTC found this advertisement deceptive on the grounds that consumers would naturally interpret this to mean that Efficin lacked many of the side effects caused by aspirin. This implied claim was false, however, since Efficin and aspirin are chemically very similar. A different sort of implication was involved in the famous Volvo advertisement that depicted a big-wheeled "monster truck" rolling over a line of cars, crushing all of them except the Volvo. The spot failed to disclose the fact that both the Volvo and the other cars had been specially rigged to produce this result. The implication that only a Volvo can withstand a monster truck intact was thus false. Advertisers are as responsible for the message consumers draw from an advertisement as they are for what is actually stated or shown.

A special kind of implication is addressed by the FTC's advertising substantiation doctrine, according to which advertising claims that do not have a reasonable basis are deceptive if the ad implies that such a basis exists. When Bayer claimed its children's aspirin to be superior to any other children's aspirin in terms of its therapeutic effect, the FTC held that Bayer implied a factual basis for this claim which the company lacked. Interestingly, even if such a claim is ultimately proven to be true, the advertisement making it can still be prohibited if the advertiser lacks a reasonable basis for the claim when it is originally made. In another case, advertisements for Promise margarine used the slogan "Get Heart Smart" and showed heart-shaped pats of the product on food items. The FTC found these advertisements deceptive because the manufacturer could not adequately substantiate the implied claim that using Promise helped diminish the risk of heart disease.

Comparative advertising raises especially thorny questions of implication. While relatively rare in Europe, comparative advertising has flourished in the United States since restrictions on it were lifted in the 1970s and 1980s. One kind of issue arises in incomplete comparisons. Suppose it is claimed of Brand X pain reliever that Brand X relieves pain faster—faster than what? Another kind of problem is raised by implied superiority claims. Suppose that Brand X is advertised with the line that no other pain reliever works faster. If Brand X relieves pain faster than some competitors but only as fast as others, is the advertisement deceptive? A further issue results if Brand X is claimed to both relieve pain faster than Brand Y and be long-lasting. Consumers may infer that Brand X is longer-lasting than Brand Y, which may be false.

This last issue arose in connection with Kraft's advertisements of its Singles line of cheese products. After years of losing market share to lower-priced imitation slices, Kraft began advertising the fact that Singles were made from five ounces of milk per slice versus hardly any for the imitation slices. Although these claims were true, the FTC objected to the fact that the same ads touted the calcium content of milk. As it turns out, much of the calcium contained in milk is lost during the cheese-making process, and many brands of imitation slices actually had more calcium than Kraft's Singles. Without knowing these details, however, consumers would likely infer that the calcium content of the Kraft product was higher than that of imitation slices.

Deceptive advertising in its various forms should be distinguished from mere puffery, which has long been treated permissively by regulators and the courts. A *puff* is an evaluative claim used by an advertiser, such as when a product is described as "the best," "best tasting," "the freshest," or "amazing." Strictly speaking, a puff cannot be legally deceptive. This is partly because the law regards such claims as mere subjective opinions that cannot be disproved. It is difficult, for example, to pin down the precise meaning of Tony the Tiger's exclamation that Frosted Flakes are great. Regulators also tend to assume that puffs are forms of hype and exaggeration that customers do not take seriously. This point is sometimes questioned, however; were it really true that customers do not believe puffed claims, advertisers would stop using them. Particular examples sometimes raise difficult questions as to the distinction between evaluative and factual statements. If, for instance, the claim that a certain brand of beer has more flavor than competitors is taken to imply that a majority of consumers agree, the implied claim is factual and not purely evaluative. In general, the more vague and imprecise the puff, the less likely it is to be found legally actionable.

Advertisements directed at children are also a special case. It is widely acknowledged that children are particularly vulnerable to advertisers' enticements, and the FTC has accepted special responsibilities in this regard. Still, many authors complain that regulators have not done enough to curb abuses, especially since in much programming aimed at children the lines between commercials and entertainment have become blurred.

Product placements and the so-called stealth advertising are increasingly common forms of advertising that also seem at least potentially deceptive. A product placement occurs when an advertiser pays producers of a television show or movie to integrate its product into the story. The potential deceptiveness of the practice is that viewers may not be aware that the product has been included only because a fee has been paid. Stealth advertising is a practice whereby people are paid to tout a product under the guise of doing something else. For example, a camera company might hire representatives to pose as tourists, standing on street corners in a large city and asking passersby to photograph them with a new camera the company is marketing. Those who agree to the request end up holding and using the new camera—the purpose of the ruse, from the company's perspective—although the passersby may quite naturally believe that they are merely doing a stranger a favor. Thus far, however, both these practices have escaped serious regulatory attention. As advertisers invent new methods of pitching their products, however, further questions about deceptive advertising can be expected to arise in the future.

Deceptive Practices

Deceptive practices are incidences of unfair or deceptive acts that are deliberately made against consumers by businesses. In commerce, sellers may not omit, misrepresent, or make false statements that lead to a consumer decision that is injurious. Deceptive practices are formally defined in Section 5 of the Federal Trade Commission Act (FTCA) and administered and enforced by the Federal Trade Commission (referred to here as the Commission).

The FTCA prohibits unfair and deceptive practices in or affecting commerce. The Commission is an independent federal agency and the only organization sanctioned to enforce the FTCA. It is empowered to act in the interest of all consumers to prevent deceptive and unfair practices and protect consumers from commercial enterprises that mislead or affect consumer behavior or decisions about a product or service. It also has the authority to stipulate interpretive rules and general statements of policy. The Bureau of Consumer Protection is a part of the Commission, and it works directly with the consumer to enforce federal laws, provide information to educate consumers, and process fraud or identity theft complaints. The Commission's jurisdiction encompasses a wide variety of entities and individuals, including interstate and foreign commerce.

As incidences of deceptive and unfair practices have increased, consumer protection laws have expanded. For example, the Fair Credit Billing Act requires businesses to investigate billing errors and provide the consumer with a written acknowledgment of the complaint before the consumer's credit rating is affected. There are many more laws that are aimed at protecting consumers from harmful, unfair, and deceptive business practices. Most states have chosen to enact additional laws that increase the level of consumer protections and, in some cases, include both criminal and civil penalties. It varies by state.

The Commission is authorized to investigate, prohibit, and enforce the laws under its jurisdiction. Victims of deceptive practice may file a claim with the Commission. Following a review, the Commission will determine whether a harmful or deceptive practice has been committed. The accused must dispute the claim that is being investigated. If an appropriate rationale is not offered, the Commission will request a cease and desist order. If the issue perpetuates, it may be addressed in the civil courts in which the Commission will make a recommendation and report its findings to enforce a ruling. The Commission is involved with only civil suits, and it may impose fines up to $11,000.

Under the FTCA, commercial enterprises must not engage in harmful practices that deceive consumers. Some examples of deceptive practices include scams, false advertising, identity theft over the Internet, monopolistic practices, and bait-and-switch advertising techniques. For example, Microsoft Corporation was sued when it introduced its Vista operating system. It was accused of deceptive practices because the company had allowed personal computer makers to promote computers as "Windows Vista Capable" before the product was released in order to, allegedly, maintain strong sales between the time of the announcement and the release date. When Vista was released, consumers discovered that its compatibility with PCs bought the prior year was only applicable to one version of the software, the more basic version. Microsoft was accused of a "bait-and-switch" technique, where it lured its customers into buying PCs that did not support the functionality of all versions of the Vista software.

There are numerous ways in which an entity or individual may engage in deceptive practices. Two large areas include deceptive advertising and security of information on the Internet. Advertising claims must be truthful and not mislead consumers. If there are disclaimers, disclosures, warranties, or guarantees, they must be obvious and clear. In addition, a typical consumer must be able to replicate the claims made in testimonials and endorsements. If a seller engages in deceptive practices, it must refund the customer if the promise cannot be fulfilled.

There is an immense amount of personal data on the Internet that includes confidential and sensitive information. It requires a high level of security and protection. Privacy is at issue. Despite the steps to deter security breaches, unauthorized individuals can gain access and immediately collect, analyze, package, and disseminate personal information. These deceptive practices may result in identity fraud. In 2006, 8.9 million people were victims of identity fraud in the United States, and the 1-year cost was estimated to be $56.6 billion. Both businesses and individuals are victims. A common example of identity fraud is when consumers respond to an official-looking e-mail and supply personal information such as credit card numbers. The e-mail may request a contribution for a new business venture, for example. Actually, this information is then used to deceptively represent the person in another financial transaction. These transactions can be costly—the average cost to victims of identity fraud was $6,383 in 2006. Consumers must be cautious and aware, and businesses must be truthful and clear.

Conclusion

Businesses have dual responsibilities with regard to consumer protection and preventing deceptive practices. First, they have an obligation to the consumer to not mislead or deceive when advertising and promoting products and services. They must consider consumer protections and business integrity in strategic plans and business conduct. Second, businesses have a commitment to the consumer to inform them of how they will use and protect information privacy. Businesses must take the necessary steps to ensure that data are safeguarded and maintained properly for consumers. Businesses have an opportunity to provide a leadership role in developing industrywide practices that endorse and promote consumer protections and ethical operations, minimizing the opportunities of those who choose to engage in deceptive practices.

Decision-Making Models

There is no one model of decision making. Rather, there are many theories of decision making, each of which tends to be associated with a particular area of scholarly inquiry and has different assumptions about human nature, the manner in which decisions are made, and the quality of the decisions made.

This entry organizes the many theories and approaches to decision making into four broad approaches that inform, or are found in, business and society literatures, other than ethical decision making since that theory has its own entry. First, *rational decision making* is an orderly, cognitive process where individuals form probability estimates of outcomes to select between different courses of action. Second, *political decision making* emphasizes power and dependence; the balance of power among people influences decision makers' assessments and results. Third, the *garbage can model of decision making* emphasizes decision makers' uncertainty and lack of control over external and internal factors key to a decision. Finally, *improvisational decision making* views decision making as a real-time process where decision makers harness their intuition and spontaneity to identify, evaluate, and pick options. This last model was developed largely in response to the shortcomings of the first three models. When decision makers consistently rely on a single style of decision making, it can influence their ability to make moral judgments (explore the ethical implications around a decision) and take moral action (behave in a way that is ethical).

Rational Decision Making

The rational model of decision making claims that individuals engage in strict cerebral rationality when making decisions. Decision making is viewed as a sequential process that consists of (1) problem definition, (2) alternative generation and evaluation, and (3) decision selection and implementation. During the first two stages of rational decision making, individuals engage in an exhaustive and systematic search for information. To arrive at a selection among alternatives, individuals typically engage in a detailed cost-benefit analysis. However, cognitive constraints limit individuals' ability to explore alternatives comprehensively; they commonly readjust objectives and usually settle for a "satisfactory" instead of an "optimal" decision. These constraints generally come from two sources. First, many individuals lack full information; thus, the selection among alternatives is necessarily limited to selection among known alternatives. Second, human cognitive limitations contribute to this lack of information. For example, individuals cannot accurately foresee or predict all the possible consequences of their decisions, and thus, complete evaluation of the consequences of alternatives is not humanly possible. This is a variation of the model known as boundedly rational decision making; individuals who intend to be perfectly rational are limitedly so.

Many managers employ a decision-making style that is consistent with the boundedly rational decision-making model. When faced with a decision, the individual first generates a comprehensive list of pros and cons of various alternative paths of action. They will also describe using procedural methodologies to distill alternatives in order to arrive at a decision. Ultimately, decision making is viewed as a measurable, mechanistic, and routine process that they can control and over which the individual has significant authority. Most economic theories are based on the assumption that individuals are rational decision makers.

When individuals rely predominantly on one form of decision making such as the boundedly rational model, the way in which they view the decision-making process also mirrors how they view the associated ethical implications—that is, how they make moral judgments and take moral action. Decision makers who rely on rational decision making typically develop a rigid and formal set of rules to negotiate the ethical implications of their actions. Their moral judgments sometimes lack depth, as they view ethics as a systematic series of rights and wrongs with little room for gray. They tend to see moral action as a behavior that must be justified by a favorable cost-benefit analysis; efficiency tends to dictate individuals' (particularly managers') interest in ethics and morality. Decision makers often force their interpretations of the ethical implications around decisions into neatly identifiable parcels of information; they do their utmost to simplify ethical dilemmas and make them unambiguous.

Power and Politics Decision Making

The power and politics model of decision making advocates that decisions are the result of individuals competing with one another to satisfy their individual interests. Since self-interests are often conflicting, the decision-making process involves the use of influence, political tactics, and negotiation between different power bases across individuals and organizations. Decision makers who employ the power and politics model of decision making are frequently less concerned with developing reliable and valid decisions and more concerned with finding ways to ensure that their decisions are accepted and supported by others in power. They view decision making as a social interactive process where political gaming is the key function of the decision maker. Decision making consists of lobbying in key individuals both formally and informally to rally behind certain decisions. Political decision making consists of manipulating information, forming coalitions, stacking groups to influence decision evaluations and outcomes, and even attempting to remove naysayers. Individuals' understanding of the established power bases in the internal and external environment substantively influences their decisions.

Managers using power and politics decision making tend to be unconcerned that politicking often distorts information, usurps a tremendous amount of valuable time, and omits input from less powerful, although key, stakeholders within the organization. Managers who rely on the power and politics model of decision making are more concerned with outcomes than process. Increasing one's own power is also a key goal of managers who invoke the power and politics model.

Ultimately, self-interest guides the moral judgments for individuals and managers deeply involved in the power and politics model of decision making. Depending on their goals, managers will often repress their own moral judgments, espousing instead the ethical views of the most powerful stakeholders within the organization. However, if invoking a certain stance on morality and ethics can help influence members of the powerful coalition, managers will make strong moral judgments. Insightful and reliable moral judgments and consistent moral action are not strengths of individuals and managers who rely heavily on the power and politics model of decision making.

Garbage Can Decision Making

The garbage can model of decision making stresses the roles of chance, luck, and timing in decision making. Decisions are a random convergence of problems, solutions, participants, and opportunities. The garbage can model assumes that decision makers face so much complexity and ambiguity that decision making is essentially a haphazard, anarchical process. Unlike other models of decision making, garbage can decision making is not deliberate and purposeful. Managers do not consciously identify issues and problems and undergo a logical process to arrive at a decision. Instead, decision makers often stumble accidentally on a decision or are forced to make a decision with almost no preparation or time for deliberation. The quality of decisions made in this manner is often poor.

In this model of decision making, the context of the decision has a larger influence on the actual decision outcome than the characteristics of the decision maker. This is because the individual has so little control or power over the decision. Individuals employing garbage can decision making typically cannot consciously make moral judgments or take moral action, because this would require some level of intentionality on the part of the decision maker. Under the garbage can model of decision making, a problem randomly meets an opportunity and the decision maker makes a decision. The decision itself is unlikely to be rich and insightful, drawing a discerning path toward success. Instead, the decision will likely be superficial and one dimensional. The associated moral judgments and actions are also likely to look similar.

Improvisational Decision Making

Of all the models of decision making presented thus far, improvisational decision making is in the early stages of theoretical development and empirical support. Its development was a response to the inability of existing models to address dynamic decision-making contexts. Many of today's individuals and managers are under pressure to make fast, adaptive, and innovative choices. Under such pressure, individuals are likely to behave rationally but will also have to improvise; in short, decisions are not random but rather intentionally spontaneous and action oriented. Moreover, almost no decisions are as exclusively rational, political, or haphazard as the rational, power and politics, and garbage can decision-making models, respectively, imply. Theories of improvisational decision making are being developed both in response to increasingly high-velocity and uncertain business environments and also in response to the complexity of goals that managers should and do pursue. Improvisational decision making makes use of any relevant information and resources, including intuition, insight, real-time information, creativity, emotional sense making, opinions of others, and trial-and-error learning.

Individuals who rely on an improvisational decision-making process tend to depend less on common sources of knowledge and more on peers for information. For example, managers regularly engage in constructive conflict to quickly evaluate alternative paths of action and rely on role playing, scenarios, and frame-breaking techniques to stimulate discussions while defusing interpersonal tension. They are committed to being open, repeatedly listening to alternative and out-of-the-box points of view without discarding them instantaneously. This principle does not mean that managers who invoke the improvisational decision-making model agree with everything they hear but that they seek, value, and consider diverse viewpoints when making decisions. To be successful, managers find themselves in fast-paced environments in which there is frequently no time to engage in the detailed cost-benefit analyses suggested by rational decision making. Instead, in fast-paced environments, surprise, urgency, and uncertainty are commonplace and individuals must put aside power struggles, focus on the common goal, and rely at any moment on the most appropriate person to lead the decision. Shared leadership is an important characteristic of improvisational decision making.

Strict rules or rigid processes do not significantly govern individuals who use improvisational decision making, thus engendering a certain degree of latitude in the kinds of moral judgments they can make around specific decisions. For example, ethical decision making requires managers not only to wade through issues around right and wrong, but they also have to consider the consequences of their decisions on themselves, their business unit, their organization, and society. It is reasonable to assume that this wading-through process will be challenging, iterative, and nonlinear and require a great deal of cooperation between various stakeholders. Given that managers who engage in improvisational decision making are open to other ideas and perspectives, are willing to work with stakeholders both inside and outside the organization, operate in team environments, and are able to tap into the inherent rhythm of their organization, the moral judgments that result are likely to be diverse and inclusive. However, the relationship between moral judgments and moral action is unlikely to be consistent as managers rely on information that is changing and share control with those around them. Moreover, the velocity associated with improvisational decision making can lead to inexperienced managers glossing over key ethical implications surrounding decisions.

Unfortunately, the mainstream management literature has made minimal progress so far in integrating ethics with the well-established decision-making models such as bounded rationality, power and politics, garbage can, and improvisation. This is unfortunate since decision-making styles have important implications for how individuals and managers make moral judgments and take moral action.

Deep Ecology

Deep ecology is primarily an environmental philosophy—or "ecosophy" as some call it—which holds that there is a pressing need for humans to radically change their relationship to nature and to recognize that nature has an inherent value and is not to be taken as valuable solely for its usefulness and instrumentality to humans. Deep ecology also offers a new definition of the self that differs from traditional notions, and it designates a social movement that sometimes has religious and mystical undertones. This philosophy, taken together with a number of other competing schools of thought and environmental practices such as the science of ecology, conservationism, and protectionism, among others, comprises the general idea of environmentalism. But taken as an ecosophy, deep ecology distinguishes itself by making broader and more basic philosophical claims about matters in metaphysics, epistemology, and social justice.

The practitioners of deep ecology often draw a contrast between their own position and what they refer to as "shallow ecology." This designation is employed since they hold that the movement of ecology reflects a hidden bias. At first glance, it seems to be concerned with topics such as pollution, resource depletion, and overpopulation, but on examination one will find (according to the deep ecologists) that these concerns are real only to the extent that these topics have a negative effect on the ecology of an area and have the result of disrupting human interests. From the perspective of the deep ecologists, then, the main concern of environmentalists is not the environment, but how humans will be affected. Ecology or environmentalism is shallow in this view, since its focus is narrow on humanity rather than on the whole of the biosphere, and its bias is a form of anthropocentrism that needs to be rectified by replacing this attitude with that of ecocentrism or biocentrism where the biosphere becomes the focus of concern instead of humans.

What the deep ecologists would rather see is the prevalence of an attitude or belief system that moves away from anthropocentrism toward a more inclusive philosophy where respect for nature and the role of humans in nature are central. Anthropocentrism is typified as a human-centered attitude that sees humans as the source of all values and disproportionately tips the relationship between humans and nature toward benefiting humans. It contains an instrumentalist view of nature and a view of man as the conqueror of nature, subduing it into submission and standing in domination of it. Anthropocentrism gives credence to practices where man only values nature for its uses, and then goes on to abuse nature to the point of environmental degradation. Such a relationship is descried by deep ecologists as being unproductive and destructive and standing in need of change.

Arne Naess and Deep Ecology

Deep ecology first appeared in the early 1970s and was developed and promoted in the writings of Norwegian Arne Naess. By the time Naess had introduced the phrase "deep ecology," environmentalism was already under way as a grassroots movement. Conservationism and environmental protection were being advanced as intelligent responses to what was becoming more and more obvious about the natural environment thanks to the science of ecology. Ecologists were demonstrating the interconnectedness between living things and their environment, and it was being suggested that human activity, especially the products and by-products of industrial activity, was disrupting the balance between them. Steps needed to be taken, according to the environmentalists of the day, which would conserve and protect nature so that humans could continue to flourish. This can be taken as the beginning of the modern environmental movement that has evolved today into practices that strive to achieve sustainability.

In this context, Naess suggested that much more than just some steps toward conservation and protecting the environment were necessary. He held that we needed to reevaluate our understanding of human nature in a radical way. In particular, he claimed that environmental degradation was likely due to an inadequate realization of the human self that had been ill defined in the past. According to Naess, the self traditionally has been seen in too narrow a form as a kind of solitary and independent ego among other solitary and independent egos. This propensity to understand the human as primarily an individual, cut off from others and from its surrounding world, leads to the pitfalls of anthropocentrism. What is now necessary, given the insights of the environmentalist movement, is a new understanding of the self that Naess has referred to as "self-realization."

In the deep ecology view, the self should be understood as deeply connected with and as part of nature and not disassociated from it. Deep ecologists often call this conception of human nature the "ecological self," and it represents humans acting and being in harmony with nature and not in opposition to it. According to Naess, when this ecological self is realized, it will also recognize and abide by the norms of an environmental ethic that will end the dominance, subservience, and abuses of nature that typifies the traditional ecological self that is trapped in the anthropocentric attitude. The ecological self respects the diversity and richness of nature, sees itself as part of nature and as part of an "ecological holism," and acts accordingly. Moreover, it will see the virtues of practicing a kind of "biocentric egalitarianism" in which each natural entity is held as being equal to every other entity with regard to their inherent value. In short, Naess holds a nontraditional view of the self that connects it with nature and defines it according to environmental dictates.

The Deep Ecology Platform

In 1984, along with George Sessions, Naess devised an eight-point statement or platform for deep ecology that the two wrote while on a hiking trip in Death Valley, California. Unlike other platforms, this set of planks was not offered as a rigid or dogmatic manifesto. Instead the deep ecology platform was designed as a set of fairly general principles that could help people articulate their own deep ecological positions. It was also meant to serve as a guide toward the establishment of a deep ecology movement. The ensuing social movement had as its aim the formulation of new policies that would reflect the ideological base of deep ecology, and the platform also suggests that there is some ethical obligation for people who espouse the intellectual claims of deep ecology to go on and engage in activism that would result in the new policies called for in the platform.

Among the eight planks in the platform, there is a consideration of topics such as biocentric egalitarianism and ecological holism, although these more academic-sounding terms are not used in the document itself. What is claimed early in the eight points is that both living and nonliving entities have intrinsic worth independent of any instrumental value that they may have. Furthermore, because the richness and diversity of natural life are also valuable, humans have no right to reduce the levels of richness and diversity except to satisfy human need. But, nonetheless, humans have interfered with the nonhuman world excessively, and this interference grows worse as the human population continues to grow exponentially, presenting various dangers to the natural world such that there is a necessity for a decrease in the human population if nature is to flourish at all in the future. These ideas comprise the first five points of the platform.

The remainder of the document is a call for activism based on the expressed beliefs that anthropocentrism and human activities that promote only human interests are a threat to the richness and diversity of nature. Here, one finds a more sustained critique against both human economic activities and the advances of technology that the platform suggests can be cited as reasons for the degradation of nature. The platform expresses the need for changing public policies in these areas so that they reflect an appreciation of life rather than the promotion of an increasingly higher standard of living. What is also at issue in this section of the platform is an attempt by Naess and Sessions to underscore a belief that business and commercial enterprises have played a major role in the interference of the nonhuman world and in the reduction of the richness and diversity of nature. Their negative references to the ever-present goal of increasing people's standard of living might be taken as a backhanded critique of what has been called "conspicuous consumption" that has created the "consumer society," which is often defined as an overconsumption of those people living in the more economically developed nations and egged on by businesses eager to engage in production to meet the increasing consumer demands. These references may also be taken as some of the deep questions that Naess said needed to be posed for deep ecology to surpass shallow ecological thinking.

Deep Ecology as a Social Movement

The eighth and final plank of the deep ecology platform by Naess and Sessions is one that refers less to any ideological axiom of deep ecology as it does to the practical obligations of those who adhere to the claims and critique of the first seven planks. Here, the emphasis is on doing and a call to activism. The plank says that those who have agreed with the foregoing ideological aspects of deep ecology have an obligation to participate in the attempts at change. Of all the differing philosophies that can be said to compose environmentalism, deep ecology is the one that has generated a following such that it has been called a social movement, and this call for activism in the deep ecology platform counts as one reason why this has been the case.

Deep ecologists formed something of a grassroots movement made up of those who held a set of diverse positions on the environment. It should come as no surprise that in its early days the social movement of deep ecology was more akin to a loosely knit array of followers and factions coming from the ranks of groups such as feminists—who in this context are often called "ecofeminists"—pacifists, "social ecologists," mystics, and postmodernists. Each of these diverse groups brings to bear its own perspective in its interpretation and critique of what deep ecology ought to be and in what directions it ought to proceed. The ecofeminists, for example, argue that *andro*-centrism, rather than anthropocentrism, is the genuine cause of the degradation of nature. They claim that "male centeredness" as seen in traditional, power-wielding patriarchal society is responsible for the striving to dominate nature. Just as males have always tried to dominate women, so too have they tried to make nature subservient and bend to its will, according to the ecofeminist critique.

Another faction forming the grassroots of the deep ecology movement was called "social ecology." According to this view, the problems of environmentalism are due to a defect in society that manifests itself as an authoritarian hierarchy that, this group says, is also responsible for such social ills as racism, sexism, and classism. For social ecologists, environmental problems such as global warming or species decimation are caused in the same way as major social problems such as poverty and widespread crime. These can all be attributed to a social structure where only some enjoy real power, while the majority remain powerless. For the social ecologists, how humans treat one another in society gives evidence as to why there is environmental degradation, and until such social conditions are addressed, environmental concerns will continue.

Some critics of deep ecology stand external to the social movement that bears the name and here the claim is often that deep ecology is a movement based on mysticism and that it appears to be more of a religion than a rational approach to environmental matters. In fact, these critics will point to the creation of the "Church of Deep Ecology" that was formed in Minnesota in 1991 as an example of how this movement had devolved into more of a spiritual and mystical approach to nature than as a way to solve environmental problems and issues. The claim was that deep ecology was similar to the religions of the American Indians or to pantheists and pagans who worship nature. This matter came to a head in a lawsuit, *Associated Contract Loggers v. United States Forest Service*, in which it was argued by the timber industry that Forest Service decisions were tantamount to privileging deep ecology–related environmentalists who they understood to be part of a religious movement. Their argument was, therefore, based on the required federal separation of church and state, but the case was dismissed in 2000.

As this legal case suggests, the deep ecology movement has made attempts to have an impact on business and industrial practices. As seen above, the deep ecology platform is openly critical of the culture of industry for having encouraged the creation of an overly consumptive society and for allowing nature to be reduced to a mere instrument to fulfill human desires. The Foundation for Deep Ecology has taken up an antibusiness, pro-environment theme by backing projects that have offered changes in social policies that have been established by the industrial development model. It has published books dealing with the "tragedy of" forestry and agriculture, for example, and another that is critical of livestock production. The Foundation for Deep Ecology was created by Douglas Tompkins, who has dispersed much of his fortune earned in the fashion industry (he and his wife had helped start The Northern Face and the Esprit brands) to ecologically minded groups. It is therefore with some irony that money made in business transactions has found its way into the deep ecology movement that has been anything but a friend to business.

Deferred Compensation Plans

Deferred compensation plans refer to arrangements in which employees defer some portion of their current income until a future date. Wages earned by an employee in one period are actually received by the employee at a later date. The overall effect is to postpone taxation for the employee until compensation is received, usually in retirement.

Deferred compensation plans are either qualified or nonqualified. Qualified deferred compensation plans receive certain tax preferences under the Internal Revenue Code; most notably, employers are entitled to a tax deduction for the amount of money they contribute to the plan. While the funds remain in the plan, the benefits grow on a tax-deferred basis to the employee until they are actual paid. Qualified deferred compensation plans are designed mainly to provide cash payments in retirement or to defer taxation to a year when the recipient is in a lower bracket. To be a qualified deferred compensation plan, the benefits available under the plan have to be nondiscriminatory, which prohibits an employer from providing benefits for highly compensated employees to the exclusion of all other employees. In addition, the employer has to comply with regular reporting requirements and is limited in the amount of contributions it can make to the plan.

A nonqualified deferred compensation plan is also used to postpone taxation for the employee until compensation is received, but employers do not receive favored tax treatment. Employers are not entitled to tax deductions until these benefits are actually paid to the employee or the employee receives the rights to the benefits. The advantage of a nonqualified deferred compensation plans is that the employer can choose who receives the benefits without regards to years of service, salary, or any other criteria. Often the recipients of this type of plan are officers, executives, and other highly paid employees. Nonqualified deferred compensation plans are less expensive to set up, there are no significant reporting requirements, and employers can contribute unlimited amounts of money to them.

Social and Ethical Issues

A major component of nonqualified deferred compensation plans is stock options grants. These grants represent the right to purchase stocks at a given "grant" price within a certain time. If the underlying stock increases in value, the option becomes more valuable as the employee is able to exercise the option and purchase the stock at the grant price, which is below market. If the underlying stock decreases in value below the grant price or stays the same in value as the grant price, then the option becomes worthless. Corporations use stock options grants not only as a tool to delay compensation into the future but also as an incentive for executives to make decisions that will result in an increase in future value of his or her holdings. In other words, an executive who holds stock option grants will make company-based decisions that will increase the value of the firm, thereby increasing the value of the stock option grants and, thus, their personal wealth. Some of the social and ethical issues surrounding the use of stock option grants in deferred compensation plans include the accuracy and disclosure of stock option grants, distributive justice in the case of large stock option grants, the relationship of actual performance to the award of stock options grants, and their use in "golden parachute" arrangements.

Accuracy and Disclosure of Deferred Compensation

Disclosure to stockholders and other stakeholders of the actual compensation paid to executives under deferred compensation has been an ongoing concern. Although gains from exercising nonqualified stock options are treated as an expense for tax purposes, historically there is usually no accounting expense recorded either at the time the stock options are granted or exercised. Concern exists about what is the true value of compensation received by executives and whether the value of stock options granted are more than the direct cash payments the executive receives.

The failure to expense the value of stock options granted to executives appears to contradict the objectives of financial statements, which are supposed to be fully transparent and report the fair values of all assets, liabilities, exchanges, and transactions that could potentially affect the investor's equity position. Proponents of expensing stock options argue that expensing them would provide more informative financial statements and improve the credibility of reported earnings. Furthermore, expensing them would discourage pay plan designers from using excessive amounts of stock options and would make executive compensation more transparent to stakeholders.

In 1995, in response to stockholders and other stakeholders concerns, the Financial Accounting Standards Board (FASB) recommended that companies expense the fair market value of stock options granted. However, due to pressures by these same nondisclosing firms, FASB allowed firms to disclose the value of stock options in a footnote to the financial statements instead. Until late 2003, only a handful of companies adopted FASB's recommended approach of expensing stock options, and the rest chose to disclose the value of stock options in footnotes. FASB readdressed the issue of expensing stock options after the accounting scandals of the early 2000s. Effective June 30, 2005, FASB mandated that all stock option compensation be expensed. The Securities and Exchange Commission granted a 6-month deferral to the implementation of these standards, moving the effective date of expensing stock option to the end of 2005.

Distributive Justice and the Size of Grants

In the early 2000s, on average, 60% to 70% of a company's CEO compensation was composed of stock options received under nonqualified deferred compensation plans. The average annual value of total stock options granted by Fortune 500 companies was more than $230 million, with the average CEO receiving just more than $7 million in stock options. For larger firms, the total value of CEO stock options granted exceeded $100 million.

Stakeholders of firms are often concerned about the size of these stock options grants and wonder whether they are excessive. Some argue that the total value of these grants violates the principles of distributive justice inasmuch as the large stock option granted to executives are in effect transferring wealth from shareholders to executives as the additional shares purchased by executives dilute the value of each share of stock held by the shareholders. Critics also argue that the concentration of wealth in the hands of corporate executives results in society's wealth being distributed unjustly and that new social arrangements aimed at preventing this concentration are needed to achieve justice.

Incentive Base

Corporate boards and executives often justify the use of stock options as part of deferred compensation plans on the grounds that they effectively link pay to performance. Critics argue that company executives are overpaid for the value they provide to the firm and are given stock options regardless of performance. Research has found little evidence to support management's argument as study after study has found no significant relationship between executive compensation and firm performance. Thus, many stockholders and stakeholder activists are pushing boards of directors to more closely align executive pay to corporate performance.

This issue has regained increased interest in response to the accounting scandals of the early 2000s. The questionable behaviors of highly paid executives at Enron, WorldCom, Global Crossing, and other companies have been caused allegedly by the escalation in stock option grants due to the excessive risk taking and an excessive fixation on stock prices by company executives. The perception is that the compensation committees of these companies did not act independently of management when determining their compensation and just rubber-stamped management desires.

The result of these perceived abuses has led to the passage of the Sarbanes-Oxley Act of 2002. The act creates pressure on the compensation committees to do a better job of evaluating performance (company and personal) before making base salary changes, awarding stock options or other variable payments, or approving any other special financial treatment. In addition, the act requires full disclosure of all executive compensation and allows shareholders to sue if they suspect that company's profits are being siphoned off through excessive executive compensation. It is hoped that making compensation committees more responsible for executive compensation and making compensation information more transparent will more closely align executive compensation levels with firm performance.

Golden Parachutes

Golden parachutes are provisions in employment contracts of top management that provide for compensation in the event of a loss of job following a change in the organization's control. This provision is usually adopted as an antitakeover strategy and is used as a precautionary measure against mergers and takeovers. Golden parachutes can come in a variety of forms, including additional stock option grants along with earlier vesting of stock option grants. Companies argue that they need to use gold parachutes in order to attract and retain qualified management personnel who will act in the best financial interest of shareholders and to maintain a competitive executive compensation package.

There has been increasing criticism from shareholders and other stakeholders concerning the size and use of the golden parachute clauses. From a stakeholder viewpoint, golden parachutes provide one group of stakeholders, management, with protection against hostile takeovers, while other lower-paid employees often receive layoff notices. They also argue that golden parachute payments seem unnecessary because managers of a firm are paid to act in accordance with their fiduciary duties to shareholders. Thus, golden parachutes should not be necessary to align managerial interest with shareholder interest. Others argue that if a golden parachute clause is necessary to align stockholders and managerial interest, then the preferable alternative would be stock options. This argument further contends that insofar as managers are already compensated with stock and stock options, the interests of shareholders and managers are already adequately aligned without the need of a golden parachute.

Conclusion

The size of deferred compensation plans given to top company executives continues to be the focus of much stakeholder attention. These large awards often lead to discussions concerning fairness, corporate governance, greed, ethics, and CEO compensation. The large gap between executive pay and that of other employees of the firm supports the view that some injustice must account for the difference. Furthermore, stakeholders question whether firm performance justifies the size of these awards. As a result of this controversy and dissatisfaction, improved rules on the proper accounting and disclosing of stock options grants have been put in place. Increasingly, new accounting rules and regulations are putting more pressure on boards of directors, compensation committees, and CEOs to be clear and transparent about the deferred compensation plans they receive and to ensure that the decisions they make are justifiable.

Deontological Ethical Systems

Deontological ethical systems maintain that an action can be morally right (a duty or an obligation) even if an alternative action in a given situation would have better overall consequences. Theories of this type thus deny what consequentialist ethical systems affirm, namely, that morally right actions are all and only those that have optimal consequences. (*Nonconsequentialism* is often used as a synonym for *deontology*.) While deontological and consequentialist views sometimes differ as to whether particular actions are morally right or wrong, these disagreements stem from a more basic dispute about what *makes* right acts right and wrong acts wrong. In contrast to consequentialists, deontologists generally hold that actions are morally right insofar as they accord with principles or rules that require something other than simply bringing about desirable states of affairs. A wide variety of moral principles fit this description, and deontological ethical systems encompass many conceptions of moral justification. The theories of Immanuel Kant and W. D. Ross are the ones that deontologies most frequently encountered in business ethics, but John Rawls's influential theory of justice is also deontological, as are contractarianism, some natural law theories, libertarianism, rights-based theories of ethics, Divine Command theories, and the Golden Rule.

Variations and Misconceptions

Although the term derives from the Classical Greek words for duty (*deon*) and study or science (*logos*), deontology began to be used in the 20th century as a way to refer to moral theories that lacked the structure distinctive of consequentialism (and act consequentialism in particular). Consequentialist views begin with a conception of the ultimate nonmoral good, such as happiness for the utilitarian, and then define moral rightness instrumentally, as that which maximally produces or most effectively promotes the good. Deontological theories deny that rightness is dependent on goodness in this way. Some deontological theories are pluralistic in the sense that they posit a set of unrelated and nonderivative moral rules or precepts. The Ten Commandments and Ross's theory of prima facie duties take this form. Other deontological views are founded on a single overarching principle. The Golden Rule and Kant's Categorical Imperative are foundational principles of this sort. In virtue of their principle- or rule-oriented structure, deontological ethical systems are often considered to better reflect commonsense morality than consequentialist views. We seem to believe that lying, stealing, promise breaking, exploitation, discrimination, and the like, are wrong even when their results are desirable; even noble ends do not always justify the means.

In virtue of their nonconsequentialism, it is sometimes thought that for deontological ethical systems the consequences of actions are irrelevant. However, denying that rightness is a matter of bringing about optimal consequences does not entail that the consequences of actions are of no moral significance whatsoever, and few deontologists have embraced this strong and implausible position. Rawls, whose theory of justice is decidedly deontological, writes that any moral theory that refused to take consequences into account in judging rightness would be irrational. And among Ross's list of prima facie duties is the duty of beneficence, which requires that we promote others' well-being. What deontologists deny, rather, is that the consequences matter *in the way* they do on consequentialist views. Similarly, in denying that rightness is a matter of maximizing good results, deontologists need not hold that rightness and goodness are unrelated in all respects. Kant claims that goodwill is the sole unconditional good. But since having goodwill, in his view, is a matter of being firmly committed to doing the right thing, goodwill is neither a nonmoral good nor an effect actions ought to maximize.

A related misconception is the thought that deontological theories are committed to absolute and exceptionless moral rules. In fact, few deontologists are absolutists in this sense. The tendency to associate deontology with absolute prohibitions is at least partly due to Kant, who notoriously argued that it would be impermissible to lie even to a would-be murderer to save a friend's life. It is doubtful, though, that either this harsh conclusion or an absolute rule against lying can be convincingly derived from any of Kant's various formulations of the fundamental moral law, the Categorical Imperative. Deontologists generally agree with ordinary moral thinking in holding that it is wrong to lie and yet there are situations in which lying is morally permissible. An analogous point would hold for other kinds of wrongs. Most business ethicists would say that the management of a firm has a fiduciary obligation to promote the financial interests of shareholders, but none would maintain that management should promote shareholders' interests at all costs whatsoever, for example, by disregarding the law or the basic human rights of employees, customers, and others.

Apart from their intuitive implausibility, deontologists have resisted endorsing absolutist rules because a system of such rules would produce irreconcilable conflicts of duty. Even still, any rule-based theory needs a means of handling situations where the rules give conflicting guidance. One strategy is to build exceptions into the rules themselves. In terms of the previous example, the relevant rule would not be "promote shareholder interests (no matter what)" but rather "promote shareholder interests unless doing so requires violating the law, basic human rights, or . . ." The problem with this approach, obviously, is that it is difficult to craft the rules so that all possible conflicts are avoided. Novel and unforeseen scenarios are bound to arise for even the most well-designed system. A second strategy is to incorporate a method for resolving conflicts of duty into the system as a whole. One way of doing this would be to prioritize or order the rules such that in cases of conflict, one rule takes precedence over the others. A firm's obligation to respect basic human rights, for example, might always have priority over the obligation to promote the shareholders' financial interests. Another way is suggested by Ross's theory. Ross posits various basic duties, such as the duty of fidelity that requires keeping one's promises and telling the truth. Although Ross's principles of duty are absolute in form, he maintains that these duties apply only at first glance. When two or more first-glance duties conflict, one's actual or all things considered duty can be determined only by weighing the significance of each duty to the circumstances at hand. Ross thus avoids claiming, say, that the duty of fidelity itself has exceptions or that another duty always takes precedence over it.

Deontology and Reasons for Action

The contrast between deontology and consequentialism can also be stated in terms of reasons for action. A consequentialist holds that reasons for action are always grounded in the goodness of the states of affairs that actions can bring about. From this perspective, however, the deontologist's claim that one can be morally justified in aiming at something other than optimal states of affairs can seem irrational. Why should one follow a rule when breaking it would produce more good? The response from the deontologist would be to deny the instrumentalist conception of rationality that the consequentialist's complaint presupposes. Consider Kant's respect for persons principle, which is of particular importance to contemporary nonconsequentialism. The principle commands that we treat persons as ends in themselves and never merely as a means. It rests on the idea that all persons have an intrinsic value or dignity—an incomparable worth "beyond all price"—in virtue of their status as free and autonomous rational agents. To Kant and many others, the appropriate way to respond to value of this kind is to respect the persons who possess it rather than trying to maximize the amount of it (e.g., by encouraging population growth), as a consequentialist approach would imply. In other words, according to Kant's principle at least some reasons for action direct us to act for the sake of values that already exist, as opposed to directing us to bring things of value or states of affairs into existence. It can be rational to act out of respect for someone without trying to produce a result beyond the action itself.

These divergent ways of conceptualizing the relationship between reasons for action and value can make a substantial difference in deontological and consequentialist analyses of particular cases. To a Kantian way of thinking, the reason that one ought to, for example, keep a promise to a customer is not that keeping the promise produces more good than breaking it (although it may do this). Moreover, the reason one ought not to subject employees to dangerous working conditions without their consent is not that doing so diminishes the total amount of well-being in the world (although this too may be true). Instead, the idea is that certain ways of treating people are incompatible with the intrinsic value and dignity of persons. The reason one should keep promises to customers, generally speaking, is that as persons, customers are owed the consideration and respect that promise keeping involves. Breaking a promise, particularly when this is done for questionable reasons, demonstrates disregard for the person to whom the promise has been made. Moreover, persons are entitled not to have their lives threatened without their consent in order to achieve higher profits or some other good. Using reasoning of this sort, the respect for persons principle is frequently invoked to ground and justify claims of human rights.

The Significance of Deontological Ethical Systems to Business Ethics

Although the instrumental conception of rationality found in consequentialism is also deeply embedded in economics, deontological ethical thinking is prominent in business ethics. While this is true for various reasons, two distinctive aspects of business ethics are worth mentioning in this regard. First, not only are contemporary moral claims commonly made in terms of rights, but rights are often the means by which we designate moral boundaries in competitive contexts such as business. Almost everyone acknowledges, for example, that an employee has a right to change careers if he or she so chooses, a right to not be treated in degrading and demeaning ways, and a right not to be discriminated against. Customers have a right not to be purposely deceived about the products they buy. Shareholders have a right to vote in electing members to the board of directors. And so on and so forth. Consequentialist theories, however, are poorly equipped to make sense of such rights claims. Briefly, the problem is that it would appear that the only right a consequentialist theory can coherently acknowledge is the right to be treated in ways that are consistent with bringing about the most overall good. Yet on the face of it, there is little reason to suppose that the overall good is always maximized by respecting the various rights that people in the world of business are commonly said to possess. By their nature, rights are rule oriented and not results oriented in the way consequentialism demands.

A second reason why deontology is of particular relevance to business ethics has to do with the importance of roles and role obligations in business. Deontology seems better able to account for role obligations than consequentialism. The problem for consequentialism, egoistic versions of the view aside, is that it demands that we give impartial consideration to the interests of everyone. But many obligations in the business world seem to depend crucially on specific job responsibilities and particular contractual relationships. A salesperson, for example, is morally obligated to promote the interests of the corporation that employs him or her. While this does not mean that a salesperson should promote the employer's interests at all costs, it does mean that in the ordinary run of things, a salesperson ought not to steer customers toward competitors when the employer offers a product that would adequately meet the customer's needs, even if doing so would somehow increase the overall good. The fact that the salesperson works for *this* business (and not *that* one) is of moral significance in itself. Likewise, a corporation is obligated to return excess profits to *its* shareholders, and not to whomever may be in the greatest need. Management, similarly, has obligations to *its* employees that it has to no others. The list of such role obligations in business could be extended indefinitely. The consequentialist is likely to respond by insisting that fulfilling role obligations does in fact bring about the greatest good. At best, however, this is an empirical generalization that is unlikely to be true in all cases.

Deregulation

Deregulation is the removal or reduction of the demands of regulation. It often takes the form of eliminating a regulation entirely (e.g., government deregulation of airline routes and fares in 1977) or altering an existing regulation in a way that scales it back (e.g., telecommunications in 1996).

One important issue with regard to deregulation is which level of government (multinational bodies, national, state, local) makes the decision to deregulate in different circumstances. Different countries will resolve this issue differently. In the United States, some deregulatory matters are within the purview of the federal government (generally when there is interstate commerce involved) and other matters will be decided by states and localities. Other countries have a different mix of local- and national-level regulatory decision making, and in still other contexts—such as the European Union—decisions about deregulation will be made by multilateral bodies.

There are a number of sources of deregulation. The most common source comes when a legislative body (with or without the concurrence of the executive branch) passes legislation that has deregulatory effects. Regulatory bodies, including government agencies, are also sources of deregulation—through the deletion or modification of the rules that enact a piece of regulatory legislation, one practical effect may be deregulation. Finally, courts may strike down a regulation as illegal or unconstitutional and such an action would also have a deregulatory effect.

In general, we should expect businesses and industries to support deregulation when a particular regulation is costly and limits their autonomy. (Some regulations are favorable to business and industries, and we should not expect deregulatory pressures in such cases.) Deregulation will almost always be in the interests of individual businesses, industries, and the institution of business. Whether the interests and desires of business will lead to regulation or deregulation depends in large part on the broader social climate and the prevailing political ideologies that have power at any given moment.

Rationales for Regulation

To understand better why deregulation occurs, it is necessary to understand the varying rationales for regulation. Regulation generally occurs for one of the four reasons:

1. The normal functioning of a market yields a result that is perceived to be socially undesirable. Minimum-wage laws, for example, exist when a society believes that a market-clearing wage for some workers is too low.
2. Regulation also occurs when there is a natural monopoly—electricity transmission being one example—that requires intervention to ensure that its monopoly position is not misused in ways that lead to higher prices and poorer service. Due to changes in technology, however, some industries that were thought of as natural monopolies (such as telephone service) no longer are.
3. Externalities—costs of production not paid by the producer—are another rationale for regulation. Pollution regulation exists because pollution harms parties other than the producer (such as surrounding communities) and in the absence of regulation more pollution than ideal would occur.
4. Market imperfections—such as imperfect information—are a final rationale for regulation. Consumers of pharmaceuticals lack enough information to make informed choices about what pharmaceuticals should

> be taken and what side effects and risks exist. Government regulation in this case takes three primary forms—approving a drug as safe and effective, requiring the disclosure of information when a drug is advertised, and requiring that a physician prescribe particular pharmaceuticals.

Rationales for deregulation can, therefore, be understood as the inverse of rationales for regulation.

Why Does Deregulation Occur?

Given the rationales for regulation identified in the previous, three broad reasons for why deregulation may occur can now be identified:

1. The regulation is no longer effective and thus ceases to produce a socially desirable result. When the airline industry was deregulated in 1977, it was largely because the system of price and route regulation in place at the time was perceived by policy makers to be holding back the industry's growth. After deregulation, the number of airlines competing in many markets increased and real prices for air travel fell. However, for many small communities, the federal government had to provide subsidies to ensure continued air service. Furthermore, airline profits have fallen along with consumer prices. Similarly, regulation of natural monopolies, externalities, and market imperfections may be lessened or eliminated when (1) substitutes for regulation are perceived to exist, (2) market changes make the original rationales no longer operative, or (3) the regulation is perceived to be too costly for whatever social benefits it generates.

2. Ideology plays an important role in determining whether deregulation occurs, both for particular industries and for the institution of business generally. The institution of government changes in terms of how dominant political ideologies believe that the institution of business should be regulated. Sometimes political leaders believe that business behavior needs to be reined in, and expansion of regulation is likely to occur. In other cases, political leaders believe that there is too much regulatory control over business, and a pattern of deregulation is likely to occur. Ideological commitments, therefore, shape when political decision makers seek to bring about increased regulation or deregulation.

   It should be generally noted that there are two competing ideologies with regard to regulation. One ideology posits that free markets (along with individual business and industries) relatively unfettered by regulation bring about the best results for society. The second ideology is more skeptical about this claim and tends to promote increased regulation of business. Deregulation is more consistent, of course, with a free-market economic and political orientation.

3. A regulated industry might seek to bring about deregulation through political pressure. Regulation often occurs after a triggering set of events—such as the 1929 stock market crash or the rash of corporate scandals that occurred in the late 1990s. When there is significant and negative public attention directed at an industry or business generally, regulatory pressures increase. But the passage of time may cause such pressures to decrease, providing opportunities for an industry to seek deregulation. In general, businesses and industries prefer less regulation to more regulation, and regulated industries will seek to bring about deregulation through political pressure. Industries have interests and will seek to bring about deregulation when doing so is consistent with those interests.

In short, regulatory decisions—including deregulation—are affected by a variety of contingency factors. The general preference of business is less regulation and more deregulation, and deregulatory pressures should be expected when deregulation is in a business's or an industry's interests. Economic and scientific analysis plays a role (or at least should), but so does political ideology. Policy makers can look at the same evidence and come to radically different conclusions with regard to the attractiveness of regulation or deregulation in a given context.

Problems With Deregulation

As is the case with regulation, deregulation can be fraught with problems. Sometimes deregulation removes a regulation that is costly to business (and by extension, society) and, therefore, leads to a societal benefit. But sometimes deregulation leads to bad outcomes for society.

Some regulatory areas—such as pharmaceutical safety—are probably poor candidates for deregulation. When a particular regulation corrects a market failure or helps consumers make better and more informed choices, deregulation is generally not in order. However, regulatory reform that seeks to better equilibrate costs and benefits may be sensible in such circumstances. Because regulation imposes costs on business and society, it is necessary to ensure that it is effective.

In other cases, deregulation can lead to businesses within an industry seeking to game the system in ways that benefit themselves at the expense of society. Deregulation of electricity markets in the United States is one example. Many states deregulated electricity markets in the 1990s and 2000s, with the general goal of allowing for competition that would supposedly lead to greater efficiency and lower prices for consumers. But because of the way the deregulation was structured in many states and because of the nature of electricity (which cannot be stored), there were strong incentives to behave in socially harmful ways. Some companies—Enron in California is one example—withheld power from the spot market to drive up prices and earn abnormal profits. Some states, because the rules for deregulation were poorly thought through, did not experience the electricity price declines forecast. At present, electricity deregulation has not lived up to what was promised for it.

Getting the rules right for deregulation, therefore, matters. Companies will—as is the case for regulation, of course—seek to find advantages for themselves when deregulation occurs. Hence, it is necessary to structure deregulation in a way that restrains misbehavior by corporations.

Substitutes for Regulation and the Public Control of Business

One of the most important issues with regard to deregulation is whether self-regulation and/or market forces are substitutes for regulation. If so, then deregulation is more likely to be socially beneficial than if not. This is an issue of political ideology at least in part—if one believes that markets are largely self-correcting in nature, businesses and industries are capable of self-regulation, and bad behaviors by businesses are punished accordingly, then deregulation will be attractive. If one believes that business is only prevented from behaving badly by coercive means, then increased regulation rather than deregulation will be attractive.

There is no one answer to the question of whether deregulation will or will not be effective generally. It is necessary to look at the structure of the particular market, the number of companies involved in it, whether self-regulation or markets would be effective substitutes for regulation, and the goals that regulation is trying to accomplish to determine whether deregulation in a given case makes sense. Although political ideology does affect whether the trend is toward regulation or deregulation at any given time, in many cases economic analyses can provide well-informed answers about the suitability of deregulation for a particular industry with regard to a particular kind of behavior.

Conclusion

The regulatory impulse waxes and wanes. Sometimes broad social and political sentiment is in favor of increased business regulation and sometimes in favor of deregulation. When regulation is no longer effective, deregulation will lead to an increase in social welfare. But political ideology also plays a role in determining both regulation and deregulation. Perhaps in an ideal world, economic analysis would determine the direction of regulation and deregulation. But policy makers are driven by ideologies that affect their views on the role of government, and those views in turn largely shape whether deregulation occurs.

Descriptive Ethics

Descriptive ethics can broadly be thought of as the study of morality and moral issues from a scientific point of view. It can be thought of as the branch of ethics that attempts to develop conceptual models and test those models empirically in order to enhance our understanding of ethical or moral behavior, moral decision making, and more broadly moral phenomena. This area or branch of ethics might also be referred to as behavioral ethics. Descriptive or behavioral ethics, then, describes and explains moral behavior and phenomena from a social science perspective or framework.

One might distinguish morality from ethics. Morality can be thought of as the set of norms, rules, standards, principles, or values that guide adherents in their behavior as to what is right and wrong, good and bad, or appropriate and inappropriate behavior. In this sense, virtually every human has some morality or moral code. Or morality might be considered the practice of such moral codes among members adopting such standards or codes. To the extent that the practice of business has such a code or set of norms, we might refer to that practice or practices as "business morality." "Ethics" may be thought of, then, as simply the study of morality. Accordingly, ethics is critical reflection or critical analysis of moral issues and moral phenomena. Furthermore, business ethics can then be defined as the study of moral issues in a business context, that is, an applied area of ethics or ethical inquiry. Organizational ethics can be thought of as studying moral issues in a broader organizational context.

To position descriptive ethics, we may distinguish different approaches to studying moral issues and phenomena. One distinction is between normative and descriptive or behavioral ethics. Critical reflection that attempts to answer questions as to what is right or wrong, good or bad, would constitute normative ethics. Such approaches are "normative" or provide guidance and direction in terms of making moral or ethical choices or living in morally acceptable ways. Such approaches tend to be philosophical or religious, providing frameworks and theories that are *prescriptive.* These analyses prescribe general principles or even specific guidance. These *normative or prescriptive* theories include typical philosophical approaches, such as utilitarianism and duty-based approaches such as Kant's. Some have said that there are only two normative ethics questions: (1) What is good? (2) What is right? Aristotle's virtue-based ethics represents a normative theory that answers the first question. Utilitarian and Kantian theories provide competing theories that provide decision rules or answers to the second question. What they all have in common is to approach ethical inquiry from a normative or prescriptive point of view.

Descriptive ethics, on the other hand, approaches the study of morality or moral phenomena by asking different questions. In general, this approach attempts to describe and explain moral action, moral decision making, and moral phenomena. For example, how do individuals process and resolve perceived moral conflicts? What are the most important influences or causes for individuals behaving ethically or unethically? What is the system of beliefs that guides individuals or groups in making the moral choices that are observed? Answers to these kinds of questions are descriptive or explanatory in nature. As such they use social science frameworks that often include theory building and hypothesis testing in terms of discerning answers. Engaging these kinds of questions in a business context, then, can be thought of as *descriptive business ethics*, or the application to the broader organizational context can be referred to as *descriptive organizational ethics*.

Moral Psychology and Social Psychology

One important body of research of descriptive ethics is cognitive moral development theory. This research grew out of the seminal work of Lawrence Kohlberg in the late 1950s in his study of modes of moral thinking and choice among adolescent boys. Kohlberg's theory describes the developmental processes used by individuals as they grow and develop in terms of how they resolve moral issues and make moral choices. It is thus a descriptor of individuals, who vary in terms of their level of cognitive moral development. Kohlberg's theory is the most widely disseminated and tested theory in moral psychology. It has been cross-culturally tested in more than a hundred cultures, and it has been used as an important variable in many descriptive studies of business and organizational ethics. One of the most important implications of cognitive moral development is its relationship to behavior or action. Numerous studies have been conducted, and the general result is a positive but modest relationship to decision making and action. Thus, those individuals having higher levels of moral development are more likely to make ethical choices and behave ethically. Of note in extending Kohlberg's research was James Rest, who developed a more general four-stage model of ethical decision making.

Other social psychology research from the 1960s and 1970s has been used in business ethics to show the influence of factors other than individual, rational processes. Of note here are the Milgram experiments from the early 1960s, in which Stanley Milgram and his colleagues designed experiments that demonstrated how ordinary subjects would comply with authority in carrying out orders that were patently contrary to standards of morality. Here social scientists advanced theories to explain the atrocities of Nazi Germany. Other social psychology experiments followed, including the Zimbardo experiments of the early 1970s, in which normal college students (absent direction from a perceived authority) allowed themselves to engage in abusive behavior in a prison simulation experiment. The Zimbardo experiments were related directly to the kind of behavior exhibited by guards in the Abu Ghraib prison outside Baghdad. These kinds of social psychology experiments and studies have been related to organizational behavior, in particular in business contexts.

Descriptive and Behavioral Business Ethics

Describing and Summarizing Data

One approach to descriptive ethics is just that to describe various aspects of business ethics. This might include surveys of ethical attitudes among employees and managers, for example, whether individuals feel pressure to compromise moral principles to achieve organizational goals. One might describe the kinds of principles that individuals use in making decisions. On the other hand, researchers might turn their focus on the organization itself rather than individuals as the object of study ("unit of analysis" in social science terminology), for example, describing the adoption rates among Fortune 500 firms of codes of ethics, appointment of ethics officers, and other such organizational characteristics. All these questions describe or summarize data about individuals or organizations. Even anthropological studies might be included in this kind of research. One might, for example, engage in a systematic study of the ethical aspects of Japanese business culture.

Theory Building and Hypothesis Testing

However, since the late 1980s and for more than 15 years there has been a growing body of research from which has emerged more complex and complete conceptual models of ethical decision making and ethical behavior. Of particular note is the seminal work of Linda Treviño in 1986. She proposed a person-situation interactionist model to explain ethical decision-making behavior in organizations. Citing the lack of a comprehensive theory to guide empirical research in organizational ethics, Treviño proposed a model that posited cognitive moral development of an individual as the critical variable in explaining ethical/unethical decision-making behavior. However, improving on previous models, Treviño proposed an interactionist model that posited individual variables (e.g., locus of control, ego strength, field dependence) and situational variables (e.g., reinforcement contingencies, organizational culture) as moderating an individual's level of moral development in explaining ethical decision making in organizational contexts. Other conceptual models followed proposing alternative frameworks and variables that describe and explain ethical decision making and behavior in business and organizational contexts.

These conceptual models posit various relationships that can be empirically tested, and this is another critical aspect of this approach, hypothesis testing. Hypotheses are derived propositions that can be tested empirically, and the results of these empirical studies lead to further refinement and modification of the conceptual models. There has been a significant amount of such hypothesis testing in the past 15 years. Such hypothesis testing requires attention to measuring variables, design for testing such relationships, and selection of the appropriate statistical methods for evaluating results. Thus, business ethics has developed as another branch of the social sciences.

To summarize this descriptive body of research would be impossible here. However, we can provide some of the more salient factors that have been studied. For example, it is fair to say, and not surprisingly, that the attitudes and behaviors of employees and managers are strongly influenced by organizational factors and context. Factors studied include the existence of formal ethics policies, the use of ethics training programs, and the commitment of top management in terms of implementing ethics policies and programs. Other organizational factors include the reward structure of the organization and whether and how sanctions are used for ethical/unethical behavior. Beyond such formal features of organizations, attitudes and behaviors are likely to be influenced by the ethical climate as well as the ethical culture of organizations. The behavior of peers and, more generally, the immediate job context in the organization are also likely important, as is the behavior and commitment of leaders in organizations. Included here would be perceived role conflict of one's position, what is rewarded in the unit, the behavior and attitudes of coworkers and management, and job pressure.

Besides organizational factors, individual characteristics are likely to influence decision making, attitudes, and behavior. Following a stage model of decision making, moral awareness or ethical sensitivity would be an important, initial factor. To the extent that individuals vary on such awareness and sensitivity, it is likely to have an impact on decision making. Moral judgment or level of cognitive moral development is perhaps the most widely studied individual characteristic. The ability to follow through on judgments made is also an important factor in the actual decision and behavior, what some refer to as ego integrity. Related to this ability to follow through is the extent to which individuals vary on whether they think they are able to control what happens around them, rather than being passive products of the environment, which social scientists refer to as locus of control. Among other factors thought to influence ethical decision making and behavior are gender, age, and tenure in the organization.

The overall objective of the theory building and hypothesis testing approach is not to just describe but understand and explain complex moral phenomena, and this has been a dominant approach among those social scientists engaged in business ethics in the past 15 years.

Case Development and Storytelling

While from a social science perspective, cases and other forms of descriptive storytelling would not be considered a form of descriptive ethics, a place of descriptive cases in business ethics is acknowledged. Cases and storytelling more generally involve an age-old approach to understanding and knowledge. That is the tale of an effective storyteller. Sometimes the most effective learning is from a good story that is described or told effectively and has important lessons to be drawn from the story. In business schools, the use of case studies is an old and venerable method of teaching and learning. While social science and its techniques have been discovered and developed as tools in business ethics, the description of situations, decisions, and the consequences that follow might also be considered part of the umbrella of descriptive ethics. Such "business case studies" are typically descriptions of situations, people, and decisions, leaving the analysis and lessons learned to emerge from the story itself. Those cases written with a particular ethical dimension might then be properly considered a form of descriptive business ethics. Beyond shorter case studies, any longer accounts (such as books) that describe or relate ethical stories may be considered another aspect of descriptive ethics. In summary, descriptive or behavioral ethics, in its many forms, can be thought of as a branch of ethics that attempts to describe, understand, and explain moral phenomena.

DESERT

Desert is a three-place property uniting a subject, a thing or treatment, and a fact. When certain facts are true of certain subjects, they have the property of being deserving of certain things. Thus, claims that subjects deserve things (or, desert-claims) have the form, "P has the property of being deserving of (or deserves) T in virtue of F," where P is a subject, T is a thing, and F is a fact about P, also known as a "desert base." It is widely believed that people ought to get what they deserve—at least when other things are equal. There is less agreement about the conditions under which people come to be deserving, and hence about what in particular they deserve. After years of neglect, desert is regaining popularity among political philosophers as a principle of distributive justice. In business ethics, this concept has potentially wide application. It proves especially useful, however, for addressing the justice of personnel (e.g., hires and promotions) and compensation (e.g., salaries and profits) decisions.

The Nature of Desert

To understand what desert is, it is useful to contrast it with the closely related concept of entitlement. Deservers are said to be in a "natural" or "preinstitutional" sense worthy of what they deserve. Desert may incorporate institutional elements, but it is always in some sense independent of them. Entitlement, in contrast, is a wholly "institutional" notion. P becomes entitled to T by satisfying a set of public rules or criteria for the distribution of T. Unlike P's desert of T, P cannot be entitled to T unless there exist rules or criteria for its distribution.

Both desert and entitlement are thought to have normative significance—that is, to provide reasons for treating people in certain ways—but their significance is understood in different ways. According to the standard view, to say that P deserves T is to say that it is "fitting" or good, other things equal, that P has T. Desert is thought not, however, to create rights. If P deserves T, then to fail to give T to P would be bad, other things equal, but it would not violate or override P's rights. Entitlement, in contrast, is standardly understood in terms of rights. If P becomes entitled to T by satisfying the rules for its distribution, then P has a right to T, and to fail to give T to P would be to violate or override P's rights.

These points can be illustrated through an example, borrowed from Joel Feinberg. Suppose there are two candidates for the U.S. presidency, A and B. Candidate A is smart, hardworking, and magnanimous. A wants only what is best for the country and has great ideas about how it should be run. B is dull, lazy, and mean-spirited. B does not want what is best for the country and has terrible ideas about how it should be run. Suppose, moreover, that A works much harder than B to get elected. B, let us suppose, leaves all the work to advisers. Of these candidates, surely A deserves the presidency more than B. But suppose, in the election, B receives more votes than A. As a result, B is entitled to the presidency, and not to give it to B would be to violate B's right to it. Nevertheless, it makes sense to say that, because of A's superior qualities, A deserves the presidency, and because of this, there is some value in A's having it. This is so even though A is not entitled to the presidency. This example highlights desert's role as a critical notion: It can be used to critique the distributions (e.g., of offices) generated by institutions, even ones that are prima facie justified on other grounds.

Desert and Other Values

Desert matters in the sense that it provides a reason to treat people in certain ways, but it is not all that matters, and it may not matter most. Suppose C is a talented employee who deserves a promotion, but suppose the promotion was promised to D. Suppose also that it is more important to keep promises than to requite deserts. It follows that although there is a reason for C to get the promotion, D should have it all things considered. This does not mean that contrary to our original assumption, D actually deserved the promotion. This wrongly equates *desert* with "should have all things considered." C still deserves the promotion, and there remains some reason to give it to C, but for other reasons, D should have it all things considered.

This raises the question of how important desert is compared with other distributive criteria such as need, utility, equality, and entitlement. Few theorists have tried to say how important, in general, desert is compared with these values. But this question is unavoidable in debates about specific issues in business ethics. For example, it has been claimed that the value of equality justifies programs of preferential treatment. An objection to such programs is that, by denying jobs to the most qualified applicants, they conflict with desert. Similarly, it has been claimed that chief executive officers (CEOs) deserve less pay than they now receive. Defenders of the current level of executive compensation claim that, because boards of directors have freely agreed to pay CEOs these sums, CEOs are entitled to them, whether or not they deserve them. Implicit in these debates are disagreements about the relative value of desert—in the first case, compared with equality, and in the second, compared with entitlement.

In fact, more than one disagreement may be implicit in these debates. It can be plausibly denied that the most qualified applicant deserves the job, and that CEOs deserve less pay. On this ground, there is disagreement about the precise conditions for desert. More will be said about the role of desert in debates about specific issues below. First, more must be said about its nature.

The Elements of Desert

All theorists agree that some uses of "desert" are legitimate and some are not, but they disagree about which ones. This is manifest in the debate about the ranges of P, T, and F in desert claims, that is, about what subjects can be deserving, what things or treatments can be deserved, and what facts can serve as desert bases.

Deservers

It is undeniable that persons can be deserving. There is disagreement, however, about whether nonpersons can be deserving. It is natural to ascribe desert to subjects other than persons. We know what is meant by the claim "Everglades National Park deserves to be protected; its beauty is remarkable." But some consider this a misuse of *desert*. According to them, while Everglades should be preserved, it does not, strictly speaking, deserve to be.

It may be wondered where this leaves corporations. A claim such as "Frankfurter Industries deserves an award; it has done so much good in the community," is perfectly intelligible. Whether one thinks of this as a legitimate use of *desert* depends on whether one thinks of corporations as persons, or if one does not, whether one thinks nonpersons can be deserving.

What Is Deserved

Most writers agree that what is deserved must have some sort of value—it must be good or bad, desirable or undesirable. All these examples that we have used so far—promotions, offices, preservation, and awards—satisfy this constraint.

A point of contention concerns whether nondistributable goods can be deserved. We might say of a research chemist, "After all these years, G deserves a breakthrough." Some have claimed that, while it might be good for G to have a breakthrough, because human beings cannot distribute breakthroughs, G cannot, strictly speaking, deserve one. Others think that whether the thing can be distributed is irrelevant from the point of view of desert.

Desert Bases

When there is disagreement about whether P deserves T in virtue of F, it is usually due to disagreement about whether F is a desert base or the appropriate desert base for T. For example, the disagreement about how much pay CEOs deserve is not about whether CEOs can be deserving or whether pay can be deserved but about what the desert bases for pay are. As a result, there has been extensive discussion of the question of what facts can serve as desert bases.

Writers agree that the facts in virtue of which P deserves T must be facts about P. P cannot deserve T in virtue of facts about another person Q. Three further features of desert bases merit attention.

First, it is widely agreed that desert can be based on past actions. For example, H might deserve a high salary in virtue of making a valuable contribution to a firm. Some writers think that, in addition, people's present characteristics can serve as desert bases. They claim, for example, that J can deserve a job in virtue of being the most qualified applicant. Still fewer writers think that future actions also contribute to desert. They claim, for example, that people diagnosed with terminal illnesses deserve pleasant treatment now for the suffering they will later endure.

Second, the majority of writers think that desert is based only on appraisable facts. An appraisable fact is one that is, or should be, the subject of an appraising attitude, such as admiration, gratitude, disgust, or resentment. Suppose K takes a sip of tea. This behavior is not appraisable and, therefore, does not make K deserving of anything. But consider again H, who makes a valuable contribution to a firm. This behavior is admirable, so H can be deserving (e.g., of a high salary) in virtue of it. Note that, if this view is accepted, then people cannot be deserving (e.g., of assistance) in virtue of being in need. Of course, we can imagine exceptional circumstances in which need is appraisable, as when people carelessly squander their resources or when they admirably conserve them. But on this view needs are not normally desert bases, a result that some philosophers are reluctant to accept.

As the example of H suggests, the appraisals that desert involves are not necessarily moral appraisals, that is, appraisals of moral worth. H's making a valuable contribution to a firm makes H deserving and provides a reason to treat H in a certain way, but it does not make H a more morally worthy person. Thus, while all desert is morally (or normatively) significant, not all desert is moral desert.

Third, many writers think that desert is connected to responsibility, such that if P deserves T in virtue of F, then P is responsible for F. Again, the case of H is illustrative. Intuitively, H can be deserving of a high salary in virtue of making a valuable contribution only if H is responsible for that contribution. H must have acted voluntarily and intentionally, so that H can claim credit for what was done. If H's contribution was the result of luck or an accident, or if it was made under the influence of a mental illness or hypnosis, then it does not count toward H's deserts.

This view was the received wisdom until recently. Philosophers who reject it say that while some desert claims, such as H's, require responsibility, others do not. They point in particular to cases in which compensation is deserved. Innocents who are injured in accidents, they say, deserve compensation, even though they are not responsible for being injured. Indeed, they deserve compensation precisely because they are not responsible for being injured. Proponents of the view that all deserts require responsibility have responded by devising more complicated formulations of the connection between responsibility and desert or by arguing that desert of compensation is an illegitimate form of desert.

What Desert Requires in Specific Cases

Desert can conflict with other values, such as equality and entitlement. So it is thought that egalitarians endorse programs of preferential treatment, while desert theorists oppose them. And it is thought that desert theorists criticize the current level of CEO pay, while libertarians do not. We now see that these claims are insensitive to the fact that there are different conceptions of desert theory (as well as of egalitarianism and libertarianism). Some, but not all, desert theorists oppose programs of preferential treatment and object to the current level of CEO compensation.

The claim that the most qualified applicant deserves the job is intuitively plausible. If we think of jobs as prizes, and application processes as competitions, then it seems that, just as the fastest runner in the race deserves the gold medal, the best applicant deserves the job. But some reject this view on the grounds that people's qualifications are not sufficiently under their control. Qualifications consist of, among other things, native talents and acquired skills. It is obvious that people have no control over what native talents they have. Even the skills they have may be the product more of favorable genetic and social circumstances than free choice.

The claim that CEOs deserve less pay than they now receive is likewise controversial. What view one holds in this debate—and the debate about how much pay workers in general deserve—depends on what one thinks the desert bases for pay are. Several have been proposed, including the value of the worker's contribution (perhaps as estimated by the marginal revenue product of labor), how much effort they expend, the hardships they endure, how much responsibility they have (e.g., over other workers), or a combination of these factors. CEOs probably deserve less pay than they now receive if the desert base for pay is effort. Their jobs require about as much effort as the jobs of, say, university presidents, who are paid much less. CEOs might not deserve less pay if the desert base for pay is the value of their contribution. Because they command enormous resources, CEOs can make significant contributions to the organizations for which they work, as well as to the economy as a whole.

How much pay CEOs and other employees deserve has been treated separately from the question of whether entrepreneurs deserve their profits. Here again, there is debate about what the desert bases are. Profits may be deserved as compensation for risk taking, as a reward for the creative deployment of capital, or both. Worries about the role of luck in market outcomes figure centrally in these debates. Some deny that entrepreneurs deserve their profits on the grounds that how much profit they make is affected by factors beyond their control, such as sudden changes in the price of raw materials and the actions of competitors. Others downplay the role of luck, attributing profit instead to entrepreneurs' shrewd choices.

Skepticism About Desert

The difficulty of determining what people deserve has led some theorists to abandon desert as a distributive criterion. This is hasty. If desert is normatively significant, as many believe, then attention must be paid to it.

To assuage these worries, some defenders of desert have emphasized the relevance of comparative as well as noncomparative desert. Consider employee H, who makes a valuable contribution to a firm. It may indeed be impossible to determine how much pay H deserves noncomparatively. That is, it may be impossible to say whether H deserves $50,000 per year, $60,000 per year, or some entirely different sum. But this is compatible with it being possible to determine how much pay H deserves comparatively, that is, compared with other workers. H deserves more than workers who have made less valuable contributions (assuming contribution is the desert base for pay), but less than workers who have made more valuable ones. So if H gets paid $50,000 per year and L gets paid $60,000 per year, and H's contribution is more valuable than L's, then this is unjust from the point of view of comparative desert.

A more important skeptical challenge to desert has its source in John Rawls's work on distributive justice. Rawls and others make much of the fact, mentioned above, that people are not responsible for some of the traits and actions in virtue of which they are said to be deserving. There has been considerable debate about how precisely Rawls himself wanted to develop this insight, but two clear antidesert arguments have been built on this foundation. Some claim that people are not responsible for any of their traits or actions and hence are not deserving of anything. Others concede that people are responsible for some of their traits and actions but claim that we cannot tell which ones. The effects of natural and social endowments are thoroughly mixed together with the effects of free choice, and we cannot pull them apart. Worries about the robustness of human agency may be responsible for desert's relatively small role in recent theories of distributive justice, including Rawls's own. (Curiously, desert has continued to play a major role in recent theories of *retributive* justice.)

Unfortunately for desert theorists, there is no easy solution to this challenge. Some respond by arguing that not all deserts require responsibility. This is unsatisfactory. In the first place, it may not be true. Second, even if it is, it is likely that many kinds of desert—for example, desert of pay for work, desert of a job—do require responsibility. To rebut this challenge, the defender of desert must prove that, at least in some cases, people are responsible for what they do and who they are. This is a tall order. A strategy, which in the short run is effective, is to point out that most moral theorists—including most business ethicists—make this assumption. Desert theorists are no better or worse off in this respect than other theorists.

Developing Countries, Business Ethics in

Business ethics of developing countries refers to the moral standards governing responsible business practices in countries that are still working toward an acceptable standard of living. Developing countries are generally characterized by lack of industrialization, low per capita income, and widespread poverty. Business ethics in these countries tends to relate to norms that have arisen largely independent of Western expectations and values.

The assumption is often that less industrialization is a sign of weaker moral standards. In fact, this is not necessarily the case—standards in developing countries are often simply "different," and "different" standards do not necessarily translate into "lower" standards. The reality is that societies in developing countries, absent Western influences, have tended to structure themselves according to different values. In

China, for example, there is an emphasis on the collective good, in contrast with the protection of individual rights often prioritized by Western values. It is worth noting that a strong argument can be made that, in some ways, people in developing countries—such as China—adhere to higher moral standards.

In considering business ethics in developing countries, it is important to distinguish between cultural values and moral problems. Business ethics in developing countries is heavily influenced by the particular cultural values (such as emphasis on the common good) that shape those societies, many of which are not prioritized in the same way in the West. It is, nevertheless, possible to identify moral problems that exist in business in developing countries, without challenging the legitimacy of the different underlying value systems. Although the value systems themselves do not necessarily promote corruption, atrocious labor practices, or intellectual property infringement, the operation of those values in the context of poor industrialization leaves those societies vulnerable to behavior generally considered inappropriate.

Corruption

One of the most pervasive themes that extends throughout developing countries is that of corruption. Corruption, in this sense, tends to relate to agents providing special considerations in their official capacity in exchange for financial payments (i.e., bribery, greasing payments) or other personal benefits. In many of these countries, the absence of legitimate political authority and/or proper infrastructure has left institutions and organizations vulnerable to this sort of corruption such that corrupt practices have become the dominant sort of behavior.

This is considered problematic from multiple perspectives. On the one hand, corrupt practices—that is, practices in which official duties or responsibilities are compromised by considerations of personal financial gain—are inherently morally questionable. At the same time, corruption threatens to distort the operation of business by influencing how the market works. The Foreign Corrupt Practices Act prohibits American companies, and their employees and agents, from engaging in bribery anywhere they conduct business. Many people contend that this places American enterprises at a competitive disadvantage. Other people argue that taking a strong position against bribery can be turned into a competitive advantage. Although the data remain inconclusive, a number of other countries have recently followed the lead set by the United States through legislation and other means aimed at deterring corrupt business practices.

While the United States and other Western, developed countries have traditionally condemned corrupt business practices, some view this as hypocritical, given the existence of corruption in the West as well. Others view this as an example of cultural imperialism as Western countries attempt to impose their standards for doing business on developing countries. In fact, the common understanding that this is how the markets operate in many of these countries has led to the development of predictable channels through which these payments are made. Although these countries still only aspire to industrialization and an acceptable standard of living for the majority of their people, to attempt to eliminate corruption categorically denies the reality of the dependence of local communities on the systems on which the bribes and other financial payments are based. For example, government officials in some of these countries receive salaries that are understood to be supplemented by financial payments from business entities seeking special assistance, similar to how waiters and waitresses in many countries, including the United States, receive under-market salaries because customers are expected to contribute tips. In fact, people in the service industry pay taxes according to actual or assumed tips.

Corruption, therefore, remains a complicated issue in the developing world. Viewed from the outside, it is considered problematic, while, from the inside, it is accepted sometimes neutrally as part of doing business. As the momentum builds against these sorts of business practices, it is important to keep in mind the different moral perspectives from which corrupt practices can be evaluated and the consequences of forcing the elimination of this sort of behavior from an economy that assumes the existence of corruption.

Labor Practices

Another key area of concern has to do with labor practices in developing countries, particularly because many of these countries are attractive to multinational enterprises seeking outsourcing opportunities. Working standards become a huge concern in light of the lack of local infrastructure protecting basic human rights. This is particularly true of China, which is becoming an increasingly attractive locus for new business growth, and where there is a long history of flagrant human rights violations. An inherent tension exists between the tradition of long-considered acceptable business practices in China and the Western values of new entrants to the Chinese market.

The trend in many of these developing countries has been toward the acceptance of standards consistent with the recognition of basic human rights. This has manifested itself in the form of concern about sweatshop labor practices. In sweatshops, a range of human rights violations have turned into the modus operandi for these factories, that is, child labor, unreasonably long working hours, failure to implement adequate safety precautions, absence of a living wage, and so on.

The movement toward fair global labor practices is complex. While the goal is the improvement of working standards, it is important to keep in mind the impact of these sorts of changes. For example, in many parts of the world, children are safer in factories than in local schools, which might be no more than a clearing with no protection from the elements. Furthermore, in many instances, families depend on the meager wages brought in by as many family members as possible—the immediate consequence of raising labor standards can ironically end up harming the people whom the change is intended to benefit. This occurs as children are put out of work or hours are reduced for workers whose families rely on the meager wages of all possible wage earners.

The issue of global labor practices thus remains a pivotal area of contention for business ethics in developing countries. Although there are compelling reasons for improving labor practices in these countries, it is essential to recognize the far-reaching consequences of the embeddedness of these practices in local cultures. The improvement of standards needs to be accompanied by measures that compensate for the financial losses the local laborers initially feel and by public or private initiatives that can, over the long term, contribute toward elevating quality of life.

Intellectual Property

Intellectual property is another area where business norms vary, particularly in developing countries as compared with developed, Westernized countries. Although the United States, and many other Western countries, extend significant protection to intellectual property rights (and grant reciprocity to rights guaranteed in other countries), this is not necessarily the case in developing countries. In China, for example, intellectual property violations are rampant. Many of the brand knockoffs (i.e., Rolex watches, Prada purses, etc.) are both manufactured and sold at cheap prices throughout Asia (particularly China and Hong Kong).

This is at least partially the result of the surplus of labor, much of which is already involved in the manufacture of the original merchandise. The absence of moral restraints regarding the valuing of intellectual property leaves the marketplace vulnerable to intellectual property infringement. While considered theft by Western values, local standards do not necessarily view this as harmful in that the perceived loss associated with the unauthorized use of the intellectual property is merely financial. It is possible to argue that there are not even any tangible financial losses: The individual who can afford a Louis Vuitton handbag or a Rolex watch is not going to bother with a fake. The market for knockoffs is a separate market—in general, buyers of knockoffs would not have otherwise purchased originals.

In fact, it can be argued that the harm to the brands extends beyond the loss of potential sales. The proliferation of counterfeit products jeopardizes the reputation and value of the brands. Furthermore, ownership of original products no longer necessarily carries with it the expected prestige. Companies who invest in high-end brands contend that widespread intellectual property infringement threatens future investments.

Conclusion

Globalization has resulted in the clash of cultures and values throughout developing countries as multinational enterprises have expanded operations. This has created tremendous friction. This has resulted in the adoption of cultural relativism by many people—that is, the view, "When in Rome, do as the Romans do." This is in contrast with the imperialistic view, "When in Rome, you should do as you would do." Freeman and Gilbert offer an alternative: "When in Rome, do as you and the Romans agree to do." The middle ground offered by Freeman and Gilbert reflects the notion that there are independent standards by which local practices can be judged inappropriate. Even from within a culture, it is considered possible to recognize the unreasonableness of particular practices.

As developing countries continue to move toward industrialization and to eradicate widespread poverty, business ethics also continues to evolve. Practices considered acceptable in those countries are increasingly challenged as multinational enterprises move in. Business ethics in developing countries, therefore, remains a moving target. It is important to remain cognizant of the potential consequences of change and, particularly for the companies involved in this process, to be prepared to assist in the development of initiatives and creation of infrastructure that becomes part of newly developed countries.

Developing World

The term *developing world* refers to countries that are poorer, less industrialized, and less technologically advanced than western Europe and North America. The label "developing" is contested, as are the criteria for its application. Similarly, what counts as poverty, what causes it, and what might lessen it are controversial. What is beyond question is that in much of the world the suffering caused by poverty, disease, and violence is profound.

According to the World Bank, in 2005, 1.1 billion people lived in extreme poverty, defined as less than $1 per day; 2.6 billion were living on less than $2 per day. Approximately 3 million people die each year from AIDS; 60 million people live with HIV infection, and there are 6 million new AIDS orphans each year. Three million die from diarrhea, 2 million from tuberculosis. Each year somewhere between 300 and 500 million people suffer from malaria, and a million die of it. Half a million healthy young women die in childbirth each year. Six to ten percent of all infants die before reaching their first birthday. Childhood malnutrition is rampant: The United Nations reports that 30% of the children in the world have been stunted in their growth, and only about 40% attend secondary school. In many areas, violence is endemic, in the form of civil wars, terrorism, warlordism, and criminality.

From these facts arise a number of ethical issues: about obligations to help, or at least not to exploit or hurt, and—assuming that such obligations exist—whether they apply not only to businesses but also (or instead) to governments, to nongovernmental organizations (NGOs), and to individuals. When such obligations exist, the next ethical question concerns how to compare them with other duties such as those to one's stockholders. For entities other than businesses, the conflicting obligations might be to one's citizens, neighbors, or family members.

The Term and Its Application

Most countries in Africa, Latin America, the Middle East, southern Asia and the Pacific islands count as "developing," with obvious exceptions (Israel, Japan, New Zealand) and borderline cases (South Africa, Turkey). The status of former Soviet countries and satellites is unsettled. Since pockets of poverty and of wealth are found in virtually every country, some would classify inner city regions in the United States (for instance) as "underdeveloped" or developing.

In spite of such disagreements, many find the UN Human Development Index useful for measuring and comparing countries. It too is the product of criticism and controversy over time. For years, the UN Development Program (UNDP) measured development in terms of gross domestic product (GDP), the fraction of GDP produced by manufacturing, and literacy rates. In 1990, a broader definition was adopted, in terms of what kinds of lives people could choose to live. This definition is operationalized in terms of the Human Development Index (HDI), which measures longevity (life expectancy at birth), knowledge (in terms of literacy and school enrollment), and purchasing power (in terms of GDP per capita).

The label "developing world" is controversial also for what it suggests: that industrialization, technology, and increased market activity are inevitable and desireable. "Developing world" may be the latest in a series of terms used for these regions and then rejected. The Cold War, for instance, produced the term *Third World*, originally meaning "nonaligned"—that is, countries allied with neither the Soviet Union nor the West—but quite soon coming to mean areas of deprivation. The phrase was discarded not only because the Cold War ended but also because the adjective *third* seemed to suggest "less important." "Developing world," with its own problematic connotations, may give way to "the Global South," although that term too is inadequate, on geographical grounds.

Causal Explanations

Many different explanations have been given for the enormous variation in standards of living around the world. Sometimes the role of geography is emphasized: Countries in temperate zones with access to the seas, for instance, tend to do better than others. Other physical factors—depleted soil, the presence of malaria-carrying mosquitoes—can also be blamed. Some of the proffered explanations are historical: Most countries with low HDI scores were colonies of European powers until the mid- to late 20th century, and their former colonizers enjoy high HDI scores; exploitative colonialism clearly played a role in shaping present inequities. Other theorists focus on the present: Corruption in government creates and perpetuates poverty. High birthrates put pressure on limited resources. Without democracy and a free press, governments are freer to let their people starve.

A larger frame implicates the present global political and economic system, which (for instance) needs cheap labor or needs to recognize de facto rulers, no matter how corrupt or oppressive, in order for business to continue. The World Bank (WB) and the International Monetary Fund (IMF) are often criticized for the Structural Adjustment Programs (SAP) of the 1980s and 1990s. These programs were imposed on debtor countries, who were not allowed to default on their loans (no international form of bankruptcy was permitted), and whose often overpowering debt resulted from factors in the world economy such as rising interest rates. Allowing the countries to default would have had a destabilizing effect on public and private lenders alike, and so these countries were required instead to deregulate and privatize much of their economy, including education and health. The SAPs also required lowering barriers to international trade. Wealthier countries, not subject to the demands of the WB and IMF, did not always reciprocate, and at times became able to exploit an uneven playing field. (See below for other aspects of the work of the two institutions.)

The adequacy of any single explanation is vigorously contested, but most of the above play some role. Some factors, obviously, are results of or reinforced by others. In the past two decades, HIV/AIDS has devastated much of the developing world, targeting as it does adults in their most productive years. HIV/AIDS is in fact a good illustration of the complexity of causal stories: The disease is caused not simply by the microbe, but also by sexual behavior, governmental inaction, a lack of condoms, the lack of antiretroviral drugs, and the subordination of women, for whom the greatest single risk factor is marriage, because in many cultures in Africa, a married woman has no power to refuse her husband sexually, even if she knows he has or had multiple partners, and even if she knows he is HIV positive. Nor can she insist on the use of condoms. Behind these factors are others; some argue that U.S. endorsement of "abstinence only" programs contributes to the lack of condoms, and it is clear that the World Trade Organization treaty on Trade-Related Intellectual Property Rights has impeded access to cheap antiretroviral drugs (because pharmaceutical companies, backed by their governments, have vigorously protected their patent rights). Activism is forcing some changes in these policies, and so the extent and nature of activism is also a causal factor.

Intervention and Its Goals

Closely related to questions of causality are questions about intervention. Some of these questions are empirical: What, if anything, would improve matters, and do so in the long run? More fundamental questions are conceptual: What should count as improvement? The UN Millennium Development Goals (MDG), like the HDI, reflect a practical consensus on certain goals: better health, longer lives, and more education. These goals were formulated as part of the UN Millennium Declaration, adopted by the General Assembly in September 2000. They are

- Eradicate extreme poverty and hunger
- Achieve universal primary education
- Promote gender equality and empower women
- Reduce child mortality
- Improve maternal health
- Combat HIV/AIDS, malaria, and other diseases
- Ensure environmental sustainability
- Develop a global partnership for development

Both the HDI and the MDG reflect the work of development theorists, prominently including Amartya Sen, a Nobel Prize–winning economist and philosopher. Sen argues that true development should be understood as the expansion of human capabilities, where a capability refers to the ability to exercise central human capacities, like the ability to live a full life in good health, the ability to learn, to marry, to work, to be politically engaged. The approach is Aristotelian; it focuses on what one can do, not on what one possesses. Neither Sen nor anyone working in the field believes a simple list of these capacities is available, although Martha Nussbaum offers a specific (and controversial) list to further the discussion. Importantly, a capability in Sen's sense requires more than the absence of interference. The ability to live a full and healthy life, for instance, does not exist unless enough food, clean water, and health care are available. And on the other hand, a capability can exist even if people choose not to exercise it—for example, those with enough to eat can choose to fast. Assuming a rough agreement on these sorts of goals, the practical question is how to achieve them.

Efforts to Help

Whatever objections can be raised against market activity as a criterion of development, markets can be instrumentally invaluable. They can provide meaningful work, increased income, and abundant affordable products, all of which play important roles in the development of human capabilities; markets also increase freedom in the sense of expanded, often greatly expanded, choice about what to buy and what work to pursue.

Because market activity can provide significant relief to the poor, the expansion of businesses into the developing world can sometimes be described as an effort to help. Some would argue that businesses—which is to say, profit-making organizations—cannot enter the developing world primarily to help. Their aim must be to make a profit. Yet this defining aim, at least in privately held companies, can be a side constraint rather than the single final purpose of all decisions. Publicly held companies, too, can take broad views of what is in the financial interest of their stockholders and can decide that assisting those in a poorer country is likely to improve the company's profit margin in the long run or in various indirect ways (such as contributing to a better public image or fending off misguided regulation). Finally, some have argued that direct humanitarian aid from businesses, using their special skills and strengths, is also justified, given an underlying social contract between business and society. Well-known examples of corporations that have, directly or indirectly, set out to help include Merck's development of a medication for river blindness, Citicorp's funding of microcredit projects, and Intel's support of scientific and mathematical education.

Both the WB and the IMF try to lessen world poverty, the IMF through efforts to increase market activity but also to make it more efficient and more stable. The WB's official motto is "Working for a world free of poverty," a goal it promotes through low-interest loans and grants to poorer nations for projects about health, education, infrastructure, communication, and similar work. The grants and loans are often conditional, requiring that the recipient country change its structures and policies in complementary ways. A loan for an environmental project, for instance, might require that the country pass stricter pollution regulations. When what the WB requires is fiscal restructuring along what are called neoliberal lines, criticism can be intense. In the face of such criticism, and of internal self-assessment, the WB's official strategies now specify that projects should be "owned" by the recipient country and by local stakeholders, and be led by the recipient countries themselves.

A vast number of NGOs, national and international, domestic and foreign, work in the developing world. Many began as relief organizations and later turned to "development" projects—for instance, an NGO might have first provided food aid, then tried to develop local agriculture. The line between relief and development is in fact hard to define. Some NGOs conduct their own projects (e.g., digging wells, building schools, providing micro loans) while others (particularly those from outside a country's borders) support such local projects with money, labor, or expertise. Some NGOs are primarily lobbying groups, pressuring governments to respect human rights or improve the conditions of the poor. There is by now a substantial body of literature questioning and criticizing NGOs: The initial impulse to help can be thwarted or deformed in a wide variety of ways, including the need to attract donors and the need to be accepted by powerful bodies in the host country (e.g., the military, the government, warlords, village elders).

The largest philanthropic organization in the world is the Bill and Melinda Gates Foundation, which spends hundreds of millions of dollars each year to improve public health around the world. Its efforts include funding of vaccine research, efforts to eradicate polio, and projects to help children with HIV/AIDS. Other significant organizations have different foci. The Open Society Institute (part of the Soros Foundations Network) promotes democracy and human rights. Oxfam works to eradicate poverty. The Aga Khan Development Network supports health, education, and cultural preservation within the Muslim world.

Ethical Issues

The developing world poses ethical questions for businesses, for governments, for NGOs, and for individuals. For businesses, ethical questions arise whenever maximizing value for stockholders conflicts with other ethical principles. Foreign workers, for example, can often be paid less than Americans and required to work longer hours and in less safe conditions. In some circumstances, this amounts to exploitation, but the issue is complex, since, for instance, local standards of living are probably also lower. But the claim that any job freely accepted must make the workers better off, and therefore cannot be exploitative, is also too simple. For one thing the improvement may be temporary; as businesses move from one country to another, the lives to which workers return may be worse than those which they left. For another, the term *freely chosen* needs interpretation. Legal and physical coercion clearly interfere with freedom; do hunger and poverty? The baseline against which to measure exploitation has been the subject of extensive philosophical analysis, as has the nature of coercion.

Hiring workers abroad is ordinarily accompanied by a loss of domestic jobs, at least in the short run. Economic theory predicts that in the long run the average amount of utility will increase, at least if something close to perfect markets exists. But it does not predict that the utility will be evenly distributed, and it has nothing to say about justice; questions of obligations to workers "at home" and to the communities in which one does business thus arise.

Furthermore, many developing countries have few or no environmental protections in place. As a result, products can be produced more cheaply but at the cost of environmental damage. Businesses must choose which value to honor.

Businesses must also choose how to lobby governments, since they can have significant impact on national policy. Should the lobbying be only in the corporation's self-interest? (There is also an interesting moral question of self-deception here, since it is natural to believe that one's own work contributes significantly to the general welfare. Combined with a simplified economic view, slogans such as "What's good for General Motors is good for the country" often result. Such slogans usually have at least a germ of truth, sometimes considerably more, and can make it difficult to recognize the situations in which what is good for a particular industry creates harm and injustice elsewhere.) In fact, since businesses could not exist outside legal and social frameworks, most of the ethical issues faced by business are intertwined with those facing governments, NGOs, and individuals.

Governments of developed nations have obligations to their own people. Should the welfare of those people be promoted at the expense of other, less powerful, countries? The issue is sometimes this blunt, but can be more complex. U.S. law, for instance, at the beginning of the 21st century required that food aid to starving nations be provided only with food (not money), purchased in the United States, and transported on American vessels. This requirement ensured that aid to other countries benefited American farmers and shippers. It also solidified political support for donations. But the arrangement was inefficient: Financial contributions would have entailed fewer transaction costs and would reach the needy sooner.

Governments themselves are not monolithic, and so general questions about their obligations usually entail further, more finely grained, questions. To use the example of the United States, decisions about treaties, trade arrangements, and so forth, are the result not only of the interplay between legislative, executive, and judicial branches but also of the nature of campaign financing, lobbying, and special interest groups. If one concludes, for instance, that food aid should be supplied through money rather than shipments of grain, the next question would be which of the various players affecting national policy bear responsibility for changing it. Should farmers and shippers lobby differently? Should the legislature filter and resist more courageously? Should campaign finance laws be changed so that legislators are more independent?

NGOs face any number of ethical questions. The most fundamental question was mentioned earlier: What should be their goals, specifically and generally? But even with something like a consensus on that question, many other vexing issues about means to the ends would remain. Some examples: Should one exaggerate the extent of threatened famine, since only that kind of media coverage brings enough donations? Should one deliberately allot some aid to local belligerents, knowing that in any case some of the aid will be diverted to them, and open books are better than covert ones? What counts as a bribe, and should one be paid if that is the only way to get help to those who need it?

Finally, for individuals the question is ultimately how much, and in what way, to try to help, where help can mean giving money, time, or effort, and where effort can mean anything from volunteering one's medical skills to organizing activist protests. The most well-known utilitarian answers to the question of how much one must help come from Peter Singer, who answers simply: as much as one can. Strictly speaking, utilitarianism requires that we give (money, time, or effort) until doing so causes more pain than it eliminates. For most people that bar is set too high, and so Singer simply urges giving as substantially as one can manage. Nonutilitarians such as Bernard Williams reject this way of approaching the issue, arguing, for instance, that obligations to those in one's family and community outweigh those to distant strangers; or that the kind of projects that gives one's life meaning cannot be simply measured against the happiness that one might instead produce for others.

The question of what and how to give, however, admits of no simple answers even for utilitarians, because making a difference might require pressuring one's government (an expenditure of time and energy), ethical shopping (requiring research, which also costs time and energy), or other sorts of commitments. Even simply giving money requires serious thought about where to donate.

Conclusion

The suffering in most of the world is so great that it requires an ethical response. But finding the proper response is complicated. Decisions about what to do rest on what one should be seeking, what sorts of tools are most likely to be successful, the relative moral weight of obligations within and beyond one's own community, and the morality of possible strategies for improving matters. These questions confront businesses, governments, and private organizations, as well as individuals in both their private lives and their lives as citizens.

Development Economics

Development economics is the application of economics to the study of low and middle countries that are typically characterized by more agricultural and less industrial economies and account for five sixths of the world's population. This broad definition of development economics encompasses a wide variety of topics and approaches. Most applied economics topics (and some theoretical ones) are relevant in the study of developing countries so that development economics overlaps with labor economics, industrial organization, monetary policy, public economics, environmental economics, and so on. Work in growth theory and information economics is also essential for the study of development. Some topics such as structural transformation and informal markets are relatively unique to the study of development, while others such as household models and the diffusion of technology originated elsewhere but have been greatly refined by development economists. There are a number of different analytical approaches, including neoclassical, structuralist, dependency/Marxist, and world systems. The first approach is more prevalent among economists, the latter three being more evident in the work of scholars in development sociology and other disciplines. With advances in the availability of data on developing countries and widespread interest in institutional and information economics, the lines between development and other branches of economics have become increasingly blurred.

The roots of the neoclassical approach to development can be seen in the origins of economics. Many introductory courses in economics start with Adam Smith's pin factory discussion in which Smith describes the productivity gains from specialization. David Ricardo's analysis of international trade identifies comparative advantage as the source of the gains from trade. We can apply these ideas to economic development starting from a subsistence economy. Such an economy is limited in its ability to develop because each family must perform a wide variety of tasks (grow staple crops, process them into food and clothing, gather water and fuel, educate children, care for the sick, etc.). The main potential for a higher standard of living is through specialization. Some farmers may specialize in food crops well-suited to their geographic and labor resources. Different ecological zones would specialize in different crops, perhaps including inputs for clothing, medicine, and shelter. If each specializes in the crop in which they possess a comparative advantage, the total amount grown would be greater. The various farmers could trade so that all had more than under subsistence. Likewise, villages might form with individuals to specialize in tasks previously performed by each household: processing crops into food and clothing, providing potable water, gathering and selling fuel, educating children in schools. The development of the economy continues through more specialization, including professions that provide the institutions necessary to facilitate specialization and trade. A natural extension of this is to the international arena where international trade allows a country to capture even more benefits through greater specialization.

Taking this perspective of development driven by specialization and facilitated by markets, development economics then focuses on ways in which markets or governments fail and how best to address these failures. The early approach, dominating policy in the 1950s and 1960s, focused on market failure. Adopting the attitude of colonial administrations, many development economists saw market failure as widespread and largely uncorrectable. Small-scale agriculturalists were bound by custom and tradition; private agents were deficient in entrepreneurship; missing capital and risk markets meant that private companies would not undertake large investments even when immensely profitable. Thus, government was seen as the prime mover, often using compulsion rather than market forces. This attitude also reflected the apparent lesson of the Soviet Union at the time, namely, that government planning could more rapidly propel a country from a simple agrarian system to an advance industrial power. This view was reflected in W. W. Rostow's "Stages of Growth" and Nurkse and Rosenstein-Rodan's "Big Push" where there was a critical level an economy must reach before achieving sustained, modern growth. Work in this area of "development planning" shifted its focus to include distributional issues as evidence accumulated in the 1960s that growth could have high social and environmental costs.

A competing perspective that focused more on markets developed alongside the planning apparatus, gaining more support through the 1970s. While Nurske and Rosenstein-Rodan envisioned market disequilibrium leading to paralysis (e.g., a shoe factory with no one to buy the shoes), Albert Hirschman saw disequilibria as the very source of growth. Backward and forward linkages would spread growth from one sector of the economy to another.

In the 1960s, T. W. Shultz emerged as an ardent critic of the view that small-scale agriculturalists were unresponsive to economic incentives. The traditional view implied that market-based policies to increase production of crops for sale to urban areas or for export would not succeed and that poverty in rural areas was thus largely self-inflicted. Shultz argued that outside observers had mistaken rational responses to extreme scarcity for economically irrational adherence to traditional customs. Shultz offered his "efficient but poor" hypothesis as an alternative, arguing that detailed analysis of the constraints facing small-scale agriculturalists would reveal decisions consistent with economic rationality once people had had sufficient time to adjust to changes in prices and other factors. Over time, the efficient but poor hypothesis has come to dominate the field of development economics, giving rise to increasingly sophisticated models of household decision making and providing a basis for governments to anticipate the likely response to different agricultural policies, including market-based policies that rely on a rational (i.e., self-interested) response to changes in prices.

One important application of the efficient but poor hypothesis is to explain the relatively slow and selective spread of the so-called Green Revolution, high-yielding hybrid crops and complementary fertilizers, herbicides, and pesticides engineered specifically for developing country conditions. With funding from the Ford and Rockefeller foundations, these varieties of rice, wheat, and other staple food crops were designed to dramatically increase yields regardless of farm size so as to assist small-scale agriculturalists. In time, the Green Revolution was successful in increasing yields and helping many less-developed countries to achieve food self-sufficiency. However, adoption was much slower than anticipated with wealthy farmers adopting quickly and, thus, receiving a large share of the benefits. Such behavior might be the result of tradition-bound peasants, but the evidence suggests that increased risk, credit constraints, access to irrigation, and limited information explain the slow and differential adoption. Lessons learned continue to inform agricultural policy and the design of agricultural extension programs.

The notion of efficient, albeit constrained, behavior on the part of poor rural agriculturalists is also reflected in the reconsideration of apparently inefficient institutions. Sharecropping, widely practiced in poor communities in South Asia and elsewhere, provides a good example. Sharecropping is a form of land tenure where the "rent" the tenant pays to the landlord is a fraction of the harvest, frequently one half. Sharecropping is an economically inefficient institution because it reduces the incentives for the tenant to produce. In a standard rental contract, the tenant pays a fixed rent but then keeps all the remaining harvest. If additional inputs will increase the harvest enough to justify their cost, the tenant will choose to use them since the full benefit accrues to the tenant. Likewise, if the landlord uses a fixed wage contract rather than a share contract, the landlord pays the fixed wage but then keeps all the remaining harvest. Again, if additional inputs will increase the harvest enough to justify their cost, the landlord will choose to use them since the full benefit accrues to the landlord. However, with a sharecropping system, the sharecropper bears the full cost of at least some inputs (e.g., labor) while only receiving a fraction of any increase in the harvest. The result is that the sharecropper will use fewer inputs and produce less output. Thus, sharecropping has historically been considered a "backward," inefficient institution. However, research in information economics has demonstrated that it may be a rational response to information asymmetry and risk aversion. The structure of agriculture is such that landlords cannot monitor workers well so that a fixed wage contract may result in very low labor productivity. The solution is a rental contract that motivates the laborer to improve productivity since all the gains of high productivity accrue to the laborer. However, the variability of weather and market prices introduces considerable risk, which a poor laborer is ill-equipped to bear. In contrast, the richer and more diversified landlord is much better suited to bear risk, an argument in favor of the fixed wage contract. Thus, sharecropping can be seen as a compromise between a fixed wage contract and a rental contract. It provides some of the "risk insurance" of the former and some of the incentives to improve productivity of the latter. This is but one example of institutions that can be interpreted as responses to failures in credit and risk markets due to incomplete or asymmetric information rather than being interpreted as "backward," that is, economically irrational.

The growing belief by the 1970s in the rationality of economic agents in developing countries helped fuel a broader debate over the appropriate role of government in promoting development. The early view of market failure being the central obstacle to development led directly to development planning and considerable government involvement in the economy. As an approach to industrialization, this was widely applied in import substitution strategies where the growth of selected domestic industries (infant industries) was fostered via tariff and quota protection from imports. The economic justification rested on arguments of capital market failures and positive externalities. If the cost of production falls with size (increasing returns to scale) or experience (a learning curve), small and inexperienced domestic firms may be unable to compete with cheap imports from larger, established foreign firms. If these domestic firms lack access to capital markets, they cannot survive an initial period of losses while they grow and gain experience to achieve lower costs. Furthermore, if experience is embodied in skills gained by workers, the investment a firm makes may be lost when the worker switches to a competitor. While such an investment is socially beneficial (since the competitor gains from the initial firm's investment—a positive externality), it would not be beneficial for the initial firm. Such problems can prevent the development of the industry despite the country's latent or dynamic comparative advantage in the industry. One solution to these problems is to fix these market imperfections; an alternative (seen as more feasible) is to provide some kind of support to infant industries as they grow and gain experience to become competitive. Import taxes (tariffs) and restrictions (quotas) achieve this by increasing the price of imported goods. Similar arguments can be applied to starting export industries though support usually took other forms such as cheap credit or direct subsidies. Overall, the activist state approach led to substantial government involvement across the economy in many countries.

Following initial impressive results in the 1950s and 1960s, the import substitution model appeared to falter in the 1970s and 1980s. The logic of import substitution had led to greater and greater government involvement in the economy as interventions caused price distortions (and consequently resource allocation distortions) that required additional interventions. Furthermore, the theory of infant industry protection—selective and temporary—rarely matched reality where political influence usually determined the selection of industries and guaranteed long-term rather than temporary protection. The oil shocks of the 1970s and ensuing 1980s debt crisis exposed the inefficiency of these regimes and often forced substantial change in the form of structural adjustment. The confluence of these events eroded support for the practice of import substitution among development economists.

Industrial policy in the form of export promotion has shown considerably better success but has sparked heated debates between development economists, particularly during the 1980s and 1990s. With attention focusing primarily on South Korea and Taiwan, some development specialists have argued that competent governments can accelerate development by selectively promoting certain industries over others. Others point to the same experience as support for a laissez-faire approach with limited government involvement in the economy. The first group highlights intense but narrowly focused interventions (via state control over bank credit and other means) as the source of rapid industrialization, exploding export growth and soaring income. The second group instead attributes success to relatively low average levels of government involvement across these economies. Even if the weight of the evidence supports the pro-industrial policy position in the cases of Korea and Taiwan, the question of government competence remains critical, and we return to the central question of whether market failure or government failure is the more important obstacle to development.

Recent research on barriers to development has focused on the quality of institutions, mostly linked to basic government functions. These include the security of personal and property rights, political institutions for policy formation and decision making, and basic market-facilitating institutions. This can be seen as something of a middle ground where the role of the government is emphasized but primarily in its capacity to provide the basic institutions of a market economy. Nonetheless, the "states versus markets" controversy is likely to continue to be an important subtext of debates in development economics.

Debates over globalization are closely linked to the choice of development strategy. From the perspective of neoclassical economics, where the cornerstone of development is specialization and trade, arguments against open markets are limited and typically temporary. Trade restrictions temporarily may act as bargaining chips to pressure other countries to free their markets. For a country large enough to influence world prices, the optimal tariff is greater than zero but typically still low. If consumption of foreign products has negative externalities (e.g., Western movies undermining traditional culture), some level of taxation to impose this cost directly on consumers (internalizing the externality) is appropriate, but this would typically stop short of a complete ban. While trade restrictions may address some market failures (e.g., the infant industry argument above), free trade solves others (e.g., local monopolies) and may function as a source for new technology and information. Many economists are more guarded about suddenly opening markets in cases where basic institutions such as secure property rights are weak, although the long-run prescription is to open markets after strengthening these institutions. Overall, neoclassical economists do not see most trade restrictions as supported by legitimate economic analysis but rather as driven by domestic distributive politics where narrow interest groups are able to impose restrictions in spite of the net loss to the country. In contrast, an antiglobalization argument advocating long-term restrictions on trade could be based on structural, dependency/Marxist, or world systems theories.

Digital Divide

The digital divide is the gap between those who have regular, easy access to digital technology and those who do not. U.S. Assistant Secretary of Commerce for Communications and Information Larry Irving popularized the term *digital divide* in a series of technology reports in the 1990s. The term is primarily used to refer to the uneven distribution of Internet access, although other information technologies are sometimes included. The digital divide cuts across nations and across demographic groups within nations.

The digital divide generates great concern among governments, nongovernment agencies, and the private sector. In 2006, a Google search on "digital divide" turned up about 27 million entries. From an ethical perspective, the digital divide raises questions of distributive justice—the fair distribution of goods relative to demand. Many believe that the digital divide both represents and reinforces socioeconomic inequalities. Inadequate access to the Internet diminishes opportunities to conduct business, communicate, find employment, interact with government agencies, research health issues, join groups, engage in distance learning, and participate in political processes. For the world's rural poor, the lack of Internet access forms a barrier to vital information about agriculture, fisheries, forestry, health, nutrition, and other keys to rural development. Such structural links between digital access and socioeconomic inclusion mean that the digital divide feeds the disparities that created it. Consequently, many observers have voiced fears that the growth of digital technology will further marginalize the information have-nots.

While the starkest gap appears between those who have at least some Internet access and those who completely lack it, significant differences also exist among those who go online. For example, one study found that having a broadband (high-speed) connection more strongly predicted users' range of Internet activity than did their number of years of experience in using the Internet. Differences in usage patterns also appear between those who must visit a school, library, or community center to go online and those who have home computers plus smaller devices that permit Internet access nearly anywhere, anytime. Much attention has been paid to the "democratic divide" between those who use digital technology to participate in political life and those who do not.

