The average size of factories, in terms of assets, output, and valued added, has increased consistently since the 1970s. Assets increased from 8.7 million rupees in 1970 to 20.2 million rupees in 2002; output increased from 16.7 million rupees in 1970 to 45.9 million rupees in 2002. In contrast, average employment in Indian factories witnessed a decline, from 86 workers per factory during the 1970s to 78 during the 1980s. Clearly, output growth during the 1980s was not accompanied by a corresponding increase in the generation of employment. The declining trend in employment persisted during the 1990s and was further pronounced during 2000–2001 and 2001–2002, when it fell to an average of 60 workers per factory. This was, perhaps, symptomatic of greater use of capital in the production process, leading to higher capital intensity over time. In fact, increases in real wages and job security regulations in the late 1970s seem to have induced entrepreneurs to shift over to capital-intensive techniques. It has also been argued that surplus

employment in the 1970s set a limit to the additional employment opportunities in the 1980s and beyond. Structural ratios calculated on the basis of data from the Annual Survey of Industries provide evidence to support this theory.

Almost all the indicators used as proxy for capital intensity show that production processes in Indian industry have increasingly become more capital oriented. Capital employed per worker has increased substantially since the 1970s. Capital-wages ratio increased marginally from 7.3 in the 1970s to 8.3 in the 1980s, but increased substantially following the economic reforms of 1991, to 12.64 by 2000 and to 14.25 in 2002. On the other hand, it should be noted that capital employed per unit of output did not undergo much change during the three decades from 1970 to 2000, reflecting a greater efficiency in the use of capital in the production processes.

A disaggregated industry-wide analysis by J. Thomas in 2002 showed that capital intensity varies widely across different industries. It has been the lowest in jute textiles, and the highest in electricity generation, transmission, and distribution. Basic metals, chemicals, rubber, and petroleum also have high capital intensity, while jute, beverages, textile products, leather, wood products, and food products continue to be the least capital-intensive sectors in Indian manufacturing.

The relationship between size and capital intensity in the Indian industrial sector also seems to have witnessed a noticeable transformation since the 1970s. With the increase in the size of factories (in terms of output), capital per head of worker increased during the 1970s. Correlation coefficients between output (size factor) and capital-labor ratio demonstrate that the covariation strengthened further in the 1980s and in the post-1991 period. In contrast, the capital-labor ratio was inversely related to the size of the labor force in factories. The covariation of capital-output ratio and total output has been negative since the 1970s, probably because growth in output in most of the years since 1980 has been higher than growth in capital, indicating the efficient use of capital by Indian industries.

In retrospect, Indian industry has been undergoing a structural transformation since independence. With the government initially adopting an industrial development strategy that promoted heavy, capital-intensive industries, size indicators in the Indian industrial sector expanded substantially, facilitated by the evolving industrial policy and increased domestic and external demand. Thus, the predominance of primary raw material-based industries in the 1950s was gradually replaced by the emergence and faster growth of metal-based and heavy industries. The industrial policy initiatives since 1991

have led to a diversified Indian industrial structure. While the transition process has led to greater use of capital in relation to the labor force, productivity enhancements have resulted in a gradual decline in the capital-output ratio in recent years.

SMALL-SCALE AND COTTAGE INDUSTRY, 1800–1947 In 1800 India had a diversified manufacturing base, employing a significant proportion of the workforce. Textile production was the leading sector, and the weaving of cotton cloth by India's village artisans was a universal occupation. When cloth was produced for the village or local markets, the weavers sold the cloth directly to consumers. In such cases, the capital requirement was low, and the costs of preparatory processes, like spinning and preparation of yarn, were internalized through the labor of the nonweaving members of the household, usually women and children. The organization and relations of production were far more complex when cloth was produced on a commercial scale to produce finer textiles which catered to distant markets, especially for export. Even the preparatory processes of cleaning and carding the cotton were done by specialized workers, and spinning was a distinct and skilled occupation that provided employment to millions of women.

The hinterlands of the three major cloth exporting coastal areas—Gujarat, Coromandel, and Bengal—were best known for their textiles. But textiles were produced for external markets in many other parts of the country. Weaving remained largely a rural activity, though small

Women Spinning Yarn with Wooden *Charkhas*. In India's struggle for self-rule, Mahatma Gandhi forcefully advocated for the revival of this cottage industry as the solution to the nation's economic woes, as the center from which other industries would flow. He declared the wheel "the symbol of the nation's prosperity and, therefore, freedom." AMAR TALWAR / FOTOMEDIA.

towns and even larger cities also had a small population of weavers. The location of weaving itself was less relevant than the markets for which their products were intended, which were predominantly urban and upper-income classes. Weaving was a full-time occupation in most regions. The exception was Bengal and northeastern India, where weavers alternated between cloth production and agriculture. Weaving was also a caste-dominated activity that was carried out by various sub-castes of weavers; caste performed a role similar to guilds, providing organizational unity for each activity.

A noteworthy feature of textile production in India was the seemingly endless variety of plain and patterned fabrics produced in every region. Plain, or solid-colored, fabrics were produced in coarse, medium, and fine textures. Patterned fabrics were produced both on the loom, or by using complex dyeing, painting, and printing techniques on woven cloth. The dyeing of cotton was, in fact, India's unique specialty. Because cotton did not absorb dyes directly to achieve a permanent color, Indian dyers used a variety of mordants, resists, astringents, and other products in conjunction with dyes in order to fix a

permanent color to the cloth. Since many dyes were derived from plants, the cultivation of dye crops was an added supporting activity in textile production. With this extensive range of plain, dyed, and patterned cloth, India supplied the textile requirements of most of the world.

Production on a commercial scale, however, increased the requirement of working capital, particularly for purchasing yarn in the market. This capital was provided by merchant capitalists, who played a pivotal role in pre-modern trading. They advanced working capital to the weavers, usually secured against future deliveries of cloth. For the merchant, this negated a major uncertainty on the supply side by securing a large enough stock of cloth from many individual weavers. The merchant also provided the interface between distant markets and the weavers, ensuring a flow of information on the market so that production could be adjusted to consumer preferences.

The unit of production for this large volume of output was still the weaver, working from home on his own loom. The tools and equipment tended to be rudimentary and the techniques, especially of spinning and dyeing,

required a great deal of time. The key factors in maintaining a high level of quality and performance were the highly developed manual skills of the workers, and the empirically evolved intricate techniques of all processes. In such a system, the notions of productivity and wages related to productivity had little relevance. Though data on wages are sketchy, it is evident that wages were by and large pegged to subsistence levels. Low wages were partly the result of controls exercised by the merchants over the weavers, who had no direct access to the market. Textile production was characterized by a high ratio of net output to fixed capital and a low share of wages in the final price.

In crafts like ornamental metalware, master craftsmen worked with apprentices in workshops, which were usually located in urban administrative centers. Since the products were primarily intended for local elite and ruling classes, there were no uncertainties regarding the market or consumer preference, nor were the products traded to distant markets.

Impact of Colonialism

The impact of colonialism on Indian industry has been much debated, but the most widespread view was that the invidious policies of the British colonial government, aimed at protecting the interests of domestic industries in Britain, had destroyed India's handicraft manufactures, especially textiles. This "nationalist view" was first articulated by R. C. Dutt, who also stressed that, in this process, India was transformed from an exporter of manufactured goods to an exporter of raw materials, with most of its population forced into subsistence agriculture for survival. Further, Marxist theories of the world capitalist system cite India as a prime example of the process by which colonized economies were relegated to raw material production to feed the development of the capitalist center. Even where traditional manufacturing survived, this was possible only with the use of zero cost household labor and when the producer depressed his own wages to compete with the cheaper imported goods.

A contending school of thought, which argued that traditional Indian industry had declined because it was unable to compete with mechanized production, was too simplistic, ignoring the unequal power relations that were inherent in colonialism.

Survival of Handicrafts

The incontrovertible evidence of the viable functioning of many crafts, especially hand-loom weaving, well into the twentieth century has led to a reassessment that seeks to understand the dynamics of survival of artisanal industry and the complex processes of adjustment to the

forces of rapidly changing technology and improvements in transportation and communications. The latter integrated India's economy into the global economy at a time when costs were declining internationally.

The sector that was most vulnerable to these forces was the highly export-oriented indigenous textile sector, which had to compete with cheaper cloth in domestic as well as export markets. The general consensus is that textile production did decline during the first half of the nineteenth century, but this impact was both region and product specific, and Bengal as a region and a whole array of medium quality fabrics produced for export were the most affected. However, there was no noticeable decline in the volume of output in most regions.

Until about 1870, hand-spun yarn was still being used extensively, but imports of machine-spun yarn eventually wiped out hand spinning in India, with the resultant loss of employment and income for millions of women. The introduction of chemical dyes toward the end of the nineteenth century similarly pushed out traditional vegetable dyeing techniques. Hand-loom weaving and production of patterned cloth survived, however, by switching to the more cost-effective, though not necessarily better, inputs.

More reliable data are available from 1870 onward. Between 1881 and 1931, the proportion of male workers in industry declined, which happened not merely in textiles, but in many other activities. At the same time, real income per worker rose steadily, indicating that productivity-enhancing technology was being adopted in the crafts, and that nonviable workers were forced to shift to other occupations.

In all crafts, there was a distinct preference for maintaining production within a small, artisanal firm. Imported inputs and new technologies were adopted within the economic rationale of small-scale production. In textiles, a richer class of weavers was emerging, many of whom turned to trade or became entrepreneurs. Such entrepreneurs set up small-scale hand-loom workshops in urban centers in southern and western parts of India. More significant in the long term was the setting up of small power-loom manufactories in towns in western India. Weavers migrated to work in these workshops, shifting from self-employment to wage employment.

The individual weaver, however, remained the mainstay of hand-loom weaving and adjusted to the new macroeconomic environment. The most important reason for the survival of hand-loom cloth was the strong domestic demand for traditional dress materials, designs, and patterns, none of which could be produced through mechanical processes. But the weavers also responded to changing market preferences, producing new fabrics,

weaving with silk and manmade yarns, and gradually adopting new technologies, which were economically viable in hand-loom weaving.

Though the Indian mill industry dated back to the 1870s, it did not really compete with the hand looms until the 1920s. The hand-loom sector responded by shifting to higher value products in which it had an advantage. The major problem for hand-loom weaving during the 1930s and 1940s was the shortage of yarn. Weavers had to depend on middlemen merchants for credit to buy yarn and entered into highly disadvantageous tied transactions, which ultimately forced a high percentage of weavers into a debt trap, raising fears about the future of hand-loom weaving.

SMALL-SCALE INDUSTRY, SINCE 1947 India's real gross domestic product (GDP, in 1993–1994 prices) increased from 1,405 billion rupees in 1950–1951 to

11,939 billion rupees in 2000–2001, by 8.5 times. The share of manufacturing in GDP, which was 9 percent in 1950–1951, rose to 18 percent in 2000–2001. Manufacturing is divided into two sectors: registered (factories that use power and employ 10 or more workers, or that do not use power for manufacturing and that employ 20 or more workers) and unregistered (smaller units). In 1950–1951 the two sectors had roughly an equal share; in 2000–2001 the registered sector's share increased to two-thirds and the unregistered sector's share declined to one-third.

Modern and Traditional Industries

Small-scale industries (SSI) are divided into modern and traditional industries. Traditional industries are home-based, use simple tools and equipment, depend on family labor, and are completely manual. Modern SSIs may have a separate workplace, employ outside labor, and use machines and power. Nearly all of the traditional industries and a very large number of modern SSIs fall into the unregistered category, so the GDP of these industries will be roughly equal to the GDP of the unregistered sector. The share of modern SSIs has improved greatly both in production and employment between 1973–1974 and 2002–2003: in production from 68 to 94 percent and in employment from 28 to 43 percent. Over the same period, the share of traditional industries declined: in production from 16 to 6 percent and in employment from 58 to 55 percent.

An SSI is currently defined as an enterprise with investment in plant and machinery up to 10 million rupees (original value). This sector also includes ancillary, export-oriented, and women's enterprises, with an investment limit in each of 10 million rupees and with a special condition for each, and business and service enterprises in specified lines with investment limits of 2.5 million rupees and 0.5 million rupees, respectively, without any condition.

Growth and Change

Production, employment, and exports of SSI increased by 10.0, 5.9, and 12.7 percent per annum from 1973–1974 to 2000–2001. The subperiods 1973–1974, 1980–1981, 1990–1991, and 2000–2001 witnessed deceleration of growth on all the three measures.

In 1972 SSIs producing metals and electrical equipment had the largest share in the number of units, employment, and fixed assets and production, 43–49 percent. Other manufacturing, food, textiles, and services followed, in that order. In 1987–1988, other manufacturing was first in each of the above categories, with a share of 35–42 percent, followed in each category by metals

and electricals, food, textiles, and services. The share of food and textiles increased and that of metals and electricals declined, both substantially.

Support and Incentives

SSIs enjoy some advantages, but they also suffer from handicaps relative to large-scale industries in the marketplace. On balance, they are in a weak position. However, they have an appeal in terms of socioeconomic objectives and have, therefore, a strong case for state support. In India, capital is scarce and labor abundant. SSIs are thought to have lower capital-output and capital-labor ratios than large-scale industries, and to therefore better serve growth and employment objectives. Additionally, entrepreneurship has been restricted in India to certain castes, communities, and language groups, and has been male-dominated. It is the policy of the Indian government to widen this base by promoting entrepreneurs from other groups.

It is on these considerations that various assistance programs and incentives have been devised for SSI development. Since independence in 1947, especially since the late 1950s, development has been wide-ranging, both in terms of programs and regions. The programs include information and technology services, entrepreneurship development and training, modernization and technology support, industrial facilities, assistance in procurement of raw materials price preferences, finance, and nursing of “sick” industrial units. To operate these programs and to monitor their progress, new agencies and institutions have been set up, and the existing ones strengthened at the national, regional, state, and lower levels. There is also a special bank for SSIs. The SSIs have their own associations, and are also represented in the national- and state-level associations of large-scale industries.

An attempt was made to estimate the value of incentives on SSI production. The study examined nine programs or incentive schemes for six industries in seven states. It was estimated that the value varied from 70 percent in cosmetics and toiletries to 33 percent in gases.

Policy Issues

There is no doubt that the SSI sector has registered considerable progress. But there are also areas of concern in the policies and programs, arresting further progress. What are these concerns, and how do they influence the outcome? And what is needed by way of corrections?

Overcrowding and failure. The capital and skill required to start and operate an SSI are small, and product is undifferentiated. These easy entry conditions have led to overcrowding of the SSI sector. Assistance programs make

Textile Workers in Rural Rajasthan. Though rich in natural resources, Rajasthan lags behind other states in terms of high poverty and unemployment rates. In recent decades, New Delhi has commissioned numerous studies of small-scale industry in the state (how to make existing businesses more profitable and expand their corresponding markets). The textile industry figures prominently in current initiatives for the region. AMAR TALWAR / FOTOMEDIA.

entry easier. Also, officials administering assistance may tend to be overgenerous, as more assistance improves their service record, adding to overcrowding.

It is therefore not surprising that a substantial number of SSIs close their doors within a short span of operations. The 1987–1988 census reported that of some 300,000 units that closed, one-half were closed within 5 years of the start of operations: 14 percent within 1–2 years and 36 percent within 3–5 years. Evidently, there is a case for a more focused and selective approach to assistance.

A presumption of the SSI policy is that SSIs have low capital-output and low capital-labor ratios relative to large-scale industries. Thus, they are in tune with factor

proportions, and thus, they serve growth and employment objectives better. Considerable evidence casts doubt on that presumption, and some studies have pointed to capital-output and capital-labor ratios being higher in SSIs than in large-scale industries.

Definition. The earliest definition of small-scale industries in 1950 had a limit of 0.5 million rupees in fixed investment, with fewer than 50 workers in units using power or fewer than 100 workers in units not using power for manufacturing. The definition has changed several times since then. In 2004 the definition had a limit of 10 million rupees for investment in plant and machinery (original value), without any additional conditions. With this amount one can now buy only an obsolete, low-grade, or secondhand plant and machinery. This limit seems to have more adversely affected the capital-intensive industries like metals and electricals. The SSI censuses show a sharp decline in the shares of this group in number of units, employment, fixed assets, and production between 1972 and 1987–1988. Also, the percentage of closed units to working units in this group was 59, against 52 for all units in 1987–1988.

There is clearly a need for raising the limit. Following the recommendation of the Expert Committee on Small Enterprises, the limit was raised to 30 million rupees in 1997, but in 1999 it was brought down to 10 million rupees. Considering inflation and the availability of better technologies since then, the limit needs to be increased substantially, perhaps to 45 million rupees.

Reservation. The policy of reservation of items for exclusive production in the SSI sector was first introduced in 1967 with 47 items. The number since then has been increasing, reaching a peak of 873 in 1984. Since then, the number is being reduced. As of October 2004, the number of reserved items was 605. Since then, 108 items have been identified for de-reservation, which will bring the number to 497. Under this policy, the production of items in this list by large-scale industries is frozen to their existing capacities, giving protection to small-scale industries in those categories. As a consequence, the SSI sector, especially the reserved part, is expected to improve its efficiency and grow faster.

This policy has been criticized on various grounds such as it has been ad hoc, obstruction of technology and scale up-gradation. Moreover, such evidence as is available on efficiency, profitability, and growth shows that in general the performance of SSI in the reserved items does not outshine that of other SSI, or is it poorer. It would thus seem that the government's policy of gradual de-reservation is moving in the right direction.

SOMA As a god, Soma is the most prominent deity in the Rig Veda after Indra and Agni; Soma as god and soma as sacrificial substance are one and the same in Vedic tradition. The ninth book of the Rig Veda is devoted solely to Soma, and some 120 hymns address him. The ritual texts of later Saṃhitās, Brāhmaṇas, Āraṇyakas, and Shrauta Sūtras are structured by sacrifices, many featuring two essential offerings: soma and *pashu* (animals). The god's name is also the name of a plant and its "pressed" juice (from *su-* "to press"). *Haoma*, the corresponding name of the plant, juice, and cult in the Avesta, attests to an Indo-Iranian origin, although mythologies of a divine plant or elixir that brings immortality, visions, and insight suggest an even earlier background. Poets of Rig Veda 4.26 and 27 celebrated the theft of soma by an eagle in one of the earliest and most enduring myths concerning a celestial or mountain origin.

Many substitutes for soma were named in Brāhmaṇa texts before 800 B.C. Possibly the plant known to early poet-ritualists became unavailable during migrations from steppe or highland regions onto the Gangetic Plain. Identification of Vedic soma or Avestan *haoma* has been vigorously debated since the late eighteenth century; botanists, archaeologists, and historians have proposed as candidates species of the genus *Ephedra*, as well as *Peganam harmala*, *Amanita muscaria*, *Cannabis sativa*, *Papaver somniferum*, and others. An asclepiad called *soma-lata* or *somatiga*, probably a species of *Sarcostemma*, a bitter-tasting green creeper, not hallucinogenic, is pressed

in parts of South India today by small communities of Vedic sacrificers.

The ritual process of extracting juice from plant stems was institutionalized in the soma sacrifice with three pressings each day. The pressings are filtered through wool; the liquid is collected in tubs, sometimes mixing in water, milk, curds, clarified butter, barley flour, or honey. It is then poured into offering fires for designated gods. Soma is served in special carved wooden cups to the sacrificer (*yajamāna*) and ten priests called by heralds (*somapravāka*) to perform the sacrifice. Both sacrificer and wife (*patnī*) are transformed by the rite and entitled to be renamed soma sacrificers. After the initiatory five-day *agnishṭoma*, they become eligible to perform other soma rituals of varying magnitude and duration, including the seventeen-day *Vājapeya* (drink of strength).

Whether from chemical inspiration, or exhaustion and sleep-deprivation during intense sacrificial sessions, an ecstatic response to the drinking of soma juice is clear from ancient poetry and formulas of ritual texts. After offering and drinking soma, a priest may recite Rig Veda 8.48.3, boasting on behalf of all, “We have drunk soma, become immortal, attained the light, reached the gods.” A common epithet of soma is *amrita* (not mortal). Several gods receive soma offerings, but none more than Indra. The consequence of his soma-drinking is an enthused battle fury, rendering him invincible in combat.

Associations with immortality led to an important role for Soma in traditions of death, particularly after the Upanishads distinguished the *pitṛyāna* as a “path of the fathers (ancestors)” that recycled an immortal *ātman* (self) down from the moon for rebirth in this world. In Hindu rituals, *amāvāsya*, new-moon day, is traditionally a time to offer rice as food for ancestors. Soma as the moon—therefore one of the *navagraha* (nine planets)—lends his name to the calendrical weekday *Somavaram* (Monday is from Old English “moonday”). In Sanskrit epics and *Purāṇas*, Soma lives on as *Oshadhīpati* (lord of plants), husband of the *nakshatra* (constellations), and guardian deity of the auspicious northeast.

SOUTH ASIAN ASSOCIATION FOR REGIONAL COOPERATION (SAARC)

Regional cooperation in South Asia is a recent phenomenon, even though the idea of regionalism long formed an important element of the foreign policy of India. It took the seven countries—India, Pakistan, Bangladesh, Sri Lanka, Nepal, Bhutan, and Maldives—nearly four decades of the post-colonial era to set up a regional association, the South Asian Association for Regional Cooperation (SAARC). The proposal for SAARC was first made by the president of Bangladesh, Zia ur Rahman, in January 1980. While the smaller countries welcomed the idea, India initially appeared reticent, apprehensive perhaps that the association would bring anti-Indian opinions together to limit its policy options. Similarly, Pakistan suspected the idea to be an Indian ploy to strengthen its regional hegemony. Amid such unfounded fears, diplomatic efforts resulted in a series of consultations and the meeting of foreign secretaries in Colombo, Sri Lanka, in 1981. Foreign ministers of all seven countries then met in New Delhi in 1983 to give a concrete shape to SAARC, which was formally established in December 1985, when the seven heads of South Asia’s states and governments held the first summit in Dhaka, Bangladesh.

SAARC has a well-defined charter specifying its objectives, principles, and mechanisms for formulation and execution of policies and programs. One of its principles is that contentious and bilateral issues are excluded from the scope of its deliberations. Decisions must be made unanimously at the summit, based on the recommendations of foreign ministers and a standing committee of foreign secretaries. Technical committees coordinate and monitor the implementation of programs. The overall responsibility for follow-up action on summit decisions is assigned to the SAARC Secretariat, located in Nepal’s capital, Kathmandu. Its secretary general is nominated by the member states on the basis of rotation.

Notwithstanding many difficult challenges to its growth, SAARC has begun to evolve a common regional approach to trade and socioeconomic development. Areas of cooperation include agriculture, rural development, poverty alleviation, sports, art and culture, science

South Asian Association for Regional Cooperation Summit. Members of 11th SAARC (South Asian Association for Regional Cooperation) summit, in Kathmandu, Nepal, 5 January 2002. At this meeting, member nation-states pledged their commitment to creating a South Asian Economic Union. INDIA TODAY.

and technology, and women's development. Some of the noteworthy decisions of the member states pertain to the establishment of a food security reserve, the suppression of terrorism, the prevention of trafficking in narcotic drugs and psychotropic substances, the establishment of a SAARC Chamber of Commerce, regional arrangements for preferential trading, and the establishment of a South Asian free trade area. A development fund has also been created. SAARC audiovisual programs seek to foster contacts and interactions among people.

Many laudable objectives of SAARC have not been achieved, however. In the eighteen years of its existence, it has held only twelve summits. Seven summits were postponed, mostly because of rivalry and confrontation between India and Pakistan. There is now a realization that the success of SAARC is contingent upon the resolution of contentious bilateral problems like the Kashmir dispute between the two countries. In addition, a lack of sufficient commitment on the part of some member states to implement summit decisions has contributed to SAARC's sluggish growth. For example, Pakistan still has not ratified a 1987 regional convention on the suppres-

sion of terrorism, thus weakening the association's record of cooperation. Nevertheless, SAARC's formation and its ongoing efforts have created a growing South Asian consciousness and have helped stabilize regional identity, enhancing interactions among the various peoples of South Asia.

SOUTH ASIAN ECONOMIC COOPERATION
India, Pakistan, Sri Lanka, Bangladesh, Bhutan, Maldives, and Nepal agreed in 1980 to form the South Asian

Association for Regional Cooperation (SAARC), which mandated cooperation in a number of areas, including trade and investment, economic development, environmental management and resource sharing, educational enrichment, and poverty alleviation. However, SAARC has yet to achieve its goals of enhancing regional economic cooperation and delivering prosperity to and well-being to its people. Geopolitical analysts may attribute the slow progress to the political tensions between India and Pakistan, but the reality is that South Asia needs to become more actively engaged in the global economy in order to optimize its resources, instead of being left behind in the race for better incomes and jobs.

The new economy has opened up several opportunities for South Asia to move beyond the focus of its traditional commodity trade items, harnessing the economic benefits of business cooperation in high value-adding areas such as natural gas, electricity and power sharing, telecommunications infrastructure, training and manpower development, information technology, and joint projects for foreign investment. The continuing boom in India's economy—especially in high-tech areas like business process outsourcing, information technology (IT) services, computer solutions, biotechnology, consumer call centers, and knowledge-based industries—has added new pressures for enhancing business relations among all South Asian countries.

Traditional Economic Relations: Limited Formats

Traditional trade relations in South Asia have been characterized by the following features:

1. South Asia accounts for less than 1 percent of world income, and its share in total global trade is negligible.
2. All South Asian countries show low volumes of foreign trade as a percentage of their respective gross domestic product (GDP), although South Asia is a major supplier of textiles and garments, raw cotton, rubber, jute, rice, tea, pearls, and precious and semi-precious stones to the rest of the world.
3. Regional trade among the SAARC countries has been a dismal 3 percent for the past decade. This compares poorly with European Union (EU) regional trade, which stands at nearly 65 percent, and trade among the Association of Southeast Asian Nations (ASEAN), which stands at about 35 percent.
4. India is central to South Asian trade, as it accounts for about 80 percent of the combined GDP and population of South Asia. It is also the largest trading partner for Bangladesh, Nepal, and Bhutan, and significant for Sri Lanka. However, India has shown the lowest amount of intraregional trade (5.1%), as compared to its smaller neighbors Maldives and Nepal (29%), and Sri Lanka (21%), who are trading more intensively within the South Asia region.
5. While intra-SAARC regional trade is low, the South Asian countries do not hesitate to import large quantities of items from the rest of the world, many of which could be imported from within the South Asian region. For example, Pakistan imports tea from China and Kenya, instead of India, despite the availability of better quality, lower price, and geographical proximity of India.
6. The traditional export basket of most South Asian countries is dominated by semimanufactured products, and appears to be quite similar for all the countries, making it difficult for any one country to have a comparative trade advantage over the others. Primary commodities, however, still account for a significant proportion of their trade, which includes jute in the case of Bangladesh, rubber and tea for Sri Lanka and India, rice and raw cotton for India and Pakistan, and iron ore for India. Among manufactured exports, textiles and garments dominate the export basket.
7. All South Asian countries show a high dependence on a few commodities for their export basket. In fact, the top ten export commodities (mainly textile and garment items) account for nearly 82 percent of the total exports of Bangladesh, Maldives, and Nepal; 74 percent for Pakistan, 66 percent for Sri Lanka, and about 42 percent for India. As for imports, all South Asian countries show “industrial intermediates” and crude and processed fuel as major imports. Food deficit countries, such as Bangladesh, Nepal, Bhutan, Pakistan, and Sri Lanka, continued to import food throughout the 1990s.
8. Most South Asian exports are directed toward developed countries. In the case of Pakistan, more than 60 percent of exports are accounted for by the United States, the United Kingdom, Germany, and Japan, while the Middle East constitutes 11 percent of total exports. East Asian countries are providing a growing market for South Asian exports, particularly for India, Pakistan, and Maldives. Bangladesh mainly exports to China; Pakistan to South Korea, Indonesia, and China; and Maldives to Thailand.

Areas of Recent Business Cooperation

SAFTA: South Asian Free Trade Area. The South Asian nations launched a regional economic trade agreement in 1995 that would aim at providing “preferential trade concessions” to each other, under the South Asian Preferential Trade Agreement (SAPTA). After three successive rounds of SAPTA negotiations, a total of 5,550 commodities have been listed for trade under SAPTA.

Although SAPTA showed a high potential for success, its progress has been slow, due mainly to: the bureaucracy's lack of commitment to put aside narrow political interests and support each member state's economic interest; the continuing refusal of Pakistan to grant the most favored nation status to India, which is granted to all other trading partners in South Asia; technical limitations to the implementation of SAPTA, under which negotiating trade concessions on a "product-by-product" basis becomes very tedious.

At the twelfth SAARC Summit meeting in Islamabad in January 2004, it was agreed to initiate the South Asian Free Trade Area (SAFTA), beginning in 2006, to be completed in phases by 2008. However, for the success of any free trade area in South Asia, it will be critical to actively involve the business community in the negotiations as a primary stakeholder, not just as a beneficiary of governmental decisions.

The information technology (IT) sector. The South Asian region has been made aware of the high potential of the information technology and software industry through the recent success of Indian "high-tech" firms in the global market. The Indian software industry has grown consistently at a phenomenal rate of over 50 percent during the 1990s, rising from a modest revenue base of U.S.\$195 million in 1989–1990 to an \$8.3 billion industry by 2000–2001. India's software industry revenue growth is projected to reach U.S.\$85 billion by 2008, of which \$50 billion is to come from exports alone.

Software engineers and professionals of Indian origin currently constitute about 10 percent of the employees in the top four global IT companies (Microsoft, IBM, Intel, and Oracle). The Indian industry trains over 1 million people in the country every year in IT, and provides IT-enabled services at one-tenth of the global cost. Thus India has today become a major outsourcing base for businesses all over the world, offering a huge pool of highly qualified, English speaking, analytically strong, and talented professionals.

The South Asian region has the potential for being developed as a regional hub for offshore software development for clients within SAARC and in other countries, with India as its core. The larger challenge will be to attract Indian corporations into doing business with South Asian nations, given that the main markets for their products lie in the United States, Europe, Southeast Asia, and China.

Harnessing the power sector. South Asia is one of the richest sources of hydropower in the world. The estimated hydropower potentials of the countries in the region are: Bangladesh, 52,000 megawatts (MW); Bhutan, 21,000 MW; Nepal, 83,290 MW; India, 75,400

MW; Pakistan, 38,000 MW; and Sri Lanka, 2,000 MW. However, less than 11 percent of this vast regional potential is being exploited so far. Because power generation and supply in South Asia has been a state monopoly over a long period, it has been highly dependent on state subsidies and therefore deprived of a competitive and efficient working environment. A large number of reforms for private sector participation and restructuring in the power sector have been introduced in all the South Asian countries in recent years, which has opened up a valuable potential for private sector collaboration in harnessing the hydropower of South Asia.

India and Bangladesh have an arrangement under which surplus power from the eastern states of India is exported to the deficit western region of Bangladesh. India and Nepal have signed the Treaty for the Integrated Development of the Mahakali Rivers for mutual cooperation in the power sector. Nepal has set up four hydroelectric projects with Indian assistance. India purchases 50 megawatts of power from Nepal, with reliable transmission assured, and provides 70 million units of energy annually free of charge to Nepal from the Tanakpur power plant.

In Bhutan, the 336-megawatt Chukha hydroelectric project was set up with technical and financial assistance from India, and India also constructed a number of micro-hydropower projects in Bhutan. This is a classic case of gains from cross-border trade, built on the basis of common interest and sovereign equality. Bhutan has earned considerable profits from export of this surplus power to India, which is primarily distributed to the Indian power-deficit states of West Bengal, Orissa, and the North-East region.

Conservative estimates made by the government of Pakistan indicate that Pakistan is likely to have surplus power over the next few years. If Pakistan were to export its surplus 200 megawatts of power to India, it could earn U.S.\$1.2 billion annually over a period of twenty years. This would be a major nontraditional export item in Pakistan's export basket, and would optimize the use of power plants in Pakistan at 80 percent of their capacity, rather than the current 60 percent levels.

The case for natural gas pipelines. The prospect for the emergence of natural gas pipelines as a key area for South Asian economic cooperation is based on the increasing demand in Indian markets for energy, India becoming one of the fastest-growing energy markets in the world. The prospect for supplying natural gas from neighboring countries like Bangladesh and Pakistan—either through their own resource endowments or as transit points for supply to India—has come up for discussion in recent years. Interest by "third" countries like Iran, Oman, Myanmar, and Turkmenistan to supply their

surplus natural gas to India and the region, and the willingness of multilateral funding institutions and foreign multinational corporations to provide insurance guarantees, has generated further expectations for earning revenues from natural gas.

The initiative for an Iran-India gas pipeline began as early as July 1993. Both nations have decided to undertake an offshore feasibility study for laying a pipeline from Iran to India “outside the Exclusive Economic Zone (EEZ) of Pakistan.”

Pakistan, on the other hand, has confirmed its willingness for the construction of an onshore gas pipeline from Iran to India, which has the potential for raising a huge revenue from “transit fees,” estimated in the range of \$500 million annually for Pakistan. However, no decision for an onshore pipeline has yet been made, given the institutional, political, and long-term supply security risks involved in this option for India. A large number of Indian corporates (such as Reliance Industries), foreign multinational companies (such as British Gas, Royal Dutch Shell Group, BHP Australia, and UNOCAL), and multilateral lending institutions (such as the Asian Development Bank), would be key players in supporting active discussions for the construction of a natural gas pipeline in South Asia.

In recent years, major gas reserves have been found in Bangladesh at the Bibiyana Natural Gas Fields. Market studies by UNOCAL and others have confirmed that the Bangladesh market will not be able to utilize such volumes for over fifteen years. An opportunity thus exists for exporting more gas to serve customers along the Hazira-Bijaipur-Jagdishpur (HBJ) pipeline, on the proposed route between Bangladesh and India. The estimated benefits to Bangladesh are in the range of U.S.\$3.5 billion in revenues and tax receipts over a twenty-year period. It would also develop approximately 1,900 jobs for Bangladeshi citizens, and could generate \$55 million to \$75 million for local procurement during the construction phase. Despite these major benefits, however, Bangladesh has not shown any inclination to export natural gas to the Indian market.

It is clear that the emerging global economy—based on communications, technologies, innovation, and new formats for doing business—will open up several new sectors for economic cooperation in South Asia. It is the responsibility of all the nations of South Asia to find the political will to place high priority on regional economic cooperation, development, and poverty reduction.

SOUTHEAST ASIA, RELATIONS WITH India’s relations with the countries of what is today known as “Southeast Asia” date back to antiquity. Early Indian texts referred to Southeast Asia as *Suvarnabhumi* (land of gold). Trade and the transmission of the Hindu and Buddhist religions were key elements of India’s early interaction with Southeast Asian lands, including Myanmar (Burma), Thailand, the Indochina peninsula, Malaya, and Indonesia. This was not a one-way traffic; Southeast Asians, particularly traders of the Malay world, also sailed west across the Bay of Bengal. The flow of Indian priests, traders, and adventurers, along with intermarriages and cultural assimilation, left a deep and lasting impact on the cultural landscape of Southeast Asia, one of the most impressive examples of acculturation in history. By the eleventh century, a number of strongly “Indianized” kingdoms, such as Funan and Champa, emerged in the Indochina peninsula, as did Nakhon Sri Thammarat in the Malayan peninsula.

Indianization

What historians describe as the “Indianization” of Southeast Asia was “the expansion of an organized culture, founded on the Indian conception of royalty, Hindu or Buddhist beliefs, the mythology of ancient Hindu

Purāṇas, and the observance of the Hindu law codes, expressed in the Sanskrit language.” Other features of Indianization included the use of alphabets of Indian origin, the pattern of Indian law and administration and monuments, and architecture and sculpture influenced by the arts of India. But the subject of “Indianization” or “Hinduization” of Southeast Asia has been controversial. The thesis of Indian colonization of Southeast Asia, or Indian views of Southeast Asia as “greater India” or “further India,” popularized by nationalist groups, like the Greater India Society of Calcutta, and historians of ancient India, such as R. C. Majumdar, has found less favor among contemporary historians of Southeast Asia.

Archaeological and literary evidence suggests that India’s impact on Southeast Asia was achieved largely through peaceful means, by commerce rather than conquest, and by cultural assimilation rather than outright colonization. Nor were Southeast Asians mere passive recipients of Indian ideas, but actively engaged borrowers.

Ideas that suited indigenous traditions, or that could easily be adapted to local interests and practices, were more readily received than those that did not have such potential. The Indian caste system and the practice of according lower status to women were not popular in the Southeast Asia. The temple arts of the Hindu-Buddhist kingdoms of Pagan, Angkor, and Java differ from those of India. The influence of Indian ideas was heavily mediated by indigenous Southeast Asian beliefs and practices; Southeast Asians adapted or localized them to suit their own interests, needs, and values.

The decline of Buddhism in India by the end of the twelfth century and the erosion of Hindu political power with the advent of Muslim rule in India contributed to the decline of Indian influence in Southeast Asia. The conversion of Malacca to Islam in the early fifteenth century saw Islam supplant Hinduism and Buddhism there, although it was Indian Muslim merchants who, ironically, played a key role in the spread of Islam by bringing with them mullahs, Sufi mystics, and Arab preachers. Indians, especially Muslim traders from the Tamil and Gujurati areas of India, played a major role in the rise of Malacca as the premier port city of Southeast Asia. Through intermarriage and commercial power, they became a major force at Malacca’s royal court.

The advent of European rule in Asia and the restrictive trade policies of the Dutch and the British severely undermined India’s commercial links with Southeast Asia. The Europeans took control of the trade in spices and textiles, the staples of India-Southeast Asia trade. Under the British Raj, the Indian economy was transformed from being an exporter of manufactured goods to

a supplier of raw materials for Britain. The British also actively curbed Indian shipbuilding and shipping. But British rule started a new type of migration from India to Southeast Asia, especially to Malaya, dating from the foundation of Penang in 1786. In contrast to earlier Indian migrants, who tended to be traders and financiers or priests and pandits, the new migration was more regulated and of a larger scale, consisting chiefly of indentured, illiterate laborers. Annual levels of migration from India to Malaya jumped from less than 7,000 in 1880 to over 18,000 in 1889, while migrations to Burma increased from less than 7,000 to over 38,000. In 1910 an estimated 331,100 Indians migrated to Burma, while the figure for Malaya was 91,723. In 1935 the respective figures were 296,600 for Burma and 81,350 for Malaya.

The Post-colonial Period

The Japanese conquest of Southeast Asia and the advance of the Japanese army to the border region between Burma and British India underscored the strategic vulnerability of India to attacks through Southeast Asia. During the Japanese occupation of the region from 1942 to 1945, Southeast Asia also became the launching point of the military campaign led by Netaji Subhash Chandra Bose and his Indian National army, drawn mainly from Indians in Southeast Asia, to oust the British from India.

In the early postwar period, Indian interests in Southeast Asia comprised political, economic, and strategic dimensions. Politically, Indian nationalist leaders viewed the anticolonial struggles in Southeast Asia as being indivisible from their own struggle. India’s struggle for independence from British rule was viewed in Southeast Asia with great interest. The second Asian country, after the Philippines, to achieve independence, India after 1947 played an important role in the campaign for self-determination in Southeast Asia. Economically, Southeast Asia was a market for Indian textiles (Burma was an almost exclusive Indian market); and India was heavily dependent on Burma, Indonesia, Malaya, Thailand, and Indochina for oil, rubber, tin, rice, and timber. An estimated 1.3 million to 1.8 million Indian immigrants in Southeast Asia during the immediate postwar period provided another crucial link between India and Southeast Asia; the treatment of Indian migrants in Burma would become an issue in Indian relations with that country. Strategically, Indian diplomat K. M. Panikkar (who is credited with being among the first to use the term “Southeast Asia”) suggested the creation of an “Indian security sphere” extending from the Persian Gulf to Burma, Siam (Thailand), the Indochina peninsula, Malaya, and Singapore. Indian leaders like Deputy Prime Minister Sardar Vallabhbhai Patel expressed concern

about instability and Communist insurgency in Southeast Asia as potential threats to Indian security. This concern was fueled by the meetings of Asian Communist leaders under the banner of the South Asian Youth Congress in Calcutta (the so-called Calcutta Conference) in February 1948, which was followed by the outbreak of Communist rebellions in both India and Southeast Asia. At the same time, the emergence of China as a major Asian power introduced an important new dimension to India's interest in Southeast Asia.

Despite professing a strong commitment to decolonization in Southeast Asia, Prime Minister Jawaharlal Nehru was prepared only to extend diplomatic support to Southeast Asian struggles. Nehru refused Ho Chi Minh's request for material support against the French, though he took a more active role in supporting Indonesia's struggle against the Dutch. India took the lead in convening the 1949 conference on Indonesia to show support for Indonesian nationalists, though again Indian support was mainly moral rather than material. This affected Nehru's bid to organize a regional grouping of newly independent Asian nations. The unofficial Asian Relations Conference held in New Delhi in 1947 under Nehru's chairmanship attracted delegations from all Southeast Asian countries, but the resulting Asian Relations Organization was moribund and short-lived.

Nehru joined Indonesia's efforts to convene a conference of African and Asian countries, which led to the famous Bandung Conference of 1955. At this time, the regional identity of Southeast Asia remained closely tied to that of India. The Bandung Conference was convened by the Conference of Southeast Asian Prime Ministers (also known as the Colombo Powers), a regional grouping that included the leaders of Pakistan, India, and Sri Lanka, as well as Indonesia and Burma. That conference, though successful in articulating a sense of solidarity among the newly independent countries, revealed serious differences, however, between India and the pro-United States Southeast Asian nations, Thailand and the Philippines. Nehru bitterly condemned military alliances between Asian nations and the superpowers, targeting specifically the Southeast Asia Treaty Organization, antagonizing the leaders of Pakistan, Thailand, and the Philippines.

A highlight of India's involvement in Southeast Asia in the 1950s was its efforts to mediate in the conflict between the French and the North Vietnamese following the Geneva Accords in 1954. Indian diplomacy in the Indochina conflict included Nehru's call for an immediate cease-fire in February 1954. Nehru sought to prevent both Chinese military intervention in support of Ho Chi Minh and large-scale U.S. intervention that might have included nuclear weapons. India's role led to its appointment as chairman of the International Control Commission

(ICC) on Indochina, whose role was to control the flow of armaments into Laos, Cambodia, and Vietnam. But the ICC suffered from a weak mandate and shortage of manpower, and was consumed by the escalation of great power rivalry. China made diplomatic and commercial gains in Southeast Asia at India's expense, while Nehru seemed more preoccupied with domestic issues.

The 1962 war between India and China dashed any remaining hopes of Indian interaction with Southeast Asia within a pan-Asian framework. This was accompanied by a growing divergence of their national economic policies and development strategies: India remained preoccupied with its domestic problems and the conflict with Pakistan over Kashmir, while the Southeast Asian nations remained concerned with the threat of Communist insurgency and potential Chinese and Vietnamese expansionism. Economically, while Southeast Asian countries were experiencing robust economic growth through openness to foreign investment and multinational enterprise, India could muster only what was derisively called the "Hindu" rate of growth of around 5 percent, which was seen in Southeast Asia as the result of its socialist, centrally planned economy. Later, in the 1990s, India's democratic system invited unflattering comments from the likes of Singapore's Lee Kuan Yew, who favored "discipline over democracy." The divergence in strategic outlook was equally pronounced, especially after the formation of the Association of Southeast Asian Nations (ASEAN) in 1967. While India remained somewhat uninterested in joining ASEAN, its leaders also ruled out Indian membership on the ground that it was not "geographically included in Southeast Asia." More importantly, India's nonaligned outlook, albeit with a tilt to Moscow over cold war issues, conflicted with ASEAN's pro-U.S. stance, camouflaged in its doctrine of a "Zone of Peace, Freedom, and Neutrality" in Southeast Asia. The signing of the Indo-Soviet Treaty of Peace, Friendship, and Cooperation in August 1971, intended to deter any Chinese or American intervention in support of Pakistan, was seen in Southeast Asia as compromising India's nonalignment. The Vietnamese invasion of Cambodia in December 1978 led India to recognize the Vietnamese-installed Heng Samarin regime in Cambodia. This was at serious odds with ASEAN's effort to condemn and isolate Hanoi. Moreover, in the 1980s, India's naval modernization program caused some apprehension in Southeast Asia.

India "Looks East"

The coolness and mutual neglect in India-ASEAN relations persisted until the early 1990s. But a major shift occurred in 1994, when Indian prime minister Narashimha Rao outlined India's "look east" policy,

whose main thrust was “to draw, as much as possible, investment and cooperation from the Asia-Pacific countries, in consonance with our common concept and solidarity and . . . our common destiny.” The “look east” policy was a logical and necessary extension of India’s domestic economic liberalization drive, which was dictated by harsh domestic economic and political realities. ASEAN is a key part of the look east policy.

The focus of India’s look east policy and India-ASEAN ties has been in the economic arena. According to official Indian figures, India’s exports to ASEAN jumped from U.S.\$2.9 billion in 1996–1997 to U.S.\$4.6 billion in 2002–2003, while imports from ASEAN during the same period rose from U.S.\$2.9 billion to U.S.\$5.2 billion. Although Southeast Asia accounts for only 8.77 percent of India’s total exports and 8.44 percent of India’s total imports, and foreign direct investment (FDI) by ASEAN states in India accounted for only 3.4 percent of total FDI flows to India (January 1991–May 2002), India’s impressive economic growth portends rising trade with ASEAN. India’s leadership position in information technology provides ASEAN with an opportunity to forge stronger economic links with India through greater economic integration.

India’s relations with ASEAN have been facilitated by New Delhi’s participation in a number of common regional forums. In 1992 India became a sectoral dialogue partner of ASEAN. Although restricted to areas concerning trade, investment, tourism, science, and technology, this represented India’s first formal involvement with ASEAN. In 1995 India was made a full dialogue partner by ASEAN, becoming eligible to participate in a much wider range of sectors, including infrastructure, civil aviation, and computer software, as well as in ASEAN Post Ministerial Meetings. India was invited for the first time to summit level talks with ASEAN in Cambodia in November 2002, and at the second ASEAN-India Summit in Bali in October 2003, India signed a Framework Agreement for creating an ASEAN-India free trade agreement (FTA) in a decade. The same year, India also signed a Framework Agreement for creating an FTA with Thailand, and started negotiations for a Comprehensive Economic Cooperation Agreement with Singapore.

In 1996, India joined the ASEAN Regional Forum (ARF), the first multilateral security organization in the Asia-Pacific region under ASEAN leadership. Until then, ASEAN members had opposed Indian membership. India, as with the rest of the South Asian countries, was considered to be outside the geographic scope of the Asia-Pacific region. A more important, if not publicly stated, factor was ASEAN’s fear that South Asian membership

would saddle the ARF with the seemingly intractable India-Pakistan rivalry, including the Kashmir problem. ASEAN’s motives in inviting India into the ARF was partly determined by ASEAN’s perception of the importance of India as a counterweight to China. India’s growing links with ASEAN and sub-ASEAN groupings is indicated in its participation in the launching of a new subregional group involving Bangladesh, India, Myanmar, Sri Lanka, and Thailand for Economic Cooperation, whose objectives include regional cooperation in transport and infrastructure. India also engages the newer ASEAN members through the Mekong Ganga Cooperation initiative, which involves building transportation links between India and the newer ASEAN members.

India has no border or land disputes in Southeast Asia and has already marked out its maritime boundary with Indonesia and Thailand. Currently, no Southeast Asian nation considers India to be a threat; nor does India expect any threats to security from any Southeast Asian country. While the situation in Myanmar, especially the growing military ties between Myanmar and China, has been a source of concern to Indian strategists, successive Indian governments have favored a policy of “engaging” China. Like ASEAN, India opposes the isolation of Myanmar. While Indian strategic planners recognize the importance of global trade routes through Southeast Asia, and share a concern over the rise of Chinese military power, India does not appear to have any grand plans for assuming a major security role in the Asia Pacific region, despite its powerful navy.

Nonetheless, the changing strategic climate in Asia appears to favor the development of closer political and security ties between India and the Southeast Asian countries. The 1990s saw increased defense contacts between India and ASEAN countries. The Indian navy has conducted a number of “friendship exercises” with ASEAN navies, including the navies of Singapore, Indonesia, Thailand, and Malaysia. India and Malaysia have cooperated in a program to provide familiarization and maintenance training for Russian-supplied MiG aircraft to Malaysian air force personnel. Since the terrorist attacks of 11 September 2001, India has joined the U.S. Navy in providing escort vessels in the Straits of Malacca.