Closing the digital divide would help realize the unique potential of digital technology, some observers say. Older technologies, such as print and television, traditionally allowed users to receive content produced somewhere else by someone else. Digital technology can enable users to produce their own content and deliver it locally or globally.

Critics question the terms in which discussions about the digital divide are typically framed. For example, some argue that the divide will go away on its own as wireless technologies become cheaper. Others see the concept of a digital divide as "welfarist" or mainly as marketing for Internet service providers and e-commerce retailers. Still another viewpoint stresses effective Internet use rather than mere access. From this perspective, ignoring such questions as "access to what" and "access for what" will lead to an elite group of producers using the Internet to deliver content to an expanding group of passive consumers. Effective Internet use would mean ensuring "e-readiness"—the knowledge, skills, and financial, legal, and other necessary supports so that individuals and communities can both consume and produce content to achieve their objectives.

Global Digital Divide

Access to digital technology is expanding. Estimates indicate that global Internet usage quadrupled between 2000 and 2005 to more than 1 billion. Much of this growth has come from such populous nations as China, India, and Brazil. A significant portion of the growth can be traced to new wireless technology. Other factors include the development of smaller, more affordable digital devices and increased broadband capacity. Cell phone and Smartphone access to the Internet is expected to increase Internet usage in developing nations during the next decade.

At the same time, stark inequalities remain. A 2001 UN Development Programme report noted that all the bandwidth in Africa totaled the same as the bandwidth of São Paulo, Brazil, and the bandwidth available in Seoul, South Korea, equaled that available in all of Latin America. According to a 2006 report by the United Nations Conference on Trade and Development, people in low-income countries, which had 37% of the world's population, were 22 times less likely to use the Internet than were people in high-income countries. Internet access in high-income countries was not only faster and more stable but also more than 150 times more affordable than in low-income countries. Moreover, the slow, unreliable dial-up connections typically found in low-income countries often prevented Web browsing and limited users to character-oriented applications.

National levels of access to the Internet tend to correlate with levels of economic development, education, democratization, and investment in science and technology. Factors such as urbanization, foreign investment, and the presence of nongovernmental organizations also correlate with Internet access.

Culture can be an additional factor in Internet usage. In Japan, for example, unfamiliarity with English and with alphabetic typing has led many to avoid computers and the Internet.

Social Digital Divide

The digital divide within nations appears along lines of income, education, race, age, immigration status, urban versus rural location, disability, and gender. As overall Internet access expands, it penetrates different demographic groups at different rates. This pattern resembles the diffusion of older technologies, such as the telephone, radio, cable television, mobile phones, and fax machines.

Socioeconomic Factors

Income and education strongly influence Internet digital diffusion in the United States, where 68% of adults had access in 2005. In a 2006 Pew survey, 91% of those with annual incomes over $75,000 used the Internet, compared with 53% of those earning less than $30,000. Research from the 2005 Pew Internet and American Life Project found that 89% of college graduates had Internet access, compared with 29% of those who had not graduated from high school. African Americans and those aged 65 or older also had lower rates of Internet access. A steep drop-off occurred after the age of 70, and older women were far less likely to use the Internet than were older men.

Rural Internet penetration in the United States lagged about 10% behind the national average from 2000 to 2003. Some of the difference may have stemmed from lower incomes and higher percentages of older Americans in rural areas. Residents of rural areas report less access to broadband Internet connections, which are needed to receive quality audio and visual information. High costs and low returns create disincentives to bringing broadband to rural areas. China has a much larger rural versus urban penetration gap. Rural areas, home to more than 60% of the Chinese population, have less than 1% of the country's Internet connections.

An Internet access pattern similar to that in the United States appears in 15 European Union countries (EU-15), where 43.5% of the population had access in 2003. Despite growth in overall access, a 2005 report from the Commission of the European Community found a strong, persistent connection between higher Internet use and higher income and educational status. Gender, age, and whether one lived in a rural or urban area also affected Internet access. Digital divides related to income and geographical were wider in the New Member States and the Candidate Countries (Romania, Bulgaria, and Turkey) than in the EU-15.

Immigration status has recently gained attention as an influence on Internet access. In the United States, data from the 1997–2003 Current Population Survey (CPS) Computer and Internet Supplements showed a widening native-immigrant gap in home computers and Internet access. In 2003, more than 60% of native-born Americans could access the Internet from home, as compared with 48% of immigrants. The immigrant–native gap appears even within ethnic groups. For example, the home Internet access rate for immigrant Latinos was 15 percentage points lower than for U.S.-born Latinos, with the lowest access rates among Latino immigrant households where adults spoke only Spanish. Data on other language groups were not included in the CPS survey. Asian-born youths had slightly greater access to home computers and Internet than did U.S.-born Asian youth.

Disability

Inaccessible Web design has created a barrier excluding many people with disabilities. For example, the text in graphical Web pages typically cannot be read by audible screen readers used by people with visual or cognitive disabilities. Online forms designed to prevent keyboard navigation and input form a barrier for people with visual or mobility disabilities. A lack of captioning prevents people with hearing disabilities from accessing streaming audio and video clips. Such barriers hinder access to distance learning, governmental and business transactions, online textbooks, and work involving the Web-based environment.

Democratic Digital Divide

Theorists disagree about the impact of digital technology on civic life. Optimists say the Internet will enhance democracy by providing smaller, less powerful groups with lower cost and more effective ways to communicate, organize, and mobilize. Transnational advocacy networks and alternative social movements demonstrate the Internet's potential to gather people around issues of concern. Pessimists say the same people who already dominate political life will use digital technology to reinforce their dominance, while the politically apathetic remain so.

Solutions

Governments, intergovernmental organizations, nonprofits, and the private sector are working to close the digital divide. For example, the Federal Communications began an "E-Rate" program that offers discounts on telephone service and Internet access to U.S. schools and libraries. The discounts vary according to local incomes and rural or urban location. When the program began in 1996, 65% of U.S. schools had Internet access. By the end of 2002, the rate had increased to 99%. In 2003, Samsung launched its "DigitAll Hope" program to award grants to youth development programs using digital technology in eight Asian countries and Australia.

Other efforts focus on giving inexpensive laptop computers to economically disadvantaged groups or providing personal computers to schools, libraries, or community technology centers in areas with low access rates. Some groups seek to harness solar power to run digital devices in developing countries or to expand the availability of broadband connectivity in rural areas.

Many organizations give attention to factors beyond mere physical access that affect the Internet's effective use. For example, these organizations help underserved populations to understand how the Internet can help them achieve their goals. Advocates of greater Internet access also engage in planning to ensure a hospitable legal and business environment as well as locally relevant Internet content.

Meanwhile, researchers are assessing the effectiveness of the various efforts to close the digital divide. There will be an ongoing need for such research as digital technologies and plans for sharing them move forward.

Dignity

To possess dignity is to be worthy of respect, and the concept of dignity is closely allied to ideas of self-worth and self-esteem. Because possessing dignity means that one has a claim to be treated with respect, the possession of dignity by a person implies a moral obligation of others to behave with respect toward that person. Not all forms of respect are a tribute to dignity, however. A race horse may be respected and appreciated for its speed and grace, but it does not, therefore, possess dignity. Similarly, one may well treat rattlesnakes with respect, but that does not imply that rattlesnakes have dignity.

Instead of being associated with general respect, in its core usage, dignity applies only to human persons, in virtue of their specifically human qualities. The possession of dignity seems to require a reflective consciousness that is not possessed by simple life forms or inanimate objects. In some sense, the possession of dignity requires the capacity to be indignant, that is, to feel offended by being treated with less respect than that to which one is entitled. Nonetheless, the concept is sometimes extended beyond the human realm to include other animals. Today many think that we owe a moral respect to nonhuman beings and even to the natural environment.

Dignity is often thought to attach to humans simply as a result of their being persons, the idea being that every person, just in virtue of being a person, possesses dignity or (equivalently) is worthy of that certain kind of respect demanded by a person's dignity. Beyond the dignity that belongs to each person simply in virtue of being a person, some persons may possess a special dignity. This incremental dignity can be associated with age, status, achievement, or the office that a person holds. Almost all societies regard elders as having greater dignity than the young. Similarly, persons of great achievement are often thought to possess greater dignity and to be worthy of additional respect. For example, great scientists, artists, and business leaders generally receive greater respect and possess greater dignity than the common person. In addition, greater dignity often attaches to those who hold special office or roles. Thus, a president or prime minister generally receives a treatment that is commensurate with their greater dignity.

Dignity plays a role of great importance in business. Different stakeholders who interact with the firm all possess the common dignity that attaches to all persons, but various stakeholders can also possess a differential dignity due to the role that they play with respect to the firm. For example, potential customers are typically treated with greater dignity than a vendor to the firm.

Philosophical Foundations of Dignity

Immanuel Kant is the great philosopher of human dignity, as he made the concept of human dignity and worth the basis for his entire moral philosophy. Kant gives several formulations of a principle that he regarded as a categorical imperative, that is, as a moral law that must never be disobeyed no matter what the consequences might be or other considerations might suggest. While Kant regarded the various formulations of his categorical imperative as equivalent, his second formulation bears the clearest relationship to the concept of dignity. The categorical imperative demands that we at all times treat humanity, whether in ourselves or others, as an end in itself, and never merely as a means. For Kant, this moral law imposes a perfect duty, one that can never be evaded or ignored. Thus, it can never be permissible to treat another human being as a mere means to some other end, but we must treat other humans with respect. To regard a person as an end in itself is to acknowledge that a person has his or her own interests and life plan and that it would be wrong to ignore that dimension of a person.

Kant does not prohibit treating others as an end to some other objective, but he does prohibit treating them merely as a means to an end. For example, when one gets a haircut one employs a barber as a means to an end. However, if we treat the barber merely as a means to getting a haircut, we fail to respect their humanity and fail to regard them as a being with their own interests. Probably, we have all seen situations in which a person treats an employee or social inferior with a great rudeness that ignores a person's humanity. For example, to treat a barber as a mere "haircutting appliance" fails to regard them as a person, refuses to recognize their dignity as a fellow human being, and violates Kant's categorical imperative.

Kant's moral theory laid the foundation for much of the modern Western understanding of what it is to be a person. His theory imbues the human individual with a status that can never be ignored justifiably. So Kant stands at the head of the great liberal Western tradition that focuses on the dignity of the individual, and his thought plays a major role in the philosophical justification of democracy, individual autonomy, and the right of each person to direct his or her life as the individual sees fit.

Dignity in Business

The concept of dignity within the context of business emerges most clearly in the relationship between employer and employee. Consider a manufacturing firm. The owner or manager hires employees to manufacture the firm's products. Thus, the employer uses the employee as a means to an end. The question of the dignity of an employee turns on whether the employee regards and treats the employee as a mere means to the production of the firm's output. If the employer makes clear to the employee that he is merely a "factor of production" and has value in her eyes only as labor input, then the employer fails to recognize the employee's humanity and treats the employee without dignity. Alternatively, if the employer recognizes the employee's humanity and acknowledges that the employee has his own desires and life plans, then she treats the employee with dignity and respect. Similarly, the employee should realize that the employer possesses a certain dignity as a person. This implies that the employee should not regard the employer merely as a means of gathering financial resources, but must treat the employer as a person having her own interests and life plans.

In most business situations, a potential customer is treated with considerable courtesy. After all, customers are essential to realizing any firm's main objective—the achievement of profit. While courtesy is a virtue, courteous treatment is not the same as recognizing the potential customer's dignity. For example, consider a sales situation in which a salesperson very courteously and knowingly misleads a potential customer about the qualities of a product and ultimately encourages the customer to buy a product that the salesperson knows will not meet the customer's expressed need. In this situation, the salesperson treats the customer only as a means to profit and fails to respect the customer's dignity as a person.

Perhaps most of us have witnessed something like the following situation. In a small grocery, the cashier is the only employee present and is serving a customer. At the same time, one of the store's vendors arrives to make a delivery. Most likely the cashier knows and has a friendly relationship with the delivery person, and may look forward to a pleasant social interaction with the delivery person. However, almost invariably, the vendor will have to wait in the background for the attention of the cashier. This situation emphasizes the relative importance of the customer and the supplier, with the customer receiving top priority. In this situation, the cashier virtually ignores or disregards the vendor. Is this an affront to the delivery person's dignity? Generally it is not, because the vendor, customer, and cashier all play specific roles in this situation. Not only is the customer likely to be more important in generating profit for the store, but the customer may be entitled to priority in attention due to the role the customer plays in the commercial interaction. The vendor knows and accepts a specific role in this situation. Of course, we may also have seen other situations in which a vendor appears and is treated harshly merely because the vendor appears as a petitioner and occupies a position of relatively low power. In all such situations, the question is to treat persons with the proper respect and dignity, with the proper behavior being governed to some extent by the relative roles that people play in the business situation.

Areas of Controversy

Some people believe that recognizing people's dignity is incompatible with the commercial world as we know it. Furthermore, there is considerable disagreement about what is required to treat people with proper dignity.

The most central aspect of Karl Marx's great critique of capitalism turns on the question of human dignity. Marx believed that the business enterprises of his time, as well as the entire class structure of industrial Western society, treated labor merely as an expendable factor of production. In doing so, Marx believed that employers failed to recognize the humanity of their employees. In virtually all business relationships, whether in Marx's time or ours, people are treated with some measure of respect and dignity. However, the great question is whether people are treated with the proper respect and dignity.

We have addressed this issue to some modest extent with the example of the grocery store and the delivery person. As another example, consider the differing conceptions of dignity that are implied by the agency theory of the firm and those who demand that all full-time employees receive a living wage. According to the agency theory of the firm, the firm is essentially an organization that enters into arm's-length transactions with the firm's stakeholders, such as employees, customers, suppliers, stockholders, and so on. On this view, the moral firm is the one that avoids fraud and deceit, keeps its promises, and fulfills its contracts. Advocates of this view of the firm believe that firms that behave in this way treat others as full moral agents capable of assessing their own interests and entering into contracts that benefit those stakeholders. So on this view, taking the employer–employee relationship as an example, treating an employee with dignity and respect is achieved when the firm contracts with the employee in an honest way and fulfills its side of the bargain. Other attitudes toward employees would be regarded as paternalistic or failing to respect the autonomy of the employee. The welfare and happiness of the employee is not a special concern of the firm—the firm's special concern and obligation are to contract honestly and to fulfill the contract.

In contrast, those who advocate that a firm pay a living wage (a wage sufficient to maintain some minimally decent standard of living) believe that such a wage is necessary to human well-being and to human dignity. For advocates of this view, a firm that does not pay such a wage to its full-time employees fails to treat them with dignity and fails to respect them as persons. This outlook seems to imply an obligation of caring toward employees that is not found in the agency theory. Those who demand that firms pay a living wage focus on the outcome to the employee, not just the procedures of honesty in contracting. They would argue that firms that do not pay a living wage offend against the employee's dignity.

This contrast between adherents of the agency theory of the firm and advocates of a living wage shows the diversity of views concerning human dignity and the kinds of attitudes and behavior that are compatible with respecting human dignity. The example also shows the centrality of the concept of dignity to business, as well as its great importance as a central moral concept of human life.

Dilemmas, Ethical

An ethical dilemma involves a situation where there is uncertainty regarding what is the proper or right thing to do. This occurs when either of the following two conditions appears involving circumstances that require a resolution:

1. There is a conflict between two, equally valid ethical principles or values.
2. There is a conflict within an ethical principle or value.

Some of the more common ethical values or principles that frame ethical dilemmas include the following:

- *To whom do I have a duty*—self, family, friends, workers, investors, consumers, future generation, and so on?
- *How can I minimize the causes of harm*—harm that is physical versus economic versus psychological, or harm that is actual versus potential, or harm to many versus harm to a few, or harm that is severe versus harm that is minor, and so on?
- *What is a fair or just resolution*—is fairness or justice based on everyone receiving equal shares, or more to those who merit or have earned it, or more to those who have a greater need, or more to those of higher rank or status?
- *How do I protect the entitlements due others,* that is, protect the rights of others—the right to life, to be informed, to be safe or healthy, to be heard (free speech), to conscience (personal beliefs or opinions), to freedom, and so on?
- *How can I maintain or express the importance of* being honest, trustworthy, behaving with integrity, and the like?

A business moral dilemma places the decision maker in a situation confronted with making a decision where ethical principles or values discussed above are in conflict. For example, the classic Ford Pinto case of the 1970s found Ford's management struggling with the challenge of how to bring to the marketplace the new Ford Pinto to stem the tide of consumer purchases of the cheaper, fuel-efficient, Japanese-made automobiles. This quest was confronted by the discovery that the Pinto was highly susceptible to fires if involved in a rear-end collision. These fires placed occupants in the Pinto at greater risk of burns or even death. Ford management wrestled with the importance of offering the car to the American consumer quickly and cheaply versus delaying the delivery of the Pinto while outfitting it with a safety device to prevent or slow the spread of flames if the car was involved in a rear-end accident.

In this and other ethical dilemmas, the decision maker is asked to make a decision that requires placing certain ethical values above others—for example, the value of minimizing people's exposure to harm versus significant economic benefits accrued by other people, or the value of many benefiting versus the value of a few people being harmed. Despite the obvious ethical duty to act in a way that produces "good," sometimes a person is challenged to act in a way that will cause some harm or inflict harm on some people for the sake of the greater good or the benefit of the many.

Ethical dilemmas also may be framed in a way that pits different ethical theories or value structures against each other. For example, in the Pinto dilemma posed above, the answers generally are framed toward seeking the greatest good—maximizing the benefit received by as many as possible despite the suffering endured by some people. But one could also question whether there is ever justification for someone to take another's life or place someone in harm's way. The ethical principle of a "right to life" should be paramount for a decision maker, outweighing a preference for seeking to maximize the benefit for all affected by the decision.

How one addresses (or creates) an ethical dilemma may depend on the person's value structure or adherence to specific ethical principles. For example, a utilitarian reasoner might frame an ethical dilemma as "It is a question of seeking the greatest good for the greatest number." Whereas, a justice or rights reasoner might see the question differently: Life should be protected, or what is a fair resolution to the dilemma while protecting the rights of the individual involved?

Some ethical dilemmas may not be solvable. Again applying the Pinto dilemma stated above, the resolution to the dilemma may not be universally agreed by those struggling with the challenge. Utilitarian thinkers may reach a consensus and agree to a resolution based on a calculation that the greatest good will be served by bringing the Pinto to the marketplace and, therefore, providing profits to the company, growing job security for Ford employees, increasing the return on investment for Ford's shareholders, and offering the American consumer with an American-made, fuel-efficient, affordable automobile. But the deontological (justice and rights) thinkers may find the process of calculating benefits and costs to reach an ethically defensible resolution to be abhorrent.

The utilitarian thinkers may never convince the deontologists that principles should be violated or ignored for the sake of good outcomes. Yet the deontologists have a similar challenge—convincing utilitarian thinkers that sometimes it may be necessary to sacrifice good outcomes for the sake of a principle. For example, they might argue that some things may be worth dying for (the ultimate negative consequences) because of some stance or action that needs to be taken in the spirit of justice.

Ultimately, the ethical dilemma is a dilemma because of the character and intentions of the decision maker. If one callously does not care about the consequences to others, then the decision maker would not hesitate to ignore the life-threatening lack of safety associated with the Ford Pinto if it means achieving personal gain or recognition. For a situation to be considered a dilemma, the decision maker must be aware of and torn between two conflicting ethical values or principles. Yet others who hold precious the value of life may see the actions acceptable to the callous decision maker as a new dilemma—how do we save others from this callous person who would not hesitate to place people in jeopardy?

Directors, Corporate

Corporate directors are the elected representatives of shareholders, put in place to safeguard the interests of the investors who bear the residual financial risk of their firms. They make up one third of the corporate governance triumvirate of executives, investors, and directors. Corporate governance examines the roles of each of these groups, along with their interrelationships and their balance of power. Through most of the 20th century, directors in the United States held significantly more power than did diffused shareholders, although much less than the corporations' CEOs.

Director Responsibilities

In the United States, corporate law dictates that directors must monitor the leadership of the firm to ensure that the corporation is run in the long-term interest of shareholders. They owe investors both the duty of care, or due diligence, and the duty of loyalty, or putting the investors first in their decision making.

Boards of directors are generally recognized as having five key charges. First, and most important, they must select, monitor, evaluate, and when necessary replace the CEO of the firm, with a key underlying duty of engaging in careful, advance succession planning. Second, the board is responsible for ratifying the company's overarching vision and strategic plan, once it is developed by the CEO and his or her staff. Advising and counseling the CEO and other top managers as needed is a third function of the board, underscoring the importance of a board's diversity of expertise. The board's fourth responsibility is to locate and nominate high-quality board members and to evaluate the processes of the board and the performance of both the board and its members. Finally, the board is responsible for ensuring the adequacy of the firm's internal control systems, a duty that is now reinforced by the Sarbanes-Oxley Act.

Director Types

Corporate directors fall into three general categories: inside, outside, and independent. The newer, "independent" profile is replacing the "outside" moniker on most U.S. boards.

"Inside" directors are employees of the firm who also sit on the board of directors. Most commonly, the chief executive officer (CEO) is a member of the board, and often its chair. Chief financial officers, chief operating officers, presidents, and other confidants of the CEO have also frequently been tapped as board members. Inside directors are often credited with being the best informed about the firm and industry, but the presence of CEO subordinates on boards is also criticized because they are beholden to their superiors and likely to vote in their favor.

"Outside" directors are defined as those who are not employees of the firm. Outside directors have traditionally been acquaintances of the CEO or existing board members, invited onto the board to give an outsider's perspective on the firm's prospects and operations. Most often, CEOs or executives of other corporations have constituted the majority of these corporate directors, although retired government officials, celebrities, and academicians have also been frequent members.

In recent years, and particularly since the passage of the Sarbanes-Oxley Act, regulators and shareholders alike have focused on directors' "independence." Some ostensibly outside directors had been found to have significant nondirector relationships with their firms, leaving them subject to pressure from the executive office. "Independence" is defined as a director having no relationship with the firm beyond the individual's board seat.

In the wake of the corporate governance scandals of the early 2000s, the New York Stock Exchange and NASDAQ enacted rules requiring all listed companies to have a majority of independent directors, and that the independent directors meet regularly without the inside directors present. While director independence is now a widespread corporate goal, the empirical investigations pursuing a link between the proportion of independent directors on a board and firm performance have led to mixed results. Board processes, director behaviors, and the "fit" between board and firm characteristics have all been suggested as potentially more reliable predictors of corporate success.

Director Selection and Compensation

As noted above, directors have traditionally been selected through their network of relationships with existing directors. More recently, with the move toward director independence, nominating committees are more frequently used to seek out qualified, yet objective, board nominees to present to shareholders for a vote.

While director pay averaged around $40,000 per year in the early 2000s for U.S. corporations of all sizes, it has risen sharply due to directors' increased legal liability, workload, and media scrutiny. Among the 350 largest U.S. firms, the median director compensation was $155,000 in 2004. Equity is also an increasing proportion of directors' packages, representing 55% of these directors' pay in 2004, up from 36% in 2003.

Board Characteristics

Recently, U.S. boards of directors have become smaller, more external, more diverse, and more focused on committees. As of 2002, boards had an average of 10.9 members, with one quarter of the S&P 500 having between 8 and 9, a significant reduction in size over the previous decade. Another radical change in board composition is in the insider/outsider mix, with one third of S&P 500 firms now having the firm's CEO as its only insider, as compared with only 10% of firms with that composition in 1992. The number of full board meetings has risen with the increase in board vigilance, with the average S&P 500 board meeting 7.5 per year, in addition to a variety of additional meetings of newly constituted and powerful committees. As of 2002, virtually all S&P 500 firms had compensation committees, while 75% had formed nominating/corporate governance committees. Diversity among board members is also increasing, although the overall proportion of female and minority directors in the United States is still very small.

Disability Discrimination

Individuals with disabilities have physical or mental impairments that prevent their executing one or more major life functions in the species-typical way. This general conceptualization orients discussions of the moral and political dimensions of disability discrimination. For legal purposes, however, who is subject to and protected from disability discrimination is determined by statutory language or judicial interpretations, both of which vary from jurisdiction to jurisdiction.

Individuals considered to have disabilities under the U.S. Americans with Disabilities Act (ADA) must have or be regarded as having a physical or mental condition that substantially limits a major life activity. Under the California Fair Employment and Housing Act (FEHA), however, individuals for whom success in a major life activity is fully achievable but made more difficult than usual because of a physical or mental condition also are protected from disability discrimination. Furthermore, ADA case law takes mitigating measures such as corrective lenses or medications into account in the determination of how limiting a condition may be, while California law explicitly provides for physical and mental limitations to be assessed absent consideration of mitigating measures.

When an individual who has disabilities, or thought to have disabilities, is for this reason treated less well than other people, or excluded from opportunities most others enjoy, that person has been subjected to disability discrimination. Often such discriminatory practice intentionally targets individuals with disabilities with the aim of ensuring that others need not suffer their presence nor have to interact with them. Just as often, however, disability discrimination is the result of thoughtlessness. Practices built on the presumption that only species-typical people will participate can have a disparately negative, and therefore discriminatory, impact on people with anomalous bodies or minds.

That a practice is discriminatory does not, however, establish for everyone that it is wrong. There are individuals who advance a moral claim to freedom of choice of their associates, which they understand as a right to treat some people less well than others, and to remain socially removed from them, on the basis of sex, race, religion, or national origin, or because the people have disabilities. The question this argument provokes is whether the harm of disability discrimination (and of race and sex and other kinds of discrimination as well) resembles the harm absorbed by an unpopular person bereft of invitations to dance or play or join the group for lunch, or whether the harm is of a more profound kind that commands moral consideration. That the harm caused by disability discrimination rises to the level of injustice has not been a commonplace view in the past, nor does this view command universal assent today.

Introduction to Disability Discrimination

Two years after the 1964 U.S. Civil Rights Act banned discrimination based on race and sex, Jacobius tenBroek, a leading legal scholar and founder of the

National Foundation of the Blind, wrote a law review article describing the pervasive harm rendered by disability discrimination and calling for the extension of civil rights protection to people with disabilities. He pointed out that individuals with disabilities were subjected to social and legal sanctions—in the form of inferior standards of care, conduct, risk, and liability that result in exclusions, penalties, and hurdles—when they attempted to participate equally with other people in civic and commercial activity. tenBroek characterized the placing of such barriers to discourage and delimit civic and commercial engagement of people with disabilities as a kind of house arrest that curtailed their ability to contribute as citizens. Despite holding a chair at a research university and winning the most competitive fellowships and book awards, tenBroek himself had no legal recourse when restaurants declined to serve him and banks refused to let him open an account, and he was denied transit on planes and trains despite having purchased a ticket, just because he was blind.

In such a discriminatory climate, comparatively few people with disabilities succeeded in the workplace. Race and sex discrimination keep their targets in low-paying jobs, maintaining a source of cheap labor. But disability discrimination forces its targets out of the workforce altogether, situating them instead as natural recipients of state or charitable support.

Five years after the Civil Rights Act, just as racial minorities and women were beginning their great strides toward employment equality, the United States initiated a program of Supplemental Security Income (SSI) to support people with disabilities from childhood to grave on the premise that they will not be in the workforce. A wide variety of programs, such as aid to the blind and aid to people with permanent and total disabilities, were consolidated under the Social Security Administration. The Social Security Disability Insurance (SSDI) process for determining whether workers are too disabled to be employed was extended to SSI, even though some SSI recipients were children who were thus labeled unfit for work even before they reach working age.

History of Disability Discrimination

Disability discrimination had long been embedded in every aspect of civic and commercial life. For many centuries, however, discrimination was more a matter of ignoring than of targeting people with disabilities. The example of the influential 18th-century literary figure Samuel Johnson is illustrative. Dr. Johnson was blind in one eye, had limited vision in the other, was deaf in one ear, was badly pockmarked, picked compulsively at his skin, suffered from spasticity or palsy and later in life from severe arthritis, and seems sometimes to have been so depressed as to remain bedridden. These impairments struck his contemporaries not as disabilities but as mere anomalies, facets of the life of a singularly independent-minded brilliant man, nothing that would mark a person as unfit for social participation.

Pre-19th Century

Before the 19th century, chronic impairments were considered inescapable features of ordinary life. A few, such as leprosy, condemned those who suffered from them to be shunned because they were believed to be contagious. Some were attributed to supernatural intervention. Blindness, for instance, sometimes was explained as punishment meted out by supernatural beings. As often, however, blindness was understood to render an individual able to commune with the supernatural and to function as a seer of the future or offer other insightful advice. In the main, however, people with disabilities were not banned from participating socially if they could do so despite their impairments.

At least from early sixth-century Athens, war veterans with disabilities were maintained at public expense. By Aristotle's time, men whose means fell below a specified line, and who were too incapacitated to work, received daily public payments through a treasurer elected by lot. Programs such as this, or such as the Roman pension plan for veterans of foreign wars with disabilities, were considered insurance against the bad luck of diminished ability to earn one's bread. Such benefits were protection due to individuals who had contributed to the community's welfare when they were able.

In general, people worked despite their impairments if they needed, and were at all able, to do so. Individuals with mild or moderate cognitive impairments, and hearing impaired individuals as well, engaged in the manual labor of agrarian societies. Guilds of blind musicians and fortune tellers survived for many further centuries in China; and in Japan there were guilds of blind acupuncturists, and of masseurs who often doubled as money lenders (the worth of coinage being discernible by feel).

In Western Europe, there also were groups such as the guilds of the blind who joined together to hire guides, work at certain crafts, and visit the sick. But in

European cultures the inclusion of people with disabilities in the workforce, whether in ordinary or in specialized roles, and in society in general, declined with the rise of a factory economy and the concomitant emphasis on standardization of workers. Before 1820, in the United States, for instance, most cognitively impaired people stayed with their families or were placed with other community members to do simple but necessary work in the household or on the farm. During the next 40 years, institutions meant to train these individuals so that there could be more productive sprung up, supported by charitable donations and local government funds.

19th and 20th Centuries

Beginning in the period after the Civil War, however, these facilities created to improve the life skill proficiency and productivity of cognitively impaired people and to return them to work in the community were transformed into custodial institutions. Several economic factors intersected to promote the change. First, waves of immigrants needed work so jobs in the community became scarcer, and other groups did not want competition for work from people with disabilities returning home from the training schools. Second, as populations became urbanized and their work industrialized, caring for an impaired family member interfered with wage earning. Third, the factory and office did not have the same tolerance for anomalous individuals as the house and the farm. Indeed, 20th-century efficiency experts have urged that work sites and tools be standardized and employment focus on individuals whose bodies and minds are of standard form.

To improve their financial condition, these "homes" vigorously recruited less-impaired inmates who, once they were institutionalized, were put to work caring for the others and doing the routine maintenance work. When inexpensive paid help was hard to find, institutional officials were especially reluctant to release better worker patients. Deaf, blind, and cognitively impaired individuals, and people with other kinds of biological anomalies, were forced into situations that resembled nothing more than slavery. Institutionalization was rationalized as a way of protecting ordinary people against individuals too damaged to observe proprieties and exercise proper moral constraint, and of relieving communities of burdens of care.

In the United States, intentional segregation of people with disabilities has been primarily a post–Civil War phenomenon, initiated at roughly the same time as racial segregation. The aim was to ensure that people with disabilities not delay progress by inserting themselves into civic and commercial activities. During the first half of the 20th century, and in some places through the 1970s, eugenics programs that sterilized people with disabilities against their will furthered this aim.

Hundreds of discriminatory practices abounded, ranging from banning people with disabilities from jury service to systematically denying custody of their own children to parents with disabilities. To have a recognizable disability was (and to some degree still is) to be disqualified from the ordinary guarantees of fair treatment and from the opportunities the state offers for a flourishing life.

Impact of Disability Discrimination

Intentional Disability Discrimination

The impact of this history of segregation continues to permeate and plague business activities today. Some businesspeople mistakenly believe that an individual's disabilities constitute a legally defensible justification for not doing business with that person. For example, in 2004 the largest number of complaints received about overt discrimination by landlords and rental discrimination violating federal fair housing laws came from people with disabilities. A test project conducted in Chicago as a preliminary to federal enforcement of the Fair Housing Act's antidiscrimination provisions found that people with disabilities had a one in three chance of being illegally denied housing because of prejudice such as overt policies of not renting to people with disabilities. It is similarly illegal (under federal or state law) for businesses to refuse to serve, transport, or otherwise engage with individuals simply because the individual has disabilities, or because other customers might be made uncomfortable by the presence of a person with disabilities, or because the person with disabilities relies on an aid such as a guide dog or wheelchair.

Intentional employment discrimination based on disability also is illegal. To illustrate, in 1999 a federal jury found for a plaintiff with intellectual disabilities who communicated using picture cards and a handheld computer device. Employed as a janitor at a Chuck E. Cheese establishment, the individual received excellent evaluations from the onsite manager but was fired by a regional manager who stated that the business did not employ those kind of people. The company CEO ignored coworkers' pleas to reverse the decision, and the company's attorneys argued that people with mental retardation are not distressed when ejected from the workforce. The jury disagreed, awarding $10,000 in back pay, $70,000 compensatory, and $13 million in punitive damages (reluctantly reduced by the judge because of statutory limitations).

Thoughtless Disability Discrimination

Instances of thoughtless disability discrimination vastly outnumber intentional discrimination, however. The historically embedded expectation that individuals with disabilities should not engage in commerce nor present themselves to work invites inattention to the existence of barriers to their participation. Examples of such barriers include construction practices that assume all customers are able to walk up stairs, informational practices that rely on broadcast announcements, and scheduling practices that ignore the regularity with which people with diabetes must ingest food.

Such practices that disparately disadvantage people with disabilities discriminate against them, and failure to remedy the resulting barriers may expose businesses to legal action unless the remedy is unreasonably costly, measured against the business's overall operating costs. That other customers may retreat from mingling with people with disabilities, or other employees resent working alongside a colleague with disabilities, is never a legal defense for discrimination. But employers have defended successfully if they demonstrate that an individual's disability results in higher absenteeism or earlier retirement, so that other employees absorb the burden of doing extra work.

Improving Social Participation of People With Disabilities

Employing People With Disabilities

Far from being generally burdensome, employees with disabilities appear to have more reliable attendance records and greater longevity and loyalty than do people without disabilities, according to the national surveys conducted regularly by the National Organization on Disability. Embedded discriminatory attitudes and practices, nevertheless, make it twice as difficult for qualified people with disabilities to find employment. In both the United States and the United Kingdom, roughly 80% of working age people have gainful employment, but only roughly 40% of people with disabilities with demonstrated work capability find employers willing to give them work. These individuals swell the roles of public benefits programs. Furthermore, the rarity of successful people with disabilities in the workplace strongly suggests to workers who become disabled the futility of attempting to support themselves.

Technology and People With Disabilities

Far from impeding progress, enabling the participation of people with disabilities stimulates innovations that have revolutionized business efficiency. For example, the typewriter was invented to enable people with visual impairments to record written text. Not all innovations meant for people with disabilities have benefited them, however. Alexander Graham Bell, son and husband of deaf women, was aiming for amplification to improve communication with them by inventing the telephone. But this device had a disastrous outcome for the group for whose benefit it was invented, for business communication no longer needed to be face-to-face, and individuals who relied on lipreading gradually found themselves forced out of the majority of work sites because they could not use the telephone.

Just about a century later, the situation reversed, as the Internet, which configures information for sight rather than sound, was invented and rapidly became a major route for business communication. Now, however, the already restricted opportunities for visually impaired individuals were threatened, for communication through text was as much a barrier to them as telephoned communication was to deaf people. This time, though, increased social commitment to eliminating inadvertent disability discrimination made for a very different story.

Computers can deliver aural as well as visual output. During the last decade of the 20th century a spontaneous disability community campaign, furthered by research in a few university sites, convinced software companies to make proprietary codes available to software developers specializing in voice output programs, and to fold voice output capability into their own development programs. Spurred by federal antidiscrimination measures, books may be purchased in computer-readable form, banks use this technology to offer talking ATMs, and businesses generally are more responsive to the integrated community that includes some for whom seeing, but others for whom hearing, is the vehicle of communication.

An Untapped Market

The National Organization on Disability describes the disability community, comprising nearly one fifth of the American population plus families and friends, as a market untapped because of residual discrimination but conservatively worth at least $220 billion in collective spending power. To remedy discriminatory practices, businesses have initiated a replete repertoire of strategies, from manufacturing items that meet the standards of universal design and thus are usable by individuals of varying degrees of dexterity, sensory acuity, and strength to fostering a culture of inclusion by ensuring that disability is a central topic in the organization's diversity training.

Legal Remedies

In the United States, the 1990 ADA is the main staging ground for federal investigative and judicial action to remedy disability discrimination in employment, housing, education, and access to public services. The Rehabilitation Act prohibits discrimination on the basis of disability in programs conducted by federal agencies, in programs receiving federal financial assistance, in federal employment, and in the employment practices of federal contractors. Its provisions predate and are reflected in those of the ADA. The Individuals with Disabilities Education Act (IDEA) requires public school districts to provide an appropriate education in the least restrictive environment for children with disabilities. The Architectural Barriers Act requires that facilities designed, built, altered, or leased with federal funds be accessible to people with vision, hearing, and mobility impairments. Under the Air Carrier Access Act, airline operators must provide equitable access to air transport for individuals with disabilities because carriers are prohibited from discrimination against qualified individuals with physical and/or mental impairments. The Fair Housing Act prohibits discrimination in any aspect of selling, renting, or denying housing because of an individual's disability. Reasonable exceptions to housing policies must be made if needed to afford equal housing opportunities to people with disabilities. States also offer many statutory protections against disability discrimination.

Many other nations also offer legal protection to people with disabilities. Most, however, situate these within a human rights rather than a civil rights frame. They tend to understand disability discrimination as a problem of failing to care for the special needs of people with disabilities rather than as a diminution of opportunity to satisfy ordinary needs. As a consequence, they are less likely to enact statutes that promote systematic social integration, but more likely to offer supportive services.

In the short run, businesses may prefer the latter approach, which expects government to support those with disabilities as compensation for the adverse effects of disability discrimination. By requiring businesses to do their part in improving the economic and social status of people with disabilities, however, the former approach may be more cost effective in the long run.

Disclosure

Disclosure is the release of information that would not otherwise be known by the parties that receive it. Disclosure may be the release of information either to the general public or to a limited, selected audience, sometimes under conditions of confidentiality. The release of information may also be either voluntary or legally required. Although the disclosure of financial information is an important topic in accounting and finance, the concept of disclosure in business applies to all kinds of information that are released for many different reasons. Disclosure is studied in business, mostly in accounting and finance, primarily to determine its impact on firms' performance, but it also raises many ethical concerns. The main ethical issues concerning disclosure are the following: (1) When is disclosure morally required? and (2) when is disclosure morally permissible or morally prohibited? These two questions may also be asked of the law on disclosure, and in some cases, disclosure is legally required, legally permissible, or legally prohibited. In general, morality and law are in close alignment, but they may occasionally differ so that, for example, disclosure may be morally required but not a legal obligation.

Morally Required Disclosure

A person or an organization may be morally required to disclose information for three reasons: The release of information (1) may prevent some significant harm that cannot easily be prevented in other ways, (2) may be required to ensure fairness in markets, and (3) may manage a conflict of interest.

With regard to the first reason, a manufacturer may have a moral obligation to release information about a defect in a product in order to protect consumers from serious injury or even death, and they are also morally obligated to inform employees about some workplace hazards that can cause illness or injury. The disclosure of some product defects and workplace hazards are also required by law either directly through legal requirements, such as an order from the Consumer Product Safety Commission or the Occupational Safety and Health Administration, or indirectly by the standards for negligence in tort law. Thus, a manufacturer may be said to have a legal obligation to disclose a defect if the failure to disclose it could be considered negligence. The principle involved in both morality and law is that one ought not to knowingly cause harm to another. However, disclosure is only one means for preventing harm, and so it may not be morally required if other, more effective means are used. Thus, an employer may not have an obligation to inform employees of workplace hazards if the employer takes other, more effective steps to protect employees.

The second reason—to enable markets to operate fairly—arises from the fact that markets produce mutually beneficial outcomes only if there is perfect information. Fair, as well as efficient, markets require, in other words, that buyers and sellers have full information about what they are giving up and receiving in return. The need of markets for perfect information does not, by itself, entail an obligation on either party in a transaction to disclose except in two cases. One exception is fraud, which is committed when one party to a transaction makes a false or misleading statement or omission of a significant fact that the other party relies on to his or her detriment. Thus, a seller of a house is under a moral and a legal obligation to disclose significant defects since a failure to disclose is an omission that constitutes fraud.

The other case in which disclosure may be morally or legally required in market transactions is when it enables buyers to acquire information that enables them to benefit from market transactions and not be at an unfair informational disadvantage. For example, a consumer cannot easily determine the contents of packaged food products, and so federal consumer law requires the manufacturer to disclose certain information, including the weight or volume of the product, the ingredients, and certain nutritional information. Similarly, federal securities law requires the issuer of securities, such as stocks or bonds, to provide a prospectus that contains certain information about the issuer and the securities. More broadly, securities laws require that issuers make extensive disclosures in regular filings that are available to all investors. The law also regulates how information is disclosed. Thus, Regulation FD (for fair disclosure) requires that public companies make any disclosures to analysts publicly so as to avoid selective disclosure to some analysts but not others.

Although fairness in market transactions requires that both parties have certain information, it is not easy to determine what information either party has an obligation to disclose. For example, is it fair for an art expert who identifies a valuable painting at a rummage sale to buy it without telling the owner of its value? It might be argued that the art expert has a right to take advantage of superior knowledge and that the owner could have sought an appraisal. The information in question is itself a valuable commodity, and so, arguably, the art expert has no obligation to provide for free what the owner is not willing to pay an appraiser to provide. However, the legal obligations to disclose on labels and prospectuses may be morally justified on the ground that the government has a right to facilitate fair and efficient markets. In particular, such laws are based on the premise that buyers ought to have certain information and that the sellers can more easily provide it. Thus, social welfare is enhanced if these kinds of disclosure are legally required.

Government may legally require disclosure for reasons other than market fairness. For example, disclosure is an important means of regulation. The requirement that issuers of securities provide a prospectus is intended not merely to enable buyers to make rational decisions but also to ensure that securities are fairly priced. This could be achieved without disclosure by requiring approval from an agency that evaluates the price of stock and bond offerings, which is the approach of the so-called blue sky laws. However, disclosure, which allows the market to determine prices, is probably a more effective means of assuring fair prices than the use of a state agency. Disclosure may also be required by government to prevent restraint of trade under antitrust law. For example, the European Union has sought to require that Microsoft disclose its code for Windows so that other software companies could develop Windows-compatible software. Another example of the use of disclosure to regulate is the requirement of the Securities and Exchange Commission (SEC) that public companies disclose certain information about executive compensation. In this instance, the SEC, unwilling or unable to set limits on pay, has used disclosure to allow the market to prevent excessive compensation.

The third reason—to manage conflict of interest—is due to the point that disclosing a conflict enables the party who is potentially harmed to be aware of the conflict and take protective action. A conflict of interest arises when a person has a personal interest that interferes with an obligation or duty to serve the interests of another. Thus, a physician who owns a laboratory to which he or she refers patients has a conflict of interest because it may bias the physician's judgment, which ought to be exercised solely for the patients' benefit. However, if patients are aware of the physician's ownership, they may be able to question the physician's judgment and make a more informed decision. Disclosure in such a case may not be morally required because there are other means for satisfactorily managing conflicts of interest. However, morality requires that some means be employed to manage the conflict of interest and thereby enable the physician to fulfill the duty to serve the patients' interest. Disclosure is used in a similar manner to manage conflict of interest among public officials by rules requiring them to disclose their financial holdings.

Morally Permissible/ Prohibited Disclosure

The question of when the disclosure of information is morally permissible or morally prohibited arises mainly when the information in question is confidential and proprietary. The owner of a trade secret, for example, has a right that it not be released without authorization, so that its unauthorized release is morally, and perhaps legally, impermissible. However, it may be morally permissible in some circumstances for a person without authorization to release confidential, proprietary information.

For example, whistle-blowing, which is the disclosure of information to the public in order to protect people from the harmful activities of an organization, is sometimes held to be morally permissible and possibly, in some instances, morally required. The information released by a whistle-blower is generally proprietary, but its release is morally problematic only when the whistle-blower has a duty to preserve its confidentiality. For example, a journalist has no obligation not to publish proprietary information as long as it was not wrongly obtained, because the journalist, unlike an employee of a company, has no duty of confidentiality to the employer. In general, the disclosure of confidential, proprietary information by a whistle-blower is morally justified when, among other conditions, the good that results from protecting the public outweighs the violation of the information owner's right that it not be disclosed.

The permissibility of disclosure is an issue not only with the proprietary information of a business organization but also with people's personal information. An individual's right to privacy is respected when certain information about themselves is not known by others. Thus, it would be a violation of privacy for a person's medical or financial records to be disclosed to other parties without that person's consent. Accordingly, record keepers have an obligation not only not to disclose personal information but also to take steps to secure it from inadvertent disclosure.

The question of the permissibility of disclosing information also arises when disclosure could cause some harm. For example, software designers disagree on whether security flaws in operating software ought to be disclosed to the public. On the one hand, such disclosure could make the public aware of security flaws and lead to fixes that would provide greater protection. On the other hand, the disclosure of security flaws could aid hackers and lead to more breaches of security. There was a similar controversy in the 19th century when locksmiths debated whether weakness in lock systems should be publicized or kept secret. The enactment of the so-called Megan's Laws, which permit or require the disclosure of sex offenders' names, brings two legitimate moral concerns into conflict. Sex offenders who have served their sentences have a right to resume their lives without restrictions, and yet parents arguably have a right to know of sex offenders' presence in a community in order to protect their children. Whether disclosure of their names is morally permissible thus involves the weighing of two moral goods.

The World Wide Web has exacerbated the moral problems of disclosure by making access to information much easier. Much of the information available on the Internet has long been publicly available so that there has been little question of the moral permissibility of its disclosure. However, the impact of this information for good or ill has been of little concern since much of it could not be easily obtained. With the easy access provided by the Web, the benefits and harms of the disclosure of this information may need to be reevaluated.

Discounting the Future

Discounting the future occurs when an immediate benefit is systemically valued more highly than a delayed benefit. As with other discounted cash flow projections, the variables are the size of the estimated cash flow, the number of discounted periods in the future, and a relevant discount or interest rate. In a case involving one cash payment or outflow (PV) and one future payment or inflow (FV) at a relevant discount rate (r) for a number of discount periods (n), the present value (PV) can be expressed as

$$\mathrm{PV} = \mathrm{FV} \div (1 + r)^n$$

A classic example is an amount of cash placed in a savings account (PV) to be redeemed on a future date (FV). All other things being equal, the present value of a cash flow decreases with a decrease in the size of the future cash flow, an increase in the number of discount periods, or an increase in the discount rate. Alternatively, the present value of a cash flow increases with an increase in the size of the future cash flow, a decrease in the number of discount periods, or a decrease in the relevant discount rate.

Cost-benefit analysis takes into account all present and future cash inflows and outflows expected to occur over the life of the project. The present value equation is at the heart of cost-benefit analysis. The discount procedure is essentially a way of reducing a stream of costs or benefits over time to a single sum. Thus, different projects with different cost streams are comparable.

Future payments and costs should be treated in the same way as future receipts and benefits. When future payments or costs and receipts or benefits are discounted to the present and added together, the resulting amount is the net present value (V_0). Therefore, the net present value at time $t = 0$ of a project, which has a duration of n years, and which has costs and benefits of C_t and B_t for $t = 0 \ldots n$, is given by

$$V_0 = (B_0 - C_0) + (B_1 - C_1) \div (1 + r) + \ldots + (B_n - C_n) \div (1 + r)^n$$

The project should be undertaken only if $V_0 > 0$. A value of 0 is the point of indifference with respect to accepting or rejecting the project.

Cost-benefit analysis is based on a number of assumptions that must be valid for the calculation to be accurate and relevant to the decision at hand. First, it is assumed that all costs and benefits can be reduced to monetary amounts. The problem of placing valuations on untraded goods and services or intangible factors such as environmental quality is difficult when market values are not available. The value of intangibles such as historical landmarks, Stonehenge or Mount Rushmore for example, is likely to vary widely among the populace. In the absence of market values, a consensus ranking might be used according to public opinion. However, consensus rankings cannot be expressed meaningfully in the same manner in which a consumer might express his or her preferences among economic goods.

A second assumption is that the costs and benefits in the analysis are the same for each person. Only in rare circumstances is everyone a beneficiary of a project. This situation is especially obvious in projects that are undertaken by a present society to benefit future generations.

A third factor is the discount rate. An objective discount rate for monetary costs can be determined by the opportunity cost of funds or the benefits forgone by investing in a given project. A discount rate may also be a subjective reflection of a consumer's preference for immediate rather than deferred benefits, expressed as the marginal rate of time preference.

Using a positive discount rate in cost-benefit analysis incorporates the assumption that today is more important than tomorrow. From this it follows that present generations discriminate against future generations. Using a discount rate of zero or a negative discount rate is one means of avoiding such discrimination in a cost-benefit analysis.

The discount factor is often modified in cost-benefit analysis by imposing a risk premium on projects that are perceived as more risky than others. Adding a risk premium is intended to place projects under comparison on equal footing. However, the addition of a risk premium increases the discount rate and magnifies the time preference for today.

Future Generations

As a branch of welfare economics, cost-benefit analysis is framed by considerations for morally correct or fair decisions. For example, the Hicks-Kaldor criterion asserts that a project should be approved only if those who gain from it could compensate those who lose and still retain some net benefit. Thus, the short-term and long-term effects of the decision are relevant. A utilitarian perspective focuses on the consequences of a decision with the objective to maximize the good for the greatest number. In actual practice, comparisons of gains and losses between groups and among individuals are rarely made. A utilitarian perspective does not necessarily include consideration of consequences borne by future generations. Utilitarian frameworks are commonly used to evaluate the costs and benefits of long-term decisions.

The Rawls's theory of justice differs from the tradition of Hume, Adam Smith, and Bentham in the sense that it is nonutilitarian. Rawls rejects the idea that the loss of freedom for some is justified by the greater good shared by others.

Rawls's theory of justice acknowledges the rights of future generations. Rawls establishes principles that exclude all forms of discrimination. Standing behind the Veil of Ignorance, no rational person would chose to be a member of a disfavored class. The principle of intergenerational equality is in fact the first principle of justice in Rawlsian theory. From the perspective of a society, pure time preference is unjust because it means that the living take advantage of their position in time to favor their interest. Second, the Difference Principle can be applied to future generations who are "least advantaged" in terms of consequences to a decision. Justice requires that if others profit from a practice or decision, the least advantaged must also benefit. One group should not benefit at the expense of another group or another individual. Thus, if the present generation benefits from a decision, future generations must benefit as well.

Weiss's theory of intergenerational equity derives from Rawls's arguments. The theory states that each generation has an obligation to pass on to the next generation the natural and cultural resources in no worse condition than the condition in which the resources were received.

Decisions That Harmed Future Generations

Cost-benefit analysis disfavors future generations when the benefits are received by current generations but the costs and consequences are delayed to future periods. Two prominent examples of economic decisions that provided current benefits to one group of people and heavy penalties to later generations were ecological disasters coinciding with the end of the native Anasazi and Mayan civilizations in North America. Recent examples appear in the 21st century.

In 2002, scientists reported the drying up of the Aral Sea, located in central Asia, as one of the worst ecological disasters of all time. The Aral Sea was once the world's fourth largest lake. However, diverting river water to the desert areas of Uzbekistan, Turkmenistan, and Kazakhstan for cotton farming for the past 30 years has reduced the lake to one third of its original size. Without the moderating effects of the large sea, the climate in the Aral Sea area changed producing shorter, hotter summers and longer, colder winters. The change in climate and shrunken sea destroyed the economic base of fishing and agricultural products. The community was affected by poverty, lack of drinking water, malnutrition, and disease.

In 2004, the U.S. National Aeronautics and Space Administration (NASA) compared Landsat satellite images taken in 1992 and 2000. Light sensors aboard the Landsat craft detect different features on the Earth's surface, such as the existence and condition of vegetation, soil conditions, and the existence of wetlands. Image comparison revealed a transformation in southern Iraq and a rapid shrinking of the Mesopotamian marshlands from their original size of 15,000 to 20,000 sq. km to less than 1,500 to 2,000 sq. km.

In the early 1990s, Iraqi dictator Saddam Hussein ordered the destruction of the marshes in retaliation for an uprising against his regime. Draining the marshlands reduced the yield from fisheries, shortened the supply of drinking water, and narrowed the habitat for migrating birds. Because the marshlands have historical significance and intangible religious value, the elimination of the marshlands is a cultural disaster as well as an environmental disaster. As a cultural disaster, it affects not only the Marsh Arabs who live in the marshes, but also those who ascribe to Christianity, Judaism, and Islam, whose origins are in the Mesopotamian marshlands. The marshlands are also known as the cradle of civilization and the site of the Sumerian, Akkadian, Babylonian, Assyrian, and Chaldean civilizations; the Epic of Gilgamesh; the Garden of Eden; the Great Flood; and the birthplace of the patriarch Abraham who is given credit in the Old Testament for founding the Jewish nation.

Current Decisions Affecting Future Generations

There are examples of current decisions and public projects that are communal in nature and accordingly affect current populations and future generations. Projects for the generation of nuclear power were started decades in advance of viable plans for the disposal of waste. Radioactive waste such as iodine-129 has a half-life of 17 million years. Current and future costs include those for devising safe and effective means of protecting the biosphere from radioactive waste, construction and waste removal transportation costs, monitoring costs, failure costs in the form of cleanups and health issues from accidents and exposure to waste, and the costs of decommissioning worn out nuclear power plants. Related costs are the development of alternative energy sources.

Global warming is attributed to man-made emissions of carbon dioxide and other greenhouse gases traced to the use of fossil fuels. The costs of climate changes and the resultant effects on future generations are inestimable. Major effects include floods, storms, and droughts and the loss of life for humans, plants, and animals. Along with private citizens and grassroots movements, several nonprofit organizations are actively involved in promoting international cooperation to reduce emissions. The World Wildlife Fund states that the most effective way to reduce emissions globally is for the world to work together under one agreement rather than multiple plans and agreements. The Kyoto Protocol, based on binding caps on emissions, is the first working treaty to counteract global warming. As of 2005, the Protocol has been signed by 152 nations. The United States and Australia have not signed the agreement.

In 1997, the Kyoto agreements set targets of a 5% reduction of fossil fuel emissions to be attained by 2012. By 2005, rapid industrial growth in a few highly developed countries had actually increased emissions. In the United States, industrialization and emission levels had grown such that a 5% reduction of the 1990s levels would have been approximately a 25% to 35% reduction of the levels produced in 2005. Cost-benefit analysis determined that the Kyoto protocol was unaffordable and, furthermore, too difficult to attain by 2012.

Forest restoration projects are an example of costs undertaken in the present to benefit future periods. The average maturity period for softwoods such as pines and spruce and hardwoods such as oak, beech, and ash range between 40 to more than 100 years. The costs of maintaining forests include the opportunity cost of the land, cost of planting and replanting, thinning and rotation, losses from fire and disease, and costs from tax levies. The distance of the benefits on the time line and the current costs of reforestation projects are calculable. However, some benefits are often overlooked in a cost-benefit analysis of the project. These include flood control, prevention of soil erosion, avalanche control, and protection of the tree species, recreation, and pollution abatement.

U.S. Congress has enacted several pieces of legislation that recognize obligations of current generations to preserve the global ecosystem and maintain a habitable planet for the future. Notable legislation includes the Clean Air and Water Acts and the Endangered Species Act. The World Wildlife Fund and the Defenders of Wildlife Organization are two of many nonprofit organizations that sponsor projects through private donations and grants from various entities. These groups emphasize the importance of protecting biodiversity for future generations. The global and international importance of safeguarding the natural resources of the earth, including air, water, land, flora, and fauna, is expressly stated in the Stockholm Declaration on the Human Environment following the 1972 Stockholm Conference on the Human Environment.

Diversity in the Workplace

Diversity may seem self-explanatory, yet it may have different meanings in organizations with respect to different contexts. The term is first defined, followed by a historical background, and contrasted with its definition in today's environment. Diversity issues from the management and employee perspectives are finally considered.

Until lately, diversity in the workplace has been implied as the ongoing interaction between employees and employers with different cultural, ethnic, and racial backgrounds that have significant influences on the operations and management of an organization. However, recently, diversity has broadly been redefined as the collective differences and similarities of different dimensions. For example, diversity issues related to demographic characteristics of employees are different from those related to diverse functional issues such as marketing, research, manufacturing, finances, and so on within an organization. Thus, employees' demography and organizational functions are two different dimensions of diversity. In other words, today's workplace diversity represents the complex multidimensional issues involving workers and management of similar and dissimilar nature.

The History of Diversity in the Workplace

Diversity and multiculturalism have gradually been a part of the workforce in the United States since the latter half of the 19th century. The melting pot and Americanization movements of the 1880s were directed toward removal of cultural and linguistic differences by assimilation. Throughout the history, politicians, educators, and industry leaders tried to eliminate the differences between new immigrants and contemporary American residents in society, as well as in the workplace. Their efforts were only partially successful, as it became obvious that blending into the American melting pot was not so easy for immigrants who had very different cultures and were visibly different from the early settlers from the European continent.

Policy makers started to recognize the issues related to diversity since migration from developing countries was growing faster than those from the developed nations. In 1940, more than 85% of immigrants were from Europe, whereas in 1995, 75% were from non-European countries. By early 1990s, the organizations felt the hard reality of managing a workforce consisting of immigrants from developing countries with diverse and "unmeltable" social, cultural, physical, and racial backgrounds. Increasingly, studies have shown the growing concerns of managers about diversity issues in the workplace. The two most important concerns were how to communicate with their employees and how to motivate them.

Today's workforce is more diverse than ever. According to the U.S. Bureau of Labor Statistics, of the 26 million new workers who came into the workforce in the United States between 1990 and 2005, about 80% were minorities, including women. Sometime between 2055 and 2060, the total minority population is projected to surpass the nonminority population, which now consists of Euro-Americans. At the same time, the buying power of the minority groups are increasing at a fast pace. For example, in 2005, African Americans spent $630 billion a year in goods and services, while the Latin American market continues to grow even faster and is comprised of the largest minority group with a spending power of more than $700 billion.

Diversity and Characterizations of Employees in the Workforce

The most important reason for diversity to become a major issue in organizations is the significant change in workforce population since the later half of the 20th century. The steady growth of minority populations is projected to make them the domineering force in the workplace in the future.

The earlier philosophy of the "melting pot" was to ignore the individual differences and thus form a unified society with a distinct hierarchy in the workforce. But it ceased to be effective with the increase in immigrant population from non-European countries during last few decades. It became more difficult for the new immigrants to be unified with a society with very different social and cultural values. They spent more energy on adapting to the existing organizational culture—this sometimes hindered their ability to develop innovative ideas and build personal strengths.

Based on ethnicity, gender, and other factors, the workforce populations can be categorized in many ways. Major groups (listed alphabetically), based on ethnicity and religion, are African Americans, Arab Americans, Asian Americans (e.g., Chinese Americans, Asian-Indian Americans), Euro-Americans, Jewish Americans, and Latin Americans, among others. Other groups based on reasons other than ethnicity and religion are the elderly; persons with disabilities; individuals with gay, lesbian, and bisexual orientations; obese people; and women. Characteristics of the three largest ethnic groups are briefly described in the following paragraphs.

African Americans

According to the statistics from the U.S. Census Bureau and U.S. Department of Labor, 12% of the workforce consisted of African Americans. Their resilient culture nourished certain key values and customs for surviving in the society, such as sharing and interrelating, expressing personal style and uniqueness, being genuine yet assertive, expressing feelings, and bouncing back. African American churches have had a major influence on their community life.

Latin Americans

The fastest growing minority group in the United States is Latin Americans. According to the U.S.

Census Bureau and U.S. Department of Labor, 12% of the employees is comprised of Latin Americans. The majority of Latin Americans are Mexican Americans (58%). The rest of this group consists of Puerto Ricans (10%), Cubans (4%), Central (5%), South (4%), and other Latin Americans (19%). The population of Latin Americans grew four times more than the growth of the U.S. population between the years 1990 to 2000. This trend of fast population growth will continue for this group because they are relatively young and have almost twice the birthrate of Euro-Americans. By learning and understanding the common Latin American culture, the efficiency and productivity of this group can be increased to its fullest.

Asian Americans

Asian Americans consist of 4% of total U.S. population according to U.S. Census results. The Asian American group consists mostly of people from China, the Philippines, India, Vietnam, Korea, Japan, and a few other countries from this continent. About 66% were foreign born, and 54% of them live in the Western region, mostly in California. They have the highest level of education, and their work achievements make them valuable assets in the workforce. Many of the Asian Americans have a reputation of working hard, being productive, willing to work long hours, maintaining a frugal lifestyle, investing in higher education, and identifying the American dream of hard work leading to a better life.

Strategies for Success for Minority Employees

The minority employees can follow several strategies to sort through the complexities in the workplace. At the outset, keeping an open mind about the management's diversity policies is very important. Sometimes, even well-intentioned managers may need to be educated about the cultural trends and personalities of minorities. It is also essential to socialize, acknowledge, maximize mutual interests, and empathize with supervisors, colleagues, and subordinates. The communications must be built to make the dominant group members comfortable.

Recognizing their differences as assets to the company will provide a positive attitude for the minority group members. Focusing on keeping their skill sharpened and improving them constantly will make them valuable for the company. Networking with people, taking risks, being creative, and promoting their past accomplishments are some of the ways to be noticed and be successful. It is equally necessary to learn how to accommodate some of the company requirements without losing the personal identity as a minority. The goals and vision of the minority group members should be complementary to the company's mission for the overall success of the individual.

Diversity Management in the Workplace

Most organizations now see diversity as an asset that offers valuable opportunities for innovation, networking, marketing, and similar benefits. If properly harnessed, the power of diversity will bring the corporation to the forefront by enhancing creativity and efficiency. The focus of diversity management is to promote people as a necessary factor to the organizational success. Although most of the medium to big corporations have a diversity management team, it is the CEO of the company who defines the importance and the effectiveness of that team. The CEO or head of the organization gives clear directions to the director of the diversity team, on which the scope of work is built. The director and members of a diversity management team often have prior experiences working in human resources, training, and social work. A senior-level manager with extensive experiences in the same industry is usually appointed as a director of the team. Additions of team members from the minority and majority groups, as well as cross-level and cross-functional groups, provide effective team-building experiences with a positive image of the diversity committees in the organization.

It is essential to educate the team members about the demographic data, policies, and practices in the organization, while introducing the plans and initiatives of diversity management. Activities in the company can be recorded regularly as a measure to check on the efficiency of the diversity committee. The process of diversity management involves clearly identifying the problem, the elements of diversity involved, traces of conflict, and the diversity tension, which involves stresses and strains associated with the various elements of diversity. The task of this committee is to provide alternatives to the managers in order to resolve the problems when diversity tension increases without any effective outcome. The options available to the managers can be categorized in eight different alternatives according to R. Roosevelt Thomas. The selection of a course of action usually depends on two criteria—the type of diversity mixture at hand and the internal and external factors that include the personal inclinations and mind-set of the manager and the employees, the organizational environment, the intensity, and the impact of diversity tension in the organization. The eight options can be summarized as follows:

1. *Inclusion/exclusion*: The perfect example of inclusion is affirmative actions or Equal Employment options in an organization, where the goal is to increase the number of the target-group members in the organization at all levels. Exclusion is the opposite of inclusion, for example, if a company tries to minimize stockholder participation in decision making. This option is usually legally and/or ethically unacceptable.
2. *Denial:* In many cases by denying that differences exist, the management tries to eliminate the question of change. This option is becoming increasingly difficult since the employees are more than ever wanting to be recognized for their differences.
3. *Assimilation:* For successful organizations, assimilation is the most common approach to all dimensions of diversity. This approach assumes that the minority group will fit in the dominant culture of the organization. However, when more of the employees become comfortable being different, they might not like to follow the requirements set up by the dominant group in the past.
4. *Suppression:* This approach recognizes and acknowledges the differences among the employees, yet discourages its exposure for the welfare of the company. The tradition of sacrificing for the organization used to be very common in the past. The policy of keeping business and personal lives separate and thus suppressing the employee's need to balance work and family is not effective in today's diversified work atmosphere.
5. *Isolation:* The management often finds it practical to isolate different functions in an organization with minimal contact among each other so that each group can operate independently with the fullest efficiency. They create isolated functional entities or "silos" that are best suited to thrive on their own. This option gives the manager opportunity to reduce the complexity by giving personal time to the minority groups without disrupting the order of the dominant groups.
6. *Toleration:* Sometimes diversity is added to an organization due to business reasons, but the new groups are only tolerated, not accepted functionally and/or culturally. This type of coexistence without connecting works well in established bureaucratic environments, where different departments rarely communicate. This option is the middle ground between exclusion and full participation.
7. *Building relationships:* Organizations are taking this approach to resolve problems among diverse groups by collaboration and communication. This option creates harmony among employees, and thus increases productivity. By focusing on similarities, this option is used to minimize the differences.
8. *Fostering mutual adaptation:* Only a few organizations have fully accepted this still-evolving holistic concept of acceptance and understanding of diversity. This option considers the requirements of the organization and the employees and finds the balance between the company mission and fulfilling the individual identity by pushing all the conventional ideas and organizational preferences away. This approach also allows the dominant and the minority groups to work together for necessary changes thus creating synergy. This enables the complexity of diversity to be truly eliminated.

As mentioned earlier, the management needs to make a conscious choice of the option(s) to be considered. It is a dynamic process, which varies according to different situations. None of the options should be considered as bad or good without understanding the contextual issues. They can also be used in different combinations as demanded by the situation. Before choosing an option, one should consider not only the differences but also the similarity of the diversity mixtures. Finally, only one of the above mentioned choices, that is, fostering mutual adaptation, is truly seeking into diversity as a part of the organization, whereas the rest are only partially trying to minimize or avoid the issue at all.

Diversity of Organizational Functions

After its initial success in the industry, an organization enters its growth phase. Then it is likely to divide itself into many different branches based on their functions, so that each division can be managed successfully.

By doing so, it creates the diversity of functions in the same organizations. The different branches of the company may have different work culture, different levels of formalities, and time-oriented goals. Self-containment of different functions is not a problem until they need to work together for the organization to strive for a creative way toward success.

The old business model has levels of managers between the top level and the workforce to relay the information back and forth between top-level management and workers. Technological advances assist companies in directly communicating with team leaders of different divisions to respond faster to the developing issues. The divisional teams increasingly consist of experts and workers with diverse knowledge base and perspective, thus creating an environment of creative thinking resulting in superior product innovation.

The goal of the diversity management team is to find a balance between the interdepartmental communication and the independence of each of the department. The same eight options discussed in the previous section are available to the managers to minimize the complexity of the functional diversities.

Conclusion

The mission of organizations in the 21st century is to create new models for workplaces that motivate and access the potential of each of those diverse workforces, thus striving toward the common goal of the organizational success and personal achievements of the employees. A proactive strategy is necessary for bridging a diverse workforce to the business goals.

The employers as well as the employees are required to be educated through experimental and informational seminars to make necessary attitudes shift in organizations. The multicultural approach benefits an organization in many ways, such as attracting and retaining talented people in the company, gaining and keeping greater market shares, reducing costs and increasing productivity, improving the quality of management, increasing organizational flexibility, solving problems more effectively, and contributing to social responsibility.

Mergers and acquisitions between companies have become commonplace these days, forcing employees of different companies and sometimes even competitors to work together. This imposes a challenge to employees' work ethics and capabilities. In a joint venture, managers have difficulty forming a cohesive group of workers from diverse functions.

With the growth of the minority population, including women in the workforce, managers are facing expectations of a wider range of accommodations from workers to balance their work and family lives. The only way to build an honest and fulfilling relationship between management and employees is by improving communications among them.

Managers in a diverse workplace should recognize their personal ethnocentricities. Learning about different cultures existing in the company will help them recognize their differences. Building trust among diverse groups can be achieved by expressing respect and appreciation of their contributions. It is essential to learn to listen and be open-minded about other points of view. With strong interaction skill, the management and the employees can work together toward common goals.

Over the last decade, many American corporations have expanded their organizations globally. Corporate success, more than ever, depends on managing their diversified workforce properly inside as well as outside the United States. The ever-growing complexity of diversity issues demands dynamic and innovative adaptation and implementation of new strategies to survive and succeed in business today and in the future.

Divestment

Divestment refers to the disposal of assets in any one of a variety of ways. For example, a new judge can divest herself of stock holdings that might generate a conflict of interest, or an individual investor might divest himself of computer stocks if he thinks they have a poor future. At the institutional level, divestment is a policy and set of economic sanctions used by corporations, groups of shareholders, individuals, and governments to put pressure on a company and/or a country, to protest either the company's or the country's policies and practices. It is a means of leveraging economic power to help bring about political, economic, legal, and/or social change in the target company or country. Divestment is a result of pressure from shareholders, consumers, activists, nongovernmental organizations, and/or government sanctions. Divestment can take several forms, including the withdrawal of new corporate investment, withdrawal of available credit from banks, the selling off of operating units, cutting off all operations, and reducing portfolio holdings in firms doing business in the target country.

There are four reasons for divestment at the institutional level: political, legal, financial, or moral, and these often overlap one another; a company may respond to shareholder and/or consumer pressures and close down its operations in a country with a poor human rights record, doing so for financial and moral reasons. Then the government may pass legislation banning an investment in that country, so the company is now complying with legislation. Because divestment has been used as leverage by corporations to bring political, social, and/or economic change in countries where human rights have been violated, it is considered to be an ethical or moral action by business that can be used to promote human rights. In this way, investment and divestment can be seen as either ethical or unethical, based on moral foundations. In both Burma and South Africa, the democratic opposition coalitions encouraged multinational corporations to return and reinvest only after a democratically elected government was established.

Sanctions, selective purchasing, and disinvestment are additional actions that can be used along with divestment to bring about political, economic, and social reforms in a targeted country. Another strategy, constructive engagement, is the continuation of economic activity between a corporation or government and a targeted country. Often those who oppose divestment support constructive engagement as a viable alternative, maintaining that the ongoing economic relationship will bring about dialogue or pressure for change in the targeted country.

Divestment for Moral Reasons

In the 1970s and 1980s, businesses and governments throughout the world protested the apartheid regime of the white-ruled government in South Africa by divesting. Some examples of multinational corporations that partially or fully divested from South Africa during the 1980s include Eastman Kodak, IBM, CocaCola, General Electric, and Xerox. In 1987, the state of California divested by restructuring its investments so that $90 billion would be divested from companies doing business with South Africa. Divestment has been used to protest the military-ruled government of Burma. During the 1990s, multinational corporations that divested from Burma include PepsiCo, Eastman Kodak, Texaco, Hewlett-Packard, and Federated Department Stores.

In practice, in South Africa and in Burma, while some companies withdrew their direct holdings, they would sell to local companies or third parties, creating licensing or franchising arrangements so that their products or services would still be available. Kodak is an example of a corporation that did this in South Africa, while Sony has done this in Burma.

In 2006, because of continuing genocide in the Darfur region of the Sudan, several states in the United States such as Illinois, Louisiana, Oregon, and New Jersey have passed legislation requiring public pension funds to divest companies operating in Sudan. In addition, institutions of higher education, such as University of California, Harvard, Amherst, Yale, and Stanford, have passed policies divesting their portfolios of investments in companies doing business with Sudan. In spite of this, more than 130 companies continue to do business with Sudan. Most of those companies are based in Europe and Asia, but many are listed in U.S. stock exchanges and have access to U.S. capital markets.

In 2004, the governing body of the Presbyterian Church in the United States, with $8 billion in investments, approved selective divestment from corporations doing business with Israel. It would divest from multinational corporations that sell goods and services used by the Israeli military to maintain the occupation, expand settlements, and otherwise violate the human rights of the Palestinians. Similarly, investors have campaigned against Caterpillar, a U.S. firm that manufactures armored bulldozers used by the Israeli military to level Palestinian homes. Some supporters of Israel are hostile to these divestment activities, interpreting them as anti-Semitic and an attempt to weaken a strong yet vulnerable nation that needs economic and political support throughout the world.

Divestment for Reasons of Public Policy

Because of changes in antitrust public policy, in 1982 AT&T was mandated by the U.S. government to divest itself of its local telephone companies. In addition, several of the examples of divestment for moral reasons are also examples of changes in public policy, as in the example of the United States passing legislation imposing a ban on imports from Burma.

Arguments in Favor of Divestment

Arguments supporting divestment fall into two categories: (1) a positive assumption of rationality or (2) a negative assumption that economic force is the only means for change. Both arguments assume a long time line and the necessity for cooperative effort by the divesting firms and/or governments. The assumption of rationality assumes that the host country will eventually understand that respect for human rights contributes to economic growth. Furthermore, when multinationals divest, they pressure repressive regimes to step down and allow democratic elections, leading to political, economic, and social reforms and to higher economic standards and political and social stability. Not assuming common moral values, Archbishop Desmond Tutu, supporting divestment in Burma, said it was sanctions, not constructive engagement, that brought the end to the apartheid regime in his country of South Africa. He believes that economic might, not moral reasoning, is the only language tyrants understand.

Arguments Against Divestment

Opponents of divestment claim that continuing investment assures employment for the local population and predict that through economic ties the host country is exposed to democratic and free-market processes and will eventually move in that direction. They argue that divestment would jeopardize already tenuous possibilities of democracy. Withdrawing investment leads to shutting down factories, mining, and/or drilling activities, which leads to unemployment. As an example, when the United States banned any new imports from Burma in 2000, reports indicated that 35,000 factory workers lost their jobs. In addition, in the case of Burma, because it is a state-controlled, military-led government, with a state-controlled economy and poor human rights record, and shares a border with China, its largest trading partner, the West fears that any sanctions will force Burma to rely even more on China. The partnership between Burma and China, with its own state-controlled economy and poor human rights record, is seen as threatening to the hope of democracy and capitalism in that region. In contrast, South Africa did not have an economically or politically powerful country as its neighbor, thus posing no particular threat to eventual democratic reforms.

Divine Command Theory

Business leaders, along with society in general, rely on ethical frameworks to guide daily decision-making processes and logically confirm gut feelings. Prominent ethical frameworks such as deontology, utilitarianism, and virtue ethics are popular tools employed in this process. However, various alternative ethical frameworks are also commonly used to determine the morality of contemplated actions. The Divine Command Theory (DCT) is such an alternative ethical framework based on a belief in God and an acceptance that the morality of actions stems directly from God's commands. According to the DCT, an action is morally acceptable if God commanded such action or if a divine command motivates someone to take a morally appropriate action. As commonly formulated, the DCT can be divided into three ethical subframeworks: (1) Religious Communities, (2) Command as Motivation, and (3) Created Morality. All three alternatives are found throughout the Judeo-Christian tradition and certain other theistic religious traditions. The DCT has faced prominent criticisms since its inception beginning with a dilemma posed by Socrates during a heated discussion with an early adherent of the DCT. Over time, many DCT theorists responded to these objections by positing philosophical and religious counterarguments and defending the DCT, whereas others modified the DCT into various iterations addressing such objections while faithfully retaining the core idea that God's commands dictate and/or motivate morality.

Subframeworks of the Divine Command Theory

The Religious Communities Framework

The Religious Communities framework of the DCT posits that God's commands, and only God's commands, define what is morally right and morally wrong. However, this version of the DCT requires that only members of DCT-adhering religious communities are required to interpret and then abide by the commands of God. For instance, certain Christian denominations view the appointment of females in ministry to be contrary to God's commands and, therefore, morally wrong, while other Christian denominations do not interpret God's commands in such a manner and consequently appoint females to ministry positions. Interestingly, many adherents of the Judeo-Christian tradition fall outside of this Religious Communities version of the DCT because they view God's commands as only a partial source of their ethical responsibilities. For example, a Christian might believe that loving a neighbor is morally good even without a corresponding commandment issued by God. This framework acknowledges that the DCT is meaningless to a nonbeliever as one cannot be forced to abide by God's commands without a corresponding belief in a supreme deity. Finally, the Religious Communities framework accepts the idea that groups outside the religious community define morality independent of God's commands and that these interpretations of morality might significantly differ from the interpretations of the religious community.

The Command as Motivation Framework

The Command as Motivation framework of the DCT claims that certain actions are moral independent of any divine command but that God's commands provide people with the necessary and proper motivation to act morally. Therefore, like the Religious Communities framework, the Command as Motivation framework only applies to individuals who sincerely believe in God and are, therefore, motivated to follow God's commands. For example, honesty is a practice explicitly commanded by God in the Judeo-Christian tradition. Assume that an atheist is presented with an opportunity to lie and chooses instead to act honestly. In this instance, the atheist's decision to act honestly is a moral decision—because honesty is moral independent of God's commands—but the honest action in this instance is viewed as coincidence because the atheist will not have the divine motivation required to consistently act honestly. This version of the DCT places God as the motivating force behind ethical actions but relinquishes the idea that moral actions depend on God's will.

The Created Morality Framework

The Created Morality framework of the DCT states that God's will, expressed through God's commands, is the exclusive determinant of morality and that no action can be considered moral if performed without regard to God's commands. In other words, a person must believe that an action is moral because God wills such action to be moral—not because the action is good in and of itself—and then must take action (or refrain from taking action) solely because God has commanded (forbidden) such action. For example, if an atheist refrains from committing adultery based on a deontological belief in a duty to be a faithful spouse and not because God has commanded people to refrain from committing adultery, the atheist has acted unethically under the Created Morality framework. This is true even though the atheist abided by God's command and refrained from committing adultery because the atheist operated under a belief that refraining from adultery was moral without regard to God's commands. Although all three subframeworks of the DCT require that certain people comply with God's commands, only the Created Morality version of the DCT claims that God defines morality for everyone in all circumstances.

Objections to the Divine Command Theory

The most prominent objections to the DCT stem from a Socratic dialogue commonly referred to as the "Euthyphro Dilemma." The dialogue began when Socrates entered into a friendly discussion with an early Athenian adherent of the DCT. The two men were discussing the Athenian gods and the virtue of piety. Euthyphro—the other participant in the discussion—argued that piety was a virtue loved by the gods when Socrates posed the question as to whether the gods love piety because piety is good or whether piety is good because the gods love piety. Over time, this two-part question has been modified—removing the plurality of Athenian gods and replacing them with a singular God and also replacing the virtue of piety with the more generally concept of moral goodness—to form the modern version of the Euthyphro Dilemma. The modern version asks the following question to an adherent of the DCT: Is an action morally good because God commands such action or is the action morally good in and of itself and this goodness constitutes the reason why God commands such action? An affirmative response that an action is good because God commands it can be met with two objections—the Abhorrence Objection and the Emptiness Objection. An affirmative response that an action is good and, because the action is good, God commands such action can be met with the Irrelevance Objection.

The Abhorrence Objection

If an action is good only because God commands such action, then what would happen if God chose to issue an abhorrent command? This criticism can be referred to as the Abhorrence Objection. What if, instead of God commanding that a person love a neighbor, God issued a command that a person must be cruel to a neighbor? Under the DCT, an adherent would now be required to be cruel to a neighbor in order to act in a morally acceptable manner. This type of action contradicts the believer's expectations of God and God's nature, yet strict adherence to the DCT would seemingly require such abhorrent action simply because God commanded it.

The Emptiness Objection

In addition, if any particular action is good only because God commands it, then God serves as the ultimate arbiter of what is morally right and what is morally wrong. An issue then arises as to whether the sentence "God is good" has any meaning in a world where God determines what is good. This criticism can be referred to as the Emptiness Objection. For example, DCT proponents state that "God is good," while the DCT itself claims that "Good is whatever God commands." The Emptiness Objection transposes these statements and claims that saying "God is good" is the same as saying "God is whatever God commands." The argument is then made that this statement is empty, trivial, or entirely without meaning. Because adherents of the DCT strongly believe that the concepts "God is good" and "Good is whatever God commands" have meaning, then any suggestion that these belief statements are meaningless tautologies undermines a core principle of the DCT.

The Irrelevance Objection

Alternatively, a response that an action is good and this goodness is the reason God commands such action is met with the Irrelevance Objection. This objection states that if an action can be considered good regardless of God's commands then God's commands cannot be the source of all moral goodness. This places a stumbling block in front of the DCT argument that all moral correctness and moral wrongness stem solely from God's commands. For instance, if loving one's neighbor is good in and of itself and this goodness is why God commands people to love their neighbors, then God's specific command becomes irrelevant to moral goodness—the action of loving a neighbor is already good.

Responses to the Euthyphro Dilemma

Many philosophers and religious adherents over many centuries have attempted to counter the objections presented by the Euthyphro Dilemma. These defenders of the DCT argue that the logical flow of Socrates' argument is flawed and that a believer in the DCT is not limited in choosing either the first or the second prong of the Euthyphro Dilemma. DCT adherents also attempt to specifically counter each of the three objections presented by the Euthyphro Dilemma.

Some defenders of the DCT counter the Abhorrence Objection by claiming that God is a loving God and would never issue abhorrent commands. This counterargument makes the Abhorrence Objection meaningless because there is no possibility that God would issue abhorrent commands. Other DCT proponents argue that God's nature prevents God from issuing abhorrent commands. This specific counterargument makes the Abhorrence Objection irrelevant because God is restrained from issuing abhorrent commands.

The Emptiness Objection can be countered by the idea that it is not an empty statement to claim that "God is what God commands." This counterargument states that because God is omnipotent and has the power to act differently than specific commandments, it is significant that God chooses to act in accordance with such commandments. Therefore, the statement that God is what God commands is not a meaningless tautology and, indeed, shows that God has made a choice to comply with specific commandments.

The Irrelevance Objection can be countered with the idea that God cannot be considered irrelevant even if good is determined to exist independent of God's specific commands. The counterargument is as follows: If God, before issuing any commands, defined what good is and then, at a later time, commanded that people act in accordance with what is already good, this process makes God relevant and not irrelevant. Without God, good would not exist in the first place.

A Modified Divine Command Theory Framework

The philosopher Robert Adams, unsatisfied with responses to the Euthyphro Dilemma objections—particularly the response to the Abhorrence Objection—created a new iteration of the DCT. This new version modified the idea that moral wrongness stems from violating the commands of God with the idea that moral wrongness stems from violating the commands of *a loving* God. This modified DCT renders the Abhorrence Objection meaningless because a loving God would never issue abhorrent commands. This theory is further supported by the fact that a loving God is the theistic model prominent in the Judeo-Christian tradition and, therefore, such a nature of God makes logical sense to believers.

A major criticism of this modified theory relates to the believer's concept of the supremacy of God and the corresponding requirement to obey God in accordance with this supremacy. For instance, when a person believes that an apparently abhorrent command would not come from a loving God, that person is allowed to freely disregard the command. This decision would be considered ethical under the modified theory even though the actor is purposefully disobeying the commands of the supreme authority.

The Divine Command Theory Today

The DCT is as old as God's first commandment. The theory has gone through various iterations culminating in three commonly known subframeworks. Today, the DCT is viewed as a substantive ethical framework whose merits and flaws continue to be debated in the public square with input coming from various arenas—including philosophy, religion, and even the business community. These debates continue to focus on the objections created by the Euthyphro Dilemma, and the DCT continues to be modified into new versions with the continuity of a consistent focus on God's commands as defining or at least motivating appropriate moral conduct.

Doctrine of Double Effect

The Doctrine of Double Effect is an ethical principle that is used to explain how certain actions that would cause considerable harm can be morally permissible where the bringing about of such harm is a side effect of the promotion of some good end. This principle is usually invoked by ethicists who subscribe to a deontological, or rule-based, approach to ethics, especially those who subscribe to the Judeo-Christian ethical tradition. (Indeed, Thomas Aquinas is credited with developing the first formulation of this Doctrine in his discussion of self-defense in the *Summa Theologica.*) Such ethicists are unwilling to hold that the good that could be brought about by the infliction of such harm would itself justify the bringing about of the harm, as would, for example, a utilitarian ethicist.

According to the proponents of the Doctrine of Double Effect, four conditions must be met in order for it to be justly invoked to explain the moral permissibility of an act whose performance would cause harm as a side effect. First, the act itself must be morally good or at least morally neutral. Second, the agent performing the act must not intend the bad effect, but must merely foresee that it would occur as a result of his action. Third, the good effect that is intended must be produced directly by the act that the agent performs; it cannot be produced through the bad effect. That is, the bad effect cannot be used as a means to secure the good effect; it can only flow from the agent's act as a corollary effect of it. Finally, the good effect must be proportionate to the bad effect.

To illustrate this, consider an example where a developer builds a housing project, knowing that to do so will have the side effect of causing environmental damage as a result of the increase in fuel emissions from the increased use of cars in the vicinity. According to the proponents of the Doctrine of Double Effect, the developer is permitted to build the housing project, even if his doing so will lead to environmental damage, provided that he only intends to build the houses and merely foresees such damage occurring. The building of houses is itself a morally neutral act, the bad effect is foreseen but not intended, the good effect is not produced through the building of the houses; this is merely a corollary to the developer's act, and the badness of the environmental damage is outweighed by the goodness of providing housing.

The Doctrine of Double Effect is, however, subject to the criticism that there is no more than a semantic distinction between what is foreseen and what is intended in the cases where the Doctrine is invoked. Thus, when the developer above builds his houses he must intend to do, and not just foresee, environmental damage, since the two effects are inherently linked. As such, it is argued, the core distinction of the Doctrine is untenable.

Doha Development Round of 2001

The Doha Development Round of 2001 was a forum created by the World Trade Organization (WTO)—the international institution responsible for overseeing the world trading system and policy—to negotiate and discuss issues related to global trade. It was named after the city in which the conference took place. Ministers from 144 WTO member countries gathered in Doha to reach consensus on how to integrate the world's poorest nations into the world economy in November of 2001.

Arranged by the WTO, the declaration of the Fourth Ministerial Conference in Doha, Qatar, was the eighth round of trade liberalization held since 1948. Following the Uruguay Round of 1986–1994, which created the WTO as the successor to the General Agreement on Tariffs and Trade, the Doha Round was held to bring to the forefront the needs and special interests of developing countries to the WTO's agenda. The Doha conference marked the start of a new series of multilateral trade talks scheduled to end in 2004.

The agenda set at Doha and discussed at successive meetings in Cancun in 2003 focused on dismantling trade barriers for developing nations to promote growth. Toward this end, the main issues centered on agricultural subsidies, liberalizing trade of manufactured goods and services, and intellectual property rights protection.

Related to agriculture, the declaration defined the objective of establishing a fair global market-oriented trading system that would allow market access to all developing nations. The intent was to reduce and eventually eliminate all forms of export subsidies for these countries and to significantly reduce any domestic trade support within nations. The discussion on the reduction of export subsidies also covered industrial goods. Tariff reduction and all nontariff barriers on clothing, textiles, and other nonagricultural products were also agreed by the ministers for the least-developed countries. However, none of this was to be at the expense of the environment. The Ministerial Declaration included a commitment to environmental sustainable development in all member countries by defining, in part, the relationship between WTO trade rules and environmental agreements.

One of the more pressing issues negotiated at Doha involved trade-related aspects of intellectual property rights (TRIPS). The stated goal of the declaration was to allow access to existing medicines and to encourage the development of new pharmaceutical drugs to improve public health in developing nations. These countries lobbied for relaxed rules on pharmaceutical inventions from developed nations. Building on talks held at the Uruguay Round, Third World nations demanded greater access to essential medicine to deal with epidemics such as AIDS. This accessibility involved offering lower-priced generic drugs to countries unable to solve public health crises. Demonstrating the grand importance placed on this issue, the ministers at Doha created a separate declaration on TRIPS. Member governments of the WTO are not to be prevented from taking measures to protect their country's right to public health under the TRIPS Agreement. The council set out to discover solutions for compulsory licensing of medicines and agreed to extend the deadline for underdeveloped nations to establish provisions on drug patents until January 2016.

The WTO expanded its membership at Doha to include China and the Taiwan Province of China. This accession reinforced the WTO's goal of facilitating the addition of other less-developed nations. Related to WTO membership, the Doha meeting emphasized the importance of transparency of operations and information and nondiscrimination of negotiated agreements for all members. Special provisions were established for developing countries to receive special and differential treatment to implement the agreements resulting from the round. The desired long-term implications of the discussions were to bring about the benefits of free trade and the opening of markets to developing countries. This has yet to be determined.

—David M. Wasieleski

Domini Social Investments

After her clients expressed concern about investing in defense contractors, tobacco firms, and other types of companies, stockbroker Amy Domini realized the opportunity and importance of screening firms for environmental, social, and ethical concerns. It was the early 1980s and, at the time, there was only a small group of professionals and investors dedicated to this area. In 1984, Domini coauthored *Ethical Investing*, one of the first books to summarize and popularize the strategies for linking values and beliefs with investment portfolios. More than two decades later, Domini's name is synonymous with socially responsible investing. *Time* magazine named Domini one of 2005's 100 most influential people.

In 1989, Domini, Peter Kinder, and Steve Lydenberg launched the Domini 400 Social Index, a market capitalization–weighted common stock index. The Domini 400 index serves as a benchmark for examining the performance of firms that pass broad social screens on diversity, the natural environment, employee relations, and product safety. Companies included in the index are, on the whole, relatively strong in these areas. Firms that generate more than 2% of sales from military weaponry, receive any revenue from alcohol or tobacco products, use nuclear energy, or engage in gaming activities are ineligible for the index. Since its inception, the Domini 400 Social Index has provided evidence that social and environmental screens do not limit financial performance.

After launching the index, Domini and her colleagues introduced the Domini Social Equity Fund to track the index. The fund uses a full replication strategy, which means it invests in the 400 public companies found in the index. Investors in the fund can expect a return just short of the index's performance, since operating expenses must be covered for the fund. In addition to social screens, the fund also advances its social and environmental goals through a variety of strategies. Domini strives to create an open dialogue with top executives and other stakeholders in order to advance its goals and create corporate change. When dialogue stalls or management is unresponsive, fund representatives will often file shareholder resolutions, usually in conjunction with other social investment groups. Domini has filed nearly 100 shareholder resolutions on a variety of issues, including recycling, human rights, sweatshop labor, diversity, global warming, and sustainability reporting. Domini considers these resolutions a success when they are withdrawn because the company has agreed to pursue some or part of the request. Domini was also the first fund to disclose its proxy voting guidelines and actions to investors.

In addition to the index and fund, Domini has introduced the Domini Social Bond Fund and the Domini Money Market Account. These products support community economic development loans and initiatives. Domini is also affiliated with KLD Research & Analytics, Inc., a firm that specializes in corporate accountability research. In all its activities, Domini focuses on the three pillars of social investing, including (1) social and environmental screening, (2) shareholder advocacy, and (3) community investing.

Double Taxation

Double taxation refers to situations in which the same financial assets or earnings are subject to taxation at two different levels. For instance, one form of double taxation occurs when income from foreign investments is taxed both by the country in which it is earned and by the country in which the investor resides. To prevent this type of double taxation, many double taxation treaties currently exist between countries that allow income recipients to offset the tax already paid on investment income in another country against their tax liability in their country of residence.

Another example of double taxation can occur with regard to the taxation of corporate earnings. This happens when corporate earnings are taxed at both the corporate level and again at the level of shareholder dividends. That is, the earnings of a corporation are first taxed as corporate income and then, when that income has been distributed to the shareholders of the corporation in the form of dividends, these earnings are taxed as the personal income of the shareholders. Since the shareholders are the owners of the corporation, they are effectively paying taxes twice on the same income, once as the owners and again as part of their personal income tax. In the United States, this type of taxation is widespread, because the tax on corporate profits and the personal dividend income tax are federal, and thus universal, taxes. Many states have personal income taxes that include the taxation of dividends as well.

This latter form of double taxation is particularly contentious and has been the subject of much debate, particularly in the United States where recent efforts to reduce or eliminate this form of double taxation have been widely disputed. Opponents of double taxation on corporate earnings contend that the practice is both unfair and inefficient. They claim that the practice is inherently unfair in treating this type of corporate income differently than other forms of income in subjecting it to taxation twice. Opponents also claim that the practice engenders economic inefficiency since it encourages companies to finance themselves with debt, which is tax deductible, and to retain profits rather than pass them on to investors. Opponents also argue that the elimination of dividend taxes would stimulate the economy by encouraging individual investment in corporations.

On the other hand, proponents argue that the economic effects of reducing or eliminating double taxation of this form are overstated and that such cuts would only benefit the wealthiest persons, whose earnings are substantially constituted by dividend income. Here, for example, proponents argue that eliminating dividend taxation could actually stifle capital reinvestment and thus discourage economic growth. Some proponents also question whether the taxation of dividends truly constitutes a form of double taxation. In this regard, they argue that there is a legal and conceptual distinction between a corporation and its shareholders because the former, as a unique legal entity, has rights, privileges, and obligations that are distinct from those of the latter. As such, they argue that there is nothing unfair in taxing the income of the corporation distinctly from the personal income of its shareholders.

Dow Corning

Dow Corning Corp. was established in 1943 as the joint venture between Dow Chemical and Corning Glass to produce silicones for commercial purposes. Later, Dow Corning gained notoriety for its manufacture of the controversial silicone breast implants. In 1992, after thousands of lawsuits and several multimillion dollar jury awards, Dow Corning discontinued the manufacture of its silicone implants and filed bankruptcy in 1995. A Mayo Clinic study published in the *New England Journal of Medicine* in June of 1994 showed that there was no difference between women with silicone implants and those without with respect to the incidence of connective-tissue disease. Twenty other large-scale clinical studies have also shown no correlation between silicone and any other disease. This case highlights several social issues: corporate responsibility for the safety of their products, scientific studies versus public opinion, and patient safety versus patient choice.

Dow Corning silicone breast implants were first made available to plastic surgeons in 1964 along with silicone chin and testicular prostheses. Since that time numerous companies both domestic and international have manufactured implants. It is estimated that over 1 million American women now have silicone breast implants.

In the 1960s, the implants were not subject to any government regulations. In 1976, Congress gave the U.S. Food and Drug Administration (FDA) authority to regulate all medical devices. Because implants had been on the market for 15 years, they were "grandfathered" in and classified as "Class II" devices, meaning that they did not need testing to remain on the market.

In the 1980s, women with silicone implants reported certain patterns of illness, including severe joint and muscle pain, fatigue, and weight loss. It was alleged that leaky silicone bags were responsible for various autoimmune disorders such as rheumatoid arthritis, lupus erythematosus, and scleroderma, the latter being a disease in which the body's immune system attacks its own connective tissue. Because of these concerns, the FDA reclassified silicone implants as "Class III" in 1986. Thereafter, all manufacturers of the silicone implants were ordered to file Premarket Approval Applications (PMAAs), backed by valid scientific data to prove the safety and effectiveness of their devices. The PMAAs were due by 1991 at which time the FDA would have 180 days to review the data and rule. The FDA's advisory panel composed of experts from various fields, including plastic surgery, oncology, epidemiology, internal medicine, immunology, radiology, pathology, toxicology, as well as industry and consumer groups, complained of a lack of hard scientific data. The symptoms the women who brought lawsuits complained of were not uncommon in the general population. For example, connective-tissue disease strikes 1% of all women. The percentage of women who suffer from connective-tissue disease with implants is statistically indistinguishable from the population at large and thus impossible to distinguish coincidence from causation. Furthermore, not only does silicone appear to be chemically inert, but silicone from a ruptured implant will remain trapped inside a fibrous capsule of scar tissue. After studying the data submitted by the various manufacturers the panel ruled that the manufacturers had failed to prove that their devices were safe; neither was there evidence that they were harmful. The FDA could not vouch for the safety of implants without more clinical research. The panel advised the implants to be made available to women on a limited basis.

In 1991, an Alabama jury heard the case of *Toole v. Baxter* and awarded Brenda Toole, who showed only preliminary symptoms of autoimmune problems, $5.4 million. In the same year, Dow Corning was found guilty of negligence in a case brought by Mariann Hopkins and ordered to pay $7.3 million. After the Hopkins case, the new chairman of the FDA, David A. Kessler, called for a moratorium on breast implants, but advised women who had implants not to have them removed. The moratorium terrified women who had received implants and galvanized legal forces against manufacturers of silicone bags. Meanwhile, nine medical and cancer survivor groups petitioned the FDA to make breast implants accessible to women after breast cancer surgery. In April of 1992, silicone implants were made available only to women who agreed to participate in clinical studies.

In March 1994, the largest ever class action settlement was finalized with manufacturers Dow Corning, Baxter, Bristol-Myers Squibb/MEC, and 3M. The manufacturers claimed that there was no scientific evidence linking silicone breast implants with autoimmune diseases. Nonetheless, set monetary amounts were awarded to women with specific medical conditions with no requirements to prove that implants caused their ailments.

In 1994 and 1995, several new studies were published in the *New England Journal of Medicine*. They included the Mayo Clinic and the Harvard Nurses epidemiologic studies, both of which showed no increased risk of connective-tissue disease in women with implants. The American College of Rheumatology issued a statement saying the evidence was compelling that implants did not cause systemic disease. The *Journal of the National Cancer Institute* published a review of scores of medical studies in September 1997 that concluded breast implants do not cause breast cancer. Reports from two large Scandinavian studies published in April 1998 also concluded that silicone implants are not linked to neurological disease.

Facing 20,000 lawsuits and approximately 410,000 potential claims that had been filed in the global settlement, Dow Corning filed for Chapter 11 bankruptcy in May of 1995. The bankruptcy essentially halted all litigation against Dow Corning.

In June of 1999, Dow Corning filed for bankruptcy reorganization that included a $3.2 billion settlement with women who said their implants had made them ill. Dow Corning emerged from bankruptcy protection on June 1, 2004, after a group of Nevada women dropped their opposition to a settlement plan. The reorganization efforts under Chapter 11 took longer than any in history, lasting 3,305 days. Dow Corning continues to be a major supplier of silicone for everything from cleaners and adhesives to automobiles and buildings.

On November 17, 2006, the FDA ended the 14-year ban and approved silicone implants. Dow Corning does not plan to manufacture the implants.

Downsizing

Downsizing is a reduction in a company's employees and positions undertaken as an intentional, proactive management strategy to improve the company's performance. Companies such as Cisco, Dell, Aetna, AT&T, General Motors, and many others have at various times implemented large-scale downsizing programs. Downsizing differs from terminations for cause, in which employees are released in response to issues with their behavior or performance, and from attrition, in which electing to not fill positions as they are vacated reduces staffing levels. Downsizing is also different from situations in which a company is forced to lay off all employees because it ceases operations, by choice of owners or by bankruptcy. During a downsizing, employees whose performance may be satisfactory or even above average are terminated through no fault of their own.

Intended reductions of employees have become common practices in both the U.S. corporate and public sectors. During the 1990s, downsizing became a favorite strategy of many companies in response to fundamental structural changes in the world's economy. The term *rightsizing* is commonly used to describe downsizing that companies believe to be a proactive approach to dealing with overstaffing. Between 1979 and 1999, approximately 43 million jobs were downsized in the United States. Companies have settled into a routine of reducing and rebuilding large segments of their workforce in a continuous restructuring process. Many companies may now feel pressured to downsize because they want to be perceived as operating "lean and mean."

In general, companies adopt a downsizing strategy to achieve one of three goals—to save, to improve, or to change the company. Downsizing to save the company may be undertaken when a financial crisis requires the company to reduce labor costs as a last resort before bankruptcy. Downsizing to improve the company may be undertaken as a preventive measure to reduce labor costs to fend off a looming financial crisis.

Reducing staff is usually the fastest way to affect the bottom line because of accounting rules that allow all costs associated with downsizing to be expensed in one quarter, a tactic that is usually viewed favorably by financial analysts. Downsizing can also cause considerable stress and heartache for the individuals affected as well as those in management who must develop and/or implement the downsizing plan.

Downsizing to change the company may be undertaken through strategic staffing reductions, perhaps as part of a merger or acquisition, or in response to a decision to outsource a function. Many companies believe downsizing to facilitate organizational change will have a positive impact on their long-term viability; however, researchers have been unable to find consistent evidence that downsizing is positively correlated with future financial performance. Adopting a downsizing strategy is more ethically murky, therefore, when the company is performing well and is in no imminent financial danger.

The stock market generally reacts favorably to a decision to downsize, with a company's stock price rising in response to the announcement. Over time, however, companies that downsize to improve performance often do not attain the desired results because of the emotional impact on the survivors, increases in uncertainty, and changes in individual work responsibilities for which employees are ill prepared. In addition, when companies elect to downsize to save or improve the business, it may be unclear as to whether this is the best option for the company or just the most expedient.

The pressures associated with downsizing can only be justified if it does in fact improve the company's performance; however, there is contradictory evidence as to the actual benefits. There are several ethical theories that may be applied to assess the morality of a downsizing strategy. Utilitarian theory contends that a decision is moral if it results in the greater good for the greatest number of people. This is the most commonly used justification for downsizing to save or improve the company, that is, laying off 1,000 employees will save the company from bankruptcy and thus save the jobs of 20,000 employees.

Kantianism and rights theories contend that individuals have rights that preclude treating them as a means to the ends of other people. As such, the organization has a duty to act in a way that doesn't violate individual rights. These theories may not necessarily dictate that companies desist from conducting layoffs under any circumstances. They can, however, influence how companies implement layoffs in terms of notifications, and providing severance packages and outplacement services.

Social contract theory suggests that people expect companies to be good corporate citizens in keeping with the values and mores of the community. The degree to which downsizing is considered acceptable may depend on what the community finds acceptable. The terms of the social contract may also be defined by the norms of the industry; if downsizing is widely accepted in an industry, it is more likely that a company in the industry will adopt a downsizing strategy.

Justice theory suggests that downsizing may be perceived as fair if the layoffs are evenly distributed throughout the organizational hierarchy, adequate notice is given, the downsized employees are given fair compensation, and impartial procedures are used to determine who is downsized. Perceptions of fairness are also enhanced if employees believe that external forces are driving the downsizing decision and the downsizing is for the overall good of the organization.

The manner in which the reduction plan is designed, implemented, and communicated is, therefore, critical to mitigate negative repercussions from downsizing. Many companies prefer to move quickly when downsizing, but investing time in planning and consideration of all the implications can greatly enhance the outcomes. In determining the appropriate mix and level of staff to meet its strategic goals, companies must also consider fairness issues related to Title VII, that is, age, race, sex, and so on, as well as the terms of labor agreements if applicable.

Companies can minimize the backlash from employees and the public by providing emotional and financial support to the employees affected. Providing advance notice of the pending layoffs, outplacement counseling, extended benefits, and severance pay will benefit the employees who are being terminated and may also help alleviate the "survivor's guilt" of the employees who are retained. Frequent, consistent, and honest communication to employees throughout the downsizing process is also critical to minimize the effect on employee morale and performance during the downsizing and in its aftermath.

Due Care Theory

A consumer expects, as a matter of course, that a product purchased is as safe as possible. In recent years, the issue of product safety and the question of the locus of responsibility for unsafe products has been an important topic in business ethics. One approach to product liability is that of "due care."

The "due care" approach is based on the assumption that in commercial transactions, the consumer and manufacturer do not meet as equals in the relationship. The manufacturer, and to a lesser degree the retailer, has greater knowledge and expertise. This leads to assigning the duty to deliver a product that lives up to the expressed and limited claims made about the product to these individuals. The manufacturer is held to the duty of "due care" even if an explicit disclaimer of responsibility is made. The manufacturer in virtue of having greater expertise has a positive moral duty to take whatever steps necessary to ensure the safety of a product. The manufacturer is obligated to take all reasonable precautions to ensure that products are free of defects that could potentially cause harm to the consumer. Every individual has a moral duty to refrain from any action that could harm another, and conversely, every individual has a right to expect such treatment from others. Failure to take "due care" is a breach of moral duty and violates the rights of the consumer who may be injured. The right of the consumer to have a safe product rests on the need of the consumer to rely on the expertise of the manufacturer.

Legal Context

The legal expression of the "due care" theory is expressed in the law of torts, which holds persons liable for acts of negligence. The definition is contained in the Second Restatement of Torts, Section 2820, as a conduct that does not meet the established legal standard for the protection of others against unreasonable risk of harm. Product liability falls under the law of torts, which governs private transactions in which there is no written contract. Under tort law, a person has a claim against another if one has been harmed due to an act or omission that constitutes a breach of duty. Tort law has three purposes. First, it is designed to compensate the injured party, and second, it intends to provide incentives to manufacturers to take precautions in the production of goods and services. The third purpose of tort law is to punish offenders. The standard of care is the "reasonable person" standard expressed as what care a reasonable person would exercise in a given situation. The standard is obviously higher for those persons possessing greater skill or knowledge. In this case, the manufacturer can be assumed to have greater knowledge about the product and its use than the consumer. Therefore, the manufacturer can be held legally liable for harm caused by the product.

The standard applies to all areas of product development and production. In design, the product ought to be in accordance with government and industry standards. It must be designed to be safe under all foreseeable conditions, including possible misuse by the consumer. To ensure design integrity, many manufacturers have established review boards to evaluate the product for safety. There are also external firms such as the Underwriters Laboratory that reviews electrical products for safety and quality.

Another area covered by the standard is the choice and use of materials. These materials must meet government and industry standards and have the necessary strength to withstand normal and reasonable use by the consumer. The manufacturer is obligated to test the product adequately to be able to guarantee durability in ordinary use. Due care must be exercised in the production process as well. Parts must be fabricated to stated specifications, assembly ought to be carefully done, and adequate inspections conducted. It is critical that employers provide employees with the training and working conditions needed to perform their work satisfactorily. Quality control must be a central concern. The manufacturer must conduct systematic and thorough inspections of design, materials, and the production process. These inspections may be done by either trained personnel or specially designed and calibrated machines. In certain situations, every individual product is inspected, while in other situations only sampling is done. The manufacturer is obligated to maintain accurate records of inspections. Care must also be exercised in the packaging and labeling of a product to ensure that the product is not damaged in transit and that sufficient directions are included so that the consumer has clear directions on the use of the product and is warned of any dangers that may be associated with use or misuse. The manufacturer is obligated to warn the consumer of any hazards that are discovered later. For example, automobile manufacturers issue recalls when safety and mechanical defects are discovered after the model has been in use for a period of time.

The U.S. Court of Appeals has held that the manufacturer's obligation to ensure product safety to use as intended or anticipated under all conditions under which injury could occur extends to foreseeable misuse by the consumer. In *Larsen v. General Motors Corp.*, due care included a duty to design the product so that it would meet any emergency use that could reasonably be anticipated. Generally, the courts have held to a flexible standard derived from Justice Hand's formulation of the negligence rule, such as in *United States v. Carroll Towing Co*. This formulation states that negligence involves the probability of harm, the severity of the potential harm, and the burden of protecting against harm. Manufacturers have a greater obligation to protect consumers when injury is more likely to occur; when harm is likely to be greater and when the cost of avoiding injury is relatively minor—the case of the Ford Pinto.

Due care is difficult to apply legally because the fact that a product is defective is not, in itself, sufficient for holding that the manufacturer has failed to exercise due care. For negligence to be proven, one must have knowledge of specific acts that the manufacturer either performed or failed to perform that lead to injury.

Ethical Justification of Due Care

Morally due care rests on the principle that agents have a moral obligation not to harm or injure others by their acts. This obligation is particularly stringent when those who might be harmed are vulnerable and dependent on the judgment and actions of the agent. Various moral perspectives support due care.

The Aristotelian principle of compensatory justice holds that an agent who harms another owes the injured person compensation. Compensatory justice traditionally possesses three characteristics. First, the action that causes the injury must involve wrong or negligent behavior on the part of the agent. Second, the action taken by the agent must be the real cause of the harm or injury, and finally, the injury must have been voluntarily inflicted. The manufacturer who fails to exercise due care is responsible for compensating injured parties. An "ethics of care" approach can also justify due care theory by holding that the well-being of those with whom one has a special relationship, particularly one of dependence, imposes the requirement that one ensure that one's care for the dependent person meets that person's needs and qualities.

Utilitarianism holds that the morality of actions is determined by the consequences of that action. An action is right if it leads to the best possible balance of good over bad consequences, thereby maximizing benefits and minimizing harm for as great a number of people as possible. Rule Utilitarianism, a form of utilitarianism, holds that actions can be justified by an appeal to abstract moral rules. These rules can be justified by an appeal to the principle of utility. These moral rules are not subject to change in light of specific circumstances. Utilitarian rules are, then, firm and protective of individuals. Rule Utilitarianism defends the principle of due care on the grounds that if the rule is accepted, everyone's welfare will be advanced.

Due care can also be justified using a Kantian approach, which argues that persons ought to be treated as ends and never exclusively as means to other ends. One is obligated to respect others as autonomous agents. Respect for human life is a necessary, not optional, component of the obligation that manufacturers have with respect to product safety. The motives for human action are central to a Kantian analysis because this theory expects persons to make correct decisions for the right reasons. A manufacturer must do the right thing, not because it is profitable or to avoid bad publicity but because the action is the right thing to do.

The application of the principles of due care presents difficulties because there is no clear method for determining when due care has been adequately exercised. There is no tried and true way to determine how far a producer must go to ensure that due care has been taken. No product is intrinsically risk free. If one was to apply a utilitarian analysis, one could hold that the greater the probability of harm, the more a corporation is required to do with respect to ensuring the safety of the product, but even here it is difficult to evaluate the balance between higher risks in relation to higher costs. Due care assumes that risks can be identified before the product hits the market. This is not necessarily a valid assumption because many defects take an extended period of use of the product to emerge. Some argue that the due care approach is an overly paternalistic one that places too much responsibility on the manufacturer and too little responsibility on the consumer who uses the product.

Due Diligence

Due diligence is a standard of vigilance, attentiveness, and care that is often exercised in various professional and societal settings. The effort is measured by the circumstances under which it is applied, with the expectation that it will be conducted with a level of reasonableness and prudence appropriate for the particular circumstances. Due diligence is generally expected in any interaction when one party owes a duty of care to the other party, although it is most often associated with professionals and businesses. For example, a patient expects his or her doctor to exercise due diligence when prescribing medications to ensure there are no allergic reactions or harmful interactions with other medications the patient may be taking. Professionals such as lawyers, psychologists, and consultants must also exercise due diligence by protecting the privacy of their clients and guaranteeing confidentiality with regard to sensitive personal information that should not be shared with others. Expectations of due diligence can also evolve with changing social norms. For instance, organizations are now expected to be greater advocates for their stakeholders through various responsible business activities that improve both economic and social well-being. Politicians are also expected to acknowledge and address emerging and sometimes controversial social issues that interest certain groups within the general public. In addition, accounting professionals are incorporating due diligence services for their clients, and services include reviewing benefits plans for funding sufficiency and compliance with regulatory requirements, checking an entity's accounting systems and internal controls, and assessing the potential costs savings in combining the operations of a target entity with those of a client enterprise.

Due diligence is also essential in commercial real estate. Potential investors in commercial real estate recognize that they must look beyond the traditional priority of location and verify factors such as compliance with zoning laws, the structural soundness of buildings, and most important, compliance with environmental laws. The new owner of commercial property can be potentially liable for millions of dollars of remediation costs and fines as a result of a prior owner's violations.

Due diligence is often considered an ethical issue in business because without such reasonableness and prudence there is an opportunity for management to misrepresent information to key stakeholders. Furthermore, managers might ignore questionable behavior in a company or not take appropriate action to prevent workplace misconduct. Proper due diligence should therefore be viewed as a responsible business practice, and the practice should be included in the strategic planning of an organization.

The process of due diligence is most commonly applied to business transactions, often in the context of the sale of a business. Due diligence is expected of the buyer to ensure that all relevant facts regarding the acquisition target have been ascertained prior to consummation of the purchase. Due diligence is also expected in other business contexts, most notably mergers or consolidations, funding new ventures, performance of partnership duties, as well as within the mutual fund industry. These due diligence expectations arise from, and are enforced by, the common law of the United States (which is a body of law evolving from numerous court decisions).

The standards of due diligence can also be applied through federal statutes. For example, Section 11 of the Securities Act of 1933 may protect issuers of publicly traded stock from liability for inaccurate statements if they can show they performed adequate due diligence in ascertaining the veracity of those statements. In addition, Chapter 8 of the Federal Sentencing Guidelines allows for the reduction of sanctions for organizations that have exercised due diligence by establishing compliance and ethics programs.

Due Diligence in Business Acquisitions and Venture Funding

When a business is being acquired, whether through outright purchase or through a merger or consolidation, it is incumbent on the acquiring entity to perform due diligence on the acquisition target. Due diligence primarily involves, but is certainly not limited to, examining the financial books of the acquisition target to ensure their accuracy. Due diligence also includes examination of the legal, strategic, and operational aspects of the target. The goal of the due diligence is to ensure that all is known about the business and risks associated with the acquisition target. Thorough due diligence may ultimately lead to the terms of the transaction being altered or even the acquisition being abandoned altogether.

During the due diligence process, there exists a potential tension between the acquirer and the acquisition target. Due diligence is an obligation of the acquirer, performed for its own financial benefit. To what extent must the acquisition target participate in the due diligence process? Obviously, the target must supply access to the relevant supporting information. And the information supplied must be truthful—the acquisition target can be liable for fraud if it misrepresents material information. On the other hand, must the target disclose information the acquirer fails to ask for? The acquisition target can also be liable for fraud if it fails to disclose significant information that causes the transaction to be materially misrepresented. Short of this legal standard, the issue is whether the acquisition target is ethically bound to be more forthcoming than if it strictly complied with only the literal requests of the acquirer.

These same issues apply when an investment is being made in a new business venture. Reflecting how the standards of due diligence vary with the particular circumstances, due diligence performed on a new venture is necessarily going to be less thorough, as the venture has less history to examine. In this regard, the potential investor must accept a higher level of risk, regardless of the level of due diligence performed.

Due Diligence in Joint Ventures and Mutual Funds

It is important to understand that there is risk associated with any business transaction. Due diligence does not guarantee the success of a venture or transaction—although its purpose is to minimize the risk of failure. For example, where a joint venture seeks to acquire another business, some members of the joint venture may rely on other members of the joint venture to perform due diligence as part of the acquisition process—and failure to do so could constitute a breach of the fiduciary duty that all members of the joint venture owe to each other (a fiduciary relationship is one of trust and confidence). But the due diligence process does not alone guarantee success of the joint venture. Bad business judgment leading to the failure of the venture, despite due diligence, does not constitute a breach of a fiduciary duty.

Due diligence also plays an important role in emerging trends in the mutual funds industry. As the popularity of hedge funds has grown, so has the popularity of funds of funds, which are portfolios of hedge funds. (While there is no exact definition of hedge funds, their most common attribute is engaging in short-term, highly speculative trades in an effort to achieve above-average returns regardless of market conditions.) To protect their investors, managers of funds of funds are expected to perform due diligence on the funds in which they invest. However, as the collapse of the multimillion dollar Bayou Group hedge fund has exposed, the same managers who are to perform due diligence on a hedge fund are also paid a percentage (up to 3%) of the assets they invest with the fund. While funds of funds extol the extensiveness of their due diligence relative to the funds they invest in, the fact remains that receipt of fees for investing in the hedge funds raises significant conflicts of interest. The obvious concern is that a fund manager may be less prudent to receive the hedge fund fees.

Due Diligence Requirements Under U.S. Securities Laws

Under the Securities Act of 1933, certain securities cannot be sold unless the seller has registered them by filing a registration statement with the Securities and Exchange Commission. If any part of the registration statement is false or misleading, any purchaser of securities sold pursuant to such registration statement can bring suit under Section 11 of the Securities Act against certain people involved in the publication of the registration statement, including the issuer of the securities, directors of the issuer, anyone who signed the registration statement, the underwriters of the issue, and experts named as having prepared or certified a false part of the statement. Under certain circumstances, a defendant against a Section 11 claim may be able to assert a due diligence defense and, thus, escape liability. To successfully assert a due diligence defense, the accused will have to prove it had, after a reasonable investigation, reasonable grounds to believe, and did believe, that the statements in the registration statement were true.

Generally, the more experience with, and control over, the issuer a person has, the greater the standards required in performing due diligence—because it is assumed that someone so close to the issuer would be aware of any mistakes or omissions in its registration statements. For example, inside directors (i.e., directors who are also officers of the corporation) have not generally been able to use the due diligence defense, on the basis that they are intimately involved in the operations of the business. Outside directors (i.e., directors who are not also officers of the corporation), however, have been considered to have shown due diligence and, therefore, escaped liability for a fraudulent prospectus, by pursuing a reasonable investigation of the accuracy of the securities registration statement by relying on independent audits and investigations by accounting firms, underwriters, and the company's management. However, some courts have held outside directors did not show adequate due diligence by merely relying on information supplied by other officers and directors of the company. Likewise, auditors have been found to have failed to show adequate due diligence by relying solely on answers given by the corporate officers without making an independent investigation.

Underwriters of a securities offering have been deemed to have performed due diligence in investigating a corporation that was issuing securities by, for example, thoroughly analyzing the issuer, its finances, management and future plans, the state of the relevant industry, and the reputation of the corporation in its industry. There may, however, be obstacles to performing adequate due diligence when the possessor of information is adverse to the process. For example, where a company was raising money through a public offering to acquire another company, the owner of the "target" company refused to provide certain information. The underwriters of the public offering were deemed to have performed their due diligence despite being unable to obtain the information in question—even though the omission of the information was deemed to be material.

Due Diligence Under the Federal Sentencing Guidelines

In 1984, Congress passed the Sentencing Reform Act in an attempt to eliminate disparity in sentencing for federal criminal violations. The Sentencing Reform Act of 1984 created the U.S. Sentencing Commission that issued guidelines for compliance with the act. Chapter 8 of the *Federal Sentencing Guidelines* applies when an organization is convicted under federal criminal law. The guilty organization's fine can be reduced if it has in place an effective compliance and ethics program that decreases the likelihood that questionable conduct will occur in the workplace. This is done to offer an incentive to organizations to reduce and ultimately eliminate criminal conduct by providing a structural foundation from which an organization may self-police itself through an effective compliance and ethics program. Under the *Federal Sentencing Guidelines*, an organization demonstrates due diligence to prevent and detect criminal conduct by promoting an organizational culture that encourages ethical behavior and a commitment to compliance with the law (through the establishment of an effective compliance and ethics program under the requirements set forth in the *Guidelines*). Such an environment at work can be advanced through the development of codes of conduct that prescribe ethical values and behaviors, as well as through professional training that increases employee awareness of noteworthy ethical issues that occur in the organization or industry. Managers should also consider developing a system for the identification and reporting of questionable conduct when it occurs and identify a top leader who is directly accountable for the management of these ethical programs. Finally, management must initiate appropriate disciplinary action when questionable acts are identified in an organization and develop action plans to prevent recurring ethical problems. By taking these steps to promote an ethical culture in an organization, managers demonstrate a level of attention and commitment to ethics recommended by the *Federal Sentencing Guidelines*.

In January 2005, however, the U.S. Supreme Court, in the case of *United States v. Booker*, held that the *Federal Sentencing Guidelines*, particularly by allowing a judge to increase a criminal defendant's sentence, violated defendants' Sixth Amendment right to a jury trial and were therefore unconstitutional. The Supreme Court concluded that the *Federal Sentencing Guidelines* could not be compulsory, though they could be advisory. As a result, there is a significant amount of confusion as to whether the organizational due diligence requirements under the *Federal Sentencing Guidelines* will continue to be used to reduce an organization's criminal sanctions, and thus remain an incentive to implement effective compliance and ethics programs.

As discussed above, due diligence applies in a number of contexts, though primarily in business settings. While the notion of due diligence can be fluid, requiring different standards in different contexts, common traits can be found. Primarily, due diligence is a standard of investigation into the background and facts surrounding a business activity. And that investigation must be conducted with thoroughness and care. In addition, conducting or complying with due diligence may involve ethical standards that go beyond merely complying with the applicable law. Managers must proactively advance principled and socially responsible standards to ensure that all stakeholders recognize the company's position on ethical practices. Companies must also select ethical leaders and take action when questionable conduct occurs to demonstrate this commitment to business ethics. More important, the resulting ethical organizational culture will encourage employees to make ethical decisions and behave in an appropriate manner while at work.

Due Process

Due process involves following established procedures in the enforcement of laws, rules, or policies and enforcing each in a fair and just manner rather than arbitrarily or capriciously. Due process serves to protect the rights of individuals facing adverse actions by the government, organization, or other entity.

In the United States, due process is based on principles from the U.S. Constitution and Bill of Rights that protects a person from being deprived of life, liberty, or property without due process of law. As applied to actions of federal, state, and local governmental entities, a person cannot be deprived of life, liberty, or property without appropriate legal procedures being followed and without the actions being legitimate and reasonable. While due process protection extends to employees working in government organizations, employees in private sector organizations have no guarantee of due process. However, employees in private sector businesses may have due process protection provided either through union contracts or formal policies of their employers. Such due process policies may govern employee grievance procedures, disciplinary actions, and appeal processes. From a broader stakeholder perspective, due process procedures governing the relationship between businesses and stockholders, suppliers, customers, and other stakeholders are generally provided through the legal system in the United States rather than through specific due process policies of businesses. Because the majority of due process issues concern the employment relationship, this entry will focus on due process policies and practices governing businesses and their employees.

History

The concept of due process can be identified in ancient historical records and in many different cultures. Due process has been found in the laws of ancient Egyptian, Greek, and Roman civilizations. Teachings from different religions and philosophies also include concepts of due process.

The use of due process in the United States can be traced to the Magna Carta (Great Charter) of 1215, a document drafted by King John of England, who under pressure from his barons, agreed to limit his power and provide certain rights to England's citizens. Rather than being subject to arbitrary or capricious decisions of the King, the Magna Carta established a code that delineated the power of the government and the rights of its citizens. Actions against citizens could only be taken based on the lawful judgment of peers, or by the law of the land. The specific phrase "due process of law" appeared in a 1354 revision of the Magna Carta. The phrases "law of the land" and/or "due process of law" were incorporated into the U.S. Constitution and many states' constitutions.

Due process is specifically mentioned in two amendments of the U.S. Constitution. The Fifth Amendment, ratified in 1791, states that no person will be deprived of life, liberty, or property without due process of law. The Fourteenth Amendment, ratified in 1868, says the same with respect to the individual states.

Procedural and Substantive Due Process

Two components of due process are recognized: procedural and substantive. Procedural due process focuses on whether the actions against an individual are carried out in accordance with established laws, rules, or policies. Substantive due process concerns the reasonableness and legitimacy of laws or policies and whether the laws or policies are fair and just in and of themselves. For both aspects of due process to be achieved, established procedures for handling an individual's offense must be followed (procedural due process) and the law or policy must be reasonable and serve a legitimate purpose (substantive due process).

Whereas the Bill of Rights, ratified in 1791, applied specifically to the laws and actions of the federal government, with the ratification of the Fourteenth Amendment in 1868, procedural and substantive due process protection was extended to individuals with respect to state laws and actions. This meant that state laws could now be reviewed by federal courts to determine not only the appropriateness of procedural processes in enforcing the law but also whether the state laws and actions were reasonable and legitimate (substantive due process).

Determining whether actions taken against an individual meets procedural due process standards has been less controversial as compared with deciding whether laws and actions meet the substantive due process standard. In determining whether procedural due process has been attained, the courts examine whether the actions taken against a party were based on existing law and that the law was appropriately applied and enforced. However, in deciding if a law fulfills the substantive due process criteria, the courts must look beyond the words of the law and determine whether the law is reasonable and serves a legitimate purpose, a much more subjective approach to interpreting the law's meaning and application. The more subjective nature of substantive due process has created continuing disagreements and controversy.

Some argue that the term *due process* should be applied only to issues concerning procedural due process and that decisions based on subjective determinations of reasonableness and legitimacy allow the courts to legislate from the bench and assume power over state legislation not intended by the Constitution. On the other hand, adherents of substantive due process argue that even if laws passed by legislatures are enforced appropriately, no protection is provided against unjust laws. Allowing the courts to rule on issues regarding substantive due process protects individuals against unfair and unjust laws. Although the courts have largely accepted substantial due process protection, controversies remain with regard to how extensively substantive due process should be applied to laws regarding liberty and privacy issues such as abortion and gay rights.

Public and Private Sector Employees

Because the Fifth and Fourteenth Amendments apply to actions of the federal and state governments, only employees of federal, state, and local government entities (referred to as public sector) are guaranteed due process. While union members in private sector companies often have due process procedures included in their employment contracts, employees in a large number of private sector companies (including public and privately held companies) have no guarantee of due process. Rather, the employment relationship in many private sector companies is governed by the employment-at-will doctrine.

Employment-at-will employees work with no assurances regarding the terms or conditions of their employment. The employment relationship can be unilaterally altered or terminated at any time, for any reason (good or poor), or for no reason. While employees also have the right to end the employment relationship at any time for any reason, generally the employer has the stronger position to alter the relationship.

Constitutional guarantees of due process have not been extended to private sector employees as the courts have considered such relationships to be private contractual relationships between consenting parties. In other words, each party is able to freely negotiate the terms and conditions of employment and arrive at a mutually agreeable contract. While certain state and federal laws protect the rights of employees in the private sector, employers and employees have been largely free to establish the provisions of the employment relationship.

Every state except Montana recognizes the at-will employment relationship, although, as will be explained below, some restrictions exist. In 1987, Montana passed the Wrongful Discharge from Employment Act that requires that terminations be based on "good cause" once an employee has completed the probationary period of employment (6 months maximum).

The courts have generally supported the employment-at-will doctrine although various state and federal laws provide some restrictions. For example, federal antidiscrimination laws such as Title VII of the Civil Rights Act of 1964 restrict an employer's right to make employment decisions that cause discriminate treatment (intentional) or disparate impact (unintentional or unintended) on protected classes of employees. Other restrictions that prevent employers from terminating or taking adverse actions against at-will employees include public policy reasons (whistleblowers) or when due process procedures are explicitly or implicitly included in an employee's contract (including provisions in employee handbooks).

Although these laws provide employees some protection against unfair and unjust actions of their employers, critics of the employment-at-will doctrine argue that such employment relationships remain unfair because employers are still largely not held accountable for many other types of adverse employment decisions that may still be capricious, prejudiced, or maliced. Thus, critics argue that for at-will employees not to be disadvantaged, due process should be extended to all employees. In this way, all employees are more likely to be treated ethically, that is, in a fair and just manner.

Due Process Methods

Although private sector companies are not legally required to provide due process for their at-will employees, many companies have opted to implement such procedures. The reasons why companies adopt due process procedures vary. Companies may adopt due process procedures to better ensure that ethical decisions will be made when employees face adverse employment actions. Companies may also adopt due process policies as a means of avoiding litigation costs or unionization. A more pessimistic view of why companies implement due process procedures is that such policies restrict employees' access to the courts for settling disputes. By requiring all employment-related disagreements be settled through company due process procedures, management also has greater control over the process.

Three methods commonly used to ensure due process for employees when resolving employment-related problems will be discussed in this section: progressive discipline policies, grievance procedures, and alternative dispute resolution (ADR) methods. While each method helps ensure due process, each serves a different purpose. Progressive discipline procedures are initiated by managers and seek to provide steps for corrective action when employees' conduct or behavior falls below acceptable standards. Grievance procedures adopted by companies allow employees to raise problems or complaints with management. Finally, ADR methods (mediation and arbitration) permit employees to appeal adverse employment-related decisions.

Progressive Discipline

One method adopted by companies to provide due process to employees is a progressive discipline policy. Such policies incorporate escalating penalties for unsatisfactory employee performance. Penalties vary in severity depending on the nature of the offense, whether unsatisfactory performance continues, or if offenses are repeated. For serious offenses, employees may face immediate suspension or termination.

Progressive discipline systems can provide procedural due process to employees when clearly delineated step-by-step procedures are adopted to govern the process that managers must follow when disciplining employees. In general, a manager would inform an employee about a performance or behavior problem, explain to the employee what needs to be done to correct the problem, provide a reasonable period of time in which to improve, and ensure that the employee understands the consequences for failure to improve. The legitimacy and reasonableness of the manager's action (i.e., substantive due process) can be demonstrated as each action by the manager is documented. An appeal process, perhaps using an ADR method (explained below), is also often included as part of the progressive discipline system. In this way, decisions by managers are more likely to be ethical, fair, and just.

Grievance Procedures

Besides progressive discipline policies, companies may also provide grievance procedures for employees. Unlike progressive discipline systems in which actions are initiated by managers, grievance procedures allow employees to bring concerns, problems, or complaints to management's attention. Such issues may include terms and conditions of employment, harassment, work policies and practices, and discriminatory practices among other issues.

A company's grievance procedure may encourage employees to initially follow an informal process perhaps using an open-door policy where an employee can discuss the situation with a manager of the employee's choosing. If the situation is not resolved satisfactorily, employees often have the option of filing a formal, written grievance, which is investigated by the company. If the employer's decision regarding the grievance is not acceptable to the employee, an appeals process may be initiated perhaps through an ADR method. Again, the goal for providing grievance procedures for employees is to provide a fairer and more just workplace.

Alternative Dispute Resolutions (ADRs)

ADR methods such as mediation or arbitration (mandatory or nonmandatory) are another means that companies can use to provide due process to employees. ADRs can be used to settle employees' disagreements regarding disciplinary actions, grievance decisions, or other adverse employment-related decisions.

In a mediation process, the two disputing parties attempt to settle their disagreement by involving a neutral third party or mediator as part of the discussion. The mediator does not make a decision about how the disagreement should be resolved but instead facilitates the discussion between the parties in search of a mutually agreeable solution.

A more commonly used ADR method is arbitration. Employment arbitration agreements are governed by the Federal Arbitration Act (FAA) of 1925, which permits arbitration agreements between employers and employees. The FAA preempts state laws that restrict or constrain the use of arbitration agreements. Besides the FAA, other legislations such as antidiscrimination laws include language that encourages arbitration as a means of settling employment disputes.

Companies may require employees to sign a mandatory arbitration agreement, often as a condition of employment. Such agreements require employees to arbitrate all employment-related conflicts, including claims of discrimination, and generally prohibit further litigation. The arbitration decision is generally binding on both parties and provides a final resolution of the conflict.

Because the arbitration process is largely designed by the employer, critics argue that there may be bias built into the arbitration process that favor the employer and force employees to give up certain rights, especially the right to seek resolution of the conflict in the courts. Critics further argue that companies that require mandatory arbitration agreements have little incentive to ensure that standards of procedural or substantive due process are fulfilled as employees have no further recourse beyond the arbitration process.

Rather than adopting mandatory arbitration agreements, critics would urge employers to adopt nonbinding and nonmandatory arbitration agreements as a means of better ensuring that ethical and fair decisions are reached. In nonbinding arbitration systems, employees retain the right to pursue a case through the courts, if the decision of the arbitrator is not acceptable. Nonmandatory arbitration agreements allow employees to decide whether to take part in the arbitration process. Such approaches would strengthen employees' due process protection.

In addition to the differing views regarding the use of mandatory arbitration agreements, decisions by different federal courts regarding arbitration have also been in conflict, which created additional uncertainly in the application of such provisions. However, in 2001 in *Circuit City Stores v. Adams*, the Supreme Court ruled that mandatory arbitration agreements were permissible and that the agreement could include virtually all employment disputes, including questions of discrimination. (Only employees involved in interstate transportation were considered exempt from the FAA.)

While there remains disagreement regarding the provision of due process for employees, especially with regard to mandatory arbitration agreements, a number of procedures can be adopted by companies to better ensure that employment decisions are ethical, fair, and just. In adopting due process procedures, companies should meet the following criteria:

- Provide notification to employees regarding any adverse employment decision.
- Permit employees sufficient time to appeal the decision or action.
- Grant employees full access to evidence and information relevant to the case.
- Permit employees to use an attorney they so choose.
- Allow sufficient time for employees and their representatives for discovery.

If a company adopts a mandatory arbitration process, the company should further ensure that

- arbitration agreements are clearly written and thoroughly explained to each employee,
- an unbiased arbitrator, mutually acceptable to both parties, is selected, and
- a written copy of the arbitrator's decision is given to the employee.

Including such procedures will better safeguard employees' rights and strengthen employees' sense of fairness and justice while providing companies the ability to take adverse employment actions against an employee when good cause exists.

Conclusion

Within certain legal parameters, companies have the right to adopt employment policies and practices that management deems appropriate and applicable in the workplace. However, how these policies and practices are applied and enforced raise ethical concerns that should be thoughtfully considered by government and company officials. Are appropriate procedures followed when making decisions that adversely affect the employment relationship? Are actions reasonable and legitimate, and have the decisions been reached in a fair and just manner?

Currently, employees in federal, state, and local governmental entities have a guarantee of due process provided by the U.S. Constitution. In addition, some employees in private sector companies, mainly union members, also have due process rights included as part of their labor contracts. However, a large segment of the workforce, namely at-will employees, has no guarantee of due process and may not be protected from unethical decisions and actions by their employer. Thus, one question to consider is whether due process protections should be extended to all employees so that all will be treated equally and better ensure fair and just treatment in the workplace.

While there is currently no legal requirement that due process be provided to at-will employees, some companies have adopted such procedures. Companies may implement such policies with a genuine desire to ensure that their employees are not subject to arbitrary or capricious decisions and actions. Other companies may adopt such policies as a means of protecting themselves against costly and less easily controlled litigation processes. Thus, while arbitration systems may provide safeguards for employees against arbitrary and capricious employment decisions, concerns remain that such processes may fall short of ensuring ethical and fair treatment.

A company's arbitration process may introduce a certain level of bias into the process that favors the company rather than ensuring a level playing field. Since employees who sign mandatory arbitration agreements have no recourse through which they can appeal unsatisfactory arbitration decisions, it would be more difficult to ensure that the process is fair. Thus, a second question to consider is whether safeguards should be established to better ensure fair and just treatment of employees when mandatory arbitration agreements are used. While employees have some protection against antidiscriminatory practices through the Equal Employment Opportunity Commission, changes or restrictions regarding mandatory arbitration agreements could allow employees to litigate a dispute through the courts if a satisfactory resolution is not reached through the arbitration process.

Companies may determine that implementing due process procedures and providing more diverse options for employees to resolve adverse employment actions will provide not only a fair and just workplace for employees but also benefit employers. In this way, fair and just treatment can be better ensured while at the same time allowing companies to apply just and fair disciplinary actions against employees for good cause, thus protecting the rights of both employees and employers.

Dumping

Dumping refers to a business practice in which a foreign company sells its products into the domestic market at a lower price than it sells in its home market, sometimes called "less than fair value" (LTFV), and causes substantial injury to the domestic producers.

For example, a Chinese company might sell a bolt of cloth in the United States for U.S.$3 and the same cloth in China for the equivalent of U.S.$5 causing U.S. producers to lose money or go out of business. This practice is sometimes deemed to be unfair by national trade authorities and brings the remedy of antidumping duties that are assessed on those products. National dumping laws are in accord with the World Trade Organization's (WTO) Anti-Dumping Agreement (General Agreement on Tariffs and Trade [GATT] Article 6). Dumping can be contrasted with the practice of subsidies, such as export subsidies, done by national governments and not businesses, and which may be subject to countervailing duties as allowed by the WTO's subsidy agreement. Dumping, as defined here, differs from the business practice of selling products in foreign markets that are banned in the domestic market. For example, sometimes chemical companies sell products in developing countries that are banned in developed countries, such as the gasoline additive TEL or lead, and this practice has been termed "dumping."

Originally, dumping was seen as a pernicious business practice in which a strong international competitor would drop its prices in certain foreign markets, sometimes called international price discrimination, in order to knock out competitors and to obtain a strong market position, perhaps even a monopoly, in that domestic market. Once the international competitor gains market power in the foreign market, it could then raise its prices, hold back output, and engage in other anticompetitive practices. To illustrate from our example above, the Chinese company might drop its prices for its bolts of cloth in the U.S. market until all the U.S. companies go out of business and then raise prices above U.S.$5 per unit as its competition dwindles. The dumping laws allow the injured domestic companies to file a petition for relief on behalf of the injured industry. With their remedy to set a duty at the level of the dumping margin, in this case U.S.$2 per bolt of cloth, the dumping laws are meant to discourage this business practice. The dumping laws are in theory consistent with utilitarianism because they attempt to minimize market distortions by unfair trade practices that result in lower prices and more wealth for consumers.

Much controversy exists about both the concept of dumping and the administration of antidumping laws. With the concept, many believe that with the globalization of commerce, especially stemming from the joint effects of improved technology, communication, and transport, it is much more difficult for a company or a national industry to achieve a monopoly position in a foreign country for any substantial length of time. This is so because if profits are very high in a given market, producers from other countries, as well as new domestic competitors, are likely to enter. For example, if after knocking out the U.S. companies, the Chinese company raises its price in the United States to U.S.$9 per bolt of cloth, substantially higher than the original sales price and with a higher profit margin per unit, many firms from other countries, including the United States, are likely to enter the market to capture some of these profits. So in most cases, it is doubtful that the foreign company could afford to practice dumping for long. The second conceptual problem is that the focus on differences in prices across national markets ignores many important differences across markets such as demand conditions, substitute products, and other factors. A third problem is that in considering injury, it is sometimes difficult to isolate the deleterious effect on a domestic industry of trade as opposed to other factors such as changes in technology or shifts of consumer tastes away from one's products.

Nevertheless, at present, the greatest problem surrounding dumping is not conceptual but instead the administration of the antidumping laws by national governments. Most countries have developed an administrative system that receives complaints or petitions from the domestic industry or companies representing that industry. This system solicits evidence and makes recommendations based on both national and international law. The controversy is that several countries, notably the United States, are charged with creating an obtuse and opaque process for evaluating dumping cases that is biased toward domestic companies. For example, in the calculation of LTFV, the United States has promulgated many technical rules about the calculation of foreign and domestic prices, currency conversions, constructed costs (when price data are difficult to obtain), accounting rules, and the like. Furthermore, the process is allegedly tilted against the foreign companies that must respond to the dumping petitions. As a result, many foreign companies pull their product from the U.S. market at the onset of an antidumping investigation.

Most countries feel that the United States uses its dumping laws to protect some of its internationally weak industries such as steel and fishing. In 2000, the United States signed into law the so-called Byrd Amendment, which in effect remits any dumping duties collected in successful investigations to the

U.S. companies that filed the petition. In 2004 and 2005, Canada, the European Union, Japan, Mexico, and Thailand each challenged U.S. antidumping cases or portions of antidumping law before the WTO's dispute mechanism. The Byrd Amendment was also targeted. The WTO's dispute panel ruled in 2004 that member nations could take retaliatory measures until the United States changes its antidumping laws.

Controversy surrounding antidumping is not limited to the United States. In 2004, 10 of the 20 trade disputes between nations were in the dumping and antidumping areas, including cases against Egypt, the European Union, India, and South Korea. Because of this, the WTO is likely to revisit its dumping rules in the current round of trade negotiations.

There are several ethical implications of antidumping laws that favor domestic petitioners, typically producers, over other interests. If antidumping laws are used by national authorities to protect less efficient domestic producers over more efficient foreign producers, antidumping duties represent a transfer of wealth to domestic producers from domestic consumers and foreign producers (depending on price elasticity of demand). In effect, this is a form of distributive justice (or injustice, depending on where you sit). If "biased" antidumping regimes, however, are used as part of a larger package of liberalization reforms for the entire economy, such as to gain the support of sectors that are likely to be harmed by international competition in the home market, then antidumping might be seen as part of a redistribution of wealth from winners of the liberalized economy to sectors that are likely to lose without some assistance. In this light, an antidumping regime that is tilted toward internationally weak domestic producers might be the most politically expedient way to gain a set of trade policies that liberalize most of the economy, which creates in turn efficiencies, consumer welfare, and overall social wealth and is consistent with ethical utilitarianism.

DUTY

In daily speech duty is often conceptualized as a requirement that a person has to fulfil. It is typical of this everyday conception that duty is supposed to overrule other considerations a person might have concerning the choice of his or her actions, considerations that may, for example, be based on his or her desires or particular inclinations such as self-interest. Failing to acknowledge or live up to a duty means that a person's conduct is morally wrong.

It is, however, characteristic of thinking on duty in Western culture that "right action" is not necessarily equivalent to conduct that fulfills a duty. The concept of "right action" has an ambivalent or double meaning. If we say that a person acted "right," we can indeed mean to say that his or her conduct fulfilled a duty. In this sense, we can say that if a person helped a little child from drowning, he or she acted right or obligatorily. However, when we say that a person acted "right," we can also (just) mean to say that he or she did not act contrary to duty. If a pharmaceutical company decides not to hand out all its supplies of AIDS medicines to patients who lack the resources to buy them, we may still say that the company acted right. We commonly do not attribute a duty of beneficence of this intent to pharmaceutical companies; the company, therefore, does not act wrong by holding on to its stock. The ambivalence in the concept of right reveals that Western societies are free societies.

One implication of freedom is that conduct cannot simply be divided into right and wrong. Many actions are permissible. They do not fulfill a duty but also do not violate one. So when a person decides to have tea in the morning instead of coffee that is permissible in this sense. The same goes for the decision to become a carpenter instead of a doctor, the decision to stay childless instead of having a big family, or to buy a small car instead of a big one. Especially, the last example makes it clear that even if a freedom-oriented culture will always try to make the category of permissible action as extensive as possible, it is not true to say that what is morally permissible under specific social and historical circumstances must necessarily be morally permissible under all circumstances. We can think of social and historical circumstances in which the choice between a big car and a small car is not morally neutral. Environmental and economic circumstances may force on us a duty to at least seriously consider the consequences of one's choices in this regard.

The concept of duty is employed in many domains of action. We distinguish, for example, parental duties and professional duties. Still, the two most important contexts in which the concept of duty is employed are the law and morality. The law gives rise to legal duties; morality to moral duties. This explanation will focus on the concept of a moral duty since that is exemplary for our understanding of the concept.

Multiple Interpretations of Moral Duty

The concept of duty has three rather different meanings. First, we can use the concept "duty" to refer to the conclusion of a process of deliberation that strikes the actor involved as a commandment he or she must obey. Thus, a person might say,

> It was my duty to steal this bread in the aftermath of the hurricane Katrina even if it violated the principle that a person ought not to steal; given the circumstances my obligations toward my family provided a higher ground of obligation.

In this interpretation of moral duty, one of the most important questions to be answered is how (by what power) an actor is necessitated to obey this commandment.

Second, the concept of moral duty can also refer to a principle or the set of principles that we (intersubjectively) use as directive or even authoritative in the process of deliberation mentioned before. Thus, we can, for example, say that it is our moral duty to respect others, respect humanity, care for the natural environment, be beneficent, and defy servility, as well as not to kill others and not to steal. None of these principles can be transformed into a simple rule that can always be applied in practice in a clear-cut way. Still, when it comes to the relation with action, there is a lot of difference between the principles. The implications at the level of action of some of the principles are pretty clear. These principles imply rules that allow for little exceptions. Examples are the duty not to kill and the duty not to steal. There are only a few circumstances in which violating these principles does not constitute moral wrong conduct. For other duties, such as the duty of beneficence, the implications at the level of action are far less clear. The duty surely does not implicate that we must always help others, but it also requires much more than the proposition that we must sometimes do other people a favor. With regard to this interpretation of the concept of duty, several important questions arise, such as what is the content of the authoritative set of principles, who determines the content of this specific set, how can this specific set be justified, and is the acknowledgment of these principles and the possible rules they imply enforceable.

Yet another meaning of the concept of moral duty is identical with the phrase "to act as a person ought." In the line of this interpretation of the concept, we can, for example, say that "corporations that embrace corporate social responsibility do their duty" or that "the soldier performed his duty by defending his outpost against an enemy attack." The main question to be answered in relation to this interpretation of the concept is how we are to value dutiful conduct.

Moral Duty as a Contested Concept

The concept of moral duty does not only have three meanings. The concept also is contested. This means that with regard to each of the three interpretations, many different answers are given to the questions posed in relation to that interpretation. One striking difference, for example, is that the philosopher J. S. Mill claimed that if we may compel a person at all, we may compel him or her to perform his or her moral duties. Over against this the philosopher Kant claimed that exacting moral duties goes against their nature. Another striking difference is that according to some beneficence is indeed one of our central duties, while others claim that even if it is morally valuable, it is not a moral *duty*. Again, some will hold that moral duties derive their legitimacy from the fact that they are the commandments of God, while others will say that they are grounded in the specifics of human nature as both free and rational beings.

Here, the specific Kantian account of moral duty will be clarified. Kant's interpretation of duty is quite complex but also one of the most elaborate accounts. What is more, on close inspection our cultural understanding of duty also happens to be quite complex. The contested nature of the concept of duty is acknowledged by touching on some of the main differences with other traditions in the process.

Kant on Duty as a (Subjectively Felt) Commandment

Kant believes that humans are intentional beings. They have the ability to set ends and makes choices. By itself this conception of humans is quite commonplace. But Kant also holds that the human capacity to choose is always mediated by our rationality and, thus, never directly influenced by desires or incentives (such as self-interest). The Kantian model of human motivation, therefore, fundamentally differs from the account prevalent in many modern academic disciplines such as economics and psychology. Here, the human faculty of choice is conceptualized as a "vector model": The decision made by a person can be modeled as the result of the game of push and pull of various desires and incentives that directly influence the faculty of choice.

Still, when it comes to many normal choice situations the differences between the Kantian vision and its rival may not have grave implications. Kant allows for the situation in which our rationality only mediates in a choice situation by permitting our capacity to choose to be temporarily ruled by the struggle between various desires. However, sometimes a person may have to conclude that *duty* requires that he or she must display a particular conduct. In this situation, the fundamental difference between the vector model and Kantian thinking becomes manifest. In the vector model, duty is simply just another vector power, even if it may be a strong power. Kant holds that when it comes to duty our rationality overrules any incentive or desire; they are placed out of order. This view seems to be in accordance with the way we experience duty in practice and also seems to be better able to explain situations such as the behavior of soldiers under fire.

Duty thus has a very special place in the Kantian thinking on human motivation. Kant articulates this special structure of duty by claiming that duty as a commandment is unconditional. The binding force of duties does not depend on some contingent desire or on the contingent fact that a person has set himself or herself a specific end. Moral duties as commandments are categorical. What is more, moral duties are the *only* categorical commandments. Even legal duties do not have that status according to Kant. Legal duties only bind if a person has set himself or herself the end of wanting to forego the direct—penalties—and indirect—social isolation—consequences of living outside the law. (A complicating factor, however, is that according to Kant we also have a *moral* duty to obey all legal duties.) This view of the uniquely categorical nature of moral duties is commonplace in modern moral philosophy even if there are many views as to the exact status of legal duties and their relation to moral duties.

Necessitation

A central question of modern moral philosophy is how we have to understand that when persons come to the conclusion that duty requires something of them, how are they able to subjectively necessitate themselves to obey the moral command? Who or what imposes the subjective *necessity* to obey a moral command? This question is sometimes grasped as the *obligatory* aspect of moral duty (but the difference between a duty and an obligation is sometimes not acknowledged or seen in a different light). Before Kant—and also after Kant—the obligatory aspect of moral duty has been explained by referring to an innate sense of duty that all humans have. Many have also referred to the necessity of obeying the will of God or to man's pursuit of (individual) happiness. Kant's conclusion is that the necessity is grounded in the structure of rationality itself. When we act on duty we are necessitated by the force of pure rationality itself. Kant calls this pure rationality a priori rationality. Kant argues for his position in many ways. One is that duty as moral choice is by its nature a free and autonomous choice. However, only if we ground morality into rationality are we able to maintain that moral choices are autonomous choices. Any other ground would have as its effect that duty implied some form of obedience to something external or contingently related to ourselves. Some contemporary Kantians still argue along these traditional Kantian lines. Others are no longer convinced or fear that this type of argument overburdens the concept of rationality.

Implications

An interesting implication of the Kantian view of the necessity of duty that is still embraced by all modern Kantians is that a distinction is rejected that is common in a lot of modern academic literature on morality. It is quite common nowadays to distinguish the rational process of deliberation that persons go through, leading up to the conclusion that "*X* is their duty," from the emotional process that persons must go through to motivate themselves to actually do or acknowledge *X*. To make a fundamental empirically based distinction between these two processes is improper in Kantian thinking. The rational process of deliberation itself is motivating. Reasons have the power to motivate humans. Reason is not just an instrument or a slave of the passions, as Hume had it.

To those who say that we do sometimes experience a sense of duty, Kant replies that this experience does not cause us to obey our duty but that it is the effect on the level of our emotions of the discursive process that convinced us. Another radical implication of Kant's view that is shared by most modern people, Kantians and non-Kantians alike, is that morality is fundamentally democratic. Everybody is rational, and everybody, therefore, is qualified when it comes to moral matters. Kantian theory fiercely objects to the medieval position that some people are superior to others in moral matters because they stand somehow closer to God or any other origin of morality. Our rational nature is the ground of duty and rationality characterizes any human being.

Kant on Duty as a Requirement (or Set of Requirements)

In his thinking on duty as a set of principles, Kant makes a fundamental distinction between duties of justice and duties of virtue. These two types of duty differ at multiple levels, such as their justification, their structure, their enforceability, and the ways in which we can be motivated to perform them. Kant considers both the duties of justice and the duties of virtue as moral duties. Still, as regards their *structure* the duties of virtue are exemplary as moral duties in Kantian thinking.

Duties of Justice

Examples of principles typically belonging to the duties of justice are the duty not to steal, the duty not to kill, and the duty to resist injustice. As a special category, the duties of justice find their justification in the fact that they are conditional for the possibility of a free society. Without the duties of justice being instituted, the idea of a well-organized society is simply impossible. Because of their specific justification, Kant holds that the duties of justice may be exacted from a person. They are the minimum rules of social coexistence and, therefore, enforceable. Again, because of their specific justification the duties of justice are closely related to—or translatable in—clear practically relevant rules. Otherwise, they could not be enforced. One last characteristic of the duties of justice is that there can be several reasons why a person decides to obey the duties of justice. According to Kant, it does not matter what this specific reason is, as long as a person decides to obey. Given their structure, the duties of justice are related to the legal system. We can maintain that in a society with a perfect legislator and a perfectly working legal system, the content of the duties of justice is completely encompassed within the legal system. In actually existing societies, the duties of justice will not be completely encompassed due to imperfections of both the legislator and the legal system.

Duties of Virtue

In contrast, the duties of virtue find their justification in man's aspiration to become a moral person or man's pursuit of perfection. Given this origin, it goes against the nature of the duties of virtue to try to enforce them or push people into acknowledging them. It follows from this that with regard to the duties of virtue, we can only be motivated by the sincere conviction that we want to acknowledge the duty on account of the fact that it strikes us as the necessary thing to do. Or as Kant says, "Duty itself must be the incentive when it comes to the duties of virtue" (see below). Again, because of their origin, duties of virtue cannot be transformed into rules that can be directly applied to action. With regard to structure, duties of virtue are always principles (Kant calls them maxims) that a person must take into account in the process of taking a decision. An example is that in our decision making we must always take into account that we must help other people (in dire straits). It follows that other people can never determine whether a person has fulfilled the requirements of the duties of virtue. There is no result that is externally measurable. Persons can only be their own judge here. They are both the legislator of their own interpretation of the duties of virtue as well as their own judge when it comes to specific judgments in particular situations. Examples of principles that typically fall into the category of the duties of virtue are beneficence, respect, and sympathy, as well as the duty to resist envy. All these duties are complexly related to the fundamental moral categories wrong, permissible ("right" as not contrary to duty), and obligatory ("right" as fulfilling a duty). We can say that to be beneficent or to help another in dire straits is an obligation. But in the way we materialize these duties, there are various degrees of latitude. So a good swimmer will jump into the water to save a drowning person. But for someone who cannot swim well—or who is uncertain as to his capabilities in this regard—it is permissible to call the attention of someone else, to throw a life-saving device in the water, or to do something else that is proper given the circumstances.

Perfect and Imperfect Duties

To consummate his taxonomy of duties, Kant introduces several distinctions that all are complexly related to the main distinction between the duties of justice and the duties of virtue. Several of these distinctions are also commonly employed outside the specific Kantian context. One important distinction is between perfect duties and imperfect duties. A perfect duty directly refers to a rule or requires a specific action that a person should or should not perform. An example of a perfect duty is the duty not to kill another person. An imperfect duty is a duty that refers to a principle that must be taken into account in one's decision-making process. The distinction almost completely overlaps the distinction between justice and virtue but—as always—Kant makes a few exceptions.

Another important distinction is the one between duties of narrow obligation and duties of wider obligation. Duties of narrow obligation are duties that allow for little latitude in interpretation. With regard to duties of wider requirement, the person involved has (quite) some latitude with regard to the interpretation of the principle in practical situations. Logically, most duties of justice are of narrow requirement. Some duties of virtue are of narrow requirement, such as respect; most are of wider—or even widest—requirement. It should be noted, however, that modern literature often blurs the difference between perfect and imperfect duties on the one hand and duties of narrow and wide requirement on the other. Thus, it is spoken of imperfect duties as duties that provide actors with some leeway as to their interpretation.

Beyond Duty

A striking difference between the Kantian edifice on duty—as a set of requirements—and other traditions is that though the duties of virtue are often considered important morally speaking, they are sometimes not conceptualized as *duties*, precisely because they are not considered to be enforceable. Duties of virtue are then considered to be supererogatory or beyond duty (even if some authors classify a few specific duties such as beneficence that Kant classifies as a duty of virtue in the set of enforceable duties). Apparently, there is a tendency in Western moral thinking to link duty and enforceability. This may be related to the fact that in many accounts duty is only grounded in the need of coordination of action within society, and not—as Kant has it—also in man's pursuit of perfection. Kant maintains that grounding duty simply in the need of coordination of action is spurious because it grounds duty only in strategic or prudent considerations.

A similar kind of comment is that many accounts of duty maintain that the concepts of "duty" and "right" completely mirror each other. If there is one person having some duty, then there is also one (or more) other person(s) with rights and vice versa. Kant rejects this mirror view of duties and rights. It applies to perfect duties but not for all imperfect duties.

Another difference with other, in particular contemporary, accounts of duty is that Kant does not make a big issue of what the exact set of our moral duties is and how can we determine this set. For him and for his contemporaries, that was pretty clear. In our pluralistic times, it, however, is a major issue. Many authors specifically try to determine what the (minimum) set of duties is that everyone has to abide by. They also try to find a position of authority needed to justify that specific set. Again, Kant did not discuss the question whether we have moral duties at all. Moral scepticism did not bother his time, as it does ours. A notable difference between Kant and contemporary neo-Kantians is that the latter seem to renounce or at least question whether each person is the sole legislator and judge with regard to the duties of virtue. The question "what do we owe others" is made relevant both with regard to the duties of justice and part of what falls under Kant's interpretation of the duties of virtue.

Kant on Duty as "Doing What We Ought"

The third interpretation of duty is as "to do as one ought." In relation to this interpretation, an important question is how to value dutiful behavior. For example, how are we to morally value the actions of a shopkeeper in a situation in which he deals fairly with inexperienced customers (which is his duty) but only because he wants to avoid a bad reputation? And how are we to morally value the actions of a sympathetic person who helps another person in dire straits, primarily—or also—because of the joy that helping others brings him or her? And what if this helping person was not a sympathetic person but one who had lost all love of the world and who helped only because he or she considered that to be his or her duty?

In answering these questions, Kant makes the distinction between acting in conformity with duty and acting out of duty. Acting in conformity with duty means doing what is right for whatever reason. Acting out of duty means doing what is right solely because one knows this to be one's duty and one is rationally committed to do one's duty. Kant calls this "the motive of duty." According to Kant, acting in conformity with duty does not deserve moral esteem, only acting out of duty does. This means that the shopkeeper and the sympathetic person do not deserve esteem for their action, only the action of the person without love of the world does.

This view of moral esteem does seem to be too strict and inhumane. However, we must take two Kantian distinctions into account here. First, we must distinguish the question of whether an action is morally right from the question of whether the action deserves esteem. All the actors in the examples acted right, according to Kant. Second, we must sharply distinguish the evaluation of actions from the evaluation of persons. According to Kant, the person without love of the world does not deserve esteem, only the person's particular action does. The reverse is true with regard to the sympathetic person. Their action is nothing special morally speaking, but they do, of course, deserve esteem for the personality (at least if their sympathetic character is not something that is completely a gift of nature).

Kant's theory of moral value has been fiercely criticized by many. Most of this criticism, however, is based on misinterpretations. A common one is to confuse the moral value of an action with its moral rightness. On the basis of this confusion, it is said that Kant held the ridiculous view that a person who helps a friend out of sympathy acts morally wrong. Still, however much Kant's theory of moral value is contested it is also—at least partly—in line with the daily understanding of moral value in Western society. For example, when Milton Friedman claimed that most of what goes under the banner of corporate social responsibility (CSR) is not CSR at all because it simply can be explained by referring to the self-interest of corporations, he was talking along Kantian lines.

Economic Efficiency

Economic efficiency studies production, distribution, and consumption assuming that the goal of these activities is to gain a return from using or moving resources. It is similar to the concept of mechanical efficiency, which measures the efficiency of physical processes by relating energy output to energy input.

However, unlike physical processes, in which output and input measures are the same—for example, newtons—measuring the efficiency of an economic action involves transforming physical quantities of resource inputs into physically different outputs, which may be valued in monetary units, or utility (i.e., satisfaction) units, or by some other measures, for example "equity" or "fairness," on which unanimous agreement may be lacking. Without agreement as to what is the relevant output measure or goal (e.g., your satisfaction or mine?), discussions of efficiency quickly become debates about what it is that should be valued by individuals, producers, and society at large. That debate is not addressed here.

An economically efficient action leads to more of the quality being sought, be it profits for producers, satisfaction for consumers, equity for citizens, or whatever the chosen measure, while using no more resources than were used before. Studying resource use in production, distribution, and consumption has been the main focus of economics since the first sustained writing on the subject in ancient times—for example, Xenophon's *Oeconomicus*, written in approximately 380 BCE. It is considered in both microeconomics and macroeconomics.

To examine the concept of economic efficiency, it is necessary to define it in production, distribution, and consumption. Production combines resources into one or more outputs constrained by the quantity of resources, the available technology, social concerns, rules, regulations, and any other considerations producers face. Exchange activity consists of using resources in moving goods and services through space and time, again under given technological and social considerations. Exchange is another form of production, where moving a good from Place A to Place B is a substitute for producing that good at B. Consumption activity consists of using goods and services to derive satisfaction subject both to consumers' resource constraints and to social considerations.

Efficiency requires that changes made in any allocation, using the same resources and technologies, improve the situation of at least one party without at the same time reducing the well-being of any other. Usually, a change in a producer's profits—total revenue minus total cost—is the measure of a change in productive efficiency. However, profits need not be the measure, and even if they are, this does not exclude the fact that producers have to work within both technological and social constraints. For consumers, efficiency requires that any change from the status quo raising at least one person's satisfaction does not result in the worsening of anyone else's utility or satisfaction.

Economic efficiency may be consistent with equilibrium, a state where all opportunities have been explored and no profit- or utility-enhancing opportunity (including side payments by gainers compensating losers) remains. This condition is known as Pareto efficiency (or a Pareto optimum), after Vilfredo

Pareto. However, equilibrium is not the necessary outcome of a search for efficiency as search behavior, experimentation, random acts, changes in the state of the world, changes in technology, change in the legal system and rules and regulations, and so on can easily be seen to keep an economy in motion as opposed to a state of rest.

Production Efficiency

Production efficiency requires that any resource user produce as much output per monetary unit (e.g., the dollar or euro) spent on that resource as any other user. Stated technically, for the last, or marginal, unit of output produced, the opportunity cost per unit of output must be identical across all producers.

If this equalization does not take place, at least one producer will have a cost advantage and, hence, higher profits than the competitors. Self-interest (profit seeking) as one motivator will compel that user to hire more input and expand output to the point where its comparative cost advantage is eliminated. A central authority with knowledge of the comparative costs and efficiencies could also direct this result.

Efficiency is seen to be good because it leads to more of what is valued without expending more resources. Moving toward greater efficiency is a win-win situation. This begs the question of how resources—for example, labor—might feel about shifting from one producer (e.g., firm) to another or moving from location to location even if a rising wage is attractive and whether or not these costs are included in the modeling.

Also assumed, following Milton Friedman's views on ethical firm behavior, is that firms act according to prevailing laws, honestly, and in the long-run best interests of their ownership. This may also mean that extralegal, nonbinding social constraints are rationally being followed and that the interests of third parties, or stakeholders, may be a relevant decision criterion for the firm or, if the firm is centrally directed, that social interests are also being taken into consideration by the decision makers.

In the more realistic case of multiple inputs, the production efficiency condition is slightly more complex. All resources must be used to produce output such that the ratio of the marginal products per unit of cost of the inputs moves toward equality across all inputs and all users. If the marginal product per unit cost differs across goods or users, then output can be increased by shifting resources.

It must be remembered that while this discussion focuses on economic efficiency using monetary measures, as is most common in the economics literature, a monetary measure is not the only measure of efficiency. Societies value other measures—for instance, fairness, equity, justice—and these can be the ones that are used to measure efficiency.

The guiding principle of efficiency is the same: Use a resource to the point where its production of what is valued (e.g., equity) is the same per unit of input for all firms. There would be balances between equity, the distribution of work between capital and labor and between labor of various types, and the other social measures, including profits. So society may find it socially efficient to hire some labor beyond its narrowly defined marginal product rather than have it suffer unemployment or have it forced to undergo dislocation, retraining, or education that might raise its marginal product.

Competition and Production Efficiency

One startling result of economics, the first theorem of welfare economics, states that a competitive market system may lead to economic efficiency. For this, markets must be perfect: There should be no impediments to entry and exit; producers sell identical products, and they are small relative to the market; information is perfect; and producers are self-interested profit maximizers. For production efficiency, the ratio of the marginal products of the inputs must be the same across producers and across outputs. Why should producers necessarily end up having identical ratios of marginal products of inputs for the same products? If markets are competitive, they will arrive at this condition by seeking their own advantage.

To decide on how much to produce and how many resources to hire, a producer will look at the cost of inputs and the prices received for outputs and its own cost structure. In perfect competition, prices for goods and resources are identical for all producers. By the definition of perfectly competitive markets, no one producer can gain a more favorable wage rate for labor or rental rate for capital or land than another; no producer can get a higher price for any of its outputs than another, nor can any resource owner gain a better wage or rental rate.

Producers face the same input costs per unit and the same prices for their output. In the process of maximizing profits, producers will hire resources to the point where the marginal product per dollar spent on each input is equalized across inputs. So, MPL/wage rate = MPK/rental rate for each firm, where MPL is the marginal product of labor and MPK is the marginal product of capital. Cross-multiplying yields MPL/MPK = wage rate/rental rate for each firm. Given that perfect competition ensures that each producer faces the same input prices (wage and rental rates), this ensures that each will hire inputs to the point where the ratios of the marginal products are identical.

What about product mix? Again, perfect competition ensures that producers will produce different products to the point where the ratio of the marginal products of inputs is equalized across products. In perfect competition, inputs are hired to the point where the price of the input (e.g., the hourly wage rate) equals the marginal revenue product of the input. The marginal revenue product is the price of the output times the marginal product of the input. Producers, facing the same output and input prices, hire inputs to the point where their marginal revenue products are equal to the input price: MRPL = Po × MPL = wage rate, where MRPL is the marginal revenue product of labor and Po is the price of the output. This implies that the marginal product of the input for each firm will be equal, MPL = wage rate/Po, and that equalizes the MPL across producers. A similar argument may be made for other inputs.

For multiple products 1 and 2, the market-determined output prices, Po_1 and Po_2, respectively, are given. As above, each user will hire inputs to the point where the marginal revenue product of each input is equal to the price of the input divided by the price of the product for each good: MPL_1 = wage rate/Po_1, and MPL_2 = wage rate/Po_2. The wage rate is common to both, so wage rate = $Po_1 \times MPL_1 = Po_2 \times MPL_2$, or $Po_1/Po_2 = MPL_2/MPL_1$. Since all producers receive the same product prices, Po_1 and Po_2, they all hire inputs to the points where the ratios of the marginal products are equal.

Thus, the competitive process yields production efficiency. The second theorem of welfare economics, a corollary to the first, is that any equilibrium may be shown to be consistent with a competitive process.

In neoclassical economics, these are important results because they show that self-interest may be consistent with a coordinated social outcome. In the broader view, this need not rule out the fact that self-interest may also include concern for our fellows and that equity, fairness, and justice may be built into the motivations of both producers and consumers. As a benchmark, the perfectly competitive model may yield some clues as to how changes in the underlying variables—for example, a change in a tax or a subsidy—may alter the behavior of both producers and consumers.

The perfectly competitive result is highly artificial in that most markets deviate from the perfectly competitive conditions required. Consequently, there are arguments in favor of making markets more like the perfectly competitive ideal—for example, by making wages and prices more flexible, making information more readily available, and reducing monopoly advantage.

A counterargument is that a market mechanism is inherently noncompetitive due to manipulation by those with more power, and consequently, adjustments to market results must be made by governmental or quasi-governmental bodies. For example, in the United States, a floor is put on wages at rates determined by legislatures; in Europe, laws on layoffs affect firm behavior. Almost all countries have health and safety legislation that affects both firms and consumers. Naturally, this is only a short list of social influences on markets, and it is for this reason that modern economies are typically referred to as mixed economies, to reflect the existence and influence of nonmarket mechanisms, such as local, state, national, and even international governments.

Consumption Efficiency

For consumers the situation is similar to that for producers. Assuming self-interest means assuming that consumers will seek to maximize their utility derived from their own—and possibly others'—consumption of goods and services subject to prices, their budgets, and possible social constraints.

Consumption efficiency dictates that for a given budget, consumers purchase goods to the point where the marginal (or additional) utility (MU) per unit of cost is equalized across goods. If not, a consumer can raise the total utility by rebalancing expenditures from goods with lower to higher marginal utilities per dollar.

For example, for two goods 1 and 2, if $(MU_1/Po_1) > (MU_2/Po_2)$, where Po_1 and Po_2 (as above) are the prices to the consumer of a unit of Product 1 and Product 2, respectively, then the consumer could gain utility by reducing expenditures on Good 2 and raising expenditures on Good 1. Diminishing marginal utility in consumption causes the ratios to move closer together as more of Good 1 is consumed (and less of Good 2). Total utility will increase until the ratios are equilibrated.

Rewriting the utility-maximizing result as $MU_1/MU_2 = Po_1/Po_2$ shows that utility is maximized where the ratio of the marginal utilities is equal to the ratio of the prices. This is consumption efficiency, because once this point has been reached, no further increases in total utility are possible. The consumer is squeezing out the most utility possible.

Consumption Efficiency and Perfect Competition

If markets are perfectly competitive, all consumers face the same prices for the same goods and all producers receive the same prices for the same goods. Hence, for all consumers, $MU_1/MU_2 = Po_1/Po_2$, and the ratio Po_1/Po_2 being common to all means that all consumers consume to the point where the ratios of their marginal utilities are equal. This is what exchange allows consumers to do, and they will do so to the point where all gains have been tapped. The ratio of the marginal utilities, MU_1/MU_2, is also known as the marginal rate of substitution in consumption of Good 1 for Good 2. In equilibrium, it is equal to the ratio of the prices and is the same for all consumers. As in production, it can also be shown that any efficient consumption allocation is attainable through a competitive process, a corollary to the above result where the efficient allocation was shown to be consistent with the competitive process.

Implicit in the above discussion is the fact that consumers know both the short- and the long-run benefits (and costs) of consuming goods. Again, a "perfect-information" condition is assumed to hold, and it is arguably the case that for some goods, this information is not available, not disseminated, or ignored in the short run to the long-run dismay of the consumer. This occasions more social involvement in markets in aid of consumers. For example, antismoking campaigns seek to lay bare the long-run health consequences of smoking; antidrug campaigns criminalize certain activities based on superior information about production and consumption residing with governments. Equity considerations may also indicate that those with low—or nonexistent—budgets may also be able to exchange and consume—as opposed to starve—by the use of tax and transfer programs.

Exchange Efficiency

To complete the neoclassical illustration of economic efficiency, we show that self-interest and markets will ensure that producers produce what consumers wish to buy. As above, markets and self-interested behavior determine input and product prices. In equilibrium, markets determine the ratio of the product prices, Po_1 and Po_2. In perfect competition, that ratio of prices is identical across buyers and sellers. As long as the price ratio is common to both, as long as the production possibilities set exhibits nonincreasing returns to scale, and as long as the preferences of consumers exhibit diminishing marginal rates of substitution (which denies addictive-type goods), then there is a unique equilibrium of the system as a whole. These are the strong assumptions behind neoclassical economics' perfect markets, profit, and utility maximization.

If the product price ratio is common to all, as it will be if markets are perfect and there is self-interested behavior, then in equilibrium, producers are just able to produce the goods at the same relative prices as consumers are willing to pay for them. The producers' marginal rate of transformation in producing the goods (the ratios of the marginal products of the inputs, reflecting technical considerations and cost) is just equal to the consumers' marginal rate of substitution, reflecting their preferences in the consumption of the goods. There are neither shortages nor excesses of products. Markets and self-interest yield economic efficiency.

Relaxing Assumptions

The assumptions of perfect markets, profit maximization, and utility maximization, taken as a set, are sufficient conditions for economic efficiency. However, they are not necessary and, as discussed above, are not present in many—if any—markets. Etzioni has shown that cooperation rather than competition may also lead to an economically efficient result. It is also conceivable that economic efficiency could be engineered by other means—for instance, a central authority, though, as Hayek famously argued, the informational and knowledge requirements would be daunting. Thus, for this reason and his stress on personal liberty and freedom, he argued for competition, markets, and policies enhancing them.

The realism of many of the assumptions underlying the concept of economic efficiency is sometimes ignored by those proposing "free market" policies based on partial equilibrium models. These advocates ignore the fact that imperfections in one set of markets, for which they may be recommending "deregulation" or other market-"freeing" prescriptions, may require more rather than fewer regulations or constraints in other markets to come closer to overall efficiency. This is the theory of the "second best."

The underlying assumptions used to arrive at economic efficiency are open to serious question, and to the extent that the assumptions deviate from reality, actual societies are some distance from textbook economic efficiency. Imperfect markets occur in actual economies due to the existence of public goods, common property resources, externalities, nontrivial transaction costs (thus vitiating the Coase theorem), imperfect/asymmetric information, and increasing returns. If, contrary to the assumption of self-interest, consumers do not maximize utility (or if producers do not maximize profits), then again, prevailing prices are not quite "right" for economic efficiency, quantities are "incorrect," and deadweight losses result.

Obviously, producers seeking goals other than immediate profit maximization might purposely stop short of that goal. For example, Henry Ford may have missed out on opportunities to earn greater short-run profits when he famously raised workers' pay to $5 a day. However, in a longer-run and dynamic context, this move may have brought the firm more worker loyalty, higher productivity, lower turnover rates, and lower costs in the myriad other dimensions that encompass the labor-management relationship.

Goals of "good" corporate citizenship may also be seen in a similar light. In fact, it becomes difficult to distinguish acts of good corporate behavior—for instance, publicly donating to charitable organizations or creating foundations—from advertising or other revenue-enhancing activities for the firm. Thus, Milton Friedman claims that an assumption that firms behave *as if* they maximize profits—at least in the long run—is more useful than trying to build a model of a firm's behavior dotted with assumptions on corporate preferences. Friedman's "as if" methodology is a way of putting certain economic assumptions—for instance, self-interest, profit maximization, utility maximization—beyond question as he argues that the purpose of theory is predictive power (an instrument), not a perfect description of reality. Finally, if consumers exhibit envy, the desire for status, bandwagon, or snob appeal, along the lines argued by Thorstein Veblen, with one's utility falling when the utility of others rises, then defining "mutually advantageous" trade is problematic and there would be no trade.

Economic Growth

Economic growth is most commonly defined as the rate of increase in the value of a country's output over a period of time. It is often presumed that economic growth is necessary and valuable to a society because it is accompanied by an improved quality of life for that society's citizens. For example, increased economic growth may allow a society to become better educated. As a result, more effective medical systems will be developed that allow for healthier lifestyles within that society. In this example, societal gains are achieved from both fiscal and health perspectives.

Thoughts About Economic Growth: Then and Now

As a means of gaining a more comprehensive understanding of economic growth, it is instructive to look at the theories of some of the topic's thought leaders over time. This perspective will make it easier to understand the wide array of successful and unsuccessful economic development or growth policies used by various government entities. Although ancient Greeks and Romans demonstrated an understanding of economic security and growth as the foundation for social and political health, most of the discussion about the topic has occurred in the last 250 to 300 years.

Some of the economic writings from the 16th through the 18th centuries dealt with the growth of commerce resulting from European expansion. The Mercantilists sought limitations to trade between countries while expanding their own contiguous territorial or colonial trading systems. On the other hand, one of the most highly regarded anti-Mercantilists was David Hume, who wrote *Political Discourses* in 1752. Hume argued that international trade is not a zero-sum game and that the growth of international trade was directly related to the strength and diversity of the trading partners. Today, the viewpoints of both the Mercantilists and Hume are endorsed by political leaders as they struggle to achieve economic growth in a global economy.

One of Hume's contemporaries, Adam Smith, provided additional thoughts about economic growth when he published *An Inquiry Into the Nature and Causes of the Wealth of Nations* in 1776. Smith's premise was that the self-interest of individuals drives them to compete. This competition will in turn result in the production of goods and services that society wants, in the amounts that it wants, and at appropriate prices.

In other words, it was Smith's belief that an evolving capitalist system, driven by economic growth, would benefit society as a whole. More than 200 years later, Smith's beliefs about growth benefiting society were highlighted in a series of articles in *The Economist* in 2005. The discussion cited examples of how economic growth had improved people's lives, with the production of ample food supplies, the provision of adequate housing, the facility to travel freely, and a sharp reduction in chronic diseases.

In 1798, Thomas Malthus prepared *An Essay on the Principle of Population.* In this writing, he suggested that the population would grow at a geometric rate, while the food supply would only grow at an arithmetic rate. This writing was in direct conflict with a popular notion at that time that a productive society, or one that experienced growth, was a society that maintained a high fertility rate and ultimately a larger workforce. It was Malthus's belief that population growth would decrease output per worker, particularly in agriculture, thus reducing the standard of living. Malthus held the lower class responsible for this situation and suggested that the British government should establish restrictive policies to hold the middle and lower classes responsible for maintaining the proper rate of population growth. To a certain extent, his premise is followed today in certain countries, such as China, which has implemented a policy of one child per family.

In the early 19th century, David Ricardo added to the work of Malthus by suggesting that as economies grow, they will ultimately reach a point where the law of diminishing returns takes effect, forcing the economy to come to a standstill. Karl Marx built on some of these ideas in his criticism of capitalism. Marx and his followers challenged capitalism on social, moral, and economic fronts, pointing out the peaks and valleys of business cycles and the inherent exploitive tendencies of capital accumulation as weaknesses in the capitalistic economic system. Marx believed that communism was a preferable economic system to capitalism because it provided economic growth at a controlled rate, thus eliminating the human suffering associated with class conflict and sharp downturns or recessions. The Austrian economist Joseph Schumpeter offered a more positive assessment of economic turbulence within the capitalist system, arguing that economic growth and change arose from an entrepreneurial gale of creative destruction.

Finally, John Maynard Keynes should be acknowledged for his 1936 publication of *The General Theory of Employment, Interest, and Money.* Through his in-depth analysis of business cycles, Keynes suggested that recessions could be eliminated and economic booms controlled through the selective use of government fiscal and monetary policy. While Marx and Keynes shared the viewpoint that the economy should have fewer peaks and valleys, their methods for accomplishing this goal had different real-world implications for society as a whole.

Determinants of Economic Growth

Economic growth is driven by a variety of factors. By definition, the primary determinants of growth are frequently classified as either factors of production or factors of supply and demand.

Factors of production include natural resources such as land, minerals, or other inputs. Most resources are limited and often scarce. This is in sharp contrast to the unlimited needs and wants of people. For example, countries in the Middle East are rich in oil, yet the long-term demand for petroleum products exceeds the supply of oil in the Middle East and other countries combined.

In addition, labor and human capital are factors of production. It should be noted that there is a portion of the goods and services produced by workers such as housewives or volunteers that is not recorded in the gross domestic product (GDP). A second factor for consideration is human capital, which is the quality of labor resources. Obviously, not all laborers are of the same quality. Their level of production can vary based on such factors as their education, age, training, experience, happiness, health, and family environment.

The final factor of production is capital. While capital can refer to the money used to run a business, it is more frequently thought of as the investment in "capital goods" that can be used to generate other goods. In other words, computers, machinery, and other equipment are purchased and placed in buildings for the creation of specific products, such as automobiles, televisions, and cellular phones. The factors of supply and demand relate to the range of prices and quantities of the resources, the capital goods, and the trained workforce that is available for use in the production process.

It is also necessary to acknowledge the role that technology and technological advancements play in economic growth. While there is no doubt that technology played a major role in economic growth and productivity gains during the late 20th century and early 21st century, there does not seem to be a consensus about how technology should be included as a determinant of growth.

The combination of increased affluence, desires for instant gratification, technological advancements, and growing concerns about built-in obsolescence within a disposable society has altered the demand for goods and services in the more affluent parts of the world. To some extent, desires for a cleaner and safer environment and higher quality of life are being factored into growth expectations. As a result, the factors of production are being looked at more closely, and alternate methods of evaluating economic growth are evolving.

More About GDP Growth

As mentioned previously, the most common measure of economic activity is the GDP. This rate of change in the value of goods and services produced within a country is typically calculated on a quarterly or annual basis. It is also possible to look at real GDP growth, or the change in the value of production with the effect of inflation factored out. The real GDP per capita is useful for comparing economies of different sizes because it provides a measurement of how much each person produces during a designated period. It is calculated by dividing the real GDP by the size of the population. Potential GDP growth is the optimal rate at which an economy should grow. Finally, gross national product reflects the value of goods and services produced by an economy, regardless of where its citizens are located.

The following example describes economic growth in the United States. Table 1 shows U.S. economic growth by decade, based on changes in the GDP and real GDP. The data series, produced by the Bureau of Economic Analysis, was initiated in 1929. It can be seen that the periods of highest GDP growth for the eight periods occurred during the 1940s and 1970s. A closer look at the inflation-adjusted data shows that the decade of the 1970s was actually ranked fifth, below the overall average, with real GDP growth of only 3.2%. The lesson from this example is that it is often instructive to use more than one data set when evaluating economic growth.

Table 1 GDP Growth in the United States Between 1929 and 2005

Period	*GDP (%)*	*Real GDP (%)*
1929–1940	−0.2	1.6
1941–1950	11.2	5.6
1951–1960	6.0	3.5
1961–1970	7.0	4.2
1971–1980	10.4	3.2
1981–1990	7.6	3.3
1991–2000	5.4	3.3
2001–2005	4.9	2.6
Overall	6.5	3.4

Other Measures of Economic Growth

A variety of economic growth measures are used at lower levels of government. At the state level, it is slightly more difficult to evaluate productivity. While the gross state product exists, it often has limited use because it is not published in as timely a fashion as its national counterpart and because commerce is not necessarily dictated by state boundary lines. As a result, it may be necessary to look at other measures or a combination of them to monitor changes. Other common means of measuring economic growth in a region or state are to evaluate changes in population, employment, unemployment rates, personal income, per capita income, annual average wages, and retail sales.

Many of these data sets are also available for evaluating geographic areas smaller than states, such as cities, counties, or special districts. In addition, some data sets evaluate economic characteristics specific to the local area. For example, tourism-based economies may focus on the number of hotel rooms occupied, average hotel room rate, rounds of golf played, or number of skier days. Communities that place an emphasis on intellectual capital may look at patents awarded, R&D expenditures, grants awarded, or the number of high school or college graduates. At the local level, factors such as traffic congestion, social service funding, quality of public schools, crime rates, housing affordability, public safety, and air quality are examples of indicators that measure social or environmental welfare associated with economic growth.

Economic Growth, Social Welfare, and Environmental Responsibility

Many discussions about the impact of economic growth automatically assume that the expansion of the economy is good for society and translates into a higher standard of living for the general public. This is an assumption that may not necessarily be true.

For example, during the first years of the new millennium, the business infrastructure of China improved. A review of data from the World Bank reports that the number of aircraft departures, telephone subscribers, and Internet users has risen dramatically. Growth in these and other areas has allowed China to experience real annual GDP growth of 8% to 10%, over twice the annual growth rate of the United States.

In some cases, China's rampant growth has imposed societal costs that have not been adequately addressed or measured. For example, increased energy and electric power consumption has been accompanied by greater pollution. Anecdotal evidence also suggests that growth has occurred without regard to workforce safety, employment security, and environmental sustainability. In addition, unemployment in China during the early 2000s was about 20%, compared with 6% in the United States. This example illustrates that increased productivity, or GDP growth, for an entire country does not necessarily translate into quality-of-life gains for society as a whole; nor does it ensure that the income gap between the rich and the poor is narrowed.

Consider another situation that occurred on June 23, 1969, in Cleveland. On that date, the Cuyahoga River caught fire for at least the third time in less than 30 years. The fire was caused by various forms of human and industrial waste dumped in the river by the city sewage plant and by chemical and petroleum companies that resided on its banks. In the short term, the city waste plant and companies along the riverbank achieved a high level of productivity and prosperity, factors favorably associated with economic growth. On the other hand, the societal and environmental impact of polluting the river to the point that it caught fire should be included in an assessment of the welfare benefits of economic growth.

These two examples suggest that there is value in having a broader, more balanced definition of economic growth. Such a definition might take into account the triple bottom line (measuring social and environmental as well as financial performance), economic stability, and sustainability. It would consider not only the production of goods and services but also any social or environmental impact brought about by their production and delivery throughout the world.

The genuine progress indicator (GPI) is offered by its developers, Venetoulis and Cobb, as a more accurate measure of economic growth than the GDP. This indicator evaluates both personal consumption and the well-being of households. The latter component attempts to measure the social costs associated with the labor force, such as crime, divorce, or loss of leisure time. It also considers the depreciation of the factors of production—in other words, the impact of growth on environmental assets and natural resources. Research conducted by the GPI developers shows that GDP economic growth is substantially greater than the GPI. In this case, pure economic growth is diminished by the impact of societal and environmental factors.

An expanded definition of economic growth could include measurement of efforts to maintain a balance between profits, the planet, and the people affected by the production of goods and services. It might also evaluate the give-and-take between companies within an economy and the members of society.

Finally, consideration could be given to the organization's integrity, transparency, and willingness to be held accountable for the social and environmental impact of its economic actions.

Economic Incentives

A fundamental tenet of economics is that human behavior is explained by the combination of preferences and incentives. Preferences reflect the wants, needs, and desires of humans, while incentives are what actually motivates behavior. If people prefer to maximize their utility (or satisfaction) and if businesses seek to maximize profits, then those things that will result in increased utility or profits are by definition economic incentives. Economic incentives cannot be understood without taking account of preferences. For instance, people who prefer only wealth will likely respond differently to monetary rewards than people who prefer power or social status rather than wealth. When explaining and predicting human behavior, economists assume that preferences do not change. Therefore, changes in behavior are explained by changes in economic incentives. Much of economic analysis involves the study of institutional and organizational structures that give rise to and alter economic incentives.

Incentives can be either extrinsic or intrinsic. Extrinsic incentives are external to a person. These may be monetary rewards, such as cash payments, income, and profits, or they may be nonmonetary rewards, such as peer recognition and fame. In contrast, intrinsic incentives are psychological and, thus, internal to people. Knowing that you will receive a good feeling for doing something right is an intrinsic incentive. Extrinsic and intrinsic incentives often complement each other. People may be motivated to take a certain action because they are paid to do so and because they take pride in performing the work. However, many researchers have shown that extrinsic incentives often crowd out or diminish the effect of intrinsic incentives—for example, volunteerism declines when people are offered money for their services. The classic example here is donation of blood in the United States. In a 1971 book titled *The Gift Relationship*, Richard Titmuss contrasted the voluntary system of blood donation in Britain with the mixed commercialized and voluntary systems in the United States. He showed that paying donors resulted in a decline in voluntary blood donations and an increase in chronic and acute shortages of blood.

If incentives promote behavior, then disincentives discourage behavior. Societies use combinations of incentives and disincentives to motivate people to behave in socially desirable ways. Prizes and social accolades have the function of encouraging people to do things that are in the public interest. In contrast, fines, incarceration, and social ostracism are disincentives designed to discourage socially undesirable behavior. Similarly, feelings of guilt, shame, and regret are intrinsic disincentives for unethical behavior.

Many ethical problems can be explained by the incentives people face. Dishonesty, deception, bribery, theft, fraud, misrepresentation, plagiarism, and falsification are examples of unethical behaviors that can be largely explained by the incentives people face. Some scholars believe that unethical behavior in business is a response to the pressures people face in their employment. If economic incentives help explain why people in business engage in unethical behavior, then economic incentives can also be used to promote ethical behavior.

Economic Liberalism

See Liberalism

Economic Rationality

Economic rationality refers to the conception or conceptions of rationality commonly found and used in economic theory. While there is no single notion of rationality appealed to by all economic theories, there is a core conception of rationality that forms the basis of much economic theorizing. This view of rationality, termed the neoclassical conception of economic rationality, takes rationality to consist largely of the maximization of subjective utility. While it has sometimes been assumed that subjective utility is equivalent to self-interest, these notions are not identical. The notion of subjective utility allows that an agent might have preferences or desires that are not purely self-interested.

This view can be taken as either a normative account of how rational agents ought to act or a methodological assumption used by economists to study and predict the economic behavior of individuals. In either case, it is not meant as a purely descriptive account, since ordinary agents often fail to maximize their own utility. Furthermore, this view can be taken as a global view of rational behavior in general or as a narrower view of rationality in contexts of market exchanges. In either case, the concept of economic rationality treats reason instrumentally, insofar as it merely specifies the adoption of certain means with regard to given ends. This economic theory of rationality has little to say about the proper choice of goals or ends but sees irrationality as primarily a failure to eschew the means most productive of one's chosen ends.

Criticisms of Economic Rationality

The conception of economic rationality as the maximization of interests or utility has been subjected to a number of criticisms, several of which are ethical in nature. For instance, some critics contend that in failing to provide any criterion for the selection of basic goals or ends, the theory fails to discriminate between legitimate and illegitimate pursuits on the part of individuals. While it is true that accounts of economic rationality have little to say about the choice of ends or goals themselves, this criticism, if sound, would not necessarily show that the theory was false but merely that it was incomplete. Thus, many proponents of the economic account of rationality as maximization, particularly when taken in the narrower sense above, see the theory not as a complete account of rationality but solely as a means of understanding the rationality of certain economic choices and decisions that can be supplemented with an independent account of the rational choice of ends.

A more forceful criticism of economic rationality is that this account is intrinsically incompatible with the demands of morality if taken as a normative account of rationality. According to this criticism, in requiring agents to maximize individual interests or utility, the economic account of rationality will necessarily lead persons to violate the interests and/or rights of others. That is, in this view, economic rationality will often recommend immoral behavior when interests come into conflict. Furthermore, even when the theory is merely used as a methodological tool for the analysis of economic behavior, critics see a tendency on the part of economists to begin to view the theory as if it was normative in nature and to use it as a de facto standard of normative evaluation.

Defenses of Economic Rationality

Defenders of the economic theory of rationality have responded in a number of ways. For one, some defenders argue that as long as the narrow scope of the economic account of rationality is clearly defined, it provides the most powerful learning tool available to analyze market behavior. Such an account, they argue, is not incompatible with a more robust account of normative rationality that includes deontological considerations. On the other hand, some defenders of the neoclassical view of economic rationality as a normative account of rationality argue that the pursuit of maximization on the part of individuals will lead to cooperation with others and, through the invisible hand of the market, ultimately to the common good of all. However, the extent to which such a utilitarian defense of economic rationality, even in limited spheres, can alleviate all concerns about moral obligations to others is still the subject of much debate.

Models of Human Rationality

Even those economists who use a very narrow conception of rationality as preference maximization recognize the limitations of applying this notion of rationality to actual human behavior. Such a model of rationality may allow for the resolution of certain theoretical problems and a model that approximates some forms of economic behavior, but human beings often reason in ways that fail to meet the logical demands of this ideal of rationality. As such, some economists have appealed to the idea of bounded rationality as an alternative means of modeling economic behavior. The notion of bounded rationality appeals to the cognitive limitations and psychological factors that influence the less than rationally perfect reasoning of real individuals. The idea of bounded rationality has become central to the discipline of behavioral economics. Behavioral economists seek to incorporate empirical research and experiments from cognitive psychology and related disciplines in developing alternative models of economic rationality. In using empirically grounded representations of decision-making processes, behavioral economists believe that they will be able to model and predict real-world economic behavior better.

Economic Recovery Tax Act (ERTA)

The Economic Recovery Tax Act of 1981 (ERTA) contained numerous provisions that helped businesses and individuals. Businesses were aided by accelerated capital recovery through new depreciation rules, special tax treatment for acquirers of troubled thrift institutions, an increased amount of retained earnings not subject to taxation, relaxed rules for Subchapter S corporations, and encouragement of merger activity. However, ERTA is best known for a large reduction in personal income tax rates across the board. The act also helped individuals through a significant increase in the nontaxable portion of inheritances and gifts and by raising the maximum limits on contributions to individual retirement accounts and Keogh Accounts for the self-employed.

ERTA was the first major legislative activity in President Reagan's administration. He came into office at a time when the U.S. economy was in the doldrums, experiencing a situation called stagflation, meaning modest economic growth during a period of high inflation. ERTA was proposed as a way of stimulating the economy in an approach based on supply-side economics, which holds that increasing productive resources should be the focus of economic policy. The tax cuts were controversial because of their size and the opinion of some that this would reduce federal government revenues and further damage the economy. ERTA proponents relied on an economic theory, the Laffer curve, propounded by the economist Arthur Laffer. It is represented by an inverted "U," which shows federal revenue at zero when tax rates are zero and again at 100%. When tax rates are zero, no taxes are collected. When tax rates are 100%, no one has the incentive to work, so revenues are again zero. According to the theory, along the Laffer curve there is a point where the tax rate can be set to maximize revenue.

The economy did prosper during the Reagan administration, although federal deficits grew during the later years. ERTA was credited as the first major victory of supply-side economic theory. Opponents responded that the economy grew on its normal cyclical track following a recession and would have recovered without ERTA and that the large deficits would burden the economy in the future.

ERTA reduced the highest tax rate from 70% to 50% and reduced the lowest tax rate from 14% to 11%. The act also included a provision to index tax brackets beginning in 1984: As the earnings of taxpayers increased, the brackets would move in proportion, keeping taxpayers with modest increases in taxable income at about the same tax rate.

The accelerated cost recovery system (ACRS) was introduced by ERTA, which changed the recovery period for depreciation from useful life to an amount determined by the Internal Revenue Service. This allowed businesses to recover expenditures for capital development more quickly. ACRS was modified by the Tax Act of 1986 to reduce the impact on federal revenues.

Economics, Behavioral

Behavioral economics uses insights from human psychology to investigate how individuals actually make decisions. In contrast to neoclassical economics theory, which generally posits that individuals are rational decision makers who are capable of maximizing personal welfare, behavioral economics theorists build models of economic decision making that take account of human errors and limitations. The work of early behavioral economics theorists such as Herbert Simon, Daniel Kahneman, and Amos Tversky has applicability for work in business ethics.

Key Ideas From Behavioral Economics and Their Applicability to Business Ethics

Three key ideas from behavioral economics are helpful for the study of business ethics. *Bounded rationality* captures the idea that human beings have limited cognitive abilities that inhibit their abilities to make optimal decisions. Herbert Simon argued that bounded rationality leads to decisions that are perceived to be satisfactory to the decision maker, not optimal. *Framing* suggests that the way a decision is presented to a decision maker affects the kind of decision that is made. Finally, *bounded self-interest* suggests that individuals are not simply selfish personal welfare self-maximizers but are capable of true altruism.

If the idea of bounded rationality is true, then it follows that people making ethical decisions in business might (and likely will often) make mistakes. The ability of any individual to factor in all the possible outcomes of a decision, weigh them against some set of criteria, and then make an optimal decision is limited. Trying to make an optimal decision is also time-consuming. No human being can predict the future with complete certainty, and when the outcomes of a decision are hard to forecast (as is the case with many ethical decisions), then ethical decision making will frequently look in hindsight to have been faulty. Stakeholder analyses, for example, require decision makers to account for stakeholder interests and to use forecast benefits and harms to different stakeholder groups in ethical decision making. But in an environment of bounded rationality, it is possible that a decision maker will either forget to include a stakeholder group or forecast the effects of a business decision on one or more stakeholder groups incorrectly—leading to a suboptimal ethical decision. For the same reason, bounded rationality makes utilitarian analyses of decisions—often used in business—problematic in ethical and instrumental terms.

Framing—the idea that the way in which an opportunity for a decision is presented to a decision maker affects the kind of decision that is made—also is useful for analyses in business ethics. Perceptual frames naturally affect the kinds of conclusions that people come to. For ethical decision making in business, framing suggests that the same decision maker can come to different conclusions for the same ethical dilemma. Organizations that want to promote ethical decision making and are cognizant of framing effects might therefore seek to explicitly include ethical considerations in the analysis and framing of business decisions rather than make a decision that everyone commits to and then ask if the decision is ethical or not.

Finally, bounded self-interest suggests that people are willing to sacrifice their own self-interests to help others without hope of return. While the notion of bounded self-interest might seem to represent obvious common sense, it is controversial within the field of economics. If people are capable of bounded self-interest, then it is possible to appeal to motives other than profit maximization or career advancement. Bounded self-interest suggests that people (say in business) are motivated by a variety of goals: Some of these goals are self interested to be sure, but others might be altruistic. It seems that there might be more freedom for humans to behave ethically within organizations if bounded self-interest accurately describes how most people make decisions.

Implications for Practice

Behavioral economists have sought to bring nuance to analyses of human behavior. People are more complex than the caricature of selfish welfare maximizers, typical of work in neoclassical economics, would indicate. The study of behavioral economics might yield richer analyses of business ethics and ethical behavior.

First and foremost, the idea of bounded rationality raises an interesting question: How can people make better ethical decisions? It is true that the ability of individuals to account for stakeholder interests is limited. But can it be made better, say, through education and training?

Second, framing theory suggests that decisions differ based on how they are presented. Here it might be interesting to speculate on how decisions in organizations can be framed in ways that will bring about more ethical behaviors. Furthermore, the relationship between societal expectations of business and how ethical dilemmas in business get framed merits consideration.

Finally, the notion of bounded self-interest suggests that ethical behavior is possible and even likely in particular circumstances. Organizations can inculcate ethical behavior by appealing to individual goals beyond self-interest—and by extension, organizations themselves can act to achieve a variety of goals, including but not limited to organizational self-interest.

There are significant opportunities for organizations to use insights from behavioral economics to improve ethical decision making and behavior. Similarly, business ethicists would benefit from using the work of behavioral economists to develop better frameworks for channeling the goals and behaviors of businesspeople toward more ethical and socially desirable ends.

Conclusion

More realistic models of human economic behavior have helped better explain why people make the decisions that they do and why those decisions are sometimes wrong. Work in behavioral economics offers cause for hope and for pessimism from the standpoint of business ethics—hope in that people are more than their desires but pessimism in that people often make mistakes in their decision making.

—Harry J. Van Buren III

Economics and Ethics

Studying the complex and evolving relationship between economics and ethics can provide interesting and important insights to improve the theory and practice of socially responsible business management. Economics is concerned with the development and application of positive (i.e., scientific) means to achieve efficient allocation of productive resources to enhance material prosperity and satisfy consumer preferences. Ethics is concerned with the development and application of normative rules to guide human behavior toward realization of the good life, based on expectations of personal fulfillment, fair treatment, and equitable social outcomes. While both efficient and equitable outcomes are desirable and to some extent complementary, they are not necessarily equivalent. This gives rise to the ongoing tension between economic and ethical theory and practice and the recent search for ways in which economics and ethics can better overlap to mutual advantage.

During the late Middle Ages, ethical moralizing took precedence over economic rationalizing as the Church sought to mitigate the impact of economic self-interest on the traditional social order. Calls for a "just price" on life-sustaining goods during periods of famine, as well as a ban on Christians charging "usury" (interest) for moneylending, reflect a theological urge to curb the selfish pursuit of economic gain. Such constraints on self-aggrandizement were deemed necessary to preserve the social fabric while also shielding threatened souls from the temptations that could deny them entry at Heaven's gate. Even so, it is interesting that some Scholastic theologians recognized the complementary relationship between economics and ethics by advocating private property ownership on the grounds of encouraging economic efficiency.

As a notable figure of the 18th-century Enlightenment, Adam Smith offers an intriguing juxtaposition of ethics and economics. His two major works, *The Theory of Moral Sentiments* and *An Inquiry Into the Nature and Causes of the Wealth of Nations*, reflect his simultaneous, seemingly paradoxical, stature as a moral philosopher and as the father of modern economics. Resolution of the "Adam Smith problem" can point toward a potential, albeit partial, reconciliation and integration of ethical and economic modes of thought and action in the 21st century.

This potential arises from a growing recognition that business managers currently encounter difficulty balancing their imperatives to "do well" (i.e., pursue profits) and "do good" (i.e., treat stakeholders in an ethical and socially responsible manner), since they are expected to understand and apply two alternative and seemingly contradictory ways of thinking and acting. R. Edward Freeman launched a search for a more integrative approach to business decision making in 1994, challenging the conventional "separation thesis," which held that the assumptions and methods of economics and ethics must be regarded as logically distinct approaches to sense making and problem solving. A more integrative balance between economics and ethics in business decision making requires consideration of the normative claims of a wider range of stakeholders. However, a more integrative perspective must take into account the continuing contribution of allocative efficiency to human welfare. Such consideration calls for some rethinking of the ways in which facts and values have been employed in the past to make sense of human experience.

Positive and Normative Perspectives

Through much of the 19th and 20th centuries, economics and ethics have coexisted, conceptually and methodologically, as largely distinct fields of study. This distinction arose from the decision to separate facts and values as sources of meaning within the positive and normative traditions of scholarship. Scholars in the positive camp strive to discover an objective reality (the realm of "is") by carefully scrutinizing empirical evidence for cause-and-effect relationships within factual data. The expectation of such scrutiny is a replication of experimental results, which opens up the possibility of prediction and control of natural or social phenomena. Normative scholars strive to characterize the preferred realm of "ought" by extracting ethical norms of socially desirable behavior from universal moral principles, aggregate measures of social usefulness, or context-specific community practices.

Following the publication of Adam Smith's *Wealth of Nations* in 1776, a large and highly influential school of classical and neoclassical economists has striven to elevate their field of study to the status of a positive social science. Today, this branch of the field is called positive economics. It is associated with the ever more sophisticated application of mathematical techniques to the analysis of empirical data, distilled by the *ceteris paribus* (other things being equal) assumption that value-laden "opinions" or "emotions" of human actors must be excluded to allow scientific study of the presumably rational, utility-maximizing behavior of "economic man." This inclination to separate facts from values is reinforced by the seeming fragmentation, since the 18th century, of philosophical approaches to normative scholarship. This has created the impression, especially within the positive camp, that the study of ethics is entangled in arid definitions and abstract, hypothetical, or emotional (and hence value laden) assertions that, even under the best of circumstances, fall outside the realm of scientific inquiry. By adopting the utilitarian assumptions of Jeremy Bentham, positive economists assume that the "greatest happiness of the greatest number" can be determined via a cost-benefit calculus comprehensible exclusively to economic man. Many economists argue that they are concerned with rational analysis of the *means* by which productive ends are realized, without regard for the value-imbued *ends* to which the economic surplus may be distributed.

This entry will suggest that the modern tradition of separating economic analysis and ethical analysis has retarded the development of a more robust theory and practice of socially responsible business management. It will also point to the recent call for a new, more integrative framework for thought and action that transcends the sharp distinction between facts and values and opens up the possibility of bringing closer together the descriptive/scientific realm of "is" and the normative realm of "ought" in business and society interactions. Ironically, the linkage between ethics and economics has a long intellectual history, which achieved one of its fullest and most creative expressions in the parallel writings of the 18th-century Scottish moral philosopher and economist Adam Smith.

Economics, Ethics, and the "Adam Smith Problem"

Early in his *Wealth of Nations*, Adam Smith made the claim—formative in shaping the assumptions of modern economics—that appeals to benevolence are less effective than appeals to self-love in motivating the butcher, brewer, and baker to provide for our supper. It follows that indirect outcomes shaped by the "invisible hand" of the competitive free market tend to serve the public interest better than the deliberate "visible hand" of supposedly benevolent public or private agencies. Some economists and business practitioners, taking this lesson literally, conclude that ethical motivations are irrelevant to economic transactions and relationships. A recent reconsideration of the thought and legacy of Adam Smith, focusing more on *The Theory of Moral Sentiments*, has drawn a different conclusion—that Smith regarded ethical norms and inclinations toward benevolence and law-abiding behavior to be complementary with the economic rationality of self-love in promoting the public good. Thus, Smith, in *The Theory of Moral Sentiments*, concludes that the pursuit of wealth and greatness prompted economic man to seek "mere trinkets of frivolous utility." While Smith accepts self-love as necessary to promote economic growth, he does not consider it sufficient to secure human happiness. It follows that self-regarding and other-regarding motives and actions are complementary. The division of labor generates material progress and an economic surplus, which provides the basis of support for other-regarding institutions and moral sentiments. Legal institutions ensure compliance with market agreements by protecting private property rights and claims that arise from their exercise. However, legal compliance is not sufficient to ensure the effective functioning of a liberal, market-based political and social order. In the absence of a shared moral sentiment that encourages economic actors to exercise voluntary self-governance of their selfish passions out of concern for the rights and interests of others, legal restraints will expand to encompass a Leviathan police state, thereby violating the conditions necessary to support individual liberty and economic prosperity. Thus, moral sentiments are both an outcome of and a precondition for efficient and fair market processes.

For Smith, the shared moral sentiment that can animate in each self a benevolent regard for others arises from a process of empathetic reflection. We can know what others feel only by imaginatively putting ourselves in their position. This enables us to develop moral judgment over time by learning how to triangulate an action we are contemplating from multiple points of view. By imaginatively combining and comparing the views of various spectators, we develop the capability to evaluate and integrate partial perspectives, thereby approaching the moral maturity of an "impartial spectator." The useful fiction of an impartial spectator helps us rein in our selfish and unsocial passions to control opportunistic urges while also enabling us to enjoy the shared benefits of social passions, such as generosity, humanity, kindness, compassion, and mutual friendship.

Successors of Adam Smith, concerned with developing a more positive, fact-based science of economics, tended to forget that market transactions and relationships are not sustainable in the absence of moral sentiments that arise from interaction between the warm workings of the human heart and cool calculations of the head. Thus, the Adam Smith "problem" was the artifact of later economists, who preferred to generalize about a partial view of human nature based on the presumption of self-love without incorporating Smith's complementary emphasis on the role of moral sentiments in facilitating and guiding market processes.

Positive Economics as a Value-Free Scientific Study of Market Interactions

In the early 19th century, the British economist David Ricardo abandoned Smith's judicious, if discursive, blend of historical anecdotes, illustrative arguments, and wry observations about market-based behavior. Ricardo preferred to focus on the long-term consequences of the working out of abstract, a priori economic principles, such as the "iron law of wages," which predicted that wage rates in a competitive labor market would fall to a level of bare subsistence. He discounted the short-term impact of the economic forces of supply and demand on immediate human circumstances, arguing that sentimental concerns about human misery would distract attention from the rationally determined long-term benefits of market efficiency.

Later in the 19th century, Léon Walras elaborated on these assumptions within a general equilibrium model of economic interactions. Individuals and firms engaged in both the demand and supply sides of the equation are subsumed within a complex and highly abstract set of relationships between inputs and outputs. The economic problem becomes a matter of finding mathematically the equilibrium solution to a complex interplay of input and output variables. Utility maximization among market participants is expressed as an equation rather than a value judgment. Indeed, value-laden ethical judgments are allowed in the ceteris paribus world of neoclassical economics only if they can be objectified in behavior that is quantifiably verified by measurable facts. Ironically, Walras was inspired by his father's socialist leanings to develop a model of an economic "engine" that could improve the lot of everyone, including the poor. Thus, the aspiration toward more complementary outcomes from positive and normative modes of analysis persists, even when assumptions and methods seem to be at odds.

Recent Questioning of the Normative-Positive Distinction in Economics

Some prominent scholars have begun to question the separation of facts and values by positive economists. Kenneth Boulding, a leading Anglo-American economist of the mid-20th century, expressed the dissenting view that at the policy level, economics without ethics is like a lever without a fulcrum. Since economic policies can have differential impacts on a wide variety of stakeholders, it would seem reasonable to consider the normative implications of economic policy alternatives, particularly with regard to the issue of social justice or equity.

Welfare economics addresses more directly the normative implications of economic policies; however, it does so by trying to subsume ethical considerations and value judgments into an economic mode of analysis. Amartya Sen's critique of some of the underlying assumptions of welfare economics has been influential in breaking down the positive-normative distinction. A move toward Pareto optimality is defined as a change where productive resources are allocated in a manner that improves the well-being of some without diminishing the welfare of others. Sen questions whether Pareto optimality is necessarily consistent with social justice, since different equilibrium points for the optimal allocation of productive resources are possible. Thus, the location of an optimal point on the production possibilities frontier is conditioned by the original distribution of resources. An extremely unequal initial distribution may result in an optimal solution that is normatively objectionable on the grounds of equity. A Pareto optimal move could improve the welfare of the already better off without diminishing the welfare of the worse off. Thus, Pareto optimality compares absolute differences in welfare without taking into account the relative positions.

Sen also questions the normative-positive distinction in his essay "Rational Fools." He argues that the positive assumption that utility maximization arises from the satisfaction of self-interest is no less a value judgment than is the assumption that human motivation arises out of sympathy or commitment to others. Both assumptions reflect judgment about which values are relevant to the study of human behavior. Thus, either competitive or cooperative behavior can generate utility. Under closer scrutiny, the fact-value distinction starts to break down, and "foolish" other-regarding cooperative behavior can make sense.

Do Economics-Based Management Theories Drive Out Ethical Business Practices?

Agency, transaction cost, resource dependence, and other influential management theories share with orthodox economics the fact-value dichotomy, the homogenizing ceteris paribus assumption that economic man is driven by self-interest, and the aspiration to discover causal patterns that can suggest a "scientific" basis for exercising management control, or more generally for predicting market-based producer and consumer behavior. Thus, agency theory adopts a narrow and (some would say) pessimistic view of human nature, assuming that self-interested motives will lead to shirking and opportunism without governance controls and incentives (e.g., stock options) that bind managerial agents to the interests of shareholders. Such assumptions prompted Milton Friedman's famous dictum that the true corporate social responsibility of business managers is to pursue profitability "within the rules of the game," which includes both law and ethical custom. Morality in the economic sphere may well boil down to obeying the law, avoiding deception and fraud, and living up to contractual agreements. However, critics insist that morality cannot be subsumed exclusively within the economic sphere; morality also involves a balancing of responsibilities across overlapping, value-laden economic and noneconomic spheres of social action. Thus, the unitary objective function of profit maximization to enhance share value (and trigger the exercise of stock options) may have achieved broad acceptance in the business world not so much because it reflects an objective reality as because it privileges powerful ownership interests. In addition, profit maximization is easier to model mathematically than the more complex, interdependent relationships within pluralist stakeholder networks. The positive stance holds that management theories must necessarily be amoral, since morality or ethics is inseparable from human intentionality. Since human intentionality arises out of mental states, which are necessarily value laden and idiosyncratic, proponents of management "science" are forced to exclude mental states because they are not subject to measurement and, hence, prediction and control. The recent spate of corporate scandals have been attributed to top management's preoccupation with a narrowly defined bottom-line performance and to the perverse application of management incentives such as stock options to achieve this financial performance, without regard to their effects on other stakeholders. Thus, some argue that management theory must move away from its envious emulation of natural science assumptions and methods and embrace the value-laden pluralist position that business organizations will perform best overall when they take into account the values, interests, and concerns of their multiple stakeholders. This more integrative stand, which requires recognition of the interdependence between economics and ethics and the relevance and legitimacy of different approaches to sense making, can be construed from Adam Smith's insight that self-regarding market behavior is not sustainable in the absence of other-regarding moral sentiments embedded within community relationships. Thus, the Adam Smith problem can be reconfigured as an Adam Smith–inspired solution.

Getting Past the Separation Thesis

In 1994, R. Edward Freeman, a leading proponent of stakeholder theory and of critical and feminist theory perspectives on business ethics, issued a call for business ethics and business and society scholars to abandon the prevailing "separation thesis." This conventional distinction between ethical and economic rationality bifurcates management theory into the normative, value-laden realm of "ought" and the positive, fact-based realm of "is." Standard management practice calls for economic rationality to prevail in business operations until an ethical dilemma or stakeholder confrontation triggers the exceptional and temporary intervention of an alternative logic of ethical rationality. Freeman and others argue that this bipolar swing between "normal" amorality and exceptional morality in business decision making imposes unacceptable risks and costs not only on society but also on business organizations, which can no longer afford this reactive, occasionally accommodative stance toward their stakeholder relationships and responsibilities.

The search for an integrative alternative to the separation thesis is diverse and riddled by paradox, since multiple stakeholder perspectives, values, and voices flow into a pluralist and unfolding/developmental sense-making process in which facts and values are intermingled and fused. Two leading contemporary normative approaches associated with this rejection of the separation thesis are the integrated social contracting theory (ISCT) of economic ethics and neopragmatism. The ISCT is designed to provide business managers with a comprehensive arsenal of universal "macrosocial" ethical norms, such as obligations of promise keeping and expectations of reciprocity, as well as context-specific "microsocial norms" that specify ethical business practices within the moral free space of particular economic communities. A criticism of the ISCT is that it tends to accept prevailing macrosocial and microsocial ethical norms as given. It does not specify the dynamic social contracting processes, especially at the microsocial level of particular communities, where ethical norms can evolve over time. Neopragmatism is less inclined to specify normative rules. It envisions a pluralist contest of competing stories, which achieve normative justification not from an appeal to an "essentialist" or absolute source of moral truth so much as from the pragmatic test of whether the story helps mankind, or particular communities, move toward shared visions of the "good life." Thus, Richard Rorty, a leading neopragmatist moral philosopher, argues that the world needs more poets to tell better and more imaginative stories to spark in us an imaginative sympathy for others that can help guide us toward better relationships and the good life. Neopragmatism is vulnerable to the charge that it may open the way to ethical relativism or normative nihilism. The matter of who decides on what constitutes the best poem about the good life remains an open question.

Recent developments in the theory and practice of global corporate citizenship may overcome some of the limitations and thereby help realize the full integrative potential of the ISCT and neopragmatism. The campaign for global corporate citizenship practice calls on corporate managers to embrace a more integrative, systems-based perspective in defining and fulfilling their managerial responsibilities. This would involve replacing the unitary emphasis on profit seeking on behalf of shareholders with a more pluralist emphasis on improving relationships with multiple stakeholders. "Business as usual" managerial assumptions and methods can still apply when market conditions are relatively stable and predictable. However, a "messy" complex and interdependent problem, such a coping with the human rights implications of sweatshop conditions among a firm's developing country subcontractors, could summon up a shared problem domain occupied by a number of contentious, potentially obstructionist stakeholders. Given this pluralist concern and community discord, managers are encouraged to think of the corporation as a citizen within an extended stakeholder network or community. As network citizens, corporate managers are encouraged to convene a community conversation and engage with other stakeholder representatives in exploring different perspectives on the nature of the problem. Such multistakeholder learning dialogues can be helpful in finding common ground, which can serve as the basis for cooperatively working on the problem. Thus, in 1997, Nike managers engaged with representatives of other affected apparel manufacturers, governments, and human rights and labor nongovernmental organizations to develop a voluntary "no sweat" industry code of conduct.

Such voluntary international codes of conduct define standards of corporate citizenship practice, thereby opening up the prospect for increasing transparency and holding corporations accountable to stakeholders for their social and environmental performance. The Global Reporting Initiative is an effort to extend this approach to developing and enforcing voluntary codes in multiple industries around the world. Expanding the definition of corporate performance to encompass a "triple bottom line" of financial, social, and environmental performance is at the heart of the effort to incorporate normative value considerations into corporate decision-making processes. Developing such codes of conduct and devising methods for measuring and enforcing voluntary standards are outgrowths of multistakeholder learning dialogue and engagement. This process of engagement calls on participants to place themselves imaginatively and empathetically inside the minds, hearts, and shoes of others as a precondition for finding common ground. Such imaginative sympathy for the plight of others is the essence of the moral point of view. A true triple-bottom-line approach must also embrace self-interested behavior, profitability, and economic growth as necessary complements of a sustainable corporate citizenship practice.

Conclusion

Adam Smith recognized that moral sentiments are necessary complements of rational self-interest within liberal market societies. This insight still holds in the more complex, networked world of the 21st century. Economists and ethicists are struggling to understand and apply this insight to contemporary management theory and practice. By recognizing the need to move beyond the conventional separation thesis that frames the normative and positive dimensions of conventional business practice, some economists and ethicists and scientists and poets continue to search for common ground in the minds and hearts of managers.

Economics of Well-Being (Post-Welfarist Economics)

Welfare economics seeks to evaluate the acceptability of alternative economic choices by examining their effects on the sum total of individual utilities. A limitation of this approach is that utility functions are ordinal concepts; their use is based on the assumption that individuals can rank alternatives but they cannot take into consideration the intensity of satisfaction they derive from them. Consequently, the utilities of individuals or groups cannot be directly measured and hence compared. For example, the utility of a corporate executive cannot be compared with the utility of a rural dairy farmer. This restricts the types of problems welfare economists examine so that concerns such as justice and equity are largely ignored. This means that while the level of income enters into a welfare economics analysis, the distribution of income does not. For instance, increasing a person's income can be welfare improving. However, transferring income from a wealthy executive to a poor rural farmer might not be welfare improving. The reason is that it is not obvious that the pretransfer utility of a rural dairy farmer is less than the utility of a wealthy corporate executive.

Post-welfarist economics is based on the premise that people form subjective valuations of their well-being. Although happiness might be important to people, it is not the only thing of value—justice, relationships with others, and equality might also be important to people. Consequently, post-welfare economics attempts to incorporate ethical considerations and constraints into the evaluation of alternative economic choices. For example, if justice is important to people, then they might be willing to give up material wealth in exchange for improved fairness in the economic system. This has implications for economic policy analysis because factors other than economic growth might be more desirable to people.

Post-welfare economics also accepts the subjective statements of individuals regarding things that are important to them. This means that researchers can measure the well-being of individuals through surveys or personal interviews. For instance, a survey might ask respondents to indicate how satisfied they are with their lives or how happy they are. Post-welfare economists accept these statements as meaningful measures of personal well-being, thus establishing the foundation for empirical studies designed to identify factors correlated with self-reported subjective well-being.

An important question in post-welfare economics is whether money buys happiness. Research has shown that income is positively correlated with reported well-being, at least up to a point. At low levels of income, subjective well-being increases as income increases, but at high levels of income, reported subjective well-being does not increase and has even been found to decrease slightly. For this reason, some scholars believe that relative wealth is more important for subjective well-being than absolute levels of wealth. In other words, people might report an increase in well-being only when their income increases more than their neighbor's. From a policy perspective, this means that raising one person's income might make that person happier, but raising everyone's income might have no effect on reported well-being.

Economies of Scale

A production process has economies of scale when the cost to produce each unit falls as the quantity of output increases. Some of the reasons why costs may fall when production quantity increases include volume discounts for supplies, longer utilization of equipment without downtime, increased time for learning to improve process expertise and quality, and enhanced productivity from resources (such as labor or capital equipment) that do not need to increase at the same rate as the quantity of production output. Each of these reasons explains, for example, why it costs less per car to produce many cars in an automobile factory than it does to produce just a few cars.

Ethical issues associated with *economies of scale* include honest measurement and equitable assignment of cost burdens, commutative and distributive justice, social responsibility, and management-labor relationships. The validity of the relationship between *economies* and *scale* assumes that all production costs are accurately quantified and all costs created by the production process are assigned to the process. Economies of scale may be apparent but not real—for example, if pollution costs are not completely measured or if they are borne by society rather than by process owners.

Commutative justice, or buyer-seller exchange relationships based on fairness, calls for the availability of information and knowledge in the marketplace. In a market for goods produced in processes characterized by economies of scale, sellers may consider if commutative justice requires informing current buyers that future unit costs will be lower as production scale increases. For example, sellers can factor into current prices both the current costs and the lower future costs.

While commutative justice suggests that the market should receive true and complete cost information, distributive justice calls for the value created by lower production costs to be equitably shared among a broader set of stakeholders. For example, the value of cost savings derived from economies of scale may be distributed as profit to equity owners or as wage increases to labor, two important stakeholder groups.

Processes characterized by economies of scale may increase their resource usage as they scale up but without increasing the overall contribution to social development. For example, if toy production scales up and increases its usage of plastic, then the cost of plastic may increase for other uses, such as the production of medical devices.

Managers must increase their application of coordination, monitoring, and control functions for business operations to achieve the potential cost efficiency offered by economies of scale. At the same time, ethical issues associated with management-labor relationships go with the increased scale of management functions.

When economies of scale are present, organizations that produce more output may come to dominate markets and communities. When this happens, it causes an increase in sensitivity to social responsibility and citizenship behaviors of large organizations, particularly concerning pollution, contribution to social infrastructure (e.g., community water, roads, and schools), boom and bust employment during business cycles, and business influence on government.

Efficient Markets, Theory of

The theory of efficient markets postulates that in a well-functioning capital market, the best estimate of the value of a financial security is today's price. This relationship holds because the current price of an asset reflects all the information available to buyers. According to the efficient markets hypothesis (EMH), stock prices change only when new information becomes available or discount rates change. In defense of the theory, EMH advocates point out the so-called random walks of stocks and (more generally) securities through time; that is, price changes are unpredictable because prices respond only to *new* information (and the newness of information, by definition, makes it unpredictable). In case of investor disagreements about the value of a security, share price valuations will converge around the "true value" over time because either incorrect valuations disappear due to a presumed process of natural selection (learning) or arbitrageurs interpret information correctly and can profit from these disagreements among investors. Overall, these market dynamics decrease market volatility, which is a central prediction of EMH. Furthermore, EMH predicts trading volumes in financial markets to be limited because rational investors cannot agree to disagree when they have the same information.