SPACE PROGRAM India’s space program undertakes two major activities: it builds satellites used for remote sensing, meteorology, and communications; and it constructs the rockets to launch its satellites. India’s space program has passed through two stages. The first stage began in the 1960s, and involved setting up an administrative framework and gaining experience with rocket operations. Initial low-tech space operations commenced in the early 1960s. In 1969 the Indian Space Research Organization (ISRO) was formed to coordinate these activities, and the Indian Department of Space was established in 1972.

ISRO’s first chairman, Vikram Sarabhai, planned the gradual evolution and development of the Indian space program. In 1970 Sarabhai noted that in ten years India would have to acquire the capability not only of building telecommunication satellites, such as INSAT-1, but also

of launching them into synchronous orbits. His initial goal was the development of a small satellite launcher, such as a Scout rocket, within five years. He noted that once the basic systems were developed, and enough experience acquired in operating them, a further five-year period (from 1975 to 1980) should be adequate for the second stage, the development of larger boosters. India’s space program, however, has lagged more than a decade behind Sarabhai’s ambitious schedule.

The latter phase of the first stage of India’s space program focused mainly on experimental, low capability projects that allowed Indian scientists to gain experience in the construction and operation of satellites and launchers. In this phase, ISRO built (with foreign assistance) the Bhaskara earth observation satellites and the APPLE (Ariane Payload Experiment) communications satellite. From 1979 to 1983, it also conducted four tests of its indigenously built SLV-3 rocket (similar in design to the U.S. Scout rocket). Subsequently, ISRO built an augmented satellite launch vehicle (ASLV).

The second stage of India’s space program commenced in the mid-1980s and focused on larger, more powerful, and mission-specific systems. This stage involved building the polar satellite launch vehicle (PSLV) to launch the Indian Remote Sensing (IRS) satellite, and the PSLV’s successor, the geostationary satellite launch vehicle (GSLV), to launch a meteorology and telecommunications “Indian National Satellite” (INSAT). With the PSLV commencing operational launches in 1997 after three prior demonstration flights, and the GSLV making its first flight in 2001, India’s space program emerged from its developing stages to join the ranks of the world’s five advanced space agencies, all of which have geostationary earth orbit (GEO) capability.

The SLV-3 had a single 9-ton solid fuel engine and was only powerful enough to launch a 77–88 pound (35–40 kg) payload to an approximately 186 mile-altitude (300 km) low earth orbit (LEO). Three such engines power the ASLV, enabling it to place a 220–330 pound (100–150 kg) payload in an approximately 280 mile-altitude (450 km) LEO. Such lightweight low-orbit satellites did not have significant military or commercial capabilities. However, the SLV-3 could still be used as an intermediate range ballistic missile, and its first stage was used in the Agni intermediate range missile. The more powerful PSLV and GSLV can launch more capable, heavier satellites into optimal higher altitude orbits.

The PSLV and GSLV utilize two Indian-built propulsion systems: an approximately 130-ton solid fuel engine, and a 37–40 ton liquid fuel engine (whose design is based on the European Space Agency’s Viking engine used in the Ariane launch vehicle). They allow the PSLV to

launch a 2,645 pound (1,200 kg) payload (the IRS satellite) to an approximately 497 mile-altitude (800 km) polar orbit. The same systems are used on the GSLV, and are supplemented with a 12-ton cryogenic engine, which enables the GSLV to carry a heavier payload to a higher, 22,369 mile (36,000 km) GEO. The 400–414 ton GSLV was designed to launch 2,500 kg INSAT-2 class satellites, but its first three flights carried somewhat lighter satellites weighing 3373 pounds (1,530 kg; 2001), 4023 pounds (1,825 kg; 2003), and 4300 pounds (1,950 kg; 2004). The first three GSLVs also used Russian-supplied cryogenic engines. Later GSLVs will use more powerful, Indian-built, cryogenic engines. ISRO then plans to build a much heavier 630-ton GSLV-Mark 3 that can launch 8,818 pound (4,000 kg) satellites to GEO or 22,000 pound (10,000 kg) satellites to LEO. The rocket will have a 110-ton liquid fuel booster, additional 200-ton solid fuel engines, and a 25-ton cryogenic upper stage.

The IRS satellites have found applications with the Indian Natural Resource Management program, with regional Remote Sensing Service Centers in five Indian cities, and with Remote Sensing Application Centers in twenty Indian states that use IRS images for economic development applications. These include environmental monitoring, analyzing soil erosion and the impact of soil conservation measures, forestry management, determining land cover for wildlife sanctuaries, delineating groundwater potential zones, flood inundation mapping, drought monitoring, estimating crop acreage and deriving agricultural production estimates, fisheries monitoring, mining and geological applications such as surveying metal and mineral deposits, and urban planning. ISRO has also sold its IRS images to international clients; in 2003–2004, it had about 15 percent of the global market share for remote-sensing images. India's early IRS satellites—IRS-1A in March 1988, IRS-1B in August 1991, and IRS-1C in December 1995—were launched aboard Russian rockets. Subsequently, IRS-1D and the IRS-P series were launched on India's PSLV. ISRO thus launched PSLV-C1 with IRS-1D (1997); PSLV-C2 with three satellites—IRS-P4 (an oceanographic satellite), a German Tubsat, and a Korean Kitsat (1999); PSLV-C3 with three satellites—the Indian Technology Experiment Satellite (TES), German Bird, and Belgian Proba (2001); PSLV-C4 carrying a 1-ton meteorology satellite (Kalpana 1) to geosynchronous orbit (2002); and PSLV-C5 with IRS-P6 (2003).

The INSAT-2 and INSAT-3 satellites were launched aboard European Space Agency rockets. INSATs-2A to -2E were launched from 1992 to 1999, and INSAT-3A, -3B, -3C, and -3E were launched between 2000 and 2003. These INSAT satellites have been used to set up a national telecommunications infrastructure. INSAT-1B

extended television coverage to over 75 percent of India's population, and subsequent INSATs have brought television to most of India. The INSAT-2 satellites also provide telephone links to remote areas; data transmission for organizations such as the National Stock Exchange; mobile satellite service communications for private operators, railways, and road transport; and broadcast satellite services, used by India's state-owned television agency as well as commercial television channels. India's Edusat (Educational Satellite), launched aboard the GSLV in 2004, was intended for adult literacy and distance learning applications in rural areas. It augmented and would eventually replace such capabilities already provided by INSAT-3B.

Over time, India's INSAT and IRS satellites have become more sophisticated. For example, the Indian-built 2–2.5-ton INSAT-2 satellite had a greater number of more powerful transponders than the early U.S.-built 1-ton INSAT-1. Further, IRS-1A and -1B sensors had a resolution of 236 feet (72 m) multispectral (in the visible and near-infrared band) and 118 feet (36 m) panchromatic, while IRS-1C and -1D cameras have a better resolution of 75 feet (23 m) multispectral and 20 feet (6 m) panchromatic. ISRO had also planned to launch a mapping and cartography satellite, IRS-P5 (Cartosat-1), with 8.2 feet (2.5 m) panchromatic resolution, but instead launched TES aboard PSLV-C3 in 2001. TES had a panchromatic 3.3–3.6 foot (1–2 m) resolution camera. Subsequently, PSLV-C5 carried IRS-P6 (Resourcesat-1), with sensors of resolution similar to IRS-1D. In 2005, ISRO planned to launch PSLV-C6 with Cartosat-1, after which it will launch Cartosat-2 with a 3.3 foot (1 m) resolution camera, and a radar imaging satellite (Risat) that enables observation at night and under cloudy conditions.

India's satellites and satellite launch vehicles have had military spin-offs. While India's 93–124 mile (150–250 km) range Prithvi missile is not derived from the Indian space program, the intermediate range Agni missile is drawn from the Indian space program's SLV-3. In its early years, when headed by Vikram Sarabhai and Satish Dhawan, ISRO opposed military applications for its dual-use projects such as the SLV-3. Eventually, however, the Defence Research and Development (DRDO)-based missile program borrowed human resources and technology from ISRO. Missile scientist A. P. J. Abdul Kalam (elected president of India in 2002), who had headed the SLV-3 project at ISRO, moved to DRDO to direct India's missile program. About a dozen scientists accompanied Abdul Kalam from ISRO to DRDO, where Abdul Kalam designed the Agni missile using the SLV-3's solid-fuel first stage and a liquid-fuel (Prithvi-missile-derived) second stage. The Agni technology demonstrator flew

three times—in 1989, 1992, and 1994—to an estimated range of 621–870 miles (1,000 to 1,400 km). ISRO also built a solid-fuel second stage for the 1,243 miles (2,000 km) range Agni-2, which first flew in 1999.

IRS and INSAT satellites were primarily intended and used for civilian-economic applications, but they also offered military spin-offs. In 1996 New Delhi's Ministry of Defence temporarily blocked the use of IRS-1C by India's environmental and agricultural ministries in order to monitor ballistic missiles near India's borders. In 1997 the Indian air force's "Airpower Doctrine" aspired to use space assets for surveillance and battle management. In 2000 the air force was conceptualizing various programs for an aerospace command and for the military use of space, and a parliamentary committee endorsed the idea. India's space assets provide modest reconnaissance and communications capabilities.

India's IRS and TES satellites have only a moderate military reconnaissance capability, with the drawbacks of poor resolution and limited frequency of coverage. The LISS cameras on IRS-1C, -1D, and -P6 have a 75 foot (23 m) resolution in the visible and near-infrared band, permitting the detection of large military installations. The PAN cameras on these satellites have a resolution of 20 feet (6 m) panchromatic, which can broadly detect surface ships, aircraft, tank formations, and ballistic missile units, but may not precisely identify these objects. India's INSATs can be used for multiple access digital data transmission, teleconferencing, and remote area emergency communications, features useful for a military command and control network and for search and rescue. However, the INSATs are not optimal for military operation due to their inappropriate frequency range.

India's space assets enhance India's military capabilities against Pakistan and China. If New Delhi acquires dedicated reconnaissance satellites that provide better coverage of Pakistan's military installations, it could obtain counterforce capability against Pakistan, since Pakistan's nuclear arsenal is small, and its delivery systems are concentrated at a few airfields and missile bases. If India's satellites can locate these missiles at their bases in real time, they would become vulnerable to an Indian strike. India's satellites also augment its capabilities against China. Once India develops 1,864–3,107 mile (3,000–5,000 km) range Agni-3 missiles, it would have countervalue capabilities against major Chinese cities. Further, India's reconnaissance satellites will enable New Delhi to counter Chinese conventional threats. They can detect and track Chinese military forces in Tibet. They also give India's armed forces sufficient early warning about the movement of Chinese military forces from central China toward Tibet and India,

thus facilitating the timely deployment of Indian conventional forces to counter any such Chinese military deployments.

ISRO's annual space budget was approximately \$400–500 million in the period 2000–2004 (compared against India's defense budget of approximately \$12 billion–15 billion in this period). In the future, as ISRO launches satellites more frequently (two or more times each year) and undertakes new missions, its budgets could increase. ISRO's future plans are to activate its second launch pad, and use it to launch both the PSLV and the GSLV, in 2005. Further, it seeks to send recoverable capsules into space to perform experiments, after which the capsules will land at sea and be reused. ISRO conducted airdrop tests of such a capsule in 2004 and planned a space flight in 2005. In addition, it intends to develop the GSLV Mark-3 to launch 4-ton satellites. Finally, ISRO intends to launch a lunar probe aboard the PSLV in 2007–2008; the probe would orbit and send back high-resolution pictures of the moon.

SRI LANKA A tiny island state, Sri Lanka is separated from South India by a narrow stretch of waters in the Palk Strait. It has a total land area of 25,330 square miles (65,610 sq. km.) and a population of about 19 million, including many ethnic communities with diverse histories, languages, and religions. Sinhalese constitute about two-thirds of the total population of Sri Lanka, while Tamils are the largest minority. Around 90 percent of Sri Lanka's people have Indian ancestors, as their forefathers

began migrating from India over a thousand years ago. About 70 percent of Sri Lankans practice Buddhism, which now enjoys special privileges and state patronage. Hinduism, Christianity, and Islam are minority religions. Sinhalese form the majority in seven of Sri Lanka's nine provinces; Sri Lankan Tamils are dominant in the other two northern and eastern provinces, Jaffna and Trincomalli, which they consider their traditional homeland, temporarily merged under the 1987 India–Sri Lanka accord. Muslims and Indian-origin Tamils live throughout the island, mostly in the eastern and central provinces, respectively.

Sri Lanka's independence from British colonial rule came peacefully in 1948. Given its long colonial experience, the country remained a parliamentary democracy for three decades until the second republican constitution of 1978 introduced its presidential system. A vibrant democracy, it has a multiparty system in which two parties dominate. Elections are held regularly, and participation in the electoral process has been always high. Universal adult franchise was introduced in 1931. Many governments have been coalitions headed by the United National Party or the Sri Lanka Freedom Party.

Plantation agriculture is the mainstay of the Sri Lankan economy. Tea is a major foreign exchange earner. Sri Lanka liberalized its economy in 1977. Over 90 percent of its people are literate, and the average life expectancy of 72.5 years is high.

Despite such impressive social indicators, Sri Lanka has witnessed large-scale death and destruction, especially since 1983, when ethnic riots began in Colombo and a civil war broke out in the Tamil-dominated provinces of the north and east. The root cause of ethnic antagonism lies in the conflicting visions of Sinhalese Buddhist and Sri Lankan Tamil Hindu nationalism, and the Tamil demand for its own nation-state (*eelam*) in the northeastern portion of the island. Successive Sinhalese governments in Colombo, through discriminatory policies regarding language, education, and employment, have alienated Sri Lanka's Tamil minority. The demand for equal linguistic rights and federal autonomy gained momentum in the 1950s, with the Federal Party providing early leadership. Since the mid-1970s, when the Sinhalese leadership failed to redress the Tamils' legitimate grievances, the moderate Tamil United Liberation Front launched a movement for a separate *eelam*. The movement soon took on a violent dimension, as militant organizations were formed to carry on the fight for independence.

The Liberation Tigers of Tamil Eelam (LTTE), led by Velupillai Prabhakaran, has remained the most powerful militant organization. Formed in 1972 as the Tamil

New Tigers (and renamed in 1976), the LTTE has grown strong enough to sustain prolonged insurgency since 1983 in the face of the tremendous military pressure brought upon it by the Sri Lankan state. Ruthlessness is a notable characteristic of the LTTE. By carrying out a systematic campaign of terror, it has created political disorder in the island. Many Sri Lankan leaders, as well as former Indian prime minister Rajiv Gandhi, fell prey to the LTTE's bullets and bombs. Unable to defeat the group militarily, the Sri Lankan government has intermittently offered to negotiate a peace settlement. Peace processes have not been successful, however, due to the LTTE's intransigence regarding their *eelam* goal and the Sinhalese leaders' failure to evolve a bipartisan approach to conflict resolution.

SRI LANKA, RELATIONS WITH Relations between India and Sri Lanka have been shaped by a variety of factors. The close proximity of the two states has encouraged the exchange of people, culture, trade, and hostilities over several millennia. Sri Lanka has also long served as an entrepôt for Indian Ocean commerce extending to West Asia, Africa, and Europe to its west, and Southeast Asia and China to its east. The mixture of diverse cultural influences in Sri Lanka, the relatively greater significance of maritime trade, its small size, and its geographically insular existence gave the island society a distinctive character and complex identity. This situation was reinforced by Sri Lanka's separate experience under British colonialism from the early nineteenth century. The British system of indirect rule through local notables created a commonality, which from the late nineteenth century gave way to nationalist demands by the Westernized elite in both India and Sri Lanka for increased access to representation and power. In Sri Lanka, the establishment and dominance of a colonial plantation export economy contributed to the emergence of a propertied elite with a conservative and accommodating attitude to British colonial power. The Sri Lankan nationalist movement and transfer of power, led by D. S. Senanayake, who was to become the first prime minister of Ceylon (as Sri Lanka was called until 1972), were carried

out with little involvement by the masses. The more radical mass movement of India, led by the Indian National Congress under Mahatma Gandhi and Jawaharlal Nehru, backed by the relatively more developed and independent Indian business class, aroused admiration among the more liberal and progressive segments of Ceylonese society while creating great anxiety among the latter's elite. This situation was expressed in the post-independence period in Ceylon by the foreign policy orientations of the two major political blocs that came to dominate Sri Lankan politics. The center-right political party, the United National Party (UNP), remained wary of India, preferring a closer relationship with the capitalist West. In contrast, the center-left party, the Sri Lanka Freedom Party (SLFP) founded by S. W. R. D. Bandaranaike in 1952, favored a more independent, nonaligned stance that was pro-India and the Third World.

Citizenship and Voting Rights of Indian Tamils

A major subject of dispute between the two states in the early post-independence years revolved around the formal status and rights of Indian immigrants to Sri Lanka. The large majority of these immigrants were poor Tamil workers who had come as indentured labor starting from the early nineteenth century to work on Sri Lanka's famous tea plantations in the island's central upcountry. The South Indian Tamils had become the largest ethnic minority on Ceylon by 1911, when they were categorized separately for the first time. Their numbers peaked by 1939, declining thereafter due to discriminatory measures taken against them; by 1946 the census reported there were 857,329 persons of recent Indian origin (PRIOs/ PIOs, officially referred to as "Indian Tamils"). They began to participate in the island's politics in the 1920s by supporting the growing trade union movement and leftist political parties. Though Sri Lanka was bound by agreements with India from the early 1920s to treat the immigrants in a "nondiscriminatory" manner, the competition for votes and power induced Sinhalese political leaders to target immigrant Tamil labor in an exclusionary fashion after 1930, barring them from eligibility to vote and from economic programs. This culminated in the passage in 1948 of the citizenship and franchise acts that stripped the Indian Tamils of their citizenship and voting rights. The Ceylon Citizenship Act of 1948 created two types of citizenship: citizenship by descent and by registration. Citizenship by descent was restricted to persons who could prove that at least two generations (primarily on the male side) had been born on the island. Citizenship by registration would be available to those residents who could prove that either parent had been a citizen by descent, and that the individual had been a resident of Ceylon for seven years, if married, or ten years,

if unmarried. The minister in charge could also register twenty-five persons a year for "distinguished public service." Opposition members of Ceylon's parliament belonging to the left and to the Tamil parties denounced the legislation as having a clear racial and class bias, since it required documentary proof that simply did not exist for the overwhelming majority of poor Tamil workers. In contrast, Indian prime minister Jawaharlal Nehru had suggested a far simpler set of provisions, requiring residence of seven years prior to January 1948, along with a voluntary declaration of the intention and desire to settle in Ceylon. The Indian and Pakistani Residents' (Citizenship) Act of 1949 allowed for citizenship through satisfaction of a more complicated set of conditions: residence of seven years for married persons and ten years for unmarried persons to have been completed by January 1948, applications to be made within two years of the legislation, with proof of adequate means of livelihood and conformance with Ceylonese marriage laws. As events demonstrated, these requirements provided ample scope for the rejection of most applications on technical grounds. The Ceylon (Parliamentary Elections) Amendment of 1949 made the status of citizenship mandatory for franchise rights, stripping most Indian Tamils of the franchise that a number of them had enjoyed in the late colonial period. With India taking the position that all Indian emigrants to other parts of the British Empire were equal "subjects" in, and hence citizens of, their host countries, unless they voluntarily chose Indian citizenship, the Indian-origin population of Sri Lanka were rendered stateless. Not surprisingly, as a vulnerable population, their economic and political situation declined in the following period.

With several rounds of talks failing, and pressed repeatedly by Sri Lanka to help resolve the dispute, India reluctantly stepped away from its earlier position. Under the Sirimavo-Shastri Pact of 1964, signed by Sri Lankan prime minister Sirimavo Bandaranaike and Indian prime minister Lal Bahadur Shastri, Sri Lanka agreed to accept 300,000 persons and their natural increase, and India 525,000 persons with their increase. The status of the 150,000 who remained would be decided later. These numbers were arrived at by the Sri Lankan government without any consultation with its sole appointed Indian Tamil representative and trade union leader in Parliament, S. Thondaman. Nor did the Indian central government seek input from any of its Tamil representatives, arousing strong resentment in the state of Tamil Nadu.

In direct contradiction to the agreed-upon numbers, over 630,000 Indian Tamils applied for Ceylonese citizenship by the end of 1974. Fewer than 439,000 applied for Indian citizenship, many of them reluctantly, after having been rejected for Ceylonese citizenship. A follow-up

agreement in 1974, recognizing the nonviability of the proportions in the earlier agreement, decided that each country would accept half of the remaining 150,000, but this agreement was never implemented. By the end of the period of the 1964 pact in October 1981, only 162,000 Indian Tamils had been registered as citizens of Ceylon, while 373,900 had been given Indian citizenship (of whom 284,300 had been repatriated to India). The rest remained stateless and voteless, with few individual and political rights.

In the following period, the Sri Lankan government gradually reversed its previous positions and belatedly granted citizenship to the remaining persons—a process largely undertaken by the UNP as a reward for the political support given by the Tamils in elections in the post-1977 period. The Citizenship (Special Provisions) Act of 1988 granted citizenship to the remaining persons of Indian origin who had not previously applied for Indian citizenship. This benefited 231,849 stateless persons. Further legislation, enacted in March 2003, gave citizenship to a further 200,000 Tamils.

Kachchativu Island

Another subject of dispute between India and Sri Lanka after independence related to the maritime waters and boundaries between them. For the most part, the demarcation of boundaries and areas of control over adjacent waters were settled amicably through negotiations in keeping with international law. Kachchativu, a barren island in the Palk Strait, which had traditionally been used by fishermen of both countries to rest and dry their nets while on fishing expeditions and annually for festival observances, acquired importance due to the extended maritime boundary and access to fish, prawns, and other marine resources they would give the possessing country. In the interest of improving relations, India agreed to concede the issue in favor of Sri Lanka's ownership of the island, on the condition that Indian fishermen and pilgrims would be allowed to continue to visit the island as they had in the past.

The Sri Lankan Tamil Separatist Movement

The major issue that has dominated relations between India and Sri Lanka from the early 1980s is the Sri Lankan Tamil movement for the creation of a separate Tamil *eelam* (homeland) in the northeast quarter of Sri Lanka. Differences between the Sinhalese-dominated central government and the Sri Lankan Tamil leadership were rooted in the colonial period. Sri Lankan Tamil fears of marginalization and subordination in the post-independence period grew in reaction to successive discriminatory state policies, including the deprivation of the Indian Tamils of citizenship and representation, the

consequent disproportionate representation of Sinhalese, and the declaration of Sinhala (the language of the Sinhalese) as Sri Lanka's only official language in 1956. The allocation of development funds and projects by Colombo's Sinhalese-led government to majority regions in the southwest, as well as official support of a pro-Sinhalese university admissions policy in the early 1970s, further frustrated and alienated the Sri Lankan Tamils. Militant Tamil youth groups ("The Boys") were soon ready to fight for a separate Tamil state by any means. Efforts by the state to repress these groups through coercion further polarized the situation, culminating in major bouts of ethnic violence in 1977, 1981, and 1983, and ultimately led to civil war.

This trend of events led to an internationalization of the Sri Lankan Tamil issue and drew India into a more active role. India had expressed diplomatic concern in 1977 and 1981 at the impact of the ethnic violence on Indian Tamils, many of whom were Indian citizens. The operations of the Sri Lankan army against the militant Tamil youth groups and the ethnic violence in 1983 sent some 150,000 Sri Lankan Tamils fleeing to seek asylum in Tamil Nadu, the South Indian state in closest proximity, and with which they had the closest historical and cultural ties. The press, people, and political parties in Tamil Nadu, which had its own history of secessionist movements, provided sympathy, support, and funds to the refugees and militants, and demanded action by India's government in New Delhi, led by Indira Gandhi and her Congress Party. This sequence of events coincided with larger concerns in Delhi that had been raised by the growing closeness of the UNP government in Colombo with Western powers, as evidenced by its growing economic dependence and indebtedness, military aid and training to put down the Tamil insurgency, and other concessions having strategic implications. Given the U.S. funds and arms flowing into the region, through the military dictatorship in Pakistan, to support the mujahideen in Afghanistan, India's sensitivities to the presence of an external superpower were exacerbated by the deteriorating situation in neighboring Sri Lanka, a country from which India had traditionally never felt any anxiety and with which it had generally had cordial relations.

India adopted a two-track policy toward Sri Lanka in the subsequent period, under Indira Gandhi and later Rajiv Gandhi. On the one hand, it provided support, training, and funding to Tamil militant groups to help them create pressure on the government in Colombo to desist from its increasing identification with Western interests. On the other hand, India actively sponsored repeated rounds of negotiations between the government in Colombo and the Sri Lankan Tamil parties to further reconciliation, compromise, and the recognition of

minority ethnic rights to establish a system of regional Tamil autonomy for Sri Lanka's northeast. The bilateral talks that ensued from 1983 to 1986 compelled a growing recognition and delineation of Tamil rights and demands, providing the basis for the provisions supporting provincial autonomy incorporated into the Indo-Sri Lanka Accord of 1987. Those efforts to effect a reconciliation did not, however, materialize. The many militant youth groups seeking to represent Sri Lankan Tamils suffered from serious individual and political differences among themselves, with the Liberation Tigers of Tamil Eelam (LTTE) maintaining the most militant and intractable separatist position.

Indo-Sri Lanka Accord of 1987. The Indo-Sri Lanka Accord, signed by Indian prime minister Rajiv Gandhi and Sri Lankan president J. R. Jayewardene on 29 July 1987, sought to solve the exploding ethnic conflict by declaring Sri Lanka "a multi-ethnic and multi-lingual plural society" consisting primarily of four main ethnic groups. It recognized that the northern and eastern provinces had been areas of "historical habitation of the Tamil-speaking population." Tamil and English were also proclaimed to be official languages of Sri Lanka, along with Sinhala. The Sri Lankan government promised to devolve power to provincial councils and to allow the adjoining northern and eastern provinces to form one administrative unit, or to remain separate, their preference to be determined by referendum in the Eastern province. As a temporary measure, the two provinces would be merged into a single unit, the North-Eastern Provincial Council, until the referendum could be held. India promised to send a contingent of troops as a peace-keeping force (IPKF), at the invitation of Sri Lanka's president, to be deployed in the northeast of the island to oversee the cease-fire, receive arms to be surrendered by the Tamil militants, and serve as a guarantor of the agreement. In an exchange of letters following the accord, Jayewardene assured Gandhi that specific aspects of Sri Lanka's foreign policy would be modified to accommodate Indian regional security concerns.

The accord set out a tight schedule for the completion of commitments by the various sides but ran into trouble almost immediately, and soon became derailed. Its opponents included a rival faction of Colombo's ruling party, led by Prime Minister Premadasa; the other major Sri Lankan party, the SLFP, and its leader Sirimavo Bandaranaike; the influential Buddhist clergy; and the radical militant Sinhalese youth group, the People's United Liberation Front (JVP). Nor did the accord have the open support of either the leading moderate Tamil party (TULF) or the most militant Tamil Tigers (LTTE). Only several small parties on the left, members of the progressive intelligentsia, and several of the Tamil militant

groups supported the agreement. The surrender of arms was rejected by the LTTE. This and other deliberate actions by the LTTE compelled the IPKF to engage in open armed conflict with them, while the Sri Lankan government withdrew its own armed forces from the northeast.

After Premadasa came to power as president in 1988, he called for a cease-fire with the Tigers, began talks with them, summarily asked the IPKF to leave Sri Lanka (before the accord had been fully implemented), and even clandestinely supplied the LTTE with arms to fight the IPKF, which had already lost 1,500 soldiers. New Delhi began to withdraw all its troops in December 1989. Eight months later the LTTE resumed hostilities against the Sri Lankan government. The LTTE assassinated Rajiv Gandhi in Tamil Nadu in 1991, then Premadasa in Colombo in 1993.

While political opinion in India was divided about the wisdom of sending the IPKF to Sri Lanka, it had remained sympathetic to the Tamil cause. This changed sharply after the LTTE's assassination of Rajiv Gandhi by a suicide bomber in the midst of his campaign to come back to power in India's midterm elections in mid-1991, as demonstrated by popular opinion in Tamil Nadu. India proceeded to try those charged with conspiracy to murder Rajiv Gandhi. It indicted Velupillai Prabhakaran, leader of the Tigers, and three of his closest associates to stand trial for the murder. Request for Prabhakaran's extradition continued to be pending over a decade after conclusion of the trial, given the inability of the Sri Lankan government to catch him in his jungle strongholds in the island's northeast. The LTTE was banned as a terrorist organization by India in 1993, a course later adopted by other states, including Sri Lanka, the United States, Canada, Australia, and the United Kingdom.

Post-accord relations. After withdrawing the IPKF, India continued to stand by the accord, asserting the need for all parties in Sri Lanka to work out a solution among themselves, within the parameters of a united sovereign democratic and pluralistic Sri Lanka. Another round of cease-fire occurred after the changeover of power to the SLFP-led People's Alliance government of Chandrika Bandaranaike Kumaratunge in late 1994. In an effort to compel the LTTE to negotiate a compromise, President Kumaratunge escalated the fighting against the Tigers on the one hand. On the other, she sought to restore trust by working to improve Sri Lanka's record of human rights, offering a package of constitutional reforms instituting a generous degree of regional autonomy to resolve the ethnic conflict. The opposing UNP refused to support the reforms and thereby strengthen Kumaratunge's political position. Rejecting Kumaratunge's peace overtures, the LTTE fought the

government forces to a stalemate by 2000, drawing on the globalized network of support, arms, and funds it had built up in its diaspora communities, as well as through overt and covert economic operations.

By December 2000, Sri Lanka's civil war had taken over 65,000 lives and had displaced over a million and a half people. An international coalition, including Norway and other Western powers, Japan, and India, supported a cease-fire and called for a peaceful resolution of the conflict, and were willing to back the effort with funding for reconstruction and development. Sri Lanka's new prime minister, Ranil Wickremasinghe, accepted the offer and the cease-fire was maintained for the next two years, while six rounds of talks were held by representatives of the Sri Lankan government and the LTTE in various capitals in Asia and Europe. The government made numerous concessions to the LTTE in an effort to engage it in the peace process. Over time, these served to enhance the control of the LTTE in the northeast, but the Tigers remained largely unresponsive, raising fears in the south that the unity and security of Sri Lanka was being dangerously compromised. This exacerbated serious political divisions on the issue between President Kumaratunge and Prime Minister Wickremasinghe, a development which only strengthened the separatist leverage of the LTTE.

The deepening political divisions caused opinion on the island about India's role to come full circle in favor of it adopting a more active, and even outright interventionist, role to resolve Sri Lanka's political impasse. India had resisted demands by members of the Sinhalese community and clergy to return in mid-2000, when the Tigers launched a particularly threatening attack on Jaffna. However, by the beginning of 2003, the coalition government led by Prime Minister Atal Bihari Vajpayee's Bharatiya Janata Party exhibited a greater willingness to take a more active role in fashioning a compromise between Sri Lanka's two major parties in the south, while asserting that only a "homegrown" solution with the Tigers themselves could prove durable.

STATE FINANCES SINCE 1952 In order to analyze the trends in state finances in India since the mid-twentieth century, and to identify reform issues that need to be addressed for better macroeconomic management, it is necessary to examine the fiscal role of state governments in India's federal polity and their effectiveness in fulfilling their fiscal roles. As in other important federal fiscal systems, the states play an important role in providing public services in India. The country's 1.2 billion people live in twenty-eight states and seven centrally administered territories (two with their own elected governments). The seventh schedule of India's Constitution demarcates the legislative and fiscal domains of the union and state governments in terms of union, state, and concurrent lists. The states have exclusive authority over the items specified in the state list and coequal powers in regard to those in the concurrent list. While on the one hand the states are required to make substantial investments in providing efficient physical and social infrastructure, they face binding constraints on resources. Restructuring the finances and expenditure priorities to release resources to the desired activities has not been easy. The declining revenues and transfers from the central government have only added to India's woes. The states are faced with challenging times in creating a business-friendly environment.

The Assignment System

The tax and expenditure powers of the central and the state governments are specified in the seventh schedule of the Constitution. The functions required for maintaining macroeconomic stability, international relations, and activities having significant scale economies have been assigned exclusively to the central government, or have to be carried out concurrently with the states. Functions that have a statewide jurisdiction are assigned to the states. Most broad-based and progressive taxes have been

assigned to the central government, which also has residual tax powers. A number of tax vehicles have been assigned to the states, but from the viewpoint of revenue productivity, only the sales tax is important. The states can borrow from the central government. They have the powers to borrow from the market, but if a state is indebted to the central government, such borrowing must be approved by the center. The important taxes assigned to the states include the sales tax, excise duties on alcoholic products, stamp duties and registration fees, taxes on motor vehicles and passengers and goods. They can also levy taxes on incomes from agriculture, but none of the states has found this feasible for political reasons. Even land revenue, which contributed significant revenue thirty years ago, has ceased to contribute any worthwhile resources in recent years.

The states play a very important role in the development of agriculture and have a significant role in the provision of infrastructure for industrial development. Even more significant is their role in human development, as they have responsibility for the provision of basic education and health care. The states raise 35 percent of the total revenues and incur 57 percent of total expenditures. Their role in providing social services is particularly significant. In fact, their expenditure share in education, public health, and family welfare is close to 90 percent of public expenditures.

Trends in State Finances: Macroeconomic Implications

The trends in state finances in India since the mid-twentieth century can be examined in two distinct phases. In the first phase, from 1950–1951 to 1986–1987, increased revenue receipts kept pace with revenue (current) expenditures. The emphasis on resource mobilization, particularly to finance large development plans, resulted in the steady increase in both revenues and expenditures, with states' own revenues as well as central transfers steadily increasing. In fact, from 1975–1976 to 1983–1984, revenue receipts exceeded revenue expenditures by a significant margin, enabling the states to finance an appreciable portion of their capital expenditure from savings in the current account.

The second phase in state finances began with the pay revision, following the implementation of the recommendations of the pay commission by the central government. The central government itself had such a significant revenue deficit that it could not increase transfers to meet the additional requirements to finance the pay revision. The states, on their part, did not undertake serious fiscal restructuring, and as the buoyancy of both the states' own revenues and central transfers declined (the latter more than the former), public dissaving at the

state level increased steadily. In fact, in the 1990s the states' revenue-gross domestic product (GDP) ratio remained steady at about 5.5 percent, whereas the central tax-GDP ratio declined by two percentage points. The consequence of this has been to reduce transfers to the states by one percentage point. Thus, with stagnant revenues, declining transfers from the center, and ever-increasing pressure on expenditures, revenue deficits in the states widened significantly in the 1990s. Although the states tried to contain their expenditures to adjust for stagnant revenues, the revision of pay scales of state government employees, following the implementation of the fifth central pay commission, did not help matters. Thus, since 1998–1999, the revenue deficits of the states increased sharply, and borrowed resources of over 2.5 percent of GDP were being used to meet states' current expenditures. Correspondingly, fiscal deficit on states' accounts increased from 1.3 percent in 1975–1976 to 2.8 percent in 1985–1986 and accelerated to 4.7 percent in 2001–2002.

The deterioration in state finances since 1987–1988 also marked a sharp deterioration in the quality of deficits as well. Infrastructure spending declined from 3.7 percent of GDP in 1980–1981 and about 3 percent in 1985–1986 to 1.7 percent in 2000–2001. As a ratio of total expenditures, capital expenditure declined from about 27 percent in 1980–1981 to a mere 13 percent in 2001–2002. Sharp increases in expenditures crowded out maintenance expenditures, thereby reducing the productivity of the infrastructure sector as well. Even in labor-intensive social services such as education and health, increases in the pay scales have significantly escalated the input cost of providing these services, and increasing expenditures have not been reflected in the improvement in the standard of these services.

The persistence of large and growing fiscal deficits in India's states over the years has led to a steady accumulation of debt. The states' outstanding debt as a ratio of GDP was steady from 1965–1966 to 1997–1998, but thereafter increased sharply. This deterioration in fiscal imbalances is not just an aggregate phenomenon. It is seen in the case of each of the individual states, particularly after the pay revision in 1998–1999. Even in 1995–1996, some of the states had surpluses in the revenue account, but after the pay revisions in 1998–1999, every state has had revenue deficits of varying magnitude, and capital and maintenance expenditures have been lower than in 1995–1996.

There are a number of reasons for fiscal imbalances at the state level. Since the 1980s, the growth of the states' revenue expenditures has outpaced the growth of revenue receipts mainly because of the two pay revisions, one in the late 1980s and another in the late 1990s. The

last one in particular had disastrous effects on state finances. Pay revision was not accompanied with any restructuring plan in public employment, and expenditures on salaries and pensions increased sharply after 1998–1999. The second important reason for the states' imbalances is the decline in transfers from the central government as a ratio of GDP. The central government's own revenues as a ratio of GDP declined by about two percentage points in the 1990s, and this led to the compression of transfers to states by one percentage point. Third, there has also been a significant deceleration in the growth of states' own tax revenue. Fourth, the artificial distinction between plan and nonplan expenditures and an emphasis on increasing the plan size year after year have led to unbridled growth of expenditures. Fifth, increased borrowing, particularly from uncontrolled sources at high interest rates, has caused a sharp increase in the debt service burden. Finally, public enterprises, particularly the power utilities, have continued to be a drain on the states' funds.

The states' fiscal operations have important implications on microeconomic efficiency as well. On the tax side, the structure and operation of sales tax systems has been a major source of distortion. The relative price distortions caused by complicated, cascading type, preretail and partly origin-based sales tax and the impediments to internal trade and distortions and inequity arising from multiple tariff zones (created by interstate sales tax and the tax on the entry of goods into a local area for consumption) are well known. These are only some of the problems in the tax side. On the expenditure side, steady decline in the allocation to the creation and maintenance of infrastructure has adversely affected its quality. Similarly, a significant increase in the input cost due to pay revision has adversely impacted the standards of social services.

Reforming State Finances: Challenges Ahead

Concerned over the perilous condition of their finances, some of the states have taken reform initiatives. A number of states have published white papers on their finances. Some of the states have initiated reforms in their tax and expenditure systems, have tried to quantify contingent liabilities, and have passed fiscal responsibility legislation to cap deficits and impose fiscal discipline. In some cases, reform initiatives have been taken at the instance of multilateral lending agencies as a condition for their lending. The central government also has initiated a fiscal reform program for the states and has linked a portion of its transfers to fiscal performance. However, the design of the program and its implementation leave much to be desired.

In a more open market economy, the state governments will have to provide a higher quality infrastructure.

In particular, their role in human development is critical. This change would require a number of reform initiatives. These initiatives include: restructuring the administrative machinery, improving the buoyancy of the tax system, better cost recovery on the services provided, downsizing of bureaucracy, and prioritizing expenditure allocation to provide quality infrastructure and the creation of a business-friendly environment.

One of the most important areas requiring urgent reform is the power sector. Reform is necessary not only to achieve fiscal consolidation but also to ensure the quality of the infrastructure. Restructuring other public enterprises will also prevent a drain on resources. Reforms in the tax systems are important to ensure that the resources for investment in infrastructure are generated in the least distortionary manner. The states took initiatives to substitute the prevailing cascading sales tax with the value-added tax (VAT) in April 2002. Transition to VAT was necessary not only to impart efficiency to the tax system but also to enhance revenue productivity. The reform journey for the achievement of fiscal consolidation, the improvement of efficiency and productivity, and the creation of a competitive environment will be long and arduous. Political will and administrative competence, along with an awareness of the need for reform among the general public, are the most important ingredients that will be needed in abundance to achieve the desired goals.

STATE FORMATION From the dawn of its recorded history, an enduring feature of India's state formation has been the struggle for power between its settled cultures and invading forces. The geographical configuration of the Indian subcontinent also played its part in determining the patterns of invasion and settlement, whether by the "land nomads" from Central Asia,

who entered northern India through the invasion corridor of the northwest, or by the “sea nomads” of Europe, who crossed the oceans and penetrated the Indian subcontinent from the coastal areas.

The earliest known population movement was by the Indo-Europeans (Aryans) from the steppe lands of Central Asia, who settled in the Indo-Gangetic Plain and established the North Indian linguistic and cultural tradition. However, the unique configuration of the Indian subcontinent also dictated that most invading forces from Central Asia encountered the barrier of the Hindu Kush Mountains before reaching the plains of northern India. The new waves of invasion that followed—by the Greeks, Kushans, Huns, Turkic and Mongol tribes—were launched as military expeditions that crossed the Indus to conquer the Punjab. Most of them lost their momentum by the time they reached the Gangetic Plain. Thus, while a few established ephemeral dynasties of considerable power, they were not able to change the mass of population or cultural core of the Gangetic region.

The other aspect of the territorial history of the Indian subcontinent is that of the geographical divide between continental and peninsular India. The political concept of India as an “empire state” was first developed during the time of the Mauryas (321–184 B.C.) and defined Bharat (India) as stretching from the northern Himalayas to Kanya Kumari (Cape Comorin) in the south. The ambition of all subsequent Indian rulers has been to achieve the territorial and political unification of the Indian subcontinent. Here again, geography has played a part; the Vindhya Mountains of the Deccan plateau have provided a formidable barrier to the imperial ambitions of the land-based powers of the north.

In the post-Mauryan period, the Indo-Gangetic Plain was subjected to extensive invasions, and periodic attempts at unification were interspersed with long periods of turmoil and conflict. The Gupta dynasty (4th century) was the last North Indian empire to rule from the Gangetic heartland. Their political collapse came in the wake of fresh invasions by Hun nomads in the fifth century.

Muslim rule followed much the same pattern of invasion and conquest, but the introduction of Islam as a new religion and culture proved a critical break in terms of its impact on state and society. The establishment of the Delhi Sultanate in A.D. 1206 changed the political landscape of northern India, the strategically placed capital of Delhi becoming the new seat of central power.

India’s next imperial unification, under the Great Mughals, from Babur to Akbar (A.D. 1526–1605). Akbar’s rule was renowned for its tolerance, and for his fostering of pluralism and a syncretism of Hindu-Muslim culture and civilization. The Mughal empire was also a warrior

state, administered by a new class of military bureaucratic elites (*mansabdars*). The Northwest and the Northeast of the Indo-Gangetic belt became Muslim majority areas, the former by invaders who settled there, the latter mostly by Sufi conversions, while the Gangetic Plain retained its Hindu majority. Southern India developed a maritime tradition and a seafaring economy, in contrast to the landlocked economy of the North. The Dravidian culture consolidated its position as the region’s major strand of South Indian civilization, and the post-Mughal repository of the Hindu cultural traditions of the North.

The “European epoch” of Indian history dawned as an age of maritime power, of western European authority based on the control of the seas. European expansion to South Asia by sea fundamentally altered the course of Indian history, presenting an entirely new set of challenges to the land-based powers of the North, the Mughals, Rajputs, Marathas, and Sikhs. Not only were the routes, methods of conquest, and patterns of settlement different, but the pressure from the sea had a relentlessness that invasions from land did not possess.

The British, who eventually marginalized all other European contenders (the French, the Dutch, and the Portuguese), penetrated inland from the sea through the two great river valleys: the South’s Cauvery valley, and the Ganges valley of the North. Surmounting the Deccan barrier, and in the nineteenth century finally bringing together both continental and peninsular India, the British imperial Raj transformed itself from a sea-based maritime power to a continental empire.

The British Raj emulated and incorporated many of the features of the previous rulers, especially the Mughals, retaining elements of their military and bureaucratic administration. The role of intermediaries (merchants, traders, and moneylenders) and scribal elites, land revenue systems, and mercantile imperatives were common to both empires. Both were warrior states, and the role of the army drawn from the so-called martial races, was crucial for both. The British, however, had to propagate a new theory of martial races after the Great Mutiny of 1857, when Punjab and the tribal Northwest, instead of Bengal, became the new recruiting ground. The induction of Jat Sikhs, Rajputs, Punjabis, and Pathans into the British army changed the sociopolitical history of the Northwest. It has had immense consequences for the successor state of Pakistan, which inherited the strategic “real estate” of the Northwest and the so-called martial races tradition associated with it.

The Unification of British India

The most significant achievement of British colonial rule was the strategic unification of the Indian subcontinent.

It constituted a significant break from the past, as the concept of strategic frontiers and boundaries was introduced to demarcate the sovereign limits of the British Empire. However, the demands of the greater British Empire added an extra dimension to imperial frontier making. The strategic and economic interests of imperial Britain and Tsarist Russia led to the “Great Game” in Central Asia between the two powers. The northwestern frontier became militarized, and Afghanistan emerged as a classic “buffer state.”

The colonial enterprise was by no means a unilateral exercise. Interaction as well as synthesis were integral to the encounter between India and Britain, whose ideologies and institutions had a profound impact on India. Ideas of nationalism and self-determination were crucial, giving an impetus to India’s nationalist movement. Britain’s industrial capitalism had its effect as well on the modernization and industrialization of the state. Railways were the great unifiers, both in the strategic and economic sense, helping to extend and consolidate British rule.

Decolonization was a critical juncture in the contemporary history of the Indian subcontinent. In the case of British India, the distinctiveness of the decolonization process lay in the dichotomy that developed between the secular Indian Nationalist Congress’s demand for independence and the Indian Muslim League’s demand for a Muslim homeland—Pakistan. In the stalemate that followed, the religious separatism of the minority Muslim community became the determinant factor in granting freedom from colonial rule.

In 1947 British power was “transferred” to the two dominions, India and Pakistan, the former as the primary successor state of British India, with Pakistan a secondary successor state. The price of independence was the partitioning of continental India on the basis of the communal majority principle of the “two nation” theory of the Muslim League, which asserted that Hindus and Muslims were two separate nations.

Independence and Partition

British India’s partition was both a turning point and a traumatic event in the history of South Asia, as it left many conflicts unresolved and many questions unanswered. One question that has intrigued historians is why independence became conditional on partition. The British policy of creating separate electoral rolls for Hindus and Muslims, which inaugurated modern Indian political communalism in 1909, provides part of the answer. Another part of the answer lies in the genesis of the Pakistan movement and the communal cleavages that developed between the Indian National Congress and the Muslim League over the issue of power sharing and

the principle of democratic rule. The notion of parity was an important consideration for the Muslim elite, as was also their concern that the electoral politics of “majoritarian” rule would translate in practice to a “Hindu Raj” in the guise of a “Congress Raj.”

One of the paradoxes of the Pakistan demand was that the impetus came not from the Muslim-majority provinces but from a small section of the Muslim elite from the Muslim-minority provinces of North India. North India’s Muslim elite were motivated by a complex mix of religious and economic reasons—not the least of which was their apprehension about loss of privilege, status, and economic power under a secular and democratic India. Partition triggered the exodus of these elite Muslims to the promised new state of Pakistan. The decline in status of this Indian Muslim diaspora, from the “creators” of Pakistan to that of refugees (*muhajirs*) in their chosen homeland, is one of the ironies of the Pakistan movement.

The answer to another question has also remained elusive: why did independence and partition give birth to only two nation states in the Indo-Gangetic region, not to many more? Fears of balkanization and the desire for strong centralized state(s) by India’s and Pakistan’s elites are said to have eliminated those options. The legal and political status of some six hundred autonomous princely states was for the most part resolved by integrating them into the two larger states, India and Pakistan—with the notable exception of the largest state, Jammu and Kashmir.

The application of the communal majority formula as the basis for creating a viable state produced the anomaly of a bifurcated Pakistan, separated by a thousand miles of Indian territory. Geographically, the communal majority formula could be applied only to those regions where Muslims were in a majority, but the provinces of the Northwest, where the Muslims were an absolute majority (North-West Frontier province, Baluchistan, and Sind), constituted only 10 percent of the total Indian Muslim population. Therefore, the two large provinces in which Muslims constituted a bare majority—Punjab (54 percent) and Bengal (57 percent)—were carved up to create the new state of Pakistan.

The legacy of partition. At the time of partition, very little attention was paid to the geopolitical consequences and human dimensions of physically dividing the Indo-Gangetic belt. Once the partition became a reality, however, these traumatic and tragic factors began to impinge on the process of nation building of both fragmented states. The human costs of the partition, the killings and population exchanges that accompanied it, and the refugees and diasporas it created, left a bitter legacy. In

effect, the partition produced a divided polity, a divided elite, a divided economy, and divided security.