The general definition and explanation of EMH above are most consistent with the semistrong form of EMH: Current market prices reflect all *publicly* available information. Other forms are the weak form (all information contained in past price movements is fully reflected in current market prices) and the strong form (current market prices reflect all pertinent information, whether publicly available or privately held). Studies generally found that whereas the weak form and the semistrong form of EMH typically hold, the strong form generally receives little or no empirical support. These conclusions about strong-form EMH are supported by the fact that inside traders are able to make abnormal profits.

The theory of efficient markets has had a lot of success since its conception and further theoretical development by, among others, Eugene Fama and Myron Scholes. EMH became widely known after Fama's seminal article in 1970. Over time, it was widely accepted as the orthodox model of academic finance and spawned the options-pricing model that created the derivatives industry. Moreover, investment strategies tied to indexed funds are a manifestation of the idea that no investor can consistently second-guess or outperform the market.

Undoubtedly, this latter implication of efficient markets theory usually holds: It is very difficult for any investor to beat the market consistently. However, there is no empirical evidence that markets are always right or that market prices represent rational assessments of fundamental values. Behavioral finance scholars, such as Robert Shiller, Andrei Shleifer, and Hersh Shefrin, have shown to what extent psychological heuristics and biases can affect buyers' and sellers' behaviors and, thus, make markets less than efficient. Specifically, irrational exuberance can first lead to an overpricing of securities, which in turn may lead to various drastic reactions to such mispricing, such as investors' panic selling. This happened, for example, in the stock market crash of 1929 and the bursting of the dot-com bubble at the turn of the millennium. (Peter Garber pointed out that the most famous market bubble, the 17th-century tulip mania in Holland, should actually not be regarded as an example of irrational mispricing.)

Research that casts doubt on the validity of EMH has wide-ranging implications for business ethics. If markets are not efficient, market prices cannot really reveal the intrinsic value of securities at any particular moment. In a broader sense and in contrast to arguments by Ayn Rand and others, market prices are not revelatory of value in moral terms if markets are inefficient due to the irrational behavioral dynamics of most market participants. This would cast doubt on the frequently presumed equivalence of "value in/for society" and "economic value." According to Shiller, opinion leaders may also have a moral obligation to direct the public's attention to possible over- and underpricing errors.

In sum, there is growing evidence that markets can be irrational and inefficient. The new and expanding area of behavioral finance shows human psychological responses and emotions to be important in pricing. This evidence seems to undermine the previously broadly held assumptions of EMH. At the same time, there are also several methodologically sophisticated studies demonstrating the validity of EMH. The field has yet to reach firm conclusions, but the most accurate view might be the middle-ground position that the extent of the validity of EMH depends on the nature of the stock concerned. When stocks can be categorized easily in industry classifications, conditions may in fact approximate the postulates of efficient markets theory. However, when a stock cannot be easily classified, it becomes more difficult for investors to interpret information about it. This cognitive uncertainty in the market may increase trading volumes and stock volatility to levels beyond those predicted by EMH. In other words, either extreme view of the market (as either highly efficient or highly inefficient) is most likely false; the truth most likely lies in between this dualism set up by orthodox finance theory and behavioral economists and may depend on a variety of contingencies, or scope conditions, which future research may reveal.

EGALITARIANISM

Egalitarianism suggests that there should not be different levels of equality or preference given to some. Inequality violates the basic notion of the same rights for each person irrespective of one's education, occupation, age, ethnicity, or social class. The core idea of egalitarianism is the view that all humans are equal and should be treated as equals not only in terms of political rights but also in the allocation of resources. This is true not merely with respect to property and other forms of wealth but in political, social, cultural, and other aspects of life as well.

The English word *egalitarian* is derived from the French word *égal*, meaning equal. In this entry, five main topics will be considered, beginning with a definition of egalitarianism. A brief history of the term is followed by a discussion of the various different types of egalitarianism. A critique of egalitarianism will be provided, along with an analysis of the case for egalitarianism.

Egalitarianism Defined

Egalitarian doctrine essentially advocates equality of some sort, although there is considerable diversity in egalitarian theory and practice. Equity in business dealings and equality of corporate opportunity would certainly be hallmarks of business or corporate egalitarianism. No one should receive unfair preferential treatment, according to egalitarian philosophy.

Specialized, field-specific definitions may also be consulted. According to one respected perspective, egalitarianism is the moral principle espousing the belief that all human beings are and should be treated the same. All persons should be treated equally in some respects. Similarly, egalitarians believe that everyone is fundamentally and essentially of equal worth and moral status. In the Western European and Anglo-American traditions, the most significant influence on this thought is the Christian concept that God loves everyone equally. Egalitarianism must be considered to be a protean doctrine, because there are numerous types or categories of equality.

Egalitarian History

Egalitarianism has been an evolving concept subject to diverse interpretations. It is appropriate that the term *egalitarianism* is French in derivation, as the French revolution was probably the first modern manifestation of the philosophy. The Englishman John Locke may have supplied one of egalitarianism's initial modern foundations with his idea of moral rights. In the mid- to late 1600s, Locke contended that all people should have equality of moral rights, which he termed "natural rights."

Marxism, and its corollaries socialism and communism, represented the next major step in the history of egalitarian thought. Karl Marx's socioeconomic studies in the late 1800s realized that complete revolutionary structural change would be necessary in the industrialized nations to achieve the Marxist goals of common ownership and collective economic enterprise. Both socialist and communist political philosophy has been used to guide governments in the 20th and 21st centuries in Cuba, Eastern Europe, China, and the former Soviet Union, with very limited success.

A third noteworthy development in egalitarian thought involved the work of John Rawls. According to Rawls, there are "primary social goods" of basic importance, which should be equally available to everyone. The two most important aspects of egalitarian philosophy, according to Rawls, were as follows: (1) All persons have equal citizenship and personal liberty rights, and (2) the only justified exceptions to an equal division of income and rewards would be those helping the most disadvantaged, and only if offices and positions of leadership were equally accessible to every possible aspirant. Rawls's work on egalitarianism is still considered important and influential egalitarian thought.

Different Types of Egalitarianism

Egalitarianism is often mentioned with respect to social and political rights and economic privileges, but there are also other types of egalitarianism, as this theory can be applied to many specific domains. These areas include economic egalitarianism, moral egalitarianism, legal egalitarianism, political egalitarianism, gender egalitarianism, racial egalitarianism, and asset-based egalitarianism.

Economic Egalitarianism

Economic egalitarianism or material egalitarianism refers to the notion that people should be and/or are equal with regard to material possessions. Political movements such as communism, socialism, and Marxism developed from the central egalitarian idea that all people in society are created equal and that all humans should have economic equality. Social control of resources is necessary to avert the usurpation of vast amounts of wealth by the wealthy. With equal distribution, there is no room for economic inequality, thus solidifying economic egalitarianism. Economic egalitarianism is incompatible with capitalism and free enterprise economic systems.

Moral Egalitarianism

Moral egalitarianism suggests that all people are equal with regard to each person's intrinsic individual moral worth. Although people have different moral backgrounds and religious beliefs, each person has the same moral worth as another and should be treated with an equal amount of respect and dignity. Moral egalitarianism contributes to many religious ways of thinking.

The principal idea of moral equality is one of equal dignity and respect, an ideology that is widely accepted as a standard of Western civilization. In fact, the basic idea of equal respect being paid toward all humans is a standard for religions and schools of political and moral culture worldwide, including Christianity, Islam, and Buddhism. A business operated under this philosophy would treat all customers and clients exactly the same, without substantial dissimilarities in prices, discounts, terms, or other preferential business practices.

Legal Egalitarianism

Legal egalitarianism asserts that all people are equal under the law. One of the prominent portions of the U.S. Declaration of Independence includes the moral and legal aspects of egalitarianism with the main philosophy, "All men are created equal." Without the foundation of egalitarianism, the modern civil rights movement could not have advanced thus far in society.

Most contemporary American businesses probably already assume a legal egalitarian philosophy as the basis for their corporate legal posture. Examples or manifestations of legal egalitarian philosophy in the corporate world would involve policies as different as equal opportunity employment practices and corporate benevolence and charitable giving. Emphasis on legal equality is both natural and commonplace in the corporate environment.

Political Egalitarianism

Political egalitarian philosophy advocates the belief that all people are equal in political power or influence. Political egalitarianism is considered by some to be the founding principle of democracy. It is essentially a political doctrine above all else.

Political egalitarianism played a key role in women's suffrage and the civil rights movement. Political egalitarians believe that each person should hold an equal vote in political power. This is an important basic belief in democracy because every person has the right to vote in all elections and every person's vote will count equally toward determining who wins and who will govern. An organization conducted in accordance with political egalitarian values would prize participatory decision making and encourage employee empowerment enterprises.

Gender Egalitarianism

Gender egalitarianism asserts that both genders should be treated equally. Gender egalitarianism was publicly advocated during the equal rights movement and the women's suffrage movement in the United States. The suffrage movement sought women's right to vote; women's right to own property; and equal rights and opportunities in employment and education, with equal pay.

Racial Egalitarianism

Racial egalitarianism perceives biological equality among the human races. This was an especially important concept during the civil rights movement in the United States during the 1950s and 1960s. During that time, African Americans and other minorities in America fought to abolish public and private acts of discrimination against minorities. The civil rights movement was similar to the women's suffrage movement in that both sought equal rights to vote, own property, and receive identical or comparable opportunities in work and education, including equal pay. The American Jewish community empathized with and supported the civil rights movement.

Racial egalitarian policies in business might involve fair employment, diversity, and human resources issues internally and racially sensitive marketing practices externally. Racist tendencies have been noted in the American workplace in a variety of contexts and situations. Since both individual and group-oriented egalitarian concerns are present in cases like this, these can be complex and potentially litigious situations.

Asset-Based Egalitarianism

Asset-based egalitarianism involves the sudden acquisition of vast amounts of wealth, such as through inheritance or corporate transactions. The doctrine states that equality can be made possible by a redistribution of resources, usually in the form of a grant. In an economy where asset-based egalitarianism is an actual policy, the redistribution of wealth is provided by giving everyone a lump sum of money, usually at the age of majority. Inheritance is a significant point of controversy in discussions between egalitarian-minded people and their critics.

Some national governments have practiced asset-based egalitarianism. Both Saudi Arabia and Venezuela have distributed oil-generated annual stipends to their citizens. While the motivation behind these policies probably did not involve egalitarian philosophy, the net effect of these payments is to improve the standard of living of all citizens by an equal amount.

Critique of Egalitarianism

At first sight, egalitarianism would seem to be a desirable goal for our modern world to achieve. As time moves on, the gap between people who have "value" to society and those who do not grows deeper. Some people are born into wealthy families and never have to work a day in their lives, while most others must work their entire lives to attain a meager standard of living.

The issue that many philosophers take with the primacy of equality in egalitarianism is that the doctrine merely advocates equality or near-equality between people without a solid understanding about what that equality gives us. In this section, two criticisms of egalitarianism will be voiced: (1) Egalitarianism is not necessarily progressive or beneficial, and (2) egalitarianism conflicts with other values.

Egalitarianism Is Not Necessarily Progressive or Beneficial

Egalitarianism must be considered a controversial concept in social and political philosophy, in light of the contentious issues confronting its advocates and critics. A major initial problem with this belief system is that egalitarianism, in the strictest sense, is not at all concerned with the well-being of people. It is more concerned with the fact that every human is equal.

The principles of equality that egalitarianism advocates do not *necessarily* mean that everyone should get to live in beautiful houses, have access to high-quality medical care, and eat three square meals a day. Egalitarianism advocates equality between people, which means that it would fulfill the concept of egalitarianism just as well if everyone were emaciated and starving, without any sort of medical aid or shelter. As long as *everyone* is emaciated and starving, the core principles of egalitarianism would be fulfilled.

This argument has been consistently noted by critics: A society that facilitated formal egalitarian philosophy might conceivably do so by providing a harsh and generally grim standard of living for those who are unsuccessful in the individual Darwinian competition for an advantageous position at the workplace and in society. In fact, if a perfect meritocracy satisfied the rigorous Rawlsian equality standard of the fair opportunity principle, it might impose the same harsh and grim conditions of life on those lacking marketable merit and salable skill. It is important to note that Rawls's concept avoids "harsh and grim" conditions through voluntary and self-organized collective society, as common activity is negotiated and pursued for mutual individual advantage.

Egalitarianism Conflicts With Other Values

Egalitarianism cannot be fully realized without conflicting with other important Western values, because of the relatively extreme nature of the concept. One such value conflict would place the parental values of helping one's children squarely in a clash with the basic tenets of egalitarianism. Some parents have considerable resources to facilitate the education and intellectual development of their children, while others lack those means to assist their offspring. The traditional interaction of parents with their children thus becomes an obstacle to the achievement of equality of fair opportunity.

Taken in isolation, egalitarianism is attractive because it emphasizes notions of equality and fairness that are traditional human values. The trouble is that one cannot take a political philosophy such as egalitarianism in a vacuum, because it must coexist in a world with other, mutually exclusive values. Egalitarian doctrine does not favor personal initiative, nor is a strong individual work ethic valued, because they lead to positions of advantage for some. No one wants to be disadvantaged in any way, but does that mean that others should not be advantaged?

The Case for Egalitarianism

The philosophical criticisms of egalitarianism could arguably be wrongly directed by focusing too much on the material well-being of humans. Most of the critiques that philosophers direct at the concept of egalitarianism end in assuming that egalitarian beliefs focus only on the value of what we attain in our lives and what kind of family we are born into. However, the values that egalitarianism promotes are never clearly defined as being only wealth, power, and material goods.

Egoism

Psychological Egoism

Psychological egoism (sometimes called descriptive egoism) claims that every individual does, as a matter of fact, *always* pursue his or her own interests. In other words, it claims that people never act altruistically for the good of others or for an ideal. Since psychological egoism claims to state what is the case, it is a descriptive theory and so is very different from a normative theory such as ethical egoism, which purports to say how people ought to act.

Psychological egoism seems to rest on either confusions or false claims. If self-interest is interpreted in a narrow or selfish sense, then psychological egoism is simply false. There are clearly many generous people who often sacrifice their own interests, including their money and time, to help others. Indeed, most of us are generous on some occasions. Some defenders of psychological egoism admit this fact but claim that it is irrelevant because even a person who is generous is acting on his or her *own* desire to be generous and, hence, is really being self-interested. The problem with this defense of psychological egoism is that it reduces psychological egoism to a logical necessity; the motive for any action must be that agent's motive—this is logically necessary, for obviously it cannot be someone else's motive. Other psychological egoists argue that what appear to be generous motives are always a front for some hidden self-interested motive. For example, Mother Teresa was really, they claim, motivated by a desire for fame or respect or a desire to get into heaven. The problem with this form of psychological egoism is that there is no reason to believe it is true. It is mere speculation and must always remain so since we can never have access to a person's "genuine" motives. It may be believed mostly by people who are generalizing from their own ungenerous character.

A final form of psychological egoism rests on a confusion regarding the nature of desires and motives. Some psychological egoists argue that whatever selfish or generous desire motivates us, what we really want is the pleasure of satisfying our desire; thus, all human motivation is really self-interested. This misunderstanding was laid to rest in the 18th century by Bishop Joseph Butler and others, who pointed out that a person needs to have generous desires in the first place in order to get any pleasure from satisfying them. They also pointed out that supposing we have a second-order desire to fulfill our desires is redundant and involves an infinite regression.

Ethical Egoism

Ethical egoism is very different from psychological egoism. Ethical egoism is a normative ethical theory that claims that every individual ought to *always* pursue his or her own self-interest and only his or her own interests. An ethical egoist believes that people should never altruistically pursue the good of others and that people should never make personal sacrifices for an ideal. Ethical egoism is not limited to a person's economic interests but applies equally to all types of interests a person may have, such as family interests, love interests, religious interests, and so on.

Advocates of ethical egoism often view it as a fundamental moral principle that cannot be justified using any more basic moral assumptions. However, there have been some attempts to make ethical egoism morally plausible, the best-known being Ayn Rand's claim that putting the interests of other people before one's own is demeaning and humiliating and does not show proper respect for oneself. According to Rand, if people have a morally proper concern for themselves, they will always consider themselves first.

Several aspects of ethical egoism require clarification. First, it needs to be emphasized that a belief in ethical egoism does not prevent a person from being cooperative with others. If the egoist benefits from cooperation, then he or she is required by his or her moral belief in egoism to cooperate. This is true not just of cooperating directly with other people but also of cooperating with social rules, norms, and ethical customs; if following the rules or norms will pay off for the egoist, then he or she ought to follow the rules. Perhaps an ethical egoist ought to defect in a one-shot prisoner's dilemma or be a free rider when there is no chance of being caught, but life rarely resembles such situations. A good egoist is always concerned for his or her reputation for honesty and cooperation because it is generally in a person's interest to be accepted as a part of cooperative endeavors. It can be argued that even in situations when one's reputation with others is not at stake (such as in a highway service center one does not plan to visit again), an egoist has an interest in preserving the habits of honesty, politeness, and cooperation. The human ability to detect liars and cheats is sufficiently subtle so that egoists who want to be thought of as honest and cooperative serve their own interests best by always cultivating the social virtues, even when among strangers. It can be argued that it is generally in a person's interests to have an honest personality as well as a reputation for honesty. An egoist will guard against the corruption of his or her character. In fact, if virtue ethicists are right in saying that cultivating the virtues is an essential part of human happiness, then ethical egoism from the broadest perspective would be compatible with virtue ethics.

Ethical egoism should not be thought to advocate selfishness. Ethical egoists advocate that we pursue our own interests, but they often do not claim that our interests are narrowly selfish. Most people have genuine interests in their family, friends, community, nation, and religion, among other interests. They do not just want these to thrive so that they will themselves benefit; they have direct interests in many aspects of society even when no personal advantage can result. Furthermore, some egoists point out that many people are inherently generous, which gives them an interest in helping others, not just an interest in mutually beneficial cooperation with others. Most ethical egoists include satisfying social desires and generosity as part of pursuing their self-interests.

A similar point can be made about narcissism; excessive attention to oneself is probably suboptimal from an egoist point of view. A thorough pursuit of one's own interests requires that one's calculations take into account the larger picture, including other people's interests and emotions, their likely behavior and reactions, social rules, laws, politics, and so on. Nor is it likely that an egoist will benefit from excessive self-regard, lack of self-awareness, or obsessive ambition, even though such characteristics are often loosely associated with egoism.

Numerous objections can be raised against ethical egoism. These include claims that as a fundamental moral principle, ethical egoism is plainly wrong; that people have a purpose in life other than just pursuing their own goals; that we have moral obligations to other people and not just to ourselves; that there are universal moral principles that prohibit some egoistical actions; that altruism is a moral duty that extends beyond feelings of generosity; and that ethical egoism misuses moral language and violates our most basic moral intuitions.

These are powerful objections to egoism in its pure form, but rejecting egoism altogether violates the common moral intuition that pursuing one's own interests is often morally permissible or even required. A compromise position might be to accept what can be called constrained ethical egoism. It is important to note that constrained ethical egoism as discussed here is not a form of ethical egoism as that phrase is usually used; it uses the word *egoism* in its ordinary meaning and appeals to many people's intuitions about egoism and the ethical limits of egoism. It is, however, some sort of normative egoism insofar as it maintains that people *ought* to pursue their own interests, albeit within constraints, and not just that it is permissible to do so. Possible constraints on egoism are either some religious or deontological moral principles or the more simple constraint of not doing serious harm.

A deontological moral theory labels certain types of actions as unethical regardless of their consequences. The moral principles of many religions are of this type. Immanuel Kant's categorical imperative is the most sophisticated philosophical deontological theory we have. Constraining ethical egoism by the categorical imperative would give this principle: Everyone ought to pursue his or her own self-interest by any action that does not violate the categorical imperative. Since the categorical imperative is clear (or so Kant claims) on what actions are unethical but vague about the purpose of human actions, this form of constrained ethical egoism is possible.

A simpler form of constrained ethical egoism may be this principle: Everyone ought to pursue his or her own self-interest by any action that does not cause serious harm to anyone. What constitutes "serious harm" may be vague, but at a minimum it would include death, physical harm, or psychological trauma. The seriousness of financial harm is more difficult to determine. Although not without problems, constrained ethical egoism seems closer to our normal moral intuitions than ethical egoism in a purer form.

How common is it for people to seriously commit to ethical egoism in either its pure or its constrained forms? Are there many people who believe that one ought always to pursue only one's own interests, or even that one ought always to pursue only one's own interests within certain ethical constraints? It is difficult to say because it is probable that admitting that one is an ethical egoist, or trying to get others to be ethical egoists, is seldom in one's own interests. It is generally a much better idea to get other people to be mindful of the needs of others, including your needs. If this is true, then truly serious ethical egoists would never admit that they are ethical egoists, nor would they ever advocate ethical egoism; it would never be in their interests to do so.

Egoism in Business

Using egoism in the general sense of the pursuit of a person's own self-interest, many people believe that in a capitalist economy, business is founded on egoism and runs on egoism. Egoism is thought to be one of the primary motives for workers to take jobs and pursue careers, for management to run corporations, and for entrepreneurs to build new businesses. Egoism is viewed as the key incentive for people to save, invest, take risks, and innovate. I will refer to this form of egoism as business egoism to distinguish it from ethical egoism and psychological egoism. By business egoism, I mean the belief that it is morally acceptable, or even required, for every individual to pursue his or her own economic interests when engaged in business.

Business egoism is not inherently unethical. Its ethical permissibility can be justified in two ways. The rights justification is based on a person's right to own private property, freely exchange property and services, and freely enter into consensual contracts. Since all people have (or should have) these rights, they have the moral right to pursue their own interests by exercising them. Business egoism can also be justified on utilitarian grounds by using the invisible hand argument. This claims that if everyone pursues his or her own interests, it will lead to a thriving and dynamic economy from which everyone can benefit.

The moral justifications of business egoism do not justify unlimited egoism. First, business egoism includes only economic activities; it does not include other areas of life such as politics, family, or community. Business egoism cannot even be extended to other occupations. Both the rights and the utilitarian justifications of business egoism suggest that in many cases a corporate employee's egoistical pursuit of his own career goals is limited only by his employment contract and not by other obligations to his employer; on the other hand, dedicated physicians, teachers, and professors have fiduciary obligations to their patients, students, and the truth that transcend and may sometimes limit their own egoistical career interests.

Second, business egoism has three significant constraints on it. Neither the property rights nor the utilitarian justifications of business egoism can justify violations of law and ethics. Furthermore, both justifications assume a morality of respect for the free market, including respect for private property and honest contracts. These three constraints are an essential part of business egoism because without them, neither the rights nor the invisible hand justifications of business egoism will work.

These reflections raise the issue of the status of business egoism as a moral theory. Clearly, it is not a form of pure ethical egoism because it requires significant constraints on egoism. It is a form of constrained ethical egoism only insofar as it recommends that people ought to pursue their own interests in business. However, many people's moral intuition is even weaker in that they would only want to claim that it is *permissible*, not obligatory, to pursue one's own interests in business. Constrained business egoism as most people intuit it is not a form of ethical egoism as most philosophers use the term.

Business egoism has many critics. Both the rights and the utilitarian justifications for business egoism have been criticized—the utilitarian justification on the grounds that business egoism does not in fact lead to the greatest good even in a free market and the rights justification on the grounds that property rights are less basic and more limited than the argument requires. Other criticisms include the claim that business egoism corrupts one's character and tends to become obsessive; that business egoists tend to ignore the moral constraints on egoism even though these are an essential part of the justification of business egoism; and finally, that business egoism trivializes life into the pursuit of economic gain.

Business egoism is often discussed in the context of Milton Friedman's famous article defending the obligations of corporate managers to try to maximize the profits of their corporations. Many people interpret Friedman as defending business egoism when he advocates a stockholder theory of corporations, but there are problems in viewing stockholder theory as a form of egoism. First, viewing corporations as egoists when they try to maximize profits raises the question of whether corporations are moral agents that have the kind of interests that egoism requires. Second, Friedman is recommending to senior corporate executives a morality very different from egoism: Executives should, according to Friedman, pursue the interests of the corporation's owners, not their own interests. Executives should not be egoists because they have fiduciary obligations to act in the interests of other people. Viewing Friedman's theory as a form of egoism may come from extending the legal fiction that corporations are persons into ethical discussion, thus raising the possibility of a corporation being an egoist. This extension needs more justification than it has yet been given.

Business Egoism and Ethical Egoism

Business egoism is very different from normative ethical egoism both because it applies only to a person's economic activities and because it needs to be constrained by law, ethics, and respect for private property and honest contracts. However, if one accepts ethical egoism, business egoism would seem to follow from it: If people believe that they should always pursue their own interests, then they would do so in business as well as in other areas of their life. If ethical egoism is used in this way to justify business egoism, business egoism changes slightly. Since under ethical egoism one is committed to a general pursuit of one's own self-interest in all areas of life, one's business interests would have to be balanced with one's other interests. Excessive concentration on one's business interests harms a person in ways that violate a more general egoism. This is the point that Dickens is making with Ebenezer Scrooge in *A Christmas Carol.* Scrooge greatly prospered in business but at the expense of everything else in life. He lost his fiancée, his family, his friends, and the pleasures of society and generosity. Before he saw the ghosts, Scrooge was an excellent businessman and a great business egoist but a very poor ethical egoist.

Conclusion

Of the various kinds of egoism, psychological egoism, which claims that all people as a matter of fact will always pursue their own interests, can be dismissed as either confused or false. This leaves the normative question of whether people *ought* to pursue their own interests and in what contexts they should do so.

Business egoists will pursue their own interests in business without necessarily accepting egoism in other areas of their lives. They can morally justify this on either rights or utilitarian grounds. Many people believe that egoism lies behind the immense productivity of capitalist economies, though the sustainability of that productivity in the medium and long terms has been questioned. Business egoism, whether justified by rights or utilitarian arguments, necessarily has three constraints on the pursuit of self-interest: People should obey the law, follow ethical principles, and respect private property and honest contracts.

A business egoist is not necessarily an ethical egoist because ethical egoists pursue their self-interest in all aspects of their lives, not just business. An ethical egoist would likely be a business egoist insofar as he or she is involved in business, but the nature of business egoism would change if a person were an egoist in all areas of his or her life. Ethical egoists would have to balance their business interests with other interests, including family, friends, community, religion, and so on. They would never sacrifice their other interests entirely to mere economic gain. They do not necessarily recognize constraints on the pursuit of their self-interest, but if business egoism is to be compatible with most people's moral intuitions, then a business egoist is likely to recognize the constraints of religion, morality, or at least the principle of not doing serious harm to others.

Neither business egoism nor ethical egoism should be confused with selfishness, narcissism, excessive self-regard, or even obsessive ambition. Egoists pursue their own interests, but this does not mean that they do not have interests that involve the promotion of the good of other people. Egoists may cooperate with others, and with laws and social norms, as a means to their own ends. But egoists may also include the interests of others as a constitutive part of their self-interest. If an egoist loves his or her family, for example, then their interests constitute a part of his or her interests.

Electronic Commerce

Electronic commerce, also known as "e-commerce," refers to the marketing, distribution, sale, and exchange of products and services via the Internet and encompasses a multitude of Web-based (often called "virtual") commercial transactions. Through e-commerce, funds are transferred, supply chains are managed, and data are collected. E-commerce depends on and is the result of the application of new technologies to traditional forms of business. The commercial transactions that result are considered virtual or simulated—in contrast with traditional, or "real," brick-and-mortar transactions—because they take place invisibly. The *e*, for "electronic," reflects the technological systems that facilitate commerce, and e-commerce thus entails the complete network of systems and processes that enable commercial transactions to take place electronically via the Internet.

E-commerce is a vehicle through which businesses reach out to a virtual marketplace of customers united by need, desire, and/or mere curiosity. It enables firms to transcend barriers such as time and geography and thereby allows businesses to reach a broader audience than might otherwise be possible. It also provides businesses with the opportunity to collect massive amounts of information about their stakeholders—particularly their customers. Finally, use of the Internet by firms enables them to exercise significant control over operations and marketing.

At the same time, e-commerce can serve as a Pandora's box for firms, for there are just as many, if not more, obstacles as there are opportunities for businesses as they operate in the virtual world. Because the Web is largely unregulated, the Net creates an illusion of freedom for businesses and individuals and lulls them into the idea that conventional business practices and the law no longer apply. Businesses and individuals have sometimes discovered the hard way that customary business practices are important and that the law and the public can be unforgiving when people feel violated by online transactions.

Historical Development

E-commerce has evolved considerably during the past 30 years. The term *electronic commerce* originated in the 1970s in connection with technology that enabled the electronic transfer of data in commercial transactions. Electronic Data Interchange (EDI) and Electronic Funds Transfer (EFT) are two examples of the technology developed during this time. EDI facilitates the computer-to-computer exchange of information over private or public networks and remains even today the primary data format for electronic transactions. EFT, in a similar fashion, is used for financial transactions. It, too, continues to exist, albeit expanded far beyond its initial use.

During the 1980s, businesses began to rely increasingly on such electronic means of exchanges to enhance the efficiency and minimize the costs associated with their transactions. Individuals became more familiar with electronic exchanges as automated teller machines (ATMs) proliferated and grew in importance and popularity and as the use of debit and credit cards became more widespread.

It was not until the 1990s, however, that the term *e-commerce* took center stage as the Internet became widely accessible and commercialized, particularly with the establishment of the .com registry, which establishes ownership and regulates the use of domain names. From that time onward, businesses began accessing new and untapped markets, and individuals were able to engage in commercial transactions without having first to establish a physical presence. This heralded what has become known as the "dot-com" era, because of the multitude of Internet-based start-up companies that emerged in a short period of time, along with the use of e-commerce by traditional brick-and-mortar companies.

The term *dot-com* commonly refers to the extension ".com" in a Web address or domain name and indicates a Web site that is commercial in nature. Although .com remains the most commonly recognized extension, other domain names are also available. The extension ".biz," for example, was introduced in 2001 and is restricted to business use. Specific countries have adopted their own extensions, such as ".au" for Australia, ".br" for Brazil, ".co.jp" for Japan, ".com.mx" for Mexico, and ".co.uk" for the United Kingdom.

The Dot-Com Bubble

The late 1990s witnessed a tremendous surge in the emergence of dot-com companies, and a new era began to take shape as businesses adopted Internet addresses, either as their main market presence or as a way to augment existing business. This move had a profound positive effect on Western stock markets, particularly in the United States. Between 1997 and 2001, markets grew suddenly and to unprecedented levels, and this created a speculative bubble that has become known as the "dot-com bubble." A bubble occurs when stock prices boom in a particular industry and speculators, recognizing the rapid increase in share price, invest further, not because they believe the stock is undervalued but in anticipation of continued growth. This bubble is called the dot-com bubble because it was linked to the emergence of a new group of Internet-based companies, commonly referred to as "dot-coms."

Stock values of Internet-based companies soared on the crest of a tremendous wave of opportunity and enthusiasm. Triggered by the shocking rise in value of Netscape's initial public offering (IPO) and allegedly manipulated by some of the world's leading investment banks and venture capitalists (CS First Boston, Goldman Sachs, Morgan Stanley, Merrill Lynch, and others), speculators hoping to get rich quick drove up the stock values of Internet-related businesses. Millionaires were born overnight as venture capitalists invested billions of dollars to fund incipient ideas, while traditional business models seemed to be largely set aside if not altogether abandoned. Low interest rates in 1998 and 1999 increased the availability of capital for entrepreneurial, Internet-based ventures. It was during this time that a number of today's Internet-based leaders emerged, including Amazon.com, eBay, Google, and Yahoo!

The Dot-Com Crash

The ethereal and fragile nature of the bubble quickly became apparent, however, as the bubble burst almost as quickly as it had grown. Between 1999 and 2000, the economy began to slow as the Federal Reserve increased interest rates six times. The failure of these businesses had a cascading effect such that, by 2001, the dot-com boom was over and many of the enterprises viewed so promisingly just a year before were now considered "dot-bombs."

The dot-com crash put hundreds of companies out of business almost overnight and cost thousands of people their jobs. Investors lost millions of dollars. In 1999 alone, there were 457 IPOs of stock of private companies—most of them linked to the Internet and technology. Of those IPOs, 25% doubled in price the first day their stock was traded. By 2001, there were only 76 IPOs, none of which doubled in price the first day of trading. Between March 11, 2000, and October 9, 2002, the NASDAQ fell 78%. The lesson of e-commerce was clear: It holds the potential for tremendous opportunity, but the path toward realizing that potential is fraught with challenges and not that far removed from traditional good business practices.

Ethics and E-Commerce

By 2006, the dot-com market gradually began to rebound. The popularity of enterprises such as Skype (an Internet-based telephone service) and YouTube (a vehicle for Internet-based video sharing) signaled a renewed growth in technology. Even so, ethical issues continued to nag the sector. The unbridled opportunism and manipulation of markets during the bubble had never been fully addressed, and the lure of windfall profits never completely left the psyche of some speculators, despite the legal, financial, and social costs of such behavior.

With the implosion of the dot-com bubble, questions have arisen regarding whether or not e-commerce calls for a new set of ethical guidelines. On the one hand, many maintain that e-commerce is unique and needs an ethic separate from mainstream business and marketing ethics. Others claim that e-commerce is just another form of business and should be subsumed within the broader fields of applied ethics. The chief assertion here is that the problems associated with electronic commerce are merely new manifestations of old business issues that can be addressed adequately through established ethical processes. E-commerce simply contextualizes, in new form, traditional considerations such as fair pricing, distribution, responsible advertising, and respect for privacy.

Not surprisingly, considerable debate has ensued regarding the Internet as a new or variant form of business. Questions persist regarding the Internet's encroachment on individual privacy, but concern for privacy has been a prominent theme in other contexts for decades. The mistake that many companies make lies in framing questions in e-commerce as new territory, for in doing so, they deprive themselves of the years of experience in dealing with those same sorts of issues in the brick-and-mortar marketplace.

Distinguishing Features

While the fundamental difference or sameness of e-commerce is disputed, virtuality—a defining characteristic of e-commerce—certainly alters the dynamics of commercial transactions. While being online might not render it necessary to create a distinct code of ethics for e-commerce, it is important to recognize the presence of significant attributes that exacerbate concern about this way of doing business.

Availability of Information

Information is a valuable commodity, and corporate use of the Internet for marketing purposes presents managers with a pressing problem regarding how to handle the metaphorical mountain of information that the Internet makes available to them. Because firms cannot afford to market their products to everyone, managers must cull through information with a strategic purpose in mind. In other words, it is not enough to acquire information; that information must be handled in such a way as to create value for the firm. To aid in this process, support businesses have emerged whose primary purpose lies in collecting information to be sold for marketing purposes. In addition, businesses themselves are becoming increasingly adept at collecting information about customers and then selling that information to other firms.

Unrestrained information gathering is a concern to many people, especially those who care about individual privacy protection. In their view, while information gathering per se is not necessarily worrisome, how that information is used matters. The magnitude of the information available via the Internet coupled with the temptation to misuse it has exacerbated privacy concerns among a number of stakeholders in e-commerce. Because the Internet enables businesses to distribute widely the data they collect, the monitoring, control, and use of information have become focal points of concern.

Lack of Transparency

As odd as it might seem, an online presence often diminishes corporate transparency. While e-commerce allows firms to harvest large amounts of information about people, it also enables corporations to cloak themselves and their practices in deceptive anonymity.

Although many firms volunteer information about their goods and services, a significant number do not. Xfleas.com, for example, is a low-cost distributor of pet supplies. Although its Web site states that the company only sells products licensed in the United States, the only information available about the company is an e-mail address, a mailing address, and a fax number. There is very limited information about the specific products offered, and no information is provided about expected delivery times and other particulars associated with purchase and delivery.

Although customers might choose not to patronize such a company, many do so without being bothered by the lack of transparency in their transactions. Any qualms they might have are overridden by the lure of comparatively inexpensive products. In this case, the product offered is a 12-month supply of Interceptor, a popular heartworm preventative, which costs $25.54, including shipping. This compares favorably against Interceptor at $38.98 with $3.99 for shipping from 1-800-PetMeds, another popular Internet competitor—and so individuals willingly give their information to Xfleas.com.

Absence of Accountability

Accountability is noticeably absent in e-commerce as well. This can be a concern for customers who anticipate the possibility of mistaken delivery or defective products. Xfleas.com, for example, does not post any sort of return policy on its Web site. While it is uncommon for companies not to publish a return policy, they are not required to do so, and many opt out of this. Even in situations where the company does publish an explicit return policy, customers still encounter problems. Policies can be placed on Web sites such that they are not easy to find; the style in which policies are written can render them difficult to understand and/or apply; and the policies themselves can be replete with loopholes.

Product delivery is another area where accountability can be absent. Delivery is often delayed. Sometimes the product shipped is not the one that was ordered. It is frequently impossible to reach someone by phone or e-mail to handle or respond to complaints. While customers can choose which companies with which to do business, the reality is that the absence of accountability remains a significant concern regarding online transactions.

Perception of Vulnerability

The physical and metaphorical distance between firms and their customers, coupled with the ongoing flow of information (both accurate and deceptive), enhances Internet users' feelings of vulnerability. Customers complain about failed transactions and the lack of easy means of redress. Similarly, firms constantly strive to weed out customers who do not honor their debts. Other stakeholders express similar concerns about their vulnerability when engaging in online transactions.

In the end, stakeholders of all sorts recognize the value of information afforded by the Internet as well as the fact that the volume of information gleaned can be overwhelming and lead to inaccuracies, deception, increased financial risk, and feelings of vulnerability. The presence of these attributes serves to impose an obstacle to online trust. Ironically, it is trust that is arguably the linchpin for successful e-commerce. It is therefore essential for e-commerce ethics to incorporate consideration of such attributes in making ethical decisions regarding e-marketing.

Data and Discrimination

As destructive as improper use of data can be by brick-and-mortar enterprises, it is even more dangerous in the electronic domain because of the lack of formal restraints. Even so, a number of companies, failing to exercise proper judgment, have found that laws and ethical norms are unforgiving when it comes to the exploitation of personal data for commercial purposes.

DoubleClick and Data Miners

DoubleClick introduced people to "cookies," the term for information users leave behind as they surf the Internet. Cookies contain records of the keystrokes that Internet users enter and are stored on personal computers. They provide a record for return visits to Web sites, and the information they contain enables companies to construct profiles of customers.

Not long ago, DoubleClick, through the manipulation of cookies, created an extensive database of 100,000 online customers. When this was discovered, the company received harsh criticism by those who were unknowingly profiled. Early customers/surfers who had agreed to share information about themselves with DoubleClick had done so with the assurance from DoubleClick that their information would remain confidential. People felt betrayed and became outraged when DoubleClick attempted to merge with Abacus Direct, an offline marketing company with a database of information on 88 million households in the United States. Even before DoubleClick had the opportunity to use the data, the proposed merger alerted people to the dangers of intrusive target marketing that databases such as these could trigger.

Interestingly, although the DoubleClick merger issue was heavily publicized, it was not the first instance of such activity. Earlier, in 1998, Geocities was sued for selling personal information to third parties after guaranteeing its Web site users that their information would not be shared. Toysmart, too, was sued in 2000 for similar behavior in violating its privacy agreement during bankruptcy proceedings when it attempted to sell personal information to settle its debts with creditors.

While this type of activity occurs more frequently within e-commerce, where data can be more easily and opportunistically collected and disseminated, it echoes a similar situation relating to a database that Lexis-Nexis offered in the mid-1990s. At that time, Lexis-Nexis established what it called its P-TRAK Person Locator service. It provided address information along with aliases, maiden names, and social security numbers for millions of people in the United States. Although there is no public record of a lawsuit, the P-TRAK service was short-lived. Even though the data had been collected through legitimate means, their availability and accessibility posed a significant threat to the public. Both situations underscore the message that it is not the legitimacy or manner of obtaining the data that is necessarily determinative but their susceptibility to being used for manipulative or malign purposes that renders such databases questionable.

Amazon and Price Discrimination

Amazon has used data monitoring to develop customer profiles that it uses toward multiple ends—ostensibly to enhance customer service. For instance, Amazon uses historical purchase information to tailor Web offerings to repeat customers. Interestingly, there are serious questions about the accuracy and reliability of this sort of customer-driven information. When customers input the information themselves, it is often accepted without verification. Although this is troubling in itself, the underlying assumptions are even more problematic. With regard to purchases, not every single purchase can be interpreted as indicative of a customer's overall taste. Some purchases, for example, are made as gifts, others as one-time extravagances. In the end, Amazon was constructing profiles that appeared accurate but very likely were not.

In addition, Amazon allegedly used data profiling to set prices. In September 2000, Amazon customers discovered that they were charged different prices for the same CDs. Although the company claimed that the price differentiation was part of a randomized test, the result was price discrimination that appeared to be based on demographics. In other words, Amazon appeared to be redlining, or "e-lining" (redlining via the Internet)—a practice of price discrimination that differentiates financial opportunities on the basis of demographics such as race. Redlining is widely considered both unethical and illegal.

In the end, Amazon found that its use of information derived from online sources led to all sorts of complications. In this regard, Amazon is not alone.

Kozmo and Delivery Discrimination

Kozmo is another e-tailer identified as an e-liner. This company—a provider of 1-hour delivery services—excluded certain neighborhoods as a result of its racial redlining practices. In short, it refused to deliver merchandise to customers in undesirable neighborhoods, identified by their zip codes, which were predominantly black. Again, such behavior is considered legally and ethically inappropriate, for it deprives classes of people of opportunities available in the marketplace.

PayPal.com and the Global Marketplace

PayPal's less publicized e-lining behavior is particularly disturbing because of its influence on global e-commerce and its extensive relationships with people in different countries around the world.

E-commerce tends to be unique in that it renders geography virtually moot. PayPal, an e-commerce giant, emerged as a way of streamlining payments in arms-length purchases. As a disinterested third party, PayPal links parties for payment purposes in secure transactions. PayPal can link anyone, anywhere. The problem is that PayPal became selective with regard to the people with whom it chose to do business. In doing so, it effectively redlined groups of people on an international scale. In the United States, businesses can redline neighborhoods; in the global marketplace via the Internet, the ramifications are huge because e-businesses can e-line entire countries. This is what PayPal did by eliminating or not allowing transactions with parties in countries that are disfavored.

PayPal attributed its reluctance to do business with people in certain countries to the rampant corruption, lack of infrastructure, and risks associated with not receiving payment. While it is true that particular countries are notorious for "carding" (passing off illegally obtained credit card numbers), the problem was that the people of entire countries were denied access to a service and thereby forcibly limited in their access to e-commerce (since PayPal is a major e-payment tool). PayPal effectively engaged in discriminatory behavior, even though that behavior was for a legitimate business purpose (i.e., the minimization of financial risk). Unfortunately, although such behavior is considered illegal in the United States, there is no legislation to prevent it in e-commerce and in the global arena. PayPal thus engaged in practices via e-commerce that it could not have legally engaged in as a brick-and-mortar company in many countries, including the United States.

E-Trade

An emerging area of concern is that of e-trade. E-trade refers to the online trading of securities and financial products. Buyers and sellers connect through the Internet in e-marketplaces. It used to be that stock markets were physical locations where buyers and sellers met to negotiate prices. The Internet renders this moot.

Although NASDAQ set up the first electronic stock market in 1971, it took more than 35 years for the New York Stock Exchange to automate its trading process. This step is significant in that it signals the potential end of traditional trading room floors. If this is true, it is imperative that those involved in this business enhance online security and privacy measures, both to preserve trust and to protect customers.

Conclusion

The e-marketplace remains an amorphous domain, rife with both promise and danger. Where neither legislation nor regulation provides clear direction and where moral norms are not clearly defined, businesspeople must determine for themselves how to navigate through ambiguous ethical situations. The examples of companies such as DoubleClick, Amazon, Kozmo, and PayPay underscore the problems associated with the emergence of new technologies and online transactions. The experiences of these companies also suggest good reasons for the need to establish and articulate guidelines for e-commerce, whether they are the same as or different from existing brick-and-mortar business principles.

Electronic Surveillance

Electronic surveillance may be defined as the use of electronic devices to monitor people, their communications, and their physical environment. Electronic surveillance techniques and equipment allow people to gather data in an automated manner, usually with the goal of concealing the surveillance efforts from one or more of the monitored parties.

There are many examples of electronic surveillance that predate the computer era. These include the use of radio and television equipment to monitor conversations, and wiretaps of telecommunication lines.

Cameras have been used for surveillance almost since their invention. The video camera is particularly well suited for this use, as it can be set up to record customers, employees, and remote locations. The recording of video surveillance has become less expensive. Film is fragile and difficult to process. Recording tape does not need to be developed, but it shares some problems with film, in particular physical damage and capacity limitations. Modern video surveillance equipment can record images directly to a hard drive, thus allowing the operator to record far more information than with film or on video. It is also relatively easy to store, transmit, and analyze digital video, and the employees who perform these functions do not need physical access to the camera or location.

By adding a computer to the surveillance equipment, data gathering may be performed in a continuous or random manner, with or without human control. Recent examples include the methods described above, along with keystroke monitoring, satellite imagery, and radio-frequency identification or tagging.

Physical access to the monitored persons and environment is not always required. Some electronic surveillance can be performed in a remote manner. This can be achieved by using monitoring equipment set up at a distance from the user. Other remote techniques require an individual to place only one visit to the person or site to perform the initial setup of the required devices. Examples include the use of global positioning system (GPS) transceivers to monitor the movement of a person or an object with a high degree of precision in real time.

The emergence of trusted computing technology has offered organizations the possibility of monitoring the patterns and details of a computer user's activities. In 1993, the federal government proposed that telephones include the so-called Clipper cryptographic chipset. This chipset used a classified cryptographic algorithm and a key escrow approach that would allow authorized investigators to monitor encrypted telecommunications. After several researchers demonstrated flaws in the encryption techniques, the government abandoned the proposal in 1998.

More recently, a consortium of hardware and software companies have proposed that personal computers, media players, game consoles, and other devices include a trusted computing module. This module is a chipset that is physically integrated into the device in such a manner that removing or disabling the module would also disable or destroy the entire device. A trusted computing module can be used as a key for encryption and as an electronic serial number to uniquely identify hardware. This module could also be employed to license or restrict any digital media, including a program, file, or document, to one or more specific computing devices. The licensing transactions could then be used for surveillance purposes.

The widespread use of personal computers, mobile phones, and personal digital assistants (PDAs) in point-of-sale, inventory, and e-commerce applications raises the possibility that investigators could use a computing device's records to find and identify the participants in any financial or communications transaction, with or without the individuals' knowledge. Mobile phone networks and wireless networks can record and report data about a specific device's physical location and state. This is already being done in practice, with the use of GPS hardware and physical tokens such as radio-frequency devices. These devices may easily be installed in vehicles with or without the user's knowledge or consent. In fact, as more automobiles are equipped with sophisticated computer systems, it has become possible for law enforcement authorities to retrieve data about a car's speed, direction, and performance. This is particularly useful in forensic investigations of automobile accidents. Thus, computer or mobile phone users may incriminate themselves by using their own electronic equipment or simply by turning on the device.

There are several ethical concerns involved in this type of monitoring. A utilitarian approach is often used to support electronic surveillance before, during, and after criminal activities. Depending on the political climate, the severity of the crime, and other factors, the utilitarian ethic tends to override concern for the individual's privacy.

Electronic surveillance techniques may be used to extend or alter the scope and purpose of existing natural surveillance programs. Natural surveillance relies on the everyday human activities in a neighborhood as a monitoring tool. Criminals seem less likely to commit offenses if they believe they will be noticed or caught.

Criminal Activities

In the United States, the Fourth Amendment of the Constitution provides the basic protections against search and seizure. All three branches of the federal government and several state governments have weighed in on the legality of electronic surveillance methods in public life, the workplace, and the home. The USA PATRIOT Act is a recent example of how electronic surveillance has been used to address a variety of issues, including public safety, national defense, and economic security. The American Civil Liberties Union, the Electronic Frontier Foundation, and various labor unions are among the chief advocates for greater restraint and care in the use of electronic surveillance.

In some ways, the European Union (EU) regulates electronic surveillance in a stricter manner than the United States. Transborder electronic surveillance is a special concern. The EU's long emphasis on freedom of personal movement has sometimes collided with the enforcement and extradition efforts of European and international law enforcement agencies. However, several EU countries, such as Germany and the United Kingdom, have deployed vast networks of video cameras and other surveillance equipment throughout their larger cities to control crime, prevent terrorist attacks, and monitor traffic.

Marketing and Advertising

Electronic surveillance of consumers has become a normal activity in most industrialized countries. The data gathered from observations of shopping, browsing, and other normal activities can be used by manufacturers, distributors, retailers, and other parties to improve service, increase revenue, and provide better performance. Along with the methods mentioned earlier, this can include programs designed to reduce theft, increase customer turnover, and enhance workplace safety.

This use of electronic surveillance can also involve affinity programs that provide the consumer with discounts or other incentives in return for continued access to detailed information about finances, transactions, and other areas of interest. The retail, travel, finance, and banking industries have all employed various kinds of programs to collect detailed consumer data, which can be used in-house or rented to other suppliers and customers.

This kind of electronic surveillance seems permissible under both the utilitarian and the Kantian perspectives. The utilitarian ethic promotes the goal of the greater good versus the sacrifice of personal privacy, while the Kantian approach emphasizes an organizational responsibility to provide users with complete information, under the auspices of informed consent.

Employers and Employees

Electronic surveillance has also become an important issue in the workplace. Many electronic surveillance methods are easily used to monitor employees. Coupled with the growing reliance on the Internet and computers in many jobs, this trend has escalated sharply in recent years.

The widespread use of GPS tracking systems to monitor and locate vehicles and individuals provides one example. These tracking systems can be installed in a vehicle to monitor historical usage and location. When a GPS receiver is coupled with a transmitter, the resulting system can report the current location and approximate speed of the GPS receiver. Employers have installed and used such systems to monitor taxi, bus, and truck drivers in the United States, in the interest of enforcing workplace rules and increasing overall performance levels. In some cases, employees and users were not informed as to the capabilities of these devices. Behavior patterns that previously seemed normal to employees may no longer escape the detection and discipline of management.

Within the workplace, the principles of pervasive or ubiquitous computing, coupled with the advancing speed of telecommunications and computers, already allow users to store their data in a centralized location and to access such data with the computing client of their choice—a mobile phone, PDA, personal computer, or terminal.

It is far easier for an employer to monitor and control sensitive information in a centralized environment. In the United States, legislation such as the Sarbanes-Oxley Act of 2002, the Family Educational Rights and Privacy Act of 1974, and the Health Insurance Portability and Accountability Act of 1996 has led many organizations to consider the pervasive and centralized models as a compliance strategy for privacy, archiving, and other standards.

EMINENT DOMAIN

Eminent domain is a U.S. legal term referring to the state's power to take private property from landowners without their consent. The U.S. Constitution does not explicitly refer to eminent domain, but the premise underlying the Fifth Amendment is that the government has that power: "Private property [shall not] be taken for public use, without just compensation." Recent U.S. Supreme Court interpretations of this clause and the limits it puts on governmental powers pose legal and ethical questions to both the government and the owners of private property, whether businesspeople or homeowners. The original conception of "public use" was that the government should not take private property unless that property was to be used by the public. In addition to this argument that takings for private purposes are unjust and tyrannical, some argue that such takings are inadvisable as they may weaken the concept of private property, weaken the incentive to invest in property, and ultimately weaken the economy. However, current Supreme Court authority allows local legislative bodies to take property from one private owner and give it to another if the taking is for purposes of economic development. In addition to controversies concerning whether *public use* includes economic development, there are recognized problems concerning what compensation is "just."

Historical Background

The term *eminent domain* was originated by Grotius, the 17th-century jurist, who held that the state possessed the power to take or destroy property for the public's benefit but when the state so acted, it was obligated to compensate the injured property owner for his losses. Prior to Grotius, political philosophers such as Plato believed that there was nothing to prevent a state from taking private property in the interest of the polis. James Madison picked up on Grotius's limitation of state power in his drafting of the U.S. Constitution's Fifth Amendment, which imposes two distinct conditions, two checks, on the exercise of eminent domain: "The taking must be for a 'public use,'" and "just compensation must be paid to the owner." Originally, this power applied only to the federal government, but the passage of the Fourteenth Amendment expanded its scope to include state and local governments as well.

Public Use

Historically, the courts have employed two interpretations of the public use exception to the bar against governmental takings: a narrow view and a broad view. The narrow view was that property could be taken only if it was to be used by the public in general: the "public purpose" line of cases. So, for example, in the colonial era, one constructing a mill (the equivalent of a public utility) under the Mill Acts was liable only for limited damages if his mill caused flooding to upstream neighbors: "Apparently, the contribution of water power to the general well-being and advancement of the public trumped the rights of the private landowner." In the 19th century, many early decisions held that governments lacked the power to permit the nonconsensual taking of private property for private use, based on natural law theories or state constitutional language. They held that actual control by the government or use by the public was essential to justifying a taking. However, this "use by the public" standard, which was adopted by the majority of the states, became difficult to apply because of the loopholes, limitations, and evasions created by 19th-century state and local courts that wanted to encourage industrial development.

Another line of cases interpreted *public use* more broadly and deferred to legislative interpretations of the term. These courts stated that when the legislature has declared the use or purpose to be a public one, they would respect that interpretation unless it was completely unreasonable. Finally, in a 1954 case, *Berman v. Parker,* the Supreme Court formally abandoned the "narrow" definition of public use entirely, defining the phrase as a generalized benefit to the "public welfare": "The concept of the public welfare is broad and inclusive. The values it represents are spiritual as well as physical, aesthetic as well as monetary." *Berman* allowed takings for purposes of economic development and also formalized the policy of deferring to the legislature in defining the limits of "public use." Mr. Berman owned a department store in an area of Washington, D.C., that the U.S. Congress wanted redeveloped because much of the residential housing was in a deplorable condition. However, Mr. Berman's store was not blighted. The Supreme Court's decision meant that Berman lost his non-blighted commercial property, which was ultimately to be transferred to another private party.

A more recent Supreme Court case, *Kelo v. City of New London*, is consistent with *Berman*; its only real change is to openly authorize legislative bodies to exercise eminent domain for purposes of economic development. The city of New London wanted to redevelop the area around a defunct Navy facility and created a rejuvenation plan that involved a large pharmaceutical company's promise to build a new plant in the area. That plan involved the exercise of eminent domain to gather the land that would eventually be transferred to the pharmaceutical company or other private entities. Susette Kelo and several other homeowners filed suit, arguing that the taking of their properties was a violation of the public use limitation on eminent domain. The Supreme Court rejected their argument, stating that it had "repeatedly and consistently rejected" the narrow test because it had fallen out of favor due to the difficulty of its application and the changing needs of society. The Court found that the city's plan was designed to create jobs and increase the community's tax base, as well as provide residential and recreational use, so that it "unquestionably serve[d] a public purpose," which was enough of a public use to justify the exercise of eminent domain powers.

In dissent, four justices argued that the majority decision deleted the words "for public use" from the Takings Clause of the Fifth Amendment. In his separate dissent, Justice Thomas agreed. He further argued that in keeping with the Constitution's common-law background, the clause was intended to be a most-needed limit on the government and worked in context with other carefully chosen language in the Constitution. The government is allowed to take private property only if it provides "just compensation" and only if the taking is for the government's or the public's own use.

Just Compensation

Just as the definition of *public use* is controversial and involves policy issues, so does the definition of *just compensation*. Under common eminent domain practice, if the taking is for purposes of redevelopment, the area must first be declared "blighted." Then, the condemning agency must attempt to purchase the property through free negotiation on the open market before resorting to condemnation. Thus, because the owner of the property at issue will usually have refused to sell on the government's terms, the assertion of eminent domain is coercive. Once the owner refuses to sell and the property is taken according to certain procedural requirements, *just compensation*, as interpreted by the Supreme Court, requires that the owner of the condemned property be put in as good a position financially as if his property had not been taken.

Although the condemned owner is due a full and perfect equivalent to the property taken, determination of that value has proven difficult. The standard measure used is that of "fair market value." Unfortunately, this measure has been widely criticized as failing to ensure that landowners are fairly compensated for their loss, failing to promote efficient use of the Takings Clause, and failing to prevent opportunistic entities from driving the price up for the government. Landowners are compensated only for the loss of their land and buildings. No "consequential" damages are awarded, and thus business owners lose business profits and goodwill, removal costs, litigation costs, and demoralization costs for which they would otherwise be compensated under common-law principles if a private party, rather than a government, took their business. Homeowners and neighborhoods lose, in addition to litigation costs and objective undervaluation of their property, any value that could be attributed to emotional or historical attachment to the property.

In addition, the market value method is criticized as inefficient because the government cannot calculate in advance the costs associated with the takings and therefore fails to consider opportunity costs. The only costs it can accurately anticipate are the fair market value costs, not the administrative or litigation costs. The administrative costs associated with takings can be extraordinarily high and include the costs of obtaining legislative authority, drafting and filing the complaint, serving process, securing a formal appraisal, and so on. The litigation costs associated with takings can also be extremely high. In one case, a homeowner who paid $778,000 for his property and then added improvements costing $100,000 was eventually awarded $1,070,000 by a jury, plus $620,000 in attorney's fees. Therefore, the fair market calculus may prevent opportunistic behavior on the part of property owners to drive up governmental costs, but it does not discourage the same kind of behavior by administrators, attorneys, or litigants.

In addition to being ineffective, some argue that the market value method is poorly defined. Fair market value is defined as the price that a willing buyer would pay a willing seller in the open market. The willing buyer is the government, but there is no willing seller. Thus, the definition of fair market value is based on a fiction. Furthermore, some criticize the courts' methods of calculating it as inconsistent with the way an appraiser would value a property's worth. A real estate appraiser estimates what a buyer would offer, ignoring the seller's willingness and instead assuming that the seller will accept the highest price offered after a reasonable time. Other concerns include when fair market value should be assessed, because the value of a property can change dramatically once it becomes known that a legislature has granted eminent domain power to a developing agency. Consequently, some argue that fair market value, as defined by the courts, should be eliminated and the proper measure of just compensation should include both market value and compensatory damages.

Fiscal and Ethical Issues Raised by Eminent Domain

Kelo led to a firestorm of debate concerning both fiscal and ethical concerns when economic development is used to justify the exercise of eminent domain. One argument was that government-sponsored redevelopment projects often fail, that allowing such projects can easily lead to overreaching by legislators in concert with business entities, and that the market is a more efficient means of encouraging economic development. Furthermore, even where an economic-development taking led to an economically improved area, it was argued that the area at issue would have improved on its own, through the operation of the market, without the use of eminent domain.

There is historical justification for the first part of this argument. For example, the Washington, D.C., redevelopment project at issue in *Berman* ultimately failed and was repealed. A similar project in the Poletown area of Detroit, Michigan, involving General Motors, similarly failed, leaving a strip of abandoned and burned-out properties instead of the pretaking busy commercial area, and Cincinnati's downtown area gained only a municipal parking lot when Nordstrom ultimately backed out of a redevelopment plan.

It has been further argued that the allowing of economic redevelopment takings encourages overreaching on the part of legislators and business interests: Business interests that want to purchase property for redevelopment at a low cost will ask legislative bodies for eminent domain support, and legislative bodies greedy for additional tax dollars will seek business interests that will agree to use eminent domain power in keeping with that interest. In either case, the concern is that private parties and small businesses may be victimized as a result.

As with the economic efficiency concerns, there have been instances of legislative misbehavior in connection with economic redevelopment. According to news reports, a city council hired first one appraiser and then another in an effort to have an aging, working-class subdivision declared blighted so that it could be slated for redevelopment. The council wanted to replace the subdivision with a shopping mall in an effort to increase tax income for the city, and so the World War II–era development was termed "blighted" despite the fact that the only problems the appraiser could find were bedrooms in some basements, front porches that had settled, and some windows that were too small to allow escape in an emergency. The developer hired to redevelop the area could not secure financing, and so the project eventually failed.

Perhaps in response to perceived or realized ethical and practical problems posed by the exercise of eminent domain for economic redevelopment purposes, 32 states passed or were in the process of passing legislation banning economic development as a public use within a year of the *Kelo* decision. Even the U.S. Congress passed a bill preventing the use of federal money in connection with a federal, state, or local economic redevelopment taking. Whether or not just compensation theories will follow this trend of change in eminent domain law remains to be seen.

Emissions Trading

Emissions trading is a relatively new and creative market approach to reducing pollutant emissions by allowing entities to trade emission allowances or credits issued by the government. An entity operating within the pollution standard, which refers to the levels of specific pollutants that are allowed in the ambient air and water in a particular location or from specific sources, can sell or trade its credit or allowance to an entity that cannot meet that standard. The overall pollution emission levels in an area or at a specific source must meet the specified standard.

Emissions trading permits greater flexibility in meeting state emission standards. Flexible emissions-trading programs are designed to capitalize on the efforts of entities able to reduce their emission levels below the level required by the relevant standards. The emissions-trading programs were originally designed to allow entities to trade credits granted them for attaining lower emissions than allowed by the state.

Types of Emissions-Trading Policies

Emission trading involves trades of emission allowances or credits. In the credit trading program, to the extent that an entity's emissions are produced at a level below the amount permitted under the applicable emission standard, such an entity can apply for certification of the excess as an emission reduction credit (ERC). The entity is then allowed to trade its ERCs to another site whether under common ownership or not.

Allowance trading is a refinement of the credit trading program. Allowance trading measures emissions themselves rather than emissions over a period of time. Allowances are granted to an entity for a certain amount of emissions that entity is allowed to produce rather than focusing on just the incremental difference between the amount allowed by regulation and the amount produced. Allowance trading bears a relation to emission standards in that entities will only trade allowances to the extent that they hold allowances that enable them to produce emissions at a level that will result in compliance with the applicable emission standards. Conversely, credit trading depends on the level of the relevant emission standard to determine the amount of ERCs available to an entity at a particular time.

Trading of emission credits and allowances occurs in the context of differing policies allowing for the use of such credits. The policies are referred to as netting, offset, banking, and bubble policies, and the specific policy applied depends, in part, on whether the emission source is new or existing and on whether the currency being traded is credits or allowances. Credit trading uses the bubble and offset policies, while allowance trading uses the netting and banking policies.

The offset policy permits the creation of new emission sources in areas that have not attained good air or water quality by requiring such sources to result in emissions that are at least 20% lower than would otherwise be required for a new source in an area that has attained good air or water quality. The bubble policy involves aggregating multiple emission points and regulating the level of emissions within the bubble through the use of standards and credit trading.

Emission sources that are expanding or undergoing modification are subject to the netting policy, which eliminates the requirement for such sources to achieve the relevant emission standard as long as the overall increase in emissions due to the expansion or modification is negligible. Credits can be used to offset any increase that would be deemed to be more than negligible to allow the modified or expanded source to remain compliant with emission standards. Finally, the banking policy allows entities to store, or "bank," their allowances or credits for use in reducing actual emissions at some point in the future, either when their emissions increase or when the emission standards call for a decreased emissions level that the entity has not yet achieved.

Legislative Background

The availability of emissions trading stems from the existence of federal and state legislative mandates to reduce pollution levels. In general, the legislative framework to achieve such levels consists of targeting certain pollutants for reduction, setting limits on the amount of pollutant emissions that companies may acceptably produce, and levying fines against those companies that are out of compliance with such levels or even types of pollutants.

The Federal Clean Air Act represents the federal government's most significant legislation in this area. The Clean Air Act was first promulgated in 1955 and underwent numerous substantial revisions. The Federal Clean Air Act, as amended, requires the Environmental Protection Agency (EPA) to periodically set standards for specific pollutants. The Clean Air Act specifies the maximum levels of pollutants that a power plant is allowed to emit. There is then an enforcement mechanism under which fines are assessed against any company exceeding such limits.

The EPA established standards for smog and soot at various points between 1971 and 1987. New rules, added in 2004 to address specific pollutants, include the following: (1) Clean Air Ozone Rules, (2) Clean Air Fine Particles Rules, (3) Clean Air Interstate Rule, (4) Clean Air Mercury Rule, and (5) Clean Air Non-Road Diesel Rule. Carbon dioxide has not been addressed and remains a point of contention.

Creation and Distribution of Allowances Under the Clean Air Act

Title IV of the Clean Air Act amendments of 1990 concerns the control of acid deposition. The rules proposed by the EPA to implement Title IV of the 1990 amendments provided for nationwide free trading of allowances. Allowances are a fairly straightforward concept. Once the allowable pollution limits were set for various pollutants, allowances were distributed at no cost to companies in the amount of such limits. Each allowance was equal to the right to emit 1 ton of the particular pollutant. Essentially, such businesses were distributed "rights to pollute." The allowance signified the business's right to emit that amount of pollutant. The company's emissions were then reviewed. If the company's emissions were less than the target level, the company had the option of banking the credits for later use either in its own business as it grew or in its business of the same size as the emission standards were reduced. On the other hand, if the business was exceeding the emission standards, it was allowed to enter into a trade for emissions credits either from another of its own sites or from another entity entirely, provided the credits were being purchased or traded from a site that had reduced its emissions below the required level. Using the emissions-trading system, businesses were able to continue in existence rather than allowing regulation to result in their closure or in significant fines.

Availability of State Restrictions on Emissions Trading

Not all constituencies agreed that the standards provided by federal legislative response to the pollution problem were sufficient. Under the Clean Air Act, states were allowed to develop their own plans once it was determined that there were areas that did not attain the reduced emission levels imposed by the national standards. State plans were developed to address those specifically designated areas. The state plans have come under attack, and in the 2002 case of *Clean Air Markets Group v. Pataki,* the state of New York's response was found to have violated the Supremacy Clause of the U.S. Constitution and was also determined to be an impermissible burden on interstate commerce.

In the *Pataki* case, the state of New York objected to provisions in the federal Clean Air Act that allow emission credit trading. New York enacted its own, tougher, statute, which was later struck down in court. The problem for New York, and potentially for other states that lie upwind of sources of pollution, was that the emissions from certain states upwind of New York do not remain upwind; they travel up to hundreds of miles and contribute significantly to acid depositions in particularly susceptible areas in New York State, such as the Adirondacks. New York objected to the free trading of pollution allowances and requested that such trading should not include the so-called upwind states. The EPA disagreed and retained its free-trading provisions.

In response, the New York legislature enacted the Air Pollution Mitigation Law in 2000 to encourage New York utilities to protect sensitive areas from acid deposition and to make business decisions regarding the utilities' participation in the federal allowance credit trading programs. The Air Pollution Mitigation Law required that all transfers of sulfur dioxide allowances were to be reported to the New York State Public Service Commission (PSC), the regulatory commission responsible for utility rates and service in New York. The PSC would then charge an offset to any company that sold emission allowances to an upwind state or to a nonupwind state if such a sale did not include restrictive covenants against its later sale to an upwind state. The amount of the offset would be equal to the proceeds from the sale of the allowance.

The U.S. District Court for the Northern District of New York found that the restrictive covenants lowered the value of the emission trading allowances and struck down the law. States were not to be allowed to enact regulations that were more restrictive of pollution than those required in the Clean Air Act. The EPA had considered and rejected geographical restrictions on the trading of allowances and had clearly mandated the free transferability of such assets. Therefore, a 100% penalty on such a transfer would constitute a significant restriction on such free transferability and is therefore contradictory to the purposes of the federal law. States do not have the power to broadly regulate emissions but rather only have the power to restrict the emissions within their own jurisdiction.

Mercury Emission Challenges

In 2004, the EPA announced new regulations applying to mercury emissions, which became final in 2005. Mercury was added to the pollutants for which power companies were able to purchase trading credits. A coalition of 11 states challenged the federal rule that allows coal-fired power plants to buy pollution credits to avoid lowering their mercury emissions. The lawsuit claimed that the new rule slows attempts to decrease dangerous mercury emissions and poses grave health risks to those exposed to such emissions. The lawsuit claimed that the credit trading system would create "hot spots" around some plants that purchase the rights to emit more mercury. Reducing overall pollution at the cost of increasing it in particular areas results in the decrease in pollution at one location, beneficial for a particular population, and a concomitant increase in exposure to the detriment of another population.

Courts have been used to address issues stemming from emission-trading laws and regulations. One argument advanced against using courts to determine pollution cases is that the constituency affected is too broad for redress in courtrooms. Carbon dioxide is an emission that is currently not regulated in the United States. The proposition has been advanced that if carbon dioxide is found to be reasonably likely to cause the harms that some believe, then Congress will be better suited than a court to consider what level of emissions will maximize the benefits provided by the utility companies while minimizing the harms of the emissions. The Clean Air Act's "cap-and-trade" system's successful reduction of the overall level of emissions through the use of market forces serves as evidence in support of such a theory. However, the question still remains as to how to balance any harm stemming from the use of an efficient market system that results in the shifting of the percentage of the burden of pollution onto alternate populations.

Interests Affected by Emissions Trading

It appears that emissions trading allows a business such as a power plant that is unwilling, or economically unable, to reduce its emissions to the level required by law to use the credits to maintain emissions in excess of those required by such law. A legal right to emit at that level has been created that may be efficient from an economist's perspective but that in effect results in a selection as to which populations remain exposed to increased pollutant emission levels. The ability of high-pollutant-source areas to maintain their existing levels of emissions rather than decrease them, which was the main stimulus behind the law, highlights the issue of the disproportionate effect that the trading of allowance credits permits. Hot spots, or high concentrations of pollution in particular locations, could be created under this system when the allocations are purchased by companies in such a manner as to allow for clustering of the highest emission levels.

Desirability of Emissions Trading

The public is one of the primary constituents to be considered in determining whose interests are affected by the pollution rights trading laws. The question that arises is, To which public are we referring? The public as a whole may be benefiting from decreased overall pollution levels if the free market theory of pollution credits is the most cost-efficient method of pollution reduction, but a question remains regarding the interests of the public residing nearest to the areas containing the businesses that are buying the pollution credits. For that segment of the public, the level of pollution is increasing or, at the very least, not decreasing to the same degree as pollution near power plants that have opted to purchase emission-trading credits for the right to continue to pollute in excess of the thresholds targeted by law.

One of the continuing conflicts between economists and the environmental community with respect to emission trading has been the issue of whether such permits constitute a secure property right under the law. Economists prefer the treatment of the permits as property rights to protect the investment in the resource, while the environmental community consistently argues that the environment belongs to the people and, as a matter of ethics, should not become private property. If the emission allowance is a property right and the emission allowance is reduced, it could give the business that held the emission allowance the right to claim compensation from the government for the reduction of the allowance. The practical resolution of this conflict has been to attempt to give a minimum level of security to the permit holders with respect to their rights while making it clear that permits are not a property right. The Clean Air Act clearly attempts to resolve this debate with respect to its provisions by including a provision in the law that declares that the allowance to emit a limited amount of sulfur dioxide is not a property right. One of the benefits of this declaration is that in the event that an awarded pollution right was limited in future years, the declaration, if accepted, would forestall a challenge to such reduction being compensable by law.

Another issue is the determination of the level of emissions actually occurring. Typically, the government relies on businesses self-reporting their emissions, which has the potential to create concern for the integrity of the information received.

Finally, one of the stated purposes of pollution credit trading is to give firms flexibility to comply with pollution regulation in a least-cost manner. The fact that the business may elect to buy pollution credits rather than decrease its emissions because such purchase results in the least cost to the company may raise ethical issues. More pollution is allowed, but the company is maximizing its bottom line and staying within the limits of the law.

Generally, the trading of emissions credits is viewed in many circles to be a beneficial commodity that decreases overall pollution in a profitable market system. The question remains whether the ability to purchase the right to pollute at a lesser cost to a business than it would incur by decreasing its pollutant emissions is a laudable societal goal that should be encouraged and legalized.

Empathy

Empathy refers to the capacity to put ourselves in the place of others and thereby vicariously experience and understand their emotions, experiences, and values. In this sense, it describes an activity of communication and knowledge. In everyday usage, the term often carries the connotation of sympathizing with another's pain.

The concept of empathy was popularized in late-19th-century German aesthetics by Robert Vischer and Theodor Lipps, who used the term *Einfühlung* ("to feel one's way into") to help explain how people were able to respond emotionally to nature and art through a sympathetic inner imitation of an object. The term *Einfühlung* was translated as "empathy" by the American experimental psychologist Edward Titchener in 1909, a translation that added the connotations of suffering and sympathy.

In some systems *empathy* is sharply distinguished from the everyday meaning of the term *sympathy*—namely, pity or compassion. However, the term *sympathy* as used by philosophers such as David Hume, Adam Smith, and Arthur Schopenhauer (*Mitleid*) primarily denotes the transmission of emotions, which is the key component of empathy. Likewise, psychology has a number of terms ("ejective consciousness," "perspective taking," "role taking") that are analogous to empathy. The term *nacherleben* has been translated as "empathic understanding" and refers to a mode of inquiry in the social sciences (associated with Max Weber and Wilhelm Dilthey) where the investigators attempt to fully put themselves in the place of a historical figure to help explain that figure's actions.

Empathy is frequently listed as one of the most desired skills of an employer or employee. Many businesses administer personality and "emotional intelligence" tests as part of preemployment screenings or promotion decisions, and most of these tests claim to measure a person's empathic skills. While developmental and social psychologists see empathy as a measurable capacity that can be tested and quantified, there is no common standard among the wide variety of tests available. Some have argued that such tests benefit women, who are assumed to be generally more empathic than men. Such "empathy tests" raise questions of invasion of privacy and adverse impact on particular classes of people.

The Nature of Empathy

Commentators generally agree that empathy is an innate human capacity but offer various accounts of how it functions. Some stress a neurophysiological basis for empathy, such as motor mimicry, where the muscles of an observer tense in imitation of the postures of another and thus help produce identical emotions. The role of motor mimicry and other forms of "emotional contagion" suggests that visual stimuli play a particularly important role in empathy, and this in turn relates to presentations of suffering in various media. If images of suffering are more likely to inspire empathy than written accounts, then this must be taken into consideration in public relations campaigns and charitable appeals. Other accounts place more stress on the role of imagination, suggesting that it is the capacity to suspend disbelief and imagine oneself in a different situation that creates a path from idea to impression to emotion. In this account, it is less our registration of another person's emotion and more our cognitive comprehension of that person's situation that leads to empathy.

The exact nature of empathy is also a matter of dispute. For Hume, there is no practical difference between the observed emotion and the empathic emotion. Smith, on the other hand, stresses the secondary quality of such sensations in both intensity and kind, as they are removed from the partiality and immediacy of personal pain. Commentators also differ on the related question of the degree to which empathy involves a dissolving of the boundary between self and other. Schopenhauer, for instance, thinks of sympathy as a complicated procedure through which the ego is temporarily set aside while the distinction between self and other is still preserved.

Ethical Role of Empathy

The ethical role of empathy can be divided into three claims—namely, that empathy (1) is an ethically positive activity, (2) can function as a guide for moral judgments, and (3) is a motivator for ethical action. In moral and character education, empathy is typically listed as one of the key qualities to be developed in students and is treated as a positive in and of itself. Hume regards empathy as a moral end in itself because of its other-directed nature. But it is difficult to make the case that a skill of understanding in itself has a positive moral status. When empathy is invoked in a business context, it is usually at an amoral, cognitive level, such as possessing the skill to understand what a customer wants. Similarly, a malicious individual can use the skill of empathy to better manipulate another person, a case of empathy being deployed for immoral ends.

The two most extensive attempts to systematically ground moral judgment in empathic feeling come from Hume and Smith, and indeed later accounts are most often merely elaborations on their positions. Hume argues that spectacles of virtue and vice arouse in an observer particular feelings of pleasure and pain that function as a moral assessment. But for Hume, these very specific feelings of approbation and disapprobation are only felt when we set aside our own self-interest and instead sympathize with the motivations of others.

In a similar vein, Smith argues that to entirely sympathize with another's emotions means that we view those emotions as appropriate to the circumstances from which they arose; our inability to fully empathize means that we sense an inappropriateness in that person's feelings. If we do not share in the laughter of a coworker telling a racist joke, for instance, our inability to share that emotion carries with it a moral judgment. This comparative understanding of right and wrong extends also to judgments about our own behavior; we regularly construct an imaginary, impartial spectator as a general standard against which to examine the relative appropriateness of our own emotions. Although the ethical duties of empathy are usually placed on the shoulders of the sympathizer, Smith argues that those who suffer also have a duty—namely, to modulate the expression of their pain to a level that makes the communication of that pain possible. But at the same time, he warns that an excessive degree of stoicism can result in less sympathy for others and less of a disposition to relieve their suffering.

Empathy is sometimes invoked when attempting to answer the question of why people do good even when it seems to go against personal interest. Hume assumes that the natural inclination to put ourselves in the place of others helps us move beyond narrow self-interest. A benevolent action that contributes to the common good, such as extending health benefits to domestic partners, may not benefit us directly; however, it is precisely sympathy that interests us in the public good. Some commentators assume that sharing the pain of others automatically leads to the desire to relieve their suffering. What is unclear is whether the motivation is truly to relieve the suffering of another or to do away with the secondary feelings of suffering in ourselves. In any case, the line between self-interested and selfless behavior is by definition blurred in the case of empathy, which involves some weakening of the boundary between self and other. This raises the familiar conundrum of whether behavior can be counted as moral in the strict sense if some degree of self-interest is involved. Nevertheless, empathic feelings can motivate people to do good with a zeal that rarely arises from a merely abstract sense of duty.

Empathy has come under renewed attention in some strands of feminist ethics, in part because it is a capacity that is commonly associated with the culturally feminine. According to these accounts, empathy represents a key element of women's moral experience that is undervalued in traditional ethics, which emphasizes autonomy, universality, and reason at the expense of relationality, particularity, and emotions.

As this dichotomy suggests, the embrace of empathy by empiricist and subjectivist moral philosophies finds its strongest challenge in rationalist schools. Certainly, it is possible to point to examples where empathy can lead to faulty moral judgments, such as overempathizing with an employee who embezzles funds to help support a sick parent. It is also questionable whether a rational, universal moral system can be created from emotions that often seem fickle and fleeting. Such objections are not unnoticed by promoters of empathy. For instance, both Hume's distinction between natural and artificial virtues and Smith's discussion of the influence of custom and fashion on moral sentiments point to their concerns that a moral system built on emotions and empathy might fall prey to social relativism.

Limits of Empathy

Most commentators acknowledge empathy's bias toward the familiar and the "here and now." They argue that it is much easier to imaginatively put ourselves in the place of those who are most similar to us and that we are more likely to feel sympathy for people and situations that are familiar. Likewise, the immediate appearance of someone in pain claims our imagination much more fully than an account of suffering removed in time and space. Despite its relative banality, the pain of a friend who failed to get a holiday bonus may be felt more acutely by a colleague than the pain of thousands of coworkers laid off in another country.

Some thinkers stress that dissimilarity is not an insurmountable barrier. Schopenhauer, for instance, believed that true sympathy erased all difference, the *principium individuationis* that hides the metaphysical identity of all humans. Smith noted that while men are physically unable to experience the pains of childbirth, they nonetheless could empathize with women in labor. He also felt that while our sphere of action is of necessity constricted in time and space, there are no inherent limits on sympathy, and humans can in fact cultivate a universal benevolence. However, the fact that we are much more inclined to empathize with those who "look like us" raises troubling questions as to the usefulness of empathy in making moral judgments or motivating ethical action.

The issue of similarity also applies to the role of empathy at the borders of the human, a topic taken up in the area of animal rights, which poses the question of whether animals are similar enough to humans to inspire true empathy. Many people will claim a sense of empathy when shown an image of a rabbit undergoing an eye irritation experiment for a cosmetics company. More people might pause when faced with PETA's (People for the Ethical Treatment of Animals) 2004 "Fish Empathy" campaign, which uses studies about the complexity of the social and mental activity of fish to encourage people to recognize that fish suffer. Studies of people's willingness to support endangered species find that they favor spending money on larger animals, ones that are presumably easier to identify with. Such examples raise the question of whether a rational or ethical policy of animal rights or environmentalism can be built around capricious identification with dogs and dolphins at the expense of moths and mollusks. Along with the fear that empathy is unable to push past the dissimilar, examples such as these suggest an equal danger of inaccurate projections where the emotions of the self occlude the object. In its original aesthetic sense as outlined by Lipps, the experience of empathy encompasses the pathetic fallacy of projecting human feelings onto the inanimate world, so that an architectural pillar or a leaning tree, for instance, might be felt by an observer to be painfully burdened. If empathy can imaginatively humanize our surroundings, it must be asked how we can assure ourselves that we are not doing the same thing in relation to animals or, indeed, other human beings.

EMPLOYEE ASSISTANCE PROGRAMS

Employee assistance programs (EAPs) are a benefit provided by employers to give employees access to confidential assistance to address personal issues, preferably before they affect job performance. When personal problems do affect job performance, EAPs may coach supervisors to effectively support employees as they address those problems, seek and receive counseling or treatment, and return to work.

Employers increasingly turned to EAPs in the 1970s to help employees cope with problems that were adversely affecting job performance and/or conduct. Performance-based interventions to address the individual and organizational costs of substance abuse were widely adopted. Gradually, the EAP's role has expanded to include a variety of support services, including counseling in most work/life issues, as well as conflict and crisis management. Most EAP programs also provide services to the members of the employee's household.

Studies have documented that reduced productivity, increased accidents, increased absenteeism, and increased health care expenditures that result from workplace stress cost U.S. businesses approximately $300 billion annually. The most often cited causes of employee stress are personal, not work related; however, the impact of these issues in the workplace is undeniable. Employers responded to these findings by developing programs to help employees deal with work/life stress. According to the Society for Human Resource Management 2004 Benefits Survey Report, 70% of all U.S. employers offer an EAP.

EAPs may vary considerably in design and scope. Some programs focus primarily on substance abuse problems, while others take an across-the-board approach to a range of individual and family problems. EAPs may include proactive prevention and health and wellness activities, as well as problem identification and referral, and some are directly linked to the organization's employee health benefit plan.

EAPs may be administered internally or externally. An internal EAP is managed directly by individuals who are employed by the company the program serves. The advantage of the internal EAP is that the program can be specifically tailored to meet the needs of the company; however, it may be more difficult to engender the employee confidence in the competence and trustworthiness of internal EAP staff that is critical to the program's success. In addition, internal EAP staff may be challenged to determine if the employee or the employer is the client to whom they have the greater responsibility.

With this in mind, external EAPs have increasingly become the preferred model. An external EAP uses outside counselors who provide services on a contractual basis. EAP contracts may be established for a fixed fee based on the number of employees, regardless of program usage, or on a fee-for-service basis, with the employer paying only for the services that are used. External EAPs tend to have enhanced confidentiality, a broader variety of available services, greater convenience, and lower overall program costs.

In addition to being the right thing to do, employers may realize significant tangible and intangible benefits from providing EAPs to employees. Studies have shown that employers may realize a return of $5 to $16 for every $1 invested in an EAP, resulting from reductions in absenteeism, tardiness, workplace accidents, and insurance claims. Intangible benefits include improvements in employee work quality, motivation, commitment, loyalty, and morale that result from a strengthening of the psychological contract between employer and employee.

EMPLOYEE MONITORING AND SURVEILLANCE

Companies have always been concerned about the loss of trade secrets and misrepresentations by employees with respect to performance, hours, and expenses. Furthermore, because of new laws requiring extensive protection of client data, organizations are resorting to measures more extensive than ever to make sure that such data are not compromised by employees. Employee monitoring and surveillance involve the activities taken on by an organization to observe its employees and their activities, usually, but not always, related to the employees' jobs. Employee monitoring often begins before the hiring decision is made, as the organization performs a variety of background checks. An organization may also administer tests to uncover the employee's personality as well as the nature of after-hours activities, such as the use of illegal substances. After being hired, the employee is often subjected to an even greater degree of scrutiny by being monitored through video surveillance, phone recordings, network scanners, and computer scanners. An employee's location may also be registered through smart-chip identification badges.

The ethical issues surrounding employee monitoring involve the organization's right to manage the workplace toward profit and the employees' right to privacy. In a competitive economy, the employer has the right to hire the ideal individual for the job. To make such a decision, the employer requires background information that can only be obtained via background checks, credit reports, and drug testing. Since all employers are under an obligation to provide a safe and productive environment, many employers perform such checks to address the potential liability under the "negligent hiring" tort. Furthermore, in several countries, many industries, including child care, are required to perform background checks on potential employees under the law. Employers justify employee monitoring after the hiring decision as a way to drive efficiency, performance, and productivity, all of which positively contribute to profit. While the organization seeks to learn more about its employees, the employees are driven by the right to privacy, protected primarily by the Fourth Amendment, statutes, and the common law in the United States and by equivalent laws in other countries. Privacy has been argued to be a matter of prudential interest, a utilitarian concern, and a moral right. In all these cases, privacy is implied to be a sphere of noninterference that requires protection. However, the resulting protections are not independent of circumstances but are rather subject to trade-offs in society's welfare, including fulfillment of the rights and obligations of the employer.

Background Checks

Many employers subject their employees to at least one type of a background check. The background checks are used in making hiring, promotion, and retention decisions. The most common types of background checks are related to an individual's credit, personality, lifestyle, and reputation. These reports are often delivered by consumer reporting agencies (CRAs), and the privacy and accuracy of the reports are protected by the Fair Credit Reporting Act (FCRA). The amendments to the FCRA, as implemented in 1997, have dramatically increased the employers' responsibilities when conducting background checks.

Credit Reports

Perhaps the most common type of background check used by employers is the credit report. One of the reasons for obtaining a credit report is that an employee who is deep in debt may not have solid financial management skills and is arguably more likely to embezzle money from the company. In most industries (trucking being the exception), the employer must first notify the individual in writing that a report may be used and obtain a written authorization for its use. However, if the credit report—or any other form of consumer report for that matter—results in an adverse action against the individual, such as termination or the denial of a job, the employer must take a series of steps to comply with the FCRA. Before the adverse action is taken, the individual must be given a pre–adverse action disclosure, including a copy of the consumer report. The purpose of this step is to allow the individual to verify that the data gathered are correct and to provide a chance to dispute the report with the CRA and the employer. If the employer does decide to take the adverse action, the employee must once again be notified after the adverse action is taken. From an ethical perspective, the investigation of an individual's financial background—an infringement on the person's privacy—may be difficult to justify for a job where money handling and the possibility of embezzlement are limited.

Driving Records

Employers also frequently request the driving records of employees, future and current. Although information concerning traffic violations, license status, and accidents is open to the public, personal Department of Motor Vehicles data are somewhat protected by the Drivers' Privacy Protection Act of 1994. It is typical for an employer to monitor the public domain of an employee's driving record if he is involved in a job where frequent driving is required, such as food delivery or courier services. Moreover, in accordance with utilitarianism, the employer has a moral obligation to do so in order to ensure that the employee's driving ability is not negatively affecting the public. Even the theories of ethical egoism support the notion of driving record monitoring because it is in the employer's best interest to have safe drivers since these people are less likely to get into accidents that will negatively affect the company's bottom line.

Criminal Records

Although criminal record checks are legal, there are once again restrictions on their use. The employer may reject a potential employee based on a felony conviction, but the felony must be related to the job duties. For example, a bank has the legal right to deny a convicted bank robber a job as a teller. On the other hand, denying a job based on past arrests (where a conviction did not occur) and past drug treatment is illegal in many U.S. states and many countries. It may be argued that the employer has a moral responsibility to investigate employees' criminal backgrounds for the sake of the safety of their coworkers and that the employer has a financial motivation to do so in order to limit the costs of potential litigation. However, the moral consequences of these actions are less clear-cut. If the employer wrongly assumes that the potential employee will inflict harm on the company or its staff and decides against hiring him or her, the employer may be harming the individual and society as a whole. After all, if all employers were to make this assumption and take the same action, a convicted individual would not be able to find employment at all and would thus effectively be forced into a life of criminality to be able to survive. At the center of this debate lies the notion of whether society, including its commercial organizations, has a moral obligation to assist previously convicted individuals and whether an individual with a history of criminal behavior can be aided in not exhibiting that behavior in the future. Although the discussion above highlights the reasons for criminal record investigation, it is difficult to strike the right balance between privacy rights and employee safety. Privacy rights are often supported by the claim that their protection is necessary to protect a value, such as self-determination, which is essential to the individual's status as a person.

Drug Testing

Safety, security, competence, and efficiency are all negatively affected by employees' substance abuse. Employers frequently subject potential employees to mandatory drug tests, and some organizations have extended drug testing to be done throughout the employees' careers with the company by implementing random mandatory drug-testing programs. Although opponents to testing have argued that random drug testing is not a proper way to test for sobriety in the workplace since the employees' time off is their own, U.S. government employees are held to a higher standard than private sector workers. In accordance with President Ronald Reagan's Executive Order 12564 and the Drug-Free Workplace Act of 1988, government employees are expected to abstain from illegal substances on and off the job. While, on average, government employees are held to a higher standard, many private organizations followed suit by implementing similar measures. In the case of a positive drug test and evidence of negative behavior, the organization has an ethical responsibility to protect its staff and other stakeholders from harm caused by a nonsober individual. However, returning to the argument of reforming previously convicted individuals, the organizations may have an ethical responsibility to aid present employees with a substance abuse problem.

In addition to the more common urine and saliva tests, polygraph tests are also frequently used to determine an individual's substance use, in addition to these tests' other uses for security-related reasons. However, the polygraph test's use among private commercial investigators has been restricted by the Employee Polygraph Protection Act. This act was enacted in response to the polygraph's frequent erroneous results and the relative ease with which the test results can be compromised. With exceptions granted to certain security positions and holders of government contracts, the law prevents employers from using the test as a preemployment screening method and from firing an employee based only on the results of the test since the employer obviously has an ethical obligation not to take adverse action against an employee based on information that is likely to be faulty.

Audio Surveillance

The Electronic Communications Privacy Act of 1986 (ECPA) has attempted to limit the amount of audio surveillance that an employer can use. This law prohibits employers from intercepting employee wire communications, including e-mail and facsimile in addition to telephone. However, exceptions exist if the employer maintains the system or the employee's consent for monitoring has been obtained; there is also the so-called business-use exception. The business-use exception covers cases where there is a legitimate business purpose for surveillance, such as screening for employees making personal calls when the company has a policy of not allowing personal calls to be made on their phones. However, further limits exist on the business-use exception. To extend the personal call example, the employer can only monitor so much of the conversation as to be able to tell that it is a personal call.

Audio surveillance, as well as video, time, computer, and networking monitoring (discussed below), is widely used by superiors to track those working for them. However, these methods are not usually consistently implemented. For example, while it is rapidly becoming a common practice for executives to be able to read the e-mail and monitor the phone conversations of regular employees, the regular employees are not able to survey the activities of the executives. Alternatively, organizations are cautioned to institute a more equitable rule, one that compromises or protects the privacy of all employees equally, regardless of their rank in the company.

Video Surveillance

Closed circuit television (CCTV) is increasing in popularity as a tool to monitor the workforce. Employers and proponents argue that CCTV discourages theft, physical confrontations, and sexual harassment. The manner of its use must also be lawful, and it must not unreasonably intrude into the employee's personal business. In addition, employees must be made aware that they are under video surveillance, unless the employer can expect to prove that informing the employees is not feasible or would distort the data collected. In the United States, CCTV regulation falls under the ECPA. CCTV operation has also been addressed extensively by the British Data Protection Act of 1998.

The balancing act of profit versus privacy is a difficult one for organizations using CCTV. It is clear that an organization can use CCTV to reduce adverse actions by its employees and customers against itself and its staff, thus increasing its profit via cost reduction. However, CCTV can rob employees of their privacy without just cause. For example, some CCTV operators have been observed to be using CCTV to zoom in on body parts of female customers and coworkers.

Time, Labor, Access, and Location Monitoring

Employers have been able to justify the use of extensive time, labor, access, and location monitoring of their employees by arguing that it is necessary for day-to-day business operations. In the United States, there is currently no law specifically addressing the location privacy of employees, a critical component of tracking access, time, and labor. Furthermore, emerging technologies such as biometrics allow for major extensions to the traditional employee-tracking systems and require little human power and money to implement and operate. The locations of factory floor employees can now be traced as a part of companies' time and labor systems (T&L). In typical contemporary implementations of T&L, employees record their time and labor location by scanning their magnetic badges while transferring between machines. Technologies have been developed to prevent identification scams, such as badge swaps. Some T&L security modules call for employees to enter personal information, such as their social security numbers, in addition to scanning their badges. The expectation is that the employees will be disinclined to share such information with their peers, thus preventing purposeful misidentification.

For decades, access to restricted areas has been controlled by security guards and identification badges. However, automation via biometric-based systems, such as fingerprint and eye retina scanning, are becoming more common in work areas in need of high security. For applications where very accurate identification of individuals is needed without the extensive hardware required by biometric methods, radio frequency identification (RFID) tags can be implanted into an employee's skin, making the mapping of the device to the user rapid and precise. Such futuristic measures are only likely to be needed in workplaces requiring the highest security.

In addition to granting clearance to restricted areas, RFID tags can also be used to track the location of employees. However, whereas RFID is capable of tracing an individual only in localized areas, technologies based on the global positioning system (GPS) can place employees around the world. For example, companies with a large sales force can easily trace the locations of their traveling salespeople around the globe by using the GPS capabilities of employees' cellular phones.

Unlike audio, video, computer, and network surveillance, access and location monitoring tends to be more universally implemented. After all, even high-level executives need a badge to pass a security guard who does not know them. On the other hand, T&L systems are rarely used for employees working in white-collar settings. Furthermore, time, labor, and even expense monitoring tends to be more relaxed for executives than for lower-level employees, resulting in more privacy for individuals of higher rank. It is difficult to draw a clear conclusion on whether the extensive infringement on employee privacy results in greater gains for the organization as a whole.

Computer and Network Monitoring

As computers saturate the workplace, organizations have found it necessary to monitor employees' use of their networks, servers, and personal computers. This type of surveillance was not just a result of the desire to protect trade secrets and prevent employees from submitting false time and expense reports. As consumer data protection legislation, including the Financial Modernization Act, also known as the Gramm-Leach-Bliley Act, and the privacy component of the Health Insurance Portability and Accountability Act, passed into law, companies found themselves legally bound to protect sensitive customer data from internal as well as external risks. The most typical tools used by companies are keystroke loggers for tracking workstation usage and packet monitors for examining network traffic.

E-mail monitoring, especially, has received a lot of attention because it has led to a number of employees being fired for distributing offensive and harassing e-mail using the employer's e-mail system. It is considered imperative that a contemporary employer have a clear policy delineating the rights of employees on the employer's e-mail system. Many companies have chosen to state that their e-mail systems are for business use only. Others allow the use of their e-mail systems for nonbusiness purposes but maintain ownership of all the e-mail sent through the system. Regardless of policy, U.S. employees have rarely succeeded in legally proving that they have a right to privacy when it comes to company e-mail systems. Because the system is maintained by the employer and is used for day-to-day business operations, it can be monitored under the exceptions to the ECPA.

As with T&L as well as audio surveillance methods, the extent of computer and network monitoring often depends on the employee's status within the organization. The decision to use a particular policy must consider privacy rights and the organization's right to profit. While the employees should have the right to do as they wish with their own time, it is in the interest of an organization to obtain maximum levels of productivity from its employees. Computer and network monitoring can be used to discourage non-work-related activities such as personal communication and online gaming. On the other hand, as discussed in connection with audio surveillance, an organization ought to consider pursuing an equitable monitoring policy, in addition to one that compromises employees' privacy rights to the smallest extent required to achieve significant productivity gains.

Conclusion

The level of employee surveillance and monitoring differs around the world, with U.S. employers and those in developing economies having the most far-reaching surveillance abilities and European and Australian/New Zealand employees having the most privacy protections. Overall, however, employees can expect little protection for their privacy in the contemporary workplace. The desire of employers to verify that employees are being honest about their work is not the only explanation for this situation. In fact, new laws calling for extensive consumer data protection have led to the high level of employee surveillance today. However, in monitoring the activities of current and potential employees, organizations must take into careful consideration the ethical impact on their employers, their stakeholders, and finally, society as a whole.

Employee Protection and Workplace Safety Legislation

Employee Protection in the Workplace

Employee protection and workplace safety address the question of who is responsible for ensuring that employees have protection from various dangers on the job. While employees certainly bear some responsibility for their own protection and safety, the employer may be held responsible for not only providing protective equipment and information but also ensuring that employees properly use that protection. When the cost of workplace protections in more heavily regulated markets increases, demand for labor in less regulated, lower-cost markets may increase, resulting in potential trade-offs between cost competitiveness and worker safety.

Early Perceptions of Protection Needs

A century ago, agriculture and small-scale retail were the dominant work settings, although manufacturing was growing. Agriculture has long been a major area of inadequate worker protection, from both an economic and a social perspective. Many agricultural pursuits were small-scale and family owned. The economic pressure of having limited financial resources sometimes led to inadequate worker protection. Often equipment was not well maintained, and farmers could not afford the latest technology of the era. Poor maintenance precipitated many accidents, but few records were maintained.

As manufacturing grew, the same mind-set was transferred from the agricultural sector; thus, employees were not viewed as resources to be protected. There were plenty of able-bodied men, and the pay was better than in agriculture. The major motivation for work was regarded as financial. Manufacturing plants, especially in clothing and textiles, were not considered safe by the employees. Fire was a critical threat, given the massive cotton dust accumulated each day. No one considered that employees needed protection from the dust in the air; lung damage was not a well-understood issue in health circles. A similar unknown problem in the lumber mills of the early to mid-20th century was sawdust. The most common cause of employee fatality in the lumber, textile, and clothing mills was fire. Yet, 100 years ago, there was little effort or apparent interest in fire safety.

Employer's Role in Hazard Identification

Each workplace is unique, and different hazards are likely to be found in each. However, some common categories of hazards can be identified. Equipment hazards abound in most industrial settings: Equipment is often large, heavy, and at times dangerous. Regretfully, employers have not always taken the time to instruct their employees about the hazards, emphasizing instead the use of the machine and the need to minimize downtime. When rushed, employees act like anyone else; they become careless, and accidents occur.

Lumber mills, metal-stamping plants, and firefighting situations are among the highly accident-prone job sites. Proper use of equipment must be continuously emphasized by the employer.

Numerous environmental hazards may be present, ranging from explosives to chemical leaks to malfunctioning equipment. Each work site will have its unique environmental hazards. The employer is charged with having an inventory of all potential hazards and working to reduce such hazards to the lowest levels. Protective equipment and protective clothing are crucial in some work areas. For example, persons in construction sites may be required to wear hard hats. However, a typical site visit reveals that many managers and some workers avoid wearing protective gear. The equipment may be provided, but whose responsibility is it to ensure that a worker uses the equipment? Legally, it is the employer's. Regretfully, the consequences of not assuming that burden are minor, and many employers do not even enforce their own work rules.

Unsafe Conditions and Whistle-Blower Protection

In many workplaces, employees best understand the conditions requiring management attention. Employees may be aware when conditions are dangerous and senior management is unaware of the problem. In some cases, there may be an organizational culture that communicates to employees that they are to maintain silence about the workplace. The Occupational Safety and Health Administration (OSHA) addresses this concern by offering protection from reprisals brought about by reporting hazards or other data under OSHA. If an employee is subjected to reprisals, the employee may complain to the Department of Labor for protection.

Violence in the Workplace

In the contemporary media, workplace violence has received increased attention. Employees have been attacked, in rare cases even murdered, on the job, by both fellow employees and strangers. Violence in small retail establishments has led to the installation of electronic surveillance cameras, but the electronic records are only valuable as evidence after the fact. Banks, and their large stores of cash, are also vulnerable, as are taxi drivers and other cash-carrying workers. However, employers have rarely viewed the problem as one of employee protection. In manufacturing facilities, there is often more restricted access as compared with retail and banking. Thus, the violence has tended to be more work-community related; for example, disgruntled employees have instigated violent episodes.

The National Institute for Occupational Safety and Health reports that an average of 20 workers are murdered each week in the United States. Homicide is the second leading cause of workplace deaths, second only to motor vehicle crashes. The majority of workplace homicides are robbery-related crimes, with only about 10% committed by coworkers or former coworkers.

In addition, there are 18,000 victims of nonfatal workplace assaults each week. Most nonfatal workplace assaults occur in service settings such as hospitals, nursing homes, and social service agencies. About half the nonfatal assaults in the workplace are committed by a health care patient. Nonfatal workplace assaults result in more than 800,000 lost workdays annually.

Employer Strategies for Workplace Violence Prevention

A number of strategies have been developed for reducing the occurrence of workplace violence. A few examples of prevention strategies include improving the visibility within and outside the workplace, policies for handling cash, physical separation of customers from employees, brighter lighting, security devices, escort services for employees, and an emphasis on employee training. A workplace violence prevention program should include three variables: a system for documenting incidents, well-communicated procedures to be taken in the event of incidents, and truly open communication between employers and workers. An effective employee education program is crucial to making a meaningful difference in preventing workplace violence in any type of business.

Smoking in the Workplace

Until the 1980s, it was common for a large proportion of the work population to smoke, even on the job. Some employers were in fact protective of the employee's right to smoke. By 1990, most employers were developing no-smoking policies based on OSHA standards. By 2005, a majority of workplaces were nonsmoking.This is an example where research, legislation, public pressure, and potential large penalties in court have reduced the threat of a known danger. Public pressure was a major force.

Workers' Compensation

One reason employers have directed attention to employee safety and protection is the potential cost incurred in not paying attention to the early warning signs. Early in the 20th century, states found that workers injured on the job became a drag on the economy. Thus, states began to develop protective legislation to protect workers' future earnings and minimize the impact on the employer. Workers' compensation laws seek to ensure that employees who are injured or disabled on the job are provided with fixed monetary awards, eliminating the need for litigation. Benefits are also provided for dependents of workers who are killed because of work-related accidents or illnesses. Laws in some jurisdictions protect employers and fellow workers by limiting the amount an injured employee can recover from an employer and by eliminating the liability of coworkers in most accidents. State statutes establish this framework for many types of employment, from office work to metalworking to hospital employment. Federal statutes are limited to federal employees or those workers employed in some unique and significant aspect of interstate commerce, such as stevedoring. The laws in the 50 states are similar but differ greatly in the fixed-income formula and in the ease of receiving the funds.

Workplace Safety Legislation

As the U.S. workplace has evolved, both in physical and in human dimensions, the interest in minimizing the dangers in the workplace and encouraging safe conditions and behavior has grown, as have the number and breadth of stakeholders. Since 1902, there have been safety statutes at the state level. Each state has reacted to safety concerns within its borders and offered protective legislation. For example, Virginia has a safety statute relating to coal mining, whereas Arkansas does not. Critics have often been vocal about the enforcement of the state statutes, claiming that workers have no real protection. Ultimately, the subject gained sufficient support for the federal government to consider the workplace safety issue.

Union Influence on Legislation

During the 1960s, labor unions noted an increased concern among their members about poor safety conditions and increased accidents and fatalities as workplace changes took place and efforts to control costs began anew. The United Steelworkers of America used a modified nominal group technique in several of its university-cosponsored summer leadership programs and came away after 2 years with a clear notion of some major concerns: a perceived lack of concern for workers, which was growing especially in larger firms; lack of maintenance of safety equipment or lack of needed equipment; lack of training in the safety area; lack of government inspections; and discharge of workers involved in safety mishaps.

The result of an intense union lobbying effort was the (Williams-Steger) Occupational Safety and Health Act of 1970. One indication of the success of the statute is the inclusion of safety provisions in 9 out of 10 labor agreements today. Unions have been the moving force in the law's establishment and in its evolution during employer-dominated legislative sessions since its passage. The major OSHA provision is its "general duty" clause; the employer is required to provide each employee with a safe and healthy working environment. The workplace must be free of all recognized hazards that may cause illness, injury, or death to an employee. Furthermore, the employer must comply with all the occupational safety and health standards adopted by the Department of Labor. Recognizing that not all employers would receive the act in a positive manner, OSHA requires employers to provide access to federal safety inspectors and post any notices and maintain an extensive array of records on employees and on the actions taken by the employer to meet the OSHA standards.

Workplace Inspections

Workplace inspections, designed to reduce hazards to workers' health and safety, may be of two types. Random inspections usually target specific industries where hazards are known to exist. The targets are changed periodically in an attempt to alleviate the more serious problems first. While there have been very significant investments of time and money by employers and the federal and state governments, the injury rates changed little in the first 30 years. The Department of Labor has initiated a new infusion of funds for employee safety training, with an emphasis on personal hazard identification and self-protection.

OSHA responses to employee complaints under the law yield more effective enforcement. Usually, an employee complaint is made only after some effort has been made internally to have potential hazards addressed. However, the problem often becomes one of enforcement of inspector orders and the relatively small monetary penalties available under the law. The collective bargaining process and the use of joint safety and health committees have minimized the risks in major industries. Employees in smaller firms and in nonunion firms are fearful of filing complaints, although there is a whistle-blower protection clause in the act. While the act provides protection, an affected employee must file a complaint within 30 days of the alleged reprisals.

Major Impediment to Higher Priority

Employee protection can impose costs that affect global competitiveness. Employers in developing markets may not face the same level of safety and health regulation and thus face lower economic costs. In recent years, employers have lobbied heavily against increasing regulatory requirements, arguing that higher costs lead to diminishing returns.

Employee Relations

Employee relations refers to the interactions between employees and their employer. Some similar, but slightly different, terms are human resources, human relations, labor relations, industrial relations, and personnel administration or personnel services. Generically speaking, the term includes an array of employer efforts, such as recruitment and selection, orientation, training, performance appraisal, safety, equal employment opportunity (EEO), handling of employee complaints, discipline, and even management training and, in some instances, union relations.

Terminology Evolution

The terminology has clearly evolved in this business functional area. During the 1930s and 1940s, the department overseeing the interaction of the employer with employees was known as the Payroll Department, a central area of interaction. From the 1950s to the 1960s, it came to be known as the Personnel Department, run by low-level staff and with negligible power within the organization. Some have referred to it as the maternal arm of the employer, with mostly women employees, who are primarily clerical, dealing with tax and insurance forms along with payroll. In work organizations with labor unions present, the department often became known as the Industrial Relations Department. If the organization was not in an industrial setting and yet was unionized, the usual term of the era was Labor Relations Department, and the emphasis was on dealing with the union.

The terminology evolution was accelerated by legislation in the 1960s and 1970s. Federal statutes changed the organizational outlook on both the employee as a resource and the significance of the staff function. The staff evolved from clerical work to developing professional and technical skills to cope with the implications of the new statutes. In the mid-1970s, professionalism became a central theme as the American Society for Personnel Administration (ASPA) evolved to meet the needs being expressed. The membership demanded more professional tools to cope with their new responsibilities. The various legislative acts placed penalties on the organization and even on senior management for failure to comply; senior management suddenly needed assistance internally, and providing that competence internally gave the newly minted professionals power within the organization. ASPA has since become SHRM, the Society of Human Resource Management.

Employee Relations Function

Employee relations is usually charged with each of the following functions.

Recruitment and Selection

Word of mouth during the pre-1960s was a key method of locating new employees. Existing employees had friends or family who wanted to work, and the employee was a natural referral agent for the current employer. For those jobs not filled in that manner, newspaper classified advertising served well. For senior positions, professional recruitment firms (headhunters) were used, but at a significant cost.

Employers changed their techniques during the period from the 1970s to the 1990s to meet the nondiscrimination mandates of legislation. By the 1990s, the nondiscrimination philosophy was more entrenched in large firms and government agencies. Also, a new recruitment method had arrived: online computerized recruitment sites such as Monster.com.

Selection is always a challenge; finding the best person for any job proves precarious due to the potential subjectivity. Today, it has evolved to a committee process involving several persons at various levels and in various functions of the organization. The employee relations staff choose what appear to be the top candidates, based on published job specifications and the qualifications presented on paper by the applicants. Naturally, the job may be in evolution, and the specifications may be changing even as the process unfurls; and the qualifications on paper are not always error free. Beginning in the 1990s, new software has allowed better screening as applicants often apply online, and the forms used are matched against the job specifications, and each applicant is scored. Still, the same criticisms are possible, but the screening itself is quicker and likely to be less subjective.

Once the screenings have been completed for an opening, the candidates' credentials are forwarded to the department manager requesting a new employee. A selection committee normally interviews the candidate and seeks to offer a realistic assessment of what the job entails and any unusual aspects of the work to be done. At the end of the interview, the committee writes an evaluation of the candidate based on its perception of the candidates as compared with what is needed. Sometimes this will yield a written score (1–100 scale). When all the candidates have been interviewed, the committee makes a recommendation. The employee relations staff will contact the candidate's references, if they have not earlier, and ultimately, after a short period, make an offer of employment to the recommended candidate. No one person is able to dominate the process, which results in reduced potential for discrimination. The process is expensive to the employer compared with earlier processes but likely yields a higher-quality employee as well as one who will be better able to work in a diverse workplace.

Orientation

The new employee of the 1940s to 1960s would spend a short period in the employee relations department to complete forms, for taxes and insurance, and then receive some form of employee rules. The new employee would then go to the work area to meet fellow workers and be given a description of the work to be done and the machinery to be used. In most subsequent business research, this orientation model was found to be inadequate.

By the 1970s and into the 1990s, a renewed emphasis on orientation was obvious. One reason was the need to reduce turnover, which had been documented often, as well as to maintain a safer workplace. The orientation often became a multiweek effort to ensure that the new employee not only was able to do the required work on the appointed equipment but also understood the company culture and was able to work in a safe manner. At the turn of the century, much of the orientation information can be provided on a DVD to be watched at home and shared with family members who might be more supportive of the work ethic and company culture. The bottom line for orientation is to reduce turnover and maximize the productivity potential.

Training Programs

Training in the 1940s and 1950s was narrow and directed completely at job skills and provided at the operator level with no employee relations involvement. Training departments developed during the 1960s in response to EEO legislation and became more widespread in the 1970s after the Occupational Safety and Health Act (OSHA) was enacted. Training became an employee relations function and more behaviorally based. Supervisory development programs were instituted during this period. EEO workshops laid a heavy emphasis on management at all levels. Some programs were offered to enhance preparation for promotion. Universities, community colleges, vo-tech (vocational technical) schools, consulting firms, and new training and development firms now present an array of programs for all levels of employees. Given the growth of external offerings, in-house offerings have often been reduced. Another trend is placing the burden of preparation for future jobs on the employee. This is both a cost-cutting tool and an effort to encourage self-help among employees. In many cases, the state will offer skills training at a public facility as part of an incentive package to recruit an employer to locate a new facility or expand an existing facility. These training incentives can often make or break a location decision.

Performance Appraisal

Beginning in the 1960s, performance appraisals (reviews) became common, partly in reaction to EEO mandates. The employee relations staff maintains the personnel records of all employees and schedules appraisals according to organization policy or labor agreement. Typically, an appraisal form is provided to managers with a due date. After the form is completed and the employee meets with the supervisor, the form is returned to the employee relations department. The form is always signed by the supervisor and may be signed by the employee. The performance appraisal may be used to correct poor job behaviors and also as a basis for pay increases.

Safety

Prior to the 1970s, safety legislation was state based and varied widely in coverage, regulations, and corrective actions. Their administration was handled by line managers and not by the employee relations staff. All that changed with the passage of OSHA. A new federal coverage was developed, with periodic unannounced work-site inspections and employer fines. To prepare for the implementation of this massive new program, many employers developed a safety program for assisting management in ensuring workplace compliance. Having no other place to house the program, the employee relations department had the safety function added to its portfolio. The insurance industry, which provides workers' compensation coverage, has worked closely with business firms to enhance the safety programs and, usually, expand the employee relations staff.

Equal Employment Opportunity Efforts

The EEO office was established in most firms and public bodies following the 1964 Equal Employment Opportunity Act. Although in some organizations it has developed into a freestanding department it was started in the employee relations department—a best-fit spur-of-the-moment decision in most organizations. The staff in this function has grown as employees have learned about the provisions of the act and its amendments. Employee counseling has proven to take the largest share of the total time, while receiving complaints and their investigation is a close second. Management has needed training sessions.

Handling Employee Complaints

A major tool for employee relations was introduced in the 1930s, although most firms fought its use then. As unions were certified in many industries between the 1930s and the 1950s, one major ingredient in their agreements was a grievance procedure. Such mechanisms were costly in terms of work hours lost. In nonunion firms, employees may view the employee relations staff as almost neutral and may gravitate there when a problem develops, usually with the supervisor or the company system or policy. Most public bodies and some nonunion companies have developed an employee complaint process. Most do not use a professional arbitrator but have developed a variety of final adjudication methods to differentiate them from the union procedures. This has proven to be an effective tool in resisting the organizing of unions.

Discipline Oversight

Until the 1960s, discipline was dispensed by managers without recourse under the laws of most states. Since then, most companies and public bodies have a progressive discipline policy, with the employee relations department as the final applicator of the discipline that has been recommended by line managers. For discharges, many company policies provide for a review of the case by the employee relations staff.

In the 1980s, a new tool, the employee assistance program (EAP), was developed to reduce discharge situations. While it began as a means of helping employees avoid discharge due to a list of special reasons, it has grown to be offered to all employees. While most plans are sponsored by individual companies or public entities, unions have also formed EAPs for their members, especially for drug, alcohol, and family financial rehabilitation. Some EAPs are housed in the employee relations department, while others are housed off-site and even operated outside the work organization by contract agencies.

Management Training

Management in industry was not worker oriented during the rise of heavy industry operations, and so unions arose. In the 1950s, industry became the primary employer of military leaders, and a new leadership approach was instituted. By the late 1960s, an alternative management style was being promoted, and management training offices were developed to institutionalize the new ideas, many of which were the product of research beginning in the early 1960s. The management development efforts have grown to include programs in total quality management, continuous improvement, and EEO and diagnostic programs such as Myers-Briggs Type Indicator and leadership studies. The management training efforts of some firms are now being subcontracted to emerging training and development companies, which can provide a multitude of programs more cheaply and on an on-call basis.

Employee relations can contribute to the development of a motivated diverse workforce to achieve success in a competitive environment. Senior management support is critical, however.

Employee Retirement Income Security Act of 1974 (ERISA)

The Employee Retirement Income Security Act of 1974 (ERISA) is a federal law that sets minimum standards for most voluntarily established pension and health plans in private industry to provide protection for individuals in these plans. ERISA requires plans to provide participants with plan information, including information about plan features and funding; establishes fiduciary responsibilities for those who manage and control plan assets; requires plans to establish grievance and appeals procedures for participants; and gives participants the right to sue for benefits and breaches of fiduciary duty.

While private sector pension plans have been in existence since the latter part of the 19th century, their period of greatest growth occurred following the decision by the Supreme Court in the Inland Steel Case of 1949. The Court upheld the ruling by the National Labor Relations Board that pension benefits constitute wages and are thus subject to collective bargaining, as are other conditions of employment. By 1974, nearly 31 million workers were covered by private pensions, with 27 million enrolled in defined benefit plans. Private retirement plans had become a major source of income for many retired workers.

In the early 1970s, the U.S. Senate held hearings on deficiencies in the pension system, which included the high rate of ineligibility for pension benefits among plan participants and the forfeiture of pensions even after many years of service. These hearings set the stage for the eventual passage of the ERISA. Among its other objectives, ERISA established the minimum standards employees must satisfy to ensure the receipt and protection of benefits when they either leave their jobs or die. Among other things, ERISA established participation rules and vesting requirements for pensions (and other covered benefit plans) to qualify for preferential tax treatment.

In 1974, ERISA established funding rules that in their most basic outline require sponsoring employers to calculate the present value of future payments the plan owes, plus the present value of future benefit payments the plan is likely to owe in the future. The plan sponsor then is required to compare those obligations with the value of the assets held by the plan. If the present value of the liabilities exceeds the value of the assets, a contribution is required. However, the act, and the rules promulgated to guide sponsors in compliance with the act, goes into extensive detail related to the assumptions to be used in valuation and the terms and conditions related to funding adequacy.

ERISA also sought to protect benefit plan assets by designating as fiduciaries those who control, manage, or provide investment advice relative to plan assets, subject to fiduciary responsibilities. The primary responsibility of fiduciaries is to run the plan solely in the interest of participants and beneficiaries and for the purpose of providing benefits and paying plan expenses. Fiduciaries are required to act prudently in order to minimize the risk of large losses. In addition, they must follow the terms of plan documents and avoid conflicts of interest. Fiduciaries who do not follow the requirements stipulated may be held personally liable to restore any losses to the plan or to restore any profits made through improper use of plan assets.

To further protect the benefits promised to employees under a qualified pension plan, Title IV of ERISA established the Pension Benefit Guaranty Corporation to ensure the payment of plan benefits under specified conditions.

ERISA requires plan sponsors to provide to every participant in a retirement or health benefit plan, or a beneficiary receiving benefits under such a plan, a summary of the plan, called the summary plan description (SPD). The SPD must provide participants with information on what the plan provides and how it operates. It must provide information on eligibility to participate, how service and benefits are calculated, when benefits become vested, when and in what form benefits are paid, and how to file a claim for benefits. If a plan is changed, participants must be informed, either through a revised SPD or in a separate document. In addition to the SPD, the plan administrator must give participants a copy of the plan's summary annual report each year. This report is a summary of the annual financial report, which most plans must file with the Department of Labor on Form 5500.

Initial ERISA regulations stipulated that most defined benefit plans should allow employees to participate on attaining the age of 25 or after the completion of 1 year of service, whichever comes later. Later, the Retirement Equity Act of 1984 required almost all plans to lower the age requirement to 21. ERISA also established rules related to an array of plan provisions, including vesting, breaks in service, survivor benefits, payout options, and many other plan features that are beyond the scope of this summary.

While most equate ERISA with pension plans, the act also covers self-funded welfare plans—for example a group health plan in which the organization pays the claims against the plan versus purchasing coverage through a third-party insurer. Historically, states have controlled traditional health insurance sold within a state. However, ERISA exempts those employers that "self-insure" their health benefit plans from state regulation, taxation, and control. Under these plans, the employer pays the health care claims directly, instead of purchasing an insurance policy to pay claims, and thus escapes state regulation of insurance.

The exemption from state regulation that ERISA provides self-insured plans has been an important feature for many large organizations that have operations in multiple states, enabling them to provide a common benefit plan for all employees versus purchasing plans on a state-by-state basis that comply with the requirements imposed by each state. In 1974, only 6 million Americans were insured through self-funded plans. Today, that figure stands at 55 million, or approximately 40% of all group health care coverage in the United States. Research indicates that the majority of employers that converted to self-insurance did so to avoid state regulations.

There have been a number of amendments to ERISA, expanding the protections available to health benefit plan participants and beneficiaries. One amendment, the Consolidated Omnibus Budget Reconciliation Act, provides workers and their families with the right to continue their health coverage for a limited time after certain events, such as the loss of a job. Another amendment to ERISA is the Health Insurance Portability and Accountability Act, which provides protections for employees and their families who have preexisting medical conditions or might otherwise suffer discrimination in health coverage.

Social and Ethical Issues

While ERISA has provided a set of standards and rules for plans to follow in order to receive favorable tax treatment, some critics have argued that the regulatory burden imposed by the funding rules of the act on defined benefit pension plans are at least in part responsible for the dramatic decline of such plans in favor of defined contribution plans. Others point to the act as weakening the ability of states to mandate various types of health care coverage for employers providing such benefits to workers in their states. Since ERISA preempts state control over self-funded health care programs, state legislatures that mandate coverage—for instance, coverage for same-sex partners or for mental health services—are unable to do so except for health insurance programs purchased by an employer from a third-party provider. As such, most of the largest employers are able to avoid the mandates to expand coverage sought by states through the protections afforded by the act.

Employee Rights Movement

Employee rights refer to the entitlements that employees have vis-à-vis their relationship with their employers. These rights dictate how employers are expected to treat their existing employees. Such entitlements are, however, contingent on the nature of the workplace environment—that is, whether it is "public" (linked to the government) or "private." Whereas public employees benefit from the protection afforded by the United States Bill of Rights, private employees do not, except where explicit protection is offered by other state or federal legislation.

Public/Private Distinction

Which rights are protected depends first and foremost on the nature of the workplace. Workplaces are distinguished as either public or private depending on their relationship to the state. Public workplaces are those that are operated by and for the state—that is, governmental agencies. Private workplaces, on the other hand, are defined as those that are separate from the state—that is, privately owned corporations. Although this distinction is often hidden and arguably artificial, the classification of a public workplace versus a private workplace is instrumental in determining the rights granted to employees and the responsibilities assigned to employers.

An employee of the public workplace is protected by the Constitution and its Bill of Rights. Many of the rights protected by the Bill of Rights are considered natural rights or fundamental rights. Even so, these rights are not protected for employees in private workplaces. The private workplace is therefore void of many rights—that is, freedom of speech, due process, and so on—considered fundamental outside the workplace.

The reason for this is quite simple: The original intent of the Constitution was based on the history of the American colonies and their relationship with England. The purpose of the Bill of Rights was to protect American citizens from excessive encroachment by the government, not to isolate citizens from one another. The founders of this country focused on civil society, without knowledge of the strong presence that business would have on the future United States and without anticipating in any way the significant impact this would have on the evolution of distinctly public and private workplaces. Although the operation of these workplaces is remarkably similar, the rights granted to their respective employees remain distinct.

Employment at Will

The default rule for employment in the majority of jurisdictions in the United States is employment at will (EAW). EAW operates in the absence of an employment contract and is recognized as the ability of either the employee or the employer to terminate their relationship at any time, for any reason, or for no reason at all. No justification for termination is required. The only prohibition is against reasons specifically deemed illegal (i.e., whistle-blowing, in those states where whistle-blower protection is in effect, gender or racial discrimination, and so on).

Unless otherwise specified, employees in the private sector are considered employees "at will" and can be terminated at any time. Except in cases where legislation has carved out specific exceptions or in Montana, the single "right-to-work" state, employees have no job security.

Although both employers and employees are ostensibly granted equal rights according to EAW, it can be argued that these rights are equivalent but not equal. There is a significant power imbalance often at play in that it is typically easier for employers to find new employees than vice versa. Furthermore, because no reason for termination is required, employees are stripped of their rights to due process and their prior investment in their work is ignored.

Due process is also a concern. Due process refers to the rights that individuals have not only to be notified of the charges made against them but also to respond to these charges. Due process is linked to employee rights in that whereas public employees are guaranteed due process, private employees enjoy no such protection.

Legislation

With EAW as the prevailing norm, legislation has been passed to carve out rights for employees. There currently exist significant legislative and statutory exceptions to EAW. The Family and Medical Leave Act of 1993, for example, mandates that employers allow employees in both private and public workplaces to take an unpaid leave of absence due to illness, maternity, or caring for a sick family member. Employers are required to keep open the position of the employee on leave, who has a protected right to return to his or her job at the end of the leave.

There also exist several pieces of legislation regarding discrimination in the workplace. For instance, the Americans with Disabilities Act prohibits discrimination based on disabilities in the workplace. Firing an employee based on a disability is deemed inappropriate and illegal. The Civil Rights Act of 1964 forbids employers from discriminating against employees according to race, color, religion, sex, or national origin. Discrimination based on age is also prohibited by the Age Discrimination in Employment Act of 1967. Though these pieces of legislation are not without certain exceptions, they provide employees with rights not otherwise granted to them according to EAW.

Privacy and Technology

Advances in technology have further limited the rights of employees in the private workplace. Legal systems have experienced difficulty keeping up with the fast pace of technological innovation. This has resulted in numerous challenges to privacy. In fact, employees in the private sector enjoy no reasonable expectation of privacy. Furthermore, what little privacy they previously enjoyed is slowly being eroded.

An example of this stems from e-mail in the workplace. People today communicate frequently by e-mail in both their work and their personal lives. This form of communication is very different from other forms of communication because it is more difficult to destroy and much easier to trace. Although many people consider this personal communication, in fact, it is not. Employers have the right, which many exercise, to monitor employees' e-mail. Some consider this not only a right but also a responsibility, in light of the possibility of inappropriate exchanges taking place via e-mail. Furthermore, monitoring applies not only to work-related e-mail but to any e-mail accessed by the employee in the workplace. The rationale is that the employer has the right to monitor anything that takes place at the workplace, with or without the employee's knowledge.

Pre- and Postemployment

The relationship between employees and employers is strictly defined. Job candidates (preemployees) and retirees (postemployees) have interests but few if any protected rights. Employee status differs from pre- or postemployee status in that employees have a current existing relationship with their employers. This is not the case for preemployees, since no relationship has been established. Postemployees had a previous relationship with their employer, but this relationship is no longer in existence.

This is significant in that while the rights of employees are limited, the rights of pre- and postemployees are virtually nonexistent. The rights protected for pre- and postemployees are only the fundamental civil rights—that is, the right to not be discriminated against on the basis of age, skin color, sex, disability, and so on. Job candidates are subject to any means of testing the employer deems appropriate, which can include inquiries into credit histories, driving records, medical records, and so on. Neither permission nor disclosure is required. Failure to concede to the "requests" of the potential employer constitutes a justifiable reason for not hiring a job candidate. Employers are not required to provide the reasons for not hiring potential employees, and they are permitted to test them by any means they deem acceptable.

As for retirees and other postemployees, because they no longer have a relationship with their employers, the same conditions apply. This is unfortunate in that postemployees still have a stake in their employer. They might need job references, and many have invested in pension plans and the like.

Conclusion

The workplace in the United States has changed drastically in the past 20 or 30 years. Employment relationships have beginning and end points in terms of rights, whereas previously, employment relationships were considered to be indefinite. Issues connected to preemployment and postemployment rights, EAW, and public versus private workplaces were not at the forefront. Today, however, long-term employee-employer relationships are becoming increasingly rare.

Although Americans tend to assume that they receive the greatest workplace protection, in fact, this is not always the case. Cultural values in many workplaces outside the United States, such as in Europe, create very different workplace standards. This is interesting, particularly as compared with other countries, where the balance of power is tilted much more in favor of employees. For example, in Canada and in many countries in Europe, women are guaranteed 1 year of paid maternity leave. This is just one example of how workplace norms differ around the world.

Employee Stock Ownership Plans (ESOPs)

Employee stock ownership plans (ESOPs) are employee benefit programs that make a company's employees owners of that company's stock. Two features of ESOPs make them unique among qualified employee benefit plans. First, ESOPs are required to invest mainly in the employer's stock. Second, these stock plans can borrow money from or on the credit of the employer, allowing ESOPs to serve as a tool of corporate finance.

ESOPs are the main form of employee ownership in the United States. At the end of 2004, the approximately 11,000 ESOPs in the United States owned an estimated $600 billion in assets and covered 10 million employees. Most U.S. ESOPs are large enough to exert a major influence on company strategy and culture, and about 2,000 ESOPs have total ownership of their companies. ESOPs also operate in Canada, the United Kingdom, Europe, India, Egypt, South Africa, Argentina, Japan, and elsewhere.

ESOPs are deferred compensation plans, with employer contributions growing tax-free until the employee leaves the company. At that time, the employee can roll the proceeds from the ESOP into another tax-advantaged retirement plan, such as an individual retirement account. ESOPs are "defined contribution" plans, meaning that the employer makes yearly contributions without specifying the resulting benefit in advance. ESOPs are called "qualified" plans because their sponsors can qualify for tax benefits by following laws designed to protect participants' interests.

ESOPs differ from cooperatives, collective ownership, and ownership by trade unions. ESOPs give individual employees ownership while professional managers accountable to a board of directors handle day-to-day operations. The company remains private and for-profit. ESOPs also differ from stock option benefits and 401(k) plans.

Companies use ESOPs for a variety of purposes. The most common use is to transfer ownership of closely held companies. In such cases, an ESOP provides tax advantages, a ready market for the owner's shares, and the opportunity to transfer ownership gradually. These features make ESOPs valuable planning tools as business owners near retirement. Companies also use ESOPs to borrow money at a lower after-tax cost. Many companies use ESOPs to motivate and reward employees. Research suggests that ESOPs boost employee loyalty and productivity when combined with management styles that encourage employee input.

A small but highly publicized number of ESOPs are formed to defend against potential or imminent takeovers. Such ESOPs generally fail to stand up in court because they appear to entrench management rather than serve the interests of employees. For similar reasons, setting up an ESOP to fend off unionization is considered an abuse.

ESOPs embody an economic theory called "ownership economics," "binary economics," or "economic democracy." This theory supports the ownership of productive assets by a broad-based group of citizens rather than by the state or by a wealthy minority.

History

San Francisco investment banker and corporate lawyer Louis Kelso is credited with inventing the ESOP in the 1950s. Kelso argued that allowing workers to share in owning capital-producing assets would strengthen capitalism. The first ESOP was established in 1957. At that time, ESOPs lacked clear legal authorization to borrow money in order to acquire shares, and few companies showed an interest in the idea.

The 1974 Employee Retirement Income Security Act (ERISA) provided a statutory framework for ESOPs, and other laws gave ESOPs tax advantages. By 1990, 10,000 ESOPs were operating in the United States. The number peaked at 11,500 ESOPs in 2002 and 2003. Several times, Congress has modified the laws governing ESOPs. Important laws affecting ESOPs include the 1984 and 1986 Tax Reform Acts, the 1996 Business Job Protection Act, the 1997 Taxpayer Relief Act, and the 2001 Economic Growth and Tax Relief Reconciliation Act.

How ESOPs Work

To start an ESOP, a company first sets up a trust fund. How the fund gets its money determines whether the ESOP is "basic" or "leveraged."

In a basic ESOP, the company gives cash or new shares of stock to the trust fund. If the employer contributes cash, the ESOP buys stock from the company or from one or more of its shareholders. The company provides additional cash or securities to the ESOP each year so that the ESOP can continue buying stock. These contributions are tax deductible up to 15% of the payroll.

Leveraged ESOPs borrow money to buy shares. The company then contributes cash so that the ESOP can repay the loan. Company contributions are tax deductible up to 25% of the payroll.

Typically, all full-time employees over the age of 21 participate in an ESOP. Each employee has an individual ESOP account. Employees increase their ownership rights to the account by accumulating seniority, a process called "vesting."

Vested employees receive their shares when they leave the company. Unless there is a public market for the shares, the company must buy the shares back at fair market value. Private companies must obtain an annual, independent valuation to determine their share price.

In ESOP companies, groups of employees may form an ESOP committee to work on the company's strategic ownership objectives. This committee may be called an "Ownership Committee" or an "ESOP Advisory Council."

ESOP Participants' Rights

Participants of ESOPs in publicly traded companies have the same voting rights as other shareholders.

ESOP participants in private companies have the right to direct the trustee to vote their allocated shares on major issues such as liquidations and mergers.

ESOP participants have legal rights to the information they need to protect their interests. For example, ESOP sponsors are required to give participants a Summary Plan Description explaining matters such as how the ESOP works, where to take questions and complaints, and sponsors' and fiduciaries' names and addresses. In addition, the sponsor must let participants see and copy a summary annual report on ESOP activities and assets. This report must be issued on a Department of Labor 5500 form. Sponsors must give participants a shorter version of the report. Each year and at other times specified by law, ESOP participants must receive a benefit statement. The statement must include the fair market value of the ESOP shares and other assets, as well as the employees' vesting status. Participants have the right to challenge the accuracy of this information. ESOP participants also have the right to view trust documents.

Contrary to some media reports, ESOPs do not give participants legal rights to information such as officers' salaries and who owns how many shares. However, most ESOP companies disclose some non-salary financial information.

Fiduciary Duties

ERISA requires ESOP fiduciaries to run the ESOP solely for the benefit of its participants and beneficiaries. This requirement is called the "Exclusive Benefit Rule." The participants' and beneficiaries' interests are defined as receiving benefits and defraying the plan's administrative costs. Incidental benefits to other parties are allowed. If the fiduciaries' impartiality appears uncertain, they may seek independent advice.

ERISA also requires ESOP fiduciaries to adhere to the "Duty of Prudence." Fiduciaries must behave with the same skill, care, prudence, and diligence that one would expect of a prudent person facing similar circumstances.

At times, ESOP fiduciaries must make difficult decisions. For example, they may have to vote on whether to tender shares, how to respond to a tender offer, and how to manage financial difficulties in the company.

Ethical and legal issues most often arise when companies form an ESOP to defend against a tender offer. Conflicts of interest can arise when trustees are also officers or directors of the company or lack independence from management.

Advantages of ESOPs

ESOPs provide a number of advantages to companies. U.S. law gives these plans significant tax breaks. For example, when a company borrows money through an ESOP, repayments for both the principal and the interest are tax deductible. Business owners who sell their share in a company to an ESOP can often defer or avoid capital gains taxes. In addition, ESOPs can produce substantial savings when partly or completely substituted for defined benefit pension plans. Some experts say ESOPs help businesses recruit, keep, and motivate employees.

ESOPs offer several advantages to employees. For example, employees participating in an ESOP can accumulate company stock tax-free. In addition, ESOP participants gain access to certain information about the company and have at least some voting rights regarding their shares.

Disadvantages of ESOPs

Not all companies find ESOPs suitable. Start-up and administrative costs are high, strict reporting is required annually, and ERISA rules are complicated. As a result, very small companies and those with high turnover are likely to find ESOPs too expensive. The obligation to buy back stock from employees who leave or retire restricts a company's cash flow. Resentment can grow if ESOP participants feel that managers do not treat them as part owners of the company. Partnerships and most professional corporations are barred from setting up ESOPs. An S corporation—a type of corporation that passes income, losses, and tax items on to shareholders rather than being taxed as a corporation—has lower contribution limits and lacks the rollover advantage given to other corporations.

ESOPs have a number of disadvantages for employees. Unlike defined benefit plans, ESOPs put all the risk on employees. The concentration of ESOP assets in company stock makes ESOPs riskier than plans with greater diversification. If the company declines, the employee cannot sell the stock, and the Pension Benefit Guaranty Corporation, which insures many ERISA plans, does not cover ESOPs. The debt involved in setting up a leveraged ESOP can restrict a company's cash flow, adding to ESOP participants' risk. Critics say the Department of Labor, which has responsibility for overseeing ESOP fiduciary guidelines in the United States, lacks the resources and political freedom to protect employees. On the other hand, diversification rules, plus the tendency of ESOPs to move out of company stock in the long term, help reduce these risks. Another offsetting factor is companies' tendency to contribute a higher percentage of pay to ESOPs than to other retirement plans. Nevertheless, experts advise employees to view ESOPs as an investment rather than as their only or main retirement plan.

Employment Contracts

An employment contract is a legal agreement that governs the terms according to which one or more parties provide personal services for one or more other parties, typically in the context of an employer-employee relationship. A contract may be *express*, that is, reciting terms for performance between the parties, or it may be *implied* in the law according to the behavior of the parties. The regulatory frameworks, policy justifications, and business practices that govern employment relationships vary widely across jurisdictions, with the two principal approaches being employment-at-will and for-cause regimes.

Types of Personal Services Agreements: Employment Agreements and Independent Contractor Agreements

There are two primary categories of personal services agreements: employment agreements and independent contractor agreements. The criteria for distinguishing between these types of work relationships in the common law include the degree of the worker's integration into the operations of the employer's organization, the scale and scope of the worker's service, whether the worker uses his or her own tools and materials, the number of employers the worker serves, whether the worker risks a financial loss in the relationship, the employer's degree of oversight and approval for the work product, and, especially, whether the employer retains the *right* to control the manner and pace of the work.

If applying these common-law factors supports the conclusion that the provider of personal services is an independent contractor, then the parties are acting at arm's length and are truly separate legal entities. The legal rules governing their relationship would be the general rules of contract. However, if applying the common-law factors supports the conclusion that the provider of personal services is an employee, then the relationship constitutes employment in the strict sense, with concomitant common-law duties of agency owing to the employer, including fiduciary duties of care, loyalty, and good faith. To sustain a practicable scope for this analysis, the remainder of this discussion will deal with the employment relationship.

Types of Employment Contracts: Express and Implied Contracts

An employment contract is a personal services agreement between an employer and an employee that is legally enforceable. The two typical forms of contract in the common-law tradition are express contract and implied contract. An express contract is one in which the parties enumerate the terms of their agreement in ways that allow it not only to be clear for practical purposes but also to be legally sufficient and enforceable. For example, an express contract should specify the identities of the parties, their respective performance commitments, their respective consideration, the timing and means for payment, the standards for assessing the sufficiency of the work product, the term of service, the governing law(s), the procedure(s) for giving notice of termination, and the means for adjudicating disputes.

In addition, the formation process for an express contract must satisfy legal standards for the document to be enforceable, including the legality of the subject matter, the mental competency of the parties, the real or apparent authority of the parties, and the legal majority of the parties (typically the age of 18 for natural persons). A contract may be in writing or oral, but it is prudent—and in many cases legally necessary under the statute of frauds in the applicable jurisdiction—to execute it in writing, particularly when the term of service exceeds 1 year from the date of the agreement.

An implied contract is an agreement that a court construes and interprets as legally enforceable retrospectively, on the basis of the actions of the parties. If a court finds that the parties behaved as though they believed that a contract existed between them, then it is likely that it will rule that there impliedly was a contract, as a matter of law.

Regulatory Frameworks for the Employment Relationship: Employment-at-Will and For-Cause Regimes

The two main regimes for construing the nature and durability of employment relationships before the law and in the context of business practices are (1) employment at will and (2) a for-cause framework. Under the employment-at-will doctrine, the employee ("servant," in legal parlance) serves at the pleasure of the employer ("master"). The employer may terminate the employee's service for a good reason, for a bad reason, or for no reason at all. This has been the default rule for most jurisdictions within the United States since at least the middle of the 19th century, and it is in the United States that this policy continues to enjoy its widest favor.

Against the backdrop of this default rule, there are four principal categories of exceptions that circumscribe the scope for employment at will in the United States—that is, four examples of situations in which a justification for an employment action may be necessary. First, for employees of the federal government, there are due process protections that arise from the Fifth Amendment to the U.S. Constitution. Such protections stem from legal constructions of incipient property rights in this employment and the special dual roles of the government, not just as an employer but also as a civil power with the capacity to deprive people of such property as well as life and liberty. Under the Fourteenth Amendment to the Constitution, this protection likewise extends to employees of state and local governments, under the doctrine of equal protection. (The principal exception to this protection for government employees relates to attorneys who serve the government in the role of counsel; it is a long-standing public policy and standard for professional practice that a client must remain free to choose its counsel.)

Second, statutory prohibitions protect employees from arbitrary or discriminatory employment actions based on (1) activities that are beneficial or even necessary as a matter of public policy and (2) status factors—for example, gender, age, family relationships, ethnic origin, religious beliefs, and national origin.

An example of the first type of statutory protection is the National Labor Relations Act of 1935, which prohibits retaliation against employees for union activity, litigation against their employer, or testifying against their employer in court. Other statutes, including the Occupational Safety and Health Act of 1970, prohibit retaliation for reporting or helping investigate dangerous, unethical, and/or illegal situations. This act also authorizes the Occupational Safety and Health Administration to administer the whistleblower provisions of 13 other statutes, such as trucking, airline, nuclear power, pipeline, environmental, and securities laws.

Other statutes extend the second major type of protection by prohibiting arbitrary or discriminatory employment actions based on the aforementioned status factors, which the federal and state governments have determined to be worthy of protection as a matter of public policy, particularly because these factors tend to be irrelevant to the substance of the employment relationship. Examples of such legislation at the federal level include the Civil Rights Act of 1964, the Age Discrimination in Employment Act of 1968, the Pregnancy Discrimination Employment Act of 1978, the Americans with Disabilities Act of 1990, and the Family and Medical Leave Act of 1993. (While some local jurisdictions include sexual orientation among these protected status factors, the federal government does not.)

Third, common-law protections on the basis of precedent and public policy help prevent arbitrary employment determinations that curtail employees' basic rights and duties when it comes to political participation. For example, it generally is illegal for an employer to terminate or penalize an employee for exercising his or her right to vote or for serving jury duty.

In the same way, common law and public policy generally prohibit employment policies and practices that constrain employees from acting in the public interest. For example, employers generally may not threaten or retaliate against employees for reporting serious dangers to life or property or information about crimes, at least without risking lawsuits for retaliatory discharge. Substantive codes of conduct of professional associations have complemented the aforementioned statutory protections by providing frameworks for assessing the legal and ethical reasonableness of their members' actions in whistle-blowing about such matters, particularly in light of the aforementioned long-standing fiduciary duties of care, loyalty, and good faith, and these codes have provided a measure of additional protection in some state jurisdictions.

Fourth, parties to an employment relationship may contract away their right to at-will terms either through individual contracts or through group contracts—for example, collective bargaining agreements. Courts tend not to consider the question of the sufficiency of legal consideration in contracts between parties that bargain in good faith and at arm's length. As a result, the primary constraints on employment contracts are those that apply to contracts generally, including the aforementioned factors of majority age, mental competency, and real or apparent authority of the contractors, as well as legality of the subject matter of the contract.

Because of the aforementioned doctrine of implied contract, parties must exercise care not only in the legally cognizable terms to which they expressly assent but also in their behavior toward one another, which a court may construe as evincing a willingness to form a bond of obligation. In the past, factors such as a long period of service, an employer's oral or written assurances about long-term employment, the wording of job application forms, the offering of service-dependent benefits, and the content of employee procedure manuals have supported findings of implied contract. In light of such rulings, employers, particularly corporate employers, have implemented prophylactic procedures to minimize such risks, for example, in the form of express disclaimers of contract and notices that all employment is at will, sometimes with requirements for written employee acknowledgments.

While these are the principal exceptions to the policy of employment at will in the United States, two points are worth noting. First, these legal restrictions derive their legitimacy from substantive moral principles. Hence, it is meaningful to interpret these justifications and assess their normative sufficiency apart from the positive laws by which constitutional framers, legislators, judges, and contractors attempt to express them. The discussion below demonstrates this in terms of the principle of autonomy, the freedom to contract, and the duty to promote efficient markets for labor and capital.

Second, despite differences in legal systems—for example, common-law and civil law frameworks—and business and litigation practices around the world, the systematic questions regarding the nature and scope of employment contracts persist across societies, including how to balance interests in efficient employment markets with just treatment of employers and employees. The language surrounding issues of employment at will often is jurisprudential, but the issues are deeper than the idiomatic exigencies and concerns of countries' legal systems.

The other major framework for governing the employment relationship is a for-cause regime, which limits significant employment actions, including terminations, to justifications on the basis of "good" reasons, upon some articulable due process arrangement that takes into account factors relevant to the substance of the employment relationship, including employee performance, market conditions, and resource constraints on the employer's ability to continue to employ the employees. Montana has been the principal jurisdiction to follow a for-cause regime (for postprobationary employees), with the passage of the Wrongful Discharge From Employment Act in 1987.

In August 1991, the National Conference of Commissioners on Uniform State Laws proposed the Model Employee Termination Act (META). This act represented a compromise that provided an example set of laws for states to consider for adoption, to promote just treatment for employers and employees across the United States, by preserving incentives for effective job performance, reducing uncertainty, and lowering costs for litigation and damages. The provisions also extended the scope for legal protections to classes of employees beyond the typically wealthier groups that were willing and able to risk the costs of litigation. Although many states have considered provisions along the lines of the META, none has adopted its terms legislatively, and employment at will remains the default rule throughout most of the United States.

Justifications for and Critiques of Employment-at-Will and For-Cause Regimes

While the employment-at-will regime seems harsh from the perspective of employees, a principled justification for it lies in the right of the parties to contract freely—that is, without coercion or deception (at a minimum). Even though the language of this principle invokes "contracting," it does not refer principally to a legal notion of contract. Rather, the usage in this normative context is similar to the meaning of a social contract, in that it refers to the ground rules for the relationship between the parties. (It is not exactly the same because a traditional social contract approach typically looks at a broader scope of relationships.) A key feature that this notion of employment contracting holds in common with the social contract model is the focus on ex ante agreements between employers and employees, as demonstrative of the freedom of the parties. The moral legitimacy for contracting arises from the autonomous judgment of the parties in (1) discerning their respective interests and (2) forming agreements that they *intend* to be resilient enough to govern ongoing, evolving relationships, even through adverse conditions beyond their control.

A corollary to this rights-based contractual claim is the right of each party to protect and to determine the use of its property—namely, the capital of the employing organization in the case of the employer and the productive capacity, or personal capital, of the worker in the case of the employee. The ownership rights of the respective parties reflect their capacity for autonomous contracting. One of the ways in which they manifest this autonomy is in forming employment relationships, with few or no barriers to entry and exit.

This reciprocity in contracting capacity lends a formal legitimacy to employment at will, in that either party may enter or terminate a contract provided it does not coerce or defraud the other. To enjoin an employee from terminating an employment relationship on the basis of his or her autonomous judgment would be to constrain unjustly his or her freedom to contract and, what is just as important, his or her freedom to terminate contracts.

The correlative argument for employment at will is that it likewise would not be justifiable to restrict the freedom of the employer to terminate the relationship. Public policy would not support imposing an employment relationship on either party, and so, despite incidental ex post claims, deprivations, and hardships that individual employers and employees might experience, their rational ex ante preferences would be to preserve the freedom to contract. In other words, the logic of employment at will as a moral argument and a public policy assumes that employers and employees as respective classes of contractors agree to support this regime as the most effective way to protect their respective interests.

When they are not discrete classes, that is, when employees own all or part of their employer, then the justification for employment at will involves recognizing a principled proportionality between the employees' interests as workers and as owners. Such owner-employees seek to safeguard their autonomy by preserving in a balanced way the capital in their personal productive capacities and the organization's capital. As they do this, they consider the respective markets for these resources in the short term and over the long term. As employees, they have options for finding other jobs, and as capitalists, they have options for holding or trading in their investments. Balancing these risks and opportunities in a practicable proportion is an ethical duty that employee-owners owe to themselves, to one another, and to those who depend on them for the prudent management of these stores of wealth. As a consequence, owner-employees should consider that the advantages they might gain as workers through constraints on the practice of employment at will might pale in comparison with the long-term costs they bear as capitalists.

The ethical justification for a for-cause regime lies principally in appeals to the autonomy of the parties and to justice as due process, both substantively, in terms of the bases for entering, modifying, or terminating an employment relationship, and procedurally, in terms of the recourse that the parties have for appeal and possible revision or reversal of the decision. Under a for-cause regime, only "good reasons" suffice for making significant employment decisions, because the emphasis is on the cogency of the determinations as they implicate the parties' autonomy rather than on the mere license to make them.

Out of respect for this autonomy, such a policy does not permit "bad reasons" as bases for such decisions, nor does it permit facially arbitrary or unreasonable decisions. The constitutional, statutory, common-law, and contractual exceptions to the employment-at-will rule above effect a similar result, by disqualifying large classes of bad reasons. However, these exceptions do not exclude merely "unreasonable" bases for employment actions. Defenders of the practice of employment at will would argue that the law should permit parties the discretion to act arbitrarily—even foolishly—provided that they do not act coercively or fraudulently, and that it is preferable to leave the regulation of arbitrary and foolish behavior to the forces of markets for labor, capital, and reputation.

In addition to invoking the moral autonomy of employees to justify a for-cause regime, one can point to the moral benefit of promoting efficiency in markets by distributing information essential for markets to function. When employers inform employees of the reasons for their termination, this can strengthen the efficiency and effectiveness of the market for labor. Current and prospective employees can learn the expectations of employers and the standards for performance that will merit recruitment, retention, and promotion. On a macroeconomic scale, this will benefit the participants in the labor market, both employers and employees.

However, such practices also can increase the legal liability and risk for employers significantly, since these revelations involve others in the bases for management's deliberative process regarding employment decisions. Putative reasons for dismissal may not fare well under scrutiny by those inside and outside the employing organization, who may view the reasons as pretexts for discriminatory and/or retaliatory policies or actions. Even when the employing organization observes a demonstrable discipline in such practices and carefully documents its contemporaneous judgments, it can become vulnerable to a broader scope of litigation than under an employment-at-will regime—that is, for retaliatory discharge, discrimination, and even defamation.

While an analogy with the aforementioned protections that public sector employees enjoy would be facially appealing as an additional justification for a for-cause scheme, critics would argue that such a construction would risk conflating substantive enduring differences between the public and private sectors, not the least of which are the qualitatively distinct constitutional and ethical interests of government employees in protection from government expropriation of their property, liberty, and lives. Regardless of the comparative scale, scope, and power of corporations and other private organizations, they do not pose the same qualitative threat to these fundamental rights that a government agency does when it functions as both an employer and a promulgator and enforcer of laws. It is possible to draw analogies with constitutional conceptions of due process in order to justify a for-cause regime, without insisting on a de facto extension to the private sector of practices for government employees.

A for-cause framework does not reject the freedom to contract that underwrites the doctrine of employment at will. Rather, it focuses on the material circumstances of the asymmetries in knowledge and power that obtain between employers and employees in the bounded rationality, the opportunism, and, especially, the asset specificity of the parties—for example, in the investments they make in training, in career development, and in serving clients, customers, stockholders, and other stakeholders. The assumption underlying a for-cause regime is that there are normatively significant barriers to entry and exit from the employment market and employment relationships and that these conditions pose particular risks for the moral autonomy of employees.

As a result, support for a for-cause regime does not require abandoning the ex ante contracting model—for example, on grounds that subsequent breakdowns in employment relationships, or other circumstances, justify abrogating a "social contract" in favor of protecting employees to the detriment of employers. This would open the door to special pleading and arbitrary conditions that would endanger the interests of all parties to employment relationships, if only because it would raise the cost of contracting.

Rather, one can preserve a contracting model and structure procedures that reflect these asymmetries and give preference to the interests of employees for substantive and procedural due process. A contracting model need not impose a policy of employment at will. Contracting is consistent with a for-cause regime as well, as long as there are ethically justifiable procedures to protect the interests of the parties to the employment relationship, with special deference to the moral autonomy of employees. (Such policies likewise should protect the interests of employers when asymmetries of information and power favor employees—for example, when an employee exerts significant influence on the employer's prospects for success, through his or her level of authority or specialized talents.)

Employment Discrimination

Employment discrimination is basing employment decisions on criteria unrelated to the applicant's qualifications for the job, generally related to race, gender, ethnicity, and so on. In an effort to have employees and applicants for employment judged on the basis of their qualifications for the job rather than on the artificial basis of prejudgments about a group the employee or applicant may belong to, in the United States, it is illegal for an employer to discriminate against employees or applicants for employment on the basis of certain criteria set out in federal and state statutes. Under federal law, it is illegal for an employer to discriminate primarily on the basis of race, color, gender, religion, national origin, age, or disability. Employers cannot discriminate regarding workplace benefits or decisions for employees including their hire, termination, discipline, training, promotion, pay, job assignment, or any other term or condition of employment.

In the United States, there are laws prohibiting employment discrimination at the federal as well as the state level. Most states also have their own employment discrimination laws, generally called fair employment practice laws, which are virtually the same as the federal laws. While the state laws may be stricter than the federal laws, they cannot be less strict. Therefore, some state laws have added categories not included in the federal law or included less stringent thresholds for application of the laws (e.g., requiring an employer to have only 4 employees before the law applies rather than 15). Some states have added categories such as marital status, sexual orientation, physical appearance, or political affiliation as a basis for employment discrimination. State claims are generally handled by the state's fair employment practice agency.

Applicants or employees who believe that they have been victims of illegal discrimination have a right to take their claim to the enforcing agency to seek redress. For violation of federal laws, this is the

Equal Employment Opportunity Commission (EEOC). Claims are handled by the EEOC free of charge (though if claimants wish to engage an attorney, they may do so at their own cost). Handling of claims may involve mediation, investigation, or adjudication, as appropriate. If the applicant or employee is not satisfied with the EEOC's final decision on the claim, he or she can then generally seek relief in a federal court. If the employee is found to have been discriminated against by the employer or someone working for the employer, he or she may receive as a remedy, as appropriate, reinstatement, back pay, front pay (for failure to hire because of discrimination), compensatory damages, punitive damages, restoration of lost seniority, injunctive relief, or other relief as the agency or court deems appropriate.

Employment discrimination claims must be based on the theory of disparate treatment or disparate impact. Disparate treatment is discrimination on the face of the employer's policy itself—that is, a policy that does not allow women to be hired for construction work or men to be hired as receptionists. While disparate treatment discrimination is deemed intentional discrimination, the discriminatory intent need not be stated by the employer and instead can be gathered from the policy itself.

Disparate impact employment discrimination involves an employment policy that is facially neutral but that has a greater negative impact on one group than on another. It is statistically based. Disparate impact is generally defined as one group not performing at least 80% as well as another group under an employer's policy. For instance, a policy of hiring only those who are at least 5 feet 4 inches in height and weigh 140 pounds or more has been found by courts to have the impact of screening out a disproportionate number of women, who tend to be shorter and slighter, as well as men from ethnic groups whose members tend to be, on average, shorter and slighter, such as Asians or Hispanics, than are most American men. If the policy is found to have a disparate impact on a group protected by law, the employer must show that the policy has a business necessity. Even if business necessity is shown, the employee or applicant has the right to prove that what the employer sets forth as business necessity is actually a mere pretext for discrimination. For example, the employer has a policy requiring all employees to be able to lift 50 pounds. This may have a disparate impact on women since many more women than men may not be able to lift 50 pounds. The employer shows that the employees will be required to lift heavy packages as part of the job. The employee then proves that most packages weigh only 25 pounds or so and males who cannot lift 50 pounds have been hired. If this is so, the employer is liable for gender discrimination.

After passage of the Civil Rights Act of 1964, subsequent legislation was passed barring employment discrimination on the basis of age, disability, medical leave for care of family members, or pregnancy and against Vietnam veterans. Before the Civil Rights Act, there was the Equal Pay Act of 1963 and the Post–Civil War Statutes. Although they were not passed specifically for employment protection as the later statutes were, the Post–Civil War Statutes were used to a limited extent for that purpose.

There are several statutes governing employment discrimination. Below is a brief description of the main statutes and their coverage.

The *Civil Rights Act of 1866* was passed to allow blacks, who had no right to contract under slavery, to have the same right to enter into and enforce contracts as whites. Before the Civil Rights Act of 1964, it was used to challenge racial discrimination, using the employer's refusal to enter into a contract with the black applicant as a basis for suit. It was of limited use for discrimination on the job, however, since it did not cover performance of contracts, only the entering into and enforcing of them. In the 1991 amendments to the Civil Rights Act of 1964, Congress amended this 1866 law to include also contract performance so that job discrimination could be covered by this law. However, since Title VII provides a comprehensive administrative structure for employment discrimination claims, it is preferred and the one most often used.

Executive Order 11246, first issued as Executive Order 8802 in 1941 by President Franklin D. Roosevelt and the final version by President Lyndon B. Johnson in 1965, is the law from which affirmative action arises. Affirmative action is conscious inclusion of those who have been shown to be excluded from employment. The executive order requires that anyone who wishes to contract to provide the federal government with goods and/or services of $10,000 or more must agree not to discriminate in employment on much the same basis as required by Title VII of the Civil Rights Act. If the contract is for $50,000 or more, the employer must also agree to conduct a workplace assessment showing the female and minority representation in the employer's workplace. The expectation is that their presence in the workplace should be roughly proportional to their availability in the area from which the employees are drawn. If there is a pronounced underrepresentation and the employer wants to contract with the federal government, the employer must agree to work to remedy the underrepresentation. This is generally called an affirmative action plan.

Quotas, or absolute numbers of employees mandated to be hired or promoted, are prohibited under the executive order but remain a persistent source of resentment for those who think quotas are actually required by the law. Many also have the misconception that employees hired under an affirmative action plan need not be qualified for the job. There is no such requirement under the executive order, nor can jobs be taken from qualified whites or men and given to unqualified blacks, women, or other minorities. Affirmative action is based on present-day underrepresentation and is not intended to make up for slavery, as many mistakenly believe. There is no set form that an affirmative action plan must take; however, the approach of the Office of Federal Contract Compliance Programs, which oversees the law, is that careful and thoughtful attention to seeking out and providing equal opportunity for underrepresented minorities and women will result in a workforce more reflective of the racial and gender makeup of the area from which the employees are drawn.

The *Civil Rights Act of 1964* is the primary, and most comprehensive, of the statutes prohibiting employment discrimination. In one of the greatest social experiments in the history of the United States, the U.S. Congress passed the Civil Rights Act in 1964, which became effective in 1965. The law was introduced by President John F. Kennedy and signed into law by President Lyndon B. Johnson. The law prohibits discrimination on the basis of race, color, gender, religion, or national origin in employment, education, public accommodations, and the receipt of federal funds. The act is divided into titles, each of which addresses a different context for discrimination (education, employment, etc.). Title VII of the law addresses discrimination in employment.

Title VII prohibits discrimination in employment by employers with 15 or more employees, unions, and employment agencies, in hiring, firing, discipline, pay, raises, training, or any other term or condition of employment. The goal of the law is to have applicants judged based on qualifications rather than preconceived notions about a group they may belong to. Exceptions are made for religious employees of religious groups, in favor of Native Americans living on or near Native American reservations, and Communists.

If an employee or a job applicant feels that he or she has been discriminated against, he or she may file a claim with the EEOC, the agency created by the act to enforce the civil rights laws and that now handles virtually all claims of workplace discrimination. Since Title VII is a remedial statute, the EEOC prefers to pursue mediation and conciliation rather than the more adversarial litigation. If employment discrimination is found, the employer can be liable to the employee for back pay that the employee should have received had he or she not been terminated in violation of the law, to the applicant for front pay that the applicant would have received he or she not been illegally rejected for the job, medical expenses, compensatory damages, and, except for governmental employers, punitive damages for willful discrimination.

The employer has defenses available under the law. The employer can show that the discrimination was necessary because the basis for the discrimination was a bona fide occupational qualification (BFOQ) reasonably necessary for the employer's particular business. This is generally used when the employer has a policy that excludes certain types of applicants from a job. For instance, there is usually an age cutoff for commercial bus drivers. Transportation companies have been able to show that their particular business is safely transporting passengers from one point to another and that they need an age cutoff because it takes about 15 years to become a really good driver and the physical attributes that a driver needs to accomplish this begin to deteriorate after age 50. Therefore, being age 35 or less is a bona fide occupational qualification that is reasonably necessary for their particular business of safely transporting passengers from one destination to another.

The employer may also use the defense of business necessity discussed above. It is not a defense to a discrimination claim for an employer to allege that he or she did not intend to discriminate. The law looks at the outcome of the employer's actions rather than the mental state behind the action. The law provides a separate cause of action for retaliation for employees filing claims under the law to enforce their rights. Below, each of Title VII's categories is addressed.

Race Discrimination

Race discrimination against blacks was actually the main impetus for passing the Civil Rights Act, though the law applies to everyone. Before passage of the law, there had been a formal and informal system of racial segregation against blacks known as “Jim Crow,” which had been in place since shortly after the Civil War ended. Racial segregation was complete and total. For instance, employment classified advertisements were divided by race and gender. The Civil Rights Act outlawed this practice.

Race discrimination has greatly diminished since the passage of the act but remains the reason for the majority of claims received by the EEOC. Many of the claims are for systemic, widespread discrimination rather than individual discrimination. That is, employers have allowed blacks to be paid less, not advance at the same rate, and generally be treated more poorly than other similarly situated, nonblack (usually white) employees. Racial harassment is also a type of race discrimination, where an employee is harassed on the basis of his or her race. Discrimination on the basis of color (rather than race) has seen fewer claims, and they are generally filed by blacks who allege that others of their race receive better treatment because their color is different from other similarly situated employees.

Gender Discrimination

This includes discrimination on the basis of pregnancy, and sexual harassment. Unless gender is a BFOQ, it cannot be used as the basis for employment decisions. Because of the country’s history of excluding women from employment, most gender discrimination claims are filed by women, but men are also protected. Denying a job because an employer thinks that it is inappropriate for a man to be a secretary or for a woman to be a construction worker violates the law. The Equal Pay Act of 1963 prohibits wage discrimination on the basis of gender for jobs that are of equal skill, effort, or responsibility performed under similar working conditions. The law permits differences in pay based on quantity or quality of production, seniority, a merit system, or any factor other than gender.

Sexual Harassment

It is illegal for an employer or other employees to make unwanted advances, requests for sex, or exchanges of workplace benefits for sex. There are two theories of sexual harassment: quid pro quo and hostile environment. Quid pro quo sexual harassment involves requesting sex in exchange for workplace benefits. For example, a manager refuses to give an employee a deserved promotion unless the employee has sex with him or her. Hostile environment sexual harassment involves engaging in sufficiently severe and/or pervasive unwanted acts that create a hostile or offensive working environment (using a reasonable employee standard) that unreasonably interferes with the employee’s ability to do his or her job—for instance, male employees in a workplace subjecting female employees to unwanted sexual jokes, teasing, groping, pornography, and so on. Claims may be filed by either males or females, and while Title VII does not explicitly include discrimination on the basis of affinity (sexual) orientation, the harasser and harassee may be of the same gender.

Pregnancy Discrimination (Pregnancy Discrimination Act of 1978)

It is illegal to discriminate in employment on the basis of pregnancy, childbirth, or pregnancy-related illness. For instance, an employer cannot refuse to hire a pregnant applicant simply because she is pregnant. In the workplace, pregnancy must be treated just as any other short-term disability. For instance, if an employer provided short-term disability leave for an employee with a heart attack or a hernia operation, a pregnant employee would also be able to take leave for the absence due to pregnancy.

Religious Discrimination

Employers cannot discriminate against employees or applicants on the basis of religious beliefs or conflicts. Religious obligations must be accommodated by the employer unless doing so creates an undue hardship on the employer, as determined by the court. For instance, if an employee cannot work on Saturdays because of his or her religious beliefs, the employer can attempt to find another employee to exchange days so that there is no conflict. If an accommodation cannot be found or would cause the employer undue hardship, the employer has met the legal requirements of the statute. An employer may not refuse to accommodate an employee’s sincerely held beliefs that take the place of religion in the employee’s life simply because the employer may be unfamiliar with the belief.

National Origin Discrimination

This category includes discrimination against employees from other countries, those whose ancestry is from another country, or those with accents. An employee's ethnicity may not serve as the basis for employment discrimination.

Other Kinds of Discrimination

The Age Discrimination in Employment Act of 1967 prohibits employers from discriminating against employees or applicants on the basis of age if the employee or applicant is 40 years of age or older. If the discrimination is intentional or willful, the employer must pay treble damages. Employees under the age of 40 are not protected by federal law. Except for certain groups such as educators or top-level management of businesses, there is no mandatory retirement age. Employers cannot terminate older employees as part of a plan to make their workplace look younger to appeal to a younger clientele; get rid of older, more highly paid employees so they can hire younger employees at lower salaries; or otherwise allow age to be the determining factor for workplace decisions.

The Vietnam-Era Veterans Readjustment Assistance Act of 1974 protects Vietnam-era veterans, especially veterans with disabilities, from discrimination. Due to the hostile way in which Vietnam veterans were treated on coming home from the largely unpopular war, Congress passed this law to give the veterans some measure of protection from employment discrimination. It applies to federal government contractors with contracts of $25,000 or more. They must agree not to discriminate against Vietnam veterans, take affirmative moves to hire them, and make accommodations for any such employees with disabilities.

The American With Disabilities Act of 1990 prohibits discrimination in employment against an employee or an applicant with a disability if that employee or applicant is otherwise qualified for the job, does not present a risk to person or property, and can be accommodated without undue hardship to the employer. A person with disabilities has a mental or physical impairment that substantially limits one or more major life functions (defined as breathing, walking, etc.), has a record of having a disability, or is perceived as having such a disability.

Certain conditions have been deemed by the courts as not constituting a disability because they do not affect a major life function. These include visual problems that can be corrected by wearing eyeglasses, high blood pressure corrected by medication, fear of heights, and so on. Active drug users do not have to be accommodated.

If accommodation of an employee with disabilities would present an undue hardship to the employer, then the employer does not have to hire that employee. Undue hardship is not defined in the law and is specific to each case and each employer. The courts, however, have made the threshold fairly low, and the accommodation need not be shown to cause the employer to suffer a great financial loss in order to meet the requirement of undue hardship. The court is the final arbiter of undue hardship.

The Family and Medical Leave Act of 1993 permits employees to take up to 12 weeks of unpaid leave from work because they are ill or to care for a newborn or newly adopted child or a sick parent. Male employees have brought suit under it when employers have not granted them leave to take time off for situations traditionally handled by females—for example, a new father who wishes to stay at home with the new baby.

EMPOWERMENT

Empowerment is a term that is applied to individuals and groups in society and in organizations. Literally, it means the taking of power by individuals or groups; alternatively, it means power being granted to individuals or groups by an authority. Thus, empowerment is the organizational or social practice by someone in a position of power giving some of that power or authority to others. Typically, those receiving power would be a group in a subordinate or disadvantaged position. As an example, a manager might empower employees to take charge of their own quality control process in a production line rather than having a quality control check at the end of the line.

Sometimes, empowerment is viewed as a psychological state of mind for individuals or groups, which allows them to feel a degree of control over their own goals and accomplishments. Empowerment enables people to feel motivated to accomplish goals while feeling a sense of self-determination, self-efficacy, and capability to bring about impacts or changes. In business and other organizational settings, empowerment most frequently means giving employees decision-making authority over various aspects of their working situation. In the organizational context, empowerment simply means that power is shared by leaders and managers with employees, which frequently means employees taking responsibility for setting up and managing their own work rather than constantly working under supervision.

Empowerment is also used in society. For example, *empowerment* has been applied to educators, who empower students to take responsibility for their own learning; to women, empowering or liberating themselves from oppression by various authorities or from men; and to disadvantaged or minority groups in society, which empower themselves in relationship to majority groups. The term has also been applied to organizational teams in the context of their taking responsibility for achieving their own performance goals. Empowerment tends to be applied in situations where a group in some way is, or feels, oppressed by another group that is in authority and has more control over the circumstances faced by the less dominant—less powerful—group. The notion of empowerment in this sense suggests that by becoming more empowered, the oppressed group will take charge of its own fate because it has more self-confidence or self-efficacy and will be motivated to institute changes in its circumstances that will lessen inequities in the system; that is, the group will assume, or be granted, more power. In organizational contexts where various sorts of empowerment programs are implemented, however, it is frequently assumed that it is the managers who "empower" their subordinates by giving them more authority, decision-making capacity, or control typically over their work rather than the employees empowering themselves by overtly seeking those changes.

The Process of Empowerment

The process of empowering an individual or group involves several steps. The person in authority must make a decision to give up some current level of power and communicate that decision to those who are currently not empowered. The individuals who are to be empowered need to be given training and education about their new tasks, responsibilities, or authorities. Then, any necessary organizational and reporting shifts must take place, including appropriate changes of the reward structure. Over time, the situation should be monitored and evaluated so that feedback about how well the process is working can be given to all the involved parties.

In societal contexts, as in organizational settings, empowerment suggests that groups that have been oppressed by some sort of authority, whether management or other groups in society, will be freed or will free themselves, through the empowerment process, from that oppression. Viewed through individual, organizational, and societal lenses, empowerment can be said to have two important facets. One facet highlights the process aspects of empowerment—that is, the delegation of power by an authority to others, a process of empowering others to take charge of themselves and/or their work in some new way. The other facet is an end state of being empowered, which is more related to the psychological state of someone who has either been given control over key issues that are important to him or her or has assumed that control. Thus, a dominant thread in definitions of empowerment is that it is a psychological term applied to individuals, encompassing attributes of meaningfulness, competence, self-determination, and impact.

Empowerment in Organizations

Empowerment in the organizational sense refers to employee-related practices within organizations that attempt to devolve some degree of power to employees.

Numerous ways of empowering employees have been developed, including the use of suggestion boxes that permit employees to give input into how the organization should operate and related mechanisms for giving voice to employee concerns. Other organizational approaches to empowerment include total quality management, employee participation, and quality of working life programs. Such programs frequently attempt to give employees some degree of control, mainly over their own working conditions and processes, and thereby foster feelings that their work is meaningful and that they have self-determination over their work or that they have self-efficacy or the capability of performing specified tasks. Underlying the application of empowerment programs in organizations is the belief that the empowerment of people who previously had little or no power even over their own work will better motivate them to perform their jobs and thereby improve results for the organization.

Empowerment in Society

Broader uses of the term *empowerment* also exist. The term *empowerment* has been applied in educational settings to the development of self-efficacy, competency, and confidence in students and politically to disadvantaged groups, which are urged to take responsibility for themselves in society. A good deal of feminist literature has focused on the empowerment of women, suggesting that women have been historically oppressed by men and need to develop their own internal sense of power.

Empowering others is considered to be a highly ethical thing to do in most circumstances, provided it is done with the proper motivations, training, and reward structures in place. Not all responses to empowerment are positive, as some critics believe that the so-called empowerment programs do not provide much real decision-making capacity to those who are being empowered; that is, only the appearance of empowerment exists. Some empowerment programs fail when managers do not really give up their own power, in part because they cannot envision a new role for themselves. At other times, empowerment programs are added to existing systems in organizations without really changing the important systems that support the empowerment process, such as training managers and employees about their respective new roles or changing the reward system to reflect the empowerment process.

Engels, Friedrich (1820–1895)

Friedrich Engels is perhaps best known for his collaboration with Karl Marx on *The Communist Manifesto.* Their collaboration also involved the publication of *The German Ideology* of 1846 and other less well-known works, such as *The Holy Family* of 1845 and *Wage Labour and Capital* of 1849. The relationship between the two men was a complex one. It appears from their correspondence that they worked independently, primarily sharing political views. Many commentators, such as Leszek Kolakowski, suggest that Engels was more adept at relating theory to practice than was Marx. Others suggest that it is fiction that Marx and Engels worked in a perfect intellectual relationship and even suggest that Engels's work was more influential than was traditionally thought in shaping Marxism.

Friedrich Engels was born on November 28, 1820, in Barmen, in the industrial region of the Rhineland, now Germany. His politically and religiously conservative father was a well-to-do manufacturer. Engels's early education was received in local schools operated by the Protestant Pietists. In 1838, before he had completed his formal education, his father sent him to work as a clerk in Bremen, where he discovered that he had a great love for learning, a great dislike for political tyranny, and a capacity to enjoy life. In this period of social and political upheaval, he read extensively in philosophy, theology, history, and literature. He was drawn to revolutionary writers and thinkers of the period, such as the literary figures who called themselves "Young Germany." He was also attracted to the radical Young Hegelians, moving in 1841 to

Berlin to volunteer in the Brigade of Artillery. His joining this Brigade had two purposes. First, he fulfilled his military obligation, and second, he was able to participate in the vibrant intellectual life of the city. During this time, Engels wrote articles under the name of Frederick Oswald.

Engels met Karl Marx, an editor at the radical daily newspaper *Rheinische Zeitung*, in 1842 in Cologne. This first meeting, along with subsequent ones in Paris in 1844 and Brussels in 1845, began a remarkable 40-year partnership. Before meeting Marx, Engels had published *The Condition of the Working Class in England* of 1845, which described the social impact of the Industrial Revolution, making particular reference to the poor conditions of factory workers. This work was produced during the period in which Engels worked as a clerk for 21 months in his father's firm in Manchester.

In late November and early December 1847, Marx and Engels attended the Second Congress of the Communist League in London, where they were charged with writing the League's program. What they produced as the League's program was *The Manifesto of the Communist Party*. It appeared in February 1848 in London.

The Manifesto set out the principles of scientific socialism, rejecting other forms of socialism as inadequate. The term *scientific socialism* was coined by Engels to describe the sociopolitical-economic theory set forth by Karl Marx. The theory purports to be scientific because observation is required, as in the method of empirical science. Soon after the publication of *The Communist Manifesto*, the revolutions of 1848 broke out, resulting in the deportation of Marx and the subsequent escape of Engels to Switzerland. Later, Engels joined Marx in London. Breaking with the Communist League, they devoted themselves to theoretical work. In 1864, following a revival of the working class movement, the General Council of the International was formed. Engels became a member of this Council in 1870.

Engels was never merely Marx's interpreter or assistant, but he was always an independent collaborator. In their writing, they attacked capitalism, claiming that this economic system promoted injustice and undermined society. Capitalism and the system of private property exploit workers by failing to pay workers the full price of their labor, providing the worker with subsistence wages, and appropriating the surplus to the employer. Capitalism necessarily produces inequalities of wealth and power. An alienated laboring class is produced, which is inherently unjust. This injustice was based on their belief that workers were exploited since the "surplus value" produced by workers was appropriated by the owners of the means of production. Workers were therefore alienated from their product, their work, and, ultimately, themselves. In addition, the interests of the economic ruling class took precedence over the interests of the worker and even national interests. The abolition of the system of private property would allow property to serve a social function by belonging to every member of the community and serving the needs of each member rather than the interests of the few. Engels died of throat cancer on August 5, 1895.

Enron Corporation

Enron Corporation's December 2, 2001, Chapter 11 reorganization filing was the largest bankruptcy in history, until it was exceeded in 2002 by WorldCom. Enron, headquartered in Houston, Texas, had grown quickly into a superficially giant and well-regarded company. It rapidly collapsed following the sudden disclosure of massive financial misdealing, which revealed the company to be a shell rather than a real business. During 2001, Enron stock fell to about $0.30—an unprecedented collapse for a blue-chip stock.

The Enron scandal helped propel passage of the McCain-Feingold Bipartisan Campaign Reform Act of 2002 (March). While Enron was neither the biggest nor the most important source of political funds, it had been active in making political contributions and attempting to influence legislators. Part of the Enron scandal involved political connections to President George W. Bush (former governor of Texas) and Vice President Dick Cheney (formerly CEO of a Texas-headquartered company). In May 2005, a U.S. appeals court dismissed a related lawsuit against the vice president on the grounds that an administration must be free to seek confidential information (including Enron) concerning energy policy.

Enron, quickly followed by WorldCom, helped propel the Sarbanes-Oxley Act of 2002 (July), the most significant change in U.S. securities laws since the early 1930s. As shocking as the sudden bankruptcy of a blue-chip company was, the subsequent revelations were worse: The traditional U.S. corporate governance watchdogs—attorneys, auditors, and directors—had either aided and abetted the responsible executives or been grossly negligent in the supervision of those executives. The United States and several other countries were rocked by multiple revelations of corporate scandals that ultimately also included analysts; auditors; banks; brokerages; mutual, hedge, and currency trading funds; and the New York Stock Exchange.

Arrogance, Corruption, Greed, and Ruthlessness

Enron was not the first or the last or the largest of the corporate scandals in recent years. Nevertheless, Enron became, above all other companies, the emblem for management fraud, director negligence, and adviser misconduct. Enron is easily the most widely studied and best documented of the recent corporate frauds. Enron was a prolonged media event.

The high education levels and intelligence of Chairman Kenneth L. Lay (Ph.D. in economics), CEO Jeffrey K. Skilling (Harvard MBA and top 5% Baker Scholar), and CFO Andrew Fastow (Northwestern MBA) raised serious questions about business school treatment of ethics and law. In January 2005, the documentary movie *Enron: The Smartest Guys in the Room*, based on Bethany McLean and Peter Elkind's 2003 bestseller of the same name, premiered at the Sundance Film Festival in Utah. Spring 2005 releases took place in Austin and then Houston. The theme of the book and the movie is that smart guys can outsmart themselves as well as everyone else.

The most astonishing aspect of the Enron scandal was that a significant number of executives had engaged in improper actions despite the company having in place the key elements and best practices of a comprehensive ethics program. There was a detailed 64-page "Code of Ethics" with an introductory letter from Chairman Ken Lay and a "Statement of Human Rights Principles" together with a sign-off procedure on the code for each employee, an internal reporting and compliance system, visible posting of corporate values (banners in the headquarters building, signs in the parking garage, and so forth), and an employee-training video—*Vision and Values*—discussing ethics and integrity. Enron issued a 2000 annual report on corporate responsibility. The "Code of Ethics," like other Enron paraphernalia, was later auctioned on eBay. The Smithsonian Institution reportedly obtained a copy of the code for its permanent collection.

The publicized "values" of Enron were respect, integrity, communication, and excellence. The real "ethical" climate at Enron was a combination of arrogance (or hubris), corruption, greed, and ruthlessness. The gap between words and deeds at Enron was dramatic. This gap suggests that it is not particular corporate governance devices that matter most but the probity and integrity of individuals in relationship to the ethical climate within a company.

The executives were arrogant in attitude and conduct. The company strategy was one of revolutionizing trading by breaking traditional rules. The "vision" at Enron was to become the world's leading energy company—in reality, by any means necessary. There were rumors of sexual misconduct by executives. Expensive vehicles and power-oriented photogenic poses were commonplace.

The weight of evidence suggests that the lure of wealth had suborned the corporate governance watchdogs. It turned out that the directors must have been asleep at the switch or mesmerized by the rising stock price. It turned out that the external attorneys and auditors could not afford to lose such a successful client. Enron executives did not hesitate to bully the external safeguards, such as analysts, when and if necessary. A corruption machine was at work, whether intentionally or inadvertently.

In the 1987 film *Wall Street*, the character named Gordon Gekko announces that greed is good. Enron—whose logo became known as "the Crooked E"—epitomized that slogan. Greed is a morally disturbing paradox at the heart of the market economy. Bernard

Mandeville, in the *Fable of the Bees, or Private Vices, Publick Benefits* (1714), argued that individual vices and not individual virtues produce public benefits by encouraging commercial enterprise. An economic actor engages in selfish calculation of interest or advantage. This consequentialist perspective emphasizes outcomes over intentions or means. The Enron executives carried this perspective to its logical extreme. Adam Smith's telling criticism in *The Wealth of Nations* of the East India Company's personnel suggests that he would hardly be surprised.

The company culture embodied ruthlessness toward outsiders and insiders alike. Skilling emphasized a process of creative destruction within the company. The rank and yank system of employee evaluation by peer review, reportedly installed by CEO Skilling, annually dismissed the bottom 20% of the employees—and perhaps corruptly rather than objectively. It has been reported that traders were afraid to go to the bathroom because someone else might steal information from their trading screen. In such a culture, no one would report bad news. In such a culture, individual achievement was everything and teamwork was nothing. Enron culture emphasized bonuses, hardball, take no prisoners, and tacit disregard for ethics and laws.

The Rise of Enron

Ken Lay, then CEO of Houston Natural Gas, formed Enron in 1985 by merger with InterNorth. Lay had worked in federal energy positions and then in several energy companies. He was an advocate of free trade in energy markets and had experience in political influence peddling. Enron was originally involved in transmission and distribution of electricity and natural gas in the United States. It also built and operated power plants and gas pipelines, and similar industrial infrastructure facilities, globally. Allegedly, bribes and political pressure tainted contracts around the world—most notoriously a $30 billion contract with the Maharashtra State Electricity Board in India.

Jeff Skilling was a senior partner at McKinsey & Co. and in the later 1980s worked in that capacity with Enron. Skilling joined Enron in 1990 as chairman and CEO of Enron Capital & Trade Resources. In 1996, he became president and COO of Enron. The company morphed into an energy trading and communications company that grew to some 21,000 employees, and its stock price rose to about $85. Enron grew to the seventh largest publicly listed company in the United States. Strategy emphasized bold innovation in trading of power and broadband commodities and risk management derivatives—including highly exotic weather derivatives. Trading business involved mark-to-market accounting in which revenues were booked, and bonuses awarded, on the basis of effectively Enron-only estimates of the value of contracts. *Fortune* magazine named Enron "America's Most Innovative Company" for five consecutive years (1996–2000). Enron made *Fortune*'s "100 Best Companies to Work for in America" list in 2000. The company's wealth was reflected in an opulent office building in downtown Houston. Business school cases on Enron's business practices and culture were circulated for teaching purposes. Skilling served briefly as CEO of Enron from February to August 2001. Then, he abruptly resigned from Enron and Lay took over as CEO.

The Fall of Enron

Following the bankruptcy filing, there were multiple investigations, including one commissioned by the Enron board of directors and directed by William C. Powers Jr., dean of the University of Texas at Austin's law school. The U.S. Department of Justice announced (January 9, 2002) a criminal investigation of Enron, and various congressional hearings began (January 24, 2002). The hearings also revealed the role of Sherron Watkins, a certified public accountant, who had warned Lay about Fastow's offshore devices after Skilling suddenly resigned. Watkins's experience helped propel into law the whistle-blower protection elements of the Sarbanes-Oxley Act. The investigations emphasized two key matters, revealing how Enron had been built as an empty house of cards.

Enron was deeply involved in manipulating the California energy crisis. John Forney, a former energy trader, was indicted in December 2002 on 11 counts of conspiracy and wire fraud and pled guilty. Tape recordings revealed Enron traders on the phone asking California power plant managers to get a little creative in shutting down plants for repairs. Forney was a *Star Wars* fan. His "Death Star" strategy involved shuffling energy around the California power grid to generate state payments relieving congestion. Death Star deliberately created congestion. He named other devices JEDI (Joint Energy Development Investments) and Chewco (after the character of Chewbacca).

The other key revelation concerned CFO Andrew Fastow's creative use and alleged partial ownership of offshore special purpose entities (SPEs) or limited partnerships. These devices separated debt from revenues and kept mark-to-market losses off Enron's books temporarily. Fastow had been a *CFO Magazine* award for excellence winner. Fastow was indicted (November 1, 2002) on 78 counts, including fraud, money laundering, and conspiracy. He and his wife, Lea Fastow, former assistant treasurer of Enron, accepted a plea agreement (January 14, 2004) in exchange for testifying against other Enron defendants. Mr. Fastow received a 10-year prison sentence and a loss of $23.8 million; Mrs. Fastow received (for income tax evasion charges in concealing Mr. Fastow's gains) a 5-month prison sentence and 1 year of supervised release, including 5 months of house arrest. The Enron board had waived conflict of interest rules in its own Code of Conduct to permit Fastow to oversee some of these SPEs. Most important were the "Raptors" (after *Jurassic Park* creatures) or "LJM1" and "LJM2," named for Fastow's wife and two children. It was alleged that Fastow had engaged in unauthorized self-dealing and benefited directly from these supervised devices.

The Enron bankruptcy resulted in the criminal conviction for obstruction of justice and, thus, forced auditing license surrender of its auditor Arthur Andersen, which collapsed. The audit partner assigned to Enron, David Duncan, pled guilty to ordering large-scale destruction of work documents. Some 28,000 Arthur Andersen employees had to find other employment. On May 31, 2005, the U.S. Supreme Court unanimously overturned the firm's conviction on grounds that the trial judge's jury instructions were too vague and broad. Federal prosecutors decided in November 2005 not to retry the case. Duncan was allowed to withdraw his guilty plea, although other charges could be filed against him.

As of July 2005, there had been 16 guilty pleas and six convictions (one thrown out) in the Enron cases. Former Merrill Lynch bankers and Enron executives were convicted in the Nigerian barge trial. (One executive was found innocent.) Nonexistent barges (to be built) were flipped between Enron and Merrill Lynch to generate paper profits and bonuses. In July 2005, three former executives of Enron Broadband Services (EBS) were acquitted of some charges; the jury deadlocked on other charges against them and two other defendants. The charges had argued intentional overpromotion of EBS's value. The judge dismissed the remaining charges against all defendants. In November 2005, a special grand jury issued three streamlined indictments against the five codefendants. Skilling was indicted in February 2004 and Lay in July 2004, both on multiple counts. Both pled not guilty; their trials had not commenced as of November 2005. The prosecution wanted to try with Lay and Skilling the former chief accounting officer of Enron Rick Causey. He had pled not guilty to more than 30 charges of fraud. He was indicted in January 2004.

Employees and Shareowners

Enron's bankruptcy had serious effects for many individuals and organizations. The Houston Astros paid Enron $5 million to rename Enron Field as Astros Field, subsequently changed to Minute Maid Park. *Playboy* (August 2002) featured a pictorial "The Women of Enron." David Tonsall, former Enron employee, became rapper "N Run" (i.e., Enron and "never run") on a December 2003 CD *Corporate America.*

Shareowners lost virtually everything. Several employees lost their jobs and their life savings that they had invested in Enron stock. Like former Arthur Andersen employees, former Enron employees may have damaged résumés. The Enron bankruptcy reorganization was a lengthy affair under a new management and bankruptcy examiner. The state of California is attempting recovery of monies from various parties. Eventually, shareowners and employees may begin partial financial recoveries from various parties, including banks and insurance companies. As of November 2005, Citigroup had settled for $2 billion, J. P. Morgan Chase for $2.2 billion, and the Canadian Imperial Bank of Commerce for $2.4 billion. These figures represent the largest securities class-action settlement on record, and there are still a number of other prominent defendant banks remaining. The U.S. bankruptcy court finalized a settlement in May 2005 of about $3,500 on average for more than 20,000 current and former employees (about $69 million total). Civil lawsuits are still proceeding against Lay, Skilling, Enron, and others. The directors of Enron (and WorldCom) personally paid damages.

ENTITLEMENTS

Someone is *entitled* to something if a relevant institution has rules assigning that kind of thing to someone in the position of the person who is claimed to be entitled to that thing, given his or her position; the word *entitlement* can refer either to the thing to which he or she is entitled or to the fact of that person's being entitled to it. The notion of *entitlement*, then, is strongly rule governed. Often these are legal rules. It is disputed whether, but not obviously impossible that, one can be entitled by moral, as opposed to strictly legal, rules. In any case, clubs, businesses, and all sorts of other organizations and informal arrangements among people have rules that specify entitlements or what amount to entitlements.

The idea is perhaps best explained by comparing it especially with the idea of *desert*, and both need to be considered in relation to the more general topic of distributive justice. Plato long ago considered the question of whether justice is "giving every man his due" (and rejected it). *Due* is not far removed from *deserve*, certainly, and sometimes it is not far removed from *entitlement* either. But the idea of entitlement does have a fairly distinctive meaning, where it is not the same as either of these other ideas.

Both desert and entitlement are primarily concerned with relations among individuals. Jones may deserve something of Smith but of no one else in the world; Robinson may be entitled to something from Larson that no one else is. More interestingly, Robinson may be entitled to it even though he doesn't deserve it—and vice versa. In a classic kind of case, Robinson might be the heir in his father's will, despite being a ne'er-do-well. Jones may have deserved the prize but not be entitled to it. What's the difference?

Both entitlement and desert are usually normative or evaluative ideas, but they work in divergent ways. When someone *deserves* something, we think especially of there being some kind of valuable quality in that individual, such that the appropriate response on the part of someone or other, or perhaps everyone, is to give the person that thing. Judges at a dance competition, say, are there to see which of the competitors danced the best. Points might be awarded for gracefulness, speed, and overall artistic merit, for example, the idea being to track these virtues well enough to determine who should get the prize, or prizes. If Competitor A is superior to Competitor B in these respects, then A is more deserving than B. Characteristically, though not necessarily always, we deserve something by virtue of something we have done. (We could be claimed to be deserving on the basis of possession of some natural trait too—e.g., intelligence or beauty.)

Entitlement works very differently. The background to entitlement is, broadly speaking, institutional, and the institutions in question are framed by rules, specifying which persons in which positions are to have this or that. Go back to our dance competition, and suppose that the judges conclude that Couple X should get the prize. Now suppose that much of the audience on hand thinks otherwise. Well, the rules of the competition specify that the judges decide who gets it—not the audience. Perhaps we would side with the audience if we had seen the show, but there it is—the judges have decided, and the couple they specify is *entitled* to the prize. Or suppose there is an election, and Ms. Graf is found to have more votes than Mr. Hawley. Then she is *entitled* to the office. She may not deserve it, in the view of many, and perhaps those people are right. Still, there was the electoral result, and given that it is such, that settles the question of who occupies the office: Ms. Graf does.

Entitlement, in that sense, is a more formal notion than desert. We can, generally speaking, dispute claims of desert: This candidate, we may think, really had more merit than the other; and it may be very difficult or perhaps impossible to decide. But if the rules are clear, then who is *entitled* to some position, some item, or some distinction can be settled, whatever we may think about the comparative *deserts* of different people.

Relation to Justice

It is instructive to compare both notions with the broader idea of *justice.* It is possible to hold—and it is often held—that the just thing to do is what is "for the best." And it is often enough held that we are all fundamentally equal, so various goods should be distributed in equal shares to all. If that is so, then justice works against desert, which characteristically varies greatly from one person to another. And the egalitarian is likely to have no use at all for entitlements, which tend to award goods to persons on the basis of considerations quite foreign to either equality or desert.

However, another view of justice is that the basic determinants of who is to have what should, after all, be entitlements. That we should have what we are entitled to is a recognizable and widely held but not self-evident view of justice. For example, it is often held that the individual who happened along first and undertook use of some item, say a bit of land, is entitled to it. Some other person, it might be thought, would make better use of it and perhaps, in a sense, deserves it more; but, alas, this other person came along too late. "First come, first served" may be held to be the rule framing the institution of property. This kind of view, advocated by many American writers as well as philosophers from centuries ago, has come especially to be identified with the thought of the late Robert Nozick.

An Example: Contracts

Another rule determining entitlements is that people are entitled to what they have contracted into, or otherwise seriously agreed to. Suppose that A and B make a bargain or a deal, A proposing to give x to B in return for B's giving y to A, and B agrees. If x and y are clearly the ex ante possessions of the two, and if the agreement is made without fraud, duress, or misrepresentation, then when A has turned over x, it is plausibly held that A is now entitled to y from B. The terms of the agreement, we will suppose, are clear, and the conditions fulfilled. Then that, it may be held, settles the matter of whether A is entitled to the item. And if A is indeed entitled, then it would be very difficult to deny that A is the one who ought to get it.

These are striking differences from other possible theories. First-comers need not address the question whether they deserve to be where they are; bargainers need not consider whether the other party merits participation in the bargain. Neither need consider whether he or she ends up better or worse off than innumerable outsiders. In any case, they proceed in the secure knowledge that others will respect their right to the results, whatever they may be.

The question arises, Why should we employ entitlements as we do? Why are there entitlements, or, more guardedly, why might we think that we ought to be using that kind of notion rather than some other? To discuss this matter, we need to shift gears and look at the entire institution from a larger perspective—that of society as a whole.

Fundamental Questions

What is the "perspective of society as a whole"? It is difficult to deny the merits of the theoretical stance known as *methodological individualism*, which has it that anything normatively interesting about society stems, basically, from the properties of individuals, though of course in the realization that those individuals interact with others, with whatever that entails. And the most popular form of individualism for this purpose is the *social contract* idea: that the principles for society as a whole are those to which all individuals would be ready to commit, as being the best each can do in light of the presence and general characteristics of all the others. The big advantage of the social contract idea is that it works from the perspectives of individuals, which are by definition already normative for them—their "perspectives" being what they are interested in, along with how they see the world. But, of course, when we contemplate the idea of an agreement with the 6 billion others around us, we have a severe problem of abstraction and generalization. We also, of course, have a problem with the sort of terms that it is plausible to think of as eventuating from this exercise.

Getting the Two Concepts Together

There is, however, an argument for adopting an entitlement format, at this fundamental level, that is very strong. Entitlement has the advantage of being based on the status quo. People are what they are and where they are—how could they not be? It makes no sense to suppose that a person can be the person he or she is because he or she *deserved* to be, for prior to birth, there is no person there to do any deserving, while afterward, of course, the thing has been done. The entitlement perspective, in contrast, gives them the right to both—we don't have to do anything to earn our entitlement to life and liberty, say. They simply come with the package of being a person. A perspective of desert, on the other hand, makes things chancy. What do we deserve? Who decides this? It is easy to conjure up chilling images of Central Committees making decisions about this, decisions that will drastically affect us in unforeseeable ways. They might decide that persons of a certain race, say, do not "deserve" to live. And while they could also create legal rules or institutions in the context of which those people are not even entitled to life, defending such a decision on the basis that humans are not fundamentally entitled to exist is nearly unintelligible.

Furthermore, it is important to see that a perspective of desert can be derived from that of entitlement. If we start with entitlements to various things, and to ourselves, then we can get into relations with others in which person A, who has something to award or distribute or confer, proposes to do these things on the basis of certain kinds of performances or features that others have that are of interest to A; A then advertises, say, that some of the items in question can be got by the appropriate performances, which will then be said to constitute the desert basis for such distributions. In this way, desert can be handled as mutually beneficial arrangements between two or various parties, all of whom accept the general criteria of performance and proceed accordingly.

This account makes entitlement the prior notion, sidestepping the enormous problem that would be posed by making people's fundamental rights a matter of desert. Yet it also anchors desert in the knowable and conveyable interests of particular persons, enabling those hoping to qualify to know what sort of things they must do or be in order to do so. This enables the two notions to get along well together instead of being seriously at odds, as it can easily seem if we try to proceed the other way around, making desert the prior notion.

Why Should Society Adopt Entitlements?

Making entitlement prior to desert, however, does not mean that it is prior to any sort of general evaluation. That we will have entitlement-like notions is itself justifiable by reference to general human interests, as well as general properties of persons familiar to all.

Entitlements can be a function of specific sets of rules laid down by various institutions. The rules of an institution specify, to a greater or lesser extent, who gets what: positions with powers and responsibilities, procedures for getting persons into those positions, and so on. Is that acceptable? A plausible answer is that it is, if those party to the institution have good reason, from their own points of view, to accept it as such. And a suitable criterion for supposing this to be true is that they do in fact accept it, so long as their acceptance is uncoerced. Many institutions meet that criterion handily—dealing with supermarkets or clubs, for example. On the other hand, institutions such as an area's government do not, on the face of it. For we come under the jurisdiction of governments whether we want to or not.

The social contract perspective has the effect of making the general procedure for assessing society's fundamental institutions the same, in principle, as the procedure for assessing some particular institution's rules. The difference is that many particular institutions have identifiable memberships, and those members are so voluntarily. When they are, the rules from the point of view of insiders can be very different, even unrecognizable, as compared with how they might be viewed by outsiders. But the general social contract view makes this unsurprising. So long as the institution takes care not to visit untoward effects on outsiders, the general social contract finding as outlined above says that this is entirely acceptable.

If we return to the example of wills, this discussion should be helpful. Outsiders may think that Offspring B is much more deserving than Offspring A. But those same outsiders can see that the maker of the will should have the power to decide who will get his or her estate, even if they suppose he or she might misuse that power in relation to the desert criteria they are likely to employ.

Philosophical advocates of an entitlement approach to distributive justice argue in the same way—that the fundamental features of the human social situation are such that rights based on the historical realities of time and place are called for rather than schemes based on visions of good societies that may not look so good from the point of view of many of the people seriously affected by those schemes.

Contemporary Issues About Entitlements

Burdens of Entitlement

In contemporary times, many government programs in numerous countries have created legal entitlements to various benefits, such as medicines, pension incomes, educational facilities, and many more. When commentators speak of "entitlements" in current sources, they most often are speaking of these. In addition, businesses may do this. The pension and other entitlements promised by very large corporations to their employees in decades past now create very large demands on the budgets of those corporations as their employees live much longer, retire earlier, or both. Meeting those demands can be difficult, even ruinous; and the problem with specifying that they are *entitlements* is that this makes it extremely difficult to evade or even to revise them, they having been created, perhaps, long in the past. The same may be true, according to many critics, of many government programs as well. The relation of this type of entitlement to the more general account given in the preceding paragraphs is clear: The institution's rules assign these things to people in various positions, notably employees, and those rules have the force of requirements, imposed or imposable by legal means. Correspondingly, there is room to question whether various such programs are wise or even morally acceptable.

Corporate Entitlements

One context in which the force of entitlements has become an issue is that of compensation packages for high-ranking officers of corporations, notably CEOs. In the United States, especially, the earnings of such officers have reached remarkable heights, and often their salaries have been nearly inverse to the success of their corporate efforts as measured by profits and sales. The packages have been, in general, negotiated with the relevant members of boards of directors, and so the executives in question become entitled to these very large payments, which the corporation in consequence is obliged to pay, despite tottering sales and declining or negative profits. This has caused criticism of the idea of entitlement among social critics. But of course, it can also simply be criticism of the boards of directors, or their construction, that has enabled such ruinous pay packages to be assembled.

Affirmative Action

Programs aimed at rectifying claimed discrimination in the past have been frequent in the past several decades. Characteristically, members of selected minorities that are perceived to have suffered from discriminatory treatment in the past are specified as being entitled to a position farther up in some queue or a higher wage, and so on, than those who are considered on the basis of the normal criteria for the situation in question. The benefits specified for such persons are known as entitlements, since legislation, or in some cases corporate procedures, specify them as recipients at the hands of the appropriate administrators. Such programs have been the occasion of considerable conflict, as persons who are normally regarded as more deserving of some level of wages or other benefit are, as they see it, pushed aside in favor of others who are less qualified. This is an example where an alien social philosophy leads to the utilization of a concept that is usually criticized by theorists of the same persuasion, who would normally object to the employment of entitlement notions. This illustrates the fact that entitlement notions are not uniquely aligned with one moral or political philosophy rather than any other.

Entitlement and Normativity

Both entitlement and desert are usually taken to be normative or evaluative ideas. But the word *usually* here has to be taken seriously. The mark of a normative notion is that when someone applies the expression, we infer that the user is for or against some action, or regards the action as something that *ought* to be done by someone. However, the use of *entitlement* is variable in this respect. Someone might say, "Well, he's entitled to it, but he oughtn't to get it!" In that case, the speaker is dissenting from the structure of institutional rules that underpins the claim of entitlement in question. It is common for an opponent of a program generating entitlements to speak of them as such but in the same breath to deny that the people who get them should really be getting them. The speaker might take either of two options, however. He might agree that given that the program is actually in place, the people thus legally entitled to those benefits should get them, at least for now, say until the program is dismantled by an act of Congress or the board of directors. Alternatively, the speaker might insist that even those getting them now should not get them and perhaps that those getting them in the past really ought to return the money, or part of it, or otherwise be required to do something to compensate the taxpayers for the expense to which they have been put.

It would, however, make little sense for the actual architect, legislator, or business executive who helps actuate such a program to deny that it *should* be carried out. In that sense, entitlement is always a normative notion, and has been so treated in this entry. Deleting the normative forces of entitlements among those who agreed to or constructed the rules that lead to them would undermine any institution, whose employees, beneficiaries, and administrators would find it difficult or impossible to know where they stand. Entitlement, in short, is a powerful idea that we probably have no option but to live with.

Entrepreneurship, Ethics of

Writing on the ethics of entrepreneurship has generally taken the form of defenses of free market capitalism, with particular attention given to the libertarian ideals supported by this system of wealth creation and distribution. Consequentialist critiques have pointed to the distributive inequities that attend concentration of wealth in the hands of a few entrepreneurs. Stakeholder theory has been invoked as one means by which to legitimize the claims of those constituent groups that are negatively affected by entrepreneurial activity. Theorists have usefully outlined moral imagination as one mechanism that is both consistent with the entrepreneurial drive toward innovation and inclusive of a variety of stakeholder interests.

With respect to the "rightness" and "wrongness" of entrepreneurial praxis, the potential ethical pitfalls facing entrepreneurs have been usefully outlined. It has been argued that entrepreneurs have a "bent" toward the profit imperative; this bent predisposes entrepreneurs to privilege their own interests above the interests of other legitimate organizational constituents.

Entrepreneurship

Entrepreneurship research has been categorized into at least three literature streams: economic, characteristics of the entrepreneur, and new venture performance. The first of these explores the role of the entrepreneur as the creator of new enterprise, the second attempts to describe entrepreneurs according to psychological attributes, and the last focuses on how the performance of the venture itself is influenced by the entrepreneur.

Definitions matter. Venkataraman identifies an entrepreneur as one who realizes or conjectures, whether through insight or luck, that some resources are underutilized in their current occupation and recombines them into a potentially more useful and fruitful combination. This focus on economic values is a consistent theme throughout much of the literature on entrepreneurship.

Numerous writers suggest that entrepreneurship is the exercise of individual freedom with a view to creating value, whether economic or social (or, less commonly, both). This focus on personal liberty offers one perspective as to what an ethical justification for entrepreneurial activity might begin to look like. Milton Friedman is chief among the writers who argue that an individual's right to personal freedom provides the strongest possible moral defense for free market activity. Such personal freedoms extend to both the consumer (as to consumer choice) and the producer (as to autonomy and independence). No activity better epitomizes the free market than entrepreneurship.

Entrepreneurship has also been defined as the process of converting a private idea into a social idea—or as intelligence in the service of greed. Kirzner bridges the gap between these two perspectives by conceiving of entrepreneurship as the seeing of a profit opportunity—often misinterpreted as merely an opportunity for personal gain—and the taking of necessary actions to realize that opportunity.

Drucker consistently argues that the defining characteristic of entrepreneurial activity is innovation, seeing innovation as the means by which entrepreneurs exploit change as an opportunity for a different business or a different service. One important implication of this perspective is that entrepreneurship can be both learned and practiced. Given this formulation, entrepreneurs search in a deliberate manner for sources of innovation, paying particular attention to societal changes that signal opportunities for successful innovation. Venkataraman similarly identifies organizational creativity as the raw material of both innovation and entrepreneurship, seeing the latter as the essential ingredient for corporate survival in a world of increasing competition and rapid, discontinuous change.

Perhaps what is common in virtually all the extant literature on entrepreneurship is the paucity of reference to the ethical dimensions of entrepreneurial activity. For the purposes of the current overview, it is not important which definition of entrepreneurship one prefers; of greater importance are the ethical dimensions of entrepreneurial activity and the variety of approaches taken to either bolster or criticize such activity.

Entrepreneurship: The Ethical Landscape

A good place to begin an exploration of the link(s) between entrepreneurship and ethics is the literature review. Hannafey offers one of the few such reviews available. This review notes that most writing in the area adopts either the perspective of society or that of the individual entrepreneur, appropriately labeling the first of these "entrepreneurship and society" and the second "ethics and the entrepreneur." The former deals with broad questions related to the complex moral situations encountered by entrepreneurs and their organizations, typically examining the effects of entrepreneurship on social life by exploring the moral expectations society places on entrepreneurs. The latter focuses more directly on the moral situations encountered by entrepreneurs and the organizations they have founded. Using this distinction, the findings of research on the topic of entrepreneurship and ethics are categorized and reviewed.

Researchers studying entrepreneurs and their ethical drivers and business have found that the motivating factors for entrepreneurs are not limited to profit but extend to a drive for independence, freedom, personal satisfaction, and personal fulfillment. Consistent with this view, it has been found that entrepreneurs' traits include self-confidence, a great need for achievement, and a propensity to take risks—and a commensurate strong internal locus of control.

The entrepreneurial process brings special challenges to the handling of ethical problems. The good news is that based on empirical work, some have concluded that independent-thinking entrepreneurs may exhibit slightly higher levels of moral reasoning skill than corporate middle-level managers or the general public. Conversely, it has been found that the ethical culture in start-ups is usually undeveloped. Studies have shown that the entrepreneur may feel more pressure to act unethically. Promotion and innovation activities figure prominently in the literature. A major business task for entrepreneurs is to promote their new venture to different publics—especially to key resource controllers.

Some have focused attention on the requirement many entrepreneurs face to manage the complex network of personal relationships essential to the success of new ventures. Family, friends, employees, previous business associates, investors, and others have been seen to form an important social network within which entrepreneurs carry out their work. It has been discovered that entrepreneurs encounter various relationship dilemmas, which may lead to complex ethical problems—a particular difficulty as roles and relationships change from their preventure to their postventure status. As one example, an entrepreneur's relationship with a family member or personal friend will be transformed if such persons become investors in the new venture. Entrepreneurs who relate to others in strictly transactional or instrumental ways—regardless of the consequences to creditors, investors, employees, and others—will likely face serious conflicts with the basic principles of ethics that persons should never be treated as a means to an end but must be treated as ends in themselves. Furthermore, changes in an entrepreneur's relationships may well lead to potential or actual conflicts of interest.

The literature identifies the most noted problems facing entrepreneurs as those related to customers and competitors, with the second most noted being the way a company treats employees, including decisions regarding layoffs and workplace discrimination as well as fairness in promotions. By way of summary, the entrepreneurship literature suggests that while individual entrepreneurs may possess a more developed instinctual sense of the moral climate inside their organizations, the harsh demands of entrepreneurial environments may seriously complicate standard ethical perceptions and practices.

Entrepreneurship and the Good Society

Sarasvathy suggests that the task of entrepreneurship is to move us from the world we have to live in to the world we want to live in. As entrepreneurs craft a vision of the society we want to live in, it is argued that this should be a deliberative process rather than one that unfolds "willy-nilly." The entrepreneurial mind-set, and associated entrepreneurial activity, whether for good or bad, impresses its stamp on the social organism.

Venkataraman notes that both Schumpeter and Adam Smith have drawn a profound connection between the personal profit motive and social wealth. Entrepreneurship is particularly productive from a social welfare perspective when, even in the process of pursuing selfish ends, entrepreneurs enhance social wealth by creating new markets, new industries, new technology, new institutional forms, new jobs, higher standards of living, and net increases in real productivity. By implication, within entrepreneurial research, a measure of performance is needed that is simultaneously able to capture the economic performance at the individual level as well as social performance.

Several writers—perhaps the most notable among them is Brenkert—have outlined the positive social outcomes associated with entrepreneurial activity. These typically include the creation of millions of new jobs and a plethora of new products, significant improvements in how people live, and greater efficiency in meeting people's needs and wants. In addition, the value of self-determination plays a significant role in discussions of entrepreneurship. Keeble and Turner identify eight areas in which ethical behavior, in the form of good corporate citizenship, can reap financial benefits for entrepreneurs: reputation management, risk management, recruitment and retention of quality staff, investor relations (in particular the ability to attract capital), organizational learning and innovation, competitiveness, operational efficiency, and the license to operate.

Working from the premise that a free society is a good society, the connections between values and entrepreneurial activity are clear. The free market position holds that the entity that creates, discovers, evaluates, and exploits an entrepreneurial opportunity should profit from it. More specifically, it has been found that the Protestant work ethic has been positively related to the rate of entrepreneurship in the United States over time. And more than a few writers, in critically examining the Protestant ethic and its relationship to entrepreneurship, conclude that enterprise by its very nature is ethical.

Another connection between social principles and entrepreneurship emerges, premised on the view that the good society is an efficient society. The market process can be characterized as one in which entrepreneurs discover various maladjustments in the market caused by imperfect information. Consistent with the writings of John Locke, Kirzner concludes that the profit or income associated with entrepreneurial activity exploiting such information asymmetry is justified on the basis of a "finders-keepers principle." In a particularly interesting permutation of this perspective, not just information inequities but also value inequities or anomalies represent entrepreneurial opportunities for individuals. By definition, whenever there is an asymmetry in beliefs about the value of a resource, there exists inefficiency—introducing a major incentive for alert individuals seeking to profit from such inefficiency.

A cautionary note is sounded by those who, rather than equating equality of opportunity with the good society, instead focus on the fairness of the outcomes of entrepreneurial activity. Derry in particular suggests that the environmental and social impacts that have followed the adoption of entrepreneurial values be carefully considered. Her suggestion is that the status conferred by entrepreneurial success contributes to severely entrenched poverty, increased consumption of disposable products leading to increased solid waste, and high rates of personal bankruptcy. The solution? Balancing economizing drives with ecologizing drives. Frederick similarly argues for such a harmonizing of these two value systems in ways that sustain human purposes within the constraints and opportunities of the still evolving system of nature and culture.

From an ethical perspective, it is particularly worth considering the claim that growing disparities of income and wealth will be matched by growing disparities of freedom. If this is the case, the libertarian justification for entrepreneurial activity is undermined by the distributive consequences of this very same activity.

Entrepreneurship and Stakeholder Theory

Stakeholder theory seeks to identify the variety of legitimate claims potentially disparate organizational claimants might have against the business enterprise. Stakeholder theory is alternatively viewed as a challenge to, or a derivative of, more traditional shareholder capitalism. The values underlying these two systems of thought are often contrasted, though some reconciliation of these points of view is sometimes offered—as when attempts are made at bridging the gap between altruism, which is the renunciation of personal well-being for the benefit of others, and entrepreneurship, which is the embodiment of individualism in the realm of economic activity.

Numerous writers on ethics have invoked stakeholder theory as a means of assessing entrepreneurship. Beyond the obvious references regarding the ethical duty of entrepreneurs to represent the interests of all stakeholders, most note that there is an element of trust in every transaction, further suggesting that trust is an efficient surrogate for more formal enforcement mechanisms, such as police and the courts. Links with transaction cost economics are invoked as it is argued that social contracts can be more efficiently discharged under conditions in which trust serves as a substitute for the more expensive mechanism of monitoring.

Entrepreneurship and Ethics: The Micro View

Here, the broader subject of seeking a social justification for entrepreneurship is supplanted by consideration of the ethics of entrepreneurial behavior itself. One primary view is that economic innovation is a moral response to others that arises out of the ethical obligation one person has for another. Crawford suggests that the notion of "being for others" be contrasted with "being for self"—the latter being the traditional perspective of entrepreneurs as utility-maximizing self-interest-seeking economic actors.

Brenkert outlines the specific dimensions of the ethics of entrepreneurship, offering the following questions to illuminate those areas of entrepreneurial activity that are most likely to present ethical challenges for entrepreneurs:

- Should entrepreneurs break various common social rules and practices?
- What are the moral limits of bluff and bravado in convincing others to join an entrepreneurial enterprise?

- What moral responsibilities does an entrepreneur have to others who have joined his or her entrepreneurial enterprise?
- What moral actions can corporations take to promote entrepreneurs within their ranks?
- What use may employees of a corporation make of corporate resources to explore their own entrepreneurial ideas?
- What justifies the profit of the entrepreneur and the greater disparity of income said to characterize an entrepreneurial society?
- What justification can be given for various measures—for instance, regarding bankruptcy laws, tax programs, and employment policies—that are said to foster entrepreneurship?

Moral imagination has been suggested as a bridge between ethics and entrepreneurship by Dunham and Werhane. Moral imagination refers to the ability to perceive that a web of competing economic relationships is, at the same time, a web of moral relationships. Philosophers have in some instances turned to moral imagination as a more relevant and workable approach to ethical decision making than traditional rule-driven ethical approaches. The premise here is that managers can foster higher levels of ethical performance—as well as greater innovation—by encouraging both the development and the exercise of moral imagination. Moral imagination enables entrepreneurs to distance themselves from the mental models that limit their perspective in specific situations—a concept not dissimilar to Schumpeter's notion of "creative destruction."

Moral imagination has much in common with the entrepreneur's more general habit of innovation. Creative problem-solving models are recommended as mechanisms for enhancing moral imagination. Such models amplify the cognitive abilities that are second nature to entrepreneurs, such as thinking metaphorically, maintaining flexibility and skill in making decisions, securing independence of judgment, coping well with novelty, and escaping perceptual sets and entrenchment in particular ways of thinking.

It is useful to join Moore in thinking of ethics as "constrained entrepreneurship." Constraints include the cognitive limits of entrepreneurs at the individual level, and at the macro level constraints result from the broader operational environment of entrepreneurship bounded by social norms and expectations. There are a number of ways in which entrepreneurs can differentiate themselves to economic advantage, including producing or marketing products and services that have an ethical augmentation and using inputs that are derived from sustainable sources. In an innovative twist, the rationale for the existence of entrepreneurial firms and corporations can be argued on the basis of economization of transaction costs—in this instance, *social* transaction costs. The idea of social transaction costs is intended to convey the notion that there are costs imposed by wider societal expectations and that these costs relate to the operation of an organization within these constraints.

Future Directions

The positive entrepreneurial opportunities that attend shifts in social consciousness have not been prominent in the discussion. As consumers are increasingly concerned with the human, social, and environmental impacts of their purchasing decisions, the possibilities for progressive entrepreneurial responses are virtually limitless. Calkins correctly notes that future entrepreneurs will likely be more socially concerned than those of the past—not necessarily as a result of their own value orientations but as a response to an evolution of thought regarding the social responsibility of business activity in general.

Environmental Assessment

Environmental assessment integrates consideration of the environment within decision making that historically valued only financial and technical feasibility and property rights. Because the world's supply of natural resources is diminishing while the human population and its needs for those natural resources is increasing, most developed countries have established laws requiring some examination of a desired action's impact on the environment. Attention to environmental consequences *before* a project is implemented allows the public, and governmental agencies charged with the responsibility of ensuring environmental protection, a voice in decision making about the use of finite natural capital. As such, environmental assessment becomes an important tool in achieving the goal of sustainable development.

Environmental assessment does not necessarily stop the depletion of natural resources, but it is an extremely important practice. Property rights and the privileges of ownership—even national boundaries—are no longer the sole determinants of whether or not a project is undertaken. Rather, with environmental assessment, the value of the natural world is acknowledged.

U.S. National Environmental Policy Act (NEPA)

Most developed countries and governing agencies—such as the United Nations, the European Union, and the World Bank—have modeled their environmental policies after the United States' National Environmental Policy Act (NEPA), enacted in 1969. NEPA requires that any action by a federal agency must be examined for its impact on the environment; in practice, many state and local government agencies also perform similar examinations. Originally, NEPA was administered by the Council on Environmental Quality, which reports directly to the president of the United States; over time, the Environmental Protection Agency (EPA) became the primary reviewer for environmental impact statements (EISs) prepared by other federal agencies. The EPA also maintains a national filing system for all EISs, now available on its Web site. NEPA law seeks to encourage "productive and enjoyable harmony" between humans and their environment. Indeed, NEPA is often referred to as the environment's Magna Carta, ensuring a more balanced relationship by integrating environmental considerations with economic and individual interests.

Under NEPA, if a proposed action is assessed as potentially having a significant impact on the environment, the proposed action must be considered with a range of alternatives, including a "no-action" alternative. In the United States, two different public documents are created: an "environmental assessment" (EA) and, if needed, an EIS. The EA is written to determine if there is a significant impact. At least two "reasonable alternatives" (including one alternative of no action) must be identified.

If there *is* such a significant impact, a more involved analysis with several alternatives to the proposed project is required; then, a second report—an EIS—is written. So NEPA provides an indirect protection of the environment by increasing publicly available information on the environmental consequences of potential actions. From information comes awareness and potential civic engagement on behalf of the natural world.

The environmental assessment considers the short-term and long-term, direct and indirect effects of the project on humans, water, air, the climate, the soil, minerals, the flora and fauna, and the visual landscape. An important aspect of NEPA's required environmental assessment is the involvement of the American public, in addition to expected consultation with experts and other agencies. This part of environmental assessment is called "scoping": the full disclosure to the public of a proposed action, along with a solicitation of many diverse comments and recommendations from that public. Certainly that public includes business interests, so the scoping process provides an important forum for the discussion of all personal and commercial interests. All comments within the scoping phase of the assessment must be written down and addressed in the final environmental report.

In the United States, EA documents have become the principal tool used for investigating impacts on the environment. In 2001, approximately 50,000 EAs were created, with only 500 EIS reports. The process of creating these provides important opportunities for members of the public and scientists and planners to provide input to the decision-making process. This input must be made early in the process, before the desired action can be taken. Such a practice ensures transparency in decisions affecting the public.

EA requires both a clear methodology and a final report that has standard components established by NEPA. The environmental factors typically considered in EA include air, water, fish, soils, noise, minerals and energy resources, vegetation, wildlife, and cultural resources (archaeological, historical, and architectural). The consequences of alternative solutions must be examined for their impact on each of these environmental factors. This examination of such a wide variety of factors requires an interdisciplinary approach, with teams of specialists (e.g., biologists, geologists, engineers, and archaeologists) performing study, analysis, and documentation.

The process of examination and assessment may seem tedious to business developers and property owners (a simple EA typically will take at least 3 months to develop, while most take about 12 months; EIS documents can take 2 or 3 years). However, the end result is generally more beneficial to the public and the environment. Many times, the impact on the environment can be "mitigated" so that, with some caution and care, many projects are eventually approved but with a minimal, or reduced, impact on the environment. Business interests often challenge environmental assessments for exaggerating environmental risk and requiring too many concessions to the environment; environmental advocacy groups challenge these business interests because the impact on the environment seems too high.

Strategic Environmental Assessment (SEA) Directive

The most current and far-reaching governmental effort comes from the European Commonwealth and its Strategic Environmental Assessment Directive (SEA Directive 2001/42/EC). The directive was adopted on June 5, 2001. While NEPA seeks "productive harmony" between humans and the natural world, the SEA now seeks *protection* of that natural world. Furthermore, if a development (such as a nuclear plant, a toxic landfill, or an oil refinery) is found to have significant environmental effects across national boundaries, the affected member state and its public are informed and included in the discussion.

This latest form of environmental assessment not only contributes to more transparent planning and decision making but also fosters processes that assist sustainable development. While NEPA is a public policy requiring *disclosure*—that is, identifying the environmental impacts of the proposed action and requiring evaluation of several alternatives—the SEA Directive actively promotes *protection* of natural resources. As with other European Commonwealth directives, individual member states must create their own national legislation and government agencies to implement the SEA Directive.

United Nations' Millennium Ecosystem Assessment

The Millennium Ecosystem Assessment is a research program authorized by the United Nations in 2001 to study ecosystem changes over several decades and to assess the impact of those changes on future sustainability. Conducted by 1,300 experts from 95 countries over a 4-year period, the project conducted a global inventory of the state of our ecosystems, quantified the effect that human activities are having on them, and offered suggestions in its first published report in 2005. It warned that the world is degrading its natural resources quickly, with a serious, negative impact for future generations. Approximately 60% of the ecosystem services that support life on earth—such as freshwater, capture fisheries; air and water regulation; and the regulation of regional climate, natural hazards, and pests—are being used unsustainably. The assessment demanded that changes be instituted firmly and quickly, since humanity still has the power and ability to prevent irreversible damages to the planet.

Environmental Colonialism

Environmental colonialism refers to the diverse ways in which colonial practices have affected the natural environments of indigenous peoples. Colonialism concerns the exploitation of native peoples through European expansion over the past 400 years. Although many peoples engaged in expansionist practices prior to this time, the magnitude of European expansion was unprecedented. Alfred Crosby has argued that European colonists were so successful partly because of the diverse ways in which they affected the native ecosystems. Colonizers introduced the pressures of foreign markets and political powers along with exotic invasive species and diseases. This two-pronged attack undermined the ability of indigenous peoples to ward off colonial invaders. The resulting damage to the native ecosystems made recovery more difficult. The colonial powers created a global infrastructure that encouraged the extraction of natural resources from poor peripheral countries by rich core countries while at the same time undermining sustainable native cultures. It is important to note that the damage caused by colonialism was not necessarily actively intended or executed with organized forethought. Indeed, R. Nixon has noted that some Western environmentalists who hoped to remediate the environmental damages caused by colonialism unwittingly further harmed native peoples and the long-term health of local ecosystems by reintroducing traditional colonial power networks in their habitat preservation efforts.

Environmental colonialism may also be referred to as ecocolonialism or ecological imperialism, although the term *imperialism* refers more explicitly to the practice, theory, and attitudes of colonizers, whereas colonialism refers to its effects. Environmental colonialism is one lens that may be applied to world-systems theory analyses of colonization. Under this lens, rather than focusing primarily on the impact of foreign military powers or economic changes, the analyst pays close attention to how the colonizing power has affected the natural environment; environmental impact is taken as a central rather than a peripheral concern.