The geographical aberration of the two wings of Pakistan being separated by a thousand miles of Indian territory created a logistical nightmare for the new state of Pakistan, which ultimately became untenable, both politically and economically, leading to the independence of East Pakistan in 1971, with the creation of Bangladesh, following the third Indo-Pak War. For the Indian state, the near detachment of its Northeast region, which is joined to the Indian mainland by a slender land corridor (the so-called chicken's neck), posed similar problems of marginalization for its inhabitants, which the state has not been able to overcome. The distancing of the northeastern region from the Indian heartland has added to the sense of alienation of the tribal Northeast states and to their depiction as India's "Far East."

The Making of India and Pakistan

In the immediate aftermath of partition, the imperatives of nation building focused on consolidating the state and constructing a central government. The task was relatively easier for the Indian state, which had inherited the mantle of the primary successor state to British India. Post-independent India had a political system and a bureaucratic structure that emphasized continuities with the past, and a national identity imparted to it by the long history of its nationalist movement. The Indian Congress central government in New Delhi stressed the civil base of its rule, underpinned by the ideology of secularism and parliamentary democracy. It soon federated along linguistic lines, seeking to safeguard the multiethnic character of its polity and to accommodate the wishes of the strongly vocal regional units that make up the Indian union. The fear of balkanization, however, made centralization a key requisite, and the Indian model of state making evolved as a federal union with centralized tendencies. In India, it was the political-bureaucratic elite that came to dominate the state structure, with the military kept out of the power equation. That situation has remained a constant in the Indian political system.

In the case of Pakistan, it was the military-bureaucratic nexus that became dominant, with Pakistan's political elite playing the subordinate role. Pakistan not only had to sustain the image of an "equal power" within the regional system, the external thrust of its foreign policy also pushed its elite toward building a military-bureaucratic state. That equation has also remained a constant in Pakistan's domestic and external politics, with its military entrenching itself within the body politic of the Pakistani state.

Regional rivals. The ideological divide created by the particular circumstances of their birth ensured that India

and Pakistan emerged as regional rivals with very different domestic, security, and foreign policy objectives. India's preeminence within the subcontinent was offset by the effort of the smaller Pakistani state to achieve military parity, if necessary, by "borrowing power" from "great and powerful" allies abroad (the United States, China, and several Middle Eastern states). The role of external actors has been vital in maintaining, and reinforcing, the so-called bipolar structure of the South Asian system. The early outbreak of conflict over partition's "unfinished business" of Kashmir soon became internationalized as a symbol of the India-Pakistan adversarial relationship. On this was superimposed the cold war dynamics of the superpower competition, with India developing a "special relationship" with the Soviet Union to counterbalance Pakistan's military alliances with Western powers.

Bangladesh. The dictates of geography, the unequal development of Pakistan's two wings, and elite conflict between the ruling West Pakistani elite and the East Bengali counterelite, all played their roles in sharpening the cleavage between the two wings of Pakistan, leading ultimately to the majority Bengali-state breaking free of Punjabi-Pathan-led Pakistan in 1971. From an international perspective, the birth of Bangladesh was the first instance of the successful culmination of a secessionist movement in the post-World War II period. The liberation of Bangladesh was the result of a conjunction of geography and Bengali linguistic and economic nationalism, supported by India's military intervention.

For South Asia, that second partitioning changed its geopolitical map, though not its political boundaries, since no territorial dispute was involved. The breaking up of Pakistan, however, did challenge the ideological basis of its two-nation theory, since Bengali linguistic nationalism took precedence over its Islamic identity.

Contemporary South Asia

The birth of Bangladesh in 1971 firmly established the centrality and dominance of India in South Asia. Not only is the Indian union now the largest state in South Asia, it is territorially and demographically larger than all the other six states combined. South Asia's geopolitical reality, moreover, is truly bilateral, since all its other states are contiguous to India, but none adjoin each other. The smaller states of South Asia are, therefore, sensitive to being overwhelmed by the enormous power of India.

On the other hand, the new geopolitical configuration has also exposed the vulnerability of the Indian state to its long, porous boundaries. The proliferation of armed secessionist conflicts in its border regions, and the ongoing "proxy war" between India and Pakistan over the

disputed state of Kashmir, is an indication that an Indian hegemony is far from an undisputed fact in South Asia. Equally telling is the policy of nuclearization followed by India and Pakistan since 1998. This policy may have enhanced India's great power status, but it has also enabled the weaker Pakistani state to achieve semiparity with the stronger Indian state. But it has certainly not resolved the security dilemma of a fractured subcontinent.

The strongest challenge to the secular identity and pluralist ethos of the Indian state has come from a plethora of ethno-nationalist and subnationalist demands, many with secessionist tendencies. The Sikhs of Punjab, the Nagas and Assamese in the Northeast region, and the Kashmiri Muslims in the state of Jammu and Kashmir have all tested the federal structure of the Indian union. The most serious threat yet to the secular fabric of the Indian state is the rise of transnational religious fundamentalism as a force in the region. The communal passions it has aroused has revived the "Muslim question" in India, and by extension, rekindled a wider debate about minority rights in South Asia.

Post-1971 Pakistan, although more viable as a territorial entity and more cohesive as a political unit, is still beset by internal contradictions, not least of which is the problem of identity among a composite people. The centralization policies of the ruling elite have come into conflict with the demands for provincial autonomy by ethnic Pashtuns, Sindis, and Baluchis. The most striking predicament is that of the *muhajirs*, who are yet to gain their own ethnic and regional identity in the "new" Pakistan. The subordination of Pakistan's domestic politics to its external relations has continued, and the periodic resort to military rule has become the most persistent feature of the Pakistani state.

Pakistan's strategic location in the Northwest and the state's policies of Islamization and an external orientation toward the wider Muslim world have also raised questions about its post-1971 identity: whether it sees itself as part of South Asia, Southwest Asia, or Central Asia. The marrying of Pakistan's Kashmir and Afghanistan policies in the 1990s, and Pakistan's continuing involvement in post-Soviet Afghanistan have kept that question alive.

Bangladesh has charted a zigzag course, reflecting two competing influences on its elites: secular parliamentary democracy and Islamic ideology. The most compelling factor of Bangladesh's security is its geography, as it is surrounded on three sides by India. Conversely, Bangladesh's location at the mouth of the Bay of Bengal and the strategic position it occupies between the Indian mainland and India's Northeast have released new dynamics in Indo-Bangladesh relations. The use of Bangladesh as a sanctuary by separatist movements in India's Northeast

has been an ongoing concern to New Delhi, as have boundary disputes arising from the indeterminate nature of their borders.

Boundary Conflicts

In contrast to the traditional natural frontiers that had developed through custom and usage, British India's colonial boundary making was the product of strategic and economic concerns, which led to the creation of an "outer frontier" that crystallized into the linear boundaries, the Durand Line in the Northwest and the McMahon Line in the Northeast. The partitioning of the subcontinent broke the strategic unity of that frontier, with Pakistan inheriting the northwestern frontier as its outer frontier, and India the northeastern Himalayan frontier. Partition also created a new set of boundaries, or "inner frontiers." Thus, apart from the logistics of maintaining their strategic frontiers, India and Pakistan have had to contend with the irredentist demands of tribal communities that were divided by the linear boundaries. The demand for Pakhtoonistan in the Northwest and the Naga demand for a homeland in the Northeast are but two examples of such transnational claims.

The outer frontier. Recent events have again reinforced the intrinsic importance of the outer frontier to the politics of the Indian subcontinent, with the reemergence of Afghanistan as a "gateway" state between South Asia, Southwest Asia, and Central Asia in the post-Soviet era. The "centrality" of Central Asia has started a new "Great Game" in the region, with its Northwest again being drawn into the calculations of great powers. For India, the destabilization of Afghanistan and Central Asia and the breaching of the Durand Line bring back memories of the Northwest as a corridor of invasion into the Indian heartland. For Pakistan, it represents opportunities to influence events in the wider Muslim world as the inheritor of the strategic "real estate" of the Northwest. The fault lines of religious fundamentalism and the nuclearization of India and Pakistan have further polarized the politics of the region. In that sense, the geopolitical patterns on the Indian subcontinent seem to have turned full circle, with the pressures again coming from the Northwest.

The inner frontier. As for the political borders that separate the modern South Asian system, what stands out most are the "unstable nation state boundaries" that are the legacies of the partition process. In recent years the changing nature of transborder conflicts has added a new dimension to the issue of boundary protection. The porous nature of the boundaries has produced the paradoxical situation of the larger Indian state fencing off its borders to stop armed incursions across the India-Pakistan border (which the Indian state characterizes as

cross-border terrorism), and illegal immigrations across the Indo-Bangladesh border (which is threatening to alter the demographic composition of the Northeast region).

Border fencing as the latest phase in boundary making has posed a different set of questions about the security dynamics of the South Asian system. The scourge of cross-border terrorism—including narco-terrorism, arms running, and trafficking in humans—is a manifestation of this phenomenon. The construction of artificial barriers by the Indian state, at enormous cost, has been likened to the modern equivalent of a “Roman Wall” or the Great Wall of China. It is also reminiscent of the ideological divide of the Berlin Wall. The South Asian system has yet to make the transition to a secure regional system, as state formation on the subcontinent still seems hostage to partition’s traumatic legacies.

STATE-LEVEL PERFORMANCE SINCE REFORMS OF 1991

India is a federal country consisting of twenty-eight states, and the division of responsibilities between the central government and the state governments is set forth in the Constitution. The states vary greatly in the level of per capita income, incidence of poverty, population size, resource endowments, and fiscal capacity, and the promotion of regional balance and equity among states is an acknowledged objective of national development policy. The regionalization of politics in India since the 1980s has focused attention on the performance of Indian states to a much greater extent

than before, and the impact of the economic reforms since 1991 on their performance has also been a focus of attention.

Interstate Variations in Growth

While per capita growth in the economy as a whole accelerated in the period after the 1991 reforms, there is considerable variation in the experience of the individual states. Critics of the reforms sometimes present an exaggerated picture of the distributional impact of the reforms, arguing that only the richer states have benefited and that the poorer states have actually become poorer. In fact, none of the states has become poorer in the sense of experiencing negative growth in per capita income. On the contrary, all states have experienced a rise in per capita income, albeit at different rates. Nor is it the case that the richer states have benefited the most from the reforms. The two richest states at the start of the reforms were Punjab and Haryana, and both states actually decelerated in growth in the postreform period. The greatest acceleration in growth was experienced by two of the middle-income states, Maharashtra and Gujarat, while other middle-income states such as Tamil Nadu, Karnataka, and Kerala also accelerated. Two of the poorer states, West Bengal and Madhya Pradesh, also did better than in the prereform period. However, several of the lower-income states that are also very populous (Uttar Pradesh, Bihar, Orissa, and Rajasthan) saw a deceleration in growth compared with the prereform period. This deceleration occurred at a time when the expectation was one of acceleration, and the fact that there was acceleration in many other states produced an understandable sense of not being helped by the reforms.

Various measures of inequality suggest that interstate inequality, that is, inequality due solely to differences in per capita incomes across states, ignoring intrastate inequality, increased in the postreform period. This is an interesting finding, since available measures of inequality for the country as a whole (which are based on the distribution of consumption) do not show a significant increase in inequality in the postreform period.

Explanations for Growth Variation

Growth outcomes are obviously the result of initial endowments, investment rates, and economic policies, which determine the productivity of investment. Since the economic reforms were designed to promote economic efficiency, and were also applied to the entire country rather than to selected regions as in China, one might expect that they would improve growth performance in every state, which should lead to an acceleration in all states. The fact that some states actually decelerated calls for an explanation.

One possible explanation lies in the weakening of one of the two mechanisms traditionally used for promoting regional balance in India. One of these mechanisms, which was not affected by the reforms, was transfers from the central government to the state governments. These transfers took the form of distribution of a share of central government tax revenues to the states, with the proportion to be transferred and its distribution among the states being determined every five years by the Finance Commission; and distribution of central assistance to state finance plans, with the amount of the transfer and the distribution among states being determined by the Planning Commission. In each case, the formula used for interstate distribution explicitly favored states with lower per capita incomes. The second mechanism used to promote regional balance in the prereform period, which was affected by the reforms, was the direction of investments toward the poorer states. This was achieved either by deliberately locating public sector projects in these states, or by using the industrial licensing mechanism to push private investments toward these states.

The scale of public sector investment relative to private sector investments declined as a consequence of the economic reforms, making this option less effective. It also became impossible to direct private investment to particular regions following the abolition of industrial licensing in 1991. Thereafter, the location of private investment was driven by competitive considerations, and these were bound to redistribute investment toward better endowed states with favorable infrastructure—states that already had a faster rate of growth.

More generally, liberalization has meant an increase in the role of the state government in determining the investment climate in each state, and the individual states have varied greatly in the way they have responded. To the extent that the low-income states have responded less or more slowly than other states to the new challenges, it is likely that investment resources have moved away from these states to those that are seen as more investor-friendly. Such a process of reallocation of investment across states could lead to an actual deceleration in growth in some states even if the “investment climate” and “productivity” indicators in these states are no worse in absolute terms than before. This is simply because the relative position of other states has improved, attracting investment toward them. It is not possible to test whether this has happened in a rigorous fashion because investment data are not available at the state level, but anecdotal evidence suggests that some such factor has been at work.

Human Development

The picture of state performance presented by the gross domestic product (GDP) growth numbers needs to be supplemented by considering performance in other

dimensions, especially human development indicators, and particularly the adult literacy rate and the infant mortality rate.

The performance regarding literacy suggests broad-based improvement in the postreform period. The nationwide adult literacy figure increased from around 52 percent in 1991 to about 65 percent in 2001, an increase of 13 percent in that decade, compared with an increase of only 9 percent in the decade from 1981 to 1991. The literacy rate has also risen substantially in most of the poorer states though the comparison with the 1980s presents a mixed picture. In Rajasthan there was an increase of 22 percent in the 1990s, compared with only about 14 percent in the 1980s. In Uttar Pradesh, the increase in the 1990s was just under 15 percent, marginally higher than in the 1980s. In Orissa, it was about 1 percent lower than the almost 15 percent increase in the 1980s. The least encouraging performance was in Bihar, which had an increase in the literacy rate of only 8.5 percent in the 1990s, which was actually lower than the increase of over 12 percent in the 1980s.

The infant mortality rate (IMR) is generally regarded as a robust indicator of the well-being and health status of the population, especially of the poorer sections. There were large differences in the IMR across states at the start of the reforms, with Kerala being the best performer with an IMR of 16, while Orissa was the worst with an IMR as high as 124. There is evidence of progress in almost all states in the postreform period, but in this dimension the rate of progress in the 1990s is much less than in the 1980s. The IMR for India as a whole declined from 110 in 1981 to 80 in 1991, but in the subsequent decade, the decline was much slower, reaching 66 in 2001. The picture for individual states shows considerable variation. Kerala was able to reduce the IMR from 16 to 11 over the decade, and many states (Maharashtra, Madhya Pradesh, West Bengal, Uttar Pradesh, Karnataka, Gujarat, Orissa) also showed a significant improvement. However, there was relatively little improvement or even a small deterioration in Bihar, Punjab, Haryana, and Rajasthan.

The Role of the States in the Postreform Period

One consequence of the economic reforms has been an increase in the role of the private sector, which in turn implies that the role of government must shift to delivering essential public services, such as health and education, as well as the creation of infrastructure and an environment of good governance, which would improve the investment climate and increase productivity. In all these areas, it is the state governments that have a major role. Health, education, the creation of rural infrastruc-

ture related to irrigation, watershed development, all roads except the national highways, and the supply of electric power are all within the domain of the states, and the administrative instruments for delivering these services are controlled by the state governments. The central government can only help fund programs in the areas that are implemented by state administrative structures.

Although substantial financial resources are being devoted to various types of development programs in these areas, especially education, health, and rural development, their effectiveness in achieving expected objectives is low. In education, for example, enrollment rates indicate that 93 percent of children in the relevant age groups are enrolled in primary schools, but a very large proportion drop out before completing primary school, and the quality of education provided is often inadequate. Similar problems exist in health and other sectors.

There is a growing consensus that public service delivery in India could be greatly improved by shifting from top-down systems of planning and managing programs toward greater involvement of local communities in the design of programs, with prioritization among different programs delegated to lower levels of government to reflect the priorities of the local communities, and also to ensure more active involvement of the local community in monitoring and accountability. One way of achieving this objective is to empower the elected local government institutions, the so-called *panchayati raj* institutions, which consist of an elected village council (*gram panchayat*) at the village level, the block *panchayat* at the next higher level, and the *zilla parishad* at the district level (the last two being composed largely of representatives from the lower-level bodies). In 1994 the Constitution was amended to establish a regular system of election to these institutions and to identify subjects that would be their responsibility. The system of electing representatives to these local bodies has been put in place, and their areas of responsibility have also been determined. However, some of the other steps needed, notably financial devolution of resources from the state to *panchayat* level, and the transfer of control over functionaries to the local level, has yet to be achieved. Some states—notably the southern states—have made greater progress than others, but a great deal more remains to be done in all parts of the country. Genuine empowerment of the *panchayati raj* institutions will make a major contribution to the effectiveness of service delivery programs in the states, and differences in this dimension of performance are likely to contribute to interstate variations in the future.

One of the most important determinants of economic growth in individual states will be the quality of the electric power supply, as this will affect not only industrial and commercial growth but also agricultural development, especially the diversification of agriculture. Reform of

the power sector is perhaps the most important unfinished reform in India, and the key to success lies in improvements in electricity distribution. At present, the state-run electricity distribution systems suffer from losses ranging from 35 to 40 percent in most states. This partly reflects technical losses in transmission, but mainly represents theft of electricity through underbilling, usually in connivance with the utility staff. Tariff structures are also uneconomical, with some categories of consumers (farmers and households) obtaining power at unrealistically low rates. The result is that the state utilities are financially unviable and unable to undertake the large investments needed to ensure an adequate supply of good-quality power. Reform of the power sector requires a gradual move toward rational user charges in which cross-subsidies are kept to a reasonable level and improvements are achieved in collection efficiency, either through improved management of the public sector system or through privatization. Thus far, only Orissa and Delhi have opted for privatization, and it is too early to pronounce whether the initiative is successful.

Progress in all these areas will depend upon how energetically state governments address these problems. As in other areas, performance will vary, but hopefully the diversity of experience will generate lessons on what works and what does not. A very hopeful development in the postreform period is the growth of awareness in the states that the state governments must work to create a favorable investment climate. Several nongovernmental bodies routinely engage in rating states regarding this issue, and the publicity given these ratings is generating healthy competition.

STEP-WELLS OF INDIA Step-wells are wells with underground flights of stairs leading down to the level of the water. They were built in all parts of South Asia, but

in especially great numbers in the states of Gujarat and Rajasthan, in western India, which have a dry climate and sandy soil. Since it was also considered an act of religious merit to dedicate watering places in memory of the dead, thousands of step-wells, ponds, and tanks came to be built. In its fully developed form, a step-well consists of an ornate entrance gateway at ground level, an underground stepped passage punctuated by a series of pillared pavilions, and a well at the far end. There may even be a small reservoir to collect any surplus water flowing out of the well.

Forms

There are step-wells proper (those with a stepped corridor and a well at the far end), and there are others that should be more correctly described as stepped tanks, though sometimes such tanks were also combined with wells. The step-wells proper are laid along one long axis; the staircase usually starts at one end, and there is in most instances only a single entrance. A step-well may have more entrances, but this is the exception rather than the rule; also, the well at the far end may be rectangular or circular. The more evolved examples, however, are always circular.

In addition to the Hindu step-wells, there are others built by Muslim rulers after the thirteenth century. Their character and purpose, however, were altogether different; while the Hindu step-wells were religious undertakings as well as useful watering places for men and for agriculture, those built under Muslim rule were essentially for pleasure, as a retreat from the hot weather.

Many inscriptions record how step-wells were built as pious acts in memory of the dead. A stone slab from Mandasor of A.D. 532 commemorates the deceased relative of a nobleman, Daksha, employing the imagery of the myth of the descent of Gaṅgā (Ganges) from heaven to liberate the spirits of an ancient king's ancestors. Another, of A.D. 1042, from Vasantgarh in Rajasthan, records that a queen, Lahini, repaired the stairs of a step-well which were to provide a stepped ascent to heaven for her husband. The reference to the world of the departed is explicit in the imagery in the records of both Mandasor and Vasantgarh.

Structure

Step-wells involve both excavation and construction in the sandy soil. It took their builders a long time to overcome all the engineering problems, but in due course they created a remarkably efficient structural form. The earliest step-wells consisted of a short flight of steps down a pit whose sides were protected only by dressed stone, and the well at the end of the corridor was at right

angles to it, that is, the two parts of the step-well formed an L shape. This was decidedly unsatisfactory, since it lacked an impressive facade, and it also involved an awkward sharp turn for someone bearing pitchers of water on the head. By the end of the tenth century, however, the structural constraints had been understood and resolved. Then followed a long series of step-wells in which the architectural potential of their basic form was perfectly realized.

In a "complete" example, a *torana* (arch) built at the ground level stands at the head of the stepped corridor. At the first landing of the steps there is an open structure or pavilion whose top reaches the ground level. At the second landing, deeper down, another pillared pavilion is introduced, of two, or even three stories, its top again reaching the ground level, and likewise at every stage of the descent. As the depth of the trench increased with the increasing length of the corridor, it became necessary to stabilize the deep walls, which might have collapsed if kept vertical; therefore, terraces were introduced, corresponding to the height of the stories of the pavilions. Finally, in order to further strengthen the walls, a retaining structure of bricks came to be constructed behind the stone facade of the walls.

By far the largest number of step-wells is concentrated in the two western Indian states of Gujarat and Rajasthan, but such watering places were built all over the country. Step-wells dug by Hindu donors, and those by Muslims as well, are in Delhi (Gandhak ki Baoli, Rani ki Bain), in central India (Vidisha), and even in the southern states (Bagali in Karnataka).

The Ranki Vav Step-Well at Patan

By far the most ornate step-well is the seven-storied Ranki Vav, "the Queen's Step-well," at Patan, the capital of the Solankis from the tenth century. It was built by the widowed queen Udayamati in memory of her husband, Bhima I, in the second half of the eleventh century. Two hundred twenty feet (67 m) long, it is 60 feet (18 m) wide, and the well is 100 feet (30 m) deep.

The long stepped corridor commences at ground level and, interrupted at four increasingly deeper levels, leads down to where the well water stayed in the driest period of the year. There are multistoried pillared pavilions on the landings, the number of the stories progressively increasing as the depth increases, to reach the ground level above. In addition to the main steps, supplementary staircases are introduced for quick access to different parts of the step-well. Deep niches and projecting panels, with hundreds of nearly life-size sculptures of gods, goddesses, and *apsarās* (semidivine female beings, nymphs) decorate the walls. The inner surface of the well is also

lined with the same kind of images. The Hindu pantheon is present in force, with Shiva, Vishnu and his incarnations, the Seven Mothers, and other divinities. But images of Pārvatī performing the harsh penance by standing “surrounded by five fires” predominate. For just as the goddess performed austerities in order to win Shiva as a husband, Udayamati by building her well was performing a religious act in order to be reunited with her departed husband in her next life.

Other Important Step-Wells

There is an early seventh-century rock-cut step-well at Mandor, in Rajasthan, that has an L shape. Though quite bare, it is important for its “architecture” because it reproduces the form of the earliest structural step-wells in living rock, before the builders had discovered how to build a corridor and a well on one axis. A more ornate example, at Chhoti Khatu, also in Rajasthan, of the ninth century, also has an L shape, and its statuary of river goddesses and *nāgas*, or anthropomorphized snakes, clearly evoke its aquatic character.

The tradition that culminated in the Ranki Vav in the eleventh century continued in the later centuries as well, but by then Muslim power had been established in Gujarat, with far-reaching changes. First, hardly any human figures were used in their decorative elements. And, more importantly, the step-wells built by the sultans functioned not as religious structures but as pleasure retreats to escape the heat of summer.

The two step-wells at Ahmedabad and Adalaj, only a few miles apart, were both built at the end of the fifteenth century. Bai Harir, a rich eunuch at the court of Sultan Mahmud Begda, built the first in a suburb of Ahmedabad. It is over 240 feet (73 m) long. A raised pavilion, supported on twelve columns, stands at the head of the long corridor in the east, and by means of graded stairs reaches first an octagonal well, then a circular well at the western end. Balconies with low parapets look down into the octagonal well. In addition to the main stairs, there are two spiral staircases on the sides that provide access to the four stories.

The consort of a local chief built the step-well at Adalaj, called Ruda Bai’s Step-Well after her name, about 12 miles (19 km) north of Ahmedabad. It is planned on a south-north axis. In addition to the main approach at the southern end, there are two more stairs at right angles to it, on the two sides, all three meeting at the first landing, in a sort of foyer with elegant balconies and richly crafted columns.

Sacred Tanks

The reservoirs described above are proper step-wells, but the sacred tank, or *kunḍa*, is a monument of

comparable character. These are deep pools of water, mostly square or rectangular, which are reached through steps built on three or all four sides, sometimes with a shrine in the middle. Their perfect geometry, the miniature shrines built at intervals along the stairs, and the well-proportioned supplementary stairs create a pleasing appearance.

Such sacred tanks may be of modest size, as is the seventh-century *pushkarin* (lotus pool) at Mahakuta in Karnataka. Or they may be planned on a more impressive scale, such as those at Osian (eighth century), Abhaneri (ninth century), and Baroli (tenth century), all in Rajasthan; and at Modhera in Gujarat (early eleventh century). The Osian and Abhaneri examples have steps on three sides, while a well placed on the fourth side feeds the tank; that at Modhera has long flights of steps on all four sides. The tank at Baroli is built over a natural spring that flows on a rocky bed; on an elevated natural rock in the center, a holy man in the tenth century built a shrine to Shiva, characterizing the god as Jhareshvara, “lord of the Stream.”

STOCK EXCHANGE MARKETS India established the first stock exchange in Asia in Bombay in 1875. Given the large geographical size of the country and the typical floor-based trading system prevalent until 1994, a total of twenty-two stock exchanges were eventually created to cater to the needs of investors in every part of India. Three basic models were adopted: associations of individuals, limited liability companies (without profit sharing), and companies limited by guarantees. Regardless of the form of organization, all were recognized by the tax authorities as nonprofit entities, or entities in which their members had no claim to operating surpluses. Although the generated surpluses were not explicitly distributed, exchanges provided various services to their members invariably below cost, with the subsidy element varying from exchange to exchange.

Exchanges enjoyed subsidies in many forms. The respective state governments allotted land for constructing the buildings for exchange operations and brokers’ offices on nominal terms. Until recently, the government of India had adopted the concept of regional stock

Bombay Stock Exchange. Site of today's Bombay Stock Exchange, which was the first stock exchange in Asia. In the era of reform after the financial reverses of the early 1990s, the BSE has followed the lead of India's NSE in providing fully modernized systems and services. BHARATH RAMAMRUTHAM.

exchanges (RSEs) defining the operating area of each exchange. A public company was required to list its stock on the RSE nearest its registered office.

A listed company has to pay listing fees, both initial and annual and such fees were linked to the size of its issued capital. For most RSEs listing fees were the main source of income. Each exchange enjoyed monopoly rights in securities trading in the city of its location. Investors had no mechanism to protect themselves from collusive behavior by the stock brokers. This monopoly also led to the creation of fragmented markets that were shallow, inefficient, and cost ineffective. Brokers generally dealt with investors through a multilayered chain of intermediaries increasing cost of transaction.

Since exchanges prohibited corporate membership, all brokerage entities were either proprietary or partnership concerns. Although the liability of a brokerage firm was

unlimited, this did not mean much to investors, as almost all the brokerage firms were poorly capitalized. Brokerage firms distributed most of the profits at the end of each accounting year, transferring them to their family members. Thus, in the event of a firm's insolvency, investors were the main losers.

Reforms since 1991

Capital market reforms process launched in 1992 was in response to a major financial scam that shook the banking system and the capital markets. Some prominent stock brokers defrauded several Indian banks (both government-owned and private) as well as prominent foreign banks. They diverted bank funds to their personal accounts for artificially increasing the prices of their favorite stocks. This became possible due to severe deficiencies in trading and settlement systems for sovereign bonds and bonds issued by public sector units. The resultant boom in equity markets attracted thousands of gullible investors who hoped to make quick gains. The bubble burst after some investigative journalists exposed the frauds perpetrated by unscrupulous stockbrokers. When the banks demanded funds back from the brokers, the market collapsed. The banks lost an estimated U.S.\$2 billion in this scam. For the Indian government, which had just launched a series of reforms in the securities markets, the crisis was a major embarrassment.

The government promptly introduced a number of measures with far reaching consequences in the securities markets. A significant component of this reform package was the need for setting up a new Indian stock exchange, which would be operated in accord with globally accepted best practices, both in trading and settlement systems. The National Stock Exchange (NSE) was thus born. It was initially conceived to be a model exchange to exert pressure on the other twenty-two stock exchanges, inducing them to improve their functioning styles. Within six years, its impact on Indian capital markets was so overwhelming that all the other exchanges, except for Bombay Stock Exchange (BSE), became virtually defunct. As a survival strategy, ten regional exchanges set up subsidiary companies that became members of NSE and BSE. The systems and procedures introduced by the NSE have been accepted by the market regulator, the Securities Exchange Board of India (SEBI), and were made applicable to the other exchanges, all of which look to the NSE for further initiatives in market reforms.

The Design of the National Stock Exchange

The NSE was set up as a limited liability pro-profit company by twenty-one leading financial institutions in 1993. Its executive board includes senior bankers, lawyers, and financial executives. To avoid any possible

conflict of interests, the day-to-day management of the exchange is handled by professionals, who do not have proprietary trading positions in the stock market.

India's NSE is patterned on the U.S. Nasdaq model, extending its trading facilities to all parts of the country, and providing trading facilities only in large stocks, like the New York Stock Exchange. It has adopted an anonymous order-driven trading system, with orders originating from all its members being matched automatically by the computer as per the price time priority trading algorithm. Thus there is no human intervention in the deal-matching process. India's NSE is the first exchange in the world to set up a captive satellite communications network, connecting its members spread across a vast geographical area in the country to its centralized trading and settlement hub. All members enjoy a response time of less than 1.5 seconds; orders originating from any part of the country are matched, and trade confirmed on the respective trading terminals, in this short time span. This highly transparent system gives investors instant information about traded prices and quantities as well as unmatched bids and offers in all stocks on a real time basis. To start with, NSE enforced on its trading members (stock brokers) certain minimum stringent disclosure norms that provided a clean audit trail of a trade at the investor level. The trading members were forced to provide automatically generated trade and order confirmation notes to all investors. This unique system of disclosure became the standard regulatory requirement subsequently.

India's NSE also started guaranteeing the settlement of members' net obligations, at a time when guaranteed settlement was unheard of in India, by establishing a subsidiary National Securities Clearing Corporation Limited, which developed unique software to monitor each member's net exposure in each stock as well as members' aggregate exposure in all stocks. Each member was required to trade within the overall exposure limits, based on the concept of initial margin adopted globally by the futures exchanges. The moment a member exceeds the exposure level, all its trading terminals are automatically disconnected from the trading system. The trading terminals are reactivated only when additional funds are brought in. If a member fails to honor its settlement obligations, member margins are usually adequate to close out positions. The BSE took more than a year to adopt its own settlement guarantee program, but later developed its own exposure monitoring mechanism based on the national model.

Impact on Other Exchanges

The impact of the major investor-friendly trading and settlement systems was so decisive that the NSE emerged as India's largest exchange before it completed its first

year in November 1995. Business losses then forced the BSE to launch computerized trading as well. Later, all RSEs computerized their operations. But since their response was slow and halting, they lost much of their business to the large exchanges.

Options and Futures

In June 2000, India's two major exchanges, the NSE and the BSE, offered futures and options products on their main indexes, with one-, two-, and three-month expiration contracts. Options on indexes on these exchanges began in June 2001, options on select stocks in July 2001, and futures on select stocks in November 2001. As of December 2004, stock options and futures were available on fifty-three highly liquid stocks. Based on certain objective criteria, the regulator approves inclusion of stocks in the list of equities eligible for futures and options trading. Stock futures and options have proved to be very popular among investors.

As of December 2004, average trading turnover in futures and options (both in stocks and the indices) was twice the turnover in the cash market for equities. The Indian futures and options market has become vibrant; from April to December 2004, the daily average of contracts traded on the NSE was 288,616. The average contract size was, however, small. India is among the few countries to have introduced stock futures, as they are feared to be highly risky. Unless stringent regulations and tight surveillance are in place, stock futures may be misused to manipulate individual stock prices. In India, stock futures account for over 60 percent of trading in the entire futures segment. The daily turnover in stock futures in December 2004 was about 155 percent of the NSE's turnover in the cash market for all traded equities. The Indian experience proves that even relatively backward capital markets can quickly and successfully absorb globally accepted trading and settlement systems.

India's new trading system has encouraged price competition and has helped in the significant decline in bid/offer spreads. As a result, transaction costs are estimated to have declined by a factor of eight to ten after the NSE came to dominate the Indian market.

STRATEGIC THOUGHT Carl von Clausewitz (1780–1831), modern Europe’s great strategist, considered the purpose of war to be the imposition of the victor’s will over the enemy (strategy), and the destruction of the adversary’s main force in decisive battle (tactics). Clausewitz also postulated that strategy was neither an art nor a science but an act of human intercourse. Furthermore, he emphasized that successful war was waged by the trinitarian structure of the state: its government, its people, and its armed forces. India, as a dependency of the rising British Empire, had a government that was alien and an army that was selectively recruited. Accordingly, neither was representative of the people of India. Earlier, the Mughals had understood the strategic significance of India’s mountain passes in the northwest, but were oblivious to sea power. Even the great Mughal emperor Akbar remained unmindful of the Portuguese embargo of his main seaport, Surat. Though the fatal weakening of the Mughals followed the invasion by the Turcoman adventurer, Nadir Shah (1739), the coup de grâce was rendered by a British mercantile company that took control of the Indian sea trade. By its conquest of India, Britain became a great power, and London used India’s central position and resources to control “any point either of Asia or Africa,” as asserted by the Viceroy Lord Curzon.

The *Artha Shāstra*

Ancient India’s greatest strategist, Kautilya (also known as Chanakya or Vishnugupta, c. 320 B.C.), prime minister to Emperor Chandragupta Maurya, wrote his great work on statecraft, the *Artha Shāstra*, which focused on the duties of a king and military affairs. Kautilya considered the *dharma* (sacred duty) of a king to expand the resources of his state by employing varying combinations of *sam* (amity or treaty), *dam* (rewards), *dand* (retribution), and *bhed* (discord). However, if war became necessary, Kautilya considered employing the following seven principles and three “controls” before hostilities were undertaken: an efficient system of governance; capable royal councilors and other officials (*amatyas*); firm control over one’s own territory (*janapada*); a fortified city (*durg*) within the king’s domain; a full war-chest (*kosba*); an adequate army (*danda*); and allies, either equals (*mitra* or *sandhi*) or stronger ones (*samasraj*). The three “controls” were equally timeless: to examine the morale and motivation of the opposing

leaders; to calculate the material resources, numerical strength, and level of training of the two states; and to consider the strengths and weaknesses of the two kings’ advisers, generals, ministers, and diplomats.

As his overall strategy, Kautilya based *vijigishu* (victory) on the concept of the *mandala* (circle), whereby one’s neighboring state was always a real or potential enemy, and the state next to one’s immediate neighbor was a natural ally. Among other related topics, the *Artha Shāstra* covered battlefield dispositions, tactics, peace treaties (a weak enemy should be crushed, whereas the stronger one should be negotiated with), and methods of combat, ranging from coercive diplomacy to clandestine warfare.

Kautilya used legends and mythology to buttress his analysis. For instance, he quoted Brihaspati, the legendary sage of sages, as saying that “three to one” superiority over the enemy was necessary for victory. This still widely quoted maxim (without attribution to either Brihaspati or Kautilya) was to make caution the strategic imperative in India, since such overwhelming military superiority was rarely achieved. Kautilya also prescribed responsibilities of the *navadhyaksha* (superintendent of ships) and analyzed sea trade but paid little attention to maritime strategy. Perhaps it was his North Indian outlook and the influence of another Indian epic, the *Rāmāyaṇa*, in which Lord Ram invades the island of Sri Lanka by building a bridge, not ships, to cross the sea. Kautilya also limited his wars of conquest to the Indian subcontinent. Hence, over the next millennium, his towering but flawed work created a defensive and introspective Indian military mindset. Muslim invasions and conquests from the twelfth to the sixteenth centuries consigned Kautilya to obscurity, only to be resurrected after 1907, when his *Artha Shāstra* was first published in English.

Independent India

Forty years after the rediscovery of Kautilya’s *Artha Shāstra*, India became independent. However, freedom was accompanied by South Asia’s partition and the destruction of the geographical unity visualized by Kautilya. The leadership of newly independent India had little experience in governance, foreign policy, or strategic planning, and was wary of the military, as postcolonial armies seized power in most newly independent states. Moreover, India’s new leaders considered British India’s military, which had remained aloof during the struggle for freedom, as little more than mercenaries. The organization and mindset of the army (by far the largest of the defense services) was based on static, not operational, considerations. Hence, a few high-ranking Indian officers had some administrative experience, but little knowledge of strategy. Furthermore, India’s first prime

minister, Jawaharlal Nehru, was determined to avoid entangling foreign alliances and believed that Indian security was enhanced by reduced militarization of the planet. These perspectives were in consonance with the Gandhian strategies of nonviolence and economic self-sufficiency. The latter stifled modernization of the military, as the country's industrial base was small and imports were restricted. Consequently, senior officers, busy husbanding scarce resources, had little time for prospective planning or post-colonial strategy. The Gandhian precept of nonviolence had its own ramifications on the military. For instance, the navy was discouraged from acquiring submarines, since they were perceived as offensive warships and therefore unsuitable for a country advocating disarmament and nonviolence. The electorate, too, was little concerned about defense issues. Accordingly, few members of Parliament wished to serve on the forty-four-member Standing Committee on Defence. Even forty years after independence, fewer than half of the committee's members attended its meetings; apart from the chairman, only seven others were present at all its sessions. Not unexpectedly, strategic thought evolved fitfully, yet incrementally under the influence of the following major factors.

History. The assimilation of non-Hindu cultures and religions is integral to the modern Indian identity. Hence, symbols of the Indian Republic are of Ashokan Buddhist origin, the link-language of the country remained English, and the Muslim Mughals epitomized Indian cuisine and many forms of the arts and architecture. History also reminded India that the country's lag in military science had led to repeated defeats in the past. Therefore, independent India made a conscious effort to keep abreast of modern technology. The sudden emergence of India as a powerhouse in the software industry may be an unintended but fortunate consequence of this commitment.

Geography. India's continental geographical contours were drawn 2,400 years ago by Kautilya. Indians were largely isolationist, for they considered their land secure behind the mountain chains stretching along their eastern, northern, and western borders. The ocean toward the south was not understood in military terms but only as a means of trade, travel, and proselytization. Neither the limited Chinese foray through the Himalayas in the seventh century nor the successive raids from the northwest altered the Indian perception of living in a safe, insular, and prosperous continental nation, though given to fissiparous tendencies that led to piecemeal conquests of the country. Hence, national consolidation of the country was a major security issue for New Delhi, whereas the legacy of insularity contributed to India's attempts to minimize the presence of outside powers in the six-country subcontinent of South Asia.

Culture. Though concerned about divisive tendencies, New Delhi considered the distinctive Indian culture compelling enough to keep the country united, despite the centrifugal effects of well-defined regional subcultures. Furthermore, the Hindu concepts of *dharmā*, karma, and reincarnation were integral to this belief. *Dharma*, as Kautilya instructed, was sacred law, requiring all members of society to perform their various duties. Karma enjoined that individual action and performance was the basis for future incarnations. The concept of reincarnation gave Indians a cyclical rather than a linear perspective on time. Hence, as the universe itself goes through the phases of birth, growth, decay, and rebirth, so must individual countries and living beings. Therefore, in a sense, Kautilya's India was basically eternal, going through cycles from birth to rebirth. Accordingly, Indians appear to possess a capacity for timeless endurance and tolerance.

Colonialism. During the colonial period, strategic responsibility for the defense of India shifted to London. Hence, Indians had little say or understanding of those issues. The net result was material poverty and numerous other losses, including confidence and management skills.

Partition. To Indians, the geographical unity of the country was torn by the creation of Pakistan, a hostile neighbor, across a newly created border that was devoid of natural barriers. Consequently, India was preoccupied by the defense of this new frontier and paid scant attention to its ill-defined border with China. In addition, New Delhi was concerned about the further instigation of Indian Muslims by fundamentalists. Accordingly, internal security became another issue. The conflict over Kashmir became India's major security and diplomatic challenge. Three Indo-Pakistan Wars were fought over Kashmir. Furthermore, the Pakistani-supported, though indigenous, insurgency (since 1987) in Indian Kashmir remains an ongoing conundrum for New Delhi.

Nuclear weapons. Despite the abhorrent nature of nuclear weapons, there was clear recognition in New Delhi of nuclear weapons as a deterrent against aggression or coercion by other countries, especially Pakistan and China. In addition, nuclear weapons came to symbolize political maturity, ultimate sovereignty, and technological prowess. Foreign military interventions in Yugoslavia and in the Gulf have added further relevance to the importance of nuclear deterrence.

Strategically, some of these factors led India to focus on the subcontinent and on its immediate neighbors. The neighbors were dealt with as minor "enemies," whereas the transneighbors, especially the Kingdom of Afghanistan and the Soviet Union, were treated as natural allies. The United States became an incipient opponent, an outsider intruding into the subcontinent as

Pakistan's partner in collective security arrangements and with its own military base on the British-owned island of Diego Garcia in the Indian Ocean.

India had, perhaps intuitively, followed the *mandala* theory as visualized by Kautilya, antagonizing its neighbors, accommodating the strong (China on Tibet), and overwhelming the weak (Nepal and Bhutan). Buffer states, a European concept, were overlooked. Ironically, it was the loss of the largest buffer state, Tibet, that compelled India to move from vague strategic concepts to threat assessment and defense planning, especially after the reverses suffered in the border war with China in 1962. However, it took another thirty years before the factors mentioned above led India to form a cohesive national security perspective. The stimuli were many: the collapse of the Soviet Union with the attendant rise of the United States as an interventionist sole superpower; the global rise in Islamic fundamentalism; the ongoing Sino-Pakistani collaboration, especially in nuclear weapons and missile technology; cross-border terrorism as part of an insurgency in Indian Kashmir; and a compelling study by an American think-tank, the Rand Corporation. Rand's main inference was that India had no long-range strategic perspectives, as evidenced by the country's reactive approach to international affairs and the absence of the military's participation in policy making. The study had its shortcomings, the most obvious being its failure to recognize the sense of mission and commitment of the scientific community to the successful development of nuclear devices, chemical weapons, and missile systems. The unusual group of scientist-strategists received such high public acclaim that one of them, Dr. K. Santhanam, was appointed director of the Ministry of Defence's leading think tank, the Institute of Defence Studies and Analysis in New Delhi. Another eminent scientist, Dr. A. P. J. Abdul Kalam, was elected president of India in 2002.

Consensus on the country's strategic imperatives was reached by the new millennium during the several years of the rightist coalition government led by the Bharatiya Janata Party (BJP). The process was invigorated by nuclear tests, accelerated missile development, and military ties with the United States and Israel. Under these circumstances, bureaucrats, scientists, politicians, and perhaps military officers set the strategic vision for the country. Hence, the contours of New Delhi's nuclear policy were already in the public domain before a draft nuclear doctrine, framed by eminent strategic thinkers, declared that India would maintain a minimal credible and survivable deterrence, based on a triad of delivery systems (missiles, aircraft, and submarines) with adequate command and control facilities. The draft also affirmed a no-first-use policy and a commitment not to threaten or use atomic weapons against a nonnuclear country.

The army, bearing nuclear weapons in mind, posited the operational strategy of a limited "hyperwar." The limits were defined as time, geographical area, force levels, and war objectives. Hyperwar meant the use of intense firepower, long-range sensors, precision-guided munitions, and the elimination of the front and the rear of battle. Such a battle could be fought continuously, regardless of day and night, and through all weather. The air force preempted the others by publishing its Air Power Doctrine in 1997. The doctrine gave equal priority to both offensive and defensive operations, and accepted the possibility of reduction in force levels if compensated by induction of high technology equipment and acquisition of force-multipliers like airborne warning and control systems, multirole war planes, and midair refueling capabilities. By implication, it distanced itself from the subsidiary role as the tactical air arm of the army. Its doctrine acquired greater relevance, as it was the only service with the means to deliver nuclear weapons. Hence, it automatically became the preeminent strategic force in the country. The smallest service, the navy, potentially has the largest strategic role through sea-denial, sea-control, power projection, management of the Indian Exclusive Economic Zone of 1.08 million square miles (2.8 million sq. km.), and as a part of the triad of nuclear deterrence. Like other navies, it acquired land-attack missile capabilities. However, its sea control and blue-water potential remains limited. The pursuit of a nuclear submarine arm as a part of the triad of nuclear deterrence, raises concerns among some admirals, as they fear that nuclear submarines would divert funds from the surface ships necessary to fulfill the navy's other tactical and strategic ambitions. Like the rest of India, the armed forces are engaging with the world. Indo-U.S. cooperation ranges from joint exercises to Indian political support for various U.S. ballistic missile defense programs.

In general, India's wider strategic goals remain constrained by an inadequate indigenous military-industrial complex, the constricted strategy of managing domestic conflicts and insurgencies by attrition and co-option, and sudden outbursts of ethnic and communal violence in the country. Furthermore, for forty years, Indians were Pakistan-centric and reactive in the acquisition of weapons and military systems. Submarines, supersonic fighters, and reconnaissance and support battalions were Pakistani initiatives with India following suit. In addition, American strategists continue to find that serving senior Indian military officers still had little exposure to the outside world and insufficient training in such strategic subjects as geopolitics, military history, and patterns of organization.

Nevertheless, the 1990s brought economic liberalization and an unfolding of talents, self-confidence, and

more pragmatic international relationships. India was no longer the hungry country of the 1943 Bengal famine trying to keep Nehru's "tryst with destiny," by espousing global peace, prosperity, freedom, and social justice. Instead, newly confident of its ancient civilization, and a vibrant, stable democracy, India sought new paradigms: self-reliance rather than self-sufficiency, and participative growth instead of a command economy. As India has no territorial ambitions, the pattern of past politico-military engagements is likely to persist. Hence, India will militarily intervene only at the request of a friendly government and withdraw its forces as soon as possible, as in Sri Lanka (1971, 1987), Bangladesh (1971), and Maldives (1988). At present, for the uniformed services and security-related establishments, the new imperatives are greater integration of command, control, modernization with triservice compatibility of acquisitions, and intelligence sharing. Still, fourteen different ministries and departments in New Delhi exercise overlapping authority over the country's maritime affairs. Howsoever slowly, a holistic approach toward strategic affairs appears to be evolving in New Delhi as India develops tangible political, economic, and military ties with countries in Southeast Asia, Central Asia, the Middle East (including Israel), Africa, and the United States. Hence, India's strategic perspective appears to have completed yet another cycle of reincarnation, from Kautilyan back to Curzonian concerns.

SUBBALAKSHMI AMMAL, R. S. (1886–1969), educator and activist for women's education. R. S. Subbalakshmi Ammal, a pioneer in the education of upper-caste widows in colonial Madras presidency, was born in July 1886 into a Brahman family. Her students affectionately called her Sahōodarii, or Sister Subbalakshmi. In an era when upper caste girls' schooling was haphazard, her father, a college professor, supervised her education, supported by her mother and a widowed aunt. In accordance with upper caste custom in that era, Subbalakshmi was married before puberty, but the early death of her bridegroom left her a virgin widow at the age of eleven. Widows were often shunned as inauspicious blights, languishing in perpetual celibacy, clothed in drab mourning, their heads tonsured. In most cases, they remained illiterate and were dependent on family charity. However, Subbalakshmi's family defied tradition by educating her, moving to Madras (Chennai) to facilitate her attendance at the Presidency Convent Higher Secondary School. She won gold medals for academic achievement, then joined Madras Presidency College, where she majored in mathematics and botany. She graduated in 1912, the first Hindu widow in Madras to receive a bachelor's degree.

In 1910 Subbalakshmi had started an informal home to educate young widows whose grieving parents had approached her for this purpose. She also simultaneously taught at her former high school for a minimum wage, respecting the nuns who had been her own teachers, but disliking their attempts to convert her. She remained a devout Hindu, committed to the ideals of Upanishadic humanism. Though critical of misogynist traditions, she avoided alienating Hindu traditionalists whose widowed daughters she wished to educate. This pragmatism enabled her to succeed in promoting the education of widows. Her success attracted the attention of Christina Lynch, the progressive inspector of Government Girls' Schools. The two women soon planned to start a government teachers' training institute for widows. On 1 July 1912, their Sārādā Widows' Ashram opened, named for the Hindu goddess of learning.