Crosby notes that successful European colonies, or what he calls "the Neo-Europes," are located in temperate zones resembling the microclimates of Europe. This enabled colonists to raise European crops and livestock to the detriment of the diversity of native habitats. Today, these Neo-Europes are the largest exporters of grains and animal products that were utterly foreign to the colonized landscape only 500 years ago. The ecological impact of replacing indigenous species with European varieties cannot be underestimated. The famines of sub-Saharan Africa stem in part from agricultural practices introduced to the area by colonists. European agriculture requires repeated cultivation of cash crops for export to urban centers, in contrast to indigenous agricultural methods, whose emphasis on crop rotations had been traditionally successful in preventing desertification of the fragile African landscape.

Environmental colonialism continues in various guises. Companies make minor alterations to crop varieties developed by third-world farmers over centuries, and unlike the native farmers, companies have the necessary funds to patent these strains as their intellectual property. This is a contemporary manifestation of environmental colonialism. On the other hand, forced introduction of nonnative, genetically engineered organisms into third-world countries is yet another way in which colonial powers fundamentally alter the ecosystems of the colonized. This makes it even more difficult for native peoples to rediscover or to continue traditional sustainable patterns of living.

Environmental Ethics

Environmental ethics is the study of the moral relations between human beings and their natural environment. Environmental ethics assumes that moral norms can and do govern human behavior toward the natural world. A theory of environmental ethics therefore seeks to provide a systematic account of such norms by explaining to whom, or to what, humans have responsibilities and how these responsibilities are justified.

Some approaches to environmental ethics argue that human responsibilities regarding the natural environment are only indirect. Anthropocentric (human centered) environmental ethics holds that only human beings have moral value. Thus, although we might have responsibilities *regarding* the natural world, we do not have direct responsibilities *to* the natural world. Anthropocentric environmental ethics typically involves the application of standard ethical principles to environmental problems. Many environmental controversies, such as air and water pollution, toxic waste disposal, and the abuse of pesticides, arise from an anthropocentric perspective, and many approaches to environmental ethics fit this standard-applied ethics model.

Much of the early work done by environmentalists and environmental ethicists followed this anthropocentric approach. Rachel Carson's *Silent Spring*, for example, warned of the potential long-term harms to humans from pesticide use. The philosopher William Blackstone argued that environmental threats created a need to recognize a new right, the right to a livable environment. While this right emerged out of the recognition of new environmental issues, it was firmly grounded in the traditional rights of life, liberty, and freedom from harm. John Passmore argued that generally accepted ethical principles, and generally recognized ethical faults, provide sufficient ethical grounding to conclude that we have a duty to refrain from pollution and that we have been ethically remiss in not doing so. Passmore also appealed to ethical and aesthetic values in his critique of materialist and consumerist culture.

A wide range of such environmental concerns are relevant for business and thus play a role in business ethics. The responsibilities of business organizations for air and water pollution and waste disposal are the most obvious issues to fit within this standard model. The ordinary ethical and legal categories of duty, harm, negligence, liability, and compensatory justice are easily brought to bear on these environmental concerns.

Ethical Extensionism

While much of the work in environmental ethics continues to fit this standard-applied ethics model, other issues challenge ethicists to extend mainstream ethical principles and values in new directions. In particular, long-term environmental problems such as nuclear waste disposal, population growth, and resource depletion led many environmental ethicists to a series of questions concerning our responsibilities to future generations. Responsibility to future generations remains within the anthropocentric approach in that human beings remain the only object of moral consideration. Nevertheless, this topic extends our responsibilities to include responsibilities to humans who do not yet exist.

Beginning in the late 1960s, population growth has become a major focus of environmental concern. Paul Erhlich argued that exploding population growth was responsible for widespread environmental destruction. Others, for example, Barry Commoner, argued that the consumption-driven lifestyle of industrial societies rather than population size per se was more responsible. In many ways, these debates represented a continuation of the applied ethics model. Debates concerning population involved common issues of individual freedom and social responsibility. Likewise, consumption debates often focused on economic rights and responsibilities to distant peoples. Both areas also focused on issues of social and economic justice to the poor and disenfranchised people living in the developing world. Standard ethical concepts and principles were applied to emerging environmental concerns. But these debates also began to focus philosophical attention on responsibilities to people living in the distant future. This shift from geographically distant people to temporally distant people raises philosophical questions seldom asked previously by philosophers. Ethical consideration began to be extended to something other than presently living human beings.

In considering responsibilities to future generations, ethicists often distinguish between two general issues: what responsibilities we have regarding future population size and what, if anything, we owe to those future generations that we assume will exist. The first set of issues, what we might call "population policy," is concerned with questions of population size, population growth, and population control. The second set of issues, often called "duties to posterity," focuses on the type of world that future people will inherit from us.

Consideration of both population policy and duties to posterity extended environmental ethics in ways that challenge standard ethical theories. For example, is there some ethically preferable population goal that utilitarianism would promote? Is the greater overall good better served by a small future population with a relatively high standard of living or a large future population with a relatively lower standard of living? If the former, does utilitarianism favor population polices that restrict reproduction among the world's poorest and encourage population growth among the world's elite? If the latter, do people living in the developed world have a utilitarian responsibility to reproduce at the highest possible rate?

Similar challenges arise for deontological approaches. Do humans have a right to procreate? Do they have a duty to do so? Do the desires of future people, desires about which we can only speculate, have a role to play in deciding what duties we owe them? Given that the different population policies adopted today would each result in a different future population (the problem of "disappearing beneficiaries"), does it even make sense to talk about responsibilities to future people? Is it meaningful to attribute rights to people who do not exist? Do justice and fairness demand that nonexisting future people have a claim to natural resources that is equal to the claims of presently living people?

Ethical theories that emphasize care and personal and interpersonal relationships also face similar challenges. Does it make sense to talk about caring for people who do not exist, and may not exist if we don't care enough to bring them into existence? Do we have greater ethical responsibilities to actual people than to possible people? Is there a sense in which there can be interpersonal relationships between temporally distant people?

While business institutions were seldom involved in population issues directly, economic and business institutions are greatly involved with potential duties to posterity. In the most general terms, the allocation and distribution of present resources will have significant consequences for people living in the future. The very question of economic development and sustainable development is the question of how economies can meet the needs of people living in the future. Normative environmental issues such as global climate change, resource depletion, waste disposal, agribusiness and agricultural ethics, and future energy supplies all involve the well-being of future generations.

It is fair to say that the topic of future generations stretches the boundaries of traditional ethics. While still within an anthropocentric framework, philosophers were forced nonetheless to address the question of moral standing explicitly. Developing a philosophically adequate account of energy or population policy, for example, required that philosophers consider the moral status of something other than presently living human beings. We can identify this practice of extending moral standing to include future humans or to develop new human rights as *anthropocentric extensionism.* Ethical concepts and categories are extended beyond traditional boundaries, but only human beings continue to possess moral standing. Our duties, such as the duty not to pollute, remain duties *regarding* the environment, but they are not duties *to* the environment. Our duties are to human beings, albeit humans who do not exist. But it is a short step from extending ethical consideration to human beings who do not, and may never, exist to the philosophical question of the very grounds for moral standing.

Moral Standing

Who and what counts morally? On what grounds do we recognize (or attribute) moral standing? Phrased in this way, we can recognize that many contemporary moral problems and public policy debates are located at the boundaries of moral standing. The abortion debate often focuses on the moral status of the fetus: Is a fetus a moral person? Does it have rights? Many debates in medical ethics concern euthanasia and the treatment of seriously impaired patients. These issues force us to consider the moral status of patients in irreversible comas, those who are brain-dead, frozen embryos, and severely impaired infants. Thus, in pursuing the question of our duties to the natural environment, it becomes necessary to examine a more fundamental philosophical issue: Where do we draw the boundaries of moral consideration? Who and what should have moral standing? On what grounds do we make these decisions? This question of moral standing, and the possibility of a nonanthroprocentric environmental ethics, became the focus of significant early work in environmental ethics as philosophers examined the possibility of direct moral responsibilities to the natural world.

One of the earliest contemporary discussions of the moral standing of animals and other living beings was developed by Joel Feinberg. Feinberg argued that to meaningfully say that we have an obligation *to* some object, rather than merely an obligation *regarding* that object, that object must have some welfare or good of its own. But to say that something has a good or a "sake" of its own is to say that it has interests, and for something to have interests, it must be capable of rudimentary cognitive experiences. On Feinberg's grounds, individual animals do, but plants, species, and nonliving natural objects do not, qualify for moral standing. Feinberg was one of the first among contemporary philosophers to make the claim that animals have more standing and deserve consideration in ethical matters.

Prior to the 1970s, ethicists within the Western tradition seldom considered such questions, and when they did, there was almost a universal consensus that only human beings had moral standing. In the *Politics,* Aristotle asserted that the entire natural world exists for the sake of man. Similarly, the medieval Christian philosopher Thomas Aquinas argued that God had created the earth and all things on it for human use. In the 17th century, René Descartes argued that animals were little more than thoughtless brutes or machines. Immanuel Kant, in the 18th century, concluded that only humans were subjects or ends in their own right, while plants and animals were mere objects and could therefore be treated simply as means to our own ends. Thus, while acknowledging that plants and animals were living beings, much of the Western tradition concluded that they lacked a certain characteristic by virtue of which living beings gain moral standing. In most cases, this missing characteristic would have been described in terms of some cognitive or spiritual capacity: reason, mind, consciousness, or the soul. As a result, much of that tradition was unsympathetic to the idea that humans have any direct moral responsibility to the natural world.

According to some critics, this Western tradition of philosophical and theological thought was not only unsympathetic to environmental concerns; it actually was among the root causes of the contemporary environmental crisis. Lynn White argued that one dominant perspective within the Judeo-Christian tradition has played a major role in bringing about environmental problems. This perspective views human beings as occupying a privileged position within all of creation. Being created in the image and likeness of God, humans transcend nature, which has been given to them by God to use as they wish.

But there have long been minority voices within that tradition. White acknowledges Christian sources such as Francis of Assisi, who advocated a much more harmonious relationship between humans and the rest of creation. Jeremy Bentham was one of the few philosophers within that tradition who questioned the exclusion of animals from moral consideration. As a utilitarian, Bentham was committed to the view that pleasure and pain were the ultimate determinates of moral value. The utilitarian axiom to maximize overall good was, on Bentham's account, equivalent to maximizing pleasure and minimizing pain. Given this, Bentham argued that the question of moral standing was not whether animals can reason or talk but whether they can suffer. On these grounds, it would seem that animals deserve moral consideration.

At about the same period when contemporary ethicists were first raising the possibility of moral standing for animals, Christopher Stone proposed that the time had come to recognize legal standing for natural objects such as trees and mountainsides. Drawing on a parallel with the legal standing already granted to things such as corporations, trusts, cities, and nations, Stone argued that natural objects deserved the same legal status. Natural objects have interests that can be represented by legal guardians, they can suffer injuries, and they can benefit from court-sanctioned relief. Stone proposed that courts should recognize the legal rights of natural objects and appoint guardians to represent their interests in cases in which they might suffer harm.

Environmental Ethics and Animal Welfare

The challenge of ethical extensionism directly raised the issue of direct moral responsibilities to natural objects. For the first time in the Western philosophical tradition, ethicists began to give sustained attention to the possibility that humans have moral responsibilities to other living beings. The question of moral standing for natural objects was most fully developed by those philosophers who addressed the question of our ethical responsibilities to animals. At least initially, these questions were thought to be central to a fully developed environmental ethics.

Perhaps the person most associated with the extension of philosophical ethics to animals is Peter Singer. Since the 1970s, Singer has argued that our exclusion of animals from moral consideration is on a par with the earlier exclusions of blacks and women. Singer popularized the term *speciesism* to draw a parallel with racism and sexism. Just as it is morally wrong to deny equal moral standing on the basis of race or sex, Singer argues that it is wrong to deny equal moral standing on the basis of species membership.

To explain which characteristic qualifies a being for equal moral standing, Singer cites the passage from Bentham referred to earlier: The question is not whether they can reason or talk but whether they can suffer. Singer uses the term *sentience* to refer to the capacity to suffer and/or experience enjoyment. Sentience is *necessary* for having interests, in that an object without sentience, a rock, for example, cannot be said to have interests. But Singer also believes that sentience is *sufficient* for having interests. Because all animals above a certain neurological threshold are sentient, all such animals deserve direct moral consideration.

While Peter Singer defended the moral standing of animals on utilitarian grounds, Tom Regan developed a rights-based defense of animals. Regan explicitly argues that some animals have rights and that these rights imply strong moral obligations on our part. Like Singer, Regan condemns on ethical grounds a wide variety of human activities that affect animals. These activities include the use of animals in scientific and commercial research; the use of animals as food; and recreational uses of animals such as in sport hunting, in zoos, and as pets. Regan believes that these practices are wrong in principle but not because of the pain and suffering they cause. They violate animal rights by denying the inherent ethical value that some animals possess.

Why is it wrong, in principle, to treat animals as food, targets, entertainment, or slaves? Regan's answer is that it is wrong for the same reason that it would be wrong to treat humans in such ways. Many animals are *subjects of a life.* Having a life, as opposed to merely being alive, involves a fairly complex set of characteristics, including having beliefs and desires, having interests, having a psychological self-identify over time, and having feelings of pleasure and pain. Regan argues that many animals can be subjects of a life. Most mammals, for example, possess the characteristics required for "having a life." These animals therefore have inherent value, and justice demands that we treat them with respect. Minimally, this means that we have a strong obligation not to harm them.

Both Singer and Regan have written extensively on the ethical implications of their views. Both would argue that we have a responsibility as a society to end most commercial animal farming. Likewise, sport hunting and trapping are unjust. Indeed, abusing and mistreating animals for any form of human entertainment is wrong. A third issue concerns the use of animals in science and research. Experimentation on animal subjects can be especially harsh. We ordinarily would conclude that experimenting on human subjects who have not given their consent is unjust at best and barbarous at worst. People have been convicted as war criminals for such behavior. So, too, should we judge experimentation on animals.

Despite the fact that both Singer and Regan defended extending moral consideration to natural objects, it soon became clear that the animal welfare approach raised serious environmental problems. While granting moral status to animals has some obvious implications for how humans ought to interact ethically with the natural world, it is not clear that granting animals moral status will prove to be an adequate *environmental* stance. These challenges shape the remainder of this entry.

First, in the view of some environmental ethicists, an ethics that begins with extended standard ethical principles remains fundamentally hierarchical and begs the question about the moral status of other living things. For example, both Singer and Regan attribute moral standing only to some animals. Other living things remain outside the range of moral consideration. This omission strikes many environmentalists as both an ethical and a logical mistake.

Second, these extensions remain thoroughly individualistic. Individual animals have standing, but plants, species, habitat, and relations have no standing in their own right. Yet environmentalism is strongly influenced by ecology, and so much of the science of ecology stresses the interconnectedness of nature. Ecology emphasizes wholes such as species, biotic diversity, populations, ecological communities, ecosystems, and biological, chemical, and geological cycles. Relations, communities, systems, and processes play a major role in the science of ecology. To preserve the ecological integrity of a certain ecosystem, it might, for example, be necessary to destroy members of a deer population or thin an overpopulated herd of elephants. Unfortunately, standard ethical theories and the animal welfare approach have little room for such concerns. Indeed, at one point, Regan dismissed the ethical focus on communities rather than individual animals as environmental fascism, a view that is willing to sacrifice actual living individuals for the sake of an abstract whole. To some environmentalists, this was an ethical prescription at odds with sound environmental policy.

Finally, ethical extensions to animals were not, nor were they intended as, comprehensive environmental ethics. Philosophers applied ethics to specific problems as they arose and as they were perceived, with little or no attempt at building a coherent and comprehensive theory of environmental ethics. This focus has had two unhappy results. First, the extension of ethics to cover, for example, the rights of animals can provide no guidance for many other environmental issues such as global warming or pollution. Second, extensionism tends to remain critical and negative. It often tells us what is wrong with various policies and actions but seldom offers anything about what the alternative "good life" should be. We turn now to approaches that develop out of these challenges.

Biocentric and Ecocentric Environmental Ethics

Two alternative approaches to environmental ethics, biocentricism and ecocentricsim, develop from these criticisms. Biocentric ethics argues that life itself provides a nonarbitrary criterion for moral standing. Biocentric ethics refers to any theory that views all life as possessing intrinsic value. (The word *biocentric* means life centered.) One criticism of the animal welfare approach suggests that the extension of moral standing to animals has remained, in a peculiar sort of way and despite its intentions, anthropocentric. Consider that the philosophical methods used by Feinberg, Singer, and Regan all begin by taking human beings as the paradigm of beings with moral standing. Thus, only animals that are enough like us can have (or only to them can we "give") moral standing. Moral standing seems a benefit that is derived from human nature and that living beings receive only if they are enough like humans.

Take the case of invertebrates. In the views of many environmentalists, preservation of invertebrates (animals that lack a backbone, such as insects, jellyfish, and mollusks) should be an ethical concern. So, too, should preservation of plants. Yet in the most obvious reading of the animal welfare ethics, these living beings lack the necessary criteria for moral standing. Invertebrates and plants are neither sentient nor subjects of a life. Biocentric ethics argues that although it may be plausible to say that sentience and subjectivity are sufficient, they are not necessary.

Ecocentricism is the second major alternative to ethical extensionism. Ecocentric environmental ethics develops out of a more ecological perspective of environmentalism. Most animal-rights-based ethics, like most traditional ethical theories, are *individualistic*. That is, ethics is concerned with protecting and promoting the well-being of individuals, not communities or societies or some one "common good." This puts them at odds with much environmental and ecological thinking, which is *holistic*. Many environmentalists emphasize "biotic communities," "populations," or "ecosystems" rather than individual members (including humans) of those communities.

But beyond this issue, the individualistic bias of the animal welfare approach seems to imply other consequences that many environmentalists find unacceptable. From the animal welfare perspective, an animal that is a member of an endangered species has no special moral status. The last remaining pair of bald eagles or spotted owls, if they lack the requisite neurological or cognitive apparatus, have less of a moral claim on us than a single whitetail deer. Preservation of the endangered blue whales is ethically no more important than preserving cows. We have no greater duty to mountain gorillas and black rhinos than to a stray cat, and we certainly have no direct ethical obligation to the millions of species of plants and animals that are not subjects of a life.

Similarly, Singer's views would also suggest counterintuitive conclusions to many environmentalists. Given the amount of suffering that can take place with intensive farming techniques, any one of literally billions of chickens would have a stronger moral claim against us (to relieve its suffering) than would the last remaining members of a plant or invertebrate species. Thus, according to critics, whatever else it might be, the animal welfare movement is not a central part of the environmental movement.

The critical point raised by an ecocentric ethics is that animals, like humans, are part of a complex ecological community. From within an ecocentric perspective, the equilibrium of natural ecosystems should be the goal of an environmental ethics. Giving special ethical protection to individual animals threatens to upset that balance and cause damage elsewhere within that system. Thus, culling a herd of deer or destroying an invasive nonnative species of rabbits to prevent damage to an ecosystem may be an ethically responsible action. Animal welfare ethicists would find such acts abhorrent. On the other hand, protecting the rights of individual animals might well lead to serious ecological harms. There simply is no guarantee that a species—or, more generally, an ecological community—would be preserved if only we protected the rights of individual animals living within that community. Ecocentric environmental ethics shifts attention to our ethical responsibilities to biotic and ecological communities such as species and ecosystems.

Environmental Philosophies: Deep Ecology

The issue of moral standing highlights the fact that environmental issues raise a range of philosophical questions beyond those normally considered within standard ethical theory. Ecocentric approaches, for example, can raise epistemological questions about biological purposes and functional explanations. They raise metaphysical questions about the nature of individuals. Are species, populations, or even genes more "real" than individuals? Perhaps more influentially, environmental issues also raise fundamental questions of social and political justice. Thus, in recent decades, philosophical attention has been paid to developing environmental philosophies that address broader questions than those of ethics alone.

Deep Ecology was one of the first more comprehensive environmental philosophies. The Norwegian philosopher Arne Naess first introduced a distinction between deep and shallow environmental perspectives. Naess characterized the shallow ecology movement as committed to the fight against pollution and resource depletion. It is an anthropocentric approach with a central objective to protect people in developed countries in terms of their health and affluence. Deep Ecology, on the other hand, takes a more holistic and nonanthropocentric approach. Naess's basic point can be made in terms of symptoms and underlying causes. By focusing on issues such as pollution and resource depletion, the shallow approach looks only at the immediate effects of the environmental crisis. Just as a sneeze or a cough can disrupt a person's daily routine, pollution and resource depletion disrupt the lifestyle of modern industrial societies. However, it would be a mistake for medicine to treat only sneezing and coughing and not investigate their underlying causes. So, too, it is a mistake for environmentalists to be concerned only with pollution and resource depletion without investigating their social and human causes.

What distinguishes Deep Ecology as a philosophical approach is its tenet that the current environmental crisis can be traced to deeper philosophical causes. Thus, a cure for the crisis can come only with a radical change in our philosophical outlook. This change involves both personal and cultural transformations and would affect basic economic and social structures. In short, we need to change ourselves as individuals and as a culture.

Deep Ecologists are committed to the view that a solution to the environmental crisis requires more than mere reform of our personal and social practices. They believe that it requires a radical transformation of our worldview. Thus, Deep Ecologists proceed in two directions. On the one hand, many are committed as scientists, artists, and political activists to work for the types of changes needed. On the other hand, Deep Ecologists also seek to develop and articulate an alternative philosophy to replace the dominant worldview that is responsible for the crisis.

The activist side of Deep Ecology has developed in similar ways as other radical social movements. Some practitioners have withdrawn from the social and cultural practices that they believe underlie environmental destruction and adopted alternative lifestyles. Other self-described Deep Ecologists have taken the more political roles of social protest and activism.

The philosophical side of Deep Ecology has focused on criticizing the so-called dominant worldview and articulating an alternative worldview. Deep Ecologists trace the cause of many of our problems to the metaphysics presupposed by the dominant philosophy of modern industrial society. The transformation they seek involves a shift away from the dominant model and toward an alternative worldview that takes its inspiration from ecology.

Deep Ecologists argue that the dominant metaphysics that underlies modern industrial society is fundamentally *individualistic* and *reductionistic*. This view holds that only individuals are real and that we approach a more fundamental level of reality by reducing objects to their more basic elements. But this dominant worldview also sees humans as fundamentally different from the rest of nature. Individual human beings possess a "mind" or "free will" or "soul" that exempts them from the strict mechanical determinism characteristic of the rest of nature. Thus, this traditional worldview creates a strict divide between humans and the natural world, a divide that explains and justifies seeing the natural world as made up of mere objects that can be used or exploited for human ends.

Rejection of these dominant beliefs is central to the metaphysics of Deep Ecology. Taking its cue from ecology, the metaphysics of Deep Ecology denies that individual humans are separate from nature. Instead, Deep Ecologists are committed to a version of metaphysical holism. Humans are fundamentally a part of their surroundings, not distinct from them. Humans are constituted by their relations to other elements in the environment. In an important sense, the environment determines what human beings are.

A philosophy that reduces humans to individuals that are somehow distinct from their social and natural environment is radically misguided. Human nature is inseparable from nature.

Deep Ecologists derive two ultimate norms, self-realization and biocentric equality, from this metaphysics. Self-realization is a process through which people come to understand themselves as existing in a thorough interconnectedness with the rest of nature. Biocentric equality is the recognition that all organisms and beings are equally members of an interrelated whole and, therefore, have equal intrinsic worth.

Social Ecology and Ecofeminism

The problem with Deep Ecology, in the view of many critics, is that it has overgeneralized in its critique of human centeredness, anthropocentrism, and the dominant worldview. From this point of view, not all humans or all human perspectives are equally at fault for environmental problems. When Deep Ecologists critique *the* dominant worldview, they fail to acknowledge that many humans are not part of that dominance. Thus, Deep Ecologists are too broad in their critique and, thus, overly broad in their positive program.

One version of this critique is raised by the Indian ecologist Ramachandra Guha. In Guha's view, Deep Ecology would have disastrous consequences, especially for the poor and agrarian populations in underdeveloped countries. Guha reasons that a policy of biocentric equality and wilderness preservation in a place such as India would effectively result in a direct transfer of wealth from the poor to the rich and a major displacement of poor people. At best, Deep Ecology is irrelevant to the environmental concerns of people in underdeveloped countries. At worst, it can be harmful to the very people who already are victimized by social and political dominance.

Similar critiques of Deep Ecology have been offered by thinkers associated with two other movements in environmental philosophy, *social ecology* and *ecofeminism.* These perspectives agree that in the search for the "deep" underlying causes of the environmental crisis, Deep Ecologists have focused their attention at too abstract a level. The more significant causes can be located at a much more localized level: the social, economic, and patriarchal structures of contemporary societies. Each philosophy claims that in faulting anthropocentrism, Deep Ecologists fail to recognize important distinctions between people. If there is *a* dominant worldview, Deep Ecology must recognize that many humans are also oppressed by it. Not all humans are equally at fault for environmental destruction, and not all humans were included in the "human-centered" dominant worldview. Instead of looking at some abstract dominant worldview, these critics seek to specify the particular practices and institutions that dominate both human and nonhuman alike.

Social ecologists and ecofeminists argue that the root of our ecological crisis lies in certain social factors. Specifically, social ecologists and ecofeminists believe that the domination and degradation of nature arise from social patterns of domination and hierarchy, patterns of social life in which some humans exercise control or domination over others. Thus, both approaches shift the philosophical attention away from questions traditionally associated with metaphysics and ethics and toward questions traditionally associated with social and political philosophy. Social justice becomes the primary focus of these philosophies.

A central insight of these views concerns the relations between individual humans and the patterns of social organization in which they live. Remember that societies are human creations, organized and structured by human beings in ways that serve human ends. Thus, when examining social problems such as environmental destruction, we should ask about the ends or purposes served by the particular institutions causing the problems. Who is benefiting from and who is being harmed by our social practices? In the views of social ecologists and ecofeminists, many social structures serve to oppress some members of society for the benefit of others.

This oppressive social structure in turn works to reinforce a way of thinking and living that encourages domination in all forms, including domination of the natural world. In this view, environmental and ecological destruction is best understood as a form of human domination, in this case the human domination of nature. To understand this crisis more fully, both social ecologists and ecofeminists agree that we need to understand the more general patterns of human domination of other humans. Thus, an adequate understanding of the ecological crisis must address fundamental questions of social and political philosophy. We must identify and analyze the patterns of domination and oppression within societies and evaluate these patterns in terms of philosophical accounts of justice.

Social ecology and ecofeminism can be distinguished by looking at their analyses of the various types of social domination and their alternative conceptions of justice. Social ecologists such as Murray Bookchin attribute environmental destruction to what they see as general and widespread forms of economic and political domination. These would include social practices and structures such as racism, sexism, and class structures as well as private ownership, capitalism, bureaucracies, and even the nation-state. These social practices and institutions establish social hierarchies in which some humans exercise power and domination over others.

Ecofeminists, such as Karen Warren, identify the oppression of women as a principal form of social domination. Ecofeminists identify many close connections between the oppression of women and the oppression of nature. As a result, they believe that the goals of the feminist movement closely parallel the goals of the ecological movement. However, ecofeminists offer various analyses of women's oppression and appeal to various accounts of social justice in critiquing this oppression and developing alternative nondominating models of society.

Ethics and Sustainable Development

The important insight of these environmental philosophies lies in the recognition that environmental problems cannot be separated from the broader concerns of social justice. It is easy for environmentalists to lose sight of an important truth. Environmental concerns are only one among several areas of ethical focus. As the social ecologists and ecofeminists remind us, environmental destruction must be understood within broader ethical contexts. Issues of social justice should not be ignored by environmentalists, nor should economic and political factors. To understand the implications of this claim, consider the environmental challenges that humans face in a broader context.

As environmentalists point out, the earth's biosphere is under severe stress. Economic growth and industrialization during the past two centuries has played a clear role in causing these problems. Worldwide population growth guarantees that pressure for continued growth will continue into the foreseeable future. Nevertheless, other ethical problems are at least equally demanding. Literally billions of people across the globe live in poverty and lack basic nutrition, health care, education, and employment. An ethically responsible stance must pay attention to both environmental destruction and human suffering.

But what is the role of economic markets, economic growth, and industrialization in this ethical stance? Paradoxically, it may be the case that the problem is part of the solution. On the one hand, unfettered markets and economic growth have been responsible for significant environmental damage. On the other, addressing the real human suffering of billions of people will require a dynamic and extensive economic system. The concept of sustainable development has been proposed as a resolution to this paradox. Future economic activity must be economically vigorous enough, and ethically focused, to meet the real needs of the world's population, and it must do so in ways that are environmentally sustainable. The three criteria of economic, ethical, and environmental viability have come to be called the "three pillars of sustainability," or the "triple bottom line" of sustainable economic activity.

From the perspective of Deep Ecology and some social ecologists and ecofeminists, sustainable development appears to be a capitulation to the economic forces that are at the root of much environmental destruction. Supporters offer two general arguments in defense of sustainability. First, sustainable development is a more pragmatic and realistic response than the radical programs associated with these other environmental philosophies. Sustainable development recognizes that it is not economic activity in itself that has caused environmental degradation but only a certain type of economic activity. Social and economic development, rather than unguided growth, should be the standard of economic activity. Second, sustainable development provides a more ethically balanced approach to environmental and social justice.

The field of environmental philosophy and ethics has often been driven by very practical policy concerns. Pressing social problems such as pollution, ecological destruction, species extinction, and resource depletion motivated ethicists to develop systematic accounts of environmental values. The goal for many is to develop a coherent and comprehensive theory of environmental ethics. However, a plausible case can be made that the ethical and value issues associated with the natural environment are too diverse and wide-ranging to be unified into one single environmental philosophy. Many now think that a more pragmatic approach is called for, an approach that recognizes the plurality of environmental values and principles and emphasizes a greater consensus on practical policy prescriptions.

Environmentalism

In general terms, *environmentalism* can be defined as a concern with safeguarding the natural world and its various elements and the differing ways in which such a concern is expressed by people. Specifically, environmentalism comprises differing philosophical approaches to nature and several social movements based on them. Conservation, preservation, "wise use," the wilderness movement in the United States, environmental protectionism, and sustainability, among other philosophies and social movements, help form and define environmentalism. Various scientific enterprises, such as the science of ecology, that have made the environment their subject matter should also be counted as part of this notion.

Individuals who were prominent in the early vanguard of the environmental movement include Henry David Thoreau, John Muir, Gifford Pinchot, and Aldo Leopold. The contemporary expression of the environmental movement is often said to have begun with the publication of Rachel Carson's *Silent Spring*, a book exposing the dangers of pesticides and the widespread production and commercialization of chemicals. Today, the movement is witnessing radicalization at the hands of some who have practiced "ecoterrorism." Environmentalism has had a major impact on how business conducts itself in the form of governmental regulations dealing with environmental protection. Indeed, the impact of corporate decision making on the environment has become a central social and ethical concern today to the point that business organizations have included the question of environmental impact in their own governance. After reviewing some of the basic concepts of environmentalism, this entry will turn to a survey of some of the major historical figures and theories of this movement.

Environmental Concepts

Environmentalism is partly defined by several concepts, some of which are in opposition to others. In fact, much of the controversy that surrounds environmental public policy formulation arises from this conceptual level, where views about the environment may greatly differ. In general, however, environmentalism is an expression of respect for nature and the natural environment that surrounds humans on this planet. Yet agreement about how this respect should be put into practice is not always easily reached. For example, at the beginning of the environmental movement, the distinction between the "preservationist" and "conservationist" environmental philosophies was problematic and led to great public policy debates that included factions from business and industry, the government, and environmental activists.

Simply stated, preservationism holds that respect for nature means that we are obliged to keep nature preserved and maintained in its pristine beauty, which must be passed on to future generations. Besides making such moral claims about the aesthetics of nature, preservationists usually also hold that nature has an intrinsic value that requires preserving and protecting. Some preservationists take this argument further and claim that nature has a high spiritual value for humans, since it was created by God, who is held to be immanent within it. Thus, for preservationists, nature is deserving of great respect from humans, and it is mandatory that it be preserved and kept intact for future generations, and public policy decisions should reflect this philosophy.

Conservationism is conceptually different from preservation, although the two terms are often used interchangeably in the popular literature of environmentalism. However, conservationists do express their understanding of how nature should be respected quite differently than do preservationists. To preserve nature is to keep it protected in its current state and quality without allowing any deterioration, but to conserve nature is to carefully use the natural environment as a resource in a way that does not exhaust or waste it and, thereby, to ensure its availability in the future. In conservationism, the emphasis is thus on use and productivity, and this reflects a philosophy of utility, which is not at all different from the idea of utility inherent in business, where nature is respected for the usefulness it represents to humans. Nature has only instrumental value, according to conservationists. Hence, the differing ways in which nature is respected in these two basic concepts of environmentalism account for a good deal of past and present public policy wrangling about the environment.

Conservationism was closely associated with the "wise-use" practitioners, who originally wanted conservation efforts to be guided by established scientific principles of management. This idea goes back to the end of the 19th century and the policies that emerged around how the United States would manage its wilderness areas, especially its vast western forests. Their managed, wise use within a kind of utilitarian conservation was proposed and accepted as the appropriate public policy, and this form of environmentalism became the hallmark of the Progressive Era politics embraced by President Theodore Roosevelt. This policy was favorable to industries such as lumber and mining, since it emphasized using natural resources and these businesses were in a position to profit greatly from such utilitarian policies.

Today, however, the term *wise use* often refers to a loosely organized coalition of mostly grassroots and special interest groups offering proposals that seem to be counter to the so-called green revolution or green movement. Specialized interests from the timber, mining, and chemical industries have entered the various public policy debates about the environment and have often provided funding for many of the wise-use groups that have become very vocal in environmental politics.

Hence, the concept of wise use has undergone something of an evolution in which its basic meaning has been transformed. Now *wise use* is a much more politically charged phrase. Wise-use advocates today will argue that the federal government should not only sell off public lands and privatize them but also not buy any more land in the hope of preserving ecosystem habitats, as it has done in the recent past at the urging of the green movement. In short, the environmental public policy arena has been characterized at times by the somewhat polarizing views of these two subgroups of the environmentalism movement. Some of the policy skirmishes in which they have been at opposite ends include the protection of animal habitats in logging areas (e.g., the northern spotted owl), policies on the growth of the ozone hole, laws preventing further global warming, the reduction of "greenhouse gases," the regulation of pesticide use, and so on.

Another central concept found within the context of environmentalism is that of *ecology*. This term actually designates several aspects of the idea of environmentalism, and it is even used as a synonym for it at times. First of all, it can be understood as designating the "science of ecology." In this sense, what is usually meant is the scientific study of how organisms—including humans—interrelate with their physical environment. The word can be traced to the writings of the German biologist and proponent of Darwin's theory of evolution Ernst Haeckel, who first used it in 1866. Haeckel derived the word from the Greek term *oikos*, which means house, home, household, or family, and so today, *ecology* has come to mean the study of the household of nature and how the members that make up the family of nature interrelate. Ecology has become that branch of science that predicts the effects that natural entities, especially humans, have on the environment.

The science of ecology is multidisciplinary. This means that it incorporates many other branches of science and devotes itself to various and diverse areas of study. So, for example, the fields of botany and zoology, chemistry and geology, and others are used by ecologists in their work, and they will study areas as different as individual organisms, populations, communities, ecosystems, and the biosphere itself. We have "arctic ecology," "tropical ecology," and "desert ecology," as well as considerations of "ecological crises" such as overpopulation, deforestation, and desertification. In short, the science of ecology is an eclectic field with wide applications.

Moreover, the term *ecology* also designates much more than just this scientific enterprise. The term has also come to designate the social movement that seeks public policies designed to protect the environment, especially from the ravages of pollution. The term when used in this fashion is, therefore, often a synonym for the term *environmentalism*, and then its meaning is much broader than when it is used to designate a branch of the biological sciences. So the phrases *ecological movement* and *environmental movement* are used interchangeably.

But the environmental concept that has become central in most discussions in this area is the notion of "sustainability." It could be argued that sustainability has become the premier concept in the environmental movement. It and the phrase *sustainable development* are banners of the contemporary environmental movement and are part and parcel of the social, economic, and political aspects of environmental matters. In general, the term *sustainability* refers to an ability to meet the current needs of a population while at the same time not harming the possibility for future generations to meet their needs as well.

This is the gist of the definition devised by the World Commission on Environment and Development, often called the Bruntland Commission after the Norwegian woman who chaired it, in its 1987 report titled "Our Common Future." The Commission, established by the United Nations, had identified a strategy in which economic development issues and environmentalism would be merged. This was necessary, according to the Commission, because it was concluded that the more developed nations were engaged in nonsustainable patterns of consumption and production, leading to the possibility that future generations would not be able to sustain themselves. This public policy debate about whether current levels of consumption and production are sustainable or not continues today.

The Bruntland Commission also urged that an international conference be convened to review the progress of steps taken in the direction of sustainable development, and in 1992, the so-called Earth Summit took place in Rio de Janeiro to explore topics such as climate change, preserving biodiversity, the problem of deforestation, and other environmental problems. The Earth Summit, officially called the United Nations Conference on Environment and Development, became the largest meeting of world leaders ever. A set of global strategies called "Agenda 21" was agreed to by 170 nations that established guidelines for environmental policies to be implemented in the 21st century by the convention's signatories. In the United States, Bill Clinton established the President's Council on Sustainable Development for the purpose of implementing Agenda 21 in 1993.

Of course, the terms *sustainability* and *sustainable development* were not and are not without their controversies, nor are UN commissions and conventions on the environment free from criticism. While the more left-leaning green movement promoted these ideas, the right wing of the environmental movement and the many critics of the "greenies" saw in them an undesirable political agenda. They believed that these ideas were designed to usher in a "new world order" where the sovereignty of nation-states and the free enterprise system would be replaced with a UN-sanctioned world government that would displace individual liberty and property rights. This critique of and objection to environmentalism was most pronounced in the reaction to the proposals of the Kyoto Protocol.

In brief, the Kyoto Protocol was agreed to by 84 nations in Kyoto, Japan, in 1997 as a major addition to the United Nations Framework Convention on Climate Change, which was another product of the 1992 Earth Summit. The main goal of the Kyoto accords was to fashion a plan that would cut greenhouse gas emissions (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) as a strategy to address global climate change. The world's more developed nations—a total of 38 countries, including, at the time, the United States—agreed to reduce their emissions by approximately 5% below their 1990 levels. In February 2005, the Protocol came into force as Russia ratified it, and by the following September, it had been ratified by a total of 184 countries, representing approximately 60% of the world's emissions of greenhouse gases. However, the major exceptions in the ratification process were Australia and the United States.

President George W. Bush stated in March 2001 that he would not submit the Kyoto Protocol to the U.S. Congress for ratification since he believed that it imposes an unfair economic burden on the United States and that it treats other countries that are responsible for much of the world's greenhouse gas emissions, in particular India and China, much more favorably. So, the overall success of the Kyoto agreements is in doubt given that the United States is not a party to them. Nonetheless, a number of U.S. states and cities have decided to observe climate protections themselves and have agreed to meet, and in some cases to beat, the Kyoto Protocol emission targets. By December 2005, 192 cities in the United States, including many of the largest, such as New York, had pledged to adhere to the Kyoto agreement.

The History of Environmentalism: Thoreau and Muir

Although it might be difficult to demarcate the actual beginning of environmentalism in the United States, the first wave of the environmental movement can be traced to the nonconformist Henry David Thoreau (1817–1862). Thoreau has often been called America's first environmentalist, and his writings in philosophy, social criticism, and naturalism have been hailed for their spirited independence and freethinking. His observations on nature have been said to anticipate the science of ecology. His book *Walden, or, Life in the Woods* (1854) is a classic text that is part social critique and part environmental analysis but dedicated to the general issue of simple living, or what today might be called *sustainability*. *Walden* relates Thoreau's experiences in a home that he built for himself on the edge of Walden Pond near Concord, Massachusetts, on land that was owned by his friend Ralph Waldo Emerson (1803–1882), the well-known American essayist, thinker, and writer.

In *Walden* and in the journals that he kept for more than 24 years as well as in a variety of "nature essays," Thoreau displayed his respect for nature. This was also reflected and refined in the philosophical school that he, Emerson, and others from New England founded and called "Transcendentalism." This school of thought held that reality was divided into two spheres, the soul and nature. The Transcendentalists claimed that thanks to God's revelation as a force in nature and thanks to God's immanence, each person had a direct knowledge of God. But at the same time, Thoreau's collected writings reveal a preoccupation with environmental matters, and his surveying, lists, charts, and other systematic accounts demonstrate his desire to express his understanding of nature in a more scientific manner. It was likely this unique combination of a spiritual feeling for and a scientific approach to nature that had an impact on the second generation of environmentalists, such as John Muir, the founder of the Sierra Club.

Muir was first acquainted with Thoreau as a student in 1862, and he possessed an edition of *The Writings of Henry David Thoreau* that he had annotated heavily. There is a commonality between the two men on environmental topics, but Muir was not at all a carbon copy of Thoreau. Muir was much less reclusive than Thoreau, and he traveled greatly in his life, having been to Africa, Australia, South America, Asia, and Europe. Yet even with all his travels, it was the Sierra Nevada and the Yosemite Valley area that made a claim on his allegiance, and he devoted much time to political initiatives to preserve the grand beauty of this region, which is not to say that Muir didn't have ample familiarity with other sections of the United States. In fact, in 1867 he walked a thousand miles from Indiana to Florida. He had an exciting and interesting life as an inventor, explorer, farmer, and environmentalist.

Although he was born in Scotland, Muir's contribution to the environmental history of the United States was immense, and in recognition of his work, there are more than 200 sites in the United States named after him. Known as the "father of the national parks," Muir's activities as a persuasive writer did much to lead to the congressional creation of the Yosemite, Sequoia, Mount Rainier, Petrified Forest, and Grand Canyon national parks. He first came to California in 1868, where he explored and studied the Sierras, and based on his findings, he formulated what was to become a controversial geological theory about how glaciers had formed the Yosemite Valley. His writing career began around this time, just after the end of the Civil War, and he published a series of articles titled *Studies in the Sierra*. In the course of his life, he published more than 300 popular articles that appeared in magazines such as *Harper's Monthly Magazine*, *The Century Magazine*, and the *Atlantic Monthly*, as well as a dozen major books that recounted his experiences with nature.

In 1892, Muir founded the well-known environmental group The Sierra Club. The group has been lauded by the left wing of the environmental movement but lambasted by the right. The original goal of the club was to preserve and protect the Sierra Nevada, but since its founding, the club has become one of the leading voices in the environmental movement. For Muir at the turn of the century, the club served as a platform from which to launch a number of important campaigns, with the most challenging being his fight against the damming of the Tuolumne River at the mouth of Hetch Hetchy Valley to create a reservoir for the city of San Francisco.

To Muir and his followers, Hetch Hetchy was a "mountain temple" standing in need of preservation. He held that the wilderness should be left as is and that commercial interests should not take priority. For others opposed to Muir's idealism, using such sites to serve the needs of people trumped the idea that nature had some intrinsic value, and, in the eyes of this group, Muir's writings were seen as mystical and even at times misanthropic. In any event, the battle of the reservoir at Hetch Hetchy began the long-running debate, continuing on even today, between preservationists such as Muir and conservationists, who urged a kind of "wise use" of the environment. The latter group was well represented by Gifford Pinchot, who became the spokesman of conservation and the use of science in conserving natural resources.

The History of Environmentalism: Muir and Pinchot

The name Gifford Pinchot (1865–1946) is synonymous with forestry in the United States, and he is often called the "father of modern forestry." In 1893, there were serious concerns about the state of western forests, so a National Forestry Commission was established with Pinchot as one of the six primary members. Muir's poor health kept him from serving on this Commission, but he did serve as an unofficial adviser to it and traveled with members to collect data. This context would serve as the backdrop to the first meeting between Pinchot and Muir, and at the time, they became friends. This friendship was hard-pressed in later years, as the two became estranged thanks primarily to their basically different environmental attitudes and the battles that erupted over this difference.

The usual designations assigned to these two giants of environmentalism are preservationist and conservationist. As stated above, Muir's activism was based on the recognition of an intrinsic value in nature that he wished to preserve and protect. Muir saw the aesthetic qualities of nature as providing people with the chance for a spiritual renewal and a respite from the growing burdens of modern society. The preservationist philosophy was reflected in Muir's founding of The Sierra Club and his many writings, and the influence of Thoreau's Transcendentalism is seen in this aspect of environmentalism as Muir raises nature to an almost sacred level. For Muir, mountains and forests need to be preserved since they provide a perfect aesthetic antipathy to the artificial creations of society.

Pinchot is better known for his utilitarian conservationist attitudes, which he promoted as the first director of the U.S. Forest Service, a post he held from 1898 to 1910, and as the chief proponent of President Theodore Roosevelt's Progressive Era political goals in the area of nature conservancy. As a utilitarian, Pinchot saw the forests for what they could do for Americans and their economy. He was among the first to hold that science and the principles of scientific management could be applied to the vast forests of the West. Until his administration of the U.S. Forest Service, the lumber industry had been practicing a haphazard clear-cutting method that left huge areas denuded. Pinchot wanted to institute a more thoughtful use of the land and its lumber that would not only conserve forests but also sustain business into the future. He saw the scientific principles of forestry as the only way to achieve this goal, and while the timber industry feared that conservation would translate into its demise, Pinchot held that economic and business wise-use development was central to his understanding of conservation.

The first skirmish between Muir, the preservationist, and Pinchot, the wise-use conservationist, occurred during the National Forest Commission studies of how the wilderness of the United States should be treated. The contrasting positions of each became apparent. What was at stake was the type of public policy that would be approved and ultimately decide the fate of U.S. forests for decades, if not longer. What Muir and Pinchot disagreed about initially was sheep. Pinchot thought that sheep should be allowed to graze on public lands, while Muir thought that sheep were a menace to the natural environment of mountainous areas. Here, the opposing views of preservationism and a utilitarian conservationism rose to the fore, and it was enough to end any friendship that Muir and Pinchot had built up earlier. The next battle between the two was over the even bigger issue of whether Hetch Hetchy Valley should be turned into a reservoir serving the needs of the people of San Francisco for drinking water.

For Pinchot, the answer was clear and easy. As a conservationist, he held principles that were based on a view of nature as a resource to be used for human benefit and that it should be used wisely. He sided with those who wanted to dam the Tuolumne River and flood the valley. His argument was based squarely on the wise-use conservationist belief that nature has but an instrumental value. Muir and other preservationists saw this proposal more in terms of a business deal where tycoons were going to make profits from the dam construction, which would not only provide drinking water but also generate electricity to power San Francisco and create large revenues for utility companies. Muir spent 14 years fighting to preserve Hetch Hetchy, but in 1913, Congress approved the plan to make it into a reservoir. Muir was heartbroken by the decision, and he died only a few months after it was made. The O'Shaughnessy Dam was completed in 1923, but the controversy continues today as the two sides are now drawn into a debate over whether the dam should be dismantled in an effort to restore the Hetch Hetchy valley.

The History of Environmentalism: Pinchot and Leopold

Where Gifford Pinchot can be called the first advocate of the conservation movement, Aldo Leopold (1887—1948), also a forester, might be called the first environmental ethicist. This is because his writings took on the task of outlining the obligations that humans have to nature—which he preferred to call "the land"—and the role that humans should play with respect to preserving and protecting the wilderness and living within a "land ethic." Leopold's creative insights have led to the creation of environmental ethics as one of the more recent additions to the general field of applied ethics within the discipline of philosophy.

Leopold was a student at the Yale School of Forestry, where he earned both his bachelor's degree in science and his master's degree, and on his graduation in 1909, he entered the U.S. Forest Service, which was directed by Pinchot. Leopold was greatly influenced at the time by the conservationist philosophy of his superior, but he gradually drew away from the utilitarian thinking of Pinchot and embarked on a different way of thinking about wilderness and the responsibilities that humans had to it. He finally articulated an ethic of environmental responsibility that holds that human actions that do not enhance the biotic community are inherently immoral.

Leopold's philosophy is one that reconstructs the relationship of humans with the land or nature. Previous and more dominant philosophies of nature saw humans as occupying a superior position vis-à-vis it, often as the conqueror of the wild and savage aspects of nature. In his land ethic, Leopold argued, all natural entities, including humans, are equal members of the land community. This represents the first expression of an attempt to switch from the previous and dominant instrumentalist view of nature to a new philosophy that places a more holistic view of nature in a central role of moral consideration. In other words, Leopold's work ushered in and was the beginning of a paradigmatic shift from anthropocentrism to ecocentrism. Such a shift would have a lasting effect on the environmental movement, in general, and on the newly emerging field of environmental ethics, in particular. Moreover, his emphasis on the equality of all members of the land community is one of the first expressions of a rights-based approach to questions of environmental ethics, and it has led to the establishment of schools of thought that hold that nature in general and nonhuman animals in particular need to be considered morally as bearing certain inherent rights.

The History of Environmentalism: Rachel Carson

The contemporary environmental movement is often said to have begun with the publication of *Silent Spring* by the zoologist and biologist Rachel Carson (1907–1964). This landmark work, which took Carson 4 years to complete, diligently detailed the relationship between animal mortality and the use—now understood as the abuse—of man-made chemicals used as pesticides, especially DDT. One of the claims of the book that she tried to demonstrate was that DDT had the effect of softening the eggshells of birds as well as interfering with their reproduction, and that such effects would lead ultimately to their extinction if use of DDT were to continue. It would eventually create a springtime of silence when the songs of birds would not be heard. Her studies also found DDT to be a human carcinogen.

Born in Springdale, Pennsylvania, Carson graduated from the Pennsylvania College for Women in Pittsburgh (now Chatham College), where she majored in English until her junior year, when a course in biology inspired her to switch to zoology as her field of concentration. She earned a master's degree in this area from Johns Hopkins University and became an aquatic biologist at the Bureau of Fisheries in 1936. During this time, she wrote for various national magazines, and her first book, *Under the Sea-Wind*, was published. The Bureau of Fisheries became the Fish and Wildlife Service, and she went on to become its chief editor of publications.

Carson had concerns as early as 1945 about pesticides being used more and more by the government. But her cautionary claims in *Silent Spring* were met with outrage by the pesticide and chemical industries. Her credentials as a scientist were challenged, and it was held that her findings were just the rants of a hysterical woman. She was even accused of being a member of the Communist Party. Monsanto, a large multinational agricultural biotechnology corporation, published and distributed 5,000 copies of a parody of the book, titled *The Desolate Years*, in which it depicted the fate of the world without pesticides. To this day, there are those who hold that DDT is safe to use and that not doing so is resulting in the needless death of countless thousands around the world where malaria is still prevalent. According to Carson's detractors, she was guilty of imposing a kind of "ecological genocide," and they want to drop the ban on DDT since they hold that Carson's work was not scientifically definitive. Some go so far as to say that she perpetrated a lie and a fraud based on poor research findings and poor research ethics.

But even in the face of such great controversy, Carson is still heralded by environmental groups for her initial work in alerting the public to the perils of pollution and its disparaging effects. She is often celebrated as the founder of the contemporary U.S. environmental movement. Yet her work in *Silent Spring*, warning about the misuse of pesticides and other chemicals, has not as yet taken firm hold. Americans likely use twice as much the volume of pesticides that they did at the time she published her seminal work, and globally, their use is ever increasing. Powerful pesticides, herbicides, and bactericides are available to homeowners and sold over the counter, and their use is so widespread that many environmentalists are fearful that chemical runoff into streams and rivers is still contaminating the animals that humans eat and the water that they drink. In short, while the main intent of *Silent Spring* was to alert the public to the dangers of the overuse of pesticides and chemicals, nonetheless the public has embraced such use.

Environmental Management

Business and industry have been deeply affected by environmentalism. There have been many pressures on business organizations from environmental groups that seek to make environmentalism a significant part of corporate responsibility. Governments throughout the world have instituted environmental regulations designed to oversee business production and protect people from pollution and other environmental hazards that business activities can often cause. Furthermore, the public itself has rising expectations about the idea of corporate environmental responsibility, and there are even some who make their purchasing decisions based on the environmental records of the businesses that sell the products that they buy. In response to this growing awareness of and concern with the environmental responsibilities of business, many corporations have become proactively involved in implementing various measures that are designed to address their environmental impact and demonstrate good environmental practices.

The U.S. Environmental Protection Agency (EPA) has become one of the more prominent institutions with a major role to play in the regulation of business and its relationship to the environment. Richard Nixon instituted it in 1970 with one of its goals the establishment and enforcement of environmental protection standards according to which corporations had to measure themselves so that environmental degradation might be slowed. In addition, state governments throughout the United States have also established environmental standards, and some of these are often more restrictive than the federal standards. Indeed, decisions about adequate environmental standards and their restrictions on business activities have been controversial, with many case examples over the years, including standards regulating leaded gasoline and safe emission levels of gases such as chlorofluorocarbons, carbon dioxide, ozone, and mercury. Global warming and climate change are good examples of an environmental controversy in which businesses have lobbied against the severity of EPA regulations dealing with the so-called greenhouse gas emissions.

However, corporations have not always needed to be prodded by regulatory agencies, and there are a number of excellent examples of businesses that engage in proactive environmental responsibility. The term *natural capitalism* has become a catchphrase for a set of management practices that hopes to revolutionize corporate behaviors and make business more energy and material efficient. Natural capital signifies the stock of natural resources and the set of ecological systems found in nature, which provide the context for all living creatures. One principle of natural capitalism suggests that businesses can learn how to be more productive from the way nature operates. For example, "industrial ecology" is an environmental management strategy that prompts businesses to adopt a new business model and function in an environmentally sound manner by mimicking a natural ecosystem so that interdependence between business and the environment takes place, waste is eliminated, and sustainable economic development becomes attainable. Another principle of natural capitalism is that business and society need to be more cognizant of the true value of nature and that "environmental economics" should be practiced so that the costs of "negative externalities" such as pollution are also recognized and included in the price of products.

In addition to this more fundamental approach to the environmental responsibility of business, many corporations have taken the initiative by becoming environmentally friendly through the adoption of "green practices." As part of an environmental management system, green practices have as their main business objectives the reduction of negative environmental impact and an increase in efficiency. In fact, the field of environmental management has become a fairly large industry itself, with consultants, trade associations, and professional groups having emerged to promote best practices in this area and to spread the word about how to implement and be successful in the "greening of the corporation." A short list of the practices included in environmental management systems includes clean air emissions, the elimination of toxic waste, the reduction of solid waste, energy savings, wastewater reduction, and clean water initiatives. Today, almost all major corporations have a functional, high-level executive office dedicated to environmental management and/or compliance with governmental regulations pertaining to the environment.

What efforts in environmental management are beginning to reveal is that people often and mistakenly hold a false dichotomy between business revenues and corporate environmental responsibility. Many organizations are finding, for example, that being aware of the environmental impact of energy use may, at the same time, create energy efficiencies that will have the effect of cost reductions and increased profits. In short, the link between environmental management strategies and competitive advantages is being realized more and more by enlightened organizations. Thus, the business case for sustainable corporate green practices is being made and advanced in many business sectors, and many corporations today qualify as environmentally friendly.

Moreover, in the academic field of business ethics, responsible environmental management has become a central topic in recent years. It has been suggested that corporations need to be mindful of a "triple bottom line." In addition to being fiscally responsible and maintaining a profit—the original notion of the "bottom line"—and being accountable for its social impact, a corporation must also engage in practices that do not degrade the environment. "Doing no harm" is a basic principle in ethics and in the context of environmentalism, and it has been argued that corporations have a primary obligation to society and to a set of stakeholders not to engage in business practices that harm people or the environment. The topic of "environmental justice" is one that has emerged in this regard, and it refers to examples of environmental management decisions made by both corporations and governments that have had a disparate impact on certain sectors of society, especially those who reside in low-income areas.

A less savory aspect of corporate environmental responsibility is that of "greenwashing" (from *green* and *whitewash*). This is a negative label that is given by environmentalists, who see in the practices of a corporation the tendency to use environmental issues as part of their advertising or public relations programs and make it appear that they are engaged in green practices when they actually are not. While there are many corporations that are genuinely concerned with their responsibility toward the environment, there are some others that are willing to take a "free rider" attitude and make claims about their affinity for the environment when their real intention is to capitalize on the environmental concerns of the public.

Radical Environmentalism

Although environmentalism in the United States began in the 19th century with a kind of spiritual appreciation of nature, it evolved into a less serene and respectful scene that today is marked by animosities, "culture wars," and public policy skirmishes. In fact, one faction of environmentalism has become greatly radicalized and has found it necessary to engage in violent destruction of property and other acts of radical protest. According to the Federal Bureau of Investigation, "ecoterrorists," as they have been called, and radical animal rights groups have committed 1,100 criminal acts, resulting in $110 million worth of damage, since 1976. These domestic terrorists are considered to be more dangerous to U.S. interests than any foreign terrorist organization.

Condos and ski lodges have been set ablaze by ecoterrorists, who have also vandalized and burned sports-utility vehicles as a protest against what they saw as threats to the environment. The Earth Liberation Front, a spin-off of Earth First!, and the Animal Liberation Front have been among the most active and well-known radical environmental groups to perform violent acts that damage private property. One highly publicized form of "monkey-wrenching," the preferred term for violent actions perpetrated by Earth First! proponents, was "tree spiking." This act of "ecotage" (sabotage to save the environment) involves the use of long spikes hammered into a tree that has been spotted for harvesting. The next step is to warn loggers not to fell spiked trees because using their chain saws could be injurious or even deadly when the chains hit the spikes and the resulting shrapnel explodes into the air. However, no deaths have ever been attributed to tree spiking, although there has been one severe injury reported in a lumber mill due to the cutting of a spiked tree.

Other well-known groups have also espoused radical environmental messages but have engaged only in nonviolent protests, direct actions, and civil disobedience. Tree sitting as opposed to tree spiking is the preferred direct action for these environmental protestors. Greenpeace and People for the Ethical Treatment of Animals (PETA) are among the most recognized names of organizations that have found civil disobedience and nonviolent direct actions to be useful in getting their messages across to the general public. In its actions against nuclear testing, whaling, and the oil platform at Brent Spar in the Northeast Atlantic, Greenpeace has a long history of acts of civil disobedience. PETA has been widely criticized for its aggressive media campaigns, boycotts, and public demonstrations against corporations that it claims are exploiting animals.

The main argument of those who favor radical environmentalism is that such actions are necessary because public policies dealing with the environment are not currently sufficient and need substantial changes. Radicals hold that environmental regulations and law do not go far enough to protect the environment and that they are not sustainable. Rather, they claim, environmental public policies really favor special corporate interests while at the same time promoting rampant consumerism, which they also see as fostering values that run counter to those of sustainability and environmental protection. As a result, they hold that they have no choice but to partake in actions that may be illegal and violent and that if they don't, then, the environment will have no chance to survive and the planet will be doomed.

Environmental Protection Agency (EPA)

The U.S. Environmental Protection Agency (EPA) is a government agency charged with protecting human health and the environment, specifically the air, water, and land. It was originally established by the president and the U.S. Congress in 1970 to promote greater coordination between environmental agencies involved in enforcing the nation's environmental laws. It addressed cleanup and restoration issues that had arisen from decades of uncontrolled and harmful pollution. It was also chartered to develop and enforce policy to ensure future environmental protection and human health. In addition, the EPA was instituted to serve as a funding agency for support of external research to state environmental programs, nonprofit organizations, and educational institutions.

As of 2007, the EPA employs 18,000 individuals. It is headquartered in Washington, D.C., and has 10 regional offices and more than 12 laboratories located throughout the United States. The EPA headquarters houses the offices of the administrator and the executive staff and large programmatic offices. The 10 regional offices serve the local population, agencies, corporations, nonprofit organizations, and other stakeholders to provide information and conduct research and development. The EPA laboratories engage in environmental research and assess conditions to identify, understand, and solve current and future environmental issues.

The EPA serves as a regulatory agency, enforcing environmental laws and developing policy and national standards. It grants authority to states and Indian (North American) tribes for monitoring and compliance. In cases of noncompliance, the EPA has the authority to issue sanctions and enforce mandates to achieve the desired levels of environmental quality. It also works with industries and all levels of government in a wide variety of voluntary pollution prevention programs and energy conservation efforts.

EPA Enactments and Business

There are many enactments that determine how the EPA interfaces with business and society: The most notable are the Clean Air Act of 1970, the Clean Water Act of 1972, and the National Environmental Policy Act of 1970.

The Clean Air Act was enacted by the U.S. Congress in 1970 (as an amended act). It established air quality standards aimed at reducing smog and pollution. This was pivotal legislation, as it reflected the environmental conscientiousness of Americans and brought important issues to the forefront in Congress. Since then, many state and local governments have enacted similar legislation, either applying the regulations of the federal programs or augmenting the local programs that supplement the gaps in federal laws.

Clean Air legislation, whether federal, state, or local, is aimed at improving human health, primarily to reduce respiratory diseases in humans, and at protecting and sustaining the environment.

Through the Clean Air Act, the EPA has set limits on all types of emissions (whether they are from the smokestacks of a refinery or the exhaust pipes of an individual's automobile) through Clean Air Alert programs. Compliance is widespread, and violators are given limited time, if any, to rectify an emissions problem.

For business, upholding EPA air standards is difficult and complex. It is expensive and ongoing, usually requiring an additional financial commitment from the affected company. For example, retrofitting a fossil fuel power plant to comply with EPA standards is costly and time-consuming. And once modifications are made, the local and state standards may be amended to mitigate high levels of pollution, causing further compliance requirements to which industry must adhere. Businesses must incorporate these updated standards into existing operations or they may be subject to sanctions and penalties.

Society is affected by businesses that pollute the air, as human health and the environment are at issue. Humans and the environment are exposed to the pollution that businesses produce, not just within the state in which an individual resides but also in far-reaching locations. For example, in 1986, the plume of radioactive fallout produced by the Chernobyl nuclear power plant disaster in the Ukraine drifted over parts of the former Soviet Union, Europe, Scandinavia, the British Isles, and eastern North America. More than 336,000 people had to be evacuated or resettled. Although the disaster occurred in one country, it was large enough to affect populations across the globe.

The Clean Water Act of 1972 (CWA) established goals for drastically reducing toxic chemical levels in water. Before businesses and individuals release pollutants into navigable water, a permit must be approved and obtained through the quality-based standards set by the CWA. The CWA not only sets discharge limits; it also prohibits harmful spills of hazardous substances and oil. There are technology-based standards, known as effluent guidelines, that are set to enforce a national maximum of hazardous substances, with the goal of creating waters that are safe enough for activities such as fishing and swimming.

Businesses are affected by the CWA in that they must file a permit with the EPA that outlines the details of any waste they consider dumping into most bodies of water. Permits are deemed acceptable or unacceptable. In the case of an unacceptable permit application, the business must modify its plan to accommodate the EPA standards. In the case of a violation, adjustments are usually required before a permit will be issued. Excessive or repeated violations may result in litigious outcomes. For example, in 1989, the oil tanker *Exxon Valdez* ran aground on Bligh Reef in Prince William Sound, Alaska, spilling approximately 11 million gallons of crude oil. The environmental impact was immense, with an estimated 259,000 animals perishing immediately. In the original civil case, an Anchorage jury awarded $900 million in actual damages for restoration and replacement of natural resources and $5 billion for punitive damages. Exxon was also held criminally liable for $150 million. As of the beginning of 2007, the civil case is yet to be settled and resides in the appellate courts. The legal battle wages on as costs have escalated for what is now known as ExxonMobil Corporation, the insurance companies, the federal government, and the many individuals and businesses affected by the disaster.

The National Environmental Policy Act of 1970 addresses the consequences of soil contamination and the associated health risks on any federally funded project. The Resource Conservation and Recovery Act of 1976 and the U.S. Comprehensive Emergency Response Compensation and Liability Act (CERCLA) of 1980 were subsequently passed; they defined guidelines for handling, transporting, and hauling hazardous materials from soil cleanup projects, and they also put in place an infrastructure to identify and clean up specific sites. CERCLA authorized the first "superfund," allocating $1.6 billion to toxic waste cleanup sites. Each of these enactments significantly affected land use and land management practices.

Sources of soil contamination include petroleum, solvent leakage, solid waste disposal, water runoff, pesticides, herbicides, dust from manufacturing facilities, and lead. Areas of concern include any location where human beings have the potential of being in contact with hazardous materials.

Businesses are affected by the National Environmental Policy Act when they make decisions regarding the disposal of hazardous waste. There are few options for disposal that are endorsed by the EPA, so it becomes logistically expensive and complex to find alternatives. Nonetheless, a business must work within the standards to be in compliance.

EPA Compliance Implications

Environmentally conscious firms may strive to meet EPA standards and, in turn, ensure compliance with the requirements. In some cases, a firm may exceed the requirements in an effort to support a cleaner environment and publicly communicate its philosophies on sound environmental stewardship. Other firms may knowingly or unintentionally violate regulations to maintain cost-effectiveness. In extreme cases, some may choose to terminate operations in the United States and offshore them to countries that have lenient standards.

Businesses must decide whether to be accountable to the environment and human health. This implies that businesses possess a commitment to the economy, society, and the environment that demands a broader vision than just profitability and competitive advantage. It calls for a commitment to environmentally sound business practices and a greater level of disclosure.

Some perceive that businesses maintain a singular drive toward profit and will do whatever it takes to maintain and sustain profitability and compete in a global marketplace. Businesses that have this view are known to continually violate EPA standards, buying time to increase profitability while adversely affecting human health and damaging the environment. They contend that the costs outweigh the benefits. Other businesses maintain a strong view that environmental stewardship benefits society and it is an obligation of business to strike a balance between this philosophy and profit margins. These businesses may make a point of being public and visible about environmental stewardship, perhaps publishing an environmental "report card," for example.

Some advocate that an increasing number of consumers are opting to purchase from and work with companies that uphold high environmental standards. These individuals contend that environmentally friendly firms may actually increase profits and stakeholders as consumers make buying decisions based on a firm's philosophies.

It is the businesses' responsibility to make these ethical decisions. Agencies such as the EPA were established by the U.S. government to ensure that a business decides on behalf of the environment and the public good it serves.

Environmental Protection Legislation and Regulation

National and international environmental laws and regulations are relatively new phenomena. For centuries, conflicts over land and water use were resolved at local levels, either informally or in courts of law. But since the Industrial Revolution, increasing numbers of humans, new technologies, and rising levels of consumption have seriously degraded natural resources, have created costly and negative consequences for many, and are even likely to have altered the earth's climate. Acid rain, Love Canal, the wreck of the *Exxon Valdez*, and Bhopal provide well-known examples of business activities that have imposed involuntary costs on others. Degradation of natural resources (depleting fisheries and forests, desertification, ozone depletion, aquifer and wetland losses) is not a new phenomenon, but the pace of consumption, population growth, and new technology has led to many new or contemplated legal restrictions on economic activity.

During the 20th century, economic activity has been particularly intense in the industrialized democracies.

William Rees and others have calculated the "ecological footprint" of various societies that depend on natural capital from beyond their own borders. The European Union (EU) has calculated that its 25 member states represent a declining portion of the world's population, but a rise in per person consumption means that, through global trade, they use an increasing portion of the world's natural resources. Home to 7% of the world's population, the EU nations generate 17% of humanity's ecological footprint. North America (Mexico, the United States, and Canada) generates even larger footprints. A perceived conflict between economic development and environmental protection emerges: If India, China, and other developing nations follow the same upward trend in consumption and generate ever larger demands on natural capital, strains on natural capital are likely.

Severe strains on natural capital can lead to collapse, as Jared Diamond has pointed out in his 2005 book, *Collapse: How Societies Choose to Fail or Succeed*. Because ecological disasters can bring an end to economic activity in that location, it may seem sensible to impose legal limits on the kinds or amounts of consumption or to encourage different technologies or activities. Effective or not, legal attempts to preserve old-growth timber, limit fish catches, or phase out ozone-depleting chemicals exemplify laws intended to avoid ecological degradation and thereby maintain natural capital for current and future generations. But each of these may inhibit profit making in the present. "The market," without governmental interference, is not inclined to place limits on the kinds or amounts of goods that are freely bought and sold; yet setting rational restraints on production, consumption, and inappropriate technologies has proven difficult without market-based rules and incentives.

Enough is known about the nature of corporations, unconstrained markets, and human behavior to conclude that some governance from the public sphere must be in place to protect the environment. Otherwise, chlorofluorocarbons would be freely bought and sold, no one could sue for damages from pollution, and preservation of wilderness would be unthinkable. The more trenchant issue is what kinds of rules and regulations will best serve society and its various constituencies. But we must first consider the meaning of *society and its various constituencies*.

As other entries in this *Encyclopedia* suggest, a biocentric or Deep Ecology perspective would take a broad view of society, rejecting "speciesism" and endorsing animal rights. In so doing, it would reject any public policy analysis that failed to consider nonhuman interests. For example, cost-benefit analyses that excluded nonhuman interests would be morally suspect. Yet as we shall see, most environmental laws and regulations in the United States and in Europe have had a decidedly more "anthropocentric" or human-centered slant. Most environmental laws also primarily aim to serve humans now living rather than provide fairness ("intergenerational equity") to future generations.

Several reasons are commonly offered for having rules that limit human activity in order to protect "the environment." In relatively rare cases, the intrinsic value of nonhuman life is given some weight; the Endangered Species Act or the Marine Mammal Protection Act are examples, along with the international Convention on International Trades in Endangered Species. More typically, cases are decided and statutes legislated to correct various market failures (e.g., negative externalities), secure rights, protect the commons, provide public goods, or provide incentives for technologies that pollute less. As we shall see, sometimes these goals are conflicting, and often there is disagreement about which laws or regulations will provide "better" results. Nuclear energy, for example, avoids carbon dioxide emissions (as greenhouse gas contributors) but creates other problems of safe storage and handling.

In looking at environmental law and regulation, it will be helpful to start first with the judicial decisions that try to balance the rights of individuals or corporations where there are no existing statutes or administrative regulations for the court to interpret. Next, U.S. federal and state statutes and administrative regulations will be discussed, along with the role of U.S. constitutional law. Last, international efforts to protect the environment will be examined and the impact of international trade agreements and institutions such as the North American Free Trade Agreement (NAFTA) and the World Trade Organization (WTO) will be considered.

Regulation Without Legislation: Basic Principles and the Common Law

Under Roman law, property owners were admonished to use their land in ways that did not harm others (*Sic utere tuo ut alienum non laedas:* Use your property in such a manner as not to injure another). English common law and U.S. state tort law require that property owners not create a nuisance on their property; damages are awarded to plaintiffs injured by other owners' negligence. The duty not to harm can also be seen in Principle 21 of the 1972 Stockholm Declaration, where nation-states are supposed to see that activities in their territories do not cause harm to neighboring states.

The underlying economic principle for these laws and principles is that negative externalities should be actively discouraged. In economic parlance, an externality is the cost or benefit of some activity that affects people who aren't directly involved with the activity. An externality can be negative (a new industrial facility can decrease property values of houses in the vicinity) or positive (repainting your house can provide an aesthetic or economic benefit to your neighbors). Pollution externalities are invariably negative; they impose a cost on someone who is not directly involved in the activity. One time-honored business strategy is to use "other people's money"; creating negative externalities in effect does just that. In the absence of legal rules and adequate compensation for the affected parties, the legal system encourages negative externalities and continuing environmental harm.

Common-law tort actions could potentially discourage people and corporations from generating pollution as a kind of negative externality. But tort actions in the United States have not systematically and efficiently encouraged polluters to pay the costs of their pollution to those who suffer harm. For example, in the "toxic tort" trial, made famous in Jonathan Harr's *A Civil Action*, the plaintiff families in Woburn, Massachusetts, were harmed by chemicals that had entered the water supply because of the nearby manufacturing activities of two companies. For some families, the harm was the death of a child. In Harr's account, the families were lucky to find a lawyer to take the case—even with major damages and the corporate defendants having "deep pockets"—because liability was far from clear. The difficulties of proving that trichloroethylene or perchloroethylene had caused the injuries complained of were considerable, as were the difficulties of proving that the chemicals had actually come from the defendants' facilities. The lay jury was overwhelmed by contradictory expert testimony, the statute of limitations cut off the otherwise valid claims of some families, the discovery process was seemingly subverted by one defendant's attorneys, and the plaintiff's small law firm went bankrupt trying to prove its case.

In the Woburn case, as well as other toxic tort cases, scientific uncertainty, multiple potential causes of environmental harm, and the economics of law practice make people's "rights" in their person and property difficult to assert. Moreover, the cost to defendants and to the government (in its Superfund investigation and lawsuit) was considerable; that it would have cost each company just a little to prevent the harm in the first place illustrates the somewhat natural inclination to let someone else pay. The push for maximizing profits may often lead to decisions that emphasize short-term benefits rather than the prevention of long-term costs. *A Civil Action* also illustrates the enormous waste of human time, talent, and money required to redress environmental harms in the courtroom. Because tort actions represent an uncertain and costly means of redressing negative externalities, one role of statutory environmental law is correctly seen as preventing harms by encouraging safer products and processes.

Thus, prevention of the pollution damage in the first place should be a goal for environmental law and regulation. In the United States, the decades of the 1960s and 1970s brought major federal legislation for clean air and clean water, established the Environmental Protection Agency (EPA), and authorized it to set mandatory standards (regulations) for clean air and clean water. Inspections and enforcement of the regulations were part of the preventive process. In the section that follows, we will see that federal legislation is potentially restricted by constitutional mandates. We will also see that states may not legislate without regard to federal legislation and may not legislate in ways that discriminate against "articles of commerce" originating in other states. We will also note that the command and control method of preventive environmental law (involving inspections, administrative adjudication, and enforceable orders against polluters) fell into disfavor; legislation and regulation that were more "market oriented" became more popular, although the use of prohibitions and planning regulations also continued.

In the international arena, more and more multilateral treaties were negotiated and ratified, including agreements on endangered species, the movement of hazardous waste across national boundaries, the depletion of the ozone layer, the protection of Antarctica, prohibitions on persistent organic pollutants, and, most famously, the Kyoto Protocol (implementing the United Nations Framework on Climate Change Convention of 1992). Nations, corporations, and nongovernmental organizations also began to appreciate the difficult interface between "free trade" and a healthy environment. Free trade rules in the General Agreement on Tariffs and Trade (GATT) seemed to favor the unrestricted movement of goods across national boundaries, while environmental groups and interests often favored restrictions on invasive species, limits on genetically modified organisms (GMOs), and the right of GATT member nations to limit the entry of products that had been produced or harvested in ways that posed a danger to particular species or the environment.

U.S. Environmental Laws

Structure of Environmental Law and Regulation

U.S. environmental law begins with state common law, which allows plaintiffs to sue on the basis of nuisance, trespass, or negligence for harms to person or property. States are free to pass environmental legislation, as well, and have historically done so to protect natural resources. At the federal level, Congress passed numerous laws, beginning in 1969, that sought to preserve clean air, land, and water. Congress also created the EPA to write regulations to implement each of the major environmental acts on clean air, clean water, hazardous waste, and chemicals and pesticides. The EPA, after appropriate notice to the public and a comment period, is empowered to issue regulations that have the same force and effect as an act of Congress. The EPA is also empowered to investigate and enforce these laws and regulations. Regulations can be challenged in court on several bases, however, and affected businesses have often been able to modify regulations that seem particularly onerous.

Constitutional Problems

The structure and content of the U.S. Constitution provide numerous issues for the courts to consider.

Commerce Clause

Congressional power in environmental matters derives from the Constitution's commerce clause, which says that Congress "shall have Power . . . to regulate Commerce with foreign nations, and among the several States" (U.S. Constitution, Article I, Section 8 [2]). From the days of Franklin Delano Roosevelt's "New Deal," the Supreme Court has given an expansive reading to the commerce clause; earlier, only laws that touched on the actual movement of goods in interstate commerce were deemed constitutional by the Court. In 1995, the Court withdrew some of Congress's power in ruling that a federal criminal statute prohibiting guns near school districts was beyond Congress's duly authorized powers. Subsequent to 1995, the Court has struck down numerous statutes as exceeding Congress's power under the Constitution.

Limiting congressional power under the commerce clause could limit the scope of the Clean Water Act to interstate waters, thus invalidating efforts to use federal law to protect purely intrastate waters (kettle lakes, canals, streams, ponds, wetlands that do not adjoin navigable interstate waters). Likewise, federal protection for endangered species that now live only in localized areas would be curtailed under restricted commerce clause powers.

Consider the southwestern arroyo toad. The arroyo toad was once found throughout coastal rivers and streams in southern and central California. It hatches in a river or stream and begins to develop in water; as an adult, it lives on land, where it lives on insects (mostly ants) and digs burrows on sandy terraces. The arroyo toad population of California has been drastically reduced over the past 100 years, and it now survives in only 22 small, isolated headwaters. The commerce clause issue is whether Congress, through the Endangered Species Act, can protect the arroyo toad even though it does not move in "channels of interstate commerce" and is not an "article of interstate commerce." In *Rancho Viejo, LLC v. Norton*, the U.S. Court of Appeals for the D.C. Circuit upheld Congress's power to regulate, but Judge (now Justice) Roberts declared in dissent that the developer's "incidental taking" of the arroyo toad could not be a matter of interstate commerce. His views may well represent the Supreme Court's future direction, limiting what Congress can do under its commerce clause powers.

Dormant Commerce Clause

When Congress does not legislate, the Supreme Court will still limit state action using the "dormant commerce clause." States may not overtly discriminate against articles of commerce from other states, nor may they place "undue burdens" on interstate commerce.

Undue burden cases. For state statutes that "regulate evenhandedly" to effectuate a "legitimate local public interest" with effects on interstate commerce that are "only incidental," the Court will assume constitutionality unless "the burden imposed on commerce is clearly excessive in relation to the putative local benefits." Under some interpretations of the dormant commerce clause, state environmental laws that are too burdensome to business may be challenged.

Discrimination cases. If the state statute by its own terms discriminates on the basis of geographical origin, the courts are likely to strike down the statute as contrary to the dormant commerce clause. A Nebraska law requiring the denial of a permit to withdraw and transport water for use in an adjoining state unless that state granted "reciprocal rights" to withdraw and transport water for use in Nebraska was held to be an explicit "barrier to commerce" between the two states. An Oklahoma law banning the transportation of minnows for sale outside the state was struck down despite legitimate local concerns for the conservation and protection of Oklahoma's ecological balance. A slightly greater "tipping fee" at Oregon state landfills for waste originating outside the state was held invalid as facially discriminatory, even though the lower in-state fees were defended on the basis that Oregon taxpayers were already paying for the inspection expenses and the infrastructure that supported the landfills.

Preemption

Congress may choose to create national legislation that will "trump" any state legislation or common law on the same subject. It can do so because of the supremacy clause in the U.S. Constitution, which says that the Constitution "and the Laws of the United States . . . shall be the supreme Law of the Land." Sometimes Congress preempts state law explicitly. For example, in creating the Nuclear Regulatory Authority, Congress made it clear that states would have no role in regulating the radiological safety aspects of constructing and maintaining nuclear power plants or ensuring nuclear safety. Where Congress does not do so explicitly, the courts may still find that Congress implicitly chose to preempt state law and will negate state laws that are in conflict with federal law or "frustrate the purpose of" federal law.

In *United States v. Locke*, for example, the Supreme Court set aside various sections of a Washington State law intended to better protect the waters of Puget Sound from oil spills. While the Court acknowledged that Puget Sound was environmentally significant, with "fisheries and plant and animal life of immense value to the Nation and to the world," it nevertheless found that the state's Office of Marine Safety had issued regulations that were preempted by existing federal statutes governing tankers, ports and waterway safety, and oil pollution. Washington regulations had imposed a strict training regimen on oil tanker crews, including oil spill prevention and response; the state laws mandated weekly, monthly, and quarterly drills. A trade association representing operators of oil tanker ships challenged the state regulations, and the U.S. government joined in the challenge, arguing that national and international rules for tanker navigation were essential to orderly trade and commerce and that inconsistent state and local rules should be preempted. The Court agreed.

Express or implied federal preemption may not always be so clear, however, and business interests have often found it useful to argue preemption where state environmental standards are stricter than federal ones. California's clean air laws, for example, are stricter than the federal standards and now require automakers to reduce carbon dioxide emissions from motor vehicles. Automakers argue that the federal Corporate Average Fuel Economy Standards (CAFE) expressly and impliedly preempt state legislation that would require CO_2 emission standards. The reasoning is that only enhanced fuel economy can deliver lower CO_2 emissions and that fuel economy is governed by the federal CAFE law. A challenge to those stricter state standards using preemption is pending.

Command and Control Regulations

The initial burst of federal environmental legislation in the 1970s typified what is known as command and control regulation, sometimes known as "direct regulation." From 1960 to 1979, 27 laws were passed to improve air, water, and land quality. Congress set the broader purposes and goals, and the EPA was charged with writing more detailed regulations to implement the statute. Typically, the laws and regulations aimed at controlling pollutants toward the end of the manufacturing process. The Clean Water Act and Clean Air Act were prime examples; standards were set in terms of total effluents or emissions allowed, and varied levels of technology were prescribed (e.g., "best available technology" or "best feasible technology"). Noncompliance by individuals or companies could result in civil and/or criminal penalties. The states were given an enforcement role; as long as states adequately enforced the EPA regulations, the EPA would not monitor compliance or bring enforcement actions.

The Reagan era (1980–1988) represented a reaction to command and control regulations, as businesses began to realize the high cost of complying with environmental regulations. Deregulation in this era at the EPA meant staff reductions, budget cuts, and reduced funding for renewable energy. Congress strengthened some environmental laws during the 1980s, however, and the first Bush administration's EPA brought a record number of prosecutions and fines for environmental violations. In 1990, a strengthened Clean Air Act was signed into law.

Still, resistance to command and control regulations by the business community was strong. The initial reductions in effluents and emissions had been fairly cost-effective; further efforts to reduce pollution were more costly and delivered more marginal benefits. Economic concerns surfaced, for instance, with the Competitiveness Council, which was instituted during the first Bush administration on behalf of business to ensure that all federal regulations would not cost business more than the benefits provided to society. Concerns over the economy would result in a shift from command and control regulation to laws oriented toward "market forces."

Incentive Regulations

Legislation oriented toward market forces began to play a greater role in the 1990s and beyond. The Clean Air Act amendments of 1990, for example, included emissions trading provisions that gave the most efficient manufacturers an incentive to not only meet standards but also exceed them. Excess "credits" could be sold to facilities that for financial reasons could not immediately comply with emission standards. Critics have described emissions-swapping programs as licenses to pollute; others note that while overall emissions of a certain pollutant (e.g., mercury) may be more quickly and efficiently lowered by means of emissions trading, "hot spots" are created around sources that are buying emissions credits, to the detriment of nearby residents.

Market-oriented regulations include pollution taxes, refundable deposits on hazardous materials, and bottle bills that encourage consumers to recycle. Such regulations also include tax incentives for consumers to purchase hybrid vehicles and for making investments in solar energy for their homes. All the above are "market oriented" because they impose costs on goods that impose negative externalities and confer benefits on the purchase of products that contribute to a better environment. For example, without a returnable cans and bottle rule, the typical soft-drink container is less likely to be recycled and more likely to create roadside litter for someone else to deal with. Without public encouragement of consumer purchase of solar energy panels, for example, the nascent solar energy industry cannot compete with oil for home heating when oil exploration and distribution are already given public assistance by federal tax law provisions and an overseas military presence that has historically served to secure oil supplies from abroad.

Other market-oriented regulations would include labeling laws that require products to include information to environment-minded consumers. The presence of labels claiming that "no animal testing has been done in the preparation of this product" attests to the growing influence of consumers who ask to know how a product is made. The regulation of the words *organic* and *natural* as labels represents an attempt to pin down the meaning of words that are important to a growing number of consumers. The underlying market logic comes from economics and from the basic tenet that buyers and sellers should have the best possible information for the market to function well.

Prohibitions and Planning Regulations

The tension between individual property rights and the collective good is well illustrated by zoning and planning laws. Under most state laws, local governments are allowed to restrict certain businesses to specific locations; noise, offensive odors, or unsightliness are widely held reasons for municipalities to impose zoning restrictions. Permits represent another form of planning regulation. Under federal law, a permit may be required to engage in mining or timbering or to create an office park or residential development. For example, the Army Corps of Engineers has historically enforced a migratory bird rule that has prevented filling in certain seasonal wetlands used by migrating species. If a species is protected as endangered under the Endangered Species Act, the permit for development may be refused. Finally, the sale of some items may be entirely prohibited if doing so seems prudent and rational; for example, to discourage the poaching and commercial sale of eagle feathers, the sale of eagle feathers can be outlawed, even though someone could show that they had found some eagle feathers without harming an eagle. In general, the courts have held that governments and their agencies are empowered to create prohibitions, set the terms for permits, and create zoning and use areas for the good of society.

Yet sometimes, planning efforts may run afoul of constitutional considerations. In *South Carolina Coastal Commission v. Lucas* (Supreme Court, 1992), the Commission studied beach erosion and storm flooding and concluded that oceanfront residences should be restricted. David Lucas had purchased two beachfront lots in 1986, intending to build houses on them. At the time, the state did not list his properties as being in a "critical area" that would require a permit for development. In 1988, the legislature's newly enacted Beachfront Management Act prohibited him from building residential structures on his lots. While there were defensible reasons for the act (preventing beach erosion mitigates storm damage, provides a habitat for numerous species of plants and animals, serves as a storm barrier that dissipates wave energy and contributes to shoreline stability in an economical and efficient manner, and helps maintain a vibrant tourism industry for South Carolina), the effect of the law was to deny him all "economically viable use of his land." In doing so, the Court held that the state law had effected a "total taking" and required the state to pay Lucas the full price he had paid for his two lots.

Following *Lucas*, then, a total taking will require the government to pay for the loss of "all economic value" due to regulation. The decision left open whether "partial takings" should also be compensable. In the wake of *Lucas*, a movement to require government to pay for "regulatory takings" has achieved some traction in the United States. A broad range of economic and political interests, including developers, small-property owners, timber companies, and others, have championed "property rights" to balance the growing government interference to protect the environment. The basic argument is that environmental regulations are trampling on the rights of private property owners, who know best how to act as stewards of the land in any case. Creation of new wilderness areas is strongly opposed by the "wise-use" movement, which would like to legislate an owner's right to payment for any reduced economic value due to environmental rules. Thus, the regulatory takings doctrine would go well beyond the *Lucas* case and require compensation for partial as well as total regulatory takings.

Proponents of takings legislation claim that it will relieve small-property owners, who are unduly restricted by wetlands ordinances, growth management laws, and other environmental statutes. Granted that government regulations may often generate strange and burdensome requirements, these claims may have considerable appeal. On the other hand, "property" consists of not only land (real property) but also personal property (cash and all other assets that may be bought and sold). Taken to its logical limit, then, all government regulations that diminished personal or corporate property would require payment to the extent of the diminished value. Thus, under the regulatory takings doctrine, prohibiting negative externalities such as pollution of air, land, and water would require the public (not the polluter) to pay the cost of pollution prevention. Regulatory takings advocates would counter that those whose property or health has been adversely affected could bring litigation to enforce their own rights; but, as we have seen, using courts to assert tort claims of negligence, trespass, or nuisance is an inefficient and uncertain remedy, with large transaction costs (see Regulation Without Legislation).

Several states have enacted some form of takings legislation since the early 1990s, and as of 2005, a number of new takings bills have been introduced. Takings legislation at the state level has one or both of the following components: assessment provisions (requiring governments to prepare a written assessment of whether a proposed action would constitute a "taking" of private property) and compensation provisions (requiring governments to compensate landowners for diminutions in property value that reach a certain threshold percentage). For example, the Real Property Rights Preservation Act became Texas law in 1995 and defines a taking as a government action that causes a "reduction of at least 25 percent of the market value of the affected private real property." Various bills have been introduced at the federal level, but none have passed both the House and the Senate.

Takings legislation has its counterpart internationally; the North American Free Trade Agreement's Article 1110 provides investor protection against measures "tantamount to nationalization or expropriation" of investments. This would be equivalent to a government's use of eminent domain in its own territory. But Chapter 11 of NAFTA also protects investors against the "measures" of a signatory foreign government relating to the "investment," and many claims have been brought by individuals and corporations against governments whose laws or regulations, either local or national, have adversely affected their financial situation. Moreover, some have been compensated through Chapter 11 arbitral tribunals even when the "taking" was a denial of a permit, an administrative determination, or a judicial decree.

International Aspects

International Environmental Law

There is a considerable body of "international environmental law" covering varied issues such as climate change, ozone depletion, movement of hazardous waste, endangered species, and maritime pollution. The efficacy of these various treaties and conventions varies, as each nation in the international order retains its sovereignty (i.e., the power to make and enforce laws within its own borders), and participation in such agreements is essentially voluntary.

The classic formulation of sovereign responsibility for transboundary pollution dates back (at least) to Principle 21 of the Stockholm Declaration from the 1972 United Nations Conference on the Human Environment. Principle 21 noted that states have the sovereign right to exploit their own resources pursuant to their own environmental policies and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states or of areas beyond the limits of national jurisdiction. Principle 21 is consistent with the Roman law maxim discussed earlier, but those who are damaged by governmental transboundary pollution will be hard-pressed to recover; sovereign immunity is ordinarily granted by national court systems to governments for actions taken on their own territories. Nations might agree to hear transboundary pollution claims or other matters involving the environment in the International Court of Justice (see, e.g., The Hungary-Slovakia Danube River dispute, September 25, 1997), but participation is voluntary.

International Treaties and Conventions

Each nation-state can bind itself to agreements with other nation-states through treaties and conventions. A treaty is an agreement between two nations, and a convention or protocol usually connotes an agreement among a larger group of nations. Whether a nation signs a treaty or is a party to a convention, the agreement is voluntary; at any time, a nation that has ratified an agreement can also resign from that agreement.

There are many notable international environmental agreements, including the Montreal Protocol on Substances That Deplete the Ozone Layer, the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal, and the Kyoto Protocol, which sets national targets for certain kinds of greenhouse gas emissions. Given the extensive fossil fuel use in the United States, the decision by U.S. political leaders not to join the Protocol has been unpopular in many parts of the world. U.S. nonparticipation also illustrates the conflict between short-term economic goals and strategies for long-term sustainability. Also, even if the United States were to join the Protocol, economic exigencies could lead to a renunciation of the Protocol's voluntary commitments.

Trade Agreements: WTO and NAFTA

A more binding set of agreements can be found in global and regional trade agreements. Globalization of trade and commerce has strengthened the role of international institutions such as the WTO. Prior to the Uruguay Round of trade negotiations, global trading nations subscribed to the GATT. Under the GATT, tariff and nontariff barriers were to be gradually reduced, increasing free trade and global prosperity (under David Ricardo's theory of comparative advantage). While the GATT did include allowances for sovereign action to protect environmental resources within its borders (in Article XX[g]), it did not allow nations to take actions that would discriminate against products based on the way the product was created or taken from the environment. For example, the U.S. Marine Mammal Protection Act (MMPA) put limits on the import of tunas caught using purse seine nets, which injured and killed dolphins in the Eastern Tropical Pacific. A GATT panel rejected the U.S. restrictions on the ground that Article XX(g) could only apply to domestic environmental protection and that discriminatory treatment in terms of tariffs or quotas could not be based on the production or processing methods of "like articles." Given that tunas caught with dolphin-friendly methods were identical to tunas caught with purse seine nets, the MMPA limits were ruled to be inconsistent with U.S. GATT obligations.

Other environmentally inspired restrictions have also faced challenges in the WTO. The EU's refusal to accept GMOs was challenged by the United States in a WTO dispute resolution panel, as were the EU's restrictions on hormone-fed beef. U.S. companies were the primary drivers of these challenges, which were successful in using free trade laws to invalidate the precautionary measures adopted by the EU. In these decisions, and in others, the WTO must wrestle with the precautionary principle, which is found in (among other places) the 1992 Rio Declaration on Environment and Development. The precautionary principle has had various formulations, but in essence it holds that where there are threats of serious or irreversible damage, lack of full scientific certainty should not be used as a reason for postponing cost-effective measures to prevent environmental degradation.

WTO disputes about precautionary measures usually center on risk assessment and the scientific validity of potential risks. In the cases involving GMOs, hormone-fed beef, and other products (the Japan Apples case and the Australian Salmon case), the burden of proof is on the regulating nations to demonstrate the risk by means of fairly rigorous scientific evidence or an existing international standard. For developing countries, this burden is significant.

The 1993 NAFTA was the first trade agreement to specifically mention environmental considerations. An environmental "side agreement" created the North American Agreement on Environmental Cooperation and a strengthened binational process for environmental cooperation and protection along the border. But these institutions appear insufficient to arrest the pressures on the environment resulting from economic integration in the North American region.

Environmentalists had opposed the agreement because they feared that further trade liberalization between the United States and Mexico would worsen the already poor environmental conditions along the U.S.-Mexican border, a border contaminated by excessive air pollution, sewage discharges, and toxic dumping. Also, environmentalists feared that NAFTA could be used to attack state or national environmental standards as barriers to trade.

At least some of those fears have been borne out. Chapter 11 of NAFTA provides for significant investor protections. If a company from any of the three nations makes an investment in another nation and the investment is impaired in any way by the laws or acts of that nation, an arbitration panel can be convened at the investor's request. One arbitration has given a substantial award to a U.S. corporation whose waste facility was disapproved by local authorities; the denial of the permit may have been a politically motivated event, but there were some legitimate environmental concerns about the facility (*Metalclad v. Mexico*). A Canadian corporation (Methanex) has challenged California's ban of MBTE, claiming that the ban was politically inspired rather than environmentally motivated; the proceedings to date make it unlikely that Methanex will recover, but the company's ability to use the investor protection provisions of NAFTA's Chapter 11 make it clear that challenges to environmental laws are likely under NAFTA's investor protection provisions.

Threats to Developing International Environmental Law

Developing more effective international environmental law treaties and conventions depends, in part, on economic and political stability among nation-states generally. Economic and political stability is currently being threatened by numerous civil wars, terrorism, and the wide dispersion of military hardware. The phenomenon of "failed states" threatens to undermine cooperation between nation-states on critical international environmental issues. Uneven development within nation-states—not merely poverty—increases instability. Corrupt and ineffective governments can also give rise to opposition parties, warlords, ethnic nationalists, and rebel forces. Environmental degradation in one nation can lead to displaced refugees.

With all these potential difficulties, it is useful to recall that people worldwide want to live with healthy air, clean water, and uncontaminated land. Humanity has only recently come to realize that there are environmental harms inherent in overpopulation, overconsumption, and the indiscriminate adoption of new technologies. Businesses have also begun to realize that the economic system is not independent of natural capital and that preserving the goods of life as we know them will require intelligent shared sacrifices within a framework of sound environmental laws and regulation.

Envy-Free Theory

Envy-free theory addresses the dilemma of allocating scarce resources through the use of complex mathematical formulae so that each individual believes that his or her share is equal to or better than that of anyone else who takes part in this resource sharing. The purpose of devising these mathematical formulae is to reduce or eliminate the envy that one individual may feel against another after the resource in question is allocated.

Over the past 50 years, mathematicians have developed several theories on how to fairly distribute scarce resources and have used the cutting of a cake to represent these devised formulae. Curiously, the application of envy-free theory dates back to more than 2,800 years ago. In his literary work *Theogeny*, Hesiod cited an example in which Zeus and Prometheus killed an ox, which had to be divided between them. Prometheus cut the ox in half but hid the tender portion under the hide of the ox to make it appear unappealing, with the result that Zeus selected the inferior, bony portion, which enraged him. This unsuccessful "cut and choose" method led to more arduous attempts to create quantitatively based, envy-free theories so that when one party cut the symbolic meat in half and the other party chose his or her half, they both would be satisfied. However, it was not until the 1940s that mathematicians such as Hugo Stenhaus questioned whether an envy-free theory could be developed for application to more than two persons.

Following Stenhaus, several mathematical methods were devised to create an envy-free division of resources for more than two individuals. One of these envy-free theorists, William Webb, combined his theory with several others.

In Webb's method, three pieces of a rectangular cake are distributed. The first person places his knife at the left edge of the cake and is instructed by the second person when to cut it, as the knife is moved to the right. The second person now believes that this cut piece is equal to one third of the entire cake and it is his or her turn to cut the cake. The second person is then told by the first person when to cut the slice. At this point, the first and second persons believe that all cut slices are equal. Now the pieces of cake are to be distributed and are selected in order: first by the third person, next by the second person, and last by the first person.

The distribution of the cake is now envy free because all three persons believe that their choice is equal to or better than the choices of the others. This method is actually mirrored in John Rawls's "difference theory," which supports any action if the least advantaged party believes that he or she is in a better situation than before. Some of the situations where an envy-free theory may be applied include heirs inheriting an estate, employees splitting a list of duties, parties in a divorce mediation, or students renting a house together.

Equal Employment Opportunity

This entry describes and explains the body of legislation and public policy known as equal employment opportunity (EEO). To best understand this complex and multifaceted set of issues, four main topics will be discussed: (1) definition of EEO, (2) the rationale and history behind EEO, (3) EEO and the Equal Employment Opportunity Commission (EEOC), and (4) EEO problems.

EEO Defined

EEO is employment practice that doesn't discriminate against applicants because of race, age, color, religion, sex, or national origin. The Civil Rights Act of 1964 proposed by John F. Kennedy (who was assassinated before he could see it passed) helped establish EEO. The Civil Rights Act of 1964 made racial discrimination in public places illegal, and it established the infrastructure and platform for EEO. Executive Order 11246, signed by Lyndon B. Johnson on September 24, 1965, required EEO. The order was a follow-up to Executive Order 10479, signed by President Dwight Eisenhower on August 13, 1953, establishing the antidiscrimination Committee on Government Contracts.

U.S. civilian employees, applicants, or former employees may file a complaint if they believe that they have been discriminated against in an employment matter on one or more bases of race, color, religion, national origin, sex (including sexual harassment), age (over 40), and disability (mental or physical). The workplace is supposed to be free of discrimination and offer equal opportunity for all.

The Rationale and History Behind EEO

There were many events that led to the establishment of EEO. The first presidential action ever taken against employment discrimination by private employers holding government contracts was Executive Order 8802, signed by President Franklin D. Roosevelt (FDR). It prohibited government contractors from engaging in employment discrimination based on race, color, or national origin. FDR signed this order in June 1941, on the eve of World War II, primarily to ensure that there would be no strikes or demonstrations disrupting the manufacture of military weapons as the country prepared for war.

In July 1948, President Harry S. Truman signed Executive Order 9981. The order required "equality of treatment and opportunity for all persons in the armed services without regard to race, color, religion or national origin." In December 1955, Rosa Parks, an African American woman, refused to give up her seat to a white man on the municipal bus in Montgomery, Alabama. She was arrested and charged with disturbing the peace. The arrest prompted a group of black citizens led by Dr. Martin Luther King Jr. to boycott the public bus system for 1 day, which resulted in a yearlong strike against the Montgomery public bus system. The boycott was successful and caused the desegregation of the Montgomery bus system.

School desegregation was a substantial challenge. In 1957, President Dwight D. Eisenhower had to send federal troops to Little Rock Central High School in Little Rock, Arkansas. Nine black students had been threatened by an angry white mob that opposed desegregation of public schools.

In March 1961, President Kennedy signed Executive Order 10925, prohibiting federal government contractors from discriminating on account of race and establishing the President's Committee on Equal Employment Opportunity. President Kennedy stated that this would help end job discrimination once and for all. In 1963, Congress passed the Equal Pay Act of 1963. This protected men and women who could perform equal work in the same environment from sex-based wage discrimination. The Equal Pay Act was the first civil rights legislation that focused on employment discrimination.

Also in 1963, approximately 250,000 American citizens of all races marched to Washington, D.C., for racial equality and justice. It was later called the March on Washington. The gathering was large but peaceful, and it assembled in front of the Lincoln Memorial, where the crowd heard Dr. Martin Luther King Jr.'s famous "I Have a Dream" speech. This was the largest demonstration in the country's history up to then.

Nearly 1 year later, after the longest debate in its 180-year history, Congress completed the Civil Rights Act of 1964 on June 19. The vote in favor of the bill was 73 to 27. On July 2, Congress officially passed the bill, and Lyndon B. Johnson signed the bill into law that same night. There were 500 amendments to the bill, and Congress debated on it for 538 hours. The Civil Rights Act prohibits discrimination on a broad spectrum of rights, including public accommodations, governmental services, and education. Title VII, a section of the act, prohibits discrimination based on race, sex, religion, and national origin. Title VII applies to private employers, labor unions, and employment agencies. The title became "the law of the land." The act prohibits discrimination in almost every aspect of employment, including recruitment, hiring, wages, assignment, promotion, benefits, discipline, discharge, and layoffs.

This title also created the EEOC. The EEOC opened its doors for business on July 2, 1965. The EEOC is a five-member bipartisan commission, whose job is to eliminate unlawful employment discrimination. The EEOC's primary responsibility is to receive and investigate charges of discrimination in the workplace. If it believes that the accusation is true, then it will attempt to negotiate a voluntary settlement.

EEO and EEOC

EEO disallows discrimination in employment based on race, color, disability, sex, religion, minority status, or national origin. EEO can affect anyone at any time and place where there is employment. The agency with jurisdiction over discrimination issues is the EEOC. The EEOC works to promote equity in employment practices and increase employment opportunities for those who suffer from employment discrimination problems. The EEOC investigates discrimination allegations through 50 field offices and determines when there has been employment discrimination. The agency is also responsible for reconciling organizations and employees, and in more serious cases, it is responsible for filing lawsuits. This commission is intended to provide support, assistance, and advice to management teams and their EEO programs.

The Civil Rights Act of 1964 protects people against employment discrimination based on race and color. EEO cannot be denied to any person because of his or her racial group or race-linked traits. EEO also cannot be denied to any person who is married to or resides with someone of a different color. The Civil Rights Act states that it is unlawful and unethical to discriminate on the basis of race and color regarding recruiting, hiring, wages and benefits, or promotions.

The EEOC supports five laws that protect people with disabilities. These five legislative acts were all meant to help reduce discrimination in employment for those with lifelong disabilities. These laws include the Americans with Disabilities Act (ADA), the Rehabilitation Act, the Workforce Investment Act, the Vietnam Era Veterans' Readjustment Assistance Act, and the Civil Service Reform Act. Most people with disabilities use the ADA. This law criminalizes discrimination again people with disabilities and promises equal job opportunities in employment as well as state and local government services. The ADA forbids employers from rejecting people with disabilities in everything from hiring to pay and benefits to promotions. Together, these five laws combine to help prevent and eliminate employment discrimination against individuals with disabilities.

EEO Issues

One major controversy confronting the EEOC concerned the pay of people who are victimized by discrimination. Generally, the minimum wage is a disadvantage to many minority groups and those who immigrate into the United States from other countries. Creating a minimum wage in the United States was intended to allow unskilled workers to earn enough money so that their families would not be in poverty.

However, it is alleged that the minimum wage has caused more unemployment of unskilled workers and that more teenagers are being employed because of the low pay. This was an important controversy for the EEOC because most of the people who receive the minimum wage feel that they are poorly compensated and rarely appreciated for their hard work. Although numerous nations such as the United States support the minimum wage, some argue that it causes inflation and unemployment, therefore not helping the poorest workers and slowing down economic growth.

A second controversy involved the male and female wage gap, or gender pay differential. Since the Equal Pay Act in 1963, the gap between women's and men's wages has decreased and narrowed; however, there still is a wage gap that has not been totally explained. Some evidence indicates that the law of supply and demand operating through the labor market was the main reason for this gap. However, many women argue that one explanation for this difference is gender preference. There is also the issue of comparable worth. Women point out that women are disproportionately represented in low-paying occupations such as primary school teaching, nursing, and social work. Yet it is argued these occupations require the same skills and qualifications as the higher-paying occupations dominated by men. Thus, gender discrimination in pay will end only when all persons in occupations with similar requirements get roughly equal pay.

Another basis of discrimination in employment is religion. Title VII of the Civil Rights Act of 1964 does not allow employers to discriminate on any terms of employment against people because of their religion. Employers cannot treat employees better or worse because of their religious beliefs and practices. Also, to make the workplace equal, employees cannot be forced to practice a religious activity as a form of employment. The EEOC monitors company compliance to prevent any discrimination involving religious practices by ensuring that employers do not place restrictions on religious expression. The need to avoid religious harassment has been emphasized by the EEOC, which also helps employers become accustomed to employees' legally guaranteed religious practices.

Some religious practices might interfere with the normal conduct of business. What if a Muslim must stop and pray five times a day during working hours? Can employees refuse to work on their religious holidays if they are needed by their employer at that time? These and similar vexing questions make reconciliation of employees' rights of religion and employers' right to require worker presence a difficult matter.

Excluded groups might constitute a final concern with regard to EEO. For instance, neither age discrimination nor sexual orientation is covered by EEO. On occasion, discrimination has been alleged by both extremes in the labor force, the youngest and the oldest. Gay and lesbian rights and privileges are not guaranteed or even recognized in EEO.

Equality

Equality is a fundamental concept in the modern political lexicon, drawn from a philosophical presumption of the equal worth of human beings regardless of their endowments, attributes, or socioeconomic worth. Equality is defined legally as equal-standing rights and responsibilities of individuals under the law, and it is understood politically as equal rights of participation in the process of government. The etymology of equality (Greek, *isotes*; Latin, *aequitas, aequalitas*) suggests qualities of correspondence and proportional value, wherein two or more distinct entities may be related or referenced to one another in certain ways, more than sameness or identical likeness, wherein two entities are indistinguishable from one another. Assertions of equality do not presume undifferentiated identity.

The concept of equality has long been recognized as fundamentally problematic. Factually, it is readily observable that people are unequally endowed with gifts and liabilities. In what respects are human beings equal? In what respects are they different and unequal? Why should people of different intelligence, character, and abilities be considered equal? If people are unique and different, what is the basis of their equality? Or is equality simply an abstract assertion of human dignity with no particular requirement for measuring material or social consequences? This entry traces the development of equality as a concept in political, economic, and distributive justice theory and then examines the concept of equality as applied to economic justice.

Equality: An Evolving Concept

The basic notion of human equality has deep roots in Western thought, although the assertion of universal moral, political, social, and economic claims based on equality is clearly a product of modernity. Even in modern times, those vigorously asserting the principle of human equality have questioned whether factors such as gender, social class, race, ethnicity, or religion should disqualify consideration of a person as human. The theoretical grounds for asserting human equality have evolved in a struggle to define and rationalize the constitutive elements of a common humanity in light of inescapable evidence of difference. In light of these differences, why should humans be considered equal?

Until modern times, human inequality and social stratification were understood as an irrefutable expression of an ontological hierarchy or divinely ordained chain of being. In a narrowly drawn universe of full human beings, contrasted with barbarians and other lesser creatures, Greek philosophers considered the reflective search for wisdom as the essential and universal element of human equality. Capacities of the soul were the factual and normative basis for some measure of equality among persons. Aristotle asserted the basic equality of persons in *Nicomachean Ethics*, declaring that because all humans are endowed with a rational soul to cultivate the path of virtue, all are therefore capable of happiness.

In the Christian era, theories of human equality emphasized the commonality of all people as creatures made in the image of God. In integrating classic Aristotelian philosophy with Christian theology, Aquinas distinguished between "natural law," accessible to all human beings through observation and reason, and the "revealed law" of religious texts and traditions, reframing Christian thought to accommodate both reason and revelation as complementary pathways to God. While early modern theorists continued to argue for some measure of human equality on both rational and theological grounds, a persistent tension between reason and revelation can be observed in the development of divergent theories of equality based either on religious cosmology or on the empirical observation of human nature. It was Descartes who tipped the balance of Western thought by placing human experience at the center of inquiry and meaning. While Descartes himself did not reject the existence of God, his *homo cogitens* became the model of the rational humanism that dominated Western philosophy until the 20th century. This radical positioning of humanity as the measure of its own meaning opened the door to exploration of the full implications of human equality beyond the boundaries of received human hierarchies.

Political Equality

The primacy of the political dimension in modern Western notions of equality is rooted in centuries of struggle as Europe evolved from the feudal domains of lords and subjects to modern nation-states of citizens and elected leaders. Theories of the human person, human communities, government, and the natural order were paramount in establishing an intellectual foundation for claiming universal political rights and freedoms based on equality. While classical philosophy and traditional religions provided some foundation for a theory of human equality, they also were embedded in a stratified view of the political, social, and economic order, which was increasingly perceived as onerous and oppressive. Before the modern era, political equality among citizens was considered to be a different issue from the intrinsic equality of persons. Both classical Athens and republican Rome developed limited theories of political equality, and elements of classical theory remain in modern political thought. The Athenian city-state and the Roman Republic exemplified some practices of political equality, although the political order of both was destroyed by a combination of class warfare and external threats that resulted in the emergence of imperial regimes. Plato and Aristotle distinguished between political equality and other forms of equality; both were advocates of equal treatment among equals, but both also believed that people should be rewarded according to their merit.

As post-Cartesians reflected on their received political hierarchies, they sought an alternative to the divine right theory to explain their origins and provide reasons to justify the claims of government for obedience from citizens and the duty of rational people to submit to the authority of government. The concept of a social contract gained traction as a humanist explanation for a stratified social order. In a rather pessimistic view of the human condition, Hobbes theorized in *Leviathan* a "covenant" wherein human beings at some point in time relinquished their natural freedom in exchange for the social benefits of orderly government. Believing that the natural selfish desire of human beings was to pursue their own interests at the expense of others, thus rendering them incapable of cooperation in building a peaceful society, Hobbes justified absolute rule as a necessary remedy that could not be altered. While this explanation did not assert claims of equality, the theory of civic authority and citizenship outlined in *Leviathan* posited the absolute authority of government on the humanist grounds of an original condition of social consent.

Locke is often seen as a turning point in the development of modern theories of political equality in establishing consent of the governed and toleration of diverse religious conscience as the principles for legitimate government. Locke grounded his theory of human equality in the human capacity for rational understanding in which people seek to fulfill two basic and universal drives well established by Descartes and Hobbes: (1) to know and understand their experience of the world and (2) to live as part of a peaceful and orderly society. From this position, Locke argued in his *Treatises on Government* that freedom and equality were the natural human condition from which individuals come together in forming a social contract of governance. Directly challenging the absolutism of Hobbes, Locke did not believe that the condition of original consent was irrevocable, reasoning that all people, including rulers, are constrained by the law of nature and that any powers of rule bestowed for the common good can be revoked if the governed lose faith in their governors.

In contrast with Hobbes, Rousseau argued in his *Second Discourse* that the natural human condition is one of freedom and happiness; in his view, it is society, with its laws and restrictions, that transforms the "noble savage" into an unnatural social condition of vice, manipulation, and disharmony. Rousseau did not, however, view human beings as equal but observed two types of inequality: the natural inequalities of age, health, physical traits, and attributes of character and the political inequalities created by human convention. In *The Social Contract,* Rousseau advocated a return to the natural state of nature in which individuals collectively exercised their political will in pursuing the common good and respecting individual freedoms. Social contract theories implicitly ground human equality in their recognition of individual rights and freedoms.

The concept of political equality has had a lasting impact on Western government. It is well known that Lockean principles of equality, freedom, and governance by consent were incorporated into the charters of new governments later established as the United States of America and the Republic of France. The charters and constitutions of modern democracies include explicit declarations of human equality as a justification for self-governance. For example, the U.S. Declaration of Independence asserts that the equality of persons is "self-evident." Article I of the French Declaration of the Rights of Citizens declares that human beings are born to enjoy freedom and equality of rights. The Preamble of the more recent UN Universal Declaration of Human Rights begins with a recognition of the "inherent dignity" and "equal and inalienable rights" of "all members of the human family."

Moral Equality

In formulating a secular foundation for equal moral worth among human beings as an unconditional metaphysical equality free from contingencies of fact, Kant has had a profound impact on the understanding of human equality. A rigorously unconditional assertion of human worth framed his categorical prohibition of all instrumental actions that would treat persons as means rather than ends in themselves. In positing the intrinsic value of the human person as the end of his or her own good rather than the instrumental means of another's good, Kant gave depth and substance to claims of political and social equality. The concept of unique moral worth established a humanist basis for attendant human rights, with lasting influence on the development of modern theories of equality.

The Kantian assertion of human equality as equal moral worth established the moral claim of the individual on society, with concomitant duties of equal protection of rights and freedoms. Following Kant, later humanists grounded arguments for equality in the assumption of unique moral worth, entitling individuals to the social, legal, and economic protection of rights and freedoms in upholding their personal dignity. Utilitarianism, for example, is based on presumptions of the equal value of human beings. The concept of maximizing utility achieves distributive justice by treating equally every person's right to the good. Therefore, what is good for the greatest number, regardless of political role or social status, is seen as the greatest good. While utilitarianism fails to account well for minority interests, it is a powerful force in the institutions and social policies of modern democratic states.

Williams outlined the fundamental considerations of equality as common humanity, moral capacities, and equality in unequal circumstances. He pointed to the "desire for self-respect" as the deepest quality of common humanity requiring affirmation. The unique human capacity for moral agency is further identified as a foundation of equality. The principle of equal protection of individual persons and their rights as the duty of government is clearly articulated in the constitutions of modern democracies. Contemporary understanding of equality has been widely framed along the lines of Williams as universal protection of human dignity, moral worth, and equality of opportunity. Rawls defined citizenship as a political function requiring full powers of moral agency among people who are free and equal. For Rawls, moral agency includes a capacity to understand, apply, and act from principles of political justice as well as a capacity to understand, envision, and rationally pursue the good.

Equality and Distributive Justice

The justice tradition of equality can be traced to Plato and Aristotle, who considered justice the foundation of a well-ordered society. Plato outlined his political ideal of civic justice in *The Republic,* explaining that individuals are the functional elements of a whole society, each person and class of persons with a valuable and specialized role. Although Plato understood this ideal city as a hierarchy of three classes, the overall ethos was one of mutual rights and obligations among citizens. This social arrangement was not thought to benefit only the city as a whole; each person was best able to achieve happiness in a society that was structured to recognize and reward people according to their varying talents, yet all were guaranteed protection and care as citizens.

Aristotle identified justice as one of four cardinal virtues, distinguishing between two types of justice: *distributive justice*, a principle of proportional equality requiring that people be accorded benefits and burdens with regard to merit, and *retributive justice* (also *rectificatory, corrective*, or *commutative justice*), a principle of exchange requiring strict, mathematical equality of "tit-for-tat" exchange as compensation for an injury or punishment for a crime to balance an injustice. He further identified *equity* as a principle of justice operating above the law through judicial means to correct inequities to universal justice created by the laws. The Aristotelian principle of equity was not an equality of undifferentiated sameness but impartial treatment of each person according to relative merit to maintain the balance of civic order. Aristotle's conception of civic justice required that power be exercised for the common good, not for the benefit of the governors or the favored segment of the population. The Aristotelian formulation of justice is institutionalized in modern society through law, the judiciary, and notions of civic duty.

Equality and Economic Justice

In modern times, persistent conditions of unmitigated poverty among developing nations and communities in a global economy of unprecedented wealth have generated questions about equality and economic justice. Marx examined the material aspect of equality, arguing that claims of equality must encompass the physical and economic conditions of individuals and social groups. What is the value of a vote without a job? And what is the benefit of expanding wealth concentrated in the bank accounts of a few when large numbers of people are hungry or lack shelter? The Marxist solution to this challenge was to eliminate private capital and collectivize property in the hands of the citizenry. While the Marxist experiment failed to deliver on its promise of universal material equality, the collectivist approach has had a lasting impact on most modern societies in the provision of social safety nets and entitlement programs that guarantee standards of living and quality of life for all citizens.

Modern liberal theories presume abstract, intrinsic equalities (pursuit of happiness, free will, supreme ethical worth) and concrete, discrete differences (bodies, property entitlements) among individual persons. The legal and political dimensions of equality are expressed as rights and freedoms involving, for example, speech, association, voting, and property. Consequently, these same individual freedoms become the foundation for material inequality; a wealthy individual's right to purchase and retain unlimited amounts of private property is protected, while an impoverished individual's right to even a minimal amount of property for basic shelter and livelihood is not acknowledged. This abstractly individualist framework of human equality forms a social ethic within which societies such as the United States are logically consistent in considering themselves free and democratic if their notions of equality are not manifested in the concrete form of jobs, housing, or health care. Because this framework fails to concretize equality in human needs or capabilities, conditions such as hunger, homelessness, unemployment, and poverty can be viewed as diverse expressions of individual freedom. Several contemporary theorists have attempted to augment the social justice aspects of equality.

Framing the foundation of equality as justice, Rawls argues that justice is fundamentally about fairness, wherein free and equal citizens engage in social cooperation in building a democratic political society. The concept of justice as fairness provides a philosophical and moral foundation for a democratic political economy. The basic concept at the heart of Rawls's theory of equality is that the social cooperation of citizens in a well-ordered political society will include a concern for economic distributive justice.

Rawls outlines social cooperation around essential features that assume equality among participants, both in the present generation and from one generation to the next. Social cooperation is guided by publicly recognized rules and assumes operational conditions of reciprocity and mutuality in pursuing the common good wherein each participant cooperates as a means of seeking his or her own rational advantage. Rawls asserts that rational people would choose a just political system not only to protect basic liberties but also to provide for the less advantaged in the knowledge that conditions of relative privilege or disadvantage are subject to change and chance. A political framework of justice creates cumulative collective advantages over time that constitute a cross-generational legacy of social equality providing continued protection and security for citizens in the present and their heirs in the future.

Sen applies the principles of equality and distributive justice directly to economic conditions, proposing a human-capabilities-based foundation for equality. Although acknowledging difficulties with basic capabilities equality, Sen sees this approach as a natural extension of Rawls's concern for primary goods with their focus on human utility. In Sen's view, a capabilities approach is focused on concrete measures of human flourishing rather than on the distribution of goods that are instrumental to flourishing. In this view, the development of concrete human capabilities is the foundation of a democratic society of equals.

Zucker extends the understanding of equality to economics in positing a social theory of property rights, holding that the just distribution of material resources is a defining characteristic of democracy. Challenging the prevailing economic and political theory, Zucker defines capitalism as an economic community constituted by social as well as individual agents, thus justifying some degree of economic redistribution based on the degree to which economic productivity is generated by social agency. In this view, individuals have rights to equal shares of at least part of the total social income of an economy. Zucker argues further that the individualistic foundation of political theory—including liberal theorists such as Rawls—fails to account for the social formation of the human person. Zucker theorizes that individuals formed within a political economy of reciprocity and mutuality develop capabilities for both self-determination and social determination.

Despite numerous attempts to bridge the theoretical gap between political and economic equality, there is at present no universally normative consensus about the concrete consequences and material conditions constituting the moral claims of equal human personhood. The diversity of philosophical approaches and public policy approaches taken by nations, states, and local communities reflects a range of responses to addressing the normative material claims of human equality in its political and economic dimensions.

—Lindsay J. Thompson

Equal Opportunity

Equal opportunity is the goal of laws, regulations, and policies attempting to ensure that similarly situated people are treated equally in virtually all aspects of life, including jobs, education, housing, public accommodations, and so forth. The United States has a long and difficult history regarding equality based on race, gender, ethnicity, and other characteristics. Women, blacks, Native Americans, Asians, Jews, gays, the differently abled, and others were variously denied the right to vote, not given equal pay for equal work, not allowed to have certain jobs, denied access to equal education, and denied access to public facilities and generally did not enjoy the same rights to pursue the same quality of life as white males. In an effort to live up to the statement in the Declaration of Independence that "we hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are life, liberty and the pursuit of happiness," the U.S. Congress has passed laws guaranteeing its citizens an equal opportunity to receive the basics determined to be part of a civilized and humane democratic society: housing, education, employment, voting, public accommodations, and receipt of federal funds. Equal opportunity encompasses a set of laws that are an attempt to rid the country of the effects of its history of denying equality based largely on immutable characteristics such as race, gender, or ethnicity.

The primary vehicle for providing equal opportunity is the Civil Rights Act of 1964. There are also other major laws providing equal opportunity on the basis of age or disability. States also have equal employment laws that by and large track those of the federal government, though some states have added other categories, such as affinity orientation, marital status, or political affiliation. The major equal opportunity laws are reviewed here.

Fourteenth Amendment to the U.S. Constitution

Arguably, the first major equal opportunity provision, the Fourteenth Amendment, ratified in 1868, undergirds much of the expectation that Americans have to be treated fairly and be treated the same if they are similarly situated. The amendment states that "all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws."

The Fourteenth Amendment was subjected to a great deal of resistance during its passage, since it was put in place to give the newly freed slaves the same rights as U.S. citizens, something they had not heretofore enjoyed. Under the law, the federal government, generally through the U.S. Supreme Court, could nullify state laws that operated to deny blacks the rights enjoyed by white citizens.

Despite passage of the Fourteenth Amendment, several southern states still maintained, either formally or informally, ironclad "Black Codes," which subjected blacks to a different set of rules and laws than whites. Such laws were in effect for nearly 100 years after passage of the amendment, until they were outlawed by the Civil Rights Act of 1964. The Fourteenth Amendment's denial of equal protection and due process has become the primary means of challenging laws that create barriers to equal opportunity in the United States.

Fifteenth Amendment to the U.S. Constitution

The right to vote was granted to blacks after the Civil War ended slavery in 1865 and Congress passed the Fifteenth Amendment to the U.S. Constitution in 1870. The Fifteenth Amendment provided that the right to vote "shall not be denied or abridged on the basis of race, color or previous condition of servitude," thus nullifying the laws passed by states to prohibit blacks from voting. The Enforcement Act of 1870, providing criminal penalties for interference with the right to vote, and the Force Act of 1871, providing for federal election oversight, allowed a brief time of Reconstruction-era voting and election to office by blacks. Since blacks outnumbered whites in five southern states and had substantial numbers in other southern states, this resulted in their election to office, and even to the governorship of Louisiana (which lasted only 1 month, due to white resistance). This period of seeming equality was, however, short-lived due to the rise of the Ku Klux Klan and its attendant violence designed to return the south to the pre–Civil War status quo. The Fourteenth Amendment required state governments, like the federal government, to ensure that citizens have a right to due process and equal protection, while the Fifteenth Amendment granted to blacks the right to vote.

Nineteenth Amendment to the U.S. Constitution

This provision, ratified in 1920, granted women equal opportunity in voting by allowing them to vote in elections. Gender-based disenfranchisement had been the norm since the country's founding and was nullified only after an acrimonious decades-long fight by those believing the disenfranchisement to be totally at odds with the Declaration of Independence and the U.S. Constitution. Women's suffrage, as the movement to gain voting for women was called, included a group called the Silent Sentinels, who staged an 18-month demonstration outside the White House to gain voting rights for women.

The Civil Rights Act of 1964

This major equal opportunity law was passed largely in response to the turbulence erupting from the Civil Rights movement in response to racial discrimination and "Jim Crow" segregation in the United States, primarily in the south; it guaranteed equal opportunity for all citizens in housing, education, employment, voting, and receipt of federal funds. The Civil Rights Act, one of the most ambitious pieces of legislation in the history of civilization, is divided into titles that address the various contexts for protection.

Title I: Voting

Equal opportunity in voting was included in the Civil Rights Act of 1964 because blacks were routinely denied the right to vote, particularly in the south, despite the Fifteenth Amendment and other legislation passed after the Civil War guaranteeing them the right to vote. In the same year that the Civil War ended, the Ku Klux Klan was born. Violation and intimidation by the Klan and other such white supremacist groups increased after the federal troops left the South in 1877. The federal troops had been in the South since the end of the Civil War in 1865, during the period known as the Reconstruction. Without the presence of the federal troops, life reverted to much the way it had been during slavery.

Blacks' homes were burned down, jobs were taken away, and poll taxes were imposed, with the knowledge that blacks would not be able to pay to vote. Blacks were routinely intimidated, harassed, beaten, and lynched for attempting to register to vote. Their economic lives were also threatened, as most were employed as menial laborers for whites, and it was understood that they would lose their jobs if they voted. Those who made it inside the voting registrar's office were often asked to explain extremely difficult arcane passages from the Constitution, asked questions such as how many bubbles there are in a bar of soap or how many grains of sand there are on the beach, or asked to pay poll taxes that were far out of their financial reach. This was not done to whites, which ended in leaving the voting to them. Blacks were effectively disenfranchised for the next nearly 100 years until passage of the Civil Rights Act in 1964.

Realizing that the Civil Rights Act of 1964 was not enough to curtail the continued harassment of black voters, the next year, Congress passed the Voting Rights Act of 1965, but not before the events of March 7, 1965, and what became known as "Bloody Sunday." In the Selma-to-Montgomery March for Voting Rights, 600 nonviolent civil rights protesters attempted to walk from Selma to Montgomery, Alabama, via the Emund Pettus Bridge, to demonstrate the need for federal voting legislation. They were met with mounted police on horseback and dogs, which were set loose on the crowd. Television coverage horrified the nation, and after obtaining a court order to allow the march, 25,000 marchers from across the country and world successfully made the trek on March 21, 1965. Less than 5 months later, the Voting Rights Act of 1965 was passed. The act outlawed the kinds of impediments to voting and registering to vote that had routinely been used to disenfranchise blacks since after the Reconstruction. The U.S. Department of Justice Civil Rights Division enforces voting laws.

Titles II and III: Public Accommodation

At various times, blacks, Native Americans, the Irish, Jews, and others were not allowed into public places or to use public facilities. Libraries, theaters, restaurants, public auditoriums, swimming pools, recreational facilities, parks, hotels, stores, public transportation, and other places were all off-limits to them, especially to blacks. If blacks were allowed in, they often had to sit in a different place from whites. For instance, in theaters, blacks often had to sit in the balcony or attend on different days from whites; blacks had to board public buses and pay the full fare, then get off, go to the back of the bus, and take a seat in the rear. If a white person needed a seat, the black person would have to get up and give his or her seat to the white person, even though both had paid full fare. If blacks were allowed into restaurants at all, they generally had to go to the rear entrance and order their food to take away. Some towns had special days for blacks to shop, and fairs had special days for blacks to attend.

The Civil Rights Act prohibited these practices and required equal access to public facilities. Blacks and others were no longer denied the right to enter into or use public facilities. Private clubs and facilities such as country clubs can still discriminate, however.

Title IV: Education

Prior to passage of the Civil Rights Act, many public schools remained segregated even though the

U.S. Supreme Court had outlawed them in its 1954 *Brown v. Board of Education* decision 10 years earlier. Black children were not permitted to go to school with whites and did not have access to the same funding, materials, facilities, and programs that were provided to white students. Black schools were generally in poor condition, with few supplies and books. Often, the first few days of school were spent taping up discarded, outdated books from white schools to be used by black schools since the white students had received new textbooks.

Such acts were outlawed by the Civil Rights Act of 1964. Equal opportunity in education is enforced by the U.S. Department of Education's Office of Civil Rights.

Title V: Housing

Prior to passage of the Civil Rights Act, segregation on the basis of race or ethnicity in housing was widespread. Restrictive covenants in property deeds were common. Such covenants dictated that the property could not be sold or rented to certain groups, such as blacks or Jews. Owners routinely refused to sell or rent their property to blacks or Jews regardless of their appearance, ability to pay, education levels, or jobs. If they did rent or sell to blacks or Jews, whites living in the area would soon move away, and the property values would decrease. Such practices relegated the groups discriminated against to enclaves exclusively peopled by those groups.

Under the provision that prohibited discrimination in programs receiving federal funds, the Civil Rights Act outlawed such practices. To further strengthen its commitment to equal opportunity in housing to ensure equal access to housing, in 1968, Congress passed the Fair Housing Act as Title VIII of the Civil Rights Act of 1968. The law prohibits discrimination in the sale, rental, and financing of dwellings and in other housing-related transactions, based on race, color, national origin, religion, sex, familial status (including children under the age of 18 living with parents or legal custodians, pregnant women, and people securing custody of children under the age of 18), or disability, and provides the structure for equal housing opportunity. Equal opportunity in housing is overseen by the U.S. Department of Housing and Urban Development's Office of Fair Housing and Equal Opportunity, which administers the federal laws and establishes national policy that ensures that everyone has equal access to housing on a nondiscriminatory basis.

Title VI: Federally Assisted Programs

From federally guaranteed school loans to welfare, from schools and universities that receive federal funding and grants to arts programs funded by government grants, no one can discriminate, and all must provide equal opportunity in their programs.

Title VII: Employment

Title VII of the Civil Rights Act of 1964 prohibits discrimination in employment on the basis of race, color, gender, religion, or national origin by employers with 15 or more employees, labor unions, and employment referral agencies. Sexual harassment and pregnancy discrimination are also prohibited as types of gender discrimination. Under Title VII, the prohibited categories cannot be used as a basis for employment decisions of any kind, including hiring, firing, discipline, promotions, raises, or any other term or condition of employment. The Equal Employment Opportunity Commission (EEOC) enforces claims of all bases for employment discrimination under Title VII, the Equal Pay Act, the Age Discrimination in Employment Act, and the Americans with Disabilities Act. By law, the EEOC must dispose of all claims filed, as appropriate, and does so through mediation, conciliation, investigation, and, if necessary, litigation. The agency's role has been strengthened over the years by Congress, and it is considered the top equal opportunity agency in the United States.

The Equal Pay Act of 1963

Enacted into law even before the Civil Rights Act of 1964, the Equal Pay Act prohibits pay discrimination based solely on gender. Under the law, men and women must be paid the same wages for work requiring equal skill, effort, and responsibility and performed under similar working conditions. Wages can be different based on other factors, such as the quantity or quality of production, a valid seniority system, a valid merit system, or any factor other than gender.

The Americans with Disabilities Act of 1990

The Americans with Disabilities Act of 1990 provides equal opportunity in employment and access to facilities to those who have a physical or mental impediment that substantially affects a major life function, who have a record of such an impediment, or who are perceived to have such an impediment. If the employee with disabilities is otherwise qualified and can perform the job, with reasonable accommodation that does not cause the employer undue hardship, and the employee presents no threat to the safety of people or property, the employer cannot discriminate against the employee because of his or her disability.

The Age Discrimination in Employment Act of 1967

Employees aged 40 years or older may not be discriminated against in employment and must be given an equal opportunity to work. Such employees may not be terminated and replaced with younger employees, have their job duties diminished solely because of age, be denied training, or be otherwise denied equal employment opportunity because of their age. The EEOC handles claims of age discrimination.

The Family Medical Leave Act of 1991

The Family Medical Leave Act of 1991 (FMLA) provides up to 12 weeks of unpaid leave for employees who take time from work because they or their child, spouse, or parents are ill or because they have a new biological, adopted, or foster care child. Men are often denied this leave based on gender stereotypes and expectations that women will handle such matters. Historically, women were often denied such leave or were given the leave but found on their return to work that they had been demoted or terminated and their benefits, leave, and/or seniority suspended during their absence. This is illegal under the FMLA. FMLA claims are handled by the U.S. Department of Labor's Employment Standards Administration, Wage and Hour Division.

Executive Order 11246

This is one of the most controversial sources of equal opportunity. The executive order, signed into law by President Lyndon B. Johnson in 1965, dictates that those who wish to provide goods and services valued at $10,000 or more to the federal government or through contracting with the federal government must agree not to discriminate on much the same bases as those mentioned in Title VII of the Civil Rights Act. If the amount involved is $50,000 or more, in addition to not discriminating, the contractor must also conduct a workplace assessment to determine the participation of women and minorities at all levels of the contractor's workplace. If there is a significant underrepresentation of women and minorities, given their availability in the area from which the contractor's employees are drawn, then the contractor must devise a plan to remedy this underrepresentation. This is generally called an affirmative action plan.

Those who feel adversely affected by the operation of an affirmative action plan have brought lawsuits on the basis of "reverse discrimination." That is, although Title VII is designed to protect everyone equally, they allege that the operation of the affirmative action plan to include those shown to have been excluded from the workplace discriminates against them and should not be allowed to be used. Affirmative action has also been used in the area of college admissions and minority set-aside programs. The theory is that unless there is a conscious effort to include groups traditionally excluded from the workplace and educational institutions, the underrepresentation will continue despite the laws prohibiting discrimination.

Affirmative action may only withstand court scrutiny if done properly. Quotas are prohibited, though the employer may set goals, setting forth appropriate numbers, to attempt to attain more representation of the underrepresented groups given their availability in the area from which employees are drawn, as well as timetables within which these goals should be accomplished. However, the plan is not cast in stone and can be adjusted as circumstances dictate. Availability only applies to those who are available for the type of job under consideration. For instance, if there are 38% females in the population, it does not mean that 38% are qualified to be doctors. Nothing in the law requires that someone who is not qualified be given a job or admission to college, and the law specifically prohibits employers from taking those presently in jobs out of them to make space for someone pursuant to an affirmative action plan.

The law provides no specifics as to what affirmative action must be taken to correct a significant underrepresentation, but certain approaches have been deemed by courts to be inappropriate. Setting quotas is not permitted. In the seminal 1987 U.S. Supreme Court case of *Johnson v. Transportation Agency, Santa*

Clara County, California, the high court ruled that plans that take into account factors such as race and gender are permissible if the plan is to address a manifest imbalance that reflects underrepresentations in the workplace of traditionally excluded groups, race or gender is only one of several factors considered, the plan is made to attain rather than maintain a balanced workforce, and the plan does not unnecessarily trammel the legitimate settled rights of other employees or create an absolute bar to their advancement. If these factors are adequately addressed in the affirmative action plan used by the employer, then the plan will be able to withstand judicial scrutiny in court when the plan is challenged as reverse discrimination.

In addition to the EEOC, there are several other federal government offices whose missions are to enforce equal opportunity in various contexts, including the U.S. Department of Justice, Office of the Attorney General, Civil Rights Division; the U.S. Commission on Civil Rights; the U.S. Department of Health and Human Services, Office for Civil Rights; the U.S. Department of Agriculture, Civil Rights Office; the Federal Aviation Administration, Civil Rights Office; the U.S. Department of Transportation, Civil Rights Office; and the U.S. Department of Labor, Civil Rights Enforcement for Department of Labor Grant Recipients.

Equal Pay Act of 1963

The Equal Pay Act of 1963 (EPA), signed by President John F. Kennedy, came into effect on June 11, 1964. It was designed to reduce the pay differential between men and women for substantially equal work within the same organization. The EPA is part of the Fair Labor Standards Act of 1938, as amended. This act, administered and enforced by the Equal Employment Opportunity Commission, prohibits all employers from wage discrimination between men and women in the same establishment who are performing under similar working conditions. If there is a pay differential, the employer must be able to demonstrate that it is based on seniority, a well-defined merit system, a system that measures the quantity or quality of productive output, or some factor other than sex. Employees filing claims under the EPA are not required to show that their employer intended to engage in sex-based discrimination. Although the concept of comparable worth was considered in the formulation of this act, it was rejected in favor of the definition of equal work. Equal work was understood to indicate substantially equal, but not necessarily identical, job tasks, effort, and responsibilities.

Congressional hearings in the spring of 1963 reflected the broad national debate that preceded and followed the passage of the EPA. The statement prepared for Congress by the National Retail Merchant Association (NRMA) exemplified the concerns of many businesses regarding the proposed act. While the NRMA asserted their enthusiastic support for the principle of equal pay for equal work, the bulk of their statement argued that federal legislation was unnecessary, burdensome, confusing, and unenforceable. Furthermore, they pointed out, higher rates of absenteeism for women increased the employers' cost of employing women. Additional costs included the necessity of constructing additional seats, lunchrooms, and bathrooms for women and the anticipated provision of longer meal and rest periods for women.

Vociferous contrasting views were presented to Congress by the Women's Department of the United Auto Workers' Union. In support of the EPA, they argued that unequal pay was immoral in depriving women of earned payment, unjust in penalizing the lowest-paid workers, inefficient in causing resentment among employees, uneconomic in incentivizing the inefficient use of workers, and contrary to the interest of the community in penalizing fair-minded employers while providing a cost bonus to employers who discriminated against women.

Since the passage of the EPA, sex-segregated job listings have disappeared, and overt sex discrimination in workplace compensation has diminished. However, the wage gap between men and women continues. In 1963, women earned 59% of the wages earned by men; in 2002, women earned 76% of men's wages. Although this oft-cited statistical indicator includes a measure of the wages of dramatically unequal positions as well as those with substantively equal tasks, it is widely acknowledged that the goal of equal pay for equal work articulated by the Equal Pay Act of 1963 has not yet been fully achieved.

EQUAL SACRIFICE THEORY

Equal sacrifice theory maintains that all members and sectors of society should make equal sacrifice for the common good. This theory has been critical to political economy since the 18th century, particularly as it pertains to taxation. Yet the idea is broader than the economics of taxation: Both the Old and the New Testament of the Judeo-Christian Bible emphasize charitable personal sacrifice—the Hebraic requirement of tithing and Jesus's parable of the poor widow giving up two coins to the collective pot; the idea even appears in 20th-century American poetry—in Robert Frost's "In Equal Sacrifice." In economics, equal sacrifice theory developed from historically and ethnically diverse strains: the 18th-century Frenchman Jean-Baptiste Say; the Swiss Jean-Jacques Rousseau; and the British William Gladstone, John Stuart Mill, and F. Y. Edgeworth. Throughout the 1900s and into the 21st century, American and British tax debates have employed equal sacrifice arguments over the costs and burdens of pre– and post–World Wars I and II and in equitably sharing the costs of ongoing, global military conflicts and commitments for the greater good.

Equal sacrifice is subject to differing interpretations yet is often measured in absolute, proportional, and marginal terms: (1) equal absolute sacrifice (where each taxpayer surrenders the same degree of utility that one obtains from one's income), (2) proportional (where each sacrifices the same proportion of utility from one's income), and (3) marginal (where each surrenders the same utility from one's income). Typically, vertical and horizontal notions of equality enter into these analyses. Equal taxation (equal treatment of equals, dissimilar treatment of dissimilars) reflects horizontal equality; progressive treatment of unequals (rich vs. poor) reflects vertical equality. A "flat tax" indicates horizontal equality and "progressive taxation" indicates vertical equality of sacrifice. Political economists use equal sacrifice theories to balance the social benefits of equality with incentives to work and to profit from one's labor and productivity.

Although Smith's 18th-century maxim says that taxation should place the same pressure on everyone, as nearly as possible, equal sacrifice theory was not fully developed until it incorporated the "ability-to-pay" principle into a standard theory of political economy, Mill's *The Principles of Political Economy*, Book 5. Often viewed as the most equitable taxation policy, still used in most industrialized economies, this principle holds that taxation be levied according to one's ability to pay, making the wealthier pay a proportionately higher tax toward the national tax demand. Determining a fair measurement of input according to one's economic contribution, labor, and production and assessing equal values and tax burdens across such disparate bases are problematic. Government must also determine how the inequality of differing tax burdens and benefits, sacrifices and payouts, would yield economic growth without social exclusions and curtailment of individual freedom. Equity and efficiency then are not equivalent factors in evaluating equal sacrifice.

A progressive tax system seems equitable under utilitarian ethics, because under the general happiness principle, tax burdens are assigned only to maximize general welfare. The modern theory of income tax progressivity begins with the utilitarian calculation of the sum total of benefits and costs, viewing unequal taxation as the trade-off between the social benefits of an equal distribution of after-tax income and the potential fiscal damage imposed by highly progressive taxes. The result is not equality but a leveling of higher incomes, which leads to minimum aggregate sacrifice.

Questions concerning the degree of tax progressivity rely not only on the tenor of taxpayers' responses to high tax rates but also on core issues concerning the government's role in determining the "value" of a tax dollar taken from a low-income family versus that from an upper-income family. Tax burdens are not to be determined according to what taxpayers get from the government but according to their ability to bear the tax imposed—that is, to tolerate the sacrifice. What benefits citizens receive from their taxes and how tax dollars are distributed differently to meet competing demands and benefits must be politically negotiated.

Equilibrium

Equilibrium is a condition of balance in which all influences on a system are held in check and no change occurs. Disequilibrium is the condition of change resulting from some alteration in these influences. Market equilibrium, Nash equilibrium (NE), and reflective equilibrium are the three prevalent types in economic, strategic, and ethical analyses, respectively.

Market Equilibrium

Economists distinguish between general and partial equilibrium analyses in market systems. Partial equilibrium analysis examines individual markets or the decisions of particular firms or households, holding constant other considerations actually varying in general equilibrium analysis. Such partial analysis can therefore be wrong. General or static equilibrium represents the condition in which the equality of all quantities of supply and demand yields no incentive for market behavior to change. If supply exceeds demand, business production will increase. Business will lower product price until equality in supply and demand is restored to stable equilibrium. In supply-demand models, a unique price exists, the "equilibrium price." Algorithms and curves graphing dependent and independent quantitative terms and variables represent these common marketplace operations.

In examining market models, one considers those forces that make and maintain an equilibrium price. This determination lies in the reaction of sellers and buyers to disturbances or shocks in the market. For instance, market price can be forced above equilibrium such that supply decisions by producers with respect to output exceed the amount demanded by consumers; then, a surplus results. Competition provides its market gravity force to maintain or restore the equilibrium price. If surpluses exist, competition among sellers forces prices downward. If shortages exist, competition among buyers forces prices upward. In typical market behavior, surpluses are the result of market prices exceeding the equilibrium price such that price-cutting behavior helps restore this equilibrium price. Shortages occur when market prices assume values below the equilibrium price; bidding helps restore the equilibrium. However, this regulating, balancing act does not always obtain.

The market system has to operate efficiently by providing incentives to weigh costs and benefits. The profit incentive should make businesses competitive by aiming to minimize costs and to use the most efficient technology and means to make their products sell at the best price (equilibrium). When there are no "externalities" (e.g., requirements for clean air, potable water, public safety), businesses weigh private benefits and costs only in their production choices. Imperfect markets, subject to inefficiency, arise from imperfect information, incomplete or incorrect information concerning products, costs, and pricing. A monopoly indicates imperfect market competition (a form of disequilibrium).

The market itself cannot reveal all costs and benefits, nor can these be perfectly weighted to yield market efficiency. In any imperfectly competitive system, wide variations in production and monetary and human resources (labor) yield disequilibria points between supply and demand that interact over time. Further difficulties arise when computing and inputting untidy, historical changes and stressors into quantitative graph analyses. Variable economic growth, military engagements, unemployment, inflation, and natural disasters are not simple demand- or supply-side factors; hence, equilibria points cannot be fixed or mapped reliably. Other complications stem from unpredictable human inputs—anxiety-based behavior and uncertainty, cautious protective hoarding of resources or savings, risky consumer and investor behavior, and the gambling mentality of assuming high stakes and high debt. Such variables constitute hard balancing acts in maintaining equilibrium.

Nash Equilibrium

NE signifies an optimum game strategy whereby no one player can benefit by changing his or her strategy while all other players keep theirs the same. For market behavior, NE assumes that "average" agents act "as if" rational, and those who are not (rational) are competed out of the market. The "market" and its evolution presumably have the inherent capability of testing all strategies; thereby, any irrational agent or agency would disappear. However, NE does not always prevail, and one cannot assume such rationality over time.

Reflective Equilibrium

Reflective equilibrium applies in ethics when the consequences of one's general principles are consistent with one's opinions about individual cases. John Rawls described such a process whereby decision makers consider alternative judgments in deciding right action in a particular case and in providing reasons or principles for their judgment. Critics raise concerns about reflective equilibrium, deeming the regulatory role of rationality suspect when made supreme in decision making.

Conclusion

Even ordinary consumers and producers should take heed of such theoretical, ethical, or mathematical analyses, how algorithms are made, rules written, and decisions made. Much is at stake in using equilibrium or disequilibrium models in market analysis. Economic theories adopt premises such as "Markets are efficient," "A stock's price reflects actual value," and "Speculators are rational in their decisions to maximize their wealth." Presumably, all these suffice in eliminating other contrary factors, such as mob instincts, greed, and "irrational" speculative "bubbles." A bubble is an unsustainable increase in prices caused by investors' buying behavior, instead of correct information about value. Real estate and energy industry bubbles and market collapses such as the "dot-com" business in 2000 indicate the unpredictable side of economics.

In doing practical business ethics, controversy ensues over methodology and deliberative processes. Instead of being conceived as generalists in their principles and rule making and mathematical in their graph making and observance, perhaps deliberative agents should be studied as particularists and casuists, who in deciding and judging must employ a detailed understanding of the specific case and situation. Nevertheless, in decision making, using these general processes and strategies—market equilibrium, Nash equilibrium, and

Rawlsian reflective equilibrium—seems worthwhile as a starting point and in explaining economic behavior and market outcomes. Though there are other gauges for evaluating the intentions and outcomes of economic agents, equilibrium provides a viable model for this process.

Ethical Culture and Climate

Interest in ethical culture has increased since the U.S. Sentencing Commission revised its guidelines for sentencing organizational defendants in 2004. Because of concerns that organizations were developing "window dressing" ethics and compliance programs, these revised guidelines call for more attention to the ethical "culture" of the organization and the need to align formal ethics programs with this broader ethical culture.

Ethical climate and culture represent somewhat different but related ways of thinking about the environment in organizations, which can influence organizational members' ethics-related attitudes and behaviors. Like the organizational climate and culture literatures more generally, these ways of thinking about the ethical environment in an organization have developed somewhat separately, but both refer to aspects of the organizational context that are thought to influence ethics-related attitudes and behavior.

The term *ethical context* is a broader term and can refer to both ethical climate and culture. The idea that the ethical context in an organization would influence employee attitudes and behaviors is based on assumptions about employee susceptibility to organizational influence when it comes to matters of ethics. This assumption, based on social scientific theories of human behavior, studies of moral development, obedience to authority, and the like, argues that the behavior of human beings is often influenced by factors outside the individual. In work organizations, those factors might include peers, leaders, rewards, and punishments as well as the messages sent by the organization about appropriate conduct.

The ethical climate approach to thinking about ethical context was developed in the late 1980s by Victor and Cullen. The authors defined ethical climate as employee perceptions of ethics-related organizational practices and procedures and proposed that ethical climate would differ between organizations and would be associated with ethics-related attitudes and behaviors. As originally proposed, ethical climate included nine dimensions based on the intersection of three philosophical perspectives (egoism, benevolence, and principle) and three loci of analysis (individual, local, and cosmopolitan). The Ethical Climate Questionnaire was used to measure these dimensions. Each specific climate is accompanied by a normative expectation that is expected to guide attitudes and decision making. For example, employees in an egoistic-individual climate should be guided by self-interest, while those in an egoistic-local climate should be guided by company interest, and those in an egoistic-cosmopolitan climate are guided by an efficiency criterion. Organization members in a benevolent individual, local, or cosmopolitan climate are concerned about the welfare of individuals and groups inside and outside the organization, respectively. Finally, individuals in a principled individual, local, or cosmopolitan climate should be guided by their personal morality, organizational rules and regulations, or societal laws and codes, respectively.

In empirical investigations, researchers have found evidence of fewer than the nine proposed dimensions (generally five). Some of these dimensions overlap with the theoretically proposed climate dimensions, and some combine the aspects of different dimensions. Additional construct validity work will be required to confirm the dimensionality of the ethical climate construct and the relationships between those dimensions, the proposed theory, and outcomes.

Researchers have also explored the relationship between employees' perceptions of the ethical climate and employee attitudes (e.g., organizational commitment) and behaviors (e.g., ethical conduct). Multiple studies have found employees' organizational commitment to be positively related to benevolent climates and negatively related to egoistic climates. In addition, several ethical climate dimensions have been associated with ethical/unethical conduct on the part of organizational members.

Ethical climate was also found to vary between firms. But in refining thinking about ethical climates, researchers have asked whether ethical climates might also vary within organizations by work group or department. For example, a study in a large financial services firm found that different ethical subclimates exist in different departments, consistent with the departments' primary task and the external stakeholders served.

The ethical culture approach was originally introduced by Treviño as part of an interactionist model of individual and contextual influences on ethical decision-making behavior in organizations. This work was later expanded to develop an understanding of ethical culture as a combination of organizational structures, systems, and practices that can influence employees' ethics-related attitudes and direct their ethical conduct. Ethical culture was defined as a subset of the overall organizational culture that represents the interplay of multiple formal and informal cultural systems that either work together or at cross-purposes to support ethical or unethical conduct. For example, formal systems include policies such as codes of conduct, explicit leader communications, formal decision-making processes, reward and performance management systems, reporting systems, authority structures, and training programs. Informal systems include informal norms of daily behavior and leader role modeling as well as organizational rituals, heroes, and stories. Member behavior is expected to be more ethical to the extent that these systems are aligned and supportive of ethical conduct.

Because ethical climate and ethical culture were both proposed to represent the ethical context of an organization, which could influence attitudes and behaviors, it became important to attempt to understand the relationship between ethical climate and ethical culture. Treviño and colleagues incorporated measures of both ethical climate and culture and investigated the relationships of these constructs to each other and to employees' attitudes and behaviors. That 1998 study found 10 ethical context factors representing three ethical culture dimensions and seven ethical climate dimensions that were found to be separate from each other. However, at the same time, many of the culture and climate dimensions were statistically related to each other, making it difficult to tease apart their separate effects on outcomes.

The study found that ethical climate and culture measures were about equally able to predict an employee attitude, organizational commitment. Employees who believed that their organizations supported employees and cared about the community (ethical climate dimensions) were most likely to identify with the organization and share its values. The overall ethical environment (focused on the culture dimensions of leadership, reward systems, and organizational norms) and obedience to authority were the most influential culture dimensions. An obedience-to-authority culture is one that demands unquestioning obedience (e.g., "Do as I say and don't ask questions"). Employees whose organizations' overall ethical environment supported ethics and did not have a strong obedience-to-authority culture were more committed to their organizations.

When studying ethical/unethical behavior, the researchers found somewhat different results for those working in organizations with and without an ethics code. For those working in organizations with an ethics code, the overall ethical environment and obedience-to-authority dimensions of culture were again the best predictors. To the extent that leadership, reward systems, norms, and authority structures supported ethics, employees said that there was less misconduct in the organization. Two climate dimensions (law and professional code and self-interest climate) were also influential. However, for those working in organizations without an ethics code, a single climate dimension, self-interest climate, explained much of the variance in ethical/unethical behavior. This is a climate in which people are simply out for themselves. So, to the extent that employees perceive such an environment, more unethical conduct is also reported.

In addition, research has found that the existence of formal ethics programs that included codes, training programs, and reporting systems has less influence on important ethics-related outcomes (misconduct, willingness to report problems to management, etc.)

than more informal ethical culture factors such as leadership, reward systems, and employees' perceptions of fair treatment. These aspects of the ethical culture appear to combine to create an organizational message to employees about whether the organization cares about ethics as much as other important outcomes (e.g., bottom-line success) and whether its formal programs are to be taken seriously.

Leaders have been expected to play a particularly important role in creating a supportive ethical environment in the work organizations they lead, creating the tone at the top. But we are just beginning to learn more about how they do so. Among other things, leaders can influence followers by role modeling ethical behavior, communicating a set of ethical values, and holding employees accountable. In fact, research has found that executive leaders can influence perceptions of the ethical climate of the organizations they lead if they have high levels of cognitive moral development and their actions are consistent with these levels, meaning that the leaders are behaving to their moral development capacity and thus are more likely to role model ethical behavior. This appears to be especially true in younger firms.

Although questions remain about the best way to conceptualize and measure the ethical context of work organizations, and much more research will be needed to understand which aspects of ethical climate and culture are the most important, the research conducted to date suggests that the organizational context clearly does influence employees' ethics-related attitudes and behaviors. It also suggests that organizations must go beyond the establishment of formal ethics and legal compliance programs if they wish to create a context that truly supports employee ethical behavior.

Ethical Decision Making

Ethical decision making is a cognitive process that considers various ethical principles, rules, and virtues or the maintenance of relationships to guide or judge individual or group decisions or intended actions. It helps one determine the right course of action or the right thing to do and also enables one to analyze whether another's decisions or actions are right or good. It seeks to answer questions about how one is supposed to act or live.

Ethical Decision-Making Process

Many ethics scholars have developed models of ethical decision making or provided us with specific procedural steps enabling one to reach an ethically supported decision or course of action. In the abstract, this process is a fairly rational and logical course. In reality, ethical decision making is filled with abstractness, illogic, and even whim. Nonetheless, the following is a synthesis of these models and procedures.

Step 1: Identify the Ethical Dimensions Embedded in the Problem

In the first step of the ethical decision-making process, the decision maker must be able to determine if an ethical analysis is required. The decision maker must determine if there is a possible violation of an important ethical principle, societal law, or organizational standard or policy or if there are potential consequences that should be sought or avoided that emanate from an action being considered to resolve the problem.

Step 2: Collect Relevant Information

The decision maker must collect the relevant facts to continue in the ethical decision-making process. Related to Step 1, if an ethical principle, such as an individual's right, is in jeopardy of being violated, the decision maker should seek to gather as much information as possible about which rights are being forsaken and to what degree. A consequential focus would prompt the decision maker to attempt to measure the type, degree, and amount of harm being inflicted or that will be inflicted on others.

Step 3: Evaluate the Information According to Ethical Guidelines

Once the information has been collected, the decision maker must apply some type of standard or assessment criterion to evaluate the situation. As described below, the decision maker might use one of the predominant ethics theories—utilitarianism, rights, or justice. Adherence to a societal law or organizational policy may be an appropriate evaluation criterion. Others may consider assessing the relevant information based on a value system where various ethical principles or beliefs are held in varying degrees of importance.

Step 4: Consider Possible Action Alternatives

The decision maker needs to generate a set of possible action alternatives, such as confronting another person's actions, seeking a higher authority, or stepping in and changing the direction of what is happening. This step is important since it is helpful to limit the number of actions that it may realistically be possible to respond to or that may be required to resolve the ethical situation.

Step 5: Make a Decision

In Step 5, the decision maker should seek the action alternative that is supported by the evaluation criteria used in Step 3. Sometimes there may be a conflict between the right courses of action indicated by different ethics theories, as shown later in the illustration provided. It might not be possible in all cases for a decision maker to select a course of action that is supported by all the ethics theories or other evaluation criteria used in the decision-making process.

Step 6: Act or Implement

Ethical decision making is not purely an intellectual exercise. The decision maker, if truly seeking to resolve the problem being considered, must take action. Therefore, once the action alternatives have been identified in Step 4 and the optimal response is selected in Step 5, the action is taken in Step 6.

Step 7: Review the Action, Modify if Necessary

Finally, once the action has been taken and the results are known, the decision maker should review the consequences of the action and whether the action upheld the ethical principles sought by the decision maker. If the optimal resolution to the problem is not achieved, the decision maker may need to modify the actions being taken or return to the beginning of the decision-making process to reevaluate the analysis of the facts leading to the action alternative selected.

Applying Ethics Theories

The following is an illustration of Step 3 of the ethical decision-making process that applies three predominant ethics theories—utilitarianism, rights, and justice—to a common business problem: Should a company close an operating plant and lay off its workers?

When using a *utilitarian perspective*—where the decision maker considers the consequences or outcomes of an action and seeks to maximize the greatest good for the greatest number of those affected by the decision—it is critical for the decision maker to determine to the greatest extent possible who will be affected by the decision. In the example used here, those affected may include the company itself (since closing the plant may improve its bottom line by dramatically reducing plant overhead and employee payroll expenses); the company's investors, if a publicly held business (who may receive a greater return on their investment if the plant closes and employees are laid off); the company's employees (who will suffer if the plant closes and they are laid off from their jobs); and the local community where the plant is located (who will suffer a reduction in the municipal tax base as well as a loss of economic activity for businesses that relied on the plant and its employees).

One might argue that the greater good is served if some workers are immediately laid off and the plant is closed, ensuring the immediate financial viability of the company. Yet others might reason to an ethical solution that requests all employees to take a slight pay cut so that no workers are laid off and the plant remains open, thus achieving the greatest good for the greatest number of people affected.

A decision maker who considers a *rights perspective* would consider the entitlements of those affected by the decision. There are economic rights affecting the displaced employees and the community surrounding the plant in question, as well as the rights of the laid-off employees to be informed of the potential plant closing. These rights may be in opposition to the managers' right to act freely in a way that could be understood as acting responsibly, by closing the plant and thus benefiting the remaining employees of the company and the company's investors.

A rights reasoner might provide ample notice to the workers of the layoffs so that they could seek other employment. Or the rights reasoner might consider the economic rights of the community and actively seek a buyer for the plant in the hope that it would remain open and continue to employ the workers. Finally, the rights of the company and its investors could persuade the decision maker to conclude that closing the plant and firing the workers is the right thing to do.

Finally, one who considers a *justice perspective* may focus on either the equitable distribution of the benefits and costs resulting from the plant closing and employee layoffs (distributive justice) or the maintenance of rules and standards (procedural justice). For the distributive justice reasoner, the ethical decision process would focus not only on the benefits incurred by the company and its investors through the plant closure and layoffs but also on the significant harms or costs imposed on those employees laid off from work and the local community and businesses negatively affected by the plant closing.

The procedural justice reasoner would focus on the preservation of the social contract that exists between the employer and employees or would seek to minimize the harm imposed on the powerless (the employees and the local community) by the powerful (the employer and investors). The procedural justice reasoner would argue that the employees, community officials, and local business leaders should have a voice in this decision since they are significantly affected by the decision.

The decision maker may decide that a more just action would require the company to assume greater financial responsibility by providing job training and outplacement services for the displaced employees. The company could consider making some type of economic contribution to the local community to soften the blow of a reduction in the tax base or economic activity in the area. Or the company could involve the employees and local community leaders in developing a system that results in the plant closure occurring over a longer period of time to spread out the eventual costs endured by the community.

Conclusion

People during their daily routine at work or in society are called on to make ethical decisions. Therefore, their ethical decision-making process may be a frequent, yet subconscious, cognitive process. Do you drive the speed limit or come to a complete stop at the intersection where a stop sign is posted? An individual can decide to act in the right way almost without thinking about it, but the decision maker is implicitly considering and processing the steps delineated above to reach the ethically supported decision to obey the speed limit or stop at the intersection in the road.

Ethical Imperialism

Ethical imperialism (which directs people to do everywhere exactly as they do at home) is the term used to describe a situation where a code of ethical behavior or attitude is imposed on another community or society. It is normally used in a derogatory or pejorative sense. Ethical imperialism is at one end of a spectrum with cultural relativism (where no culture's ethics are better than any other's) at the other. With respect to cultural relativism, St. Ambrose (339–397) is given credit for the notion of doing as the Romans do when in Rome. The theory behind ethical imperialism vis-à-vis relativism is absolutism. This means that ethical imperialists aka absolutists believe that, first, there is only one list of truths. This can be misleading because different societies may emphasize one value more highly than others—for instance, "loyalty" as in Japanese culture vis-à-vis "equality, fairness, and individual freedom" as in Western democratic countries. Second, these truths can only be expressed with one set of concepts such as the language of basic rights. This too can be misleading because Confucian and Buddhist traditions do not always recognize the same values as Western democracies. Furthermore, they have their own cultural traditions, which would have to be ignored if that path was followed. The third problem relates to following a global standard of ethical behavior. This would be impossible to do because context does matter when deciding what is right and what is wrong.

Ethical imperialism, a more specific form of cultural imperialism, is one of a number of cognate terms that emphasize the superiority of one set of values over another. Absolute domination describes a situation where a person or nation seeks to control events. Situations such as this can arise in business, international politics, or medicine when one individual or group seeks to impose its will on the conduct of other people's affairs. Ethical imperialism can be seen in a practical sense in the field of international business when an organization engaged in increasing its market share or making a takeover bid imposes its ethical and moral standards on the target group. In the field of international politics, the appointment of carefully selected representatives to bodies such as the World Trade Organization, the World Bank, the International Monetary Fund, and the United Nations suggests to critics of globalization that the concept of ethical imperialism is active. In the four examples above, the newly appointed incumbents can be expected to pursue a predictable line. There is also a suggestion that these key positions are being shared out among competing power blocs.

Cultural imperialism, a cognate and broader term, has been in common usage for some time and is easier to understand. However, imperialism, whether it be ethical, moral, or cultural, means that people, organizations, and societies with power, influence, and authority can and do impose or force their ethical, moral, or cultural standards on situations and people with less power, influence, and authority. Values that in Western democratic nations are assumed to be wholesome and virtuous, such as liberty, freedom, the rule of law, an open society, and recognition of an individual's rights, are not so easily imposed on less developed countries. For example, there are at the time of this writing, August 2005, many Iraqis who are determined not to accept a Western democratic style of government. If the West forces or imposes its values on countries that are perceived to be poorer or morally inferior, there is the risk of a negative reaction. Values and beliefs are best transmitted indirectly through trade, commerce, and higher education, whereby thousands of graduates return to their home countries with an awareness of Western democratic values.

Western ethical imperialism (WEI) is a more specific form of cultural imperialism. It has been likened to civilized/rich countries—that is, the Anglo-American, European Union group—imposing their values on countries they perceive as being uncivilized/poor or, worse, morally inferior. North Korea, Iraq, Serbia, and some African and Middle Eastern states come to mind. Libya was considered to be in this group but has redeemed itself and now takes its place with the rest of the world. WEI can be illustrated by the way some people in some Western developed nations take the high moral ground with respect to the conditions in which young children work in some third-world countries. They make judgments with respect to working conditions in Middle Eastern countries based on their own frames of reference. They impose their moral and cultural standards on situations that are very complex. There are many examples in which these cases have been documented; however, the alternatives for a young child working for a pittance in a carpet factory in Pakistan or an export-oriented shoe factory in Brazil could be much worse. The key challenge for companies and individuals working in the international arena is to avoid the extremes of both ethical imperialism and ethical relativism.

Ethical Naturalism

Ethical naturalism is the view that ethical claims are either true or false and that their truth or falsity is determined by reference to the external world, either facts about human nature or facts about the physical world beyond humans. Ethical naturalism contrasts with ethical nonnaturalism, which is the view that ethical claims are either true or false but their truth or falsity is not determined by facts about the natural, physical world.

There are two main versions of ethical naturalism. The first can be called virtue-based naturalism. According to standard versions of this view, the question of which acts are right and which are wrong for a person to perform can be answered by appealing to claims about which acts would promote and which would undermine that person's living a life that is good for human beings to live. This is a natural approach to ethics as it purports to explain when an act is right or wrong in a fully natural way, without referring to any nonnatural source of moral value. This virtue-based naturalism is based on the view that there is a distinctive way of living that human beings are best suited to pursuing and that if they were to pursue this, they would flourish. The primary objection to such virtue-based naturalism is that there is no such distinctively human life, and so it is not possible to determine if an act is right or wrong in terms of whether it is in accord with such a life or not. It is also often charged that this approach to naturalism faces an epistemological difficulty: that even if there was a distinctively human life that could ground claims about the rightness or wrongness of actions in this way, we would not know what form it would take. However, even if this last objection is correct, that we cannot have this access to the rightness or wrongness of actions, it does not show that this naturalistic account of what makes an action right or wrong is incorrect. It just shows that we cannot know when an action is right or wrong.

The second version of ethical naturalism, which can be termed metaethical naturalism, is the view that moral philosophy is not fundamentally distinct from the natural sciences. This is the version of ethical naturalism that is most often understood to be at issue in discussions of the "naturalistic" approach to ethics. On this approach to naturalism, moral value—that is, roughly, the rightness or wrongness of an action—should be understood as being defined in terms of (or constituted by, or supervening on) natural facts and properties. For example, John Stuart Mill's utilitarian approach to ethics was a naturalistic approach of this sort. For Mill, an action was morally right insofar as it tended to promote happiness and wrong insofar as it failed to do so. Since for Mill happiness was defined in terms of pleasure and the absence of pain, which are natural properties, the rightness or wrongness of an action can be explained in terms of natural properties.

Although not all metaethical naturalists accept Mill's account of what explains the rightness or wrongness of actions, they all share his belief that moral values (such as rightness and wrongness) can be understood in terms of natural facts about the physical world. For such naturalists, moral claims should be understood in terms of features of the natural world that are amenable to scientific analysis. This does not mean that moral philosophy should become simply another branch of science. Rather, it simply means that there are likely to be regular or lawlike relationships between physical properties and moral properties. Moral claims are thus claims about natural facts about the world. Metaethical naturalism is thus a type of moral realism, the view that moral claims are not merely expressive statements but are literally true or false. Thus, when people say, "Price-gouging is morally wrong," they are not merely expressing their personal view concerning price-gouging. Rather, they are stating that they believe that it is a fact that price-gouging is morally wrong—and so, like other claims about facts, this moral claim (and all others) is either right or wrong.

Like virtue-based naturalism, scientific metaethical naturalism faces some serious objections. Some object that this version of naturalism is untenable because it is not clear how to derive ethical claims from descriptions of reality. But, as was noted above with respect to the epistemological objection to the virtue-based account of naturalism, this doesn't show that this naturalistic approach to ethics is mistaken. It just shows that we cannot know when an act is right or wrong.

A more famous objection to metaethical naturalism was offered by G. E. Moore. Moore claimed that naturalists were guilty of the "naturalistic fallacy." This fallacy was to draw normative conclusions from descriptive premises. Thus, since naturalists infer from the fact that an action has a certain natural property (e.g., it maximizes pleasure) that it has a certain moral, normative property (e.g., it is right and should be performed), they are, according to Moore, guilty of this fallacy. Naturalists respond to this objection by noting that they do not need to rely on only descriptive premises in their inferences from natural properties to moral properties. They could insert into such inferences a premise such as "Whatever act has natural property X is a right act." With this premise in place, the naturalists' inferences are not fallacious.

A similar objection to naturalism was offered by Moore in his "open question argument." Moore argued that any naturalistic account of a moral property would face the difficulty of explaining how it is that a person who understood both the naturalistic account and the moral property could still question whether the moral property was present when the natural one was. For example, a person who understood what it was to maximize happiness and understood what it meant for an act to be right could still wonder whether an act that maximized happiness was a right act. If, however, the rightness of an act was instantiated by that act's maximization of happiness, this question would not be open in this way, just as the question "Is this unmarried woman a spinster?" is not open. In response to this objection, metaethical naturalists note that the meaning of moral terms might not be as obvious to people who seem to understand them as Moore assumes. Thus, a person might be able to use moral terms correctly but still be ignorant of what criteria must be met for an act to be a right act. Such persons would be competent users of the moral terms they deploy but would lack the understanding that Moore assumes they have.

If ethical naturalism is true, this will have important implications for business ethics. If it is true that ethical claims are either true or false and that their truth or falsity is determined by reference to the external world, then there will be objective ethical truths that are independent of the beliefs of humans. If this is so, then it will not be true that ethical practices vary across cultures. For example, it will not be true that bribery is ethically acceptable in some countries, whereas it is not in others. Instead, there will just be one set of ethical practices that applies universally.

Ethical Nihilism

Ethical nihilism is the supposition that any philosophical discussion of ethics and values is meaningless because of the observable fact of moral diversity and disagreements. (Thus, ethical nihilism is a thesis about the philosophical treatment of values, while nihilism is about knowledge and values themselves.) What can often be observed is that what some people perceive as "good," others perceive as "evil," and still others are indifferent to it (for instance, abortion, the death penalty, or stem-cell research). From that evidence, ethical nihilism takes a more radical step than ethical relativism, which only goes as far as postulating that ethics is ultimately relative to the moral agent or observer. Ethical nihilism argues that, in the end, nothing matters in the moral arena. Many ethicists argue that ethical nihilism is a consequence of subjectivism, the view that each individual is the sole authority concerning the selection and applicability of ethical principles.

Arguably, in everyday organizational practice, ethical nihilism may manifest itself in amoral management. Managers are said to act amorally when they are indifferent to ethical considerations in their decision making. But because ethical norms and rules are irrelevant to ethical nihilists, the typical outcome may also be immoral management, with its consequent violation of ethical principles. Immoral managers are continuously tempted to find loopholes in existing legislation to benefit themselves. This downward spiral from amorality to immorality and illegality is easy to understand with reference to, or in the context of, ethical nihilism. For if ethics were ultimately meaningless and irrelevant, nihilists would regard the law merely as governmental fiat without any compelling normative force.

It is important to keep in mind, though, that ethical nihilism has been considered a viable philosophical tradition. Among the world famous philosophers subscribing to (or at least often interpreted as subscribing to) ethical nihilism are some influential German philosophers of the 19th century. For example, Friedrich Nietzsche (1844–1900) called for the devaluing of old values, such as pity or compassion. After what he called the death of God, Nietzsche expected Western societies to pass through a transitional period of ethical nihilism until new values would be created. He was quite clear, though, that this nihilist period was a pathological yet necessary transition in his proposed "transvaluation" of values. Another German philosopher often considered an ethical nihilist is Arthur Schopenhauer (1788–1860), with his pessimistic philosophical views. However, such a view of Schopenhauer's moral philosophy is actually a misinterpretation because Schopenhauer was quite clear, in his book *On the Basis of Morality,* that compassion is the sole criterion of morally worthwhile actions. This book harshly criticized Kant's categorical imperative, but it cannot be considered nihilist because it ultimately substitutes a virtue ethic for Kantian deontology. In opposition to Schopenhauer, Nietzsche rejected any morally affirmative view of compassion and believed, more closely following a nihilist philosophical line than Schopenhauer ever did, that there could be no cultural or human progress without slavery or cruelty. (Nietzsche's approval of cruelty and slavery cannot easily be reconciled with the classification of Nietzsche as a virtue ethicist by some current scholars, although admittedly the *ultimate* outcome envisioned by Nietzsche may, in fact, be a particular antidemocratic type of virtue ethics.)

The French postmodernists of the 20th century can be considered exemplars of ethical nihilism as well. Skeptical postmodernists often emphasize the meaninglessness of life and the lack of any ultimate normative parameters for human action. Philosophers such as Baudrillard and Foucault deny the existence of any truth, so they embrace not only ethical but also epistemological nihilism. In other words, they question and indict the foundation and, thus, validity of any knowledge claim, whether ethical or scientific. However, it is important to recognize that the entire postmodernist tradition is not morally nihilist. The French existentialists, such as Jean-Paul Sartre, and the so-called affirmative postmodernists, such as Richard Rorty, do affirm the superiority of certain value choices over others. More broadly, the differentiation between "skeptical" and "affirmative" postmodernists as well as between Nietzsche's and Schopenhauer's philosophy above suggests that attributions of nihilism generally are quite controversial and subject to different interpretations.

An important philosophical work that tries to break through the modern and postmodern forms of ethical nihilism is Alasdair MacIntyre's *After Virtue.* MacIntyre regards today's moral disagreements as rooted in rationally interminable differences that are emotive in character. Emotivism, or noncognitivism, argues that positive moral judgments, such as "This is good," are actually expressions of individual, subjective feelings and, thus, are equivalent to saying, "I approve of this; do so as well" or "Hurrah for this!" In the wake of the "invention of the individual" and the (according to

MacIntyre) inevitable failure of the modernist Enlightenment project, society has lost all context for valid moral judgments. Because MacIntyre considers any philosophical affirmations of rights or utility, for example, as fictions, they cannot really provide, in his view, criteria for the moral good and, therefore, are doomed to fail. His solution to the problem of nihilism was quite different from Nietzsche's. Instead of a subjective transvaluation of values, MacIntyre tries to retrieve virtuous communities (in *After Virtue*) and a Christian moral philosophy (in *Whose Justice? Which Rationality?*). To summarize MacIntyre's perspective, ethical nihilism is an inevitable consequence of emotivism, subjectivism, and relativism. Like many other orthodox philosophers, MacIntyre recommends a particular kind of communitarianism in overcoming the modern or postmodern nihilist condition. Unfortunately, such communitarian or collectivist "solutions" present dangers similar in magnitude to those engendered in Nietzsche's autocratic moral philosophy.

Ethical Role of the Manager

In a broad construction of the ethical role of the manager, managing and leading can be said to be inherently ethics-laden tasks because every managerial decision affects either people or the natural environment in some way—and those effects or impacts need to be taken into consideration as decisions are made. A narrower construction of the ethical role of the manager is that managers should serve only the interests of the shareholder; that is, their sole ethical task is to meet the fiduciary obligation to maximize shareholder wealth that is embedded in the law, predominantly that of the United States, although this point of view is increasingly accepted in other parts of the world. Even in this narrow view, however, although not always recognized explicitly, ethics are at the core of management practice.

The ethical role of managers is broadened beyond fiduciary responsibility when consideration is given to the multiple stakeholders who constitute the organization being managed and to nature, on which human civilization depends for its survival. Business decisions affect both stakeholders and nature; therefore, a logical conclusion is that those decisions have ethical content inherently and that managerial decisions, behaviors, and actions are therefore inherently ethical in nature. Whenever there are impacts due to a decision, behavior, or action that a leader or manager makes, there are ethical aspects to that decision or situation. While some skeptics claim that business ethics is an oxymoron, the reality is that decisions and actions have consequences, and that reality implies some degree of ethics, high or low. Thus, ethics and the managerial role cannot realistically be teased apart.

Ethical Leadership

The ethical role of managers, or what the business ethicist Linda Treviño and her colleagues call ethical leadership, is a combination of being a moral person and being a moral manager. Being a moral person rests on a combination of key traits such as integrity, honesty, and trustworthiness. Integrity involves not only forthrightness and honesty or truthfulness but also consideration for the soundness of the whole entity that one manages as well as of the society in which the organization is located. Integrity also means firm adherence to a code, such as an ethical code of conduct. Thus, being a moral person suggests that the individual has integrity and can be trusted.

In addition to these traits, being a moral person also involves behaviors such as doing the right thing, concern for people, being open, and standards of personal integrity. The essence of ethics, of course, is doing the right thing, especially under difficult circumstances, and that involves being able to reason well about what the right thing to do actually is. To be able to reason well about a difficult ethical situation, a person needs to be open to learning from multiple sources about the situation while taking care not to harm people and actually attempting to treat people well in the decision-making process or when decisions are being implemented. To be able to make good decisions ethically, an individual needs to have thoughtfully developed his or her personal set of standards or values, a personal code of conduct or integrity. Personal standards allow an individual to think through a decision with a clear rationale in mind.

When decisions involving ethical considerations need to be made, Treviño and her colleagues argue, the moral person sticks to her or his core values, tries to be objective and fair, exhibits concern for society and the welfare of those in society, and follows ethical decision-making rules. But being a moral person is not the only requirement for becoming a moral leader. Moral leadership also includes being a moral manager, which involves recognition that the leader or manager serves as a role model for others in all his or her duties. It also means providing rewards and discipline around the ethical and unethical decisions made by others, so that a clear message is sent about what behaviors are and are not acceptable in the organization or situation. In addition, moral management means communicating openly, explicitly, and frequently about ethics and values.

One question that frequently arises in considering the ethics of management is whether individuals can be considered moral leaders or managers in their work lives if they act unethically in their personal lives or vice versa. Considering that an individual's character is reflected in all his or her decisions and actions, such an inconsistency would reflect badly on the individual as a whole. The branch of ethical theory called virtue ethics explores this relationship in depth.

Ethical Decision-Making Frameworks

Managers in both large and small enterprises face difficult ethical situations daily as they attempt to do their jobs. Since management decisions inherently involve ethical considerations, however, it is important that managers recognize the ethical elements that are embedded in their day-to-day job functions. They need to be able to reason through ethical decisions, just as they would reason through any managerial problem facing them. Many times, ethics-laden situations involve issues that are clearly right or wrong when judged by the manager's or organization's values or code of conduct. Furthermore, most managerial decisions and actions are legal, although there are occasions when a certain decision would clearly go beyond legal boundaries and be illegal. Assuming that the law itself is just, these decisions are not really ethically problematic in that what to do to make an ethically sound decision is quite clear. In these cases, making a decision to break the law or to do something that disagrees with a code of conduct or set of values is clearly unethical. It is not difficult to know what the right thing to do is in such situations.

Ethical decision-making problems arise for managers and leaders when decisions involve a moral conflict—that is, a moral situation in which a person must choose between at least two equally bad choices, or when there are multiple ethical considerations, some of which conflict with each other. In such circumstances, which are common in business, the manager has to be able to think through the consequences and ethical implications of the decision thoroughly and mindfully so that the best possible decision can be made given the constraints, implications, and ethical considerations. If the decision itself cannot be reframed as a situation in which all parties can benefit—that is, a win-win situation—then the manager needs a decision-making framework to help.

To help managers think through ethical moral conflicts, the business ethicists Gerald Cavanagh and his colleagues have developed a decision-making framework that relies on the ideas of philosophers and ethicists and applies those ideas to business decisions. This approach combines four methods of ethical reasoning—rights and duties, utilitarianism, justice, and the ethics of care—into a framework that helps managers and leaders step through a logical thinking process to sort out the ethical dimensions of a difficult and inherently conflictual situation.

Rights and Duties

Rights are justifiable claims or entitlements, frequently based on the law or other authoritative documents, such as treaties and international declarations, that allow people to pursue their own interests. Rights can be viewed as the positive things that people are allowed to do, but they come with an obverse side as well, in the form of duties or obligations that go along with the rights. For example, in democracies, one right is the ability to vote. Along with that right comes the duty to exercise that right by actually voting. In many countries, employees are granted certain rights, such as the right to safe working conditions or a minimum wage, and employers have corresponding duties to ensure that these conditions are met. These rights are based on laws and regulations. Other rights are based on moral grounds and are frequently written into international treaties, such as the United Nations Declaration of Human Rights and the Natural Environment. Such rights include respect for human dignity, which enables communities, organizations, and societies to thrive. In using Cavanagh's ethical decision-making framework to assess a moral conflict, one question that needs to be asked involves rights and duties: Would this decision respect the rights and duties of the individuals involved?

Utilitarianism

A second way of reasoning through a moral conflict involves using utilitarian analysis, or assessment of the greatest good of the greatest number. This type of cost-benefit analysis is a very common management approach, but as the framework suggests, it may not be a sufficient basis by itself to make an ethical decision in a moral conflict. In a utilitarian analysis, the harms and benefits of a decision to the different parties that would be affected by the decision are evaluated, with some sort of weight given to the various harms and benefits that assesses their degree. Most utilitarian analysis focuses on the good of the group or collective as a whole over that of any given individual, unless the most serious harm is to the individual—for example, if the decision would be fatal to the individual. Putting the collective, which can include an organization's interest, over that of the individual avoids the problem of self-interest. A second question in the ethical decision-making framework for managers, then, would be as follows: Who will be affected by the decision and to what extent will the various parties affected by this decision be harmed or benefited?

Justice

Principles of justice are a third way for managers to reason about ethical decisions. Just decisions require fairness, equity, and impartiality on the part of decision makers, particularly with respect to the ultimate burdens and benefits that will accrue from the decision. The philosopher John Rawls has discussed the justice criterion in terms of a concept of what he terms distributive justice, which invites decision makers to make a decision behind a veil of ignorance that suggests that they do not know where in the system they will be after the decision is made. This veil-of-ignorance consideration forces managers to take into account the fairness of the decision to any party that will be affected. Similarly, the philosopher Immanuel Kant suggests that justice can be taken into account using the concept of "categorical imperative"; that is, one should only act a given way or make a given decision if the decision maker can agree that it would be all right if any person in a similar situation acted that way. Alternatively, one can think of the categorical imperative as asking the decision maker whether this action or decision would be all right if it became a universal law. In considering justice, then, decision makers have to ask, How does this decision square with the canons of justice?

Ethic of Care

In addition to assessing a moral conflict from the perspective discussed above, ethical managers and leaders also need to look at the impact of a decision on the network of relationships that will be affected. This perspective is called the ethic of care. Based on feminist writings, the ethic of care proposes that one's moral responsibilities vary according to how closely one is linked to other people. That is, if a person is very close to another person, say, a family member, there will be more moral responsibility for ensuring the well-being of the family member than the well-being of an unrelated person. In an organizational context, using an ethic of care, more consideration might be given to the impact of a decision on long-term employees, who are more tightly connected to the organization and its goals, than to its impact on newly hired employees.

Making Ethical Managerial Decisions

Managers, according to Gerald Cavanagh, can use a combination of ways of moral reasoning based on rights, justice, utility, and care when they face a moral conflict and when these different ways of reasoning conflict, as they often do. To decide effectively, managers need to take several factors into consideration as they weigh decisions based on the principles of rights, justice, utility, or care. For example, they can consider whether there are overriding factors in the decision. If a decision might result in the death of a person made one way and the unemployment of a group of persons made another way, then the overriding factor might be the life-death decision. There are, however, no clear rules for making such decisions, and the judgment of the decision maker is needed to determine which of the relevant factors should carry the most weight.

Another consideration is whether one criterion is more important in a particular situation than others. For example, if the rights of a whole group of people are to be overrun by a decision, that factor might override the fact that one or two individuals would not be treated fairly when the decision is made. Similarly, a consideration might be whether there are incapacitating factors (such as force or violence) that would come into play in making the decision—for instance, to stop a strike, which might violate a person's right to strike but forestall the destruction and injury if the strike turned violent. The decision can be considered ethical when there is no intent to make an unethical decision, when a bad effect is simply a by-product, and when the good outcome is sufficiently good that it outweighs the bad.

Other decision-making aids for managers include thinking about whether they would want their decision made public—for example, to appear on the front page of a newspaper or on television. If they are uncomfortable with such transparency, it would be well to apply an ethical analysis to the decision. For managers operating in different countries around the world, it is useful to remember that virtually every nation of the world has at its core some version of the Golden Rule: Do unto others as you would have others do unto you. By keeping some of these principles in mind, managers can avoid the problem of relativism in their decision making. Relativism suggests that a decision is all right if it is apparently culturally acceptable, irrespective of the consequences or harms.

Moral Development

The ethical decision making framework for managers relies on reasoning using the principles of rights, justice, utility, and care. It presupposes that managerial decision makers have the capacity to reason from principles in making an ethical decision. Unfortunately, not everyone reasons from moral principles in making ethical decisions. A good deal of research on individual development suggests that people develop their cognitive reasoning skills over time and to different levels, generally termed preconventional, conventional, and postconventional.

Research on moral reasoning in men by Lawrence Kohlberg and on women by Carol Gilligan indicates that moral reasoning passes through similar stages, lagging behind cognitive development, which must come first. At the preconventional stage of development, the rationale for ethical decision making is rewards and punishments or self-interest. Most managers have passed beyond the preconventional stage to the conventional stage of development. In the early stages of conventional reasoning, individuals use their peer group as a reference point for determining what is right and wrong. At the later stages of conventional reasoning, individuals focus on the rules, regulations, and norms of society as bases for their ethical decisions. Only at the postconventional stages of development, which only about 20% of adults reach, does reasoning from principles emerge.

Reasoning from moral principles is a relatively high-level or postconventional skill. The fact that only about 20% of adults reach the postconventional level of development highlights the need for ethical leaders and managers who are able to reason not just from society's or their peer group's norms but also from core principles such as those discussed above so that decisions can be made with multiple stakeholders' needs and interests in mind. Some of the needed principles are laid out in organizational or more generalized codes of conduct, which can also help managers in their decision-making roles.

Codes of Conduct

Most large corporations today have developed codes of conduct internally, which are intended to provide guidance for managers confronting ethical situations and moral conflicts. Such codes of conduct need to be supplemented by internal systems, such as reward and information systems, promotion and hiring practices, recognition systems, and organizational culture and communication systems, that support their implementation. Strong top management commitment to and communication about values and ethical conduct is a core element of ethical leadership from the top of the organization. Ethical leadership is essential to managers and employees at all levels of the enterprise when they are faced with difficult ethical decisions and moral conflicts. Codes of conduct alone can seldom be sufficient for managers to come to good decisions unless they are supported by these other aspects of the organization.

In addition to company or organizational codes of conduct, many of which have been developed internally by companies to articulate their own value systems, a number of codes and principles have emerged globally to help managers think about their ethical responsibilities. Some of these are quite spare and lay out fundamental principles, based on globally agreed-on documents signed by many nations, such as the United Nations Global Compact with its 10 core principles or the OECD Guidelines for Multinational Enterprises. Others are more elaborate and have been developed by business groups or multisector alliances to help guide business decision making. Again, as with internal codes of conduct, these principles are helpful guides but cannot address every unique situation. As a result, codes need to be supported by the organization's managerial decision making, its culture, its reward systems, and the communication that exists about ethical practices within the firm.

Managers and Ethics in Organizations

Many managers find it difficult to speak about and sometimes even recognize ethical issues, a difficulty that the management theorists James Waters and Frederick Bird called the moral muteness of managers. Recognizing that management is an inherently ethical task and that the practices of the company embody a set of values or ethics, the management scholar Jeanne Liedtka suggests that there does exist a set of ethically based management practices that can help managers lead their companies effectively and so that they are competitive. By examining numerous organizational improvement initiatives, she determined that they shared common practices and common sets of values that could help an organization achieve its goals most effectively.

The ethics of effective and competitive business practices identified by Jeanne Liedtka include creating a shared sense of meaning, vision, and purpose that connect the employees to the organization and are underpinned by valuing the community without subordinating the individual and seeing the community's purpose as flowing from the individuals involved. A second characteristic that ethical leadership can provide is developing in employees a systems perspective, which is linked to the postconventional stages of cognitive and moral reasoning discussed above, so that a value of serving other community members and related entities in the broader ecosystem emerges. Another theme is that of emphasizing business processes rather than hierarchy and structure, which is based on valuing work itself intrinsically and focusing on both ends and means in decision making, not just the ends. Localized decision making, particularly around work processes, provides a value of responsibility for individual actions, and using information within the system is supported by values of truth telling, integrity, and honesty, the characteristics of moral persons, as well as transparency about and access to needed information.

Organizations with these types of ethically based approaches also focus on development for both employees and the organization as a whole, which means valuing individuals as ends, not as means to ends (a key ethical principle), and focusing on learning and growth. Such approaches also encourage dialogue and related freedom of expression with a commitment to seek common ground when there are differences of opinion. Ethical leaders can also foster the capacity of others and themselves to take multiple perspectives simultaneously—in other words, to move toward postconventional levels of reasoning so that they can understand other points of view and make better decisions. The final element that managers can think about in their roles as ethical leaders is creating a sense of commitment and ownership among organizational members by emphasizing promise keeping, instilling a sense of urgency about the tasks of the enterprise, and encouraging engagement rather than detachment among organizational members.

Ethics, Theories of

Ethics is the branch of philosophy that deals with morality. Ethicists are concerned with a wide range of topics, such as human nature; the meaning of life; the nature of value; how judgments are made; how judgments can be improved; how moral attitudes arise and change; and the workings of morally significant mental states such as love, hate, greed, envy, indifference, pity, desire, aversion, pleasure, and pain. Moral or ethical theories offer the means of understanding significant elements in these and other areas of inquiry.

Ethical theories tend either toward merely describing or toward both describing and judging. As a result, some moral theories seem to belong to anthropology, psychology, or sociology, while others look like instances of what ethics purports to study—that is, like moral doctrines or judgments. For this reason, a major distinction employed by moral theorists distinguishes descriptive from prescriptive, or normative, theories, or elements of theories.

Moral judgments tend to state that something is either good or bad or that something agrees or conflicts with our obligations. Consequently, a major division in moral theories is between theories of value (axiology) and theories of obligation (deontology). In each area, ethicists want to determine the meaning of moral judgments, their truth or falsity, their objectivity or subjectivity, how judgments are made, how they can be tested, how they can be justified, and the possibility of organizing judgments under first principles. A third major distinction places theories about the meaning of moral judgments in a category of their own called metaethics. Obviously, metaethical questions arise in all areas of ethics.

Prescriptive or normative moral thinking recommends at least one moral evaluation, or else it attempts the same for at least one moral obligation. Plato, Aristotle, the Stoics, the Epicureans, and the Cynics sought both to find the best kind of life and to strongly recommend the judgment that it was in fact the best. Others, such as Immanuel Kant, theorized about the nature of obligation and also provided grounds for justifying or recommending certain obligations. The theories of David Hume, Arthur Schopenhauer, Darwinism, and Logical Positivism exemplify the tendency to separate the task of description from that of prescription, or to eschew prescription altogether, in order to describe and organize moral judgments for the sake of understanding alone.

The unwavering pursuit of the metaethical question of the meaning of moral judgments brought many recent philosophers to the conclusion that moral judgments are not the sort of statements that can be true or false but instead express resolutions, preferences, feelings, demands, or other states of mind. Hume thought that they reported subjective feelings, so that a judgment such as "Insider trading is immoral" would not be understood as ascribing a predicate to insider trading but as saying something like "I disapprove of that act." A. J. Ayer, a Logical Positivist, believed that moral judgments did not report feelings but merely expressed them. For him, the statement "Insider trading is immoral" merely expresses a negative emotional reaction to stealing—along the lines of "Boo insider trading!" Such expressions are neither true nor false because they do not describe anything. Hume and Ayer represent the school known as Emotivism. A neighboring school, Prescriptivism, interprets "Insider trading is immoral" as an imperative, "Do not engage in insider trading," which is neither true nor false because it is a command rather than a description.

In value theory, the primary questions are first about the meaning of value terms, then about the status of value. With regard to meaning, the first question is whether value or goodness can be defined and, if so, how. For Plato and W. D. Ross, the good is indefinable, yet it names an intrinsic property of things, making it objective. For the Intuitionists, such as G. E. Moore, value is indefinable, objective, and absolute. Many ethicists believe that value can be defined so as to name something that is both objective and absolute, as did Aristotle, who defined the good as that at which all things aim. For others, the good has its seat in subjectivity and will be different for different persons or groups.

After the meaning and status of value, the chief concern in value theory has been the question of which things are of the highest value. The main answers have been a state of feeling, such as pleasure or satisfaction (Epicurus, Thomas Hobbes, John Stuart Mill); a state of the will, such as virtue (Epictetus) or power (Friedrich Nietzsche); or a state of the intellect, such as knowledge (Plato) or good intentions (Kant).

In the theory of obligation, similar questions have been posed. With regard to questions about the meaning and status of "right" and "wrong," Intuitionists hold that they name an indefinable, objective quality. Emotivists believe that right can have only an emotive, subjective meaning. Psychological and social thinkers typically hold that judgments of right and wrong indicate the attitudes of some person or group toward an act.

In response to the question of which things are right in the sense of their being morally obligatory, there are both teleological and nonteleological answers. For the teleologist, an act is right according to how much good it brings, or will probably bring, into the world. For the egoist, the amount of good brought to the agent is decisive (Epicurus, Hobbes), while for the universalist, it is the amount brought to the world as a whole (utilitarianism). Meanwhile, Thomas Aquinas and others have argued that an act is right according to its intent, so that an act with a comparatively better intent is a comparatively more righteous act. All these answers to the question of what is obligatory rely on a theory of value and, thus, make deontology dependent on axiology.

A fully deontological theory is supposed to hold that an act is obligatory regardless of its consequences for human happiness, ends, or other values. Deontologists, such as Kant, hold that right conduct can be determined by considering a priori principles, such as rights and laws. Kant's view was that objectively right conduct could arise from many sources, such as benevolence, prudence, or habit. However, the highest and the only morally significant motive for right action was respect for the moral law. If a course of action suggested by benevolence, pity, sentiment, or any other motive conflicted with the course indicated by moral law, respect for moral law ought to win out. The good will, the will truly searching for its duties so as to fulfill them, is supremely good for Kant, and the moral worth of an act is always guaranteed by the agent's intent to follow the moral law, regardless of any other motive or consequence.

Deontology is squarely opposed to teleological approaches to obligation because it holds that the end can never justify the means. Hence, violating another's rights cannot be justified by its serving a praiseworthy goal. Consequentialist theories, such as utilitarianism, hinge the goodness of conduct to its consequences and, hence, seem prepared to overlook a violation of rights as long as the consequences of the violation are highly valuable. In contrast, it has been said that the deontologist's motto appears to be "Let justice be done though the heavens fall." Kant argued that one must not lie even to save the life of an innocent man and that one must not commit suicide even when life has no further meaning or purpose. For Kant there can be no exceptions to moral laws because if they are to count as moral laws, they must at a minimum be universalizable. Hence, if suicide is immoral when life has purpose, it must also be immoral when it does not, and if lying to obtain a loan is immoral, lying must also be immoral in life-and-death situations.

Another version of deontology comes from theology, in which our moral duties are given by a deity. Divine command theories hold that regardless of any consequences for life or limb, we must do what the deity commands.

Virtue ethics is often described as an alternative to normative deontology because its normative elements concern the qualities of persons rather than the qualities of acts. Plato, Aristotle, and many Eastern systems of thought focus on what kind of person one ought to try to be rather than on which actions one ought to take or avoid. For Aristotle, who understood ethics as the branch of learning concerned with achieving the good life, the virtues are precisely those characteristics that make the character good and that lead to the good life. These include courage, prudence, wit, truthfulness, temperance, and justice, among others. Its detractors often say that virtue ethics is dependent on prescriptive moral judgments yet offers no insight into them.

Beyond theories of value and obligation, ethicists examine moral reasoning in their efforts to understand how our conduct is chosen and how moral judgments are or ought to be made. According to the Emotivists, a moral judgment comes about when one looks at an act or policy, consults one's sentiment, and pronounces morally about it. For teleologists, moral judgments are or ought to be made by considering the comparative amount of good or bad that an action can or does bring about. For Kantians, moral judgments ought to be made by considering the one obligation that determines all others—namely, to act so that you can at the same time honestly will that all others would act as you do. For divine command theorists, the will of the deity must be consulted in making accurate moral judgments.

One of the greatest challenges to all normative ethical theories lies in the problem of free will. We generally consider acts praiseworthy or blameworthy only if their agent could have acted otherwise. If we lack free will, we are apparently never able to do otherwise and, hence, our acts do not deserve either praise or blame. The school known as Compatibilism argues that belief in the moral status of human acts is compatible with an absence of free will. Incompatibilists, such as Nietzsche, argue that if we lack free will, statements about the moral status of human acts perpetuate a cruel myth.

A second, more contemporary challenge to normative ethics arises from the question of whether there are moral facts in the world and, if there are, whether moral judgments describe them. Moral realism answers that there are moral facts and that our judgments can describe them, and thus affirms at least three things: (1) that moral judgments are propositional, meaning that they can be either true or false because they attempt to describe features of the world; (2) that there are moral facts to be described; and (3) that moral facts are objectively present in the world, independent of our thoughts and feelings. Noncognitivism in ethics holds that moral judgments do not describe, and so are nonpropositional, and thus can be neither true nor false.

Ethics & Compliance Officer Association (ECOA)

The Ethics & Compliance Officer Association (ECOA), formerly known as the Ethics Officer Association, is a nonconsulting, member-driven association established exclusively for individuals (i.e., ethics and compliance officers) who are responsible for their company's ethics, compliance, and business conduct programs. As the first global organization designed to serve the needs and interests of ethics and compliance officers, the ECOA provides training and hosts a variety of conferences and meetings for exchanging best practices. As of February 2006, the ECOA consisted of more than 1,250 members, representing nearly every industry. Member companies include more than half the Fortune 100 conducting business in more than 160 countries. In addition to corporations, ECOA membership includes nonprofit organizations, municipalities, and other organizations. The ECOA is headquartered in Waltham, Massachusetts.

The ECOA was officially launched in 1992. Its establishment was primarily based on two key developments, the Defense Industry Initiative (DII) and the U.S. Federal Sentencing Guidelines for Organizations (Guidelines). First, following allegations of waste and fraud in the U.S. defense industry in the mid-1980s, a blue-ribbon commission concluded that defense contractors must promulgate and enforce codes of ethics that address defense procurement problems and procedures as well as develop and implement internal controls to monitor these codes of ethics. As a result, the DII was created, made up of the largest defense contractors. Together they developed a model for internal ethics and compliance programs that were designed to prevent and detect waste, fraud, and other wrongdoing. The DII also created a network of executives who were responsible for each company's ethics and compliance program.

Following the DII, other companies in other industries also began to reflect on the importance of having an executive responsible for their ethics and compliance programs. The primary reason was the promulgation in November 1991 of the Guidelines. Not only did the Guidelines raise fines for white-collar crimes; they also provided a means for greatly reducing these mandatory fines. Under the Guidelines, if a company is determined to have in place an effective program for preventing and detecting wrongdoing, the fine can be reduced by up to 95%. One of the seven minimum elements in the Guidelines for an effective program was for organizations to have someone in place (high-level personnel) to be responsible for the oversight of the program. A sufficient justification for the establishment of a new ethics profession, the ethics officer, and the concomitant need for a networking organization for these professionals, now existed. However, although the DII provided a forum for defense contractors to share best practices, no multi-industry network existed.

The first meeting that led to the creation of the ECOA was held at Bentley College, in Waltham, Massachusetts, in June 1991. The meeting was co-hosted by the Center for Business Ethics and the Dreiford Group, with about 30 ethics officers in attendance. The group decided to create a new organization for peer-to-peer discussion, and on June 17, 1992, the ECOA officially filed as a 501(c)(6) nonprofit, Delaware-based corporation. At the time of incorporation, 19 companies were ECOA sponsoring partner members. Although originally named the Ethics Officer Association, the name was officially changed to the Ethics & Compliance Officer Association on January 13, 2006.

The ECOA has a mission statement, vision, and set of values. The mission states that the ECOA is committed to being the leading provider of ethics, compliance, and corporate governance resources to ethics and compliance professionals worldwide and to providing members with access to an unparalleled network of ethics and compliance professionals and a global forum for the exchange of ideas and strategies. The vision of the ECOA is to be the recognized authority on business ethics, compliance, and corporate integrity. The ECOA's set of values include (1) integrity, (2) confidentiality, (3) collegiality, and (4) cooperation among the ECOA members.

The ECOA defines an ethics and compliance officer as an individual tasked with integrating the organization's ethics and values initiatives, compliance activities, and business conduct practices into decision-making processes at all levels of the organization. In general, ethics and compliance officers assist employees at all levels of the organization to determine the right course of action in difficult situations.

Membership in the ECOA is open to those who are recognized by their organization as having the assigned role and responsibility for devising, implementing, or administering their organization's ethics, compliance, or business conduct programs. The ECOA offers two types of membership, sponsoring partner and basic member. The ECOA offers peer-to-peer networking the main goal of which is to create more awareness of ethics by discussion through conferences, education programs, a job-listing program, and networking events and seminars among a network of individuals from a wide variety of industries. The types of events held by the ECOA include (1) sponsoring partner forums, (2) the annual conference, (3) ECOA/U.S. Sentencing Commission forums, (4) training in "Managing Ethics in Organizations," (5) seminars on "Creating an Ethical Corporate Culture," and (6) Webcasts.

The ECOA engages in a number of other additional activities, including conducting research on corporate ethics and compliance, assisting in the provision of ethics administrative software, and providing members with an e-mail newsletter. In 2004, the ECOA's board of directors endorsed the "Standards of Conduct for Business Ethics and Compliance Professionals," which detail members' obligations to their organization as well as to the profession.

The ECOA has formed partnerships and alliances with the U.S. Sentencing Commission and leading ethics centers and subject matter experts. The ECOA has also entered into memoranda of understanding with other business ethics associations, including the Business Ethics Research Center (BERC) in Japan, the Cercle d'Éthique des Affaires–Cercle Européen des Déontologues (CEA-CED) in France, the Ethics and Compliance Custodian Organisation (ECCO) in South Africa, and the Institute of Business Ethics (IBE) in the United Kingdom. The ECOA collaborates with the BERC, CEA-CED, and ECCO in organizing meetings and conferences, developing surveys and research, and assisting in expanding each other's libraries and Web sites.

Recent U.S. regulatory initiatives such as the Sarbanes-Oxley Act of 2002 and amendments to the Federal Sentencing Guidelines for Organizations 2004 continue to reinforce the importance of having an ethics officer in an organization. Empirical evidence is also beginning to suggest that the existence of ethics officers, as part of a comprehensive ethics and compliance program, may help reduce the extent to which illegal and unethical behavior takes place in organizations.

Ethics and the Tobacco Industry

Health advocates assert that tobacco is the first or second leading cause of preventable death among humans, contributing to cancer, lung disease, and coronary heart disease, among other ailments, and that the addictive properties of cigarette ingredients prevent smokers who desire to quit from doing so. While cigarettes are the primary culprit, other tobacco products, such as cigars and pipe tobacco, are potentially equally or even more dangerous, but because they are less prevalent, they do not pose public health risks on the same scale as cigarettes. Smokeless (chewing) tobacco is said to cause other health problems, such as mouth cancer. The risks of tobacco use are not limited to users of tobacco, since carcinogens, or cancer-causing agents, can be passed on to others through second-hand smoke and from a pregnant or nursing mother to her child; cigarette smoking contributes to an inordinate share of building and house fires, and the health care costs associated with tobacco are borne by the public at large. As a result of these health and economic risks, governments and nongovernmental organizations have increasingly treated tobacco as a public health hazard and have sought to economically impair the tobacco industry through aggressive regulation and litigation, thus reducing its harmful impact.

For decades, the big tobacco companies sought to downplay the health risks of tobacco products and categorically to deny claims that their products were addictive. In stark contrast to the health realities, various brands of cigarettes were associated through advertisements with social sophistication and glamour, friendship, rugged outdoorsmanship, recreation, and, generally, the good life. Historically, tobacco's place in society was more complex, a traditional pleasure among the native peoples of the Americas transported by explorers to Europe and then by commercial sailors to the Middle East and Asia. In these regions, tobacco took hold among the populace but received a mixed reception among political and religious leaders, who saw it as a pagan vice. As the global market for tobacco grew, however, its economic value became clear, and it became a key commodity grown and exported by European settlers in the southern United States as well as an exotic import from afar, hence the even contemporary references to "Turkish" and "Oriental" leaf and the famous Camel brand with images of the Near East. After industrialization, tobacco became an important enough commodity for political interests to coalesce to defend it from its detractors, for if big tobacco were suddenly to falter, the consequences for tobacco-dependent economic actors would be potentially catastrophic. At stake were the livelihoods of low-paid field laborers, high-paid executives, and those within the supply and distribution chains that linked them. Also at stake were an aesthetic view promoted by proponents of the smoking lifestyle and the search among researchers and developers for the perfect flavor. In recent years, faced with mounting regulatory pressure and litigation, big tobacco companies have become more transparent about the health risks and have been exploring new forms of innovation in product development and social responsibility to prop up their increasingly perilous economic reality. Fascinatingly, and possibly too late to flourish again, the tobacco industry has both been the target of the full range of ethical criticism that can be directed at business and demonstrated the potential for business to engage more constructively in the ethical debate on whether there is a place for dangerous products in the good life.

Ethical Criticism of the Tobacco Industry

The ethical criticism directed at the tobacco industry begins with the fact that its products are unhealthy, whether or not consumed in moderation. While other consumer goods pose risks to consumer well-being—for example, household cleaners may contain hazardous chemicals; prepared snacks may be high in sodium, fat, or sugar; and consumer electronics pose modest dangers to the laypersons who install them—the direct costs to individuals and the associated external costs to society of smoking cigarettes are perceived by critics to disproportionately outweigh any compensating benefits. Used as directed, cigarettes are high-probability, high-impact risks that are not only fundamentally unsafe but even more unsafe the more they are used.

In a free society, consumers generally are perceived to have the right to "choose their poison," but another ethical concern posed by cigarettes is that consumers may not have unfettered choice. Critics have charged that in the past decades, tobacco companies concealed evidence about the health risks of their products; manipulated studies to understate those risks; adjusted product formulae to increase the potency of nicotine, an addictive ingredient; and publicly denied that their products were addictive to fend off public concern and oversight by drug regulators. Not only were consumers making decisions about smoking based on incomplete information; those smokers who wished to quit were in effect incapable of free choice while battling addiction. The concern for consumer choice is even more pronounced with minors, who, even with complete information available to them, may make irrational choices when bombarded with advertisements that speak louder of the attractiveness of the smoking lifestyle than volumes of less accessible scientific data speak of the risks. Critics have further charged that advertising in sports venues inaccurately implies that cigarettes can be integral to a healthy lifestyle and that using cartoon characters as spokespersons specifically encourages youth to smoke. Until the early 1990s, tobacco representatives commonly took the position that restrictions on advertising restricted free speech, but this debate has for the most part been settled in favor of substantial restrictions as a matter of public interest.

Less unique to the tobacco industry but relevant nonetheless is the vulnerability of tobacco products to counterfeiting, in which inauthentic products bear name brand packaging, and the gray market, in which authentic products are purchased inexpensively in one market and subsequently diverted to be sold at below-market prices in a more expensive market. Cigarettes are vulnerable to these schemes in part because price gaps are significant from market to market due to varying regulatory practices and tax premiums and partly because the per unit price is reasonably high relative to the physical size and weight of the product. While tobacco manufacturers may not accept responsibility for these business practices, critics have charged them with complicity and with keeping suspect company. Another affair in which tobacco's role was too coincidental to ignore concerned the leveraged buyout of the tobacco giant RJR Nabisco in 1988, in which some company executives sought personal financial windfalls that would have entailed actions that were of dubious value to the company and the well-being of its employees. This episode occurred at the tail end of a decade in which investment bankers and junk bond traders rose and fell and prefigured the accounting scandals of the turn of the next century, in which executives benefited at the apparent expense of other stakeholders.

Constraints on Industry Growth

At the heart of the tobacco controversy is the question of whether the mere fact of consumer demand for cigarettes justifies the continued supply. This economic question has been answered in the affirmative to justify the market for firearms, pornography, violent entertainment, and other ironically labeled consumer "goods." The question includes consideration of manufacturers' and marketers' potential moral obligation to attempt to shape consumer perceptions regarding what will promote social well-being. While most free market theorists would contend that companies taking on such a moral obligation would smack of paternalism, tobacco companies have nevertheless, through marketing and advertising campaigns, shaped consumer perceptions regarding the place of cigarettes in the good life. Critics have suggested that in doing so they have kept the demand for cigarettes artificially high by allowing nicotine addiction to perpetuate consumer dependence on them and by withholding data that would allow consumers to make informed choices.

Because tobacco products have been part of the fabric of social relations and consumer habits since well before the health risks were documented, they bred cultural dependence among consumers, which led to economic dependence among suppliers. In the recent heyday of the industry's growth, spanning the third quarter of the 20th century, this economic dependence was rather a matter of economic flourishing, with Philip Morris, RJR Nabisco, British American Tobacco, and some of their lesser-known competitors among the United States' and the world's most financially successful corporations, enjoying brand visibility, strong margins, a solid consumer base in developed countries, and prospects for continued growth in untapped markets. The ubiquitous availability of cigarettes in large retail outlets, convenience stores, restaurants, and vending machines—anywhere the multipack-a-day consumer could obtain them to satisfy the need—required a complex supply, distribution, and sales network that could get the cigarette from the tobacco fields to the space between the smoker's second and third fingers. Consumers' smoking habits supported, among others, growers and harvesters, processors, truckers and shippers, paper suppliers and packagers, advertisers and marketers, warehousers, sales agents, and retailers—from grocers to gas station clerks to restaurateurs, who stood to pocket more when diners who smoked lingered at the table longer, ordering a few extra drinks.

An extension of the economic argument in support of the tobacco industry has thus been that any interference in this complex economic system would have unintended, harmful consequences for all these actors. To illustrate the complexity of this system, consider that tobacco farmers long benefited from governmental subsidies and that debate over the continuation of those subsidies was complicated by the fact that ending them might actually increase tobacco production (to compensate for lower margins with higher quantity) and lower prices (leading to increased consumption). However, in recent decades, regulation of the tobacco industry, especially in the United States, has accelerated, catching up with and finally surpassing the rate at which the tobacco companies envisioned their own expansion.

This regulation includes taxes and tariffs on tobacco products, which have grown to the point that as much as 80% of the cost of a pack of cigarettes in countries such as Denmark and Portugal and routinely more than half the retail price in many developed countries including the United States goes to government entities. The justification for such high taxes includes the argument that high product costs deter excessive smoking and the right of the government to recover costs that it will inevitably have to incur for the provision of health care. Also, the demand for cigarettes among young people has been demonstrated to diminish significantly with price increases. Historically, however, the tobacco industry has argued, to little sympathy, that these taxes were discriminatory since smokers are on average poorer than nonsmokers and thus spend a disproportionate amount of their income to support their habit. Notably, the percentage of the retail price that goes to taxes tends to be substantially lower in less prosperous countries.

As far back as 1954, personal injury litigation in the United States has cited adverse health effects caused by the tobacco industry, but until the 1990s, such litigation was largely unsuccessful given the relative inconclusiveness of scientific data and the imbalance of legal resources brought to the cases by the tobacco companies in comparison with what individual plaintiffs could afford. However, by the mid-1960s, the antitobacco movement took an important, if isolated, step forward when in the wake of a surgeon general's report on tobacco health risks, the Federal Trade Commission (FTC) instituted a new rule that finally resulted in warning labels appearing on cigarette packs and advertisements concisely affirming the risks posed by the product. The tobacco companies contended that if tobacco products posed any dangers, then they were no different from many other consumer goods that pose dangers to those who use them, but the FTC countered that there were no safe levels of cigarette consumption.

Tobacco companies continued with a united front to balk in the absence of conclusive clinical evidence in support of the surgeon general's claims, appealing to an age-old philosophical debate over whether any scientific evidence can ever properly be deemed conclusive, denying first the apparent link between tobacco and lung cancer and eventually the apparent link between nicotine and cigarette addiction. Despite this resistance, the report was seminal in opening the door to new regulatory strategies requiring tobacco companies to take actions, such as disclosure of risks, seemingly contrary to their own interests. Concern for the welfare of minors later resulted in regulatory proposals to restrict the placement and content of cigarette advertisements. Notwithstanding the written warnings on their products, tobacco companies continued to challenge their validity in other forums, but by the 1980s, the FTC had approved a rule requiring rotating written warnings on cigarette packages and ads that somewhat more explicitly depicted the direct and indirect risks of cigarettes to consumer, including fetal, health. In 1993, when the Environmental Protection Agency declared smoke to be a carcinogen, it was clear that the industry was increasingly subject to the scrutiny of multiple regulators. Nevertheless, as recently as 1994, tobacco executives summoned to testify before Congress uniformly denied that cigarette smoking was addictive and were successful, at least temporarily, in stonewalling the Food and Drug Administration's (FDA's) attempts at appropriate regulatory oversight of tobacco. But the increasing tide of public concern and class action personal injury litigation led finally to a breaking of the ranks among the leading producers of tobacco, so that in 1996, Liggett, then the smallest of the five major tobacco companies in the United States, settled health claims with several states and publicly admitted the deadly potential of tobacco use. These and other developments culminated in the historic Master Settlement Agreement of 1998 (MSA) between participating manufacturers and 46 state attorneys general and six U.S. territories (the other states were covered in separate agreements). Among other provisions, the MSA spelled out restrictions on the placement and content of advertisements, particularly restricting any venues and branding characters that would appeal to young people; lobbying activity; cigarette pack sizes; merchandising; and other activities that in effect seek to expand the consumer market for tobacco products. In addition, the MSA contained provisions for public access to information; the establishment of a national foundation for further coordinated public education and study on tobacco health risks; and payments for Medicaid reimbursement—the original focus of the MSA, thus illustrating the enhanced power of litigation to twist the arm of big tobacco. Once again, however, unintended consequences have caused an ironic intersection of interests, as state budgets for even non-health-related expenditures have benefited from the influx of tobacco industry funds, which would dissipate if the industry were to collapse.

The incentive for tobacco companies to enter into a settlement so evidently contrary to their interests was to reduce the litigation burden and potential share price volatility associated with fighting numerous similar cases, but the MSA has not led to a cessation in litigation against the tobacco industry within the United States. Internationally, there are few, if any, legal systems as conducive to class action and product liability litigation as that of the United States, so while the momentum for legal action against tobacco companies has not waned, there remain questions about the extent of the international threat to tobacco industry interests. The 2005 World Health Organization Framework Convention on Tobacco Control has sought to provide model instruments for its 168 signatory countries to enact legislation to reduce the demand for tobacco products through price and nonprice measures and also to reduce its supply by inhibiting illicit trade activities and sales of tobacco to minors.

Local interests have also sought action against tobacco, as demonstrated by the 2003 ban in New York City on tobacco use in all workplaces and most public venues, such as restaurants and bars, which as a sign of the times stimulated more copycat legislation than did a similar 1985 ban in Vail and Aspen, Colorado. Whereas bars were once a smoker's haven and restaurant space was long governed by an imaginary demarcation between smoking and nonsmoking sections, smoking is now increasingly a private activity, or when done in public, it is relegated to places such as sidewalks, where the space between smokers and nonsmokers is less simple to define. Well before the New York City legislation in bars and restaurants, smoking was banned from other public spaces, such as airplanes, and many workplaces.

Investors have further punished tobacco companies through nonlegal means by filtering tobacco stocks out of so-called socially responsible investment funds. Along with alcohol, defense contracting, gambling, and firearms, tobacco industry stocks are routinely classified as "sin" stocks, which are excluded from socially responsible investing (SRI) portfolios. While SRI capital continues to be a relatively minor proportion of the overall investment capital, that proportion is gradually increasing and represents yet another squeeze on tobacco companies' operating margins.

Preventing Asphyxiation

Far from eliciting sympathy for tobacco companies, the pressures from outside that seem to be contributing to the slow and painful asphyxiation of the tobacco industry—witness the 50% reduction in smoking rates among men in the United States, Canada, and the United Kingdom between 1960 and 2001—are increasingly being applied to other consumer goods. Increasing consumer consciousness of health and wellness has led to legislation demanding clearer labeling on the nutritional content of foods and beverages. Packaged consumer goods manufacturers have had to comply with good manufacturing practices to ensure product safety from food-borne disease and potential allergen contamination. Restaurants have come under formal and informal demands to use healthy ingredients or to disclose the presence of trans fats in meals. Such pressures have spawned self-regulation, such as voluntary action by soft drink manufacturers and marketers to restrict school sales and serving sizes of high-calorie, low-nutrition products.

These developments have their roots in the experience of the tobacco industry and its often innovative but ultimately futile attempts to resist adaptation to social norms regarding two fundamental ethical questions. First, to what extent do consumer goods manufacturers have moral obligations to support the well-being of consumers beyond the economic laws of supply and demand? For a long time, tobacco companies advanced a pure economic argument in defense of their product, while critics gradually restricted the applicability of that argument to adults who were free to choose, a dwindling population. Second, what should be the standard for truth telling and disclosure when scientific certainty about the effects of product consumption is unattainable? Again, tobacco companies' defense proved only temporarily effective as scientific certainty about tobacco-induced health risks drew ever closer.

As the ethical risks to the tobacco industry have increasingly become economic realities, tobacco companies have resorted to other forms of innovation to improve corporate performance. One step has been product innovation, which began with the introduction of filters in the early1950s, matured with the availability of so-called lite (low tar, low nicotine) product varieties, and more recently has manifested itself in the pursuit of the smokeless cigarette. While filters arguably made cigarettes marginally less unhealthy, lite cigarettes have been the target of litigation contending that companies essentially set forth deceiving claims about their relative safety for consumer health, and smokeless cigarettes struggle to provide the same satisfaction to consumers who choose to smoke. Another form of product and marketing innovation has been to develop cigarette varieties and advertising campaigns aimed at a specific consumer demographic, though this approach has been criticized for preying on less well-informed consumers. Likewise, producers have sought to prioritize international growth, since regulation on tobacco products outside the markets in developed countries is not typically as restrictive and consumers may be less well-informed. This has continued to spawn seemingly disingenuous advertising and marketing practices, in which tobacco companies have complied with restrictions in developed countries while handing out free cigarettes in promotions in less regulated markets. Pursuing such growth, however, has proved risky as real-time media coverage has increased the risk to the reputation of companies seeking to hawk their wares to unsuspecting consumers while disapproving investors look on. Meanwhile, the introduction of measures such as the 2005 World Health Organization Framework Convention on Tobacco Control has helped international regulators catch up. Another corporate strategy has seen cycles of diversification and disaggregation. With the introduction of other packaged consumer goods into their product portfolios, tobacco companies were able to reduce the risk of concentration and volatility to which they were vulnerable when they were exclusively dependent on tobacco, while leveraging economies of production and distribution scale since food products and tobacco products are often sold in the same retail venues. However, those economies have waned as tobacco has been perceived at times as dragging down the food side of the business, or vice versa, as tobacco purists have argued that tobacco companies would do best to focus on their core customers.

Perhaps even more interesting to watch has been the innovative transformation of some tobacco companies into odd paradigms of corporate social responsibility. It is no longer unusual for tobacco companies to promote and undermine their own interests simultaneously, making their products available to those who choose to use them while offering help and comprehensive information to customers who seek to quit and actively engaging in youth smoking prevention initiatives. Interested in preserving the stability of market share among a dwindling pool of smokers, in some cases tobacco companies have come to invite regulators such as the FDA in rather than continuing the fight to keep them out. Long engaged in active lobbying of politicians, big tobacco now manages its reputation through corporate support for the arts, education, and other community-building initiatives. Not wanting to shed the heritage of foreign royalty and American presidents, who were active in the tobacco business, and unable to deny a history of nonparticipation in constructive debate about health and the public interest, tobacco companies have increasingly sought to refresh their image with a balanced approach to perpetuating the industry. This approach recognizes that (addiction aside) there are still and may always be individuals who enjoy smoking and have a right to do so, while it appears to accept accountability for creating a framework for compliance and social responsibility that encourages open dialogue to put the decision to smoke in the hands of the consumer. While there continue to be skeptics regarding the sincerity of this approach, in theory it addresses the fundamental ethical questions challenging the tobacco industry and other consumer goods manufacturers and marketers. It remains to be seen whether the tobacco industry is sustainable in the broad sense of the term—socially, since its products are harmful to the health of its target consumer; environmentally, as its products originate from the soil and subsequently pollute the air with carcinogens; and economically, while the verdict on its financial performance remains in doubt.

What is beyond reasonable doubt is that there are many lessons to be learned by all industries from the experience of the tobacco industry: first, that economic questions cannot be wholly emptied of ethical content; second, that the accelerating pace of information availability and regulatory sophistication will inevitably catch up with attempts to restrict adequate disclosure; and third, and a consequence of the other lessons, that the decision about what consumer goods are good for social well-being is not exclusively up to the manufacturer or its business partners, government regulators, or the individual consumer. What is good is not a simple question of right or wrong but must rather emerge as an outcome of constructive debate and continuing dialogue among all parties in pursuit of an elusive, uncertain conclusion.

Ethics in Government Act of 1978

Why the Act Was Enacted

The 1970s was a decade of tumultuous social upheaval and political chicanery. Watergate precipitated the resignation of President Richard Nixon. The newspapers reported a litany of overseas bribery incidents. In response to what was perceived as prevalent, insidious corruption at the very highest level of government, Congress responded with a number of ethics-based legislative measures. Among the many acts and amendments were provisions for Independent Counsel (28 U.S.C. 591, *et seq.*) and the Ethics in Government Act of 1978 (5 U.S.C. App. 4 § 101, *et seq.*), hereinafter referred to as the Act.