In an age when prepuberty marriages were the norm, Subbalakshmi became a beacon for women whose education had been curtailed by early marriage. In January 1912 she started her Sārādā Ladies Union to promote intellectual inquiry among women. As a colonial government employee, Subbalakshmi could not openly join the nationalist Women's Indian Association (WIA), although she worked with feminist members like Muthulakshmi Reddi in an unofficial capacity.

In 1919 Subbalakshmi opened the Sārādā Vidyālaya Higher Secondary School for destitute unmarried girls. In 1921 she addressed the Indian Women's Conference

delegates on the need for establishing more teachers' training institutes for women, and on the inclusion of occupational programs in the curriculum. She was respected by conservatives and reformers, colonials and nationalists, men and women. In 1947 Sārādā Ladies' Union was finally affiliated with the WIA. After independence, Subbalakshmi served as a member of the Madras Legislative Council. Denied children of her own, she lavished her maternal love and wisdom upon countless students, nieces, and nephews to whom she became an icon.

SUBBULAKSHMI, M. S. (1916–2004), Indian vocalist. Madurai Shanmugavadivu Subbulakshmi, a charismatic singer from South India, was venerated as an outstanding exponent of Karnātak vocal music. "M. S.," as she was popularly known to her millions of fans around the world, was considered the "embodiment of music." Her music appealed to both the uninitiated and the learned with its sophistication and profundity.

Born into a family of professional musicians on 16 September 1916, Subbulakshmi was a child prodigy. Her mother, Shanmugavadivu, was a competent vina player, and Subbulakshmi took her initial lessons on the vina from her mother. Shrinivas Iyengar and M. Subraminiya Iyer taught her vocal music, as did Dakshinamurthy Pillai and veteran Karnātak singer Semangudi Srinivas Iyer.

Total concentration on the alignment of microtones, caressing diction, and purity of *swarasthanams*, or note

positions, are some of the hallmarks of Subbulakshmi's music. Her dignified stage presence, enchanting voice, versatility, and humility enhanced her career, as did her linguistic ability. She did not indulge in showmanship. Devotion was her main driving force, and her vocal communication tended to transcend words. She could simultaneously cater to the most exacting demands of an orthodox Mylapur Madras audience and also touch the heartstrings of a mammoth gathering at the Harvallbh Mela (a musical soiree held annually in the precincts of a temple in Julunder).

Subbulakshmi also acted in films in the 1940s; her portrayal of the poet-saint Mīrabai catapulted her to fame throughout India, and even Mahatma Gandhi became her fan. Thanks to her husband Sadashivam, who was a close associate of Chakravarty Rajagopalachari, Subbulakshmi was exposed to the ideals of the national movement. She enjoyed a rapport with leaders like Sarojini Naidu, Jawaharlal Nehru, and Indira Gandhi. Nehru called her "Queen of Song" and Naidu surrendered her poetic title, "The Nightingale," to her. Since Karnātak music has its origins in the ancient temples, in whose precincts the ecstatic Hindu saints sang their songs to the gods, a devout singer like Subbulakshmi built her musical interpretation on devotion to God.

The peak of her long career was her performance before the United Nations General Assembly in 1966, at the invitation of Secretary General U Thant. On this occasion she urged all nations to give up aggression and cultivate friendship. The government of India decorated her with Bharat Ratna, its highest civilian honor. Subbulakshmi died on 11 December 2004.

SUBSIDIES IN THE FEDERAL BUDGET Subsidies, like taxes, have been considered legitimate tools of government intervention. Before the 1990s, Indian government intervention over a wide spectrum of private decisions about production and consumption brought extensive use of tax subsidies, designed to achieve given objectives of its socialist approach to economic development. These subsidies took various forms, including:

standard consumer subsidies, for example food subsidies; interest or credit subsidies on priority sector lending by public sector banks; tax subsidies or tax “expenditures”; free public supply of certain services, like primary education and some health services; procurement subsidies for food grains and some other agricultural products; and regulatory subsidies arising from administered prices pegged below market prices, as for iron and steel.

Rationale

All subsidies add to public expenditure and must be financed from general revenues. In a balanced budget framework, this requires an equivalent rise in taxes or other sources of income whenever subsidies are given. Under normal circumstances, subsidies must be justified in specific benefits, and comparison of these benefits with the costs, both private and social, associated with such revenues is implied.

The basic economic rationale for subsidies is to bridge the gap between private returns and social returns of goods and services that have large externalities. Examples would include inoculation against communicable diseases, elementary education, social forestry and water conservation. In India, however, government subsidization has gone well beyond this primary reason, and widespread subsidies have been justified on several grounds, including self-sufficiency in production, supporting infant industries, poverty alleviation, or sometimes for distributional reasons (e.g., food subsidies).

The main problem with the subsidy regime in India is that much of it is nontransparent because subsidies are given in the form of unrecovered costs. As such, they are not really mandated by the empowered legislature, nor are their costs fully appreciated in general. The explicit subsidies are large but form only a fraction of the total amount of subsidies. Large implicit and explicit subsidies have been responsible to a considerable extent for the high fiscal deficits now observed at all levels of government in India. This has resulted in absorption of non-government savings to finance the deficits, leading to high interest rates, lower private investment, and consequent adverse effects on growth. Subsidies also change relative prices, and the resultant price distortions have led to resource misallocation.

Estimates

In India, official figures of subsidies either relate to only explicit subsidies or those including a small part of the implicit ones. After more comprehensive estimates of subsidies were unofficially made and widely accepted, official acceptance also followed. An official white paper on the subject that used the wider concept and its methodology for estimation of subsidies has tried to take

TABLE 1

| Goods and services | |
|----------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Merit goods and services | Nonmerit goods and services |
| Elementary education | Education, sports, arts and culture (other than elementary education) |
| Public health | Medical and family welfare |
| Sewerage and sanitation | Water supply and sanitation |
| Welfare of scheduled castes, scheduled tribes, and other “Backward” castes | Housing |
| Labor | Urban development |
| Social welfare | Social security and welfare |
| Nutrition | Other social services |

into account the justification for various kinds of subsidies by classifying subsidized services into merit and non-merit goods based on subjective judgments regarding the degree of externalities involved (see Table 1). There are several difficult problems encountered in measuring this concept on the basis of available information. The stock of accumulated capital is given in nominal terms at heterogeneous prices that vitiate the computation of depreciation. The life of the assets concerned is also not uniform, and therefore the rates of economic depreciation. There is also the problem of change in value of some of the assets, particularly land, which cannot be taken into account, but which are extremely important for understanding the opportunity costs involved.

Another important problem relates to the issue of efficiency costs as opposed to actual costs, and the conceptual need to eliminate the excess of actual over efficiency costs from the estimate of subsidies. This is an intractable problem that has not yet been tackled. There is also the problem of lags between investment and the generation of service flow, and hence the need to abstract from the associated capital costs during this lag, but the informational requirements for this are not readily available.

Table 2 presents the four discrete estimates of aggregate budgetary subsidies, all of which put the total at around 12 percent of the gross domestic produce (GDP) or more. About one-third of these constitute the share of the central government, the rest being provided at the state level. The state governments provide the bulk of the subsidies, mostly in the areas of education, medical and public health, agriculture and allied services, energy,

irrigation, and transport. At the central level, about a third of the total subsidies are explicit, the rest given through low or nonrecovery costs of public services. In fact, the overwhelming bulk of explicit subsidies are at the central level. Aggregate estimates of subsidies rose as a ratio of revenue receipts, but fell as a ratio of fiscal deficits. The implication is that subsidies are being financed less by current income of the government, and more by borrowed resources that push up the fiscal deficit, which creates problems of sustainability.

Table 3 shows the growth of explicit subsidies given by the central government, and the clear deceleration in growth during the 1990s. The deceleration would have been much larger had the trends suddenly not reversed direction in the second half of the 1990s, possibly caused by the increase in current costs of service provision due to upward wage revisions.

Assessment

The targeting of subsidies leaves much to be desired, due to design faults as well as implementation problems. Food subsidies, through the public distribution system, are good examples. Most input-based subsidies (like fertilizer or power subsidies) are ill-designed, so that they are not properly targeted and are often regressive. Subsidies at the intermediate stage of production always carry the risk of getting dispersed to all consumers simply in proportion to their consumption.

In the long-term perspective, unnecessary subsidies, coupled with persistent deficits in the public sectors, can actually have the opposite effect of that intended. Provision of many basic services by the government is now facing this paradox, since large subsidies divorce price and output decisions and breed indifference to cost recovery. With growing pressure of population increase and no built-in controls on costs, implicit subsidies keep rising until they hit a budget constraint, and the subsequent adjustments affect both quality and quantity. Poor quality confers an inferior status on such services.

Reforms

A reform that is gradually gaining ground is that of re-establishing the link between price and supply of services, by allowing some autonomy to service units in user charges and allowing use of the proceeds at the same unit for improving the quality of the services concerned. Another reform that is becoming popular concerns collection of charges for irrigation. Water user associations are being set up in some states to take care of distribution of water and collection of appropriate user charges. But proper pricing for piped water supply, particularly in

urban areas, still awaits effective reform. Similarly, problems of major power theft raise the issue of who exactly benefits from the huge subsidies in this area.

Several products actually receive unmerited subsidies, as does jute, long subsidized despite a clear worldwide trend of lower demand. This distorts cropping patterns and prevents market orientation of agriculture.

SULTANATE OF DELHI. See **History and Historiography.**

SULTANATE PAINTING The term "Sultanate painting" should refer to manuscript illustrations or murals commissioned by Muslim patrons in the regions of India ruled by sultans before the founding of the imperial Mughal atelier in 1556. Though the so-called Sultanate period began in 1206, manuscript painting cannot be traced back much earlier than about 1450. Thus, most Sultanate painting dates between about 1450 and 1550, and the centers of production seem to be primarily Mandu in central India and Jaunpur in eastern India, with some work being done in the Delhi region and in Gujarat in western India. The succession of Muslim sultans ruling from Delhi in the thirteenth and fourteenth centuries were more concerned with public building projects, and many of them were opposed to figural painting for religious reasons. Several examples of the Qur'an with calligraphy and ornamentation distinctive to India have survived from this period, but they include no figural illumination. Several passages in literature refer to the existence of wall paintings during the time of the early Delhi sultanates, but little survives.

In 1398 Timur, the Turkic warrior from Central Asia (known in the West as Tamerlane), sacked Delhi and defeated the ruling sultan, Firuz Shah Tughluq. The ensuing decentralization of political power led to changes in the history of Indian art. Provincial governors in outlying regions gained greater independence and became self-proclaimed sultans. Over the course of the fifteenth century, these provincial sultans strove to take on the trappings of kingship, following the Persian model. These trappings included the building of fortifications, palaces, mosques, schools for the study of the Qur'an (*madrasa*), and libraries. The libraries were for the use of scholars of the court and for the personal enjoyment of the patrons. They required books, and the rulers and wealthy Muslims on the eastern fringes of the Islamic world began to commission illustrated versions of the classics of Persian literature.

As a rule the works commissioned during the fifteenth and early sixteenth centuries were epics and lyric romances. Most popular were the *Shah Nāma*, a history of the kings of the Islamic world; the *Hamza Nāma*, which relates the fantastic adventures of Hamza, uncle of the prophet Muhammad; and the *Khamsa* of Nizāmī, or its retelling by the Indian author Amir Khusrau Dihlavī, which contains five distinct books of poetry, including the *Sikandar Nāma*, which recounts the exploits of Alexander the Great. The *Chandāyana* (also called the *Laur Chandā*) was evidently the most popular among the lyric romances; five fully illustrated editions survive in more or less fragmentary condition, painted in different styles.

Styles of Sultanate Painting

The illustrated manuscripts made for Muslim patrons between 1450 and 1550 vary considerably in style, as there was no unifying force in the production of these works. Some of the early works were heavily reliant on Turkman prototypes, namely paintings made in Shiraz in eastern Iran, or in Herat in Central Asia. It appears that the painters themselves were typically Indian, trained in the stylized and highly conservative indigenous styles exemplified by illuminations of devotional manuscripts commissioned especially by Jains in western India, but also by Buddhists in eastern India, and by Hindus. These Indian artists were apparently charged with adopting the Turkman style, and different artists produced works with greater or lesser fidelity to their foreign sources. Most of the surviving examples of fifteenth-century Sultanate painting are significant more for historical than aesthetic reasons. Among the more visually engaging works is a *Shah Nāma* of about 1450, now dispersed primarily among museum and private collections in Europe. The manuscript is arranged in a vertical format with horizontal

illustrations and four columns of Persian text. The paintings are closely related to the indigenous western or central Indian styles of paintings in non-Muslim sacred texts of the time.

A remarkable manuscript called the *Ni'mat Nāma*, painted in Mandu in central India around 1500, is a book of recipes, which shows the sultan surrounded by attendants preparing foods, medicines, and aphrodisiacs. The painters of the pictures were Indian, but they drew heavily from Shirazi models, with much use of thick green swards, pastel background colors, and provincial Persian figural types. Indian elements are especially noticeable in the renditions of the Indian ladies, who were part of his extensive, multicultural harem.

By the mid-sixteenth century a harmonious fusion of Persian and Indian styles was achieved, seen especially in the paintings illustrating the adventures of the lovers Chandā and Laurak in the *Chandāyana* of about 1540. The text was composed by a Muslim poet in India, written in the northeastern dialect of Hindi known as Avadhi, in Persian script, and the paintings were painted by a Hindu artist. Artists working in this unique hybrid style, characterized by bright pastel colors, repeated ground patterns, delicate line drawing, and exquisite arabesques, were particularly influential in the early decades of the imperial Mughal atelier.

SULTANATE-PERIOD ARCHITECTURE OF SOUTH ASIA Scholars frequently refer to the years 1192–1526 as the Delhi Sultanate period, defined by the establishment and proliferation of a series of Islamic states in South Asia. After the numerous Afghan Ghaznavid raids into the Indus Valley in the late tenth to twelfth centuries, the Afghan Ghurids and their Mamluk deputies, also from Afghanistan, founded the first enduring

Islamic dynasty in northern India, spanning 1192–1290. Thereafter, several other Islamic dynasties with varying territorial holdings appeared in Delhi and in other regions of India. Finally, in 1526, the Timurid prince Babur was victorious at the first Battle of Panipat, launching the great Mughal dynasty with pan-Indic ambitions. During the Sultanate period, the Islamic dynastic patronage of the many building styles of South Asia—firmly rooted in regionally based traditions—produced a plethora of Islamic architecture.

Muslim communities had settled in Sind before the late twelfth-century rise of a lasting Islamic power. Architectural remains from Banbhore in Sind (c. 711), Gwalior in central India (8th century), and Bhadresvar in Kachh, Gujarat (c. 1160) indicate that Muslim groups settled at these sites probably for mercantile purposes. The Gwalior mihrab and Bhadresvar mosques particularly demonstrate that these communities employed local craftsmen for their religious buildings. Indeed, the high quality of those remains indicate that the craftsmen had worked on Islamic architecture before, thereby pushing the presence of Muslims in central India and Kachh to earlier than the eighth and mid-twelfth centuries, respectively.

The Ghurid annexation of northern India underpinned innovations in the building tradition indigenous to the plains by introducing new architectural practices and forms from the Iranian ambit, the latter of which were executed according to local methods. Delhi's well-known Qutb Mosque (Quwwat al-Islam, 1192–1193) exhibits extensive recycling of materials from earlier buildings, a practice comparatively little documented in Hindu and Buddhist foundations of the first millennium A.D. These older fragments were integrated with others contemporaneous with the complex's foundation, meaning that Ghurid deputies also patronized local building traditions. Continuity in style and method is underscored by the arched facades, elements imported from eastern Iran-Afghanistan but constructed using corbelled arches, and iconography from the pan-Indic water cosmology. Ghurid foundations west of the Indus, such as the Ribat of Al-ibn Karmakh, also evince continuity and innovation: While the fortified grave is a conflation of forms imported from Islamized lands, the iconography shows a direct relationship to the region's earlier temples.

The architecture of the Delhi-based powers succeeding the Ghurids and Mamluks emphasized a military aesthetic of heavy proportions, battered walls, and overall austerity. Dynastic Khalji (1290–1320) and Tughluq (1320–1401) architectural patronage, seen in the Ala-i Darwaza (1311) and the Hauz Khass Complex (1388), show that brick was the preferred building material and arcuation the favored articulation of interiors. This architectural style originated in these dynasties' homeland of

Qutb Minar Complex, Delhi. With its first stones laid in 1199, the red sandstone tower of Qutb Minar. Built by Qutb-ud-din Aibak, the founder and first sultan of the Islamic city of Delhi, who applied his own name (*qutb* meaning “axis”) to the tower to mark it as a new symbol of Islamic sovereignty. AMAR TALWAR / FOTOMEDIA.

Multan, where Sufi mausoleums like the Tomb of Shah Rukn-i Din Rukn-i ‘Alam (c. 1300) were abundant. The Lodi sultans (1451–1526) of Delhi continued in a similar aesthetic vein (Tomb of Sikandar Lodi), though these buildings were more decorative, with niches puncturing their surfaces.

Throughout the fifteenth and early sixteenth centuries, two sultanates neighbored Delhi, the Sharqis (1394–1483) holding sway at Jaunpur to the east, and the Ghuris (1391–1436) and eventually the Khaljis (1436–1531) at Mandu to the west. Both sultanates dedicated much of their financial and labor resources to architectural patronage, studding their urban centers with several large mosque, tomb, and *madrassa* complexes. The influence of the Delhi-based architectural style seemed to radiate east and west: Jaunpur’s Atala Mosque (1408) raised what had originally been a military aesthetic to a monumental scale. Mandu’s Congregational Mosque (1454), with its heavy proportions, evokes the earlier Delhi buildings, though their characteristic austerity was relieved here by means of blue-glazed tile decoration applied on selected surfaces.

The architecture of the Delhi-based dynasties, derived from traditions originating west of the Indus, was adopted and further developed by the nearby sultanates. However, the architectures of many other Muslim states in South Asia, which were more removed from Delhi than Jaunpur and Mandu, stylistically and technically ensued from, and even rejuvenated, their respective indigenous building practices.

Various sultanates appropriated pockets of territories in the Deccan, and some of them maintained control of their holdings for over three centuries (1347–1686) until Mughal conquest. Indeed, the flourishing of South India’s Hindu kingdom of Vijayanagar until 1565 reminds us that the “Sultanate period” is something of a misnomer, since the dynasties of this powerful state were not Muslims but Brahmanical Hindus. Architectural patronage throughout the Deccan can be characterized by the application of old building principles to new purposes, often resulting in unprecedented spatial solutions. The Bahmanids’ Mosque at Gulbarga (latter half of the 14th century) presents a case in point: The covered prayer area and open courtyard of the archetypal mosque was

covered with corbelled domes. The arched facade, known since the late twelfth century, was here transferred to the exterior to create monumental entrances. Ibrahim Adil-shahi's Tomb at Bijapur (c. 1626) relied heavily on indigenous architectural and iconographic traditions, including South Indian column orders and ornament.

Architectural patronage in the Bengal (1339–1576) and Gujarat (1411–1573) sultanates emerged from and rejuvenated those regions' local building practices. Bengal had within its borders a well-entrenched tradition of brick construction, including the use of vousoir arches to span short distances. Moreover, the local craftsmen excelled at terra-cotta and molded brick surface decoration. Thus, Gaur's Qadm-i Rasul Mosque of about 1525 is decorated with terra-cotta plaques as well as tilework, and the arch here rose to the challenge of spanning considerably larger interior spaces than before.

The religious architecture of Gujarat was primarily of trabeate construction in stone, with exteriors profusely decorated with stone sculpture. Both of these practices were productively adapted to Islamic buildings, as seen at Ahmedabad's Congregational Mosque of 1424. The monumental entrance facade shows that, rather than the teeming exteriors of the region's medieval temples, local stone-carving methods were applied toward the creation of a surface well balanced in its proportions of ornament and austerity. The interior demonstrates that trabeation did not produce only low, dark interiors, but could also be successfully employed to create lofty spaces with natural light. The introduction of Islamic ritual and social demands, then, were beneficial for the local styles of building.

TABLA Tabla (Arabic), a pair of kettle drums with “loaded” drumheads played with the fingers, are the most important rhythmic accompaniment for North Indian classical, religious, popular, and folk music. They are probably a combination of a Central or Western Asian

kettledrum tradition (played in pairs with sticks) and South Asian drums such as the *mrdangam* (played with the fingers, tuned, and with rice paste applied to the head), although the *dbolak* tradition (a barrel-shaped drum) may also have contributed. Documentation of the

Zakir Hussain Playing the Tabla. World-renowned tabla virtuoso Zakir Hussain (left) performing in New Delhi, 1988. After the eighteenth century, the instrument slowly became the primary drum for both the classical and popular music of northern India. NEAL PRESTON.

origins of the tabla (or at least drums appearing to be tabla) does not appear until the eighteenth century in North India.

The higher-pitched right-hand drum (*dāyan* or, more simply, *tablā*) has a hollowed wooden shell. The most important feature of the goatskin heads is the weighted center, a circular patch of a specially applied and modified rice paste. The drummer usually tunes an overtone of this drumhead to the tonic pitch of the music. The drummer obtains this overtone (a result of the weighted center) by damping the head's fundamental with the ring finger of the right hand while striking the edges of the head with his or her index finger.

The lower-pitched left-hand drum (*bāyan* or *duggī*) is usually a metal vessel, although some musicians still play clay drums. This drum too has a weighted head, although the pitching of this drum is often less specific than the *dāyan*, and the drummer does not manipulate the overtones. The patch on this head has the function of helping to focus the sound and pitch so that the drummer has more control over the relative pitch of the drumhead. By pressing the heel of the left hand into the drumhead while striking the drum, the drummer can raise (or alternatively lower) the pitch of the drum.

Drummers learn and remember drum patterns through a system of mnemonic syllables (*bols*) representing drum strokes: dental sounds represent right-hand strokes, guttural sounds represent left-hand strokes, and aspirated sounds represent simultaneous strokes on both the left and right drumheads.

When the drummer solos, he or she uses a number of different forms. For example, a *kāyā* (Persian-Hindustani, “rule”; Urdu, *qā'idā*) is a composition that shows the shape of the *tal* and *theka* and serves as the basis for a number of other subcompositions and extemporizations. These include both the *dobrā* (Persian-Hindustani, “two-fold,” “compound,” or “couplet”), a variation of a rhythmic musical idea (such as a *kāyā*) in which sections of the original theme repeat, and the *paltā* (Hindustani, “turn” or “exchange”), a variation (often a *dobrā*) of a rhythmic musical idea manipulating individual strokes or groups of strokes.

TAGORE, RABINDRANATH (1861–1941), renowned Bengali poet. Author, activist, artist, choreographer, dramatist, educator, musician, and philosopher, Rabindranath Tagore was primarily a poet. He was called a “universal man,” which he certainly was. His roots, both cultural and creative, were set deeply in his beloved Bengal. His talents blossomed from the dusty and wet plains of Bengal in over a thousand poems, two and a half thousand songs, a sizable number of short stories, novels, and discursive essays on education, history, literature, rural reconstruction, politics, philosophy, and science. He became a painter rather late in his life, when he turned seventy. In ten years, he produced some three thousand paintings.

Tagore was born in the Jorasanko district of Kolkata (Calcutta) on 7 May 1861. He was the youngest child of Debendranath Tagore (1817–1905) and Sarada Devi (1826–1875). Originally from Jessore, now in Bangladesh, the Tagore (Thakur in Bengali) family belonged to a Brahman subcaste known as Pirali. Orthodox Brahmans refused to have any social contact with the Tagores and other Piralis due to their closeness to Muslim rulers. The family moved to Kolkata around the time the city was founded, in the 1690s. The Tagores prospered working for the East India Company. Rabindranath's grandfather, Dwarkanath Tagore (1794–1846), known as “the Prince,” built the family fortune with his great industrial enterprises, which included banking, insurance, agency houses, mining, shipping, and real estate. A contemporary of Ram Mohan Roy (1772–1833) and a close associate in the reform movement, Dwarkanath was arguably India's first modern and global entrepreneur. His industrial enterprises collapsed soon after he passed away, but the extensive landed estates he had built up in East Bengal continued to comfortably support the extended family in the next generation.

Debendranath Tagore's large family lived in a commodious mansion in Jorasanko. All of his children distinguished themselves in some way or another. Dwijendranath Tagore (1840–1926) was a poet and philosopher, Satyendranath Tagore (1842–1923) was the first Indian to join the Indian Civil Service, Jyotirindranath Tagore (1849–1925) was a playwright and translator, and Swarnakumari Devi (1855–1925) was India's first woman novelist.

As a child, Rabindranath had trouble studying in school. He disliked the set curriculum, the strict discipline, and the restrictive atmosphere of the four schools he attended until he was thirteen. He was withdrawn from the St. Xavier's School in 1874. Thereafter he received home schooling from his brother Jyotirindranath and his wife Kadambari Devi. Both of them exercised

great influence on Rabindranath's literary pursuits in his adolescence and early adult life.

Tagore started to publish verse, narrative poetry, short fiction, and translations from 1876 onward in the family's literary journal *Bharati*. He also started to act on the family stage. He appeared, for example, in the title role of Molière's *Le Bourgeois Gentilhomme*, adapted to a Bengali farce by his brother Jyotirindranath. The following year, he traveled to London with his brother Satyendranath. He enrolled at the University College, London, to read English literature. His frankly explicit "letters" sent from London alarmed his elders, concerned about his youthful waywardness. He received urgent summons to return home. Upon reaching Kolkata, he began to publish in earnest. His opera *Valmiki Pratibha* (The genius of Valmiki), modeled after the European operas he saw in London, impressed Kolkata's literary elites, especially those engaged in experimenting with Western literary genres and music. Tagore scored the music for the opera and cast himself in the title role. He recorded his first major poetic inspiration in a passionate work that he titled "The Awakening of the Waterfall." A plethora of new works followed, including a series of devotional songs in the tradition of the medieval Mithila Vaishnava poet Vidyapati. He composed these songs in the company of Kadambari Devi, his talented sister-in-law.

Tagore had an arranged marriage in 1883 with Mrinalini Devi. The next year, Kadambari Devi committed suicide, apparently due to her unrequited love for Rabindranath. The tragedy shattered Tagore and arguably created the emotional impetus for his novella *Nashtanir* (The broken nest), which Satyajit Ray adapted for his film *Charulata* (1964). By 1890, when Tagore revisited England, he was considered a top literary talent in Bengal by no less than Bankim Chandra Chatterji.

Tagore spent the next decade (1890–1900) supervising the family's extensive landed estates in what is now Bangladesh. The experience brought him in close and intimate contact with Bengal's countryside and its people. He wrote scores of short stories showing the dark side of Bengal's village life while celebrating in exquisite verse the beauty and bounty of the land. The first decade of the twentieth century saw the emergence of two diametrically opposed profiles of Tagore: the first was that of a dedicated patriot and political activist, and the second that of a deeply mystical poet searching for unity and oneness in the complexity and diversity of the universe.

Tagore's political involvement began in 1886, when he composed and sang at the inauguration of the Indian

Portrait of Rabindranath Tagore. The master of countless intellectual and artistic pursuits, Tagore lifted Indian culture—and even more significant, the Indian psyche—to a new sphere of revitalization. FOTOMEDIA ARCHIVE.

National Congress. The next year, he participated in the public protest against the blatantly discriminatory policies of Lord Cross, the secretary of state for India. One sees Tagore's fully formed political personality and activism in the wake of Lord Curzon's decision in 1905 to partition the province of Bengal in two halves, roughly corresponding to the Hindu and Muslim populations. The *swadeshi* (self-rule) movement (1905–1911) was the first major "militant" agitation against colonial rule. During the first phase, Tagore led the protestors in the streets of Kolkata, singing patriotic songs he had composed for the movement. He gave music to Bankim Chatterji's famous hymn to the motherland, *Bande Mataram*. The hymn soon became the battle cry of the antipartition patriots as well as the name of a fiery journal edited by Aurobindo Ghose (later Sri Aurobindo). Terror and violence marked the extremist challenge against the Raj in Bengal. Unable to accept the narrow nationalism and its destructive divisiveness, Tagore withdrew himself from the movement. He was quickly condemned and criticized; some called him a "lackey" of the British. A decade

later, in 1915, Tagore published *Ghare Baire* (The home and the world), a major novel (also later adapted to film by Satyajit Ray) in which he articulated his theses on nationalism.

This period of intense public activism was followed by private withdrawal, which coincided with great personal tragedies in Tagore's life. His wife Mrinalini passed away in 1902, his daughter Renuka died in 1903, his father Debendranath died in 1905, and in 1907 his youngest son Samindranath died of cholera. It appears that Tagore attempted to negotiate the crises in a series of profoundly moving poems, also songs, uniting humanity to nature and nature to humanity. His own elegant yet simple prose translation of *Gitanjali* took the English literary circles by storm in 1912. Among Tagore's admirers in England were Mez Sinclair, Evelyn Underhill, Ezra Pound, Bertrand Russell, and most importantly, W. B. Yeats, the Irish poet. "These prose translations from Rabindranath Tagore have stirred my blood as nothing has for years," Yeats wrote in his introduction to *Gitanjali* (p. ix). In 1912 and 1913 Tagore was in the United States, lecturing at the University of Chicago, University of Illinois at Urbana, and Harvard University. Soon after his return to India, Tagore received the news that he had been awarded the Nobel Prize for literature.

Yeats lamented that even though the poetry of Tagore stirred sublime emotions in him, he knew nothing about "his life, and of the movements of thought that have made them possible." At once unique to Bengal and universal, Tagore's work was the product of the Anglo-Bengali, East-West encounters of the nineteenth century. The colonial world that Tagore inhabited, and the asymmetrical power relations among the colonizers and the colonized, prompted him to seek new and novel pathways to express his autonomy and creativity.

From 1913 to 1941, one can locate this dialectical process in three areas of Tagore's life. The first was the project of building a utopian community in Santiniketan, 100 miles (160 km) outside Kolkata in the saffron-colored soil of southern Bengal. In 1863 his father Debendranath had bought the land, built a guest house, and named it Santiniketan (Abode of Peace). A prayer hall was built in 1891. In 1901 Rabindranath established an academic institution to provide an "overall development of the students amidst close contact with nature . . . classes were to be held in open air under the shades of the trees." In 1918 Tagore transformed the institution into Visva Bharati (World University). Although the atmosphere and environment reminded one of the intentional communities of the Upanishadic age of the pre-Christian

era, Visva Bharati was purportedly a twentieth-century academy. Tagore invited scholars and students from the East and the West to occupy an academic and creative space that was, by design and intent, outside the baneful influences of colonialism, industrialism, and nationalism. To raise funds for Visva Bharati and to speak about its mission, he traveled the globe: to China and Japan (1924), South America (1925), Europe and Egypt (1926), Southeast Asia (1927), and Canada (1929). He delivered the Hibbert Lectures at Oxford in 1930, which were published as *Religion of Man*.

Tagore attempted to provide a practical and material foundation to his vision of the World University. At the adjacent Sriniketan, he established the Center for Rural Reconstruction in 1922. Its first director was Leonard K. Elmhirt, an English agricultural expert. Experimental research activities accompanied agronomy and rural development. Chemical fertilizers and modern medical facilities were introduced. The focus at Sriniketan was, and still is, on vocational education: leather craft, wood craft, clay craft, lacquer work, embroidery, bookbinding, carpet weaving, and block carving and printing. Along with the Art School (Kala Bhavan) and the Music School (Sangit Bhavana), the Santiniketan-Sriniketan complex combined the practice of the traditional arts with contemporary and modern elements.

The second project that preoccupied Tagore during this period concerned his scrupulous spurning of forms of colonial knowledge, and his staunch anti-imperialist and antinationalist positions. He rejected, for example, "academic histories" that are narrowly focused on political and public policies of the state. In numerous poems, plays, and novels, he attempted to capture what Ranajit Guha has called the "historicality" of everyday life.

Tagore surrendered his knighthood in an angry protest against the Amritsar Massacre of 1919. Although he disagreed with Mahatma Gandhi about some aspects of the nationalist movement, his harshest critique was directed to the West, sundered as it was by the Holocaust and World War II. In his last address and testament to the world before he passed on in 1941, he stated, "Perhaps the new dawn will come from this horizon, from the East where the sun rises."

The third area of Tagore's involvement was his continued creative effort. He remained magnificently innovative and profusely productive to his last day. He started experimenting with *verse libre* in 1933; he invented a new play form combining music, mime, and dance. He took up painting at seventy, and the three thousand paintings he completed are considered among the best of modern Indian art.

William Radice, arguably the best translator of Tagore in English, divides Tagore's life and work in a series of paired oppositions borrowed from *Isba Upanishad*: he moves, he moves not; he is far, he is near; he is within all, and he is outside all. Tagore moved away from the orthodox Brahmo church founded by his father; he also moved away from the Hindu revivalism and nationalism. Tagore was quite a radical in more ways than one, but he remained tradition-bound in some key areas. For example, he married a ten-year-old semiliterate from his own caste; he followed the family custom by giving his two daughters in marriage when they were only twelve and fourteen. He can seem utterly foreign to non-Bengali readers. Although there are some good translations, most of Tagore's poetry is inadequate if not inaccessible in translation. Tagore's songs are equally inaccessible to non-Bengalis. There are over two and a half thousand of them, sung and listened to every day by Bengalis everywhere. As a composer of songs, Satyajit Ray says, Tagore has no equal, even in the West (quoted in Dutta and Robinson, p. 385). Most non-Bengalis, however, are denied the pleasure of enjoying Tagore's songs. Yet Tagore proves—in his fervent idealism, in his spiritual reality, in his romanticism—close to all of humankind. Tagore's modernity as a poet, thinker, and activist is accessible to most, as are his antimaterialist, feminist, and educational ideals. Most important is the agency or autonomy of Tagore the artist and poet, and its expression in his creative work. His personality and life are present in his poetry, plays, stories, and novels. He is within all. Yet he is outside all—human creativity is, in his own words, “amoral, arbitrary, fanciful, whimsical, unreal,” and the natural artist in him “is naughty, good for nothing, separate from the man of a hundred good intentions” (quoted in Radice, pp. 36–37).

Is it possible to overcome the translational problems to appreciate Tagore, the poet? Anna Akhmatova, who translated Tagore into Russian, offers an insight: “He is a great poet, I can see that now. It's not only a matter of individual lines which have real genius, or individual poems . . . but that mighty flow of poetry which takes its strength from Hinduism as from the Ganges, and is called Rabindranath Tagore” (quoted in Dutta and Robinson, p. 1).

TĀLA In the classical music traditions of India, *tāla* (Sanskrit, “palm of the hand,” or “clap”) is the combined concept of rhythm and meter. Analytically, a *tāla* is a cyclic and additive measure of musical time. That is, unlike the approach to musical time that has prevailed in Euro-American culture (which has parsed pulses into linear duple and triple patterns and then has subdivided the pulses), South Asian musicians have constructed time by cyclically patterning added subsections of pulses and subdividing the beats. The conceptual categories for *tāla* stem from South Asia's language and poetics, in which verses consist of patterned long and short syllable combinations. Cyclical musical time parallels other Indian conceptualizations of time, such as the agricultural rhythm of the seasons, the cycle of birth, death, and rebirth, and notions of cosmic time.

As with *rāga*, musicians in North and South India understand *tāla* similarly, while differing on the specifics. The common concepts are those of cycle (*āvartā/āvartanam* in the South and *āvartā/āvart* in the North), structural subsection (*anga* in the South and *vibhāṅ* in the North), and beat (*mātra* in both cultures), as well as the notion that these beats can have subdivisions. Similarly, the North and the South generally pattern performances from open, pulseless, and meterless beginnings (*ālāpanā/ālāp*) to the microsubdivision of the mensural musical moment. Finally, both systems think of tempo in three

broad (but modifiable) tempi: *vilambita-laya* (slow tempo), *madhyama* or *madhya-laya* (medium tempo), and *druta-laya* (fast tempo). The differences derive in large part from the historical and cultural contexts of music performance, but also from the cultural disposition of the cultures.

As with scale types, southern traditions have systematic structures for generating and categorizing musical time that inform and have been informed by performance practice. Northern traditions, on the other hand, derive heavily from performance practice, so that *tāla* structure emerges from an ecological evolution of practical forms.

South India

Musical time plays a prominent role in Karnātak music practice and is an integral part of South Indian musical instruction, while functioning as an underlying, albeit often unstated, principle. That is, in South Indian musical practice, performance reflects the underlying structures of *tāla* (the patterning of sections and relative points of importance), but no specific musical part has the charge of keeping and showing the *tāla*. Musicians will often reveal the *tāla* in which they are performing through standardized gestures (and the audience may also “keep time” in this fashion), but no musical part has the specific charge of keeping or showing the time for the other musicians.

South Indian musicians and music scholars have developed systematic formulas for generating time patterns. The overarching idea is that of cycle. An *āvarta/āvartanam* (Sanskrit/Telegu, “cycle” or “a return to the beginning”) is the span of one cycle of a *tāla*. Once established, the pattern of an *āvarta*—the *tāla*—remains consistent until the end of the composition.

This pattern derives principally from the arrangement of the subsections. Each subsection, or *anga* (Sanskrit, “member” or “part”), can consist of 1, 2, 3, 4, 5, 7, or 9 beats or *mātras* (Sanskrit, “syllable”). Karnātak musicians and scholars have developed ways to symbolically represent *angas* both by a physical gesture and/or a written symbol. The two most common physical gestures employed today are the *tattu* (Telegu, “beat” or “clap”) and *vīccu* (Telegu, “wave”) with smaller articulations of the fingers to help in the counting of longer *angas*.

Karnātak practice recognizes three different kinds of *anga* and represents them with written symbols. The *drutam* is a two-*mātra anga* marked by a clap (*tattu*) and a wave (*vīccu*) and symbolically indicated as a circle (O). The *anudrutam* is a one-*mātra anga* marked by a clap (*tattu*) and indicated as an upwardly opening circle (U).

The *laghu* is a multiple-*mātra anga* marked by a clap (*tattu*) and a number of additional silent beats to complete an *anga*. Musicians represent the *laghu* with a vertical bar and a number indicating its duration (1_n). A *laghu* can be *tishbra* (triple) with 3 *mātras* (1₃); *caturashbra* (quadratic) with 4 *mātras* (1₄); *khanda* (broken) with 5 *mātras* (1₅); *mishbra* (mixed) with 7 *mātras* (1₇); or *sankīrna* (composite) with 9 *mātras* (1₉).

Practice also allows the subdivision or *laya* (Sanskrit, *layate*, “to go”; *laya*, “the act of sticking or clinging to”) of each *mātra* in several ways. The single count pulse division is *gati* or *natai* (Sanskrit and Tamil, “pace”), *tishbra natai* is a triple submetric division of the beat, *caturashbra gati/natai* is quadruple (also known as *sarva-laghu*), *khanda natai* is quintuple, and *mishbra natai* is septuple. That is, each *mātra* at *tishbra natai* can have triplets at *tishbra natai*, quadruplets at *caturashbra natai*, and so on.

Sūlādī Tālas. The devotional singer Purandara Dasa (1480–1564) established a musical time system based on seven *sūlādī tālas* for use in formal compositions by combining the *laghu* (l), *drutam* (O), and *anudrutam* (U) in ways that reflect the performance practice of his time. The most commonly used of these *tālas* appear in Table 1.

When naming the different versions of these *tālas*, one first names the quality of the *laghu* followed by the name of the *tāla*; however, particular versions of these *tālas* have special recognition. For example, *caturashbra Triputa tāla* (that is, the eight-*mātra* version of Triputa *tāla* with a *laghu* of four *mātras* followed by two *drutams*) more commonly carries the name *Ādi tāla* (first), as this is one of the most common *tālas* in South Indian music. However, some *tālas* are common in particular contexts and yet have no special name. For example, *khanda Āta tāla* (the 14-*mātra* version of *Āta tāla* with two five-*mātra laghus* and two *drutams*) is particularly important in *tana varnam* compositions, but has no separate appellation.

Capu Tālas. While the *sūlādī tālas* have been the choice of composers for the most complex compositions of the repertoire, the *cāpu tālas* are common in lighter works and occur most often in fast *laya*. A characteristic of the *cāpu tālas* is that each *tāla* has two parts, with the second part one beat longer than the first. The most important of these are (a) *mishbra cāpu* (3 + 4; sometimes known only as *cāpu*) which often acts as an up-tempo version of *tishbra triputa* (3 + 2 + 2); (b) *khanda cāpu* (2 + 3; often called *ara Jhampa* [half Jhampa]) which similarly functions as an up-tempo version of *mishbra jhampa* (7 + 1 + 2); (c) *tishbra cāpu* (1 + 2 and a slightly different emphasis than *tishbra Eka tāla*); and (d) *sankīrna cāpu* (4 + 5).

North India

Again, North and South India share conceptions of *tal*. Each cycle or *āvarta* (or sometimes *āvard*) consists of one or several *vibhāgs* (Sanskrit/Hindi, “partition” or “break-down”), which in turn usually consist of two, three, or four *mātras*. A clap (*tālī* [Sanskrit-Hindustani diminutive of *tal*, “beat” or “clap”]) or wave (*kbālī* [Hindustani “empty”])

marks the beginning of each *vibhāg*. The most important *vibhāg* marker is the *sam* (Hindustani, “together”), the first beat of an *āvarta* and the point at which the end of the time cycle comes back and joins the beginning.

North Indian musicians and scholars use a schematic system to describe the structure of *tāla*. An “X”

marks the *sam*. *Tālis* are numbered (with the exception of when the *sam* is a *tāli*—which is true of most *tals*). An “O” marks the *kbālī* or beginning of an “empty” *vibhāg*. Figure 1 illustrates these parts in the context of one *āvarta* (cycle) of the most common *tal* in the Hindustani *sangīt paddhati* (North Indian classical music tradition): *Tīntāl*.

In Figure 1 the *āvarta* consists of 16 *mātras* divided into four *vibhāgs* of four *mātras* each, with the first, second, and fourth *vibhāgs* marked by *tālis* and the third *vibhāg* marked by a *kbālī*. (Note that an X marks the first *tāli*, the *sam*. The number “1” appears only when the *sam* is *kbālī*.)

The Hindustani *sangīt paddhati* sense of *lay* (subdivision, tempo) parallels that of the Karnātak *sangīt paddhati* in that the metric subdivision of *mātras* can be *caturasra* (quadratic, 4 subbeats), *tisra* (triple, 3 subbeats), *misra* (mixed, 7 subbeats), *kbanda* (broken, 5 subbeats), and *sankīrna* (composite, 9 subbeats). Thus, the above schematic of *Tīntāl* could have *mātras* further divided into triplets, quadruplets, quintuplets, or groups of nine. And, as in South India, the terms *vilambit* (slow), *madhya* (medium), and *drut* (fast) describe tempo, with the prefix *ati* (very) modifying the slow and fast extremes.

North Indian time, like that of South India, is conceptually additive. However, rather than a standard set of

formulas modified through a grid of metrical options (like the *sūlādī tālas*) or meters, which follow a standard mathematical function (like the *cāpu tālas*), North Indian *tāls* derive almost entirely from performance practice. Hindustani musicians generally describe *tāls* not as a series of *lagbus*, *drutams*, and *anudrutams*, but rather as a stylized series of drum strokes. These drum strokes most often come from the performance practice of *tabla* and sometimes, the *pakhāwaj*.

Figures 2 through 6 illustrate the most common *tālas*, beginning with the aforementioned *Tīntāl*. In general, syllables beginning with a “dh” sound indicate “open” strokes played by both drums in a pair of *tabla* (or drumheads, in the case of the *pakhāwaj*), with the lower-pitched drum resonating or ringing. A syllable beginning with a “t” represents a stroke played only on the higher-pitched head. A syllable beginning with a “k” or “g” represents a stroke played only on the lower-pitched drum. (Note: the use of Western notation to represent these drum strokes is for the convenience of those familiar with this mode of musical representation.)

In Figure 2, note how “open” strokes (*dbā*, *dbin*) predominate in the first, second, and fourth *vibhāgs*—marked by *tālīs* (claps)—and how “closed” strokes (*tā*, *tin*) predominate in the third *vibhāg*—which begins with a *khālī* (wave). This example is in medium tempo (*madhya lay*). Figure 3 is an example of the same *tāl* in slow tempo (*vilambit lay*). The structure remains on the principle of *mātras*, but each *mātra* has an underlying quadratic (*catu-rashbra*) subdivision (represented by the sixteenth notes).

In Figure 4, the same pattern of *tālīs* and *khālī* is manifested in the ten-*mātra tāla*, Jhaptāl; however, this time the *vibhāgs* consist of alternating patterns of two and three *mātras*.

Not all *tālas* follow this pattern, however. Some treatises list tens if not hundreds of possible *tālas*; but in performance practice, one commonly hears only around a dozen *tālas*, some of which occur only in special circumstances. Figure 5 represents a realization of Ektāl, a *tāla* that is commonly associated with both vocal and instrumental music. The twelve beats divide into six *vibhāgs* of two *mātras* each. In contrast to the other examples (but imitating them), not all “open” *vibhāgs* have claps, nor are “closed” *vibhāgs* dominated by “closed” strokes. The resulting pattern has the curious complementary and overlapping arrangements of *mātras* into three groups of four (clap-wave + clap-wave + clap-clap) and two groups of six (as defined by the rhythm: clap-wave-clap + wave-clap-clap).

Finally, not all *tāls* begin with a clapped *sam*. The popular Rūpak *tāl* (Figure 6)—a seven-beat *tāl*—begins with

a *khālī* and a *vibhāg* of three *mātras*, followed by two *tālī*-marked *vibhāgs* of two *mātras*.

TANCHOI A distinct style of textile developed in the nineteenth century, *tanchoi* was favored among the Parsi women of India. The Chinese opium trade had brought affluence to the Parsis, and a display of this Chinese connection became a status symbol. Two distinctly Indo-Chinese, or “Parsi,” textiles resulted from these interactions: the *tanchoi* and the *garo*, which was a plain fabric with embroidery. These have as much ethnic association with the Parsis, as the *bandhani* with the Gujaratis and the Paithani with the Maharashtrians. *Tanchoi* saris were so popular among the Parsis that practically every home possessed at least one, and they were an essential part of the marriage trousseau of the Parsi bride.

The *tanchoi* is woven with both the twill, and the sateen weave, which can produce an unbroken surface of color while retaining structural strength. The twill weaving produces a much more tightly woven fabric than the plain weave, and was used for the *pallu* (decorative end-piece of the sari) of the *tanchoi*. The rest of the sari was woven using a sateen weave. The most important quality of the *tanchoi* is the complete absence of loose long floats (loose threads of the weft on the reverse of the fabric, not interwoven with the warp) on the back of the fabric, even if they are required at long intervals in the pattern. In the most intricate designs too these kinds of floats are not permissible in *tanchoi* weaving.

The earliest *tanchois* seem to be only two colors, generally the color of the warp for the ground, with that of the weft creating the design on the right side of the cloth. The other side of the material appeared exactly opposite: the weft color became the ground, and the design appeared in

the color of the warp. In a multicolored sari the warp as well as the weft formed the design. *Tanchois* of the nineteenth century generally had a large *pallu* with a combination of large and small paisley motifs at both ends, while the ground designs vary from *butis* (small decorative motifs) to lozenges in an all-over pattern. *Jari* (gold or silver) was also used at times to highlight part of the motif, which required cutting off the extra weft float of *jari*. In addition to its use for saris, the *tanchoi* was also available as a fabric by the yard and was used for various decorative purposes. Parsi women preferred blouses of this material.

With the introduction of the power loom and changes in fashion, *tanchoi* weaving went out of vogue soon after the first quarter of the twentieth century. The way of life of the Parsis, who had been the chief patrons of *tanchoi*, had changed, and Chinese styles were replaced by British and European fashions. Clothing changed, and georgettes and lacy materials replaced materials like *tanchoi*. Surat has long ceased to manufacture *tanchois*, but Benaras (Varanasi) weavers have now revived the art.

TANSEN (1506–1589), Indian musician. Tansen, also known as Miyan Tansen, was a legendary Indian musician. His father, Markand Pandey, was a poet who lived in a village near Gwalior. Tansen displayed an intense interest in music from an early age, and he was sent to Vrindavan, near Mathura, to study under a famous musician saint, Swami Haridas. After completing his training, Tansen was appointed court musician at Gwalior; he later went to Rewa (in Central India) as court musician of Raja Ramsingh, a musician himself. When Emperor Akbar (r. 1556–1605) heard of Tansen, he invited him to his court and honored him as one of the Navaratna, or "Nine Gems" of the Mughal empire. Abul Fazl, the chronicler of Akbar's reign, wrote of Tansen, "A singer like him has not been in India for the last thousand years." Tansen enjoyed considerable influence in the imperial court and was an exponent of *gaurbar bani*, one of the four known styles of *dbruva-pada* music, prevalent in North India during that era.

Tansen is credited with reshaping *dbruva-pada* music by introducing such Persian nuances as *meend* and *gamaka*. Tansen created new *rāgas*, some of which are still regarded as the foremost *rāgas* in North Indian music, such as "Darbari Kanada," "Darbari Todi," "Miyan ki Malhar," and "Miyan ki Sarang." Tansen was also known to be a musical codifier, studying the structure of *rāgas*, listing about four hundred. His *Sangeeta Sara* and *Rāgāmālā* are important documents on music. He is, moreover, credited with introducing certain developments in the *rabab* and *rudra-veena*. The Dhrupad singers of the *seniya gharana* attribute their lineage to Tansen.

There are many legends about the miraculous powers of Tansen's music. The most famous legend recounts how Tansen sang "Rāga Dipaka" at a royal request, even though that *rāga* was known to generate "unbearable heat" in its singer's body. His victorious competition with the great Baiju Bawra is another legend often narrated by music lovers. The achievements of Tansen are referred to in detail in the work *Virabhanudaya Kavya* by Madhava, written in A.D. 1555, in which his music is described as "immortal."

Tansen and his wife Hussaini had four sons and a daughter, Sarasvati, a vina player. His sons—Suratsen, Saratsen, Tarang sen, and Bilas Khan—all played *rabab*. His son-in-law, Misri Khan, was also a vina player. Tansen died at the age of eighty-three, around 1589, and was buried at Gwalior next to the tomb of Mohammad Ghaus. Many musicians make pilgrimages to his tomb to seek his blessings.

TANTRIC BUDDHIST IMAGES With the introduction of the Bodhisatvayana (commonly known as Mahayana, the "Greater Vehicle"), the monastic form of early Buddhism, Shravakayana (popularly called Hinayana, the "Lesser Vehicle") underwent a radical change in the theological concept of Buddhist doctrine. In place of the wise teacher, Shakyamuni Buddha, who had already attained *bodhi* (enlightenment) and Nirvāna (literally, "extinction" or "salvation"), emerged various groups of *bodhisattvas*, both male and female, who had

attained *bodhi* but had postponed Nirvāna to help others reach enlightenment. Five transcendent, or cosmic Buddhas appeared, dominating the heavenly quarters and the whole Buddhist pantheon. These are: Akshobya, Buddha of the eastern direction; Amitabha, Buddha of the western direction; Amoghasiddhi, Buddha of the northern direction; Ratnasambhava, Buddha of the southern direction; and Vairocana, Buddha of the central direction. Of these five, Amitabha played an important role at an early date, while Akshobya was very significant in eastern India, and Vairocana, mostly as the Buddha at the center of a *mandala* in Nepal. Multiple *bodhisattvas* were ascribed to each of the cosmic Buddhas, as each of them represented a different *kula*, or family, and hence were called *kulesha*, or lord of the family. Each cosmic Buddha shows a different hand gesture (*mudrā*), each has a different complexion, a different vehicle (*vahana*) and a different female companion, Prajna or Shakti. They complete the Tantric form of Buddhism.

The noted Buddhist iconographic text, *Sadhanamala* (Garland of Meditation) describes the Buddhist divinities, most of them with Tantric affinities. The worship of the Tantric divinities in a diagram in the shape of a circle (*mandala*) originated a later phase; an important addition, it was very popular with the Tantric Buddhist priests. The Buddhist text *Nishpannyogavali* of the “great scholar” (*mahapandita*) Abhayakaragupta (12th century) gives elaborate descriptions of such *mandalas* dedicated to several Buddhist divinities, the last being Kalacakra. The *Nishpannyogavali* is basically a Tantric text describing the Tantric divinities Heruka, Sambara, and Yogambara. The *dharanis*, or esoteric descriptive formulas of each Buddhist divinity, were muttered in a mechanical way. At the time of Bengal’s Pala ruler Devapala (9th century) the *dharani* of the popular Buddhist goddess Tara was well-known in eastern India. Abhayakaragupta selected twelve principal *dharanis* and deified them with human shapes, colors, and weapons. Of these goddesses, Ushnishavijaya, Parnashabari, Janguli, and Cunda were especially well-known.

In a later development, Vajrasatva holding a *vajra* (masculine principle) and *ghanta* (female principle) was considered the Adi-Buddha, along with the other five cosmic Buddhas. Another Buddha, Vajradhara, holds two *vajras* or *vajra* and *ghanta*, embracing his Prajna, is sometimes considered the Adi-Buddha, and is confused with Vajrasatva. Together with parts of eastern India, Kashmir and the adjoining areas were important sources for Tantric Buddhism, and many manuscripts of important Tantric texts have been recovered from Kashmir. Among the specifically Buddhist Tantric deities represented in Kashmir bronzes are Vajrasatva, Vajrapani, Manjushri, Yamantaka, Sambara, and Kalacakra.

Stone Sculpture of Aparajita. Aparajita, defiant Tantric Buddhist deity. Stone, perhaps from Ganga, c. eleventh century. PHOTO COURTESY OF GOURISWAR BHATTACHARYA.

In Tantric Buddhism, the union of *upaya* (means) and *prajna* (knowledge), represented by the masculine and feminine personages, leads to *bodhicitta* (mind of awakening). Many Buddhist deities in Tantric Buddhism are therefore shown in the *yab-yum* (intercourse) position. The Hevajra-tantra, Kriyasamgraha, Advayavajrasamgraha, and Guhyasamaja-tantra are the special texts for this concept. Another Tantric manuscript of importance, especially in Nepal, is the manuscript describing the five “protectresses,” or Pancarakshas: Mahapratishara, Mahasahasrapramardini, Mahamantranusarini, Mahashitavati, and Mahamayuri. The female deities are of different complexions, many-headed and many-armed, and all seated in various sitting positions. Both the *Sadhanamala* and *Nishpannyogavali* texts describe the Pancaraksha *mandala*, in which Mahamantranusarini is in the south, Mahashitavati in the west, and Mahamayuri in the north. These Pancaraksha deities are mostly shown in the manuscripts. Tara, two-armed and of green or dark (*shyama*) complexion, is

Marici. Carved image of Marici (or Marichi), revered Buddhist goddess. Her name is still invoked by the lamas of Tibet at sunrise. From Bhimpur, c. eleventh century. Collection of Varendra Research Museum. PHOTO COURTESY OF GOURISWAR BHATTACHARYA.

the most popular goddess of the Buddhist pantheon, but her four-faced and eight-armed form, called Vajratara, is a Tantric form shown in the *mandala*. Two other Tantric female deities are Kurukulla (a form of Tara) and the popular deity Cunda. Kurukulla is one-faced but may have two, four, six, or eight arms. Kurukulla is associated with

the Tantric rite of *vasbikarana*, which brings success by enchanting men, women, ministers, and even kings. In the Uddiyana form, the goddess is four-armed, red in color, and fierce in appearance, and she sits in *ardharparyanka* position (one leg hanging down) on a human corpse.

Goddess Cunda is the embodiment of the Cunda *dharani*. She has one face but two, four, sixteen, eighteen, or twenty-six arms. As Cunda-vajri she is mentioned in one of the earliest Tantric works, the Gukyasamaja-tantra. That the worship of Cunda was popular in southwest Bengal (Bangladesh) is mentioned in a Prajnaparamita manuscript of the Cambridge University Library of A.D. 1015 as “Cunda in the excellent temple of Cunda at Pattikera” (present-day Mainamati in Comilla).

Mention should be made here of two other Tantric female deities, Ekajata and Bhrkuti, who are often illustrated in sculptures from Bihar-Bengal. Ekajata, four-armed, wearing a tiger skin and holding an elephant skin above her head, accompanies Tara, a description of whom is not to be found in the Sadhanamala.

There are some Tantric Buddhist deities who are antagonistic to some Hindu gods and goddesses. Aparajita, one such deity, tramples upon Ganesha and slaps him. Similarly, the four-faced, eight-armed male deity Trailokyavijaya, displaying anger, tramples upon the head of Shiva with his left leg and with his right leg presses upon the bosom of Gauri. Heruka, the well-known Buddhist Tantric deity of the Heruka-tantra, is known as Hevajra when two-armed and embracing his Prajna, Nairatma, but when four-armed he embraces Vajravarahi. The union of Vajravarahi with Heruka is the cult of the celebrated Cakrasambhara-tantra. Vajravarahi is a *dakini*. Vajravarahi resembles Marici, who has a sow-like face, but she has a natural sowlike excrescence just near the right ear and she dances in the *ardharparyanka* pose. Marici is more well-known as a Buddhist goddess. Marici is invoked by the lamas of Tibet at sunrise. Like the Hindu Sun god, she rides on a chariot (drawn by seven pigs, not seven horses). Recent scholars have identified her with the *bodhi* of Shakyamuni. Marici is the principal deity in the Marici *mandala* of the Nishpannayanogavali. She has different forms, but her main symbols are needle and string. As three-faced and eight-armed Maricipicuva, she is attended by four sow-faced goddesses called Varttali, Vadali, Varali, and Varihamukhi. The cosmic Buddha, Vairocana, is her mate. With six faces and twelve arms she is called Vajradhatvishvari marici. The three-faced goddess, of which two are sow faces, is called Ubhayavaranana. In this form she tramples under her feet the Hindu gods Hari, Hara,

Hiranyagarbha (Brahmā), and others. With six faces and twelve arms she is called Vajradhatvishvarimarici and is the Prajna of Vairocana.

Vajrayogini, in eastern Bengal (now Bangladesh), near Vikrampur, was a seat of Vajrayana (Tantrayana) Buddhism, and many images of Tantric deities were found there, including that of the strange goddess Parnashabari. The worship of this deity was believed to prevent outbreaks of epidemics. The pot-bellied, three-faced, six-armed deity wearing leaves (hence Parna-shabari) tramples in *pratyalidha* attitude upon a couple, the elephant-headed ram below, accompanied by an animal-headed male figure and the smallpox goddess Shitala riding on a donkey. In her six hands she holds, clockwise, an elephant goad, an arrow, a *vajra*, a branch, *tarjani-mudrā* (warning gesture), and a bow.

The prominent Buddhist male deity Kalacakra is the principal deity of the Kalacakra *mandala* and of the famous Kalacakra-tantra. With four faces and twelve eyes and twenty-four arms, he dances on the bodies of the Hindu god of love Amanga (Kama) and Rudra, who are lying on their backs. In one of his hands he holds the severed head of Brahmā. He holds various weapons, including a *vajra*, in other hands of different colors.

Avalokiteshvara was a sublime *bodhisattva* in the early Buddhist pantheon, but with the influence of the Hindu god Shiva he assumed a form called Simhanada-Lokeshvara, seated on a lion, wearing a crown of matted hair, a tiger skin, and having three eyes. In his right hand he has a white trident, entwined by a white snake, and in the left hand a sword burning like fire.

Another important (especially in Tibet) manifestation of Avalokiteshvara is his Shadakshari, or six-syllabic form. In this form he is four-armed and is attended upon by the male deity Manidhara and the female deity Shadakshari-Mahavidya. In this four-armed form Avalokiteshvara is seated, showing *sarvarajendra-mudrā* (actually *namaskara-mudrā*) with the main two hands, while the back right hand holds the rosary (*akshamala*) and the back left hand a full-blown lotus (*padma*). The six syllables are the famous mantra, *om manipadme hum*, which is uttered daily by the Nepalese and Tibetan Buddhists and which is engraved on the votive stones, popularly called Manistones. Unfortunately the mantra is often incorrectly translated and is therefore commonly misunderstood. This mantra invokes the female form of Avalokiteshvara as Manipadma.

The other well-known *bodhisattva* is Manjushri, the god of learning. He is shown brandishing a sword, which removes ignorance, and holding a blue water lily (*nilotpala*)

Painting of Vaishravana. Also known as the “Guardian King of the North,” the Buddhist god of wealth, date unknown. With the development of Tantric Buddhism in the seventh century came the images of magnificent gods and goddesses, all portrayed in paradise-like settings. In time the archetypal imagery delved more deeply into the unconscious. LINDSAY HEBBERD / CORBIS.

or a manuscript (*Prajnaparamita* text) on it. In an esoteric form he is shown riding a tiger and showing with two hands the *vyakhyana-mudrā* (gesture of explanation). An extremely important Tantric form of Manjushri is Manjuvajra, with three faces and six arms. With the principal arms he makes the gesture of embracing his Prajna, and he holds a sword (*kbadga*) and an arrow in the right hands and the stalk of a blue water lily (*nilotpala*) and a bow (*capa*) in the left hands. The deity is sometimes shown with other similar images in a *mandala*.

Southeast Bengal (*vanga-samatata*), now Bangladesh, was the home of learned Tantric Buddhist pandits, one of whom, the famous Atisha Shrijnana Dipankara (11th century), went to Tibet to preach Tantric Buddhism there.

TAPAS Although the root meaning of *tapas* is "heat," this versatile term can indicate creative cosmic energy, sexual fervor and chastity, ecstasy and pain, contemplative ardor and austerity, self-promotion and self-mortification. It held diverse meanings already in the Rig Veda and Atharva Veda before becoming the key feature of asceticism in Hinduism, Jainism, Buddhism, yoga, other philosophical systems, and in regional epics beyond the Mahābhārata and Rāmāyaṇa. Ecstatic and shamanic experiences associated with fire and heat in West and South Asia may be far older than the Vedas, as are Proto-Indo-European mythic and epic motifs of heated battle fury that rises in warrior gods and heroes. In the Rig Veda, Indra defeats Vritra with the weapon of *tapas*; ritual soma is empowered by *tapas*; ancient Rishis first envisioned the Vedas by cultivating *tapas*; ancestor-fathers (*pitris*) gained heaven by *tapas*; and the great gods of fire and sun, Agni and Sūrya, are natural reservoirs of *tapas*. In the tenth and latest book of the Rig Veda, hymns 129 and 190 separately diagram cosmogony: precosmic *tapas* is succeeded by desire (*kāma*), mind (*manas*), order (*rita*), and truth (*satya*). A famous passage in Atharva Veda 11.5 proclaims that a student learning the Vedas generates *tapas* that infuses the universe, including all its gods. Like the sun, he is a reservoir of productive *tapas*.

Brāhmaṇas that follow the earliest Vedas feature Prajāpati, famous as source of creation, Lord of Creatures, and successor to self-sacrificing Purusha, conceiving by desire born of heat. Giving up his body, as did Purusha, Prajāpati exhausts himself through self-heating in order to create by repeated emission. His *tapas* may last for a millennium. The human sacrificer identifies with both Prajāpati and his sacrificial fire (*Agni*) in a similar ritualized striving that simultaneously maintains the world and transcends it. The Upanishads provide further nuances to these homologies between inner and cosmic

heat. With the emergence of the Sanskrit epics and Purāṇas, and developing traditions of yoga and tantra, a wide-ranging pattern of ascetic practices is apparent. A *tapasvin*, one who cultivates *tapas*, usually through a solitary forest or mountain vigil, may be a celibate yogin or *yoginī*, god or goddess, *rishi* or his wife, king, demon, child, or even an animal. *Tapas* can be positive, yielding drought-ending rains, for example, or negative, producing heat that melts mountains and dries up oceans. Countless myths begin with a world threatened by an uncontrollable ascetic, demon, or deity whose silent *tapas* has the destructive power of a raging forest fire.

Tapas has a considerable role to play in Patañjali's Yoga Sūtras, its commentaries, and succeeding traditions. Three practices in *kriyā-yoga* are necessary to gain *samādhi*: self-study, devotion, and *tapas* that yields perfection (*siddhi*) of the body and senses. Perhaps it is in Jainism that *tapas* has its most vigorous adepts today. Both lay and monastic disciplines declare an increasingly rigorous program of austerities—fasting, meditation, chastity—necessary to burn off the impurities of existing karma, as in the burning of sin (*pāpman*) by *tapas* recommended in the Upanishads more than twenty-five centuries ago.

TATA, JAMSETJI N. (1839–1904), Indian industrialist. A Parsi pioneer of Indian trade and commerce, Jamsetji Nusserwanji Tata emerged as a beacon of hope

in the early phase of industrialization in India. He was born on 3 March 1839 in the town of Navsari in Gujarat, the son of Nusserwanji Tata, whose father was a Parsi (Zoroastrian) priest. Jamsetji is also known for his nationalist ideals and his humanitarian efforts to alleviate poverty in Indian society, pursuing what could be called “strategic philanthropy.”

Tata’s early education was in form of verbal instruction in the Zoroastrian prayers and scriptures. Later he attended Elphinstone College in Bombay (Mumbai), graduating in 1858. He acquired his business acumen from his father, starting a trading company with a capital of 21,000 rupees in 1868. Jamsetji went on to establish a cotton mill, the Central India Spinning, Wearing and Manufacturing Company, in Nagpur, Maharashtra, in 1874. This was followed by his establishment of the Empress Mills in Bombay on 1 January 1877, coinciding with the proclamation of Queen Victoria as the empress of India.

The last two decades of his life helped shape the course of industrialization and modernization in India, in terms of the iron and steel industries, hydroelectric power generation, and the establishment of educational institutions to promote science and technology. Though steel production started in 1912 and hydroelectric power generation in 1915, almost a decade after his death, they were visualized during his lifetime; in 1901 he had begun organizing the first large-scale ironworks in India. His son Dorabji J. Tata expanded the business under the name Tata and Sons.

Jamsetji Tata is also considered a forerunner in ushering in a professional code of conduct in the management of industries, including a provident fund for employees, decent working conditions, and management by a managing director and a board in an age of family oligarchs. Tata’s city of Jamshedpur remains a classic example of the realization of his concept of capital-intensive heavy industries, blended with a modern industrial township.

Tata’s Indian Institute of Science at Bangalore (Karnataka), which was established with his endowment, remains an outstanding symbol of corporate philosophy and citizenship. It was set up after an ideological battle with the colonial regime under Viceroy Lord Curzon, who questioned the academic credentials of Indian students. Jamsetji Tata was deeply concerned about British colonial rule and its impact on India’s economy, and he supported self-rule under British paramountcy. He attended the first session of the Indian National Congress Party in Bombay and remained committed to its cause until his death in May 1904.

TAXATION POLICY SINCE 1991 ECONOMIC REFORMS

A comparison of the current structures of India’s main central government taxes with those prevailing before 1991 indicates that, following international trends, there has been a sizable scaling back of rates in income, excise, and trade taxes. During this period, states also attempted to harmonize their sales tax rates and, most importantly, introduced a value-added tax (VAT) on 1 April 2005, comprising perhaps the most important subnational tax reform since the formation of the Indian Republic in 1950. The base of the central government’s service tax has been expanded steadily, though its full coordination into a national VAT remains to be accomplished. At the subnational level, an agreement among states to cut back incentives and exemptions met with partial success. The VAT should improve its adherence.

Before 1991 India’s overall tax structure had been broadly inefficient and quite inequitable. By international standards, the income tax rates had been high, and there was no VAT at the central level, except on a selective basis from the mid-1980s. The consumption tax base was narrow, with services excluded from the tax base, and customs duties were very high yet riddled with complex exemptions. Selected export duties reduced the international competitiveness of traditional exports. At the subnational level, state sales taxes caused heavy excess burdens due to input taxes getting built into the prices of final commodities, resulting in tax-on-tax, or cascading. The changes in India’s tax structure are generally agreed to have led to improvements in its efficiency and equity.

Nevertheless, one cost of the improvements has been the government’s inability to make up for revenue loss from rate decreases because of insufficient base expansion. The central government’s tax revenue collected since 1994 declined by 1 percent of gross domestic product (GDP) from what had been collected previously. Declines in customs and excise revenues were not compensated by the increase in income tax revenues. Some sunset tax exemption clauses were extended and new incentives crept in, despite the scaling back of central tax

incentives in the newly emerging economy. Attempts by the tax administration to expand the taxpayer net through registration drives and a new set of requirements for filing tax returns were initially successful. But further improvements would depend on the efficiency with which newly legislated information returns from third-parties is utilized and associated computer techniques implemented.

Though the states' tax collections improved somewhat, they could not fully compensate for the central government's tax revenue decline, so that the combined central and states tax/GDP ratio fell during the decade. Overall, the ramifications for the consolidated fiscal deficit and, in turn, for public debt could be significant. There are expectations that the VAT will be revenue enhancing. However, there may be an initial period of revenue loss since the VAT rates for all states are the same and, for some high-revenue states, the VAT rates are not revenue-neutral when compared to their earlier sales tax rates. As a result, the central government has agreed to compensate states for revenue loss in the initial three years.

Major Changes in Central Tax Structure

Income tax. By the mid-1990s, many developing countries had emerged from the reform process with much lower and fewer individual income tax rates, typically 15, 25, and 35 percent. Even India legislated comparable rates of 10, 20, and 30 percent in 1997–1998. Both the rates, and their number and dispersion, were reduced on efficiency grounds. Across the developing world, for example in East Asia and Latin America, corporate income tax rates were slashed. The scaling back of corporate income tax rates reflected, to some extent, the twin objectives of administrative feasibility and better tax compliance, but was motivated in particular by the forces of globalization and the increased international movement of capital. In India, corporate income tax rates for both domestic and foreign companies have been

reduced to 35 percent and 40 percent respectively (see Table 1).

Insufficiency in streamlining exemptions and incentives has adversely affected the full potential of revenue productivity in both the individual and corporate income tax. The coverage of tax incentives includes savings generation, regional development, capital investment, labor employment, research and technology, infrastructure development, exports, and charities, among others. The outcome has been a thinning out of the overall income tax base. However, income tax revenue in terms of GDP has steadily improved, reflecting administrative improvements, an expansion in the taxpayer net, and, possibly, favorable supply-side effects.

While industry tends to favor income tax incentives, these incentives have tended to benefit large entities, resulting in inequity within the corporate sector. The effective corporate tax rate is, therefore, skewed among companies. Highly generous depreciation rates were scaled back in 2005–2006 and that should correct for some of this problem. There is little doubt that without base broadening, income tax revenue is unlikely to be able to make up fully for the revenue losses emanating from structural reforms of production and trade taxes.

Central excises and customs. Central excises essentially operate as a VAT that has evolved over almost two decades, with a small beginning in 1986–1987, when a VAT-type credit mechanism for selected raw materials was introduced for the production of specified goods. In 1994–1995, capital goods were made creditable. The emerging quasi-VAT structure was termed Modified VAT or MODVAT. With a further effort to reduce the main rates to only two—8 and 16 percent—it was renamed the Central VAT, or CENVAT, in 2001.

Thus, the excises have been transformed to a VAT structure that is comparable to the successes and foibles of the VATs of most countries, with its administration carried out by the Customs and Excises Department of

the Ministry of Finance. The main, and quite important, difference is that while most countries that have introduced the VAT have tended to do so as a one-shot preparation and implementation package, India has done so in a seemingly deliberate, learning-by-doing approach. This provides an interesting alternative to the usual rapid approach to VAT introduction that has sometimes entailed strong opposition from the representative taxpayer in many parts of the world. Another crucial difference from other countries is that the base of CENVAT is truncated to manufacturing, given the taxation assignment of manufacturing only (and not sales) to the central government by the Constitution of India. This has led to much litigation by businesses on the definition of manufacturing to truncate its definition to avoid tax. The CENVAT base also gets eroded by various exemptions. More than 200 pages of the standard excise tariff, of some 700 pages, comprise exemptions. Each exemption has many entries, conditions, and lists, in turn containing hundreds of items in each list.

The rate structure of customs duties is widely recognized to have been rapidly scaled back over the last decade, the peak rate declining from 150 percent in 1991–1992 to 15 percent in 2005–2006. Nevertheless, the tendency to tinker with incentives and exemptions remains alive. This inherently leads to much complexity in interpretation and administration, let alone economic distortions.

State-Level Taxes

Multiple taxes and low buoyancy. The taxing powers of Indian states include a plethora of minor taxes and one major source of tax revenue, the sales tax, recently replaced by the VAT. In the major states (14 out of a total of 25), tax revenue has represented approximately 7 percent of the state domestic product in recent years. Indirect taxes include state excise duties, taxes on vehicles, purchase tax, entertainment tax, and some surcharges. The sales tax represents approximately 60 percent of total tax revenue, while excises are the second most important revenue source, in particular, on potable alcohol. Thus, Indian states have been assigned mainly indirect taxes by the Constitution. Direct tax powers include stamp duty and registration fee, profession tax, and an income tax on agriculture. The last is usually viewed as insufficiently exploited, while the profession tax is basically a fee with a low nominal ceiling imposed by the central government. Only the stamp duty and registration fee could be said to have been revenue productive among the direct taxes.

A disturbing factor has been the low buoyancy of revenue (i.e., the percentage response of tax revenue, including discretionary changes, to a percentage change in

GDP) from these various taxes. A tax-reform commission of the Government of Karnataka (2001) estimated that the buoyancies of various taxes fell sharply during the 1990s. Recommendations made in selected state-level tax reform studies—including Government of Karnataka (2000), Government of Madhya Pradesh (2001), Government of Maharashtra (2000), and Government of West Bengal (2001)—offer many ideas and directions in which structural reform could be undertaken, with a focus on extending the tax base.

Replacing sales tax with a VAT. Given the primary importance of the sales tax in revenue generation and its recent conversion to a state-level VAT, the main concerns and prospects are examined here. The general dilemma for a subnational VAT is that introducing a VAT at the central level is far easier than at the state level. Countries with the intention of introducing a subnational VAT have grappled with one main problem, that of structuring the VAT as a consumption tax, generally without an appropriate solution. Either they have introduced a VAT that is not a fully consumption-type (Brazil), or one that is administratively complex (Canada); or they have desisted from introducing it at all (United States), or have been debating its appropriate form for a considerable time (Argentina).

In India, all states—through an empowered committee of state finance ministers—have agreed to have the same rate structure—4 and 12.5 percent—for the VAT and the same exemptions. However, each state is allowed to have ten additional exempted items of local importance from a list of about forty items. Some goods such as petroleum products are outside the VAT base with a floor rate of 20 percent. Immediately after the VAT's introduction, however, the states felt compelled to add to the exemption list reflecting popular demand. This was especially to counterbalance the opposition-ruled states that decided not to introduce the VAT at the last moment. Out of a total of thirty-five, twenty-three states (and centrally administered Union Territories [UTs]) have introduced the VAT. Two UTs should introduce them soon, while two did not even have a sales tax. The remaining eight states that did not introduce the VAT are states with opposition governments.

The states have gone halfway in their attempt to move to a destination based VAT, though interstate trade continues to be taxed at 4 percent as before. Under the VAT, states will not give input tax credit in their own states for inputs bought in another state. However, when a good is exported to another state, input tax credit will be given against such export. It is anticipated that input tax credit for inputs imported from another state should be in place in 2006 or 2007. However, a solution would need to be found regarding how to capture the lost revenue currently

collected from this source. A computerized system for exchange of information among states, under development, would also need to be operational prior to implementation.

In sum, the states have made an impressive beginning in the introduction of their VAT, and as in the case of the central government's CENVAT, future evolution in its structure should result in its sophistication. The central government, in its catalytic role, has demonstrated its willingness to participate in the states' tax reform process. The combination demonstrates exemplary fiscal federal cooperation.

Tax Administration

Three issues in tax administration are closely connected to the success of any tax policy reform: expanding the taxpayer register; computerization; and implementation of the state-level VAT. Arguably the most successful action that has been undertaken in the area of central tax administration has been an impressive expansion of the taxpayer net for the income tax. In the mid-1990s, the taxpayer roll included some 14 million taxpayers, of which 10 million to 11 million were current. However, a rudimentary calculation of the potential number of taxpayers would be as follows. Of the total population of 1 billion, the taxable population is approximately 300 million. With an average household size of 5, that would imply 60 million potential taxpayers. Discounting 10 million for taxable agricultural households would result finally in a net 50 million taxable households. Thus only about 20 percent of potential taxpayers were within the taxpayer net.

In the second half of the 1990s, a voluntary disclosure program required individual income earners who possessed certain characteristics, such as ownership of property and telephones, and trips undertaken abroad, to register even if their taxable income was nil. The characteristics were further expanded with time so that more individuals would be required to register. By 2000 the taxpayer register had increased to over 20 million. Thus, within a relatively short period, the number of potential taxpayers doubled, an objective that had been unattainable for decades. In 2005 the register contained approximately 30 million, of which about 25 million are understood to be current.

While it has been found that the number of assesseees has not constrained tax collection, nevertheless there is a need to allocate adequate administrative resources to bring the medium to small taxpayer into the tax net. The strategy must include a credible threat of audits for all taxpayers. This draws attention to the second issue of the extent of resources the tax administration can devote to administering the returns of relatively small taxpayers. If the taxpayers that were rapidly brought into the tax net

realized that their chances of being assessed or audited were very small, then having a larger taxpayer register may not result in any significant increase in revenue collection in the long run. Needless to say, having a large taxpayer unit (LTU), which facilitates payment of all taxes by large taxpayers through a single window, is also important. India does not yet have an LTU but the intention to set one up has been announced.

In order to more effectively tackle the problem of tax evasion in a modern tax administration, a computerized information system needs to be quickly developed. For example, the income tax department collects a wide array of evidence during the course of any investigation. In addition to information from taxpayers' returns and other information returns, a large volume of information is collected during assessment, searches and seizures, and survey operations. Third-party information has been legislated from various sources, but this could lead to revenue enhancement only if such information is successfully collated, disseminated, and verified. Currently the income tax department has initiated massive information-technology transformation that is experiencing teething problems. Complete implementation will take a year or two. Customs operations, on the other hand, are focused specifically at import-export points, catering mainly to businesses, so computerization of customs procedures has moved further on. Excise or CENVAT entails cross-checks of invoices among buyer and seller. It poses more difficult challenges, and systems development is in a nascent, discussion stage regarding alternative models of computerization.

The success of implementation of the state VAT is dependent on the computerization of VAT procedures of various states. States have progressed at differing speeds in this area. The central government is lending a helping hand to some of the smaller states in the form of turnkey projects through computer training, installation, and implementation. A further challenge remains in the development of a comprehensive information exchange system among states that should enable the states to cross-check tax data across state borders, once the VAT evolves to the destination principle. The cost of developing such a system is being shared between the center and the states.

The loss in the tax/GDP ratio could be made up and further resource mobilization successfully achieved only through an expansion of the tax base. Thus exemptions and incentives for both direct and indirect taxes at the central level need to be scaled back significantly. On the administration side, computerization is imperative. At the state level, there is generally a high expectation that, through a broad tax base, and by its extension to the retail arena, the VAT would be revenue productive in the medium term.

In the long term, the goal for the reform of consumption taxation must be a national VAT. Many strides have been made, though much remains to be done. The process should not stop with the introduction of the state level VAT operating side by side with the central CENVAT. A national two-tier VAT, based on the destination principle, would comprise both the central and state levels. The center and states would appropriately share services as a tax base, reflecting cross-border or intraborder consumption, respectively. The challenge would be to achieve cooperation in information sharing between the central government and the states, and among the states themselves, for the concurrent VAT to operate successfully. Only then could the national VAT comprise a comprehensive consumption tax that would cover both goods and services at all subnational levels.

TECHNICAL CHANGE IN AGRICULTURE, 1952–2000 The fragility of the Indian food production and distribution system was exposed after the disastrous Bengal famine in 1943. Then, following partition, about 32 percent of total irrigated land went to Pakistan. Consequently, food production in India had fallen short of demand and the prices of food grains surged significantly. In order to increase the food grain production levels, the cultivated area under food crops was expanded through special programs, even in the early 1940s, with such initiatives as the Grow More Food Campaign. Further, on the basis of the recommendations of the Food Grain Policy Committee in 1947, the reclamation of 25 million acres (10 million hectares) of land was undertaken to expand the cultivated area under food crops. But this singular focus on food grain production led to an acute shortage in cotton and other fiber production in the late 1940s, and this problem was addressed through an Integrated Production Programme initiated in 1950. The consequent increase in food production was largely achieved through expansion of cultivated area during the 1950s (see Table 1). However, due to the limited scope for further expansion in cultivated area, agricultural production soon became stagnant and even declined during the subsequent drought years. At this stage, the vital role of technology was realized, particularly the land-augmenting technology that enhances the yield per unit of land. The introduction of technical changes through improved seed, fertilizer, irrigation, mechanization, and plant protection have brought dramatic changes in agricultural production since the 1950s. These technical changes in agriculture have proceeded in a step-by-step manner; initially, the focus was on the development of land, irrigation, and other inputs; subsequently, the emphasis was on high-yielding varieties (HYVs) and improved "package of practices"; and finally, postharvest and marketing aspects were explored. Following this progression, technical developments in agriculture from 1952 to 2000 can be spread across three distinct phases, based on the nature and progress of technical changes: the pre-"revolution" period, the period of production revolution, and the period of market reforms.

Pre-Revolution Period (1952–1966)

Though the major breakthrough in agricultural production had come through the "Green Revolution," which introduced HYVs, steps toward land-augmenting technical changes were actually initiated in the 1950s. In order to address the problems of food shortage and the resultant rise in food prices, the agriculture sector was given the highest priority in India's first Five-Year Plan. Focus was placed on expansion of irrigation, land reclamation, and the domestic production of inorganic fertilizers.

Rose Cultivation for Export. In recent years, rose cultivation—which once seemed a secure industry in states like Karnataka, Tamil Nadu, West Bengal, Andhra Pradesh, and Maharashtra—has faced stiff competition in the form of cheaper imports from Africa. With many small growers being driven out of business, others are trying to survive by exploring new overseas markets. DINESH KHANNA.

Land reclamation and development. As a part of the Grow More Food Campaign, the reclamation of nearly 25 million acres (10 million hectares) of land was set as a target, and land reclamation was undertaken on a large scale across India. Nearly 188,000 acres (76,000 hectares) of land was reclaimed in the Tarai region itself, through a process of mechanized jungle clearing and provision of drainage, between 1948 and 1960. Consequently, the net area sown had gone up from about 297 million acres (120 million hectares) in 1952–1953 to about 341 million acres (138 million hectares) in 1966–1967, and the respective annual average growth rates (net as well as gross area sown) were the maximum during the 1950s, compared to any other period (see Table 1).

Irrigation. A number of major irrigation projects were completed during the first Five-Year Plan, including the

Tungabhadra Project (1956), Maithon (1957), Konar (1955), Kakarpara (1957), Gandhi Sagar (1960), Lower Bhawani (1955), Ghataprabha Left Bank (1956), and Hirakud Dam (1956). In addition to surface irrigation, groundwater irrigation through tube wells gained popularity in the 1950s. Further, mechanization of irrigation operations, as reflected by the steep increase in number of diesel engines and electric pumps, picked up momentum in the late 1950s. As a result, the extent of irrigated area in the total cultivated area had gone up from about 17 percent in the 1950s to about 20 percent in the 1960s (see Table 1).

Mechanization and rural electrification. The mechanization of agriculture was also initiated in the early 1950s but was largely restricted to irrigation operation (diesel engines and electric motors) and included to a

limited extent the use of tractors. The number of electric pumps for irrigation purposes increased steeply, from about 56,000 at the end of first plan period to more than 500,000 by the end of third plan period, as a result of the expansion in rural electrification launched during the first plan period.

Fertilizer use. Though the role of fertilizers as an important source of nutrients and a substitute for organic manures was recognized, their use was not widespread and was restricted to commercial crops in southern regions of the country until 1950. In order to create awareness among farmers about the importance and methods of fertilizer application, a number of programs were created, such as the Agricultural Technical Assistance Programme (1951) and the Fertilizer Demonstration Programme (1954–1956). Soil-testing laboratories were also established to collect and analyze soil samples and to prepare a nutrient status map of the villages. As a result, the application of fertilizers increased, with an average annual growth rate of about 20 percent in the 1950s and 25 percent in the 1960s. The consumption of phosphatic and potashic fertilizers was almost negligible until the 1950s but started rising in the subsequent period; the growth in phosphatic and potashic fertilizer application outpaced that of nitrogenous fertilizers during the 1950s and 1960s, although the use was judicious in absolute quantities.

Package of practices. Following an increase in the first plan period, the food grain output actually declined in the second plan period as the result of successive drought years. As a result, the gap between the targeted and actual production became more pronounced. In view of the serious food deficit situation, the government of India invited the Ford Foundation Team to study India's food production problems and to help in shaping proposals for a coordinated effort to increase food production on an emergency basis. Based on the recommendations of the

team, the Intensive Agricultural Development Programme (IADP) was initiated, which featured a “package of practices” for each crop, based on recent research findings. According to the team, the package of practices, which included irrigation, improved seed, mechanization, fertilizers, and pesticides, could lead to a remarkable increase in crop production only if all practices were adopted in particular combination with one another. Though the program was successful in increasing yields to some extent during the early 1960s, the success was restricted to resource-endowed areas that accounted for only 5 percent of the total cultivated area in the country. Further, severe drought in 1965–1966 and 1966–1967 led to a sharp fall in food grains, to 71 million tons (72 million tonnes) from 87 million tons (89 million tonnes) in 1964–1965. Consequently, food grain imports reached more than 9.8 million tons (10 million tonnes) in 1966–1967.

Period of Production Revolution (1966–1990)

The IADP program, or package of practices, could not, however, solve the problem of shortage in food grain production completely, despite the hope for increasing yield levels through better practices. The reason for the program's limited success was recognized to be an inherent problem associated with the traditional improved varieties of wheat and rice. After the application of high doses of fertilizers, those varieties grew taller, with slim stems, and had a tendency to fall over at the time of maturity, notwithstanding the grain weight. Hence, the immediate focus was to find a technology through which vertical growth of improved varieties could be restricted.

Green Revolution (1966–1980). During the same period, U.S. agronomist Norman E. Borlaug (often called the “father of the Green Revolution”), director of the Cooperative Wheat Research and Production Program in Mexico, was successfully incorporating dwarfing

genes in high-yielding wheat varieties by crossing the short-stemmed germ plasm from Norin 10 with high-yielding Mexican wheat varieties capable of responding to high doses of fertilizers and irrigation. The Mexican dwarf wheat varieties recorded increases as high as 400 percent in their yields in 1965 over that in 1950. Soon, India had imported the dwarf germ plasm (Lerma Rojo 64 and Sonara 64) from Mexico, and Indian scientists developed high-yielding, pest-resistant, and input-responsive dwarf wheat varieties by crossing these lines with local high-yielding varieties.

Similarly, the first semidwarf *indica* rice variety, Taichung Native 1, was developed by crossing a semi-dwarf *indica* variety, Dee-gee-woo-gen, with a drought-resistant variety, 'sai-Yuan-Chung, at the Taichung District Agricultural Improvement Station in Taiwan in 1956. Subsequently, the rice breeders at the International Rice Research Institute made several crosses of Dee-gee-woo-gen and ultimately developed new semi-dwarf rice varieties (IR 8, IR 5, IR 20, IR 22, and IR 24) with heavy stalks, responsive to high fertilizer doses and capable of maturing in 100 days instead of 160 days. India, being the world's largest source of rice germ plasm, had actively participated and cooperated in developing the new rice varieties. The high-yielding semidwarf rice breeding lines were introduced, and numerous improved varieties were developed with the active participation of the Central Rice Research Institute, the All-India Coordinated Rice Improvement Programme, and various state agricultural universities. Finally, high-yielding rice varieties were released for large-scale commercial cultivation all over India in 1966. In addition, high-yielding varieties of coarse cereals, including sorghum, *bajra*, and maize, were also developed through hybridization and were released for large-scale commercial cultivation during the late 1960s.

With an established network through IADP, the cultivation of high-yielding varieties spread rapidly across the

country. Technological changes in the form of high-yielding dwarf wheat varieties became an instant success in India. Thus began the golden period in Indian agriculture called the "Green Revolution." The spread of HYVs of rice was relatively slow compared to that of wheat. The area under HYVs of wheat reached more than 60 percent of total wheat cultivated by the mid-1970s, while it took fifteen more years (until 1990–1991) to reach the same level (64 percent) for rice (see Table 2). The expansion in cultivated area under HYVs led to a steep increase in rice production in the subsequent years, from about 31.5 million tons (32 million tonnes) in the triennium ending in 1968 to about 49 million tons (50 million tonnes) in the triennium ending in 1980. However, the increase in production was much steeper in the 1980s, rising to 71.8 million tons (73 million tonnes) in the triennium ending in 1991 (see Table 3). Adoption of HYVs of *jowar*, *bajra*, and maize was slow, and most of the expansion took place after the mid-1980s. Consequently, the growth of food grain production was the highest during the 1980s, compared to any other period.

Considering the frequency of drought, a characteristic of Indian agriculture, assured irrigation has become a prerequisite for intensifying agricultural production in India, particularly following the introduction of HYVs. A number of major irrigation projects were completed, and the area under irrigation expanded rapidly in the 1960s and 1970s (see Table 1). Apart from major irrigation projects, emphasis was also placed on increasing minor irrigation projects through groundwater exploitation. Consequently, the total area under irrigation grew from about 55.8 million acres (22.6 million hectares) in 1950–1951 to about 123 million acres (50 million hectares) in 1979–1980. Most of this increase was brought about through minor irrigation projects that tapped groundwater to provide assured irrigation.

Considering the limitations to expanding irrigation through canals as well as groundwater, agricultural scientists and planners started promoting rain-fed agriculture through a promising "watershed" technology during the 1980s. A number of watershed projects emerged in the subsequent period, sponsored by domestic as well as external sources. The amount invested in watershed development reached U.S.\$500 million by the late 1990s. Further, in order to conserve soil and water, particularly in rain-fed areas, technical changes in the form of sprinklers and drip irrigation methods were also promoted through the provision of subsidies in the 1980s and 1990s.

Plant protection, though practiced in Indian agriculture since ancient times, became more vital with the introduction of HYVs. The HYVs, due to their responsiveness to fertilizers, particularly to nitrogenous fertilizers, have a tendency to grow succulent and become

susceptible to pests and diseases. With increasing irrigation and fertilizer application, the growth of weeds also increased. As a measure of plant protection, the first Pest and Disease Surveillance Service was organized in 1969 in selected districts of the IADP. The service was extended to other parts of the country in the subsequent period. With the growing awareness of pests and their control, the application of chemicals for plant protection increased sharply, from about 13,800 tons (14,000 tonnes) in 1960–1961 to about 59,000 tons (60,000 tonnes) in 1978–1979. Application of pesticides became an important component of crop production, particularly in the case of commercial crops like cotton, tobacco, and sugarcane.

Similar to the other inputs, a steep increase in farm mechanization was observed in the production revolution period. Mechanization of irrigation operation expanded rapidly and resulted in a multiplier effect on crop production through crop intensification. This led to the mechanization of other farm operations to ensure timeliness. A steep growth in the number of tractors and other major farm machinery was evident during late 1960s and 1970s.

Yellow (Oilseed) Revolution (1986–1990). The Green Revolution could be called a “cereal revolution,” as the thrust was to increase food production to meet the domestic consumption demand. As a result, other crops (oilseeds and pulses [legumes]) were left untouched, and their output levels remained stagnant in the 1970s. In view of the dismal performance of oilseeds during the 1960s and 1970s, the government of India created the Technology Mission on Oilseeds (TMO) in May 1986. The objective of the TMO was to achieve self-sufficiency in edible oils; to achieve this, the TMO implemented the introduction of HYVs of oilseeds, together with the adoption of improved production technology, a better supply of inputs, and extension services and postharvest technologies. Consequently, a major increase in oilseed production was achieved; the production of oilseeds increased from 10.7 million tons (10.83 million tonnes) in 1985–1986 to 24.6 million tons (25 million tonnes) in the late 1990s. Following the success in oilseed production, other crops, including pulses, oil palm, and maize, were brought under the TMO in 1990, 1992–1993, and 1995–1996, respectively.

White Revolution (1970–1996). Technical changes in the livestock sector, including cross-breeding, frozen semen technology, and artificial insemination, were initiated in the 1950s. But the performance of livestock as a whole, and the dairy subsector in particular, was disappointing, with near zero growth during the 1960s. In light of this, the government initiated a massive dairy development program, popularly known as Operation

Flood, in 1970. Veghese Kurien was the principal architect of the program, which was implemented in three phases from 1971 to 1996, with support from the European Economic Community, the World Food Programme, and a soft loan from the World Bank.

The aim of the program was to expand milk production through processing and marketing facilities. Toward this objective, milk producers’ cooperatives were organized to collect, process, and sell milk to achieve a secured market and remunerative prices. Further, in order to enhance milk production, inputs such as better feed and fodder, breed improvement through artificial insemination, and disease control measures were also arranged through cooperatives. This coordinated effort led to an increase in milk production and ushered in an era of “White Revolution.” During this period, milk production increased at an annual average growth of about 5 percent. Consequently, milk production in India increased from 21.6 million tons (22 million tonnes) in 1970 to 29.6 million tons (30.1 million tonnes) in 1980–1981 (first phase) and to 78.7 million tons (80 million tonnes) in 2000–2001 (following the second and third phases).

Blue Revolution. Fishing has been practiced traditionally in the coastal states of India since ancient times. The importance of introducing scientific fishing to increase productivity was recognized, and the Indian Council of Agricultural Research (ICAR) implemented an All India Coordinated Research Project on Brackishwater Fish Farming (1973–1984). The objective of the program was to develop and test various farming technologies under different agro-climatic conditions of the country. The main center of the project was located in West Bengal; other centers were located in Orissa, Andhra Pradesh, Tamil Nadu, Kerala, and Goa for demonstrating the technologies to small-scale farmers. In addition, shrimp hatchery technology was also introduced into the country, and two commercial hatcheries were established in

the late 1980s with an initiative from the Marine Products Export Development Authority. As a result, the production of fisheries, particularly of inland fisheries, increased significantly, at an average annual growth rate of 7.1 percent and 6.2 percent during the 1980s and 1990s, respectively. By 2002 India had become the third largest producer of fish. The growth of inland fisheries outpaced the growth in marine fisheries, primarily due to a rapid expansion of shrimp farming in the coastal states of the country.

Period of Market Reforms (1991–2000)

There were no significant economic reforms directed toward agriculture, except the removal of the quota system with the inception of the World Trade Organization. However, the devaluation of the rupee in 1991, as part of the financial reforms, triggered the growth of agricultural exports. Among agricultural products, exports of fruits and vegetables, meat, and marine products recorded a significant increase throughout the 1990s as a result of growing international trade in these products, underscoring the significance of postharvest and agro-processing technology in promoting exports.

Agro-processing. The growing market reforms and commercialization of agriculture has created a need for processing and postharvest handling of agricultural produce. Processing adds value, enhances shelf life, and minimizes losses. As the productivity levels of almost all crops reached near stagnation in the 1990s, processing technology emerged as an alternative for increasing the availability of food products through minimizing losses and enhancing shelf life. In addition, growing urbanization has also led to a significant increase in domestic demand for processed and packaged agricultural products. In order to encourage food processing, the government of India has taken a number of steps, first creating the Ministry for Food Processing Industries in 1988. The ministry has taken many initiatives, such as integrated food law, the creation of cold storage facilities, and the establishment of food parks (centers for distribution of all the processed grains and horticultural products across the country). As a result, the food processing industry expanded significantly in 1990s. Recognizing the potential and comparative advantage that India has in the agro-processing industry, a number of agro-export zones were established across the country. Thus, it is the changes in postharvest technology that have dominated Indian agriculture since the 1990s.

Genetically engineered crop varieties. Near stagnation in yields of all field crops in the 1990s created the need to look for alternative technology that can further boost crop yields. In this context, genetic engineering appeared to be a promising choice. Genetically engineering has been

widely used in the pharmaceutical industry, but its entry into the agriculture sector has been surrounded by apprehensions. In India, the efforts initiated in the late 1990s to release the first genetically engineered crop, “Bt cotton,” were not successful until 2002, due to strong protests from environmentalists. On the other hand, several research units under ICAR and state agricultural universities have been working to develop genetically modified crops suitable for Indian conditions. However, the dilemmas concerning the commercial cultivation of genetically engineered crop varieties still persist, owing to the serious concerns of biosafety and biodiversity.