The essential purpose of the Act was to require disclosure of the finances and financial interests of high-level federal employees, provide report formats and procedures, and give notice to all what the penalties would be for failing to make the requisite reports and disclosures. Congress's goal was to provide an objective means of determining possible areas of conflict of interest.

The General Provisions

The original Act consisted of five sections: Title I—Financial Disclosure Requirements of Federal Personnel, Title II—Executive Personnel Financial Disclosure, Title III—Judicial Personnel Financial Disclosure, Title IV—Office of Government Ethics, and Title V—Government-Wide Limitations on Outside Earned Income and Employment.

Section II, which related to executive personnel financial disclosure requirements, and Section III, relating to judicial personnel financial disclosure requirements, were repealed in 1989, effective January 1, 1991. The spirit of the prohibitions was generally incorporated in 18 U.S.C. § 203, coming under the heading of Crimes, Bribery, Graft, and Conflicts of Interest and titled "Compensation to Members of Congress, officers, and others in matters affecting the Government." The section is more general than the Act. It eliminates the detailed reporting procedures and substitutes an expansive scope of governmental investigative powers and prosecutorial powers. The portions of the Act that remain in force pertain to other federal government personnel who are not covered under Section 203.

Title I: Financial Disclosure

Sections 101 to 111 addressed financial disclosure by federal personnel. The goal of Congress was to discourage bribery and other acts of mischief associated with people in a governmental position of power by requiring them to disclose their sources of income.

Generally, the designated government officials and employees must file itemized reports within 30 days of assuming their new jobs. The Act requires the disclosure to include, but not be limited to, the source, type, and amount or value of income, honoraria, or payments made to a charity on behalf or in the name of the employee in lieu of an honorarium of more than $200 in value; the source and type of income from dividends, rents, interest, and capital gains in excess of $200, identifying the amounts involved within certain prescribed categories of value; the source, description, and category of value of all gifts of more than $250 received from nonrelatives; the source and description (including a travel itinerary, dates, and the nature of expenses provided) of reimbursements received from any source of more than $250; the identity and category of value of any interest in property in a trade or business or for investment or the production of income with a fair market value in excess of $1,000, excluding family members or savings of less than $5,000; the identity and category of value of liabilities owed to any nonrelative creditor, including revolving charge accounts, that exceeds $10,000, except for mortgages on personal residences, motor vehicles, and small household items; and the description, date, and category of value of any purchase, sale, or exchange in excess of $1,000 in real property (other than a personal residence) or stocks, bonds, and other securities (except for transactions with a spouse or dependent children). Although it is not exhaustive, this list gives a sense of the breadth of the report requirements. It also shows that the dollar amounts triggering the disclosure requirement, in some cases, is *de minimus* in comparison with the reporter's income or personal wealth.

An officer or employee covered by the Act who fails to make timely reports or files false reports (5 U.S.C. App. 4 § 104) will be reported to the attorney general of the United States. If the offender is charged, tried, and found liable, the sanction may be up to $10,000. In addition, the offender may be referred to the Judicial Council, a body of judicial officers and their appointees charged with disciplining persons within the federal court's jurisdiction. Although not specifically addressed in the Title, if an official misleads Congress, he or she can also be charged with contempt of Congress, perjury, or other criminal sanctions.

It was apparent with the destruction of Enron and Arthur Andersen that the problem of dishonesty and ethical lapses was not limited to the governmental sector. Regulation of the civilian sector is relegated to agencies such as the Securities and Exchange Commission and other industry regulatory bodies. The civil and criminal justice systems provide additional checks on civilian abuses.

Title IV: Office of Government Ethics

Title IV creates the Office of Government Ethics (OGE). The OGE director is appointed by the president and confirmed by the Senate for a term of 5 years. The director is responsible for providing the direction of executive branch policies relating to the prevention of conflicts of interest involving the officials and employees covered by Title I. In addition to whatever action or sanction the director may take, he or she can also recommend other governmental agencies for taking action. For example, the director might refer an offender to the Justice Department for prosecution on tax evasion charges. Title IV requires any action taken or any rule made by the director to be subject to judicial review.

In 2003, the OGE took the unusual position of petitioning Vice President Cheney, among others, before submitting their proposed legislation to Congress. Their goal was "to modernize the financial disclosure process for federal personnel, and for other purposes." Their proposal was titled the "Ethics in Government Act Amendments of 2003." The legislative stated purpose was to create a "single, Government wide system of public financial disclosure" that "preserves the equanimity of the current [governmental] system" (OGE's letter to Richard B. Cheney, July 16, 2003).

The hope was to streamline and simplify the public financial disclosure requirements applicable to the reporting persons. The OGE reported that the original Act, in place for 25 years, was working well. Their revisions were intended to encourage qualified persons to enter into government service but "not sacrifice the goal of public financial disclosure or deny necessary information to those responsible for determining whether a conflict of interests exists." They did not want to jeopardize public confidence in the disclosure process.

Title V: Limitations on Income and Employment

As a practical matter, many of the personnel serving at the highest level of government are independently wealthy and/or have outside income far exceeding their governmental pay. Title V addresses this situation. The Title uses a number of complicated formulae to address income, gifts, and honoraria.

Generally, members of Congress and senior officers and employees of the federal government are limited to an outside income in any calendar year not exceeding 15% of their annual government pay. Persons regulated by the Title may not personally receive an honorarium while a government official or employee. The idea is to thwart a miscreant from disguising an improper payment as an honorarium. All honoraria must be refused or directed to a charitable organization. No honorarium can exceed $2,000. No person regulated by this Title may accept a gift from an organization from which a close relative of a federal employee derives any financial benefit.

If a person within the regulated class violates any of the Title V provisions, the attorney general may bring a civil action in federal court. If found liable, the individual may be subject either to a civil penalty of not more than $10,000 or disgorgement of the compensation, whichever is greater.

Has the Ethics in Government Act Worked?

The question of whether the Act has worked as intended is difficult to evaluate objectively. Generally, the Act only addresses specific financial disclosures. In the ensuing postenactment years, we have seen a litany of prosecutions and convictions of elected officials, private individuals, and lobbyists for bribery, influence peddling, and tax evasion. Some of these convictions were a result of the Act. Some can be attributed to better investigation and prosecutorial competence.

Clearly the disclosure requirement has had some impact. It mandates transparency. The public and media can evaluate the disclosures for accuracy and for effect. We see the disclosures required by the Act all over the Internet. It seems that those required to make disclosures have, to some degree, taken the requirements of the Act seriously. However, we have no evidence as to the accuracy of any of the disclosures.

At best, we can speculate that the Act gave a reason to those who had nothing to hide to disclose their sources of income and, indirectly, their possible conflicts of interest with their public duty. The specter of sanctions may have scared some of those public officials who were ethically "on the line" to opt for honesty. However, it is fair to say the Act had little or no effect on those bent on mischief, as cases of conflict of interest have persisted in the years since the Act was established. These individuals took bribes and other income and failed to make the proper disclosures. This lapse does not indicate that the law is a failure, just that those who are going to be dishonest most likely will not be deterred by legislation.

Conclusion

Some regard the influence of money on politics to be inevitable. Others believe that the extensive revisions in our political system can substantially reduce the influence of money. A senior governmental official or employee prone to mischief will not be thwarted by legislated ethics. However, the hope, from its inception and throughout the various modifications and amendments, is that the Ethics in Government Act will give a potential miscreant cause to consider the ramifications and sanctions that will arise from his or her misbehavior. The Act also gives the attorney general's office numerous means to punish offenders. On balance, when a senior official fails the ethical test, the people have at least a soupçon of a possibility of holding him or her accountable.

Perhaps the more important issue, of which the Act is a small facet, is how we establish and then maintain a general trust by the public in our government. Requiring key, influential governmental employees and officials to disclose and publish their sources of income is important. However, until there is a more pervasive trust in those who work for and lead us, even the required disclosures will be looked on with mistrust.

Ethics of Care

The term *ethics of care* refers to ideas concerning both the nature of morality and normative ethical theory. Over the past two decades or more, a discussion has arisen regarding these ideas. The caring perspective is distinctive in that it uses a relational and context-bound approach toward morality and decision making. In doing so, this perspective stands in stark contrast to ethical theories that rely on principles to highlight moral actions—such as Kantian deontology, utilitarianism, and justice theory. Importantly, such principles are meant to be absolute and incontrovertible.

Nel Noddings has provided one of the first comprehensive theories of care. Arguing that caring is the foundation of morality, she sees the dyadic relationship as ontologically basic to our very humanity. Identity is defined by the set of relationships individuals have with other humans, and as such without relationships we would not be human. In suggesting that caring is a universal human attribute, caring relation (a relationship in which people act in a caring manner) is seen to be ethically basic to humans. Since the impulse to care (in a specific way) is universal, caring ethics is freed from the charge of moral relativism to the same degree as is virtue theory.

The particularity of relations is fundamental to the ethics of care. Each relation consists of at least two people, the one-caring and the cared-for. Such a relation can certainly be more than merely dyadic as the one-caring and the cared-for come to exhibit reciprocal commitment to each other's well-being. However, what is distinctive in all such relations is that the one-caring acts in response to a perceived need on the part of the cared-for. The act is motivated by an apprehension of the cared-for's reality, a receiving of the cared-for into the one-caring such that the one-caring feels and senses what the cared-for is experiencing. The one-caring responds to the well-being of the cared-for by initiating a commitment to help the cared-for. Authentic care provides the motivation for such assistance. This does not mean that the one-caring does exactly what the cared-for desires in all situations. Rather, the one-caring considers the cared-for's point of view, assessment of need, and expectations of the one-caring in formulating a response that provides the best opportunity for helping the cared-for. This response might be irrational, since caring involves the commitment to do something, however remote the possibilities of success, to improve the cared-for's condition. In the ideal situation, however, the reason(s) the one-caring gives for his or her actions would be sufficient to convince a disinterested observer that he or she indeed acted in a way to promote the cared-for's well-being. Caring thus involves sentiment but is not necessarily emotional in nature.

Within the ethics of care the one-caring receives the cared-for without evaluation. However, in deciding how to respond, the one-caring works in what Nel Noddings calls a "problem-solving" mode—keeping in mind the particular relationship and context to avoid slipping into the abstract, impartial, impersonal reasoning of the deontologist, the utilitarian, or the justice theorist. Ultimately, there is a defining imperative to act that is a critical function of what it means to care.

These ideals apply to both natural caring, or caring born of inclination and love for those close to the one-caring, and ethical caring, which is the feeling response of "I must" to a person's predicament. Ethical caring is a natural outgrowth of natural caring, but unlike Kant's ranking of duty as primary and inclination as secondary, in the ethics of care the inclination to care is primary. Even with regard to those with whom one has no caring relationship—complete strangers—memories of natural caring arise, generating a feeling of "I must do something." This impulse is obligatory in anyone who aspires to what Noddings calls the "ethical ideal," the sense of self as a moral, caring person. However, within the ethics of care, this obligation to the stranger is limited. Two criteria must be met for such a duty to have force: (1) The relationship with the other person must exist (or have the potential to exist), and (2) the relationship must have the potential to grow into a mutually caring relationship. One does not have either the capacity or the duty to care for everyone; however, one does hold an obligation to be prepared to care at all times for particular others—for "the proximate stranger."

Ethics of Care and Feminism

It would be easy to confuse the ethics of care with feminist ethics. Feminist philosophers have argued that the deontological, utilitarian, and justice moral theories are grounded in the masculine experience. More specifically, these theories are seen to emerge in concert with the traditionally masculine forum of economic activity. Within this perspective, the values of competition and domination are seen to undergird both the activities of the marketplace and the rational moral theories. Virginia Held argues for adopting more compassionate bases for our human interaction(s).

Feminist moral theory at its heart has tended to mirror the differing gender experiences of women and men, particularly as these affect the development of understanding with respect to the ways the ethical life is conducted. However, it has been noted by Robbin Derry and others that *feminist* moral theory is not *feminine* moral theory, as feminist perspectives are not fully determined by gendered points of view. Nevertheless, the suggestion that gender matters, particularly as gender relates to one's ethical predispositions, calls into question the inherent "objectivity" of ethical theories, which are advanced in part due to their universal merit and application. Feminine moral theory thereby deals a blow to the exclusively rational systems of thought, which have as their grounding an inherent disregard for the inherently personal—and sometimes gender biased—nature of knowledge construction.

It was not necessary that feminine moral theory be aligned with the ethics of care. It so happens that those writing in the feminine tradition, such as Carol Gilligan, came to associate care and responsibility to others with a female-gendered approach to ethics and individual rights and justice with a male-gendered approach to ethics. Gilligan in particular made the argument that, historically, philosophers have seen women as morally inferior to men, when in fact they are simply different in emphasizing care over justice. However, central to the feminist perspective is not the content of the gender-specific approaches but rather the more fundamental observation that gender—and by extension a host of other demographic factors and interpersonal predispositions as well—contributes substantially to an individual's moral insight and development. This being the case, there is no reason to privilege masculine-rational approaches to ethics above feminine-caring approaches to ethics.

Ethics of Care Within the Business Context

The caring approach avoids the problem that many approaches to ethical management face: deciding whose rights, among people with roughly equal rights, will be respected. While all have the duty to treat others in a caring way, in cases of conflicts of duty, the responsibility of the one-caring includes deciding who is most appropriately the beneficiary of care and then acting on that judgment. It is the concrete, particular individual with whom one has a caring relationship whose well-being must take priority in each inherently unique circumstance.

If caring is regarded as a natural inclination that serves as the base for the development of specific character traits, then one can begin to understand what caring business praxis might mean. Gilligan discusses three levels of a caring morality—one where the self is cared for to the exclusion of the other, one where the other is cared for to the exclusion of the self, and a third where the needs of both self and other are understood. This third level is the one Gilligan sees as moral maturity. While stopping short of equating feminist ethics with virtue ethics, Brian Burton and Craig Dunn suggest that this portrayal sounds very much like the description of an Aristotelian virtue. Not opposed to a legitimate place for emotion in ethical discourse, Aristotle outlines the importance of feeling at the proper times, about important things, concerning the right people, and for good reasons. Aristotle further sees the moral person as possessing various character traits and describes a virtue as behavior regarding a particular trait that is a mean between two extremes of behavior, with one showing an excess of that trait and the other showing deficiency of the trait. Applying this depiction to caring, the virtue would be caring (understanding the needs of self and other), the vice of excess might be codependence (caring for others to the exclusion of self), and the vice of deficiency might be selfishness (caring for self to the exclusion of others).

To achieve the goal of the caring approach to management, the manager needs to understand what the mean of caring is, what this implies for different situations, and what specific virtues are associated with the base of caring. The manager can then care for the particular individuals involved in a specific situation by apprehending their reality, considering their well-being, and acting in a manner that is in their best interest(s) or explain, in cases of conflict, why the action taken might not readily be seen as in the best interest of the cared-for.

Ethics of Care and Stakeholder Theory

Much of the discussion regarding the relevance to management of the ethics of care has taken place within the bounds, or in attempting to expand the bounds, of stakeholder theory. Efforts have been made to use the language of stakeholder theory to describe the caring perspective or use the ethics of care to normatively justify stakeholder theory. In some instances, the ethics of care—or, more accurately, feminine ethics—have even been advanced as the grounding for a new theory of the firm.

Just as the most often discussed forms of moral theory focus on masculine principles, however, most discussions of stakeholder theory give decision rules for how to interact with stakeholders. In categorizing stakeholders and in giving generic principles for interacting with the stakeholder categories thus formed, theorists have moved away from the essence of the ethics of care—understanding the particular context and fashioning a response to that context. But caring cannot be captured in decision rules and universalizable principles. Rather, discussions of caring by their nature center on how we live or, in a business context, how we manage relationships (not contractual obligations), which, after all, form the whole of managerial behavior. Caring focuses on particular cases, with the understanding that each situation is unique. Caring elicits intuitive responses at first, with rational analysis coming later. Caring has an underlying context of moral sensitivity instead of detachment.

Numerous writers maintain that the ethics of care provide a better way of describing the environment in which a manager operates and the manager's response to that environment than principle-based approaches. The primary difficulty with stakeholder theory in the latter instance is that it imagines stakeholders not as individuals but rather as members of homogeneous groups. Although they are members of stakeholder groups, however, when approaching the manager, stakeholders do so as individuals. Each stakeholder naturally holds unique—and in some instances caring—relations to the manager. Each stakeholder holds perceived needs that he or she is trying to convince the manager to satisfy, and such needs will vary from context to context.

The moral impulse of managers is to respond to each stakeholder with understanding, concern, and the desire to do something to help the stakeholder. Such impulses cannot in all instances be explained through the perspectives of the more rational systems of ethical decision making. In fact, Noddings and Gilligan both argue that training in these systems may well extinguish the caring impulse. Furthermore, that impulse decreases as the relationship with the stakeholder becomes more distant—the “I must” response becomes less of an imperative because other stakeholders with closer relationships with the manager also bring forth the “I must” response and the manager can only react to a limited number of stakeholders.

Ethics of Care and Management Theory

There is a great opportunity to apply the ethics of care to organizational research and praxis. It is not too difficult to imagine how the crafting of an organization’s statement of purpose and mission might be informed by this perspective. Policies supporting work-family balance are easily seen as a matter of ethics of care. Recruiting and hiring practices might take into account the well-being of the cared-for—the prospective employee. A variety of employment practices, from job sharing to telecommuting to job rotation, could reflect caring impulses that not only explicitly acknowledge the particularity of intra-office relations but serve to honor interoffice relationships as well. Vacation and sick leave policies, termination guidelines, employee assistance programs, profit participation plans, performance appraisal, and so on—the litany of organizational practices that might prove to be natural extensions of the moral impulse to care seems limitless.

Ethics of Dialogue

The ethics of dialogue has drawn increasing attention from scholars in the humanities and social sciences, as well as from policy makers and problem solvers in the realms of business, government, and civil society. Ethical dialogue is an approach for human discourse and reasoning directed toward improved problem understanding and possible problem resolution. Such discourse focuses on the enhancement of learning and relationship building by multiple stakeholders who are struggling to make better sense of complex, messy problems that are characterized by significant value or interest conflicts and contested knowledge claims. An ethics of dialogue can be examined by exploring dialogic modes of communication, tracing certain philosophical notions regarding dialogic ethics, and exploring possible risks and benefits for applications of dialogic ethics in organizational, business, and other contexts.

Defining Dialogue

A leading contemporary exponent of dialogue and dialogic learning, William Isaacs, breaks down the term to its etymological roots: *dia* and *logos*. *Dia* means "through" and *logos* is translated as "word" or "meaning." In this sense, dialogue is a "flow of meaning." An older derivation of *logos* is "to gather together," suggesting that meaning arises out of relationships. Thus, dialogue is an open-ended, interactive form of communicative learning that encourages those engaged in discourse to reflect on their own and others' preconceived values and ways of framing issues so that they can together move toward a common ground where joint problem solving via mutual discovery and cooperation becomes possible.

Often, the term *dialogue* is used loosely to cover a variety of modes of communication. Spoken and other forms of communication can occur solely or primarily for self-expression or for the construction of knowledge from an individual's existing cognitions and beliefs. Dialogue can be viewed as communication exchanges involving two or more individuals for purposes such as information sharing, persuasion and other instrumental outcomes, and empathetic relationship building. The learning theorist Peter Senge makes a distinction, though, between dialogue and other forms of discourse, such as discussions involving a group of individuals for instrumental or strategic purposes. These discussions usually seek a convergence of the perspectives of participants, by one point of view winning out over others, to reach some conclusion or course of action. Dialogue, instead, focuses much more on exploring and respecting the diverging perspectives and concerns of participants, seeks a richer grasp of complex issues, and fosters a unique, more trusting relationship among participants who so regularly interact.

The growth of interest in an ethics of dialogue has been associated with specific definitions of dialogue and the particular assumptions underlying these forms of communication. Recent conceptions of dialogue usually assume empowered and vocal participants and a search for "intersubjective" meanings as participants in a dialogue struggle to make sense of a shared problem from contrasting identity, interest, and value perspectives. The diverse applications suggested for dialogue include collaborative inquiry and learning, deliberation and negotiation of public policy in contested, problematic settings, and engagement for increased understanding of relationships and responsibilities among "selves" and "others." Such more recent assumptions and goals for dialogue contrast with forms of communication that are also referred to as dialogue. For example, traditional Socratic dialogue is not open-ended and exploratory since it has more strategic goals of persuasion and established roles for the master or teacher and novices or learners. Different conceptions of dialogue, thus, can have varying ontological (the nature of existence or reality), epistemological (the nature of knowledge or meaning), and ethical (the nature of the good life) assumptions.

Theoretical Contributions to the Evolving Conceptions of Dialogue

One of the more important philosophical trends of the last century has been a "dialogic turn" within philosophy in particular and in the social sciences and humanities generally. Dialogue attracted scholarly attention related to changing views about the nature of human agency or a sense of self. Premodern notions of self emphasized its place within a meaningful universal order. Enlightenment thinkers viewed the self as a rational, individualized, and very autonomous agent. A much more "decentered" conception of self is associated with postmodern thinking, where "objective truth" dissolves in a seething cauldron of competing language games. This sense of self is a fragmented construct, built from fleeting, semiconnected images of past relationships, and is subject to ongoing negotiation and self-promotion. The postmodern deconstruction of competing narratives does not offer much prospect for constructing a shared meaning from language games. In contrast, philosophers of hermeneutics and critical theory seek a more integrative, relational, dialogical understanding of meaning as constructed by expressions of self in relation to others. Hermeneutics is the branch of philosophy concerned with the discovery of human meanings by the interpretation of texts, including not only written documents but also spoken narratives, works of art, and even evocative events. Among the hermeneutic and other theorists seeking a new epistemological framework for better understanding of critical moral challenges and for generating more creative and integrative ethical responses were Martin Buber, Mikhail Bakhtin, Emmanuel Levinas, Hans-Georg Gadamer, Jurgen Habermas, and David Bohm. Criticizing the limitations of both Kantian universalism and Benthamite utilitarianism, this dialogic turn focused on identifying and developing the potential for improving awareness of the moral claims and obligations of stakeholders and for reducing self-deception, other perceptual biases, and a pervasive moral arrogance that arises from a natural psychological tendency to elevate one's own particular cognitions and interests. Cost-benefit studies of construction projects that emphasize the net positive economic values to one set of stakeholders while marginalizing the concerns about the social and environmental costs of the project voiced by other affected stakeholders are a case in point. Recent dialogic theorists, such as Habermas, have been particularly critical of excessively rationalistic and strategic modes of discourse as so dominating business and organizational life that these influences limit a broader exploration of the creative potential of self in relation to others. A relational or dialogic sense of self grounds its ethics less in terms of the discovery of universals of truth or justice or in the role of religion or science in establishing moral claims and much more in a dialogic process by which human beings create meanings and define their sense of identity through caring, social interactions with others. Advocates of dialogic learning as an approach to cooperative problem solving argue that an appreciation of reciprocal ethical obligations or relational responsibilities is more likely to arise from an interactive process of stakeholder engagement than from unilateral managerial applications of Kantian or utilitarian moral precepts.

Martin Buber characterized the essence of ethics as dialogue with genuine openness and appreciation of the other person. Instead of "I-It" relationships or "subject-object" thinking, dialogue can forge "I-Thou" relationships by viewing others as created in God's image. "I" is not the center of the universe in this perspective but a "gift" to be given to others. The focus on and respect for "Thou" or "You" through dialogue helps create a stronger sense of community and constructs a deeper sense of what "We" can accomplish and become. Between the extremes of subjectivism and absolutism and between egoism and purely altruistic concerns, Buber believed that dialogue offers resources for developing enhanced and caring interpersonal relationships. The precepts and practices of Alcoholics Anonymous (AA) are a highly effective example of a therapeutic dialogic encounter. Admitted addicts meet regularly to share stories, confess personal weaknesses, and celebrate advances within the interpersonal context of shared understanding and support. Committed AA members control their addiction by constructing an enhanced sense of self within a community of care.

Dialogic theorists with contrasting backgrounds, such as Mikhail Bakhtin and Emmanuel Levinas, regarded dialogue as an ethical imperative for better appreciating the complexity of cultures and contexts. Bakhtin stressed concepts such as the generation of meaning lying beyond the individual sphere of consciousness and "between" the texts of what is spoken (*intertextuality*). He advocated the prevalence of context over text (*heteroglossia*). Dialogue for Bakhtin and Levinas is an interactive alternative to ethical judgment arising from unilateral, or "monological," derivation of an abstract set of ethical rules. Dialogue responds, first and foremost, to a responsibility engendered by the presence and face of the Other. Dialogue goes beyond mere human exchange through words and becomes a form of virtue itself, as pure ethical (or relational) responsibility. These perspectives base an ethics of dialogue on genuine listening and the realization that the self can't be the central source of adequate moral meaning. The metaethical philosophy of Levinas did view the self as being responsible for ethical action, however, and, through dialogue, capable of transcending its own biases and limitations in order to respect and care for others. Levinas claimed that actual efforts to meet this pure sense of responsibility can never be truly complete or adequate.

Hans-Georg Gadamer commented on an ethics of dialogue from a hermeneutic tradition of textual analysis and interpretation. Gadamer believed that individual consciousness was historically effected or that individuals become so embedded in their culture and times that even their identities are shaped by these assumptions. Interpreting a text or the remarks of another person involves a fusion of horizons in which the individual tries to connect these realities, meanings, and identities. Gadamer viewed dialogue as a means to link the different mental maps of dialogic participants to achieve a broader perspective and common convictions concerning human well-being. Since understanding is shaped by the cultural and contextual influences on dialogue participants, Gadamer suggested that better understanding occurs through periodic efforts to dialogue or share and test diverse perspectives over changing times and circumstances.

These hermeneutic conceptions of dialogue were challenged by critical theorists such as Jurgen Habermas. Habermas claimed that the dialogic assumptions of Gadamer could not overcome the serious inequities of power among certain stakeholders and, therefore, could not discover certain ethical responsibilities or facilitate action with regard to these inequities. Habermas proposed an ideal speech situation or genuine conversation as a regulative ideal for dialogic intentions and processes. Such an ideal is intended to expose and help participants understand systematic distortions of communication by those with the power to dispose others to accept certain meanings and underlying values and interests. Two ethical principles underlie the normative procedural requirements of ideal speech. The first is a requirement that we recognize the right of all beings capable of speech and action to be participants in a moral conversation. The second requirement is that within such authentic dialogue, each participant has the right to initiate new topics and ask for reflection about the presuppositions that each brings to the conversation. In effect, this is a normative dialogic extension of a principle of fairness in engaging stakeholder relationships.

The conception of dialogue as an ethical ideal found in perspectives from Buber, Bakhtin, Levinas, Gadamer, and, particularly, Habermas offers an important counterbalance to human tendencies to rationalize decision-making processes as "ethical" when they merely serve instrumental purposes and outcomes.

Dialogic Alternatives, Assumptions, Risks, and Potentials

A huge tension exists between the notions of dialogic ideals proposed by philosophical theorists and recommendations for actual dialogues that would be more effective for improving human well-being. Scientific or empirical efforts to "capture" or appropriate the ethics of dialogue have some obvious limitations, according to Habermas and others. Such reservations have not impeded, and have sometimes informed, a number of recent theorists proposing dialogic alternatives. For example, the quantum physicist David Bohm advocated a particular form of dialogue to surface and change the tacit infrastructure of thought and overcome reductionist tendencies toward abstract categorization, which leads to fragmented thinking. Such forms of basic cognition become so familiar and embedded, according to Bohm, that individuals can conceive of these abstractions as actual reality and truth, and often the only or primary one. If beliefs and cognitions largely are shaped by previous communities of attachment, then more collective resources, such as dialogue, are needed to test these assumptions for new or complex challenges. For dialogue to be effective for these challenges, Bohm proposed certain basic requirements: (1) suspension of prior assumptions, (2) respect and appreciation for the contributions and assumptions of other participants, and (3) the key role of a facilitator to shape the dialogue process and context.

Building on the work of Bohm and earlier dialogic theorists, others recently have proposed related guidelines for more ethical dialogic processes and outcomes. Among such assumptions or guidelines are the following:

- A collaborative orientation and spirit of co-inquiry concerning the issues and concerns of participants
- Attempts to express viewpoints and positions with honesty and authenticity
- Appreciation of the mutual vulnerabilities and risks involved in such openness
- Reciprocity and caring reflected in the comments and responses shared with others
- Reduction of the impact of power differences among participants
- Awareness of the affective dissonance or discomfort, yet potential learning value, fostered by the unexpected consequences of dialogue
- Active, continuing critical reflection of evolving interpretations and judgments regarding the issues and moral claims of participants

Guidelines such as these have been suggested to create a safe space, or container, for tapping into the deeper learning potentials of dialogic processes. Embedded in certain forms of dialogue are powerful learning paradoxes that include concerns for self/others, interpersonal space/intimacy, and construction/deconstruction of metaphors and other linguistic structures to represent the cognitive tensions inherent in social realities and personal meanings.

Social scientists have also considered the stages of learning and relationship building in dialogic processes as well as what constitutes adequate facilitation to explore and move through these stages. Time is required for the unfolding of participants' knowledge claims, affective displays, and efforts to propose and consider possible actions in these dialogues. Preferences can differ among participants for more freedom or spontaneity versus more control or structure in undertaking the stages of dialogue. Aspects of dialogue such as allowing time for confrontation or challenge of ideas as well as for affirmation and empowerment of participants demand considerable facilitator skill and empathy.

Despite the promise of dialogue for learning and relationship building, there are obstacles and challenges in undertaking dialogue for such purposes. Patterns of human discourse are entrenched or conditioned such that suggestions for ethical forms of dialogue are in practice difficult to enact. Many individuals have poor listening skills or an addiction to conversational narcissism. Attitudes in some cultures devalue "talk" or dialogue in contrast to taking action. Frustration with dialogue, such as lack of opportunity for voice, discomfort when confronting conflicts, very lengthy or continuing time demands for dialogue, or preferences for a different dialogic process, can cause some participants to withdraw. Facilitating resources can help dialogue participants, particularly through the early stages of conflict, in expressing and listening to the diverse values and positions of participants. However, this facilitation can be perceived as biased or as less effective than possible. There are personal risks, too, in undertaking dialogue. Participants who are openly sharing, exploring, and constructing social realities or their identities are vulnerable and could be harmed by the responses of others. High levels of cognitive and affective strain can be experienced by individuals, even when such learning experiences are viewed quite positively in retrospect. The interplay of ideas and shifting relationships through dialogue can lead to perceptions of chaos, confusion, and ambiguity. More genuine dialogue can be a radical departure from the previous experiences of many potential participants, so considerable support for dialogue participants appears warranted when these communication and interaction alternatives are selected. Thus, dialogic exploration may not offer the appropriate benefit-risk profile for many social or organizational challenges. Much more research is needed to consider whether and when dialogic approaches are appropriate responses to contrasting social purposes or needs.

Stakeholder Dialogues for Business and Public Policy Applications

Given the potential for responding to learning and relationship building opportunities, ethical dialogues have been proposed as a means of negotiating, or at least generating alternatives for resolving, public and private policy problems. However, care must be taken to guard against a "strategic twist," where powerful interests can distort the direction of dialogic inquiry. Dialogue has limitations also for the actual stage of policy determination. More genuine and open forms of dialogue are oriented toward "keeping conversations going," thereby providing less guidance for any integration of viewpoints leading to particular decisions that participants might need to make. For this reason, inquiry processes developed in the social sciences, such as participative action research and action learning, have been suggested as being potentially useful in conjunction with implementation of ethical dialogic processes for policy analysis and determination. The relationship between ethical dialogues and other common organizational and institutional processes such as strategic planning and organizational development/change also presents both questions and possible opportunities.

Within the fields of business ethics, corporate social responsibility, and corporate citizenship, research on corporate stakeholder engagement has also suggested applications of dialogic ethics. The extent to which corporations are committed to and practice very high levels of stakeholder engagement, such that their key stakeholders are truly empowered and included in organizational decision-making processes, can certainly be questioned. Yet trends in corporate social performance assessment suggest that more firms are reporting more dialogues with their multiple stakeholders. Social audit consultants have proposed criteria for measuring the quality of stakeholder dialogues. These include measures of inclusiveness and responsiveness toward key stakeholders, as well as evaluation of the actual outcomes resulting from these dialogues. Concerns for the quality of inclusiveness and responsiveness toward stakeholders for purposes of social performance reporting might lead more business organizations to adopt the dialogic processes recommended by social scientists and business ethics consultants.

Multistakeholder dialogues are increasingly sponsored by nongovernmental organizations and governments grappling with complex regional or global issues such as environmental sustainability or technology assessment, in which businesses or corporations are just one of many participants. Agencies associated with the United Nations, for example, are among those sponsoring multistakeholder dialogues. Whether these dialogues can take advantage of the learning and relationship-building benefits while avoiding the obstacles and risks of more genuine forms of dialogue is an issue for continuing social science research. Private consulting firms and university research centers are already studying and recommending applications of dialogic ethics for multistakeholder dialogues. The potential for improved business and public policy practices as a result of the application of multistakeholder dialogues has been linked to concerns as diverse as providing a greater degree of workplace spirituality for employees, enhancing "moral imagination" for stakeholders in resolving complex social issues, and overcoming "paradigm wars" that block increased stakeholder understanding and empathy in cooperative problem-solving efforts.

Ethics of Persuasion

When we purposely use communication to influence others (their values, attitudes, emotions, beliefs, and actions), then we are engaging in persuasion for or against something. Adding media to the mix, so that we can extend our influence, makes us propagandists. This is not necessarily a bad thing. Without some level of persuasion, common agreements (or social contracts) about public policies would be impossible. Another reason is that although persuasion and propaganda are often negatively associated with falsehoods or half-truths, this is not necessarily the case. Much persuasion is in fact truthful, subject to review and critique. Ironically, democracies as well as dictatorships need such purposeful communication if society is to exist and progress.

Advertising and public relations, for example, have long been important persuasive communication strategies used by corporations. Without the ability to tell their stories and promote their products or services through advertising, public relations, and other forms of promotion, businesses would be unable to compete and grow.

From the point of view of self-interest, there is also compelling logic to an organization devoting resources to define problems, proactively track opinion, and be involved in shaping solutions. The process often involves linking one's self-interest to a broader public interest. This, in turn, presents unique problems since there is no such thing as a single "public interest" but rather the collective positioning of concerns in ways likely to be seen as socially desirable or undesirable. The contest usually devolves into a grab for power resources where various entities mobilize leverage for some sort of government involvement.

Of interest is the fact that a significant percentage of major corporate advertising budgets are now spent influencing various target audiences on image, ideological, and political issues in contrast to selling consumer goods. Some of this is conducted under the public service announcement banner of social causes approved by the Advertising Council, a nonprofit organization that grew out of corporate support for the war effort during World War II. Corporations and their trade associations also participate in public policy debates and referenda contests. By the mid-1980s they were already investing an estimated $1.8 billion per year, a figure that continues to grow.

These efforts are particularly controversial. Such spending on public communication by private groups raises concerns over the potential impact of more unfettered access by issue communicators, especially those with "deep pockets," or large capital resources in dominating lobbying and public policy debate. Without doubt, the deep pockets issue is very real. Driving such massive expenditures is the assumption that issues advertising informs and influences public opinion. For example, the Citizens for Better Medicare (CBM) positioned itself in the run-up to the 2000 presidential campaign as a broad-based bipartisan group concerned with the health of Americans and the future of Medicare. Actually, CBM was founded in 1999 by the Pharmaceutical Research and Manufacturers of America, a trade industry group representing more than 100 drug firms, along with some others. They were concerned after President Clinton announced his intention to request that a prescription drug benefit be added to the standard Medicare program. The resulting message of CBM, appearing in print ads and broadcast commercials starring "Flo" the senior citizen, was that they wanted a prescription drug benefit but without government intervention. Overall, they spent more than $7 million advocating Medicare proposals similar to those put forward by the Republican nominee George W. Bush in his 2000 campaign.

Criticisms from within are mostly concerned about whether or not such campaigns work. Scholars, as well as practitioners, are badly divided on whether or not the persuasive information contained in issue communication contributes to effective public policy making. While a number of studies on informational campaigns report that they can influence opinion and behavior (as was true in the CBM effort), other reputable scholars conclude the opposite.

One reason for this is inconsistency in execution. To be effective, issues communicators must demonstrate that their organizations not only seek to change others but also are prepared to reform internal policies and practices. This is often easier said than done, as Exxon discovered as a result of the *Valdez* oil spill crisis in Alaska. Contributing to the impediments caused by the natural human reluctance to admit error is the fact that those charged with issues management responsibilities generally lack a common ethical grounding in education, theory, or practice. This missing common ideological framework is one of the underlying reasons for the uncertain integration and application of issues management, a problem contributing to its overall acceptance within business. Factors such as the type of persuasion effort, the amount of information the audience already has, and how fixed opinions are prior to the campaign are also variables.

These concerns, however, do not directly address the challenges flagged by external critics who assert the perceived threat that implementation of issues management poses for fairness and equity. Some critics simply reflect the principled objection to corporate advocacy by opponents of the capitalist system. Others, while not necessarily antibusiness, raise ethical concerns when such messages use a "front group" strategy (as in the CBM campaign) to disguise who the real proponents are. If those exposed to the messages knew that they were emanating from self-interested elements, not an independent citizens group, then perhaps the audience might react differently.

Opponents also continue to argue that corporate spending, even when fully credited, allows companies to dominate public sentiment by literally overwhelming positions contrary to their own. This position is straightforward: Public opinion is not a function of even-handed debate but, instead, is significantly distorted by propagandistic corporate advocacy. In essence, business critics believe that the agenda is set for the elite media by corporate ownership and influence *prior* to newsrooms serving their gatekeeper function (the editorial selection of what makes the news and what doesn't).

Thus, the debate over the social utility of issues management remains a "hot-button" topic for a number of reasons. Private sector leaders have often been guilty of poor management communication about what they and their organizations stand for. Some businesses, for example, got on the environmental bandwagon in an attempt to look good. But without engaging in a real commitment to reform, such "greenwashing" often seemed false. The long-term erosion of public confidence in American business, a distrust now reemerging because of corporate accounting scandals and as domestic jobs disappear to globalization, is a reflection of this performance and perception failure. These concerns extend into the international arena, where corporate behavior is seen by critics to be pervasively indifferent not only to reasonable laws and regulations but even to minimum standards of human decency.

In addition to external persuasion, American businesses also exert a high level of control over internal information flow in the workplace. FedEx communicates regularly with its workforce so that they know the brand attributes of the company, including what the company's vision and values are. FedEx's leadership also listens and gets feedback from workers. This approach is generally considered a form of enlightened management. On the other hand, "employee relations" can prove a form of propagandistic control rather than simply an informational tool. Wal-Mart has successfully used employee relations to resist unionization and regulatory attempts to mandate greater benefits. So despite issues management's practical side, unless business more consistently articulates a clear-cut rationale for its own existence to a full range of publics, the future of issues management remains clouded.

Indeed, today almost any sustained effort by business to influence others raises some level of suspicion. Questions often asked about persuasive communication include the following:

- Is it unethical for issues managers in business and elsewhere to use persuasion to influence various publics and targeted decision makers?
- Is it unfair to mobilize resources to private ends, with corporate financial access contributing to this lack of balance?
- Does a capitalistic bias "defile" the public interest by propagating materialist values and overconsumption?
- Do issues management efforts push aside real issues, by stressing simpler, more manageable ones that obscure the role of business in causing social problems?
- Should communications be further regulated to ensure that people take a more active citizen-participatory role?

Some writers on the topic (only half-humorously) claim that American businesses should not be expected to do much in the way of ethics since so few corporate leaders have any expertise in it. While this is plausible, such concerns seem to be overrated, particularly when evidence shows that advocacy communication is perceived as valuable by consumers and is tempered by findings that show it to be most effective when seen as informative, nonthreatening, direct, and fair.

When then is persuasion ethical? Most ethicists turn to a utilitarian emphasis on factual information that evokes voluntary change as characterizing ethical persuasion. Voluntary participation is critical, since the recipient of such communication has the power of coparticipation in terms of accepting or rejecting the attempted persuasion.

Alternatively, when is persuasion unethical? Ethicists generally agree that it is unethical to falsify or fabricate, to distort so that the true intent is not conveyed, to make conscious use of specious reasoning, and to deceive the audience about the communicator's intent. While some forms of persuasion are unethical, this caveat is not universally applied to all mobilizing messages. Proponents further argue that propagandistic excess fortunately is generally self-correcting. When abuses occur, as they sometimes do, regulation usually follows. This generally occurs when businesses engage in questionable claims (regulation of automobile contracts) or when individuals cannot make an autonomous reasoned decision (e.g., in marketing to children, who may not be experienced enough to tune out of a dazzling ad campaign).

Today, the essential problem in information distribution involves cutting through the literally thousands of messages ("clutter") directed at individuals each day. There is very little option for larger institutions such as big business dependent on mass markets. Either they actively participate in events affecting them (through political as well as commercial speech) or they wait to respond after the fact (critical news reports, regulation). If the would-be persuader fails to offer something of interest or value, the message is unlikely to break through into consciousness, let alone the action stage.

While this tends to ameliorate the ill effects of partisan views, activists on the right and left are not satisfied. Both camps believe that the media (which after all in the United States are businesses) remain dominated by their ideological opponents, and so they look for government to intervene in guaranteeing that their views are given an airing. Similarly, those "moderates" opting for some form of social responsibility criteria tend to fall back on agencies such as the Federal Communications Commission and Federal Trade Commission for relief.

Certain regulations abroad are often pointed to as models that Americans should consider emulating. For example, Québec bans fast food marketing to youth, and Germany limits celebrity endorsements and other "fluff" in television ads, which are meant to be strictly informative of the nature of the product or service.

Current interpretations of First Amendment law focus on the right of the individual to *receive* information freely rather than on the right of the organization to communicate. Known as "the diversity principle," it serves as the moral linchpin for government intervention in the marketplace of ideas to encourage, in the words of the Supreme Court from *Associated Press v. United States* of 1945, "the widest possible dissemination of information from diverse and antagonistic sources." Issues communicators committed to two-way communication have no problem with the theory of diversity. Unfortunately, the practical aspect of government intervention through mechanisms such as the misnamed broadcast *Fairness Doctrine* (in force in the United States until the 1990s) has not proved particularly effective in policing fairness. All too commonly, the empirical result has chilled speech to the point that only those views most acceptable to regulatory authorities are actually given an airing.

There is some irony in this and a moral as well. Undoubtedly, conspiracies and evildoing *do* exist in the world. But given all we know about competition and human nature, it is particularly far-fetched to believe that there exist a series of monolithic interests in the large sector of the economy represented by business. For good or bad, social problems require real solutions and a level of independent resources only the corporate community can mobilize. This is the positive aspect of having deep pockets capable of underwriting a wide variety of organizations and activities. Indeed, as the source of disclosure for their organizations, communications practitioners contribute meaningfully to diversity. Despite the widespread use of persuasive doublespeak and George Orwell's warning of a memory hole, public communications do have a certain historical permanence that creates a traceable record. This makes for accountability. Even most nonlibertarians recognize that the more pristine corrective for unethical corporate behavior involves what happens to those who bring discredit to themselves, their organizations, and their profession.

Ethics Training Programs

Organizations traditionally have conducted training programs to educate their employees. With the increased attention to ethical behavior, many organizations have created, or expanded, their ethics training programs. The result is that organizational ethics training has become a billion-dollar industry annually. There are many reasons why organizations offer ethics training programs:

- To further communicate and explain the organization's policy on business ethics conduct to current employees
- To introduce new employees to the numerous expectations regarding legal and ethical standards
- To establish or further reinforce the organization's ethical culture
- To communicate to employees the importance of senior management with regard to ethical behavior in the workplace
- To enhance employees' awareness of potential ethical challenges they may face at work
- To provide employees with an ethical decision-making framework to use at work when confronted with an ethical dilemma
- To avoid the potential for litigation against the organization due to employee wrongdoing
- To minimize the liability assigned to an organization by the courts guided by the U.S. Corporate Sentencing Guidelines

Extent of Ethics Training

Numerous surveys have been taken to assess the extent or frequency of ethics training programs. The survey results differ widely based on the size or type of the organization investigated or the frequency or depth of the ethics training.

According to one study, 95% of the Fortune 50, the world's largest companies, have ethics training programs. Another study found that 86% of the companies surveyed trained their managers in ethics, but only 35% of these companies offered ethics training to their hourly employees. A little more than half the local governments (58%) provide ethics training for their employees.

Other reports provide a much lower number. For example, a survey of the Fortune 1000 firms revealed only 25% of the firms having ethics programs. Another study, which included firms of all sizes, found that only 20% of the firms responding to the survey reported having ethics training programs. The authors of this research noted that the size of the organization is a significant determinant of the existence of an ethics training program.

A more in-depth study questions the relatively high percentages of ethics training. These researchers reported that less than 25% of the employees surveyed reported that they had received ethics training on an annual basis. Most of the inflated reports of ethics training may be due to ethics training being offered to employees only at orientation or infrequently or due to inconsistencies in what constitutes ethics training—whether it is legal compliance, such as sexual harassment training, or training that focuses on improving employees' ethical decision-making processes.

Reports of widespread ethics training also may need to be considered in terms of how in-depth it is. One study found that the typical ethics training program lasted only about 1 hour. Very few companies provide a half-day or full day for ethics training annually.

Many believe that the number of ethics training programs will increase with the ethics scandals uncovered at Enron, WorldCom, Adelphia, and other companies. Scholars believe that the incentives embedded in the U.S. Corporate Sentencing Guidelines and the Sarbanes-Oxley Act, to reduce criminal sentencing for those found guilty or the likelihood of prosecution for regulatory violations, will encourage organizations to communicate ethical standards through training programs.

There are an increasing number of resources to assist organizations in developing or enhancing their ethics training programs. Hundreds of ethics training consultants advertise on the Internet, and there is a cottage industry of ethics training resources available through many Internet-based companies. For example, LRN (The Legal Knowledge Company) offers more than 150 interactive ethics training courses on topics ranging from money laundering to conflicts of interest.

Types of Ethics Training

Ethics training programs, like other types of training, take many different forms. Ethics training can be live, where the trainer meets face-to-face with employees. Live ethics training enables the trainer to interact with the participants and immediately handle questions that arise from the training. Some organizations use videotapes or CDs containing ethics presentations or Web-based intranet ethics training for their employees. It may not be financially prudent for a global company to have ethics trainers visit every plant or office, so training videotapes or CDs or the company's intranet are used for ethics training. Intranet training also enables employees to take the training at their convenience, possibly in the evening after work hours or during weekends. The debate regarding the financial efficiency of offering ethics training through videotapes, CDs, or the company's intranet versus offering training live undoubtedly will continue for many organizations. Some organizations use a combination of live and prepared presentations, where the company's CEO, for example, presents a taped message, and the trainer engages the participants in a live case study session.

Information can be communicated through lecture presentation or discussions of hypothetical or real case studies, with the participants using ethical decision frameworks or cognitive reasoning processes to analyze and resolve the cases. Lecture presentations may be appropriate if the ethics trainer is seeking to instruct participants on new regulations or technical information. Researchers argue that, in general, engaging the participants in case study discussions based on real-work situations may be the most effective form of ethics training.

Ethics training can take the form of role-playing exercises, where employees assume the personae of actors involved in an ethical dilemma taking place at work. This type of training may enable the participants to grasp more deeply the ethical challenges embodied in a situation or come to understand how the other person may feel when affected by their actions when resolving an ethical dilemma.

Finally, some ethics training is achieved through the use of role models or socialization, drawing on individuals from the organization or targeting exemplary ethical individuals from history as examples of how people should decide or act in the workplace. If the organization has a former leader or founder who exemplifies ethical behavior, this individual may be a good role model for new employees in the company. Ethical leaders from history may be used as examples of how someone stood up to ethical challenges or used his or her strong moral character to act ethically despite the risks or costs. People often learn from examples, and ethics training can use ethical role models in this manner.

Approaches to Ethics Training

Other important considerations include when the training should be conducted, how often it should be offered, and who should lead the training program. Sometimes ethics training occurs at the employee orientation session for new employees or employees of an organization acquired through acquisition or merger. Researchers have found that ethics training at orientation is the most common form of ethics training, yet some question its effectiveness, as will be discussed later. Ethics training also can be conducted on an annual or periodic, as needed, basis. Some organizations set aside one training program a year or require employees to complete at least one ethics training session during a calendar year. Other organizations prefer to conduct training after a new set of legislation or regulations comes into effect or after an ethical breach has occurred at work.

Some ethics trainers are in-house personnel from the organization's human resources or legal department, while other organizations use outside ethics consultants, professional trainers, or academics. There is significant debate regarding who makes a better ethics trainer. Those preferring to use in-house personnel argue that these individuals are more familiar with the organization's culture and how things are done in the company. They may be better able to provide explanations of how the ethics guidelines best fit with the company's policies and procedures. Human resources or legal personnel may have a better grasp of other, related company policies that affect or appear to be in conflict with ethics expectations. The use of in-house staff, in most cases, is more cost-efficient because these individuals already are on the company's payroll. Employees may be more likely to "buy in" to the program if it is delivered by someone within the organization and particularly if senior management is involved in the ethics training delivery.

Others believe that having someone from outside the company enables the participants to be more open and honest about their concerns or to discuss questions of ethics with someone who does not have direct authority over them at work. Employees may be inhibited during an ethics training session if the employee's boss or supervisor, who evaluates the employee's performance, is conducting the training. In addition, managers may not be well versed in ethics or moral reasoning and, thus, may not be very effective in leading the discussion requiring ethical analysis or in a program that attempts to enhance employees' moral development. Trainers based at the company's headquarters may have difficulty in conducting training at remote company sites due to possible cultural or language barriers. Local employees may resent someone coming in from outside the culture to teach them ethics, whereas a local consultant or academic may be more effective in communicating with the employees at that location.

Effectiveness of Ethics Training Programs

Whether an ethics training program is effective or not is a difficult question to answer because the objectives of the training program often are unclear or multifaceted or one's ability to measure training outcomes may be complex. However, many researchers have tried to address this important question. Very promising results concerning the effectiveness of ethics training programs have been reported by scholars. Some researchers have found that employees who have taken ethics training reportedly are more likely to refuse to take an unethical action while at work. Others have found that ethics training negates in employees the feeling that they must be unethical to get ahead in the organization.

However, some findings do not support the effectiveness of ethics training. For example, one scholar reported that only 1% of those who received ethics training believed that it made a difference for them at work. This is a disheartening result for those who hope that ethical behavior at work can be improved through training.

Why do some ethics training programs fail while others succeed? Some scholars found that an emphasis on legal compliance in the training program (which is fairly common in ethics training programs) was less effective than a focus on improving the participants' moral judgment. As discussed above, some training programs simply present legal compliance information, while others focus on challenging the participants to use ethical decision-making frameworks or cognitive moral reasoning processes. It appears that using the latter is more likely to improve the effectiveness of ethics training.

Another study reported that the least effective training is that delivered by an outside consultant using a prepackaged or canned training program. This result argues for tailoring an ethics training program to the demographics or type of work performed by the employees of the department or organization being trained. One size apparently does not fit all.

It also is important to note that many organizational ethics training programs do not contain an evaluation or assessment process. One scholar reported that the lack of evaluation may be reflective of the organization's intention to create a window-dressing ethics training program rather than a program that seeks to improve the employees' ethical awareness or decision-making skills.

In terms of being effective, researchers have found that the method used in the training program is vital. The use of role-playing situations or case studies tends to improve the training program's effectiveness. It also is important to teach employees how to make good ethical decisions by focusing on their moral reasoning skills, which reportedly results in long-term benefits for an organization.

Another effectiveness element of ethics training consists of selecting a trainer who also is the direct report manager for the participants. This interaction is critical because the participants need to believe that the manager wants the employees to behave ethically and the employees need clear guidance regarding how the manager wants them to act at work. The manager also needs to engage the employees in discussions involving job-specific dilemmas to achieve a high level of training effectiveness. The training must be relevant to the daily work of the participants rather than involve the consideration of hypothetical situations that rarely, if ever, occur at work.

In conclusion, for an ethics training program to be effective, the program should contain the following elements: live instruction, small class size, significant group interaction, a minimum of 4 hours of instruction, the separation of ethics from legal expectations, participant assessment of the ethics training program, and follow-up communications with employees after the training session. The ethics training also needs to be linked to other ethics components in an organization's ethics program, such as the company's code of ethics. Training also should be coupled with mechanisms that assist employees in reporting unethical work conduct, such as through an "open-door policy" where employees can come to their supervisor with any concern or through a company-sponsored help or assist line where employees can call anonymously if they have a question or want to report a breach of ethical conduct. Finally, ethics training should be associated with a periodic review and revision of the company's ethics program by all employees, not just managers.

European Union

The European Union (EU) is an economic and political coming together of European countries. It is not a federation like the United States of America, nor does it operate as an international organization for political or military cooperation, like the United Nations or the North Atlantic Treaty Organization (NATO). Instead, the (sovereign) member nations have decided to pool their sovereignty and delegate some of their decision-making powers to common EU institutions, which act in the interests of all member states. This way, the EU member countries have gained economic and political power that they would be unlikely to achieve individually. In 2004, approximately 380 million people lived in the EU. The EU's large size and the shift in decision-making power from the national level to more central EU institutions (see below) have also presented some obstacles to furthering European integration, most recently in the form of French and Dutch voters failing to approve of the proposed EU constitution.

Origins

The idea of European integration is more than a half-century old. After World War II, it was established in France in 1950 when the French Foreign Minister Robert Schuman encouraged economic integration, in the form of the European Coal and Steel Community. After initial successful cooperation, its six original founding countries (France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg) decided to tighten their economic links by removing trade barriers between them and forming a "common market." For this purpose, the Treaty of Rome, signed in 1957 by the governments of the six member nations, created the European Economic Community (EC) and laid the foundation for further expansions of the EC.

The Treaty of the European Union, also known as the Treaty of Maastricht, signed on February 7, 1992, created the EU. This treaty comprises two major sets of provisions. The first set defined the steps for the establishment of an economic and monetary union. The second set described the steps toward the achievement of a political union, including common foreign and defense polices.

Member States

The EC expanded in 1973, when Denmark, Ireland, and the United Kingdom joined it. Greece followed in 1981, Portugal and Spain in 1986, and Austria, Finland, and Sweden in 1995. Ten other, mostly Eastern European, countries gained access in 2004. In May 2005, the EU consisted of the following 25 member states: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Spain, Slovakia, Slovenia, Sweden, and the United Kingdom. Bulgaria, Croatia, Romania, and Turkey were candidate countries in May 2005.

Institutions of the European Union

The EU consists of three core institutions. The European Commission, the Council of the European Union, and the European Parliament (EP) form the institutional triangle that creates Europe-wide policies and laws. These institutions were originally established with the launch of the EC in 1957. These institutions are involved in decisions of joint interest at the European level. Three pillars circumscribe the institutions' activities. Fields of interest concerning member states' delegation of decision making to the EU institutions can be found in Pillar One of the EU. Pillar One includes institutional and legislative procedures, agricultural policy, the internal market, the environment, citizens' rights, economic and monetary union, and regional policy. Activities in areas that are not subject to the EU institutions are organized through intergovernmental cooperation. These areas are covered in Pillar Two, which contains provisions on a common foreign and security policy, and Pillar Three, which provides for cooperation on justice and member states' domestic policies. Pillars Two and Three play quite important roles as the EU operates under the principle of subsidiarity—that is, the intention to accomplish as much as possible at the level of the member states.

In addition to the three core institutions, there are a number of supportive EU institutions. Two judicial bodies monitor and check legal and budgetary compliance, namely, the European Court of Justice and the Court of Auditors, respectively. Furthermore, the EU has several advisory (e.g., the Economic and Social Committee), financial (e.g., the European Central Bank and the European Investment Bank), and cross-institutional bodies (e.g., the Office for Official Publications), as well as 16 decentralized agencies. However, the following discussion focuses on the three core institutions of the EU. Figure 1 depicts the institutional triangle of the EU as well as the main functions of these three institutions.

The European Commission

The European Commission is the executive body of the EU. It proposes legislation and policies and formulates legislative proposals for discussion at the Council of the EU. It is responsible for implementing the decisions of the EP and the Council. Furthermore, the Commission is responsible for managing the EU budget and various programs adopted by the EP and the Council. Finally, it negotiates international agreements on behalf of the EU and represents the EU internationally. These executive functions are one important administrative aspect of the Commission. Another important aspect is its character of a politically independent institution that embodies the European idea. Although nominated by their national governments, the members of the Commission have no obligation to them. They are (supposed to be) loyal to and act in the interest of the EU as a whole. As such, the Commission is the driving force within the EU's institutional system, initiating, implementing, and supervising common actions, programs, and policies.

Members of the Commission are known as *commissioners.* As the EU has increased its membership, the number of commissioners has risen from 20 to 30. For the Commission's activities to remain manageable, its size had to be limited. As of 2005, there were 25 commissioners (one from each member state). The Council decided that in the future, the number of commissioners

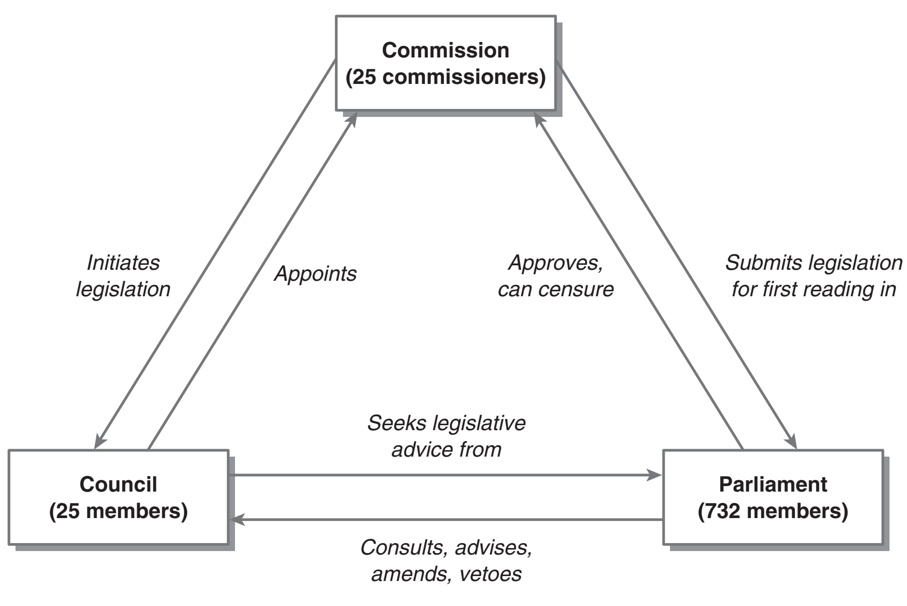

Figure 1 The Three Core Institutions of the European Union

should not exceed 27 and their nationality would be determined by a system of rotation. Commissioners are appointed for a 5-year term by the Council (see description below). The Commission is based in Brussels, Belgium, but has representations in all EU countries and delegations in many capital cities around the world.

The Council of the European Union

The Council of the European Union is the EU's main decision-making body. As the Council is made up of heads of government, it represents the particular interests of each member state. The Council has a dynamic membership; that is, one minister from each of the EU national governments attends the meetings, with different ministers attending different sessions, depending on the agenda topics of each meeting. Thus, the Council is not a permanent body but a series of committee meetings. Altogether, there are nine different Council responsibilities: general affairs and external relations; economic and financial affairs; justice and home affairs; employment, social policy health, and consumer affairs; competitiveness (internal market, industry, and research); transport, telecommunications, and energy; agriculture and fisheries; environment; and education, youth, and culture.

The most important role of the Council is its legislative role. In consultation with the EP, the Council decides on legislation proposed by the Commission. The Committee of Permanent Representatives (i.e., ambassadors to the EU) plays an important part in the EU legislation process. This committee considers proposals before passing them on to the Council. The presidency of the Council rotates every 6 months. The president is assisted by the general secretariat, which prepares the activities of the Council.

Decisions in the Council are usually (with few exceptions) made under a system of *qualified majority voting*. In this voting procedure, member states are allocated votes roughly in proportion to their population size. Since November 1, 2004, the total number of votes has been 321. Germany, France, Italy, and the United Kingdom have the largest number of votes, 29 each. A qualified majority on a proposal is reached when it is approved by the majority of member states *and* when a minimum amount of votes (72.3%) are cast in favor of the proposal. In some cases, such as the common foreign and security policy, taxation, and immigration policies, decisions have to be unanimous.

Three other important roles of the Council include (a) coordinating the broad economic policies of the member states, (b) negotiating international agreements between the EU and non-EU countries or international organizations, and (c) jointly with the EP, approving the EU annual budget. All these functions, including legislative functions, concern Pillar One of the EU, where the member states have decided to delegate decision-making powers to the EU institutions. In addition, the Council issues guidelines and coordinates cooperation on matters over which the member states have retained independent control but nevertheless decided to work together (i.e., Pillars One and Two). These are the areas of a common foreign and security policy, the police force, and judicial cooperation in criminal matters.

The European Parliament

The EP is elected by the citizens of the EU. Since 1979, parliamentary elections have been held every 5 years. The EU Parliament brings together all the main political groups operating in the EU member states. The EU ministers of Parliament sit in cross-national political groups (i.e., EU-wide parties), of which there have been seven since 1999.

The EP has three main roles: a legislative role, a supervisory role over the Commission and the Council, and a budgetary role. The legislative role is primarily an advisory role because to enact a law, the EU Council first needs to consult with the EP in a large number of areas. The EP is also invited to comment on any policy directives proposed by the Commission, a role that it shares with the Council. The EP's supervisory role, outlined in the Treaty of Rome, allows it to question and control the decisions made by the other EU institutions. It also includes the right to censure and dismiss the Commission as a body. The EP shares its budgetary role with the Council. No budget may be adopted without its agreement.

The powers of the EP have been significantly strengthened by the Maastricht Treaty of 1992. In the area of legislation, the EP is intensively involved in the process of consultation and *codecision*, which means that it shares legislative power with the Council. The EP can initiate actions of the Commission and has the right to veto certain legislation. In addition, it is authorized to appoint a European ombudsman, who acts as an intermediary between the EU citizens, business, and the EU authorities. The ombudsman is entitled to receive and investigate complaints of misadministration in the EU institutions. The EP's power also extends to approving the newly elected Commission and installing temporary committees of inquiry, which examine petitions from citizens.

Major Treaties

The treaties lay down the rules and procedures that the EU institutions must follow. They are entered into by the member states' presidents and prime ministers and ratified by national parliaments.

After the foundational 1957 Treaty of Rome, a number of other treaties, acts, and protocols have been signed by the member states over the years. The most important treaties include the following:

- Treaty of Brussels (signed in April 1965) defined the administrative structure of the EC by integrating the European Coal and Steel Community (ECSC) and the EC.
- Single European Act (signed in 1986) increased the legislative power of the EP, specified the realization of a common market, and adjusted voting procedures in the Council of the European Union (then the Council of Ministers).
- Treaty of Maastricht (1992) created the EU.
- Treaty of Amsterdam (signed in October 1997) clarified arrangements for common foreign and security policies and extended the powers of the EP. It instituted major human rights provisions, including free movement of persons, opening of internal borders, and social policy.
- Treaty of Nice (signed in February 2001) established the rules for the expansion of the EU. It created a new set of governing rules for the EU institutions and clarified the way they will work in the future.

Business Inside and Outside the EU

International business is affected by various EU features and institutions. First, its competition policy (mainly expressed in Articles 81 and 82 of the Treaty Establishing the European Community, that is, the Treaty of Rome of 1957) has the goal of balancing market integration with the precedent of U.S. antitrust law. Although European law allows defenses (e.g., economic consequences) barred under U.S. law, the consequences for business are often similar. For example, Microsoft had concurrent antitrust investigations and lawsuits in the United States and Europe. Second, like the United States in the late 1970s and throughout the 1980s, the EU has embarked on a course of market opening and privatization, leading to generally greater competition, which has benefited customers in various ways (e.g., in the form of drastic reductions in the prices of airline tickets). However, until very recently, the EU was more hesitant than the United States in abandoning agricultural subsidies and its bureaucratic social and labor market regulations. In fact, the current backlash among some EU citizens against greater European integration may be an expression of voter anguish over the importance of social-democratic welfare state features (and over the loss of member nations' cultural identity).

In its nonmarket strategizing, international business has often had to adapt to member states' corporatist structure, which means that national business associations often work with, but also co-opt, the agencies regulating organizational practices. Although the unionization rate in most EU countries tends to be higher than in the United States, business and union relations in Northern and Central Europe are often more cooperative and less adversarial than in Anglo-Saxon countries. One of the areas in which these business-government negotiations led to a compromise was the Kyoto Protocol and the EU's ecological leadership; the EU has now introduced a pollution credits trading system, which is, relative to a carbon tax, the solution preferred by industry for its economic efficiency.

Conclusion

During the past 50 years, the European Union has developed into a unique integration among European nations. It has established a single European market, launched a single European currency (the euro), developed common policies ranging from agriculture to defense, and developed a unified European voice in world economy and politics. From the initial economic cooperation among a few European countries, the EU has evolved toward a multilateral set of close economic, political, social, and environmental partnerships. However, in this and a few other areas (e.g., the debate about the candidature of Turkey), challenges remain. The upheaval brought on by the French and Dutch "No" votes on the new proposed EU Constitution in 2005 may considerably slow progress on further European integration. It has, at the very least, introduced a lot of uncertainty about the vision of a common European future, although several core member states (including Germany) had already ratified the new EU Constitution in their national parliaments.

European Union Directive on Privacy and Electronic Communications

The 2002 European Union Directive on Privacy and Electronic Communications ("the Privacy Directive") and its predecessor, the 1995 Directive on the Protection of Individuals With Regard to the Processing of Personal Data ("the Personal Data Directive"), are legislative acts that work together to protect European citizens' and employees' e-commerce privacy. Since the first of the two directives became effective in 1998, they have affected U.S. companies attempting to do business with existing or potential customers and employees in the European Union (EU). Because of underlying philosophical differences between the United States and the EU concerning the scope and purpose of legislation and privacy interests, the EU directives' legal requirements do not mesh well with U.S. laws. A "Safe Harbor" for U.S. companies doing e-business in Europe has had mixed results, but according to an official EU study, U.S. companies are not fully complying with the Safe Harbor requirements.

Scope and Requirements of the European Privacy Directive

The directives' dual goals are (1) to ensure a high level of protection for individuals' privacy in all EU member states and (2) to enable the free movement of personal data within the EU. The directives protect four aspects of individuals' private data: (1) data quality, (2) legitimate processing of data, (3) rights of the individual whose data are being collected (the "data subject"), and (4) security of data. Data quality means that personal data must be processed fairly and lawfully; collected for explicit, legitimate, and specified purposes; relevant; accurate; and erased automatically when no longer needed. Legitimate processing means that personal data can be obtained only if the individual concerned has given his or her unambiguous consent. The data subject has a right of access to the information, the right to correct or block information that does not comply with the directive, and the right to object to the processing of data for compelling reasons. Finally, personal data must be secure. It must be protected from accidental or unlawful destruction or loss and against unauthorized alteration, disclosure, or access. Of concern to U.S. business interests is Article 25 of the 1995 Directive, which prohibits data transfers to any country that lacks an adequate level of personal data protection. In the EU's opinion, U.S. law does not provide the requisite level of protection.

Differences in Legal Philosophy

European Union

Both the United States and the EU strive to protect human rights, but they differ in terms of what type of entity is likely to present a threat to those rights: The

United States has typically viewed overgrown governmental power as the most likely threat to civil liberties. Thus, in the United States, laws protecting human rights usually focus on limiting governmental powers. In contrast, the EU focuses more on potential threats from private entities. The EU's historical foundation for this concern was the misuse of data collected by private industries in pre–World War II Germany, industries that subsequently aided the Nazi attempt to eliminate targeted groups. Thus, data protection laws in Europe are focused more on limiting the powers of private entities to collect and keep data, while limiting governmental power to do the same is of lesser importance than it is in the United States.

United States

In contrast, Americans historically have a fundamental distrust of governmental intervention into the private sphere: Much of the controversy over the ratification of the Constitution was based on a concern that the new U.S. Government would gain too much power over individuals. Thus, in the United States, the government's power to collect personal information is limited. Americans traditionally are less concerned about how private industry collects and treats personal information. Consequently, most existing legislation does not include privacy safeguards, or if it regulates such safeguards between business and consumer or citizen and government, it does not address employment relationships. Similarly, the common-law concept of invasion of privacy has rarely been applied in the context of private industry, as opposed to continued concern over governmental intrusion into the right of privacy read into the Fourth, Fifth, and Fourteenth Amendments by the Supreme Court. Nevertheless, there have been some changes due to a rising momentum with regard to general privacy issues in the United States. For example, health care providers are required under federal law to advise patients about exactly how and when they will release personal data.

The Safe Harbor and Its Effects

After the adoption of the EU Privacy Directive, the U.S. Government engaged in intense negotiations with the EU to resolve the discrepancies in privacy policies and facilitate e-commerce between the two entities, their citizens, and their industries. The product of the negotiations was the adoption of the Safe Harbor agreement in 2000. Under this agreement, a U.S. company soliciting personal data from a citizen or a company in the EU must voluntarily demonstrate that it will protect the data according to seven criteria: notice, choice, onward transfer, access, security, data integrity, and enforcement. Thus, it must (1) notify individuals about the purposes for which it is collecting and using personal information, (2) give individuals the choice of opting out and refusing to provide the information requested, (3) apply the "notice" and "choice" requirements before transferring information to a third party, (4) give individuals access to their personal information, (5) take reasonable precautions to protect the security of the information, (6) ensure that the data collected be reliable, accurate, complete, current, and relevant to the use for which it was collected, and (7) have a mechanism for enforcing Criteria 1 to 6. The Safe Harbor agreement is followed by U.S. companies on a voluntary basis. The expectation is that a company must first implement the seven Safe Harbor criteria and then notify the U.S. Department of Commerce of its compliance as well as declare its compliance on its Web site.

As of this writing, the effectiveness of the Safe Harbor has reportedly been dubious: U.S. companies have been reluctant to volunteer compliance, and the EU Commission of the European Communities found three major problems even among those that had so volunteered. The Commission found that voluntary statements of adherence were not always visible, and although some Web sites mentioned the privacy policy, they did not provide access to the self-certification. Less than half the privacy policies posted reflected all seven Safe Harbor criteria. Finally, in many cases, the policies did not provide clear instructions for individuals who wanted either to exercise their Safe Harbor rights or to obtain information on dispute resolution procedures.

The 1995 Directive and the EU-U.S. Safe Harbor, as well as antispam provisions in the 2002 Directive, create an additional layer of complication for U.S. companies wanting to do business in the EU. On the other side, U.S. legislation has made it more complicated for European companies who want to do business in the United States. Examples of U.S.-generated legislative complications are the Sarbanes-Oxley Act's whistle-blowing and other increased corporate compliance regulations, brought on by Enron and other corporate scandals of the early 2000s.

Evolutionary Psychology

Evolutionary psychology is an approach to understanding any facet of the psychology field. It is concerned with how the mind is designed based on the assumptions and insights from evolutionary biology and evolutionary game theory. The purpose of evolutionary psychology research is to outline the blueprint of the mind and ultimately explain human nature. Evolutionary psychologists claim that the human brain was largely formed in primitive times, so to understand human cognition and behavior, it is necessary to evaluate the prehistoric conditions under which our ancestors lived.

The concepts and principles at the foundation of evolutionary theory can be applied to psychology based on the assumption that humans are a product of natural selection as a way of explaining behavior. This is a very different position from the one taken by most social science models of psychology. Standard models assume that human behavior is caused primarily by learned experiences and exposure to cultural influences. The standard social science model views the human brain as a tabula rasa, or blank slate, capable of unlimited flexibility. Contrary to that position, the evolutionary psychology field holds that human behavior is guided to a great degree by an interwoven set of psychological mechanisms that were formed by natural selection over time in response to various evolutionary pressures. Evolutionary psychology is a positivist approach to the design of the mind. It examines which adaptive problems the human mind is hardwired to solve and infers the structure of the brain in virtue of individuals' abilities to solve those problems.

Natural Selection and Evolutionary Biology

Driving evolutionary psychology is evolutionary theory. Critical to the theory of evolution is the fact that humans' primitive ancestors were faced with various selection pressures that compromised their survival. Charles Darwin described evolutionary theory as the progressive modification of species in which design features are altered over time to enable species to adapt to their environment. For improved designs to accumulate and be transferred to kin through genes, members of a species must be able to propagate. An adaptation is simply a successful design feature at a particular moment in time that aids the species to continue. Natural selection is the process by which successful features are passed down from one generation to the next and less successful features eventually are phased out. Over countless generations, the natural selection process designs organisms that are continuously better suited to coping with the current environment. Each design modification serves a particular purpose, or function, for coping with the surroundings. These new designs are transferred from one generation to the next through sexual reproduction. Traits useful to a species cannot be sustained by the species if its members do not reproduce.

Evolutionary biology is specifically concerned with the formation and perpetuation of physical traits in the development of a species. Traits such as humans' eyes, sense of smell, and hands all served a purpose for our ancestors and aided in their survival. These physical features enabled our ancestors to solve adaptive problems in the prehistoric environment, such as locating food and enemies and grasping objects. Researchers in the field of evolutionary biology induce the physical design features of organisms by discovering the adaptive problems those structures and traits solved in the Pleistocene environment.

Principles of Evolutionary Psychology

This same design logic is applied to evolutionary psychology in terms of the design of the mind. Some of the adaptive problems that faced primitive humans involved social exchanges (a mutually beneficial relationship between at least two cooperating parties). Hunter-gatherers often needed to cooperate with each other to accomplish tasks that could not be done alone (i.e., obtaining food, protecting kin). According to the evolutionary psychologists, natural selection favored programs in the mind that solved these problems with efficiency and precision. Each organ of the body, including the brain, solved a particular problem in ancestral environments. All human design features, both physical and mental, were formed and developed in these ancient environments. Evolution and the process that drives it, natural selection, operates in a slow and incremental manner. Any program or phenotype takes millennia to develop. Modern societal environments are very recent in evolutionary history and constitute a minuscule percentage of human existence. Evolutionary psychologists claim that our minds were formed during the Pleistocene period.

Due to the short amount of time the human species has been exposed to modern social environmental arrangements relative to the evolutionary historic timeline, the evolutionary psychologists posit that primitive environments had a profound and powerful influence on shaping the human mind. New physical features and cognitive programs have not had enough time to adapt to present conditions. Individuals' minds became hardwired to solve various tasks necessary for social exchange relationships. The brain slowly developed programs to solve particular survival problems. A common analogy is to compare the human brain with a computer in that it is designed to process information about the surrounding environment for directing behavior. Thousands of years were required to incrementally build the complex cognitive system capable of promoting survival behaviors. To understand the design of the mind, researchers essentially reverse engineer the brain by attempting to discover the conditions under which ancestral humans lived. Once the particular challenges facing our ancestors are identified, the evolutionary psychologists are able to induce the functional purpose of the circuits in the brain. The specific programs in the brain frame the way individuals perceive the world.

What is problematic for modern-day humans is that the circuits designed over time to regulate behavior and tackle certain primitive dilemmas may not be adapted to properly interpret contemporary cultures and conventions of society. This is particularly relevant to business ethicists. Leda Cosmides and John Tooby speculate that the context-specific programs that once solved prehistoric problems with precision and speed could even be responsible for shaping cultures among people.

Social Exchange

The relevance of the evolutionary psychology approach to business ethics rests on the premise that social exchange relationships are necessary for organizations to conduct business. From an evolutionary perspective, social exchange would only be selected if it aided in humans' ability to survive and propagate the species. For it to become an evolutionarily stable strategy, both parties to an exchange would have to elicit a cost in order to conditionally receive a benefit. Specifically, neural programs responsible for regulating conditional reasoning on social contracts are required for social exchange to take place. Using models from game theory to identify when social exchange would stabilize in a population, evolutionary psychologists were able to identify the specific skills necessary for reciprocal relationships. Individuals must have the ability to detect cheaters on particular social contract conditional rules and must also be able to direct future provisions to contracting partners who reciprocate. Cheaters are individuals who accept a benefit without paying the cost required by the conditional rule. It is posited that individuals' brains are hardwired with social contract circuits designed to serve the function of calculating the costs and benefits of a social exchange with a subfunction of detecting cheaters on social contract rules.

Empirical evidence exists that individuals are adept at detecting cheaters on conditional rules framed as a social contract but not on general permission-type conditionals or simple abstract logic. This lends additional support to the notion that the circuits in the brain are indeed specific to a certain problem. Since the violation of rules in business has ethical repercussions, the hypothesis that individuals are hardwired with the neural architecture designed to reason through social contracts is of interest to the business ethics field.

While these arguments are dyadic in context, in business, cooperation among three or more people is commonplace behavior. In nature, this kind of coalition forming is an anomaly except to the human species. In game theoretic terms, the impulse to free ride on a cooperative venture would become a stable strategy for dealing with relationships if it was evolutionarily advantageous. Rather, the evolutionary psychologists purport that since participation in nondyadic groups is the norm among individuals, cognitive machinery designed to punish free-riding behavior must have evolved for participation to have spread through the population. Punitive sentiments toward free-riding individuals (violators of social contracts rules) evolved over time as a moral device that served to eradicate the advantages of that behavior. Punitive sentiments are manifested in modern-day business in the form of lawsuits and the disintegration of relationships.

Critics

The alternate hypothesis to the evolutionary psychology approach is that the brain is highly malleable; that human experiences are a strong enough influence to shape the mechanics and structure of the mind. Critics of evolutionary psychology focus not only on creationist or intelligent design perspectives of human existence but also on the fact that the primary assumptions of the approach are dependent on mere hearsay. Predictions regarding the structure of the mind are proposed based on an inference about what prehistoric conditions were like. If the causal relationship between ancient conditions and physical and mental forms cannot be established, then the theory is invalid.

Other researchers have offered the possibility that the architecture in the brain is not context specific but context general. On the other side of this debate in the evolutionary psychology field is the proposition that logical reasoning comes from pragmatic reasoning schemas. This side argues that our ancestors had to consistently discover practical solutions to everyday problems and that the brain is structured according to the classes of goals that had to be attained for survival. How people practically interpret environmental situations or dilemmas forms the basis of reasoning rules in the brain.

Executive Compensation

Executive compensation refers to the total reward provided by the firm to the top level of executives in a corporation, such as the chief executive officer (CEO), the chief operations officer, the chief financial officer, and a handful of other executives who occupy the very highest level of management. At this level in the firm, total compensation generally takes many forms, including any or all of the following: salaries, bonuses, incentive payments, deferred compensation plans, stock options, and the direct provision of goods and services. Unlike direct cash payments of salaries, bonuses, and the like, the other forms of compensation can be relatively large and less visible. For example, stock options granted to executives are not generally visible to the public, yet they may be worth more than the direct cash payments the executive receives. Similarly, many executives receive quite valuable packages of perquisites ("perks"), such as apartments, personal staff, personal transportation, and the payment by the firm of many other expenses that most employees would have to bear themselves.

Social and Ethical Issues

Many observers see the size and form of executive compensation as a pressing social and ethical issue. These concerns have become particularly poignant in recent years as the public has become aware of the absolute magnitude and generosity of some pay packages. Furthermore, public attention has focused on numerous instances in which executives were rewarded very handsomely even as the firms they were supposed to be leading had floundered. Public indignation has arisen at the picture of very handsomely rewarded executives coupled with a firm that is experiencing financial losses, closure of facilities, and employee dislocations in the form of cuts in pay and benefits and enforced layoffs.

One of the most emotional aspects of the executive compensation issue is the absolute magnitude of executive compensations. For large firms in the United States, compensation for top executives can run into many millions of dollars per year. Some celebrated situations have arisen in which compensation for a single year can push toward $100 million, particularly if stock options are granted in that year. To some observers, the very size of this compensation seems totally inappropriate and even obscene.

Criticism of executive compensation has focused most intensely on practices in the United States, and critics of the present executive compensation practices often point to both domestic and international comparisons with the present level and structure of executive compensation that prevails in U.S. firms. Within the United States, critics of executive compensation point to trends in executive compensation relative to the total pay packages received by rank-and-file employees in the same firm. Most studies suggest that the ratio of executive compensation to that of ordinary workers has increased dramatically in the past few decades. In other words, executive pay seems to be rising much more rapidly than worker pay, and these critics present these data as evidence of a system gone wrong.

Two types of international comparisons play a prominent role in the executive compensation debate. First, executive compensation in U.S. firms appears to be more generous than in comparable non-U.S. firms. Studies have examined the absolute magnitude of compensation internationally as well as the ratio of executive compensation to ordinary worker compensation across countries. In general, studies have found that top executives in U.S.-based companies receive a higher level of absolute compensation (i.e., the actual dollar worth of the entire pay package) than similarly placed executives in non-U.S. firms. As a second type of international comparison, researchers examine the ratio of executive compensation to the pay of ordinary workers in U.S. firms versus the same ratio in non-U.S. firms. Most studies find a large difference in this ratio, with the executives of U.S. firms receiving a much higher wage relative to that of ordinary workers than is the case in comparable non-U.S. firms. Again, critics take this disparity as evidence of a flaw in the system in the United States.

Defenders of the present arrangement of executive compensation generally acknowledge the overall accuracy of the empirical claims summarized above and grant that executive compensation in U.S. firms is higher than it is abroad and also that executive pay in the United States has been rising faster than that of workers. These defenders of the present level and system of compensation often argue that these trends by themselves constitute no evidence that the present level is wrong or that the trend is moving in the wrong direction. To make such an argument, they assert, merely assumes that the previous levels were correct and that recent departures are in error. However, what if the previous levels of absolute or relative compensation were too low? Then, the movement toward higher executive compensation would be a movement toward a more appropriate level of pay. Similarly, international comparisons might carry little weight by themselves. If U.S. pay levels are high compared with those that prevail in other countries, it might just mean that the other countries have it wrong.

These reflections suggest that the issue must be examined at a deeper level to make real progress in understanding the social and ethical aspects of executive compensation. In particular, a more sophisticated examination of the issue might attempt to answer questions such as the following. Do executives deserve the compensation they receive? Does the present system of executive compensation serve the interest of society as a whole? Does the present level of executive compensation lead to an unjust allocation of a society's resources? Is the present arrangement of executive compensation simply the result of individuals and firms that exercise freedoms and make decisions that rightly lie within their control? Finally, what are the effects on society as a whole of a system in which some receive relatively so much and others so little? The remainder of this entry considers these issues in turn.

Desert

Could it be that executives deserve the compensation they receive? Top executives of large corporations control the deployment of vast resources in the form of the firm's financial worth, the work of thousands of employees, and even the use of the land and natural resources to which the firm has access. These executives make decisions that have extremely important social consequences. Committing the firm to the wrong investments can waste billions of dollars of wealth, destroy the livelihood of thousands of employees, and even drive the entire firm into bankruptcy. Similarly, the value of correct decisions at this level is gigantic. For example, IBM's decision to create the IBM PC in 1981 spawned an industry that revolutionized work around the world, created any number of related industries and firms, and sowed the seeds of some of the greatest individual fortunes the world has ever seen.

A gifted executive who could make the right decisions at these levels would create value for society that would dwarf even the most lavish executive pay package. Does such an individual deserve very high compensation for exercising his or her talents in a manner that is so socially beneficial? Many think that the answer to this question is clearly affirmative, and they tend to see firms as perpetually engaged in a search for such talent. According to this analysis, it is extremely wise to pay $100 million annually to an executive who can make decisions that would create $100 billion in wealth. Surely such individuals are rare and difficult to identify, but perhaps the hunt for and competition for those with this kind of potential is justified?

Critics of this desert argument reply by pointing out that actual executives seldom display such genius, and it is in fact easy to identify very highly paid executives who seem much more adept at making wrong choices and destroying value than making brilliant decisions and creating benefits. Beyond pointing out situations in which the actual performance does not seem to deserve high compensation, critics of the desert argument often maintain that no one could merit such compensation no matter how brilliant one's decisions. They argue that it is wrong for any individual to take so much for himself or herself, no matter how much benefit that individual might create for others.

Freedom

Some view the level of executive compensation as essentially unproblematic no matter what the level, subject to the basic constraints that compensation be determined simply by economic actors exercising their freedom to arrive at a contract. Here, the argument goes as follows: An executive, like any other worker, seeks the best employment contract available. The firm seeks the best managers it can find, subject to its own ideas about its willingness to pay and the perceived qualities of the potential executive. Both sides of the bargain, firm and executive, merely exercise their basic freedoms as economic actors in a free market and reach an agreement on that basis. As a result, the process is fair and leads to employment compensation that is fair simply due to its being the result of a market process that is seen to be a fair process by its very nature.

Furthermore, those who emphasize the importance of freedom of contract point out that freedom of contract benefits society, because the capitalist economic system works by allowing firms to make their own choices and to compete. For the executive, the freedoms being exercised are even more basic than they are for the firm, because the executive sells his or her own labor, so the sphere of freedom being exercised is very basic indeed.

In rebuttal to this line of argument, critics of the present system of executive compensation assert that the model of two independent agents striking an arm's-length bargain does not describe the situation very well at all, so the emphasis on freedom is misplaced. These critics point out that executive compensation is typically determined by the compensation committee, which comprises members of the firm's board of directors. However, membership in many boards is conferred directly or indirectly by the CEO of the firm. As a result, the very people administering the compensation of a CEO may owe their directors' seats to the same CEO, whose compensation they are supposed to judge and control.

Furthermore, top executives and board members are often friends, sometimes old friends of close standing. In addition, many directors serve on the boards of several companies, and CEOs of one firm often serve on the boards of other firms. This arrangement creates a class of directors and CEOs who flourish in a club-like atmosphere. As a result, the employment contract with the firm's top executive may not be a fair bargain struck by two completely independent parties. Instead, these critics argue, it may well be an arrangement of mutual advantage reached among friends, or at least it may be a situation in which directors are naturally empathetic toward CEOs who are part of the same managerial class. The result of this intimacy is a set of employment contracts for top executives that is the result not of a pure and free market process, these critics charge, but of an impure process tainted by ties of friendship or mutual appreciation.

Utility Maximization and Social Goals

Some observers of executive compensation focus on the overall benefits, or overall utility, of the present policy of executive compensation. These thinkers believe that the best approach to such an issue turns on the question of what arrangement will create the highest total societal benefit. As such, they are less concerned with what an executive might receive or deserve and instead ask, What system of executive compensation will create the greatest overall benefit for society? For them, the best system of executive compensation is the one that achieves the goal of maximizing social utility, which we may restrict to the narrower range of social wealth for conceptual convenience.

Even though these thinkers approach the issue from within a framework that emphasizes utility, they can often differ in the solutions they favor, because they disagree on which policies will contribute to utility. One group of thinkers attempting to defend the basic structure of executive compensation arrangements approaches the issue from the point of view of designing contracts. These thinkers analyze the problem in the following terms. The top executives of a firm are agents of the shareholders, who are the principals. The executives choose how to deploy the assets of the firm. The perfect agent would allocate those funds just as the principals would desire were they themselves present and able to make decisions. However, executives are not only agents of the shareholders but also persons in their own right, and thus, in their decisions as executives, they are torn between the pursuit of their own desires and the fulfillment of their role as agents of the shareholders.

This conflicted loyalty suggests that shareholders might achieve the best result for the firm by designing contracts with the firm's executives that align the incentives of the executives with those of the firm. This is the approach of *incentive compatibility*—making the incentives that the executives are offered compatible with the goals of the firm. The well-designed employment contract allows the executive to prosper when, and only when, the firm prospers. One tool for aligning incentives is the granting of stock options to the firm's executives. The properly structured option in this case is worth very little or nothing when the firm does poorly, but it is worth a great deal when the firm performs well. For example, a stock option given to an executive might pay off handsomely if the stock price of the firm rises by 50% over the next 3 years, but it might be worth very little otherwise. Under this model, the level of executive compensation is of relatively little importance. Instead, the goal is to structure executive compensation so that the executive acts to create more wealth for the firm even when the executive acts selfishly.

Critics of this line of argument charge that these kinds of arrangements abound in *contracting defects*—the failure of the compensation scheme to align the incentives of the executive and the firm. These critics point to numerous and well-publicized cases in which executives have been rewarded very handsomely even when the firm suffered horribly. When this happens, these critics protest, the incentives have not been aligned, and the result is a failure from the point of view of maximizing utility or the interests of society. As a result, opponents of the present structure of executive compensation still believe that allowing executives to absorb so much wealth diminishes overall utility.

However, merely saying that the present structuring of executive compensation has failed, in fact, to achieve compatible incentives is only a technical argument. It does not yet attack the central idea of attempting to align incentives, and it is clear that these critics are not merely calling for a technical rearrangement of contract terms. They very much believe that the entire level and structure of compensation is deeply flawed or even evil. While these deeper disagreements over utility and contract design may not have been fully defined, the terms of debate seem to be moving toward clarification.

Distributive Justice

While utilitarian arguments about executive compensation generally concentrate on the total utility effect of compensation arrangements, other critics of executive compensation approach the problem in terms of the distribution of societal resources. For them, the issue is not merely the total amount of wealth but how that wealth is distributed across persons and groups in society. Some critics maintain that the present levels of executive compensation offend against the principles of distributive justice. They maintain that a just society is one in which the distribution of wealth, goods, privileges, and positions across society meets certain conditions. These critics maintain that concentrating so much wealth in the hands of these few executives constitutes an unjust distribution of society's wealth and that justice requires new social arrangements aimed at preventing that concentration.

There are many alternative conceptions of distributive justice, and different theorists arrive at different principles of a just distribution, with radically divergent prescriptions for the allocation of the goods in a society. Considering one sample position on the issue of distributive justice can make the charge against the present mode of executive compensation more concrete by considering *egalitarianism*—the view that a just distribution of goods in a society is one of perfect equality. Egalitarians see the vast gap in wealth between executives and others in society and conclude that such a distribution offends against justice because the distribution is not equal. The egalitarian view resembles that of many distributive justice theorists who believe that a just distribution is one that can be measured against a particular paradigm of a just distribution. Egalitarians take equality as their paradigm, but other theorists allow for much more inequality and much more flexibility. However, it is fair to say that most of those social observers who focus on issues of distributive justice would be highly critical of the present mode of executive compensation.

In contrast, some reject the very idea that justice might require some particular pattern of distribution. They often argue that any actual distribution that results from processes of exchange that are free from coercion and deception is by its very nature a just distribution. These theorists tend to emphasize freedom of individual action and economic freedom rather than being concerned about how wealth actually comes to be distributed. As such, they regard the very concept of distributive justice as bogus, at least as it is framed by those who wish to maintain that there is some standard of justice to which the distribution of goods in a just society must conform.

Communitarianism

Communitarian critics of executive compensation argue that the present system harms the community. They tend to see society as a community held together by social bonds in a way that allows citizens to form an organic whole. Extremely high levels of executive compensation place a gulf between a patrician class of executives and the citizenry of workers. As such, this gulf breaks down the bonds of community, weakens society, and works toward a fractured community that is resolved into persons as atoms, unconnected and out of touch with each other.

The remedy for this situation, as far as executive compensation goes, is a system that strengthens the community of executives and workers, a result that can only be achieved by reducing the gap in pay that alienates the two groups from each other. This criticism differs from a focus on utility or distributive justice because it tends to give greater weight to organic wholes—firms, communities, or entire societies—instead of placing so much emphasis on individual persons. In contrast, while those who emphasize utility and distributive justice may agree with the communitarians on policy prescriptions, their concern with utility and distributive justice is still highly compatible with an emphasis on the individual.

Philosophers who take freedom of the individual as a prime value are the natural opponents of communitarians. Against the communitarians, they argue that attempts to build stronger communities by interfering with free contracting of firms with executives tramples on individual rights in a way that is impermissible. Instead, they believe that the right of free action for individuals has a primacy that trumps the pursuit of any social goal, whether it be the maximization of utility, the achievement of some distribution that others might deem to be just, or the building of strong community ties.

Conclusion

Executive compensation continues to attract public attention and to generate a lively debate. The lifestyles of executives made possible by the compensation they receive cannot fail to generate interest and even envy. The admittedly large gap between executive pay and that of workers is bound to support the continuing view that something is amiss with the system and that some injustice must account for the difference. However, this entry has attempted to indicate some of the complexity of the issue. Finding a proper solution to the issue of executive compensation will involve the same concepts that arise in the criticism of almost all social arrangements: desert, freedom, utility maximization or wealth creation, the distribution of wealth in a society, and the effects of all social arrangements on the structure and health of communities.

EXISTENTIALISM

Existentialism, as a philosophical theory, practice, literary genre, and human tendency, makes individual experience and self-reflection the bases for truth, knowledge, and value. Human reasoning alone does not suffice in supplying individuals their own reasons for action and morals; human emotions and passions also have moral authority. As in daily life, so too in work and business, individuals must construct reasons, meaning, and morality, assessing worth and value for their existence. Jean-Paul Sartre defined existentialism as a new form of humanism for the 20th century. In its radical turn inward, esteeming subjectivity, existentialism breaks from past philosophical tradition and legacy. Philosophers from Plato to Hegel held up objective, universal, impersonal standards of truth and morality. Soren Kierkegaard (1813–1855) made a personal perspective on truth the foundational insight for existentialism. Disparate groups of thinkers and writers—novelists, playwrights, psychotherapists, and filmmakers, as much as philosophers, theologians, and business ethicists—have called themselves or have been called existentialists. Existentialism encompasses both religious and atheistic forms (Christian, Hindu, and humanist), which differ in the source, process, and purpose of morally productive and happy individuals.

Existentialism typifies the subjective awareness of being and acting human in a nonhuman world. Especially, this interactive loop between the impersonal world and the personal (human) world creates anxiety, fear, and dread. These emotions arise from the individual's awareness of being abandoned, alienated, or lost in a world separate from the human self and its subjectivity. Altogether, these feelings give rise to existential nausea over one's human condition. Because humans are or feel abandoned by the world and by God or any independent, nonhuman guarantor and source of goodness and truth, they must learn to live with significant entailments. Troubling negative assertions follow: There is no common human nature; no given essence for beings and objects; no divine or unchanging plan, meaning, or purpose for human life or the world; no objective rationality or fixed norms for knowledge or morality; and no human determinism, only freedom. Standards of right and wrong, benefit and harm are not there for the asking or for human discovery. They are not found simply in doing our jobs and following norms. Still, creative positive assertions likewise follow: Humans are unique beings, free to create themselves by their choices and activities; humans, unlike plants, insects, and stars, are left alone to use and develop their own devices and capacities for language, rationality, productivity, and creative work.

Specifically, the existential claim that human knowledge and morality are perspectival (hence, only interpretations) renders the business life open to imposing human will and design on an apparently amoral, material, and social world. For there is no logic, science, or universal set of rules in the economic sphere of existence (or in any other). Individual workers and corporate executives alike are free, yet they must make their judgments and also be judged based on unavoidable personal or partial perspectives, arising from changing contexts of time, place, and role. Due to this unpredictability of the existentialist business model, either a corporate leader and philanthropist or a corporate raider may emerge in the system.

Everything one does or does not do hangs on individual integrity and moral fiber. There is no fixed rationale or unchanging business ethic for the individual to employ in determining value and worth, profit and loss, no preexisting bottom line for individual or collective action and planning. Existentialist business ethics thus excludes utilitarianism and duty-based ethics alike. Nor can one resort to the pragmatic rationale—it must be true and good because it works effectively or efficiently gets the job done. One must evaluate how and why some means and ends, values and endeavors are better than others are. Even choosing and expertly executing a business enterprise cannot save anyone from a lost life, for the business and its workers may not be contributing much toward their greater fulfillment and the improvement of society.

As in existential philosophy, so too in economics and work life, with absolute human freedom comes absolute risk. The premier principle of existentialism is that one is nothing more than what one makes of oneself. The existential mode of personal, moral decision making diverges from the customary structures in place to guide choice and action—family, religion, government, law, culture, science, and common sense. Existentialism, however, depicts how the self becomes liberated through the enlightened understanding that this existential predicament is shared by all. One can attain a sense of solidarity with others through committed engagement with causes and projects, privately through relationships, and publicly in the workplace under the contractual terms of business and labor.

Before existentialism, philosophers, theologians, and scientists offered alternative comprehensive systems to explain and control the world, characterizing reality either as a divinely created and sustained whole or, conversely, as a mechanistic, material world governed by necessary physical laws and discrete processes. Regardless of the theory, meaningful knowledge and morals were presumed to be discoverable and knowable to humanity, making reality more or less capable of human control, even mastery. Yet mere chance and the unpredictability of certain forces of nature make reality unknowable, hence uncontrollable, because these aspects are irrational, nonrational, and perhaps even divine. Such unknowable external forces may be the impetus for the broad existential vision of "the absurd," coined by Albert Camus. Consequently, when challenged by the futility of life, living in an absurd world of unpredictable realities and daily occurrences, one must choose and act, commit and be held accountable for what one becomes and what results from one's choice and activities.

Humans are condemned to be free, equally participating in the common paradox of being humanly free. Ironically, both existentialism and the traditional Plato-Kant philosophies share this core tenet: Being a free, self-determining person is the keystone of being moral. Sartre believed that by one's actions one is not only responsible for oneself but also responsible for humanity. Paradoxically, Sartre and the 18th-century Enlightenment philosopher Immanuel Kant accept this intertwining of individual morality, freedom, and personal accountability with collective responsibilities and social repercussions. Like Kant, Sartre held that when one judges and chooses something or an action as right for oneself, then that person de facto deems it right for all. For as humans, we are equal, equally solitary as individuals, needy, flawed, and vulnerable. Humans are chancelike creatures, subject to misfortune and disability, as well as controllers and distributors of goods and burdens, wealth and poverty, misery and well-being. In being responsible for their fates, humans learn that they are nonetheless free from the same limitations that bind them. Individuals become increasingly free and responsible in making the self and society. They do this, choice by choice, in selecting the projects they undertake and by completing or not completing those projects. The saying that you are nothing other than your life, however, does not entail that an individual is judged only by accomplishments but rather that the individual is the sum total of his or her productions, relationships, and projects.

For existentialists, being is doing. Yet in doing so, humans compete with outside forces—impersonal, inhuman influences of nature, societal and workplace structures, institutions, machines, and technology. Edmund Husserl and Martin Heidegger exposed the errors of conceiving such mechanisms, technology, and the human sciences as value-free: These too are controlled by the dominant ideologies of sociopolitical orders of their times—Marxism, capitalism, and liberalism. The world, and the uneasy human feelings about it, can lead to bad faith and inauthenticity: These psychic conditions result from evading or deceiving oneself and others. Inauthentic individuals assimilate or adapt by donning personae and roles in doing their daily tasks and jobs. Either masking or numbing themselves through habits, rule following, rote understanding, and compliance, workers and businesspeople respond to external systems and institutions of law and order. Generally, these herdlike tendencies (identified by Friedrich Nietzsche) predominate when humans follow the leader, any impersonal or personal power of authority. Yet, according to existentialism, none of the goods of human existence are given or constructed for individuals as followers.

Particularly in business as in life, the individual faces similar challenges and pitfalls. On the job, one may choose to get by and even attain worldly success by going along with the group and subcultures of business or the corporation, finding therein one's identity, function, and purpose. On the one hand, the self follows the crowd, follows orders, relying on the system to provide the norms for what is expected and acceptable. Regardless of whether one conforms to, embraces, or simply accepts these standards, the individual becomes normalized through the systems in which the self operates daily. On the contrary, the business maverick, the risk-taking entrepreneur, the self-made tycoon, and the courageous union organizer and labor leader diversely typify the heroic existentialist. These rebels radically transform or overturn the system, newly designing it according to nobler human purposes. Within these different groupings, identities, and individual roles, the self must make its own moral choices, commitments to change or refrain from change, as the world or reality exists apart, indifferent to the customary confines of human loyalties and defections, whereby the self identifies with or breaks away from the group.

The businessperson and laborer may unconsciously know and live by the tenets of existentialism by virtue of his or her career training and conditioning. For to be oriented existentially is a commonplace reality, an everyday individual experience of interacting with the risk-ridden, often arbitrary arenas of business, the market, and the workplace. Individuals under contractual relations of trust and reciprocity must assume and accept the fluctuating risks regarding loss and harm as much as gain and benefit. The existentialist freely accepts the responsibility of either following or altering commitments and work projects as they unfold. The courage to design and redesign oneself and others through work remains dicey when unjustifiable by any external power or institution that could reliably regulate individual conduct and free choice.

Especially in terms of existentialism, legal regulation and intervention and the degree of governmental control of business, the marketplace, and labor cause continuing controversy. Might not regulatory measures make individual and collective business transactions and consequences more controllable, moral, and rational, by making individuals and corporations less free and hence individually irresponsible? From the existentialist perspective, the course of doing business, and economics itself, seems more irrational and unpredictable than classic economists have theorized. Though no sensible individual or business would advocate gambling or taking undue risks with people's retirement funds, pensions, stocks, health plans, and educational trusts, the existentialist business model would maintain that risky bargaining characterizes business as part of the general human predicament.

In the 21st century, philosophers and business ethicists (e.g., Robert Solomon) vow for existentialism. Humans as free decision makers are to be held responsible for their decisions in making meaning, morals, and purpose from their productive activities. Otherwise, humans would be self-pitying creatures, enslaved to work, subjects to the world as it is rather than workers, innovators, and entrepreneurs who choose their world as it could be and work to make it so.

Expected Utility

As part of rational choice theory, the concept of expected utility is used to elucidate decisions made under conditions of risk. The expected utility of an action is a function of both an agent's estimation of the utility of the various outcomes possible given that action and the likelihood of those outcomes occurring. The utility of an outcome refers to an agent's preference for that outcome. The probability of an outcome refers to the chance of that outcome occurring and can be represented by a number between 0 (no chance) and 1 (perfect certainty). The expected value of an action is calculated by multiplying the utility of each outcome by its probability of occurring and then summing those numbers. Thus, allowing $P(o)$ to refer to the probability of an outcome and $U(o)$ to the utility of an outcome, then for some action x, with a series of potential outcomes $o_1, \ldots, o_i$, the expected value of x, or $\mathrm{EU}(x)$, is calculated as

$$\mathrm{EU}(x) = \sum_i P(o_i)U(o_i).$$

For example, suppose an insurance company issues a theft policy on a piece of artwork for a year with a replacement value of $10,000 and a cost of $500, and there is a statistical probability of .02 that the artwork will be stolen in that year. The expected value of the act of insuring for the company would then be (.98)(500) + (.02)(500 − 10,000), or $300. According to standard decision theory, when comparing alternative courses of action, one should choose the action that has the greatest expected utility.

The concept of expected utility and the rule of maximizing expected utility have wide application to decisions in business contexts, including those involving insurance, capital expenditures, investment, marketing, and operations. The utility of the outcomes under consideration in such contexts can usually be specified in terms of potential monetary profits and losses. By using their estimation of the likelihoods of the outcomes of options open to them along with their associated monetary losses and gains, businesses can determine the expected utility of each option in terms of its expected monetary profits. The option with the greatest expected utility will then simply be that which has the largest expected profit associated with it, and this option, according to the rule of maximizing expected utility, will be the optimal choice.

While the concept of expected utility has played an important role in the study of economic behavior, criticisms have been raised concerning its application to contexts of choice in business and economics. For instance, some theorists from the social and behavioral sciences argue that the cognitive limitations of human beings make the concept of expected utility as a guide to choice too idealized for use in most significant decision contexts. Such critics thus advocate notions of bounded rationality that are more sensitive to these limitations and make use of evaluative concepts that do not depend on the precise sorts of assessments that are involved in determinations of expected utility. Other critics have argued that the application of expected utility to economic decisions, including policy decisions, has engendered inappropriate valuations, particularly in cases in which monetary units are used to scale the utility of nonmonetary outcomes, such as potential deaths or damage to the environment. Finally, many philosophers have questioned whether the rule of maximizing expected utility represents an adequate or complete guide to decisions, particularly with regard to decisions of an ethical nature. The rule of maximizing expected utility represents a consequentialist form of reasoning, in which actions are judged solely in terms of their potential outcomes. As such, philosophers of a deontological stripe question whether such reasoning can provide an adequate account of the role of rights and duties in practical reasoning. Such philosophers, for instance, argue that the moral rights of those affected by an action place constraints on the worthiness of a choice independent of the value of the consequences of that choice.

EXPLOITATION

Exploitation is a contested concept. In one sense of the term, to exploit means to effectively utilize the object of exploitation. It is in this sense of the term that one exploits sunlight to generate solar power. In another sense of the term, to exploit means to take unfair or illegitimate advantage of the object of exploitation. It is in the latter sense that the term is most often employed in relationship to business practices. For example, automobile salesmen are often accused of exploiting inexperienced or vulnerable customers by taking advantage of asymmetries in information. To assess such claims, it is necessary to have a coherent account of exploitation. There are two primary questions about the concept of exploitation that any account of the concept must answer. First, what constitutes exploitation? Second, when is exploitation morally objectionable?

Theories of Exploitation

Marx's well-known account of exploitation holds that capitalists exploit workers by expropriating worker productivity. Exploitation, in this account, is a fundamental feature of capitalism. Constant technological innovation results in labor-saving processes and ensures a large pool of unemployed workers. In Marx's analysis, workers must choose between accepting subsistence wages and few benefits and joining the ranks of the unemployed. This power imbalance allegedly coerces workers into compliance, resulting in the morally objectionable expropriation of surplus value from workers by capitalists. Critics of Marx argue that his account of exploitation ignores the risks involved in capital investment and fails to acknowledge the importance of managerial expertise. Furthermore, Marx did not develop his views with the clarity typical of the best contemporary philosophers and social theorists.

Largely as a result of these criticisms, the most influential contemporary accounts of exploitation are non-Marxist. Such accounts are typically divided into two categories: (1) moralized accounts that assume the wrongness of exploitation and (2) empirical accounts that do not. Alan Wertheimer defends an influential view of exploitation whereby a mutually advantageous exchange is exploitative when A takes unfair advantage of B relative to a specific baseline. Because a fairness baseline is a moral consideration, this account of exploitation is properly understood as moralized. Moralized theories of social concepts maintain that at least one of the truth conditions of the concept at issue is moral. Moralized theories also settle the question of the moral status of the act. In Wertheimer's account of exploitation, if A exploits B, then A acts wrongly. In contrast, empirical theories of social concepts maintain that all the truth conditions of the concept at issue are empirical and none moral. For example, Allen Wood argues that exploitation occurs when A takes advantage of B's weakness or vulnerability to derive some benefit from B. In his account, the question of whether or not exploitation takes place depends on certain factual matters, such as B's vulnerability or B's capacity to benefit A. In contrast to moralized theories, empirical theories do not settle the question of the moral status of the act. In Wood's account of exploitation, the fact that A exploits B does not by itself resolve the question of whether or not A acts wrongly. Indeed, the idea of justified exploitation is consistent with ordinary language use of *exploit*. For example, we do not normally criticize a coach who exploits the weakness of an opponent's team (within the rules of the game) of acting unjustly or unfairly.

The moral baseline Wertheimer defends is that of a hypothetical market price, or the price that would be generated in a competitive market. Such a price is to be differentiated from the price generated in a perfectly competitive market, a market in which there are many buyers and sellers and perfect information. A hypothetical market price does not correspond to desert. The market price for the services of a talented and well-trained public relations specialist may be greater than the market price of a talented and well-trained elementary school teacher, but this does not reflect a principle of desert. A similar point may be made with respect to moral luck. A hypothetical market price does not take into consideration the social and economic benefits of being born into poverty versus being born wealthy.

A common view of moralized accounts of social concepts is that because at least one of the truth conditions of the concept at issue is moral, such accounts render the need for subsequent moral analysis redundant. Thus, in Wertheimer's account of exploitation, statements such as "A's exploitation of B is wrong" will be true but redundant. This is because the moral wrongness of "exploitation" is built into the concept. After all, in Wertheimer's account, if one is exploited one has been treated unfairly. His account has the additional limitation of being unable to account for exploitation that occurs in nonmarket cases, such as in relationships. Wood's empirical account, on the other hand, has none of these deficiencies.

Are Workers in Global Factories Exploited?

It will be useful to illustrate the concept of exploitation with reference to an important contemporary debate. The question of whether or not sweatshop workers are exploited depends both on the wages and labor conditions of the factory in question and on one's definition of exploitation. Imagine a case in which a multinational corporation contractor (MNC) pays employees the equivalent of $2.00 per day, whereas the amount necessary to cover basic food, clothing, and shelter needs is approximately $4.00 per day. Imagine a second case in which an MNC factory required workers to work overtime and fired workers for their legally protected rights to collectively organize. In Wertheimer's account, the workers in the first case are not exploited because they benefit from their employment and the wages they receive are generated by a competitive market. As defenders of sweatshops argue, such workers freely choose to work in that factory because the wages they earn are better than those they could make elsewhere.

It is less clear what Wertheimer's account can tell us about whether or not the second case is one of exploitation. This is because his account of exploitation requires that the victim of exploitation must be at a disadvantage relative to a hypothetical market price for the good or service in question. However, in the second case, the question of whether or not the workers are exploited is tied primarily to the terms of employment rather than to wages. The most interesting question regarding exploitation in this case appears to be whether or not the relationship between the workers and their employer is exploitative, not whether a particular transaction is exploitative. However, it is arguable that as an element of employee compensation, the terms of employment are an element of the labor contract. Understood in this way, the workers in the second case are not exploited because they benefit from their employment and the conditions under which they work are the product of a competitive market.