TEMPLE TYPES (STYLES) OF INDIA The forms of the Hindu temple are based on a rich blending of imageries, including most significantly those drawn from the ritual requirements of Vedic sacrifice and the hierarchical arrangements and towered forms of the royal palace. The geographic spread of the styles through which this imagery is expressed roughly parallels that of India’s numerous languages, in a wide range of local vernaculars that fit generally into northern, Nāgara, and southern, Dravida, regional traditions. Their chronological development is framed by the regnal eras of the dynastic powers governing their patronage.

Though we may consider any Indian shrine for icon worship a Hindu temple, the elite, refined (*samskrita*)

temples constructed in brick and stone, or excavated from the living rock of a promontory, have received the most prestigious patronage over the centuries and—because they have survived—the greatest recognition by modern cultural historians. The vast majority of these *devasthāna* or *prāsāda* (places or palaces of the gods) are Brahmanical, but Jains, Buddhists, and other sects have had closely comparable temples constructed or excavated by the same communities of artisans and more or less according to the same quasi-textual principles. Their remains in the ancient period extend beyond the borders of modern India to the historical limits of Indic culture, reaching as far north and west as Afghanistan, as far east as Bangladesh, south to the island of Sri Lanka.

The oldest evidence of these temples can be traced to the emergence of monumental arts in stone of the Maurya period of the third century B.C. The rock-cut Lomas Rishi and Sudhama excavations of the Barabar Hills in Bihar preserve in their outlines the essential form that has lasted to this day, of inner and outer chambers, constructed on carefully proportioned, symmetrical, geometric layouts, oriented to the celestial axes, and crowned with domed or vaulted ceilings. The Barabar Hills excavations were created for the Ajivika sect. Among the earliest representations we have of a Brahmanical temple is the stone relief depiction of the domed Sudhamā Deva Sabhā (the Holy Assembly Hall of the Gods) enshrining the Buddha's turban as an object of veneration, attached to the multistoried Vijayanta Paśāde (Victorious Palace) of Indra, on a railing pillar from the Buddhist stupa at Bharhut, from about 100 B.C. It shows a design quite similar to the Barabar Hills pair, of a rectilinear hall connecting to a domed chamber. As the palace of a Brahmanical deity enshrining an object of worship, it is quite literally a Hindu temple. Both designs represent wood-framed structures, carefully articulated to display refined carpentry and joinery, as contrasted with the less refined wattle and daub constructions represented for common, vernacular dwellings in early Buddhist reliefs.

The oldest texts referring to the construction of Hindu temples, such as the sixth-century A.D. Brihat Saṃhitā, and the later Vāstu Shāstras, like the Mayamata, explain the devotional temple for the worship of Purāṇic deities as the equivalent of a Vedic sacrifice, both in the process by which the metaphysical (*sūkṣma*) significance is implanted in its physical (*sthūla*) structure and in the benefits its construction achieves for its *yajamana* (sacrificer) patron. Prior to the construction of the temple, the metaphysical design was inscribed upon the chosen site as a *vāstu mandala* (sacred grid) with its various *pada* (squares) assigned to different deities. The main deity occupies the central squares of the grid, with subordinate

Mahabodhi temple complex in Bodh Gayā. Dating from the late Gupta period (fifth or sixth century), it is one of the earliest Buddhist temples built entirely in brick still standing in India. LINDSAY HEBBERD / CORBIS.

deities occupying the separate *pada*, cells of the inner and outer surrounding bands of the grid. These geometric forms are not a ground plan for the temple, but a conceptual model for the *parivārālaya-prākāra*, the concentric cloisters of chambers surrounding the *deva* (king or deity), which is the ideal form of both the royal palace and the refined Hindu temple.

Unlike the architectural systems of Europe or East Asia, where structures are conceptualized as being assembled from bays, measuring the space from one support column to the next, Hindu temples are conceived as assemblages of compartments. Even more distinctively, the Brahmanical temple is conceived as a transcendental entity. Once consecrated, it is as much the body of the gods it enshrines as the sanctum icons that represent them in figurative and symbolic form. As the worshipers pass through the temple's halls on their way to the witness the deity in its sanctum, they pass within the cloister

Gangotri Temple. In the hinterlands of the Himalayas, in Uttar Pradesh, the River Ganges, the “stream of life,” begins its flow. Built in the eighteenth century, the Gangotri temple marks this spot and is the destination of many Hindu pilgrims who often perform ritual in the surrounding cascading waters. CHRIS LISLE / CORBIS.

of compartments inhabited by the main god’s surrounding divinities.

The forms of the Vedic altars, ritual *mandalas*, cosmic mountains, and gods’ chariots are all models for the stone temple, but it is the imagery of the royal palace that dominates the temple’s visible forms and ritual operation. The temple is the god’s palace, constructed as a handsome, domed and turreted mansion of inner and outer quarters, where the deity is represented in human (as well as symbolic) form, surrounded by its court of subordinate beings and served by its human priests and worshipers. Though they are mural structures of brick or stone masonry, these celestial mansions are articulated to represent the wood frame construction, with plaster walls and thatched roofs, of contemporaneous palaces. The hierarchy of the central deity surrounded by ranges of demigods and lesser beings, protected by walls excluding

those of the lowest castes, proclaims the social hierarchy of the *varṇa* system.

The simplest temples are (usually though not necessarily) square sanctums (*garbha griha*) covered by vaulted towers, oriented toward one of the cardinal directions. Normally the sanctum is preceded by a porch or a hall where worshipers can go to approach the god, and the temple sanctum carries a tower representing multiple stories, to signify the enclosing rings of encircling deities, the *parivāra-devatā*, of the god’s retinue, described in the Shāstras.

Textual references to these temples go back to Pāṇini, in the fourth century B.C. The earliest structural temple remains are archaeological fragments, and inscriptions on structures that have long since disintegrated. The earliest preserved of these sites, like Nagari and Nagarjunakonda, show elongated halls on rectilinear and apsidal plans, located within walled compounds more or less in the forms seen more fully in the interiors of the Buddhist *caitya griha* at the contemporaneous rock-hewn sites of Bhaja, Nasik, and Ajanta.

Historic Remains

The most striking element of temple form, from the earliest examples to the present, have been the towers—called *vimāna* in the south, *shikhara* in the north—that reach over their sanctums, indicating the location of the deity, and symbolically depicting the deity as surrounded by its numerous subordinate deities. The ornate forms of these towers are the most prominent displays of their distinctive styles.

The Shilpa Shāstra texts divide the myriad temple types into Nāgara (northern), Dravida (southern), and Vesera (mixed), according to the shapes of their towers. The full scope of these traditions extends beyond the tower forms to their entire structural and ornamental vocabularies, including pillar, doorway, wall niche, architrave, and molding orders. The great majority of fine stone temples can be classed into local varieties of northern or southern regional traditions, or a combination of the two.

The locations of the Nāgara and Dravida traditions coincide roughly with the regions associated with Indo-European and Dravidian language use, upon which much Indic culture is organized, expressing a conscious alignment with that pattern. The Dravida traditions, with their additive combination of fully formed miniature *kūta* (sanctum depictions) are in accord with the agglutinative nature of Dravidian languages, much as the highly elided, nonagglutinative form of the Nāgara traditions suit Indo-European languages. Geographically the Nāgara style extends farther south than the concentration of Indo-

European language use, beyond the Krishna and Tungabhadra rivers, which are more or less the northern limit of the Dravida style. Many sorts of Vesera (mixed) style temples can be found in the upper Krishna and Tungabhadra basins, where the two macroregions overlap.

The earliest surviving Brahmanical temple remains, such as the brick temple at Bhitargaon and the rock-cut shrines of Udayagiri Vidisa, come from the fifth century A.D. and display the gradual emergence of the two style traditions. By the sixth century, temples in a number of places show them in their distinctive forms.

The Dravida Style

The mid-sixth century A.D. South Temple of the Rāvaṇa Phadi complex at Aihole offers us what is likely the simplest and possibly the earliest surviving example of the Dravida style. It is a cubical sanctum, raised on a molded basement, crowned by a four-sided cupola, and preceded by a porch. It is a simple *ekatala vimāna* (single-story sanctum). The Dravida style is characterized by the crowning of every significant element with a domed superstructure, if not such a square vault then a round, apsidal, eight-sided, or oblong (barrel) vault.

A glance toward the contemporaneous rock-cut shrine beside the South Temple shows a facade representing a pair of comparable domed pavilions flanking its entrance. As with other rock-cut temples of South Asia, the promontory into which the temple is excavated expresses its tower. A difference between the Nidhi (wealth deity) shrines, represented in relief on the cave facade, and the freestanding South Temple is the presence of a dormer window, *gavāksha*, in the center of these domes.

The addition and multiplication of such architectural details as this *gavāksha* dormer is one of the key means of developing temple design from the earliest period to this one. The other is the more subtle contouring, proportion, and ornamentation of these forms. The two-story Banantigudi, at nearby Mahakuta, adds a *gavāksha* to the dome and raises it over a pilaster-articulated second story. The subsequent Chalukya Dravida temple on the north fort at Badami raises this simple four-sided dome to a third story, articulates its supporting stories as a *hāra* (cloister) of *kūta* (cells), and sets the entire multistoried tower within a hall articulated to represent a *parivārālaya-prākāra* ring of miniature chambers set in a connecting gallery. By the early eighth century, Dravida temples, like the Malegitti at Badami and the Kailasanatha at Kanchipuram, display eight-sided domes, buttressed by miniature *kūta* and raised over multiple *parivārālaya* stories and surrounding halls.

In the Kailasanatha we can see this essential Dravida prototype articulated spatially in a towered sanctum

buttressed by surrounding chambers, set within a courtyard ringed by a free-standing *parivārālaya-prākāra* (courtyard wall of subdeity sanctums). The Virupaksha and Mallikarjuna temples at Pattadakal both display *parivārālaya-prākāra*. This is not because, as was once believed, they were copied from the Kailasanatha, but because this multiplication and elaboration of vaulted pavilions in concentric hierarchies is the essential pattern of the Dravida temple, recognizable in the decorative imagery of its towers, wall entablatures, and door and window pediments.

As the northern and southern style regions coincide roughly with the linguistic-cultural macroregions, the individual Dravida traditions in stone were developed within the vernacular-linguistic regions represented roughly by the modern states of Tamil Nadu, Kerala, Karnataka, and Andhra Pradesh. Within each region they have been most effectively distinguished by the dynasties that have patronized their creation. The imperial Chalukya developed the earliest Dravida tradition of the Kannada-speaking Deccan, and the imperial Pallava the earliest of the Tamil coastal plain. The subsequent traditions in the Tamil region, associated with the patronage of the earlier and later Chola dynasties (ninth to thirteenth centuries), carry on directly from the Pallava in relatively similar forms, enriching some decorative and structural elements and adding others. In the Chola's royal Brihadesvara temple at Tanjavur, the Dravida temple *vimāna* reaches its greatest height, at 216 feet (66 m), and begins to display the multiplication of concentric *prākāra* enclosures and barrel-vaulted *gōpura* (gateways) that become characteristic of larger second-millennium complexes.

We can see an example of this later, developed Dravida temple complex in the multiple sanctums, halls, and enclosing courtyards, of the Bhaktavatsaleshvara at Tirukkalukkundram. The Bhaktavatsaleshvara, which includes structures from as early as the ninth century at its core, reached its present size in the seventeenth century. Though early temple texts require the tower of the main deity to be the tallest structure at a site, it is interesting to note that with the multiplication of concentric temple walls and gateways, we find *gōpura* towers increasing in height as one moves away from the main temple, in a reversal of previously established hierarchy.

With the Vijayanagara dynasties from the fourteenth to the mid-sixteenth centuries, the Tamil regional formula of vast walled compounds was spread to the Deccan, and there is a multiplication of broad, open, multipillared pavilions with elaborate figurative piers. The Kannada Dravida traditions of the Chalukya of Kalyani in the eleventh and twelfth centuries are mostly, though not always, characterized by increasingly profuse

decorative detail, and a multiplication of sanctums off a common hall. From the twelfth century on, decorative *kūta* of a distinctively Nāgara type are incorporated in these designs. Thus an essentially Dravida tradition becomes subtly Vesera.

In the Telugu-speaking regions of the Deccan are found styles quite comparable to, but distinct from, those in the Kannada regions. The earliest surviving structural temples there were created under an eastern branch of the Chalukya, carrying a similarly simple, early Dravida style into the ninth and tenth centuries with a growing profusion of ornamentation. The Kalyani Chalukya tradition of Karnataka crossed into Andhra with the spread of that dynasty's power. The progressively enriched and elaborated Deccan Dravida temples of the Telugu Choda, Kakatiya, and Reddi, from the eleventh through the mid-fourteenth centuries, are marked by increasingly elaborate architectural articulation and the development of finely stylized, large-scale figurative imagery.

The most striking variations within the Dravida tradition are found in the styles of the western coastal plain of Kerala and Karnataka, where expansive wood frame roofs crown the designs and wood details take over important elements of the internal decoration as well. That these are essentially Dravida style designs can be seen from the domed pavilions depicted in its stone niche pediments and entablatures, though the dramatic visual impact of its wooden roofs leave much of these walls in shadow, obscuring this element at first glance. The temples of coastal Karnataka combine the wooden superstructures and ornamentation of the southwest coast with Deccan Dravida stone articulation.

While the conservative Dravida traditions of Tamil Nadu have been maintained within a relatively narrow range up to the modern period, changing in proportion, elaboration, and ornamentation but relatively little in their basic forms, the styles of the west coast and the Deccan have continued to create a wide range of local variation.

The Nāgara Style

The Nāgara style articulates the same underlying symbolic forms seen in Dravida temples, in an alternative stylistic tradition. Its distinctive curvilinear *latina* tower presents a more vertical and compactly unified representation of these forms than the layered, horizontal, and segmental display of the Dravida style. It is not as obvious at first glance that the rings of miniature chambers set in concentric hierarchies, raised one story above the other, are depicted on the Nāgara tower, as they are relatively obscured by the abbreviations and fusions of its decorative vocabulary and their subordination to the curvilinear outline and vertical ribs. Where Dravida

forms are composed of separate *kūta* chambers lined up in distinct rows, the *latina shikbara* represents its collection of miniature chambers more subtly, through contractions and combinations, subordinated to the commanding unity of its parabolic silhouette.

The famous Kumrahar plaque of the second century, apparently depicting an early incarnation of the Mahabodhi temple at Bodh Gayā, reveals that this variation existed from an early period. It represents a *shikbara* temple, with four stories rising over its sanctum, the miniature chambers of the upper levels represented not by fully articulated *kūta* but by the abbreviation of *gavāksha* dormers.

At Mahakuta, where eighth-century Nāgara and Dravida temples stand side by side, we can see a clear example of the *latina* tower on the Sangamesvara temple. The wall of the Sangamesvara has a raised central image niche at its center, and subordinated *udgama* (interconnected *gavāksha*) pediments on either side, representing smaller, flanking chambers. The Nāgara tower above continues this imagery with a raised central rib crowning the central niche, flanked by corner ribs over the subordinate bays. Within its curvilinear outline, the Nāgara tower blends its horizontal layers and vertical ribs into a complex unity, capped by the cogged wheel of the crowning *āmalaka*, which is the Nāgara's equivalent of the domical cupola of the Dravida style. (Both traditions add a *kalasha*, a ritual water vessel, above the crown, to signify the temple's ritual consecration.) A continuous *udgama* network blends the central rib into a single unit. The corner ribs, however, are divided into Nāgara *kūta* formed out of two *udgama* layers capped by a corner *āmalaka*. Thus, like the Dravida's *vimāna* tower, the Nāgara's *shikbara* tower represents a palatial, skyscraper crown for the sanctum, composed of story upon story of cloistered chambers.

If we shift our gaze from the Deccan-Nāgara to the Kalinga-Nāgara of Mukhalingam, in coastal Andhra, we can see the *parivārālaya-prākāra* represented on the *mandapa* of the ninth-century Madhukesvara. The Madhukesvara's hall has enlarged replicas of its curvilinear tower at its four corners, linked by a row of miniature towers in reliefs, representing a cloister of Nāgara cells. Comparable *parivārālaya* of cells are represented on most Nāgara sanctums and halls, though this may be obscured by the richness of the ornamentation, depicting the abbreviations and elaborations of the underlying forms.

Nāgara temple designers employed an impressive creativity in devising the bewildering variety of rich decorative schemes to express the uniqueness of each subregional style and each individual temple. The visual emphasis of the tenth-century Lakshmaṇa temple at Khajuraho, in central India, stresses its horizontal layers of molded

basements, and walls with figures stacked one over the other, before taking off vertically in its rippling towers. Here too every element is organized into a distinguishable sequence of linked cells, each crowned with an appropriate tower of its own.

The Lakshmaṇa temple shows an evolutionary variation of the Nāgara's curvilinear tower, where the *latina* core is buttressed by *urabshringa* (half-tower) forms on each side, and smaller quarter and three-quarter *shikhara* representations below. Each of these abbreviated towers represents the chamber of an attendant deity. But, in the nonagglutinative northern fashion, the individual cells are integrated into the compound whole through the abbreviations and elisions of modules ambiguously alluded to, rather than literally enunciated.

Preceding the Lakshmaṇa's compound tower, we can see lower, pyramidal roofs, covering its hall and two porches. These layered roofs complement the dramatic verticality of sanctum towers while distinguishing the spaces they cover as less exalted. There are smaller, subordinate temples standing at the corners of the Lakshmaṇa's subbasement, forming a conventional five-altar (*pañcāyatana*) worship complex.

As North India was divided among a larger number of local dynasties, spread over a wider geographic expanse than in the South, a greater number and variety of local styles were developed. The most widely spread variation of the curvilinear tower is found in the rudimentary-seeming *phāmsanā latina*, seen on the Madukesvara, where the horizontal tiers, visible beneath the *udgama* networks of the usual *latina*, are represented without ornamentation, within the characteristic curvilinear silhouette and crowned by *āmalaka*. We can see one of these towers on the temple beside the Sangamesvara at Mahakuta in the Deccan. Others are found from Gujarat to the Himachal foothills and to coastal Andhra. The Nāgara also makes occasional use of the barrel-vaulted form (called *valabbi* in the North), as seen in the eighth-century Teli-ka-mandir at Gwalior or the Vaital Deul at Bhuvaneshwar. Unlike the usual square sanctum, the oblong sanctum is associated with particular deities, the Seven Mothers (Sapta Matrika), or the reclining Anantasayana Vishnu, or the similarly lateral Trivikrama Vishnu.

The later Jain temples of western India represent a variation in which the cloister of exterior chambers is fully developed into discrete sanctums, as can be seen in the fifteenth-century temple of Adinatha at Ranakpur. The Yogini temple layout presents a variant in which the cloister of goddess cells surrounds a Bhairava temple or altar open to the sky, and so usually without a central tower at all. The Buddhist *vihara* layout presents a

variant in which the cloister of cells, inhabited by monks, stood alone, without a central structure. In the Mahayana phase, central cells of the cloister were enlarged to situate images of the Buddha.

Regional variations of the Nāgara grew progressively distinct over time, even appropriating a few West Asian decorative elements during the course of the second millennium. The incorporation of domes in Western India, as seen on the entrance pavilions at Ranakpur, provide an example of this appropriation.

The Vesera Style

There are a good number of temples that fit the textual reference to Vesera, or mixed traditions, in the region where the northern and southern traditions overlap, between the upper Krishna and Tungabhadra basins, and as far south as the Kaveri in Karnataka. Early Chalukya temples, from the seventh century on, incorporate distinctive elements from the Nāgara tradition into structures that are essentially Dravida, such as the Nāgara tower on the otherwise Dravida-style Durgā temple at Aihole. More rarely, Dravida elements appear on Nāgara structures, as in the wall entablatures of the Papanatha temple at Pattadakal.

Beginning with Kalyani Chalukya of the later eleventh century, there are temples that go beyond mixing, to blend elements of the two traditions together. The Hoysala, Kesava temple at Somnathpur is the most well-known example of this blending. Its crowning cupola is carved into so many wedge-shaped facets that it approaches the form of the *āmalaka*; its towers are difficult to classify into one style or the other; its niche pediments and miniature decorative elements mix northern-looking elements with southern-looking ones.

In a manner that parallels the spread of northern, Indo-European, elements into the essentially Dravidian languages of Kannada, Telugu, and Tamil, this is essentially a Dravida architectural tradition, incorporating Nāgara elements. The same combination is visible in the Deccan style of capping straight-sided *phāmsanā* towers with domical cupolas at Papanasi and Vijayanagar.

Temple Complexes

From their earliest remains, Hindu temples are found in hierarchical complexes, both as planned ensembles and as irregular assemblages, with smaller and peripheral, subordinated structures, surrounding primary shrines. From the earliest remains onward, we have evidence of enclosing *prākāra* walls and gateways. Nearly all temples of any size include a hall for worshipers attached to the sanctum. Many Shaiva temples in the South and some in the North include a Nandi *mandapa*, for the

god's alter-ego, the bull Nandi, who is located facing the sanctum on the longitudinal axis to the east. As time went on, the number of such halls increased. Dancing or offering pavilions are regularly located along the axis leading to the main sanctum in Orissa.

A number of temples were planned in pairs and in ritual or symbolic combinations. Major South Indian temples of the second millennium regularly have *amman* (goddess) shrines beside those of the god. Shiva shrines have separate temples for Chandesa, who is the custodian of Shiva's temple. *Pañcāyatana* arrangements of four subordinate sanctums surrounding a central sanctum are a conventional worship set. Tanks for ritual bathing are a common part of temple complexes. Halls without sanctums normally have flat or relatively lower pyramidal roofs, distinguishing them from the towering *vimāna* or *shikhara* over the deities.

Wherever there are temples of any importance, subordinate temples are likely to be added subsequently, by those wishing to share in the prestige of the original builder or in devotion to the god to whom the temple is dedicated. In many cases these appear to be the temples built by the courtiers or descendants of those who built the primary temples. At prosperous sites, such structures may be added at any time and often in the most irregular of manners, revealing the power of the later patrons rather than any original plan.

The Modern Period

With the Arab, Turkish, and Iranian invasions of the later twelfth century, the patronage of masonry temples declined precipitously in most of northern India. The more cosmopolitan traditions that continued exhibit the impact of new sources and the diminution of earlier continuities. An example of this can be seen in the seventeenth-to nineteenth-century brick temples of Bengal in eastern India, which preserve distinct references to the curvilinear forms of the Nāgara, while evolving a distinctly original new local style. The seventeenth-century temples at Brindaban display a style that blends traditional central Indian Nāgara forms with Mughal and west Indian architectural elements.

Nineteenth- and twentieth-century India saw three notable developments in Hindu temple style. The first was a response to the gradual emergence of a subcontinentally expansive Indian state and enhanced communications, which have resulted in the regional styles of one locale appearing in distant sites through the movement of patrons and artisans. Thus Gujarati temple designs have appeared in Varanasi, Pune, and Chennai, and Dravida style *gōpura* have arisen in New Delhi and Brindaban. The second has been a conscious historicism, based on

traditionalist, and in some cases nationalist, political goals. Large temples in this mode have been patronized by the Birla industrial families in important North Indian cities, like the Lakshminarayana temple in New Delhi and the Sri Venkatesvara temple in Hyderabad. There have also been contrasting modernist structures attempting to transcend previous traditions, in structures like the Anandamayi Ma temple at Varanasi.

BLOCK-PRINTED

EARLY PAINTED AND PRINTED

KARUPPUR

BLOCK-PRINTED

A practical difficulty in tracing the history of technological processes in India is the paucity of archaeological evidence. Ethnological evidence based on an extremely efficient method of transmission, however, helps to bridge this gap. Added to this is the strong element of social continuity engendered through the workings of caste and *jati* (the endogamous group into which a person is born within which marriages can take place) in the Indian social fabric. India has a great tradition in wool and silk, but the fabric that has received the greatest degree of commercial exploitation is cotton. Cotton, being a cellulose fiber, has not only a lesser affinity to dye than silk, but its light reflection capacity is also inferior. Ornamentation can thus be introduced more through variation in color and, to a lesser extent, through diversity in weave. The presence of a fragment of mordanted cotton yarn in Mohenjo-Daro, circa 3500–2500 B.C., attests to the mastery in dye chemistry achieved in South Asia since early times. It is evident that once the dye process had been understood it would be easy to embark

on the next step, that of selective application of mordant and resist through block or pen to control the range in color and pattern. When the term “block printing” is used in relation to natural dyes, it is important to remember that the block controls the application of resist and mordant on the material. It is on the basis of the application of mordant and resist that the desired color spectrum is developed. Turmeric and saffron, for yellow, and indigo, for blue, do not require the imposition of mordant.

Tradition

Merutunga, who recorded conditions in Gujarat (c. 884–1194), suggests that block printing was by then well established in the area. Hemachandra, born 1089 and hailing from the same region, also supports this. However, the earliest block-printed fragments of western Indian provenance found in Quseir al-Qadim, Egypt, have been dated to the thirteenth to fourteenth centuries.

The practice of block-printed textiles is spread over a large area in northern, western, and central India, inclusive

of the Gangetic belt. The northern belt includes the Jammu region and Punjab. The printing is unrefined and shares the characteristics of the tradition of Tajikistan, Uzbekistan, and Georgia. The Gangetic belt is represented in Mathura, Tanda, Lucknow, and Farrukhabad. Jafarganj, near Fatehpur in Uttar Pradesh, was a celebrated center of printing in 1908. Its characteristic feature was color: vibrant red and striking blue. Mathura, being a pilgrim center, catered to an all-India market; a specialty was the *nāmavalī*, a printed shoulder cloth for ritual use. The background color ranged between yellow and ocher, and the names of deities and sacred symbols were printed on this. Tanda reflected the Mathura tradition and had markets in Nepal and Bhutan. Lucknow and Farrukhabad specialized in the “tree of life” motif and were influenced by the Persian style in ornamentation. West Bengal, having a superlative tradition in weaving, diversified into printing only in the nineteenth century. A description of cotton manufacture in Dhaka, dated to 1851, refers to the community of *chipigur*, who printed lines or passages from the Vedas on cloth for the Hindu community. The Muslim community utilized their services

for the printing of appropriate Qur'anic texts on their winding sheets, or *kuffan*.

The western Indian belt, characterized by the use of mud resist, comprises printing centers in Gujarat, Rajasthan, and Madhya Pradesh. Individual centers, each having variations in technique, comprise the Ajrakh (a type of mud resist printing practiced on the western part of the subcontinent) printing centers of Kutch (Gujarat) and Barmer (Rajasthan); ritual cloth (dedicated to the Mother Goddess, the *Māthāji ne Pachēi*) is printed in Ahmedabad; Bagru, Sanganer (Rajasthan), and Rajapur-Deesa (Gujarat) share a common technique, while Bagh and Bhairongarh represent two variants in Madhya Pradesh. Mud and lime resist are well suited to somewhat coarsely woven cotton. However, if more delicate work is required, wax resist is preferred. Georges Roques, of the French East Indian Company, noted the printing of wax resist in Ahmedabad in 1678. Wax resist was the dominant mode in South India, but it was *kalam* (brush) painted rather than block printed. The practice of *kalamkari* block printing in Masulipatam is a nineteenth-century innovation.

There is also evidence of clamp-resist printing on silk in Gujarat. This technique is also practiced in Nepal and Tibet for decorating the mounting of Buddhist ritual paintings, or *thankba*. A characteristic feature of this form is the outlining of motifs in a white aura, rather than defining the outline in black. The sumptuous textiles depicted in Jain Kalpa Sūtra manuscripts share the former characteristic and could be taken as depictions of silk ornamentation through the procedure of clamp resist.

Technique

There are several stages in cloth printing. These include initial preparation of cloth by removal of impurities, smoothening the texture, bleaching by dunging, a natural agent, and preparation of the fiber for enhanced penetration of the mordant. There is no application of the block at this stage. The cloth is then thoroughly washed, preferably in the flowing waters of a river or stream.

The next stage is that of mordanting. Mordant is a chemical substance that enables cotton to absorb and retain certain dyes. Mordants can either be acid or basic (alkaline). Acid mordants are tannin based. The most common source in India is either myrobalam (*Terminalia chebula*) or catechu (Hindi, *katha*; *Acacia catechu*). Basic mordants are derived from salts of various metals, particularly aluminum, chromium, iron, copper, zinc, or tin. Alum is the one most commonly used in India. Alkali from *surti kar* (saltpeter) or *sapan kar* (carbonate of soda)

has been used for *al* (*Morinda citrifolia*) dyeing in Berar. After mordanting, the fabric is boiled in a cauldron along with the dyestuff. The vessel can be of earthenware, copper, or iron. In the latter two cases, the metal containers themselves contribute an element to the mordanting process, thereby introducing variations in shade and hue.

Other aspects of the dyeing procedure include the use of items such as *jajakku* (*Memecylon edule*) in Tamil Nadu, or *padvas* (*Narigama alta*) in Gujarat, which act as carriers during the dyeing operation. In the case of *al*, on termination of the dyeing process alum or *dbā* (*Woodfordia floribunda*), is used as a fixing agent.

The application of resist is associated with indigo dyeing. The resist is derived from wax, mud, or lime. The dye is reconstituted in the vat through a process of fermentation. A cold vat is used. Although indigo blue is a stable color, it tends to rub off. Rubbing fastness can be improved by a final soaking in catechu. The technology of indigo printing had also been developed and practiced in India. Jean Ryhiner in 1766 referred to the Indian method of indigo printing with the use of orpiment, sulfur of arsenic, the liquid being further thickened with gum.

Design and Use

Although there is some congruity between woven and printed design, the latter offers a much greater degree of freedom in terms of layout and pattern. The costume of traditional India has been the multifunctional unstitched garment. It remains so in many sections of rural India. The patterning, whether woven or printed, is composed of two borders along the horizontal edges and cross-borders defining the two vertical end alignments. In the female costume, the sari, the cross-border at the exposed terminal end can be elaborately designed to set it off from the inner field.

The *Mānasollāsa*, authored by the Chalukyan king Sōmeshvara III (r. 1127–1139), provides comprehensive coverage of textile design in the section titled *Vastrōpabhōga* (using or enjoying of clothes by the king). In addition to geometrical motifs, floral, vegetal, animal, bird, and fish motifs could be used. *Ikat* and *plangi* motifs (which indicate the method by which the yarn to be used in weaving is tied according to pattern and dyed) could also be duplicated in block print. With the introduction of Islam, stitched garments became popular, leading to more elaborate all-over patterning. The *buteh* and the *badam* (popularly known as paisley) now emerged in a more distinctive manner. Tinsel printing, in which gum was applied with the block, was another innovation. Draperies began to emerge as a separate category. The forest was a place of retreat and contemplation in Hindu imagery, while the hunt had symbolic overtones in Islamic

culture. The palace was no longer fixed in location, and the roving camp of the king became the shifting imperial capital, with tent hangings providing much play to the imagination in the area of block printing. It was against this background that block-printed chintz design materialized with the advent of the Europeans, heralded by the arrival of Vasco da Gama on the Malabar coast.

Today the impact of the export market, accompanied by the onset of globalization, has led to many changes. Masulipatam has managed to sustain an export market without a total loss of identity. Screen printing has begun to make considerable inroads. The expanding middle classes and a Westernized lifestyle have widened the market in block-printed textiles, despite severe competition from other emergent forms and materials.

EARLY PAINTED AND PRINTED

India's mastery over permanent dyes can be traced back to Harappan civilization (3000 B.C.) with the discovery of a fine cotton fragment dyed with mordants, attached to a silver vase. The export of dyed cotton must have been carried out during this period, as dye vats were found at Lothal, a Harappan port in Gujarat. There are hardly any fragments of printed and dyed cloth except for tie-dyed fabric (c. 1000 B.C.) found in Central Asia by Sir Auriel

Antique ghagra Skirt. In the state of Rajasthan, an often barren and colorless landscape, villagers and royalty alike commonly wear brightly colored, brilliantly detailed clothing. ADITYA PATANKAR / FOTOMEDIA.

Stien. Fragments were later found in Fostat and at Red Sea ports, dating to the thirteenth century A.D. The latest carbon dating has dated some fragments to the tenth century A.D.

Early literary sources mention the importance of the printing and dyeing industry. The Greek physician Ktesias (fl. 500 B.C.), while visiting Persia, mentioned "flowered cottons with glowing colors," greatly coveted by Persian women and imported from India. *The Periplus of the Erythrean Sea*, a first-century Roman record, gives a list of printing centers of western India, and Pliny commented that Roman coffers of gold were being depleted by the import of Indian cottons to satisfy the vanity of Roman women. It was the durability and brilliance of Indian cottons that made them renowned throughout the world.

Traditional Block-Printed Fabric from Sanganer, Rajasthan. Sanganer remains a center for textile dyeing and printing that utilize centuries-old techniques. In the printing process, cloth is spread on wax-coated tables and color in the form of a paste is applied through screens. AMAR TALWAR / FOTOMEDIA.

The eastern coast had ancient links with Southeast Asia. Kalinga (present-day Orissa) had been greatly enriched by Southeast Asian trade during the pre-Buddhist era. Southeast Asia must also have had contacts with the west coast, as early examples of semiprecious agate stone beads excavated at Lothal were found in Indonesian grave sites dating to 500 B.C. Indian as well as Arab traders used printed Indian cottons as currency, exchanging them for spices, as Indonesian islanders were not interested in bullion. Carbon dating of recent discoveries of fine Indian printed and painted cottons from Indonesia, especially from Toraja in Sulawesi, has given an accurate early date not only to these textiles, but also to printed cottons found in Fostat and Red Sea ports.

Europeans entered the trade in printed textiles much later, while Indians, Chinese, and Arabs had been trading from prehistoric times. The Portuguese were the earliest Europeans, followed by the Dutch, the French, and the English. They traded with the Spice Islands, as well as carrying printed cloth (which came to be known as chintz) to Europe.

The finest centers for Indian printing were in Sind, Gujarat, Rajasthan, Madhya Pradesh, Bengal, Delhi, Farrukhabad, Golconda, Masalipatnam, Madras (Chennai), Pulicat, and Tanjore. The printers, *chipa*, were of a separate community from the dyers, *rangrez*. In Kalamkari, also known as *vartapani*, all three techniques—painting, printing and dyeing—were done by one community.

The block makers came from the carpenters' community, but many were dedicated solely to the creation of printing blocks, requiring great skill. An old family of block makers survives in Pethapur, Gujarat. For generations they prepared the fine blocks for printed cloth exported to Thailand, known as Sodagiri, trade cloth. Farrukhabad, an important center for printing the large Tree of Life known as *palampore* during the nineteenth century, also had specialized block carvers.

Printing Technique

The hand printing of traditional textiles prepared with the use of wooden blocks was of three kinds: direct

printing, resist printing, and outline block printing augmented by hand painting. Direct printing was done on bleached cloth prepared with mordants for dye absorption; on this surface the outline block was printed, followed by a fill-in block for coloring both the outlined motif and the background. In resist printing, blocks were used to create the outline; the motif was then printed with another color, then covered with a resist material, either mud or wax, and dyed. Indigo dyed cloths were prepared using this technique, as indigo could not be used for printing with blocks. Fragments found at Fostat and Red Sea sites followed these techniques and were made in Western India. Recent finds in Indonesia have the same patterns and have been carbon dated to the tenth century. Printing carried out in large quantities in Southeast Asia especially for the Spice Islands was done at Masalipatnam using a combination of printing and painting while very fine cloths were hand painted.

Hangings from South India, known as *kalamkari* or *varatapani*, were entirely hand painted. The finest were prepared at the court ateliers of Golconda and appear to be the work of master painters working with dyes. They were like large-scale murals, similar in style to the Persian murals of the Saffavid period in Isfahan, but using Indian imagery. The large hangings created for temples were of a different style, generally using themes taken from the Rāmāyaṇa. Episodes were painted and enclosed within a frame in narrative form, with verses describing the scene painted below. These were of ritual importance in Hindu temples. Special cloths of *kalamkari* with the battle scene from the Rāmāyaṇa, showing the victory of good over evil, were made for export to Indonesia.

Gujarat produced elaborate hangings with large female figures created in western Indian style with a three-quarter face and a protruding eye. Some of these were created with blocks and then colored by hand, while others were entirely hand painted, with each figure appearing to be a portrait. These examples have all been discovered in the family “treasure chests” in Toraja. Some have been dated to the fourteenth century A.D. The tradition of figurative hangings existed from ancient times. The older Pechwais of Shri Nath cult were printed and painted.

Consumption and Export

The printing centers produced a range of textiles for local consumption and a different style for export. Local production carried the distinctive designs and colors of each caste. There were also different designs for rites of passage, as well as for different age groups. Ritual cloths with the attributes of different deities accompanied by a printed *sloka*, or litany, such as “victory to Durgā,” were for use by priests as well as householders performing rituals.

During the Sultanate period (13th–15th centuries), royal ateliers produced cloths for the court, particularly printed tents and canopies. Printed and painted tent walls of very fine quality have survived from the Mughal period (late 16th–18th centuries). Ain-e-Akbari gives a detailed description of the tented Mughal court (created while on the move), which used the richest fabrics, among which printed and painted fabrics were prominent. The Jaipur court atelier produced very fine printed cloths for use by the royalty and the courtiers, and examples from the seventeenth century are maintained in the City Palace Museum at Jaipur. The detailed “account books,” *babi kbata*, of the ateliers are preserved in the archives at Bikaner.

The export of textiles from India to Europe had been carried out from a very early period through Fostat, which had become the major port center for the distribution of printed cotton (thus the name given to these cloths, “fustian”). The records of an Anglo-Saxon Synod Calcyth of the eighth century A.D. mentions that priests were discouraged from using Indian dyed cloth. Agnes Geijner (1951) mentions references to fustian cloth as a luxury item, hence forbidden for use by clergy in Scandinavia.

At the end of the fifteenth century, Vasco da Gama landed on the southeastern coast at Calicut, which later gave its name to “calico.” The Portuguese seized power from the local Muslim ruler, the *zamorin*, winning their first base in India. They controlled trade from the area; among the commodities they took back were printed fabrics, which they called *pintadoes*. These later found their way into the European market.

In the early sixteenth century, regular trade in printed and painted cloth began to be developed with Europe, after the Dutch, French, and English set up their “factories” along India’s coasts, creating a more organized system of Indian ocean trade. By the early seventeenth century, the resident European representatives began to exert a stronger influence; elaborate detailed patterns began coming from Europe, and Indian printers and dyers began creating textiles for the lucrative European market. The Indian word for a fabric printed with a sprinkling of flowers was *chint* (sprinkled), transformed in the West into “chintz.” English patterns combined Indian motifs with chinoiserie as well as motifs taken from the Balkans. Trailing flowing patterns with subtle color combinations were developed. These created so great a demand that by 1664 the English alone imported 250,000 “calicoes.” The French, who had entered the scene with La Compaigne des Indes Orientales with factors on the western and eastern coast near Kolkota (Calcutta), became competitors of the British East India Company, until their defeat by the English army under Robert Clive.

The craze for Indian printed goods reached its zenith by the last quarter of the seventeenth century, when British and French textile producers exerted influence on their own governments to ban the import of Indian cotton. Indian cotton of all kinds was banned in France in 1686 and in England in 1700. India continued to export cloth to Holland, but the demand for Indian cottons decreased considerably.

The import of printed textiles into Southeast Asia continued until the nineteenth century but decreased considerably because of the growth of the local Indonesian batik and printing industry. By the twentieth century, the import of mill-printed wax prints from Holland captured that market. World War I broke whatever links had existed between Indonesia, Malaysia, and Thailand with India's Masalipatnam and Gujarat, and printed cotton ceased to be exported to Southeast Asia.

The printers continued to supply the local market with printed yardage for skirts, saris, and veils, as well as quilt covers and floor spreads. However, they faced severe competition from mill-made printed fabrics from Manchester, as well as from Bombay's machine-made prints. The loss of major overseas export markets and dwindling local markets created great hardship for the Indian printers, who began producing crude, cheaper prints to compete with the machine-made goods, selling them at very low prices. By the mid-twentieth century, the All-India Handicrafts Board began a special project for research, design, and promotion of hand prints, and a number of centers throughout India were revived. Exhibitions were conducted in India and abroad, and the printing industry soon revived. Today many of the centers, which had previously stagnated, are producing very fine quality printed fabrics, using both synthetic and vegetable dyes.

KARUPPUR

Relatively unknown among ancient textiles, the exquisite textiles of Karuppur can be understood only from existing masterpieces of saris, dhotis (loincloths), and turbans in museum collections, and from written accounts that appear in travelogues from India and abroad. Skilled craftsmen using special techniques appear to have made these textiles only for the royal courts of Tanjore (now known as Thanjavur), and no distribution elsewhere was recorded beyond this lineage, which does not extend past the nineteenth century.

The rulers of Tanjore, particularly Raja Sarfoji (r. 1799–1833), were strongly influenced by British taste and admired Western art in its contemporary neoclassical phase. Under Sarfoji there was a close integration of ancient tradition and European taste, which continued under his successor, Shivaji. There is no way of knowing with any degree of certainty the date at which the village craftsmen of Karuppur began to supply garments to the royal court of Tanjore. No records are available to indicate whether the fine robes had been provided from ancient times or whether they were introduced during the Maratha dynasty. It is certain, however, that the technique itself persisted from early times. Early cotton paintings of South India depict the dyeing technique, in which fine patterns are drawn with molten wax to appear white on the colored ground. The Karuppur textiles use the same technique, and early examples approach the skill of India's greatest craftsmen of the seventeenth century. The saris were still known to have been made in 1855; after that, the craft declined.

One can observe from museum pieces the fine workmanship of Karuppur textiles, which combine richness of pattern with simplicity and elegance, using a technique of resist dyeing and gold brocading. Each textile contains several shades of red and black and, in some pieces, a touch of blue, with hints of gold and the warm ecru color of the natural cotton outlining the design configurations.

The nuances of color and texture change as the cloth is moved slightly. Though the predominant designs of Karuppur textiles tend to be geometrical forms arranged within framing borders and large central fields, the repertoire was not confined to these forms but included other motifs, such as delicate vines, deer, birds, and sometimes stolid elephants arranged in a grid pattern.

In Karuppur textiles, the patterns of gold yarn were worked in the ground, on the cotton warp, using the tapestry technique. The areas that became the centers of the configurations, as well as the lines of borders and panels, were woven in gold, and the rest were in plain weave. The design forms, freely drawn using a *kalam*, or pen, were created using a wax-resist technique; the mordant for red and black was applied, and the cloth dyed a deep red. For perfecting the shades of red and black, two important mordants, alum and iron, were used in varying concentrations. Alum in association with red dye (*rubia tinctorium*, *oldenlandia umbellata*) created shades of red. Iron, steeped in a sour acidic substance, yielded a mordant that, in conjunction with tannin, produced the black shades. To further enhance the depth of the design forms, selected outlines were enriched with a deeper red, immediately at the edge of the gold. With the exception of the wax-resist areas, the dye was absorbed all over the cloth, including the yarn that formed the core of the loosely wrapped woven gold. This resulted in a graceful blend of texture, with subtle hints of gold embedded in shades of deep red. Some superb samples had the resist applied on both sides, and both faces of the textile have been worked. Certain examples indicate that blocks may also have been used to apply the mordants.

The patterns and the format of the Karuppur textiles resemble features in classic Southeast Asian textiles, indicating that textiles for the Tanjore court were a refinement of existing South Indian traditions of textile design, which had profoundly influenced the East through trade to East Asia as early as the sixteenth and seventeenth centuries. During the late eighteenth and early nineteenth centuries, the patterns of Karuppur textiles seem to have been made in a modest mordant-painted and dyed version, without the wax-resist pattern and gold yarns. The Tanjore book wrappers who used this style of textile without gold, provide additional evidence of hand-painted textiles being made in the area, though the use of carved blocks (to stamp the design) began to displace the hand-painting technique in the early nineteenth century.

During the same period, in the contiguous areas of Kumbakonam and Pudukkottai, artisans appear to have employed the Karuppur technique with slight variations. The Kumbakonam cloth seems to have been prepared first with a red dye mordant, completely covering it and making it gray in color. The design was both hand

painted and stamped, using copper perforated blocks dipped in a solution of oxalic acid and sometimes wax, which produced a pattern of white forms on the gray mordant ground. Then the cloth was dyed red.

The intrinsic beauty of the Karuppur textiles is difficult to reproduce today. The existing photographs of these textiles only raise intriguing questions about the techniques used, and their origin continues to be shrouded in the mists of time. Answers may perhaps be found by further study of ancient records in and around Tanjore.

THEATER In traditional India, theater is explicitly associated with one deity or another, and the act of performance is an act of worship for performer and congregation alike. Many forms are still staged inside or next to temple precincts, or during religious festivals and holidays on common village grounds. Folk theater often dramatizes episodes from myth and legend pertaining to divinities or devotion. The aesthetics of Indian theater, originating in Bharata's *Nāṭya Shāstra* (Theater treatise), prioritize performance, inner life, and emotional moods in expressing that life. *Rasa* (literally, "juice" or "flavor") forms the nucleus of this aesthetic. A play must evoke the *rasas*, of which there are nine, in complementary combinations, with one of them predominant. The nine *rasas* comprise the erotic, comic, pathetic, heroic, furious, fearful, odious, wondrous, and peaceful. In order to arouse these *rasas* in the "sympathetic connoisseur," performers must emote appropriate *bhavas* (feelings) throughout. The importance given to emotions causes many non-Indians, preconditioned by their own artistic heritage, to react adversely to Indian drama as being too sentimental and devoid of action.

History

Indian theater history can be classified under three rubrics: classical, traditional, and modern, by no means mutually exclusive or chronologically sequential. Indeed, all three coexist at present. Folk and traditional theater takes place in villages and religious contexts, while

Man Performing in a Hindu Dance Play. Contemporary performance (c. 1972) of *Kathakali*, literally “dance story,” in Kerala. CHARLES & JOSETTE LENARS / CORBIS.

modern theater is the preferred urban idiom. Classical theater, strictly speaking, refers to the courtly Sanskrit drama that flowered in the first millennium A.D. It is extinct, like the classical language in which it was written. But some scholars correctly argue that a couple of genres (Kutiyattam and Krishnattam) still use Sanskrit as a living medium, and directly link Kutiyattam to classical Sanskrit theater, pushing back Kutiyattam’s conjectural origins because it seems to have preserved the texts and accompanying production manuals of plays by the earliest known Sanskrit dramatist, Bhasa, in apparently unbroken continuity.

Classical. The sources of Indian theater are shrouded in obscurity, though Vedic rituals and recited duologue may have given birth to it in the first millennium B.C. A small cave amphitheater at Sitabenga, in Chhattisgarh state, possibly dates to the third century B.C., while an outdoor arena, perhaps used by Buddhist monks in the second or third century A.D., exists in Nagarjunakonda, in Andhra Pradesh. Bhasa may have composed his works around the turn of the common era, but we have no documents to

prove it. Later writers mentioned his name, but it was only in 1911–1912 that his plays came to light, discovered among manuscripts in a library in Kerala, and identified with texts performed for centuries by Kutiyattam troupes in Kerala temples. Thirteen such scripts were attributed to him, the largest number to have survived by a Sanskrit author. They reveal a wide range, from full-length seven-act plays to one-act miniatures, covering tales from the epics, and always theatrical, rather than simply literary.

Judged by the *Nāṭya Shāstra* (c. 2nd century B.C. to 4th century A.D.), Bhasa would have either failed its prescriptions or deliberately flouted them. For instance, he shows a hero dying on stage, though the *Nāṭya Shāstra* forbids such scenes. Other possibilities are that he preceded the *Nāṭya Shāstra*, or wrote when its principles had not fully crystallized—many authorities consider it to be a compendium accumulated over time. Besides expounding on *rasa*, its thirty-odd chapters offer methodological categorizations of the types of drama; guidelines on music, dance, and architecture; and details of a highly semiotic

system of gestures and expression, dividing acting into four components—verbal, physical, internal (emotional), and external (costumes and makeup). We can thus safely deduce that Sanskrit theater, composed by court poets and staged in royal durbars for aristocratic audiences, was uncommonly refined and artistic, with grace, beauty, suggestion, and idealism given primary importance.

Kālidāsa (fifth century) is unanimously acknowledged as the pinnacle among Indian authors in any language, for his masterpiece *Abhijñāna-Sakuntala* (Recognition of Sakuntala). Two of his other plays have survived, but the lyrical romanticism and spiritual intensity of *Sakuntala* gave it an uncontested primacy in Indian drama. The four verses in act 4 when the pregnant Sakuntala bids farewell to her ashram home and her foster father, to leave for her husband who seems to have forgotten her, are regarded as the zenith of *rasa* in Sanskrit poetry. Rediscovered by European Indologists in the late eighteenth century, *Sakuntala* persuaded them to reassess Indian literature and to elevate Sanskrit to levels previously reserved for the Greek and Latin classics.

Sudraka's *Mricchakatika* (Little clay cart, c. 2nd century A.D.) is probably the most revived play in the canon because of its social consciousness; it depicts a successful revolution that overthrows an unpopular ruler. Among later Sanskrit works, Visakhadatta's *Mudrā-Rākshasa* (Rakshasa's ring, 5th century) is an unusual historical drama of realpolitik, with the astute Chanakya, Chandragupta Maurya's minister, as protagonist. The famous king Harsha (r. 606–648) has three romantic plays ascribed to him, of which *Ratnāvali* is the finest. Bhavabhūti (7th–8th centuries), considered by some to be Kalidasa's equal, is best known for *Uttara-Rāmacarita* (Later story of Rāma), a moving and powerful narrative of the epic hero Rāma. A slow degeneration of standards characterized subsequent Sanskrit theater, and for all practical purposes it had ceased to be a creative force by the tenth century. Theater in the colloquial idiom of Prakrit briefly occupied a transitional phase, notably in the output of Rajasekhara (9th–10th centuries).

Traditional. As Sanskrit theater declined, the first indications of performance in the regional languages appeared, coinciding with the formalization of those tongues, descended from the various Prakrits and Apabhramsa. Popular forms unknown to us must have previously entertained the lower castes, parallel to the Sanskrit theater meant for the upper castes. Ancient texts in Tamil make cryptic reference to dance-drama genres and stage preparations, from the beginning of the common era. Certainly, several varieties of Indian puppetry (particularly shadow puppetry) have a long history; the striking similarities between leather puppets in Orissa

and Andhra Pradesh and those in Indonesia point to acculturation via mariners from the eastern seaboard who settled in Southeast Asia.

The major influence in the invention of many traditional (formerly known as “folk”) forms was the *bhakti* (devotional) movement that spread throughout the subcontinent. Advocating faith in a personal god rather than the institutionalized, priesthood-dominated ceremonies that had accumulated around Brahmanism, reformers needed to propagate their message, and opted for theater as the most effective medium of communication. Between the fourteenth and seventeenth centuries, these Vaishnava forms proliferated, telling stories of Vishnu's avatars, mainly Rāma and Krishna. One of the first, Kirtaniya, was created in the rich literary language of Maithili in northern Bihar by the poets Jyotiriswara (1280–1360) and Vidyapati (1360–1440). By the end of the fifteenth century, Raslila (based on Krishna's *rās* dance) arose in Braj, in western Uttar Pradesh, in a local dialect of Hindi. In the fifteenth and sixteenth centuries, the elaborately accoutred Terukkuttu and Yakshagana developed in Tamil and Kannada, the languages of Tamil Nadu and Karnataka, respectively, followed by Kuchipudi dance-drama in Telugu (Andhra Pradesh), credited to Siddhendra Yogi. The sixteenth century saw *bhakti* theater take shape in eastern India with the active participation of two saints: Jatra (originally called Krishna-jatra) in Bengali received the enthusiastic support of Chaitanya (1486–1533), and Sankaradeva (1449–1568) invented Ankiya Nat in Assamese. Ramlila emerged in Hindi in North India by the seventeenth century, while the Konkani Dasavata (literally, “ten avatars”) in Goa and coastal Maharashtra imitated Yakshagana from neighboring Karnataka. In Kerala, two forms were created: the delicate Krishnattam in Sanskrit by the Zamorin (ruler) of Kozhikode in 1653, and the vigorous Kathakali (initially Ramanattam) in Malayalam by the raja of Kottarakkara in 1661. The former, because of its elite language, remains cloistered in the Guruvayur temple, whereas Kathakali's choice of the mother tongue saw it flourish, into currently the most recognizable face of Indian theater worldwide. After Vaishnavism reached the far eastern state of Manipur, Maharaja Chingthangkomba sponsored the lyrical Manipuri Ras Lila in 1779. The tribal-cum-martial arts form of Chhau, in Orissa, Jharkhand, and Bengal, also adopted mythical tales for presentation.

It seems useful to distinguish two strains of traditional theater, the temple styles (of worship) from the worldly ones (of comedy and social satire), but considerable overlap occurs. Notwithstanding the intensely spiritual aim, horseplay and frightening scenes are integral to the religious forms, keeping the entire family, especially children, entertained. A few of the originally devotional forms, like

Jatra, gradually metamorphosed into secular ones, though others like Ankiya Nat or Manipuri Ras Lila retained their pristine purity. Some nominally associated with worship appear to have crossed over into subversive comic modes fairly early in their history, and became even more boisterous down the centuries. These include the Bhavai in Gujarati (ascribed to Asaita Thakar, 14th century) and Tamasha in Marathi (probably intended as a diversion for soldiers, from the 18th century). Another major form, the Nautanki in Hindi/Urdu, which evolved in the nineteenth century out of and alongside the Swang in Hindi and Punjabi, may have had tenuous sacred links to begin with, but achieved renown for exquisitely musical renderings of heroic romances. The Bandi Pethir in Kashmiri, whose records go back to the tenth century, is exclusively farcical, its clowns' routines recalling the slapstick of Italian commedia dell'arte.

With the exception of Kirtaniya, all these genres remain alive. Besides, dozens of less popular, but not inferior, forms inhabit the Indian landscape, all increasingly threatened by the incursion of film and television into rural lifestyle in the late twentieth and early twenty-first centuries. They range from ritualistic possession, such as Teyyam and Bhuta on the southwestern coast, to diverse storytelling modes (many of them orally keeping alive the Mahābhārata and Rāmāyaṇa) that incorporate substantial elements of dance and music. This multiplicity of theater is endangered, ironically, by the homogeneity of performance manufactured in the electronic media, whatever the language, which attract mass viewership by their glamour and pretensions to modernity. Villagers prefer to watch the dream-factory-generated pictures of supposedly greener urban pastures, instead of their local entertainers, whom they consider rustic and backward. Their livelihood thereby imperiled, these performers turn to other careers. Also ironically, interculturalists come to India to study these very genres, seeking the secrets of exotic techniques; renowned directors such as Jerzy Grotowski and Peter Brook have borrowed methods from Kathakali or Chhau for their own work.

Modern. The British introduced the proscenium arch auditorium to India, and with it modern (Western) theatrical concepts. Initially, the expatriate communities in the port cities of Calcutta (Kolkata), Bombay (Mumbai), and Madras (Chennai) built playhouses for their own recreation in English, in the eighteenth century. The Bengally Theater (Calcutta, 1795) established by a Russian bandmaster and adventurer, Herasim Lebedeff, pioneered the use of an Indian language on a European-style stage for Indian audiences. The next century witnessed further inroads: the formal reading of English literature by Indian students under Thomas B. Macaulay's education policy; their first amateur attempts at representation

of English drama; their translations of this canon into Indian languages; their emulation of Western models in writing and staging original plays; and, finally, the arrival of full-blown professional theater in every major language. Some regions started earlier—Bengali, Marathi, and Hindi have particularly long lineages of modern theater—whereas in others (Dogri, Konkani, Maithili, Nepali, Rajasthani) modernism began only around the time of India's independence.

The first modern Indian play was composed in English by Krishna Mohan Banerjea in 1831, but was never performed. Titled *The Persecuted, or Dramatic Scenes Illustrative of the Present State of Hindoo Society in Calcutta*, it had a modern topic: for the first time, an Indian dramatist censured living conditions. In 1853, at the Grant Road Theater in Bombay, Vishnudas Bhave produced the first ticketed shows in Marathi, soon followed by Gujarati theater from companies owned by the Parsi (Zoroastrian) community. The same year, Urdu theater commenced in Lucknow with Amanat's *Indarsabhā* (Indra's court) at Wajid Ali Shah's durbar. While these primarily comprised mythological stories, within the next ten years, eastern India contributed much original social drama. In Bengali, Ramnarayan Tarkaratna castigated Brahman polygamy, and Michael Madhusudan Dutt lampooned upper-class affectations. In Assamese, Gunabhiram Barua criticized child marriages, and Hemchandra Barua, opium addiction.

In 1872 Bengali theater turned professional as well as political. Dinabandhu Mitra's *Nildarpan* (Indigo mirror) condemned British indigo planters' ruthless oppression of peasants. Anti-British productions increased to the extent that the government clamped down with the Dramatic Performances Act (1876), banning seditious material. However, playwrights like Girish Ghosh (1844–1912) in Bengali and Bharatendu Harishchandra (1850–1885) in Hindi circumvented that law, allegorizing familiar tales of repression and rebellion under the guise of seemingly innocuous mythical or historical inspiration. Meanwhile, the spectacular commercial fare of Parsi troupes and Marathi Sangitnatak succeeded in making theater a favorite of the public. Parsi companies toured across India and even abroad, performing in easily understood Hindustani with attractive sets and special effects, the first pan-Indian theater since Sanskrit times. Sangitnatak (musical drama), created by B. P. Kirloskar in 1880, became so much the rage in Maharashtra that spectators went mainly to hear star actors deliver the songs, sometimes as many as a hundred in a show, in exquisite compositions derived from classical, devotional, and folk melodies. Bal Gandharva (1886–1967), singer and female impersonator, commanded a huge following, and women devotedly copied his fashions.

The major innovator in modern Indian theater, Rabindranath Tagore (1861–1941), authored, directed, scored, choreographed, and acted in over sixty Bengali plays, which were stylistically lyrical and symbolic. They critiqued orthodox Hinduism and dramatized spiritual quest, celebrated nature, pleaded for ecological consciousness, and foresaw the dangers of exploiting mineral resources and damming rivers indiscriminately. Tagore gave importance to women's issues and encouraged girls from respectable families to act (taboo at the time); he initiated open-air children's theater at the school he established in Santiniketan (Abode of Peace), Bengal. He experimented with the musical and dance-drama as forms, and traveled with these productions to large Indian cities. His other plays, translated internationally after he became the first non-European to win the Nobel Prize for literature (1913), were staged all over the world, bringing modern Indian drama to the attention of a global audience.

Theater's halcyon days at the box office began to fade with the arrival in 1931 of the "talkies," which cleverly appropriated the escapist formulas that had enticed viewers to the professional companies, which never recovered. In their place, new theater arose, avowedly amateur to protect itself from the demands of popular taste, overtly socialistic in its politics, and realistic in its technique. The founding of the Indian People's Theater Association (1943) signaled this change, with Bijon Bhattacharya's Bengali *Nabanna* (New harvest, 1944) revolutionizing theater by its stark radicalism (using no scenery or makeup) on the subject of the horrendous Bengal famine of 1943. The movement grew rapidly. In 1944 Prithvi Theaters' Hindustani plays took social awareness across India, and the Dravida Kazhagam Party's Tamil productions opposed Brahmanical dominance in the south. The Praja Natya Mandali (1946) and the Jammu and Kashmir Cultural Front (1953) employed folk forms to advocate their messages in Telugu and Kashmiri, respectively; the Kerala People's Arts Club (1952) espoused the Communist cause in Malayalam. Most serious groups since independence have owed allegiance to leftist ideologies, covering a wide gamut from strident Marxist activism to simple social awareness. Technically amateur, their members hold full-time jobs in other professions.

Contemporary urban theater shows great variety, though three broad currents have emerged: the above-mentioned political, the poetic-symbolical, and the folk nativistic. In Bengali, actor-director Sombhu Mitra (1915–1997) earned respect for his poetic grandeur; Utpal Dutt (1929–1993) regaled with witty plays that expressed an agitprop Communist line; and Badal Sircar (1925–) abandoned the proscenium for free street theater and informal spaces, literally a poor theater with a

conscience. Hindi theater was galvanized by the directorial visions of Ebrahim Alkazi (1925–) at the government-funded National School of Drama, the works of Habib Tanvir (1923–), who heads a troupe of Chhattisgarhi village artists, and the unusual psychological dramas of Mohan Rakesh (1925–1972). Marathi drama introduced three noted playwrights: Vijay Tendulkar (1928–), drawn to controversial topics; Mahesh Elkunchwar (1939–), sensitive to domestic relationships; and Satish Alekar (1949–), often absurdist or meta-theatrical in his themes. Tamil theater ranged from the outrageous political satires of Cho Ramaswamy (1934–) to the symbolism and folk-based work of Na Muthuswamy (1936–). Kannada brought the dramatists Chandrasekhar Kambar (1938–) and Girish Karnad (1938–), and the director B. V. Karanth (1929–2002), to the national limelight, reinterpreting folkloric material. In Malayalam (and Sanskrit), Kavalam Narayana Panikkar (1928–) revived traditional genres in modern contexts. Acharya Atreya (1921–1989), Manoranjan Das (1921–), and Arun Sarma (1931–) were the leading playwrights in Telugu, Oriya, and Assamese, respectively. Heisnam Kanhailal (1941–) gave to Manipur a theater of protest and resistance against mainstream culture from India. Gursharan Singh (1929–) bravely preached nonviolence in the Punjabi countryside during the peak of separatist extremism there. A minority English-language theater also exists in the metropolises, its most arresting authors including Asif Currimbhoy (1928–1994) and Mahesh Dattani (1958–).

THEOSOPHICAL SOCIETY The Theosophical Society was founded on 7 September 1875 in New York following a talk on ancient Egyptian spiritualism, by Helena Petrovna Blavatsky (1831–1891), a Russian occult medium, and Colonel Henry Steel Olcott (1832–1907), a U.S. Civil War veteran and abolitionist, who became the society's first president. Their goals were to study the spiritual truth underlying all religions, to reject materialism, and to do public service. The last aim enabled the society to establish schools, influence the Indian national movement, and act as the seedbed for India's first feminist association in Madras (Chennai) in 1917. Blavatsky claimed that a Rajput spirit "master" or "mahatma" had inspired her during her trip to Tibet and India in 1851. She met Olcott after writing a defense of his investigations into occult phenomena in an essay, "Rosicrucianism." In 1874 they claimed they had witnessed an apparition named Kitty King at a seance in Philadelphia. Their fascination with the occult led Blavatsky to start an Esoteric Section of the society in 1888 and to claim that her books were mystical revelations by "masters." Her first book, *Isis Unveiled* (1877) increased the society's membership worldwide.

In India

In 1879 Blavatsky and Olcott, who had corresponded with Dayananda Saraswati, the Vedic Hindu revivalist and founder of the Āryā Samāj, established their headquarters in his city, Bombay (Mumbai), calling it the Theosophical Society of the Āryā Samāj. However, theological disagreements separated them in 1882, the Theosophists moving south to Adyār, Madras. Blavatsky and Olcott's lectures across North India and Sri Lanka were reported extensively in the Allahabad *Pioneer* by A. P. Sinnett. The British kept them under surveillance as possible Russian spies.

In 1881 Blavatsky began publishing the journal the *Theosophist*, which C. W. Leadbetter edited when she moved to London due to ill health. There, in 1889, Annie Besant (1847–1933), who was to become her greatest disciple, visited her after reading *The Secret Doctrine* (1887) on the doctrine of karma (reincarnation).

Theosophist Annie Besant. Though a fervent advocate of Indian nationalism, she beseeched Hindu women not to emulate their materialistic Western counterparts, but to aspire to selflessness and the wisdom of the Upanishads. K. L. KAMAT / KAMAT'S POTPOURRI.

Blavatsky also soon published *The Key to Philosophy* (1889) and *The Voice of Silence* (1890). Besant joined the Theosophical Society in 1891, mesmerized by Hinduism and by Blavatsky's fervent appeal to "come among us!" (Besant, *Autobiography*, p. 311).

Olcott recorded the society's history in his *Old Diary Leaves* (1892). His interest in Buddhism led him to Sri Lanka and Japan in the 1880s. In *The Poor Pariah* (1902), Olcott urged the educational uplift of the Dalits, or the *panchamas*, "downtrodden, wretched human beings" who were shunned by the high castes as untouchables, and seduced by Christian zeal. In 1894 Olcott started a free school for "untouchables" in Urūr, near Adyār. He established the Panchama Education Society, starting five primary vocational schools in Madras and several others in Sri Lanka between 1898 and his death in 1907. The Olcott Schools remain in operation with the aid of government grants.

Annie Besant's Early Years

Annie Wood was born in 1847 in London to a middle-class Irish-English family that became impoverished by

her father's death. She was educated by a wealthy Calvinist widow and was married at nineteen to Frank Besant, an Anglican vicar. Annie railed against her husband's rigid Christian Victorian values, eventually leaving the marriage. In 1879 she wrote the tract "Marriage as It Was, and as It Should Be," while fighting a legal battle for custody of her children. Thwarted from attaining a degree in science by misogynistic university rules, she became a vocal advocate of women's education. Her spiritual quest led her first to Unitarianism, then to atheism and Fabian Socialism, before she finally became a Theosophist and Hindu.

Besant became a labor activist due to the trade unionist William Roberts. Her affair with the atheist Charles Bradlaugh led to her joining his National Secular Society. In 1877 she and Bradlaugh were tried for "obscenity" for having published Dr. Charles Knowlton's tract on contraception. Their victory prompted Besant to write *Law of Population*, although later, as a Theosophist, she repudiated this work. As a Fabian Socialist, she supported democratic representation on municipal boards; fought successfully in 1888 for women who were on strike in match factories; wrote and published *The Unemployed, Why I Am a Socialist, and How Poverty May Be Destroyed*. Radical socialists criticized her "Modern Socialism," and her socialist convictions declined. She became estranged both from Bradlaugh and Bernard Shaw when she espoused Theosophy. In 1908 she declared that democratic socialism would not succeed in India.

Annie Besant in India

In 1893 she and her Theosophist "guru" Gyanandra Nath Chakravarti attended the Parliament of World Religions in Chicago, where Swami Vivekananda made his inspiring speech on Hinduism, predicting that it was destined to "conquer the world" with its philosophic wisdom. On 16 November 1893, at the age of forty-six, Besant reached India. Her appearance in a sari, and her passionate lectures, praising Hinduism and Indian nationalism, sparked interest in journals like *Amrita Bazaar Patrika*, winning avid followers. She resided first in Benares (Varanasi), learning Sanskrit from Bhagwan Das, with whom she founded the Central Hindu College.

In 1896 at Maharani Girls' School, Mysore, Besant addressed the students as Hindu girls who would "grow up to be Hindu wives and mothers." Noting that there was "nothing nobler than loving, unselfish, spiritual Indian women," Besant beseeched them not to emulate materialistic Western women, but to aspire to the wisdom of female Upanishadic sages like Gargi and Maitreyi, and to the selflessness of the Rāma's heroic wife, Sītā. Her 1904 pamphlet, *The Education of Indian Girls*, became the educational blueprint for Indian girls for decades. Olcott's death in 1907 brought Besant to

Adyār as the society's new president and head of the Theosophical Educational Trust's network of National Schools.

Besant joined the Indian National Congress in 1914, when she started the journal *Commonweal*. She and Lokamanya ("Friend of the People") Tilak each started Home Rule Leagues in 1916, also helping M. A. Jinnah to forge the Congress-League Lucknow Pact that year. Arrested in June 1917 under the Defence of India Act, Besant was released after intercession by U.S. President Woodrow Wilson. As the first European-born president of the Indian National Congress in 1917, Besant spoke about women activists in her inaugural address. In May 1917 at Adyār, she became president of the Women's Indian Association. On 18 December 1918, she led a delegation to Secretary of State Edwin Montagu, pleading for female suffrage in India.

In 1919 Besant was replaced as president of the National Home Rule League by Mahatma Gandhi, whom she had tried, without success, to convert to Theosophy when he first came to London. Her last years were clouded by scandals around Leadbetter's alleged homosexuality; and around her proclamation of Jiddu Krishnamurti, a brilliant student, as "the messiah" or "world teacher" through the Order of the Star with twelve apostles. Krishnamurti himself denied that he was a "savior" and dismantled the order, breaking free of Besant's ambitions for him. Annie Besant died in Adyār in 1933, but the Theosophical Society continues to flourish there.

THUMRĪ A vocal (or sometimes instrumental) genre, *thumrī* (Hindustani, *thumaknā* “to walk with a jerky, mincing, or wanton gait”; possibly an onomatopoeic imitation of the sound of a dancer’s foot against the floor [*thumuk*]) features so-called light-classical *rāgs* and (in the case of vocal music) romantic texts. Most musicians associate the origins of the *thumrī* with the court of Wajid Ali Shah, the mid-nineteenth century ruler of Oudh, although the genre has numerous stylistic predecessors. Roughly parallel to the romantic storytelling genre *padam* of *bharata natyam* (dance idiom), *thumrī* has associations with the classical dance of northern India—*kathak*—and in a *kathak* program, dancers often mime their movements to *thumrī*.

Poets of *thumrī* texts have often drawn upon the legends of Krishna, particularly his amorous relationships with the milkmaids of Vraj. The gender of the voice of the text is usually feminine, although both men and women perform. Praise of the beloved, lament of the beloved’s absence, and anticipation of the arrival of the beloved are among the favorite topics of *thumrī*, although explicitly erotic and obscene themes occasionally occur in special contexts. The dominant *rasas* (emotions) of *thumrī* are *shringāra* (the erotic) and *karuna* (the pathetic).

Musical Characteristics

Musicians apply a select repertoire of *rāgas* and *tālas* in *thumrī*. One characteristic of *thumrī rāgas* is the affective use of alternative notes to emphasize the *rasa* of the *rāga*. *Thumrī* singers also often temporarily introduce other *rāgas* in their renditions. As with most North Indian musical genres, the melody has two musical parts—*sthāyī* and *antarā*—in contrasting registers, each having two lines of poetry.

Musical ornaments in *thumrī* are generally quicker and lighter than in *khayal*. The principal type of elaboration

in *thumrī* is the *boltān*, an improvised melodic rendering of the words of the song. These melismatic improvisations commonly function as “word-painting.” Singers repeat text lines often, each time with new elaborations. At the conclusion, the singer returns to the first line and repeats it, while the drummer briefly solos in a sped-up section described as *laggi*. A *laggi* is often in a fast binary meter such as *kabaravā* (8 *mātras*) or *tintāl*, even though the *thumrī* itself is in another *tāla* (such as the 14-*matra* *Dīpcandī* or the 6-*mātra* *Dādra*). At the end of the solo, the drummer returns to the original *tāla*. Instrumentalists often perform *thumrīs* toward the end of their programs, in which context performers choose *rāgas* and *tālas* typical of the genre. The mood of such performances is decidedly lighter than the more elaborate approach taken in *ālāp* and *gat-torā*, although devices such as *sawāl-jawāb* may still be part of the performance.

TIBETAN BUDDHISTS OF INDIA Since 1950, Tibetans escaping Chinese-occupied Tibet have resettled in numerous enclaves in India, including the community of Dharamsala in the foothills of the Himalayas, the headquarters of the Tibetan government-in-exile. In India, Tibetans have established new and stable communities, forged a united Tibetan identity, and created a democratic system of government under the leadership of the Dalai Lama, the spiritual and temporal leader of Tibetan people worldwide. The Tibetan population continues to establish a new, perhaps permanent home in India, the motherland of the Buddhist teachings through which Tibetan culture came to be uniquely defined.

History of Tibetan Buddhism

Tibetan Buddhism, or Tantric Buddhism, finds its roots in northern India, particularly in Nagarjuna’s Mādhyamika (Middle Way) system. The Tibetan Buddhist tradition arose from a syncretism of the Indian Vajrayāna (Diamond Vehicle) and the indigenous, animistic Bön religion of Tibet, a religion of deities and spirits that some scholars link to the hierarchy of *bodhisattvas*, demons, and other figures of Tibetan Buddhism. Beginning under King Songsten Gampo’s royal patronage in the seventh century A.D., Buddhism flourished, and it developed its unique Tibetan character in the centuries that followed. From the tenth

Worshiper Lights Candles at Monastery. Since 1980, Tibetans with the help of the Indian government have established almost 200 Buddhist monasteries and nunneries in India, housing nearly 20,000 monastics. FRANCOIS GAUTIER / FOTOMEDIA.

century onward, Buddhist masters in western Tibet held leadership positions alongside lay authorities, a governmental structure that soon spread throughout Tibet and became the norm. By the fifteenth century, the distinctive Tibetan Buddhist canon, consisting of the Kanjur (the teachings of the Buddha) and the Tanjur (commentaries on the teachings), and the complex monastic system, with its reincarnations of *bodhisattvas*, were established. The monastic system comprised four main orders, powerful in both political and religious spheres: the Nyingmapa, the Kargyupa, the Sakyapa, and the Gelugpa. It is from the Gelugpa (Yellow Hat) order that the Dalai Lamas of Tibet, the spiritual and political leaders of the Tibetan people, originated in 1391. The Dalai Lama (“ocean of wisdom,” or “superior one”) is understood to be the continual reincarnation of Avalokiteshvara, *bodhisattva* of compassion. He is a key figure in Tibetan Buddhism, the Tibetan government, and Tibetan identity in general.

The Community in Exile

Since the invasion of Tibet by the People’s Republic of China on 7 October 1950, and the Tibetan revolt

against the Chinese occupation on 10 March 1959, India has provided a haven for Tibetan refugees and their families. By 1960, over 17,000 Tibetans resided in settlements established by the Indian government. The village of Mussoorie served as the headquarters of the Central Tibetan Administration until Jawaharlal Nehru offered Dharamsala in Himachal Pradesh to the Tibetan government-in-exile, headed by the Fourteenth Dalai Lama, in 1960. Dharamsala and numerous other bases in India are no longer simple refugee resettlement sites but developed, stable Tibetan communities. Over 8,000 Tibetans call Dharamsala, McLeod Gunj, and the surrounding Kangra Valley their home, while approximately 88,000 more reside in other communities in India. The majority of this population lives in Tibetan agricultural, agro-industrial, or handicraft-based settlements established with the assistance of the Indian government. Tibetan refugees continue to enter India at a steady rate of between 2,000 and 2,500 per year.

The Tibetan government-in-exile was restructured according to democratic principles in 1963 with the draft of a new constitution for an anticipated free Tibet in the

future, as well as for the existing exiled government. While many leadership positions remain intact from the previous system, including the position of the Dalai Lama and his cabinet of ministers, the new democracy includes three branches of government, the executive, the legislature, and the judiciary, with clear separations of powers. The Kashag, the cabinet of ministers, incorporates departments of home, education, finance, and health, and consists of officials elected by the legislative branch of the government, the assembly of Tibetan People's Deputies. The assembly is diverse and represents Tibetans all over the world: two members currently represent Tibetans in Europe, and one represents Tibetans in the United States. The assembly, including the chief *kalon*, or chief executive officer, is elected by the Tibetan people living in India and in other countries outside Tibet. The Tibetan Supreme Justice Commission is the judicial branch of the government. Tibetans in India are subject to Indian law, but through India's arbitration law, the Justice Commission has some jurisdiction and can serve as an arbitrator in disputes. In this manner, Tibetans

enjoy a modicum of self-power within the Indian judicial system.

According to the Government of Tibet in Exile, 44 percent of refugees from 1997 to 2002 were between the ages of fourteen and twenty-five. There are an estimated 30,000 Tibetan children in India. Education of Tibetan youth is thus a vital service provided by the government-in-exile, with efforts made toward accommodating the special needs of children orphaned during the arduous journey from Tibet. The Department of Education administers over eighty schools, not only in India but in Nepal and Bhutan as well. The Indian-run Central Tibetan Schools Administration funds and oversees approximately thirty of these schools in India. This has resulted in some tension between the Tibetan population and the Indian host culture: support is necessary and appreciated, but there is concern that the Tibetan schools, if run by non-Tibetans, will teach fewer Tibetan cultural values. Imbuing children with a Tibetan sense of respect and compassion, maintaining the Tibetan

The Fourteenth Dalai Lama, Tenzin Gyatso. To Tibetans in exile in India and other parts of the world, with no geographic link, the Dalai Lama remains an all-important symbol of continuity through generations. INDIA TODAY.

Buddhist Monks Gather at Ceremony. Saffron-robed Buddhist monks gathered at McLeod Gunj, home to the Dalai Lama, nestled high among the Himalyan forests. Maintaining the Tibetan language and culture, and especially its spiritual beliefs and rituals, are all vital aims for a people living in exile. FRANCOIS GAUTIER / FOTOMEDIA.

language, and teaching Tibetan cultural arts are all vital aims for a people living in exile.

Within the Kashag, the Department of Religion and Culture seeks to provide aid to Tibetan religious institutions and other cultural institutions. Monasteries and nunneries of the Tibetan Buddhist traditions are central to Tibetan Buddhist life. Since 1980 the population in Tibetan Buddhist monasteries and nunneries in India has more than doubled, resulting in overcrowded facilities. Thus, support for these institutions, as well as the construction of new monastic centers, is a priority for Tibetans in exile. Almost 200 monasteries and nunneries, with a population of nearly 20,000 monks and nuns, have been established in exile. Projects of the Department of Religion and Culture also include Tibet House in New Delhi, the Library of Tibetan Works and Archives and the Tibetan Institute of Performing Arts in Dharamsala, the Central Institute for Higher Tibetan Studies in Varanasi, and the Norbulinkha Institute for Tibetan Culture at Sidhpur. Numerous charitable organizations worldwide and the Indian government provide additional support.

Unity and Tibetan Identity

The occasionally divisive factors of Tibetan life, including regional or tribal loyalties, political rivalries, religious competition, and varying dialects of the Tibetan language, have been set aside since 1959 in favor of promoting unity in the face of the threat to Tibetan culture in general. The new identity forged by the Tibetans in their stateless condition emphasizes the Tibetan Buddhist values of compassion, patriotism, ethnic and linguistic unity, and a focus on what anthropologist Margaret Nowak identifies as the two main Tibetan rallying symbols, the Dalai Lama and *rangzen* (self-power). The Dalai Lama is a symbol of continuity through generations, representing stability for Tibetans in exile. The status as *bodhisattva* also makes him a living symbol of Buddhist reality. *Rangzen*, often defined as independence from China, is a hopeful concept for the possible Tibetan future. The Dalai Lama and *rangzen* both serve as symbols of Tibetan identity, ontological security, and empowerment. In them, religion, culture, political activism for the Tibetan cause, and even Tibet's history and future are encapsulated and advanced.

With no geographical union, Tibetans in India and in exile worldwide innovate a cultural, ethnic, and linguistic union, and the prominent symbols of Tibetan religion and culture emerge as rallying signs for the global Tibetan community. At the heart of the Tibetan project of identity and unity in exile is the conviction that being Tibetan means upholding a compassionate, active, and hopeful Tibetan Buddhist tradition and character.

TILAK, BAL GANGADHAR (1856–1920), *revolutionary Hindu nationalist leader, called Lokamanya ("Revered by the People")*. Born to a venerable Chitpavan Brahman family in Maharashtra's Konkani village of Chikalgaon on 23 July 1856, Bal Gangadhar Tilak was married at fifteen to Tapi Bai, a Chitpavan girl of ten. A year later, he graduated from high school and immediately enrolled in Pune's Deccan College, where he focused on Sanskrit Vedic studies. Tilak later wrote books on the religious philosophy of the Bhagavad Gītā as well as Vedic astronomy and astrology. Unlike most modern Indian and Western scholars, Tilak believed that the Vedas were composed by ancient tribes, whose "Arctic home" was at the "North Pole" prior to the "Glacial Ice Age." He also studied law in Bombay (Mumbai), which he later found useful in his litigation-plagued career.

Cultural Nationalist

Tilak was one of Maharashtra's most popular cultural nationalists, publishing several important newspapers in

Portrait of Bal Gangadhar Tilak. In their extended discussions of self-rule for India, Tilak (widely regarded as a powerful figure as his penetrating gaze in this drawing and popular name, Lokamanya, attest) is purported to have told Gandhi, "There's no place in politics for saints or religious scruples." K. L. KAMAT / KAMAT'S POTPOURRI.

Pune, the *Mabratta* in English and *Kesari* (Lion) in Marathi, the latter read aloud in village centers to tens of thousands of illiterate peasants, as well as being subscribed to by urban intellectuals. Tilak thus became the cultural leader and political hero of Maharashtra's masses. Tilak denounced Sir Andrew Scoble's "Age of Consent" Bill, which tried to raise the "statutory rape" age for intercourse (with or without a child bride's consent) from ten to twelve years. He called it a "foreign Christian intrusion" in the private household affairs of Hindu Indians. Two years later he publicized the popular revival of annual religious festivals throughout Maharashtra to celebrate the "birthday" of the Hindu divinity Gaṇeśha, whose elephant-headed statues were carried around every town and village for days before being raucously immersed in rivers or coastal waters. Ganpati festivities, which included paramilitary gymnastics

by “Ganesh guards” dressed in khaki uniforms, are considered the birth of modern militant cultural Hindu nationalism. In 1895 Tilak inaugurated a second annual festival in Pune, to honor the birth of Maharashtra’s greatest Hindu national hero, Shivaji Maharaj. The Shivaji festivals drew even larger crowds than those for Ganesha. Speeches in Marathi extolling Shivaji’s heroic deeds in waging guerrilla warfare against, and defeating, the foreign Muslim Mughals, excited the most interest among young men, many of whom used their energies and time to make crude bombs in their basements, before long throwing them at British officers driving by in their carriages.

Tried and Transported for Sedition

Tilak’s most popular mantra was “*Sva-raj* (‘self-rule’ or ‘freedom’) is my birthright, and I will have it!” At times, his Kesari editorials and powerful Shivaji festival speeches incited those who read or heard his words to violent actions against British officials or other foreigners. One of Tilak’s Pune Brahman disciples assassinated an Englishman as he left the governor’s Jubilee Ball honoring Empress Victoria in 1897, just half a century before another Maharashtrian Brahman was to assassinate Mahatma Gandhi. Tilak was tried for sedition for several editorials he wrote in his newspaper. He eloquently defended himself and pleaded innocent, but was found guilty in 1908 and was transported to Mandalay Prison in Burma (Myanmar) for six years. He was released at the start of World War I and cabled his “support” for the Allied cause to the king-emperor. He outlived Gopal Krishna Gokhale, his moderate Maharashtrian Brahman rival for leadership of the Indian National Congress, by five years.

Impact on Mahatma Gandhi

Gandhi first met Tilak when Gandhi returned to India from South Africa, while visiting Pune at his guru Gokhale’s invitation. To Gandhi’s mind, gentle Gokhale was like Mother India’s greatest river, “the Ganges,” which “invited one to its bosom.” Tilak, on the other hand, was “the ocean” itself, forbidden to Hindus, who never knew what dreadful dangers lurked beneath its “dark waters.” But Tilak’s fearless insistence upon “freedom,” his successful use of popular religious and cultural Hindu symbols, and his boycott of all things “foreign”—all of which lured India’s illiterate peasant population into the nationalist movement—appealed powerfully to Mahatma Gandhi. But ever-scrupulous Gandhi insisted on nonviolence in all his *satyagraha* struggles. Tilak never feared or worried about violence. “There’s no place in politics for saints or religious scruples,” Lokamanya Tilak once told Mahatma Gandhi. Gandhi “begged to

differ,” insisting that “religion (Hindu *dharmā*) could no more be removed from ‘politics’ than from life itself.” On 1 August 1920, the day Tilak died, Mahatma Gandhi launched his first nationwide *satyagraha* in Bombay.

TRADE LIBERALIZATION SINCE 1991 Import controls in India were originally imposed in May 1940 to conserve foreign exchange and shipping for World War II. But starting in 1947, regulation of the balance of payments became the central concern of the Indian government, which introduced restrictions on the rate at which foreign exchange could be depleted. From then on, India alternated between liberalization and tighter controls, until the beginning of the launch of the first Five-Year Plan. The period during that first plan, covering 1951–1952 to 1955–1956, was one of progressive liberalization.

A balance-of-payments crisis in 1956–1957 led to a major policy reversal. India restored its comprehensive import controls, which remained in place until 1966. In June 1966, under pressure from the World Bank, it devalued the rupee from 4.7 rupees to 7.5 rupees per dollar, and took steps toward liberalizing import licensing and lowering import duties and export subsidies. But intense domestic reaction to the devaluation led to reversal of the policy within a year, and import controls were again tightened. By the mid-1970s, India’s trade regime had become so repressive that the share of nonoil and noncereal imports in the Gross Domestic Product (GDP) fell from the already low 7 percent in 1957–1958 to an even lower level of 3 percent in 1975–1976.

In the late 1970s, two factors paved the way for yet another phase of liberalization. First, industrialists came to feel the adverse effect of the tight import restrictions

Finance Minister P. Chidambaram. One of the principal architects of economic liberalization and reforms. In early May 2005, the decidedly pro-business Chidambaram declared that India must open its doors to foreign investment in order to achieve faster economic growth, a position not supported by leftist leaders within and outside the government. INDIA TODAY.

on their profitability and lobbied for liberalization of imports of raw materials and machinery that did not have domestically produced substitutes. Second, improved export performance and remittances from overseas workers in the Middle East in the post-oil-crisis era led to the accumulation of a healthy foreign-exchange reserve, raising the comfort level of policy makers with respect to the effect of liberalization on the balance of payments.

Liberalization and Growth in the 1980s

The liberalization process was initiated in 1976 through the reintroduction of the so-called Open General Licensing (OGL) list that had been part of the original wartime regime but had become defunct as controls were tightened in the wake of the 1966 devaluation. The OGL operated on a positive-list approach, whereby the item placed on the list no longer required a license from the Ministry of Commerce. This did not necessarily mean that imports of the item on the list were free; the importer usually had to be the actual user of the imports, and could be subject to clearance from the industrial-licensing authority in the case of machinery imports.

Upon its introduction in 1976, the OGL list contained only 79 items. But by April 1990, the list covered 1,339 items, approximately one-quarter of all tariff lines and more than 30 percent of all imports. Though tariff rates were raised substantially during this period, with items on OGL given large concessions on those rates through “exemptions,” they did not significantly add to the restrictive effect of licensing. The government also introduced several export incentives, especially after 1985, which partially neutralized the anti-trade bias of import controls. Above all, from 1985 to 1990, the effective nominal exchange rate was depreciated by a hefty 45 percent, leading to a real depreciation of 30 percent.

These and other liberalization measures relating especially to industrial licensing, improved agricultural performance, discovery of oil and expansionary fiscal policy combined to raise the growth rate in India from its traditional, so-called Hindu rate of approximately 3.5 percent during the years 1950 to 1980 to 5.6 percent during the period from 1981 to 1991. The jump in the average annual growth rate was particularly significant from 1988 to 1991, when it reached 7.6 percent.

Nevertheless, the external and internal borrowing that supported fiscal expansion was unsustainable and culminated in a balance-of-payments crisis in June 1991. This time, however, the government turned the crisis into an opportunity, and instead of reversing the course of liberalization, launched a truly comprehensive, systematic, and systemic reform program that continues to be implemented. The Soviet collapse, China's phenomenal economic rise following its adoption of outward-oriented policies, and India's own experience—first with protectionist policies for three decades and then liberalization in the second half of 1980s—convinced policy makers of the merits of the new policy approach that had been advocated for years by pro-market and pro-free-trade economists, most prominently Jagdish Bhagwati.

Systemic Reforms Beginning in 1991

The trade liberalization program, initiated in July 1991, was comprehensive but gradual and remains under implementation. It is useful first to consider the measures taken in the areas of trade in goods and services and then to discuss their impact.

Merchandise trade liberalization. The 1991 reforms did away with import licensing on virtually all intermediate inputs and capital goods. But consumer goods, accounting for approximately 30 percent of the tariff lines, remained under licensing. It was only after a successful challenge by India's trading partners in the Dispute Settlement Body of the World Trade Organization (WTO) that these goods were freed of licensing a decade later, starting 1 April 2001. Since that time—except for a handful of goods disallowed on environmental, health, and safety grounds, and a few others that are canalized (meaning they can be imported only by the government), including fertilizer, cereals, edible oils, and petroleum products—all goods can be imported without a license or other restrictions.

Tariff rates in India had been raised substantially during the 1980s to turn quota rents into revenue. For example, according to the Government of India (1993), tariff revenue as a proportion of imports went up from 20 percent in 1980–1981 to 44 percent in 1989–1990. According to the WTO (1998), in 1990–1991, the highest tariff rate stood at 355 percent, the simple average of all tariff rates standing at 113 percent and the import-weighted average of tariff rates at 87 percent. With the removal of licensing, these tariff rates became effective restrictions on imports. Therefore, a major task of the reforms in the 1990s and beyond has been to lower tariffs. This has been done in a gradual fashion by compressing the top tariff rate while rationalizing the tariff structure through a reduction in the number of tariff bands. The top rate fell to 85 percent in 1993–1994 and 50 percent in 1995–1996.

There were some reversals along the way in the form of new, special duties and the unification of a low and a high tariff rate to the latter, but the general direction has been toward liberalization, the top rate coming down to 20 percent in 2004–2005.

The 1990s reforms were accompanied by the lifting of exchange controls that had served as an extra layer of restrictions on imports. As a part of the 1991 reform, the government devalued the rupee by 22 percent against the U.S. dollar, from 21.2 rupees to 25.8 rupees per dollar. In February 1992 a dual exchange rate system was introduced, which allowed exporters to sell 60 percent of their foreign exchange in the free market and 40 percent to the government at the lower official price. Importers were authorized to purchase foreign exchange in the open market at the higher price, effectively ending exchange control. Within a year of establishing this market exchange rate, the official exchange rate was unified with it. Starting in February 1994, many current account transactions, including all current business transactions, education, medical expenses, and foreign travel, were also permitted at the market exchange rate. These steps culminated in India accepting the International Monetary Fund Article VIII obligations, which made the rupee officially convertible on the current account.

Liberalization of trade in services. Since 1991 India has also carried out a substantial liberalization of trade in services. Traditionally, services sectors have been subject to heavy government intervention. Public sector presence has been conspicuous in the key sectors of insurance, banking, and telecommunications. Nevertheless, considerable progress has been made toward opening the door wider to private-sector participation, including foreign investors.

Until recently, insurance was a state monopoly. On 7 December 1999, the Indian Parliament passed the Insurance Regulatory and Development Authority Act, which established an Insurance Regulatory and Development Authority and opened the door to private entry, including foreign investors. Up to 26 percent foreign investment, subject to obtaining a license from the Insurance Regulatory and Development Authority, is permitted.

Though the public sector dominates in banking, private banks are permitted to operate. Foreign direct investment (FDI) up to 74 percent in private banks is permitted under the automatic route. In addition, foreign banks are allowed to open a specified number of new branches every year. More than 25 foreign banks, with full banking licenses, and approximately 150 foreign bank branches are currently in operation. Under the 1997 WTO Financial Services Agreement, India committed to permitting 12 new foreign bank branches annually.

The telecommunications sector has experienced much greater opening to the private sector, including foreign investors. Until the early 1990s, the sector was a state monopoly. The 1994 National Telecommunications Policy provided for opening cellular as well as basic and value-added telephone services to the private sector, with foreign investors granted entry. Rapid changes in technology led to the adoption of the New Telecom Policy in 1999, which provides the current policy framework. Accordingly, in basic, cellular mobile, paging and value-added service, and global mobile personnel communications by satellite, FDI is limited to 49 percent subject to the granting of a license from the Department of Telecommunications. FDI up to 100 percent is allowed, with some conditions for Internet service providers not providing gateways (for both satellite and submarine cables) and infrastructure providers furnishing dark fiber, electronic mail, and voice mail. Additionally, subject to licensing and security requirements and the restriction that proposals with FDI beyond 49 percent must be approved by the government, up to 74 percent foreign investment is permitted for Internet service providers with gateways, radio paging, and end-to-end bandwidth.

FDI up to 100 percent is permitted in e-commerce. Automatic approval is available for foreign equity in software and almost all areas of electronics. One hundred percent foreign investment is permitted in information technology units set up exclusively for exports. These units can be set up under several programs, including Export Oriented Units, Export Processing Zones, Special Economic Zones, Software Technology Parks, and Electronics Hardware Technology Parks.

The infrastructure sector has also been opened to foreign investment. FDI up to 100 percent under automatic route is permitted in projects for the construction and maintenance of roads, highways, vehicular bridges, toll roads, vehicular tunnels, ports, and harbors. In construction and maintenance of ports and harbors, automatic approval for foreign equity up to 100 percent is available. In projects providing supporting services to water transport, such as operation and maintenance of piers, and loading and discharging of vehicles, no approval is required for foreign equity up to 51 percent. FDI up to 100 percent is permitted in airports, though FDI above 74 percent requires prior governmental approval. Foreign equity up to 40 percent, and investment by nonresident Indians up to 100 percent, is permitted in domestic air-transport services. Only railways remain off limits to private entry.

Since 1991 several attempts have been made to bring the private sector, including FDI, into the power sector but without perceptible success. The most recent attempt is the Electricity Bill 2003, which replaces three existing

power legislations dated 1910, 1948, and 1998. The new bill offers a comprehensive framework for restructuring the power sector and builds on experience in the telecommunications sector. It attempts to introduce competition through private-sector entry side by side with public-sector entities in generation, transmission, and distribution.

The bill fully de-licenses generation and freely permits captive generation. Only hydropower projects would henceforth require clearance from the Central Electricity Authority. Distribution licensees would be free to undertake generation, and generating companies would be free to take up distribution businesses. Trading has been recognized as a distinct activity, with the Regulatory Commissions authorized to fix ceilings on trading margins, if necessary. FDI is permitted in all three activities.

Impact of liberalization. The ratio of total exports of goods and services to GDP in India doubled from 7.3 percent in 1990 to 14 percent in 2000. The rise was less dramatic on imports because increased external borrowing was still financing a large proportion of imports in 1990, which was no longer true in 2000. But the rise was still significant, from 9.9 percent in 1990 to 16.6 percent in 2000. Within ten years, the ratio of total goods and services trade to GDP rose from 17.2 percent to 30.6 percent. Nevertheless, this is substantially lower than the corresponding ratio of 49.3 percent achieved by China in 2000.

The Road Ahead

Despite substantial progress, tariffs remain high and must be compressed further. At this stage, the best course will be to first unify all tariff rates applicable to industrial goods at 15 percent, and then to bring them down to 10 percent by 2006–2007. Tariff uniformity has the advantage of minimizing incentives to lobby and therefore makes future liberalization easier. It is also likely to create less distortion than a more variegated tariff structure.

In the Doha negotiations, India should press for complete elimination of industrial tariffs by 2015 in all developed countries and by 2025 in all developing countries. Such a stance may enable India to achieve its long-sought objective of eliminating tariff peaks in developed countries that apply to labor-intensive products such as clothing and footwear. At the same time, the elimination of tariffs at home is fully consistent with India's liberalization program.

Agricultural tariffs in India have risen in recent years, and there is considerable room for lowering them, but political constraints are daunting despite the potential benefit, so that change is unlikely. This makes it essential

for India to adopt a more flexible approach in Doha negotiations.

A particularly disturbing development on the trade policy front in India has been the rise of antidumping duties, which started in January 1993. By 1998, 45 antidumping cases had been initiated, covering 18 products. Definitive duties had been imposed in 11 cases, and a ruling of no injury reached in 2. India has now replaced the United States as the premier user of this instrument. Between July and December 2001, it carried out 51 antidumping investigations, which only reverses the economic liberalization policies introduced since 1991.

India has also embarked upon preferential trade arrangements that liberalize trade with one or more trading partners on a discriminatory basis. On balance, this is an inferior strategy toward trade liberalization, but perhaps for political and strategic reasons India's government has essentially committed itself to it. To minimize the damage to itself from possible trade diversion, it is more important for India to lower its external barriers as well. From a strategic point of view, India's recent decision to forge free trade areas with the members of the Association of Southeast Asian Nations makes eminently good sense. Focusing on creating a South Asian Free Trade Area, on the other hand, offers no such benefits and is almost certain to impose economic costs associated with the diversion of trade from more efficient outside sources.

TRADE POLICY, 1800–1947 Defined either narrowly or broadly, the trade policy of the British government of India did not promote the interests of most Indian producers or consumers. Narrowly defined, trade policy refers to government rates of tariffs, duties, quotas, trade agreements, and other policy instruments that affect the price and quantities of goods exported and imported. Broadly defined, trade policy incorporates all

government policies that influence a country's terms of trade, defined as the price of its exports relative to its imports. Such policies would include those targeting changes in exchange and interest rates, investment incentives, taxation and expenditure policies on tradable commodities, and nontariff barriers to trade, such as preferential treatment in government purchases. British imperial rule had many adverse consequences for India's international economic relations.

The British Raj had no consistent trade "policy" until the mid-nineteenth century. The three British East India Company presidencies of Bengal, Bombay, and Madras had operated largely independently and had adapted to a varying range of pre-colonial trade systems. For example, Mughal tariff rates often varied from 2.5 to 5 percent, depending on the region and the traders' community affiliation. Over time, the British consolidated the indigenous systems of inland and external customs rates of the eighteenth century.

By the time the East India Company's administration had solidified its hold over Indian territory, an all-India trade policy emerged. From 1846 the British Raj instituted a uniform tariff rate schedule: 3.5 percent on cotton twist and yarn, and 5 percent on all other goods imported from Britain. For imports from all other countries, the rates were double. The policy clearly favored Britain among India's numerous trading partners; yet it did not impose unique advantages to British industrial sectors over their Indian counterparts. However, what began as a simple, nonprotective tariff regime evolved during the late nineteenth century into a rigid reflection of the interests of British manufacturing and political interests.

Unlike many governments of the time, the British government of India did not rely upon import and export duties for the bulk of its revenues. In colonial India, the lion's share of revenues came from land taxes, a regressive tax regime retained from Mughal administrations. As fiscal expenditures outpaced revenues, the Raj looked to import duties as an expedient way of raising public revenues. In 1860 the rates on twists and yarn rose to 5 percent. For all other goods, the rates doubled. While this did provide additional income for the government, raising import tariffs also had the effect of raising the price Indian consumers paid for imported goods relative to those produced domestically. British cotton manufacturers cried foul. The Manchester Chamber of Commerce put enormous pressure on the Raj to lower rates, claiming that the government had unfairly favored Indian cotton goods producers to the disadvantage of British firms. Manchester's lobby found a sympathetic audience with Lord Salisbury, secretary of state for India in 1875. By 1882 all cotton import duties were abolished. When fiscal

necessity prompted the reimposition of an import duty of 3.5 percent in 1894, the government again appeased British industrialists with an equivalent excise tax on Indian cotton textile production. These excise duties, which remained in place until 1925, galvanized political opposition to the notion that the imperial government could serve as a loyal steward of India's domestic economy.

For good reason, cotton textiles are symbolic of India's international trading relationships in the period. Between 1840 and 1865, the principal commodities of import included cotton twist and yarn, cotton goods, machinery, raw metals (particularly copper and iron), metal manufactures, and railway materials. Between 1870 and 1895, India was the biggest customer of Britain's Lancashire cotton industry. By 1920, imports included cotton manufactures, sugar, iron and steel, machinery and millwork, and mineral oils. Indian imports were more technologically advanced and had greater value-added than Indian exports. For basic industrial inputs—machinery, metals, and chemicals—India depended upon overseas production. Moreover, 90 percent of all India's imports in 1919–1920 originated from the United Kingdom. During the Great Depression, the British abandoned free trade orthodoxy and built huge tariff barriers to trade. In 1930 the British government of India passed the Cotton Textile Protection Act instituting duties of 15 percent for all British goods and 20 percent for all non-British imports. By 1931 both of these rates rose by 5 percent. The justification again was fiscal necessity, not protection of Indian industry. Most commentators, however, have concluded that the intent was simply to redirect India's foreign trade toward England. In the depressed economic environment of the 1930s, the Raj discouraged trade with other major textile producers such as Japan. The case of cotton textiles thus illustrates how the concerns of Indian consumers and producers were overridden by the special interest groups within the British Empire. British India's primary economic interests were abandoned in favor of overt “imperial preference” and bilateral agreements.

India's other major import was silver. Reportedly, Indian imports of silver accounted for a third of world silver production in the last three decades of the nineteenth century. According to the *Statistical Abstract relating to British India* (various years), precious metals accounted for approximately one-fifth of the value of India's total imports. Part of India's seemingly insatiable demand for silver was for private consumption purposes, sometimes called hoarding. Another part was converted into currency. In either case, the vast majority of the population preferred to accumulate their savings in the form of precious metals, which in times of distress could be easily converted into the official silver-based rupee. Government

mints were open to the public until 1893 and charged modest commissions. Thus if the intrinsic value of the silver in the Indian rupee exceeded the exchange value of the coinage, then the government could anticipate a rise in the public's willingness to liquidate private stores. With a glut of silver on world markets, India's silver currency rapidly depreciated from 1876 to 1893. This illustrated the vulnerability of India's exchange rate, unmanaged by a central bank until 1935.

While the government of British India did have some policy instruments (in the form of counsel bills and reverse counsel bills) to affect the value of the rupee, the government developed no independent, central institution to integrate India's money markets and govern monetary policy. For most of the colonial period, the value of the rupee and its consequent impact on trade relations was left to world market forces. When the value of the rupee plummeted, Indian exports were given a huge boost.

Opium, indigo, sugar, and raw cotton were the major commodities exported by India in 1849. By 1920 exports remained overwhelmingly basic, unfinished commodities: raw cotton, jute manufactures (mainly gunny sacks), raw jute, raw skins and hides, and tea. Although from 1865 to 1920 Britain's share of Indian exports fell from 67 percent to 22 percent, on the eve of its independence India's economy resembled a classic third world economy, producing inelastic agricultural goods for a competitive world market and importing more expensive manufactured goods. Commodity imports exceeded exports by nearly 12 to 1.

Economic wisdom about protection and regulation of trade has changed considerably since the colonial period. While free trade has become the mantra for economic growth since around 1980, in the late nineteenth century many nations, including the United States, actively protected their industries. Protective duties on imports were considered essential for the nurturing of infant industries and at the same time provided a means for governments to reward important constituencies. Few economic historians would deny that India's nascent steel and paper industry got a healthy start thanks to interwar trade barriers. However, it remains an open question whether the absence of tariff protection before 1914 actually hurt the mature Indian textile sector. New research suggests that Indian craft industries, including hand-loom textile production, continued to thrive in the colonial period. Modern machine production was not always a substitute for traditionally processed textiles due to the breadth and segmentation of the textile market. It is possible that free trade may not have hurt Indian producers before 1914, but it certainly did help British producers compete on world markets. For the rulers of British India, free trade

held ideological charm, but it often proved contradictory to the necessities of colonial administration.

TRIBAL PEOPLES OF EASTERN INDIA

India's tribal population, about 83.6 million, constitutes 8 percent of the total population of the country. This population comprises about 461 distinct tribal communities. More than 90 percent of the tribals live in tribal minority states. The tribal minority states spread over a broad girdle in middle India from Gujarat to West Bengal. The tribal majority states like Arunachal Pradesh, Meghalaya, Mizoram, and Nagaland are all located in the northeast region of the country. But less than 10 percent of the total tribal population resides there.

Ethnically, the tribes in eastern India belong to two racial stocks, Proto-Austroloid and Mongoloid. The Proto-Austroloid group is found in Jharkhand, Orissa, and the southern districts of West Bengal, while the Mongoloid group covers the other tribes in Bengal and the Northeast.

The most important tribal communities are: Santhal, Munda, Oraon, and Ho in Jharkhand; the Bhumij, Bhuiya, Gond, Kandha, and Saora in Orissa; the Bhumij, Santhal, Kora, Lepcha, Bhutia, Munda, and Oraon in West Bengal; Kachari, Miri, and Rabha in Assam; the Adi, Nyishi, Apatani, Monpa, and Wancho in Arunachal Pradesh; the Naga in Nagaland; Garo and Khasi in Meghalaya; the Mizo in Mizoram; some Naga tribes, Mac, and Paite in Manipur; and Tripuri, Riang, and Chakma in Tripura.

All these tribes differ in population, levels of sociocultural and economic development, means of subsistence, religion, and language. However, 90 percent of tribal populations reside in villages. There are many tribes spread over more than one state, such as the Santal, Munda, Oraon, the Naga, and the Gond. All these tribes

Young Members of Naga Tribe Armed with Swords and Shields. In this c. 1930 photo, young Naga warriors from the northeast Assam region pose for the camera. HULTON-DEUTSCH COLLECTION / CORBIS.

are known as scheduled tribes (STs). This status gives them certain safeguards, as well as certain rights and privileges, and entitles them to additional development funds from the central government. It also provides for reservation in legislatures, services, and educational institutions. Some of these tribal communities have been identified as “primitive tribal groups,” characterized as inhabiting preagricultural land and having extremely low levels of literacy. Some of them are found in Jharkhand and Orissa. India's government pays special attention to speeding up their development and saving them from extinction.

The literacy percentage among the STs in eastern India varies between 82 percent in Mizoram and 23 percent in Orissa. The literacy percentage in the middle Indian states is much lower than in the Northeast. Among women, the rates of literacy of the scheduled caste (SC) population are lowest in Jharkhand and Orissa.

PERCENTAGE OF TRIBAL POPULATION IN EASTERN INDIA STATES

| | |
|-------------------|-------|
| Arunachal Pradesh | 63.7 |
| Assam | 12.8 |
| Jharkhand | 26.9 |
| Manipur | 34.4 |
| Meghalaya | 85.5 |
| Mizoram | 94.8 |
| Nagaland | 87.7 |
| Orissa | 22.2 |
| West Bengal | 5.6 |
| Tripura | 30.95 |

The work participation rate of the tribal population is about 50 percent, which is much higher than that of the general population, primarily due to very high rate of work participation among tribal women. The tribal population is largely concentrated in rural areas, which have higher female participation rates than the urban areas. In addition, women are employed in forestry operations, which are largely female-oriented. Since very few tribal girls go to school, they are available for taking up gainful economic activity. Ninety percent of the workers are engaged in the primary sector, about 4 percent in the secondary sector, and 6 percent in the tertiary sector.

Social Structure

Each tribal group is known by a distinct name. Some of these are divided into subtribes. Dual organization is also found among some tribes in Orissa. Almost all the tribes are made up of clans, which are exogamous. Of course, there are some exceptions, such as Maler and Parahiya in Jharkhand and Saora in Orissa. In northeast India, social stratification is found among some tribes, such as Monpa and Apatani in Arunachal Pradesh.

By and large, most of the tribes are patriarchal and patrilocal. Succession is from father to son. There are only two tribes that are matriarchal and matrilineal: the Khasi and Garo of Meghalaya. There is no polyandry among eastern Indian tribes, but polygyny is permitted and practiced among many tribes.

The basic unit of the tribal society is the family. Joint or extended families are very rare; in most places the family is nuclear. After marriage, both son and daughter leave the parental home. The son sets up a new household, while married girls go to live with their husbands. In most marriages, there is the practice of paying a bride price, either in cash or in kind, or in both. In some communities in the Northeast, the bride price consists of cattle.

Most of the marriages are negotiated by parents, but there are also other methods of mate selection. Most marriages are adult marriages, and in some cases there are love marriages that are later approved by the parents. In these tribal communities, marriages are a long process, punctuated by various rituals. However, unlike Hindu marriage, tribal marriage is not a religious sacrament, and no priests are involved at any stage in the entire process. Marriage rules prohibit marriage inside the clan and outside the tribe. Anyone breaking these rules invites social ostracism in addition to incurring divine displeasure. Divorce is allowed under certain conditions but must be approved by the village council, which provides for compensation to the aggrieved party. Widow remarriage is allowed. Polygyny is largely confined to affluent sections of the tribal society. It is also a status symbol. The eldest wife enjoys a privileged position in a polygynous family.

In matriarchal societies, among the Khasi and Garo, the family is headed by a woman who has full command over family resources and makes all important decisions regarding family matters. On her death, her position is inherited by her daughter. After marriage, a man must shift to his wife's family. A person inherits the clan title of his mother. In such a society, men play a secondary role.

In many tribal societies in eastern India, youth dormitories used to play an important role in the socialization of children. It was an effective economic organization for guests, a useful seminary of training for young men in the social and cultural duties, and was an institution for magico-religious observances calculated to secure success in hunting. It was also a place for training in music and dance. The organization was entirely managed by the youths, helping them to acquire organizational and leadership skills. It was indeed a "kingdom of the young." In Jharkhand, among the Oraon, it was known as *dbumkuria*. Although *dbumkuria* buildings are found in some villages, they have lost their functions. A similar organization known as the *ghotul* is functioning on traditional lines among the Muria Gond in the Bastar District of Chhatisgarh.

Among the northeastern tribes like the Naga, an organization of this nature, called *morung*, exists. It also functions as a community house where all the weapons of war and head-hunting trophies are placed, reminiscent of days when village raids were common. The Naga *morung* strengthens the sense of social unity, develops in boys a strong esprit de corps, and at the same time encourages competition between the *morung*, thus stimulating the activities of the whole village.

The position of women in tribal societies in eastern India is much better than in other societies, for they are

independent and do not suffer any seclusion. They move about freely in the forest, farms, and agricultural fields. They work shoulder to shoulder with men. In the Northeast they also engage in small business and manage sales in small shops.

However, tribal custom prohibits giving a share to daughters in their fathers' property on the plea that after marriage they become members of another clan. She is entitled to a share in her husband's property after his death. In other matters, women do not suffer from any inequality. In matriarchal society, the status of women is higher than in patriarchal society, since all authority is vested in the head of the family, who is a woman.

Tribal Economy

Tribals in eastern India make a living by different means. There are some communities that are still in the hunting and gathering stage. The Birhor in Jharkhand are a classic example of such subsistence. Now a section of this tribe is engaged in settled cultivation. Some communities are pastoralists, engaged in sheep or cattle rearing, such as the Sulung of Arunachal Pradesh. The number of people engaged in hunting, food gathering, and pastoralism is very small. More than 90 percent of tribals subsist on agriculture, either shifting or settled. Shifting cultivation is generally carried out in areas where flat land is not available for plow cultivation. In Jharkhand, the Maler of Santal Pargana are still engaged in shifting cultivation. Many tribal communities in Orissa, particularly in the hilly regions, are engaged in shifting cultivation. In this process, a plot where vegetation has grown is set on fire, and then the ashes are spread all over. Seeds are sown with help of digging sticks. No plow is used. One plot is cultivated for a year or two. It is then left fallow for a number of years to allow vegetation to grow again. Shifting cultivation is regarded as wasteful by agronomists and foresters. Efforts are being made to introduce scientific horticulture. In many areas of Arunachal Pradesh, apples, oranges, pineapples, and potatoes are being grown on shifting cultivation sites.

The bulk of the tribals in other areas are engaged in settled cultivation and grow a large number of food crops, but the agricultural technology continues to be traditional. Efforts are being made to improve the situation by providing irrigation, improved seeds, and fertilizers and insecticides. This is extremely important, as the fertility of the soil is quite low in plateau and hill areas in comparison to river valleys, villages, and plains.

With the growth of education and the opening up of communication in tribal areas, both in middle India and the Northeast, some tribals have shifted to secondary and tertiary sectors of employment. In Jharkhand and Orissa,

the growth of industry has attracted tribal people, who have joined largely as unskilled laborers in Jharkhand and Orissa and as contractors and small businessmen in the Northeast.

Religious Beliefs and Practices

Most tribal religions are animistic. Their deities are associated or named after natural objects like sun, moon, hills, forest, rivers, and so on. Most of them have a pantheon headed by a high god (God of Gods), such as Singbonga among the Munda of Chotanagpur. He is benevolent, omniscient, and omnipresent. Below the high god are clan and village gods. There are a number of deities associated with hill, forest, and rivers. In Chotanagpur they are known as Bonga. There are also ancestral spirits at home to whom worship is offered on certain occasions. In Jharkhand most villages have a common place of worship—known as *sarna*—where a number of village gods are propitiated by the village priest, known differently among different tribes. In recent times, *sarnaism* is a term that has been used for tribal religion in Jharkhand. However, in census reports, most tribals have been classified as Hindu.

In Arunachal Pradesh most of the tribals, except the Christians and Buddhists, are followers of the popular tribal deity Donyi Polo. In many tribal religions, there are both benevolent and malevolent spirits. The latter must be propitiated so that they do not cause any harm to man or cattle. Tribal society is also characterized by firm belief in totem and taboo. In fact, each clan has a totem fashioned after a natural object, animate or inanimate. This object is given all respect and is regarded as the protector of that totemic group. Taboo is observed in regard to certain items of behavior and ritual practices. Any breach of taboo attracts divine punishment.

All tribal societies in India observe many fairs and festivals. These are largely connected with agriculture, such as the sowing of seeds, first fruit rituals, and harvest. These festivals are spread throughout the year and are celebrated for several days. All the festivals are marked by dances, music, and community worship of deities. The fervor with which these festivals are celebrated is an assertion of tribal identity.

In Jharkhand, Orissa, and West Bengal, a large number of tribals observe Hindu festivals and worship Hindu gods and goddesses during festivals. Such practices do not clash with belief in tribal gods and goddesses. This spirit of accommodation is not evident when they come into contact with Christian missionaries.

Christian missionaries entered tribal areas in Chotanagpur and the Northeast at different times, under the patronage of British rulers. Christian missionaries

belonging to various denominations entered interior tribal areas and started to convert people there. They met with greater success in the Northeast, particularly in Nagaland, Meghalaya, and Mizoram, where they converted large numbers of tribals to Christianity. These converts shed their old religious beliefs and practices and slowly adopted the norms and behavior patterns of the missionaries. This process was accelerated by the spread of education through the medium of the church, which came to play a guiding role in their sociocultural life.

Some tribes in Arunachal are Buddhist. The Monpa follow Mahayana Buddhism, while the Singpho belong to the Hinayana sect. Tawang, which is located close to the Chinese border in Arunachal Pradesh, has a very large monastery with three hundred monks. Some tribes follow the Bon religion, which is a mixture of Buddhism and tribal beliefs and practices.

Colonial Encounters with Tribal Communities

Studies in ancient and medieval Indian history have revealed several instances of continued interaction between the local population and indigenous (tribal) groups in different parts of India. The names of such groups (Bhil, Kol, Kirat, Kinar, Nishad, Asur, etc.) are found in historical literature. Indian rulers were satisfied if tribal chiefs acknowledged their sovereignty and never interfered with tribal customs or imposed tribute. During Mughal rule some revenue was realized, but tribal rights in forest and forest produce were not disturbed. With the establishment of British colonial rule in eastern India, things changed a great deal. The government acquired tribal lands, and different kinds of taxes were imposed on them. Tribal lands were acquired to lay down railways and roads, setting up townships with administrative offices, police stations, educational institutions, and hospitals. In areas where the *zamindari* system prevailed, they were placed under control of the *zamindar*. The exploitative and oppressive behavior of administrative officials and of the *zamindars* forced the tribals to launch agitation for the removal of their grievances. Such unrest in tribal areas sometimes became violent revolts.

In the wake of famine of 1770, the Pahariya of Rajmahal hills in Santal Pargana rose in revolt against the government. Forced by starvation to come down from the hills, they engaged in theft and murder. The government tried to suppress the revolt but could not. Ultimately, it was an enlightened official, Augustus Cleveland, who solved the problem by introducing certain reforms for providing better administration. This was the first attempt at indirect rule. In 1821 the Ho of Singhbhum rose in a revolt against the incursion of British troops in their area. To solve this problem, Thomas Wilkinson, the agent of the governor-general, introduced a series of

rules by which the second example of indirect rule was put into practice. Again in 1831, the Kol rebellion forced the administration to take steps to curb exploitation and oppression by officials and others from outside the area. The Santal revolt of 1855 was mainly directed against up-country outsiders who came to Santal Praganas as shopkeepers and moneylenders. The exploitation by these elements led to a violent revolt, which continued for more than a year. After the rebellion was quelled, certain reform measures were enacted, the most important of which was the demarcation of Santal-dominated areas known as Damin-e-Koh, which were taken out of the general administration and were placed under special regulations. It is clear that all these movements originated from economic exploitation, encroachment on tribal land, infringement of tribal rights in land and forest, and interference with age-old customs.

Survival and Identity

The tribals are faced with a large number of problems emanating from land alienation, which has continued in spite of government legislation: the chronic deficit budget of the tribal family (leading to indebtedness and bonded labor), low productivity of the soil, traditional agricultural practices, poor marketing facilities due to lack of communication, low literacy, and unemployment. These problems are compounded by severe malnutrition, poor health, and lack of sanitation. In recent times many development projects in tribal areas resulted in large-scale displacement; building large industrial establishments resulted in ousting tribals from their homes. Irrigation projects in tribal-dominated areas have submerged a large number of villages by the construction of reservoirs. Reports of the commissioner for SCs and STs are replete with examples of the ravages of such projects. The tribals were displaced from the traditional sources of their livelihood and their places of habitation. The funds they received as "compensation" for their land were soon dissipated, and they joined the ranks of landless laborers. The establishment of vast industrial enterprises in tribal zones has led to the sacrifice of tribal interest at the altar of India's modernization.

In a cultural contact situation there is a greater likelihood of the smaller group losing its language and adopting the language of the economically stronger, culturally more advanced neighbor. In the past two centuries, tribal cultures have become the targets of assault from two sides. Interaction with Hindu society has led to the adoption of many norms and values that were foreign to tribals. This process has not only created prejudice against occupations such as leather working and butchering, but has introduced the dietary taboos, child marriage, and restrictions on remarriage of widows associated with

Hinduism. This is a part of the Sanskritization process, in which the norms and values of Hindu society became the reference model and principal criteria of social responsibility.

Hinduism is not the only ideological force that constitutes the cultural assault on tribal mores. With the advent of Christianity a large number of tribals in eastern India have been converted. Missionary influence has eroded much of their cultural heritage, including myths, beliefs, and rituals. Conversion of a part of any tribal community tends to destroy its social unity.

It is generally seen that not only physical survival but much of tribal social organization and its culture centers around access to land and control and management of natural resources, which is a basis of their life support system. Steady deprivation of these resources and of the traditional right of management and control of the same is reflected in the process of pauperization. The problems are compounded by the lack of diversification of occupations. Under these circumstances, some tribals in middle and eastern India began to suffer from threats to their identity. This is the result of the spread of education, exposure to urban influences, and entry into government service through job reservations. The resurgence of traditional religious identity, the creation of new literature, and the invention of scripts bear testimony to growing tribal identity assertion.

Christian missionaries, nongovernmental organizations, and tribal associations are all catalysts of social change in this regard. Tribal associations initiate social reforms in customary matters, like the reduction or abolition of bride price. Cultural movements launched by Rangunath Murmu among the Santals, focusing on education with a district script and culturally oriented curriculum, as well as social reform, continued for many decades. The Manki-Munda movement launched by the traditional headman of Singhbhum in Jharkhand emanated from an encroachment on traditional land rights but later assumed political overtones. Threats to traditional systems of control and management of resources and the search for a more satisfactory system of organization of community power leads to the creation of political platforms, launching movements that at times react with violence.

The assertion of tribal identity is more evident in tribal minority states. The tribals felt that changes initiated by the state or through market forces tended to erode their identity. In tribal majority states there is no such problem, since tribals can reshape their own future through a democratic process and legal constitutional means. They have never experienced any exploitation or discrimination at the hands of nontribals. In fact, as a

result of the dispensation of "Inner Line" regulations, tribals are protected from incursions by nontribal elements. This creates a situation of exploitation in reverse, resulting in the exploitation of nontribals who go to the tribal states in search of small business jobs.

Some of the states in the Northeast are in the grip of sustained violent insurgency. The roots of that insurgency may be traced to hopes entertained among some tribal leaders that with the end of British rule in 1947, the tribal areas in the Northeast would revert to independent status. Thus insurgency is a struggle not so much for autonomy but for secession from India. In some parts of the Northeast, like Arunachal Pradesh, Meghalaya, and Mizoram, total peace prevails and people are reaping the fruits of peace through steady development and a rise in their standards of living.

In India the tribals do not face any problem of physical survival. There has been a steady rise in tribal population, from 30 million in 1961 to 67.8 million in 1991. The literacy percentage rose from 8.5 percent in 1961 to 30 percent in 1991. Ninety-two percent of tribals in the country live in rural areas, and the percentage of people below the poverty line in the rural areas is slightly over 50 percent, while that of general population is 37 percent. They have adequate representation in government service, in the Indian Parliament, and in *panchayati raj* institutions. In the tribal minority states, where the fifth schedule of the Constitution is in operation, adequate measures have been taken to safeguard their interests in all walks of life. Whenever money has to be allotted for the promotion of "total literacy" or Integrated Child Development Service projects, priority is given to tribal areas. Steps have also been taken to promote tribal culture through songs, dances, marketing of handicrafts, and the promotion of tribal languages.

The tribals in India, both in tribal majority and tribal minority states, have retained their identity and are proud of their cultural heritage. Their leaders' main concern is to see that their rights as citizens in India's democracy are well protected. They are striving, through the help of state and the wider society, to achieve a better quality of life while slowly moving toward social integration with other communities of their region.

TRIBAL POLITICS The “tribal” peoples or *adivasis* of India, according to the 2001 census, constitute roughly 8.1 percent of the country’s population, some 83.6 million people, classified under 461 different communities. They occupy a belt stretching from the Bhil regions of western India through the Gond districts of central India, to Jharkhand and Bengal, where the Mundas, Oraons, and Santals predominate. There are also pockets of tribal communities in the south like the Chenchus, Todas, and Kurumbas, and very small endangered communities in the Andamans, like the Jarawas, Onge, and Sentinelese. Northeast India contains another major portion of the tribal population, including the different Naga subtribes, Khasis, Garos, Mizos, Kukis, Bodos, and others. The intellectual, political, and administrative rationale for treating all these communities together under a single “tribal” rubric remains unclear.

One feature common to all these communities, however, whether in central or northeastern India, is their division between different state and administrative boundaries, including national borders (e.g., the Chakmas are divided between Mizoram and Bangladesh, the Nagas and Kukis cross the Indo-Myanmar border). In central India, although communities like the Gonds and the Bhils number some 7.3 million people each (1991 census), none of them has been recognized as peoples, nor have they been given statehood, as have other linguistic communities. Even though the struggle for a tribal but multiethnic state of Jharkhand preceded that of many other linguistic states, it was finally achieved in truncated form in November 2000. In the Northeast, struggles for autonomy range from complete independence to statehood to autonomous district councils. Another common feature is the combination of special legal provisions for tribals on the one hand, and repression by the police and army on the other, when tribal peoples try to assert their own visions of the good life.

The “tribal question” in central India has traditionally been posed in two ways by academics and policy makers: the question of differentiating between tribes and castes on the one hand, and tribes and peasants on the other; and the question of how best to improve what is universally seen as a poverty-stricken condition among tribals. In the Northeast, struggles for autonomy, statehood, and secession have put the question of identity at center stage. For the government, the main issue there is law and order, and solutions are usually conceived in military

terms, such as the draconian Armed Forces (Special Powers) Act of 1958, which gives armed personnel the right to shoot on sight on mere suspicion, arrest without warrant, and enter and search premises at will. To understand contemporary tribal politics, however, it is essential to start with the colonial period.

Colonialism

In the pre-colonial period, while hill and plains people occupied different ecological, social, and often political spaces, there was often considerable trade and even intermarriage between the two. Both in central and northeastern India, hills people would raid the plains, and were in turn looked down upon as savages. Yet categories were often fungible, and the balance of power was never fixed. Colonialism was a significant watershed, both in epistemological and material terms. The production of census records, gazetteers, official or semiofficial ethnographies, grammars, linguistic surveys, and land tenure records all served to create sociological and epistemological categories such as castes and tribes. The characterization of the tribal in India was similar to that in Africa, drawing on evolutionary classifications based on race and anthropology, the denigration of any indigenous kingship or polity in favor of an acephalous, kinship-bound society, and the perceived primitiveness of modes of production. The categories “tribal,” “primitive,” “savage,” or “wild” were also used interchangeably to characterize those peoples who resisted colonial rule, and formed part of the justification for particularly violent campaigns of “pacification,” such as the burning of Kond villages in Orissa in the nineteenth century, ostensibly to suppress human sacrifice, or Naga villages in the twentieth century, to outlaw head-hunting.

But the Indian “tribe” was further understood to be differentiated by religion and culture from the Indian “caste.” The census reports, with their agonizing over the distinction between animists and Hindus, in particular contributed to this objectification, which continues to fuel social science debates. There were of course dissenters from the conventional view, for example, sociologist André Beteille (1974), who pointed out that in terms of size, isolation, religion, and means of livelihood, it was often not possible to distinguish between castes and tribes.

In material terms, the colonial view of tribal communities as isolated, poor, and backward created conditions for their exploitation. Shifting cultivation, which was a widely practiced form of agriculture, was dismissed as wasteful and destructive of the forests. Reservation of the forests to make space for monocultures, which would contribute to the British shipbuilding, railway, and war efforts, was introduced in the guise of “scientific forestry.” Restrictions were introduced on the collection

and sale of nontimber forest produce, which was a major source of income for most tribal communities. These changes set off more than a century of conflict over access to the forests. Some of the major rebellions in tribal India, such as the Bastar Bhumkal of 1910 and the Jharkhand Sal Andolan of the late 1970s, have been over forest rights. In many places, the forest department claimed land that *adivasis* had been cultivating for generations but on which their rights had never been recorded. Forced evictions from such lands, and the precarious situation of forest villages, remains a central and burning issue for large numbers of forest communities. Similarly, colonial settlement policies that transformed community lands into individually owned plots, higher rents, and unfamiliar legal systems led to significant land alienation. Moneylenders, traders, and others found a foothold in tribal areas, which they progressively expanded into complete dominance. Industrialization has further transformed the demographics of several tribal regions. In Jharkhand for example, tribals were down to approximately 26 percent in 2001 from roughly 50 percent in 1901.

Despite this clear history of underdevelopment, official policy attributes *adivasi* poverty to the backwardness and primitiveness of *adivasis* themselves, or in other words, regards it as an internal condition of their society. In the 1930s and 1940s, there was considerable debate among “isolationists,” “integrationists,” and “assimilationists” about whether to leave tribals alone, integrate them with some perceived “mainstream,” or attempt assimilation as a path toward progress. In neither case was it acknowledged that they had already been integrated, but on disadvantageous economic terms, as labor and supplier of raw materials. While the official policy of the government of India, as reflected in Jawaharlal Nehru’s five principles for tribal policy, or Panchsheel, is culturally “integrationist” and leaves space for *adivasis*’ own distinctive customs, in practice, assimilationist pressures predominate, especially in the sphere of schooling, language, and religion. For instance, the census automatically records *adivasis* as Hindus. The struggle to be recorded as followers of *sarna dharm* has been an important part of *adivasi* politics in Jharkhand in recent years.

Constitutional and Policy Provisions for Tribes

Like the scheduled castes, tribal communities are officially characterized as among the most vulnerable populations in the country, in need of special protective laws. In addition, however, tribal resistance to colonialism ensured that they were governed under distinctive administrative arrangements, some of which are now being rapidly eroded. Maintaining special tenure laws like the Chotanagpur Tenancy Act is now an important part of tribal politics in the state of Jharkhand. The constitutional

provisions for scheduled tribes are inevitably a mixture of colonial legacy and fresh thinking at the time of the framing of the Constitution.

Following the various rebellions in *adivasi* areas in the eighteenth and nineteenth centuries, such as the Santal Hul of 1855–1856, the Birsa Ulgulan of 1895–1900, the Tana Bhagat Movement of 1914–1920, and the Bastar Bhumkal of 1910, the colonial government responded either by maintaining indirect rule (as in Bastar or the Dangs) or by setting up specific areas, under the direct rule of an agent to the governor-general, where the land, forest, and other laws applicable to the rest of the British province did not apply and where special administrative arrangements could be made that recognized, at least to some extent, community rather than private property (see, for example, the Bengal Regulation XIII of 1833 which followed the Kol rebellion of 1831–1832). This state of exceptionalism was continued in the Scheduled Districts Act (Act XIV) of 1874, which listed scheduled districts across British India. Special provisions for tribal areas were continued in the Government of India Act of 1919, which allowed for certain areas to be declared “backward tracts,” followed by the Government of India Act of 1935 and the Government of India (excluded and partially excluded areas) Order of 1936. These excluded and partially excluded areas later became the scheduled areas of independent India.

There are two broad types of scheduling in the Indian Constitution: area-based and community-based. Under Article 244 of the Constitution (Part X), which deals with the “Administration of Scheduled Areas and Tribal Areas,” there are two types of arrangements. The Sixth Schedule applies to tribal areas in the states of Assam, Meghalaya, Tripura, and Mizoram, while nine states have scheduled areas under the Fifth Schedule: Andhra Pradesh, Chhattisgarh, Gujarat, Himachal Pradesh, Jharkhand, Maharashtra, Madhya Pradesh, Orissa, and Rajasthan. While there is a strong overlap between the category of scheduled tribes and scheduled areas, the fit is imperfect. Some states that have the most vulnerable *adivasi* populations, like West Bengal, Karnataka, Tamil Nadu, and Kerala, have no scheduled areas at all, and even in the states where the Fifth Schedule is in operation, not all areas where *adivasis* constitute a majority are covered under the schedule.

Article 342 of the Constitution gives the president the power to schedule or list particular communities in order to render them special protection. These lists are state specific; for instance, the Santals and Mundas are a scheduled tribe in Jharkhand, but not so in Assam or the Andamans, where some of them migrated. Even in their states of origin and despite clear poverty, not all tribal communities are scheduled as tribes, for example the Kols of Sonbhadra and Mirzapur in Uttar Pradesh.

While the Fifth and Sixth Schedules of the Constitution have colonial antecedents, the detailed provisions were framed by three subcommittees of the Advisory Committee on Fundamental Rights and Minorities. The committee, which was to look at the tribal areas “other than Assam” and whose work resulted in the Fifth Schedule, was chaired by the Gandhian A. V. Thakkar, who believed in a policy of “uplift” rather than “rights.” The basic assumption underlying the 1833 Bengal Regulation, the 1874 act, and the 1919 and 1935 acts, which has continued in the Fifth Schedule as well, is that tribal areas are best governed by a paternalistic and personalized administration with special and fewer rules than those that apply to nontribal areas. The Fifth Schedule makes provision for Tribes Advisory Councils and for certain laws to prevent alienation of land to nontribals and exploitation by moneylenders. The governor of the state has wide-ranging powers to modify or forbid existing laws or to propose special laws for these areas. In practice, experience with the Fifth Schedule has been very disappointing. The Tribes Advisory Councils have hardly any teeth, laws applicable to the rest of the state are routinely extended to scheduled areas, the governor rarely exercises the powers vested in him or her, and the net result is demonstrated by the miserable human development indicators for *adivasis*.

The Sixth Schedule, pertaining to former Assam, gives greater recognition to the right to self-governance, through the formation of autonomous district and regional councils with legislative powers in a variety of important matters, including the management of forests, the regulation of shifting cultivation, the appointment of chiefs or headmen, property inheritance, and social customs. The District Councils also have the power to levy taxes, regulate money lending, establish and manage primary schools, dispensaries, and markets. However, it still falls short of the autonomy that many groups in the Northeast region were demanding at the time.

In a parallel stream, the 73rd Amendment Act of the Constitution (1993) made it mandatory for every state to constitute *panchayats*, or councils, at the village, intermediate, and district levels. Past experience with elected *panchayats* that supplanted traditional tribal systems, however, led to a legal challenge by *adivasi* groups, and in 1995 the Andhra Pradesh High Court ruled that a separate act was needed for scheduled areas. Accordingly, in December 1996, Parliament passed the Provisions of the Panchayats (Extension to the Scheduled Areas) Act (PESA). This act is applicable to Fifth Schedule areas, since the Sixth Schedule already contains many of its provisions regarding customary law. In fact, PESA explicitly aspires to implement Sixth Schedule-like arrangements in Fifth Schedule areas. PESA mandates that any “State

legislation on the Panchayats . . . shall be in consonance with the customary law, social and religious practices and traditional management practices of community resources” and that “every Gram sabha [village assembly] shall be competent to safeguard and preserve the traditions and customs of the people, their cultural identity, community resources and the customary mode of dispute resolution.” However, most states have not passed appropriate legislation to implement the act, and there is widespread and often purposeful ignorance of its provisions on the part of officials.

In addition to the Fifth and Sixth Schedules and PESA, a number of constitutional provisions are addressed to *adivasis* as individual citizens. These include: Article 15 (4), which enables special provisions for the advancement of socially and educationally backward classes; Article 16 (4a), which enables reservations in government services; Article 275 (1), which relates to central grants-in-aid to states for the specific purpose of scheduled tribe welfare; Articles 330, 332, and 335, which stipulate seats for scheduled tribes in the Parliament, state assemblies, and services; and Article 339, which mandates the setting up of a commission to report on the administration and welfare of scheduled areas and scheduled tribes. Successive five-year plans have also created special plans for tribal development, in the shape of multipurpose tribal blocks (second plan), tribal development agencies (fourth plan), and tribal subplans (fifth plan).

Tribal Politics in Central India

However, even as the state created paternalist schemes and legal provisions for tribal “development,” it contributed to their poverty and landlessness through land acquisition for mining, hydroelectric projects, defense projects, and other “development” activities, leading to massive displacement. The Bailadilla iron ore mine in Bastar, the Hirakud and Upper Indravati hydroelectric projects in Orissa, and the Sardar Sarovar dam in Gujarat are all examples. Apart from displacement, the two other axes of tribal politics are struggles over the forest and everyday encounters with the police.

Adivasi communities have responded to their situation in several ways: many of them have succumbed to the forces of industrialization and displacement, losing their lands and migrating to urban centers or other states in search of employment. A significant number, however, have joined communist struggles, like the Telengana movement and become members of the various “Naxalite” parties, such as the Communist Party of India (Maoist), to demand land reform and access to resources. They have also been active in various struggles against displacement by large dams led by organizations like the Narmada Bachao Andolan or the Koel Karo Andolan, as

well as in the struggle against insensitive and overly exploitative mining as in Kashipur, Orissa. In each of these struggles, people have been arrested and killed by the police, their houses have been razed, and their crops destroyed.

Since the late 1990s several tribal groups have mobilized to retain rights to forest land, which are in danger of being usurped by the Supreme Court decision of 1996, in the Godavarman forest case, which gives the forest department the right to manage all “forests,” as defined in the dictionary, regardless of their actual ownership. With one stroke, this judgment negates decades of struggle for more participatory forest management, as well as the specific rights provided by local tenurial acts like the Chotanagpur Tenancy Act.

Another major plank of *adivasi* politics today is to claim the rights promised by PESA. Many nongovernmental organizations and social movements have promoted the setting up of village assemblies (*gram sabhas*), on the grounds that they have a constitutionally recognized “competence” to manage their own resources. The government, however, does not recognize these assemblies. In Meghalaya, there has been a parallel move to revive Khasi *syiems*, or chiefs. Several *adivasi* groups have also begun to make alliances with international networks of tribal and indigenous peoples.

Given the desperate situation in which many of the central Indian *adivasis* live, survival issues have usually dominated over identity questions. Competitive proselytization by Christian and Hindu groups has also served to reduce the space for the expression of an autonomous *adivasi* culture, language, and religion. In recent years, while some *adivasi* communities have been mobilized by Hindutva (Hindu nationalist) political forces, primarily through the work of Rashtriya Swayamsevak Sangh fronts like the Vanvasi Kalyan Ashram, the Bajrang Dal, and the Vishwa Hindu Parishad, others have attempted to revive traditional *adivasi* religions like the *sarna dharm* (sacred grove religion).

Tribal Politics in the Northeast Region

Many of the movements in the Northeast date back to the colonial policy of excluded areas and inner line permits, which cut off existing links between the hills and plains peoples, creating isolated tribal areas and communities. Christian missionary activities in these areas, particularly what is now Nagaland, Mizoram, and Meghalaya initially resulted in a loss of indigenous identity, culture, and religion, but eventually led to the formation of new identities, like that of the Naga and the Mizo peoples out of different subtribes, and the emergence of an educated middle class, which could articulate nationalist aspirations.

The failure of the Indian state to recognize people’s aspirations, forced accessions at the time of independence, as well as subsequent military action and repression further fueled secessionist politics.

The Northeast is marked by a multiplicity of insurgent outfits representing different ethnic groups, some of whom are engaged in interethnic warfare (e.g., the Naga-Kuki tensions) as well as conflict with the Indian state. Within the space demanded by larger nationalities like the Assamese or the Mizos, there are several minority groups that are also engaged in autonomy struggles, including the Bodos, Karbis, Dimasas, and Koch Rajbanshis in Assam, and the Hmars and Reangs in Mizoram. Some of them, like the Bodos, have been successful in negotiating accords with the Indian government, resulting in the Bodoland Territorial Council within Assam. Immigration by nontribals into tribal areas, especially Bangladeshis, is a major political issue in the area. Since it would be impossible to go into the histories of each movement, what follows here is simply a representative glimpse of two major nationality struggles, those of the Nagas and the Mizos.

Until the 1960s, Arunachal Pradesh (earlier known as North East Frontier Area or NEFA), Meghalaya, Nagaland, and Mizoram were part of the province of Assam. Manipur and Tripura, which were princely states, were absorbed into the Indian union as Part C states and then union territories, and were given separate statehood much later.

The Naga movement, which is the oldest and most powerful autonomy movement in the area, goes back to 1918, with the formation of the Naga club, in which ex-members of the World War I labor corps played a major role. In 1946 leadership of the Nagas was taken over by the Naga National Council (NNC), with representation from different subtribes. Apprehending that Indian independence and the absorption of Naga areas into India would mean a loss of autonomy, and yet with no clear alternative, the NNC wanted a ten-year interim agreement with India, during which it could decide whether it wanted complete independence. A nine-point agreement to this effect was signed between the NNC and the governor of Assam, Sir Akbar Hydari, in 1947. However, there was a dispute over the interpretation of the ninth clause, which stated that “at the end of this period (10 years) the Naga council will be asked whether they require the above agreement to be extended for a further period or a new agreement regarding the future of the Naga people arrived at.” While the Nagas interpreted it to mean that they would be given the choice of independence, the Indian government interpreted it to mean that the Naga hills were now an integral part of India. The Naga hills became a district of Assam, to be

administered under the Sixth Schedule. This led to a split within the NNC, with A. Z. Phizo demanding complete independence. From about 1953, the NNC was forced into underground resistance by the presence of the Indian army. Since then, the Naga peoples have seen continued insurgency, as well as severe army repression involving rapes, killings, and the occupation of churches and schools, all of which is “legally” sanctioned under the Naga Hills Disturbed Areas Ordinance, the Assam Maintenance of Public Order Act, and the Armed Forces Special Powers Act 1858 (amended in 1972). Pressure by Naga moderates on both the insurgents and the Indian government bought some peace in the form of statehood for Nagaland in 1963. Like the Hydari Agreement, the 1974 Shillong Accord between the central government and the insurgents died a quick death, and in 1980 the National Socialist Council of Nagalim (NSCN) was formed. This in turn split into two factions, named after their leaders, the NSCN (Isak-Muivah) and NSCN (Khaplang). From 1997 onward, again due to pressure by civil society groups like the Naga Hoho, the Naga Peoples Movement for Human Rights, and the Naga Mothers Association, there have been talks between the NSCN (I-M) and the Indian government. However, the Indian government’s proposal to extend a cease-fire to all Naga areas in 2001 created huge unrest in Manipur. The cease-fire was read as an initial step toward accepting the NSCN demand for a greater Nagaland, or Nagalim, which would incorporate the three northern districts of Manipur. Naga unification would also affect Assam and Arunachal Pradesh, creating resistance within those states.

Among the Mizos, the earliest social and political associations were the Young Lushai Association and the Mizo Union. The early struggles of the Mizos were against their own feudal chiefs, and around the time of independence, the left faction of the Mizo Union was in favor of merging with India as a way of abolishing the chiefship. Another faction, however, wanted independence or union with Burma (Myanmar). Eventually, in 1947, the Mizos became a part of India, but were split between Bangladesh (Chittagong Hill Tracts), and the Indian states of Tripura and Manipur. Unlike in Tripura, however, where there was a long struggle for the tribal areas to be brought under the Sixth Schedule in an Autonomous District Council, in Mizoram the Sixth Schedule was applied from the start. In 1958 the cyclic flowering of the bamboo led to a huge multiplication of rats and famine. Inadequate relief, the Assam government’s imposition of the Assamese language, and the construction of a separate Christian and Mizo identity led to the formation of the Mizo National Front (MNF), led by Laldenga. The MNF carried out attacks on government offices and communication lines and on 1 March 1966 declared independence. The Indian government’s

response was to declare the Mizo hills a disturbed area, aerially strafing villages and forcibly regrouping several villages into concentrations along the highway. This effectively destroyed the Mizos’ own subsistence economy, based on shifting cultivation and made them dependent on government rations. After episodic peace talks, an accord was signed in 1986 between Laldenga, the Mizoram government, and the government of India, whereby the MNF became part of the government in Mizoram.

TRIPURA Located in India's Northeast region, Tripura is the smallest of the seven hill states, the "Seven Sisters." The climate is generally hot and humid. Tripura is bordered by Bangladesh on the north, the south, and the west, Assam on the northeast, and Mizoram on the east. The monsoon usually begins in April and lasts until September. The population of nineteen tribes, led by Tripuris (over 50% of tribals), Reangs, and Chakma, who speak a variety of languages and dialects, and immigrant Bengalis, was about 3 million in 2004. The main languages spoken are Bengali, Kakbarak, and Manipuri, although Bengali is the official language. Animism plays a large part in the life of the tribals, but the largest number of people follow Buddhism, followed by Christianity and Hinduism.

The state is divided into the four districts of North, South, and West Tripura, where the capital Agartala is located, and Dhalai. Just over 50 percent of the state is covered by forest, and the landscape is composed of picturesque hills and dales and green, deep valleys. Less than 25 percent of the land is suitable for agriculture, with rice being the main crop. The main rivers are the Gomati, the largest and the one considered to be the most sacred, the Khowati, Manu, Haorah, and Muhari. Dunbar Falls is one of the most sacred places in the state.

The early history of the state is told in legend and is said to have played a role in the Battle of Kurukshetra. Some seventy-four Tripuri rajas ruled Tripura and were called "Manikya." In about 1280, Muslims invaded the state, and this was followed by settlers from Bengal and Burma. The Bengali sultan ruled until 1515, but in 1586, the Mughals defeated Jasodhara Manikya, and he ceded a part of the state to them. The state was ceded to the British in 1761.

The tribals followed *jhuming*, or slash-and-burn agriculture, or shifting irrigation, which has led to soil erosion and ecological degradation and depletion. Large-scale *jhuming* was banned by the government in 1952. The per capita income is well below the national average, and more than 80 percent of the people live below the poverty line. In addition, the state bore the brunt of massive immigration from East Pakistan and Bengal. The Bengalis brought with them plow cultivation and forced the tribals from the plains to the hills, where they fell into the clutches of Bengali moneylenders and traders.

On 15 October 1949 Tripura entered the Indian Union as a state. It became a Union Territory on 21 January 1972, and Ujjayanta Palace became the Legislative Assembly. Though the Communists had championed the cause of the Tripuris, they created the Tripura Upajati Juba Samiti, a separatist party, on 10 June 1967; their

demands included more autonomy and the recognition of the Kakbarak language as an official language. In 1978 a secret military organization, the Tripura National Volunteers, was formed, aimed at achieving complete independence for the state, and they committed hit-and-run attacks and assassinations of Bengalis, who responded through their Amra Bengali. Communal tension has never dissipated.

TYĀGARĀJA (1767–1847), poet-composer. The most influential poet-composer (*vāggēyakāra*) of South India, Tyāgarāja was born on 4 May 1767 in Tiruvārūr near Tanjāvūr, then a center of learning and culture. Between seven hundred and one thousand of his songs, mainly belonging to the genres known as *kīrtana* and *kṛiti*, have been preserved by several teacher-disciple lineages (*guru shishya parampara*). His Telugu lyrics are infused with Sanskrit and reveal a variety of literary and philosophical influences as well as a profound knowledge of music theory. Unlike his contemporaries, Muttusvāmi Dīkshitar and Shyāma Shāstri, with whom he forms the "Trinity" of South Indian music, Tyāgarāja often shares the joys and struggles of his personal life and worship with his public. Like Dīkshitar, he was an accomplished vina player (*vainika*) who succeeded in amalgamating the expressiveness (*bhāva*) of the voice and the aesthetic appeal (*rasa*) of instrumental music.

The fact that Tyāgarāja's father was an exponent of *barikathā* (musical discourse) explains the composer's aptitude for bringing the divine and heroic characters of the Rāmāyaṇa, the Purāṇas, and the Bhāgavatam to life. This art form has devotion (*bhakti*) for its subject, provides ample scope for variations on a given theme, and is based on India's ancient Hindu texts.

Tyāgarāja also composed two musical plays, titled *Naukacāritramu* (Boat story) and *Prablāda bhakti vijayamu* (Victory of Prahlāda's devotion). These original versions of popular stories were told through the characters' singing as well as in narrative passages provided by a *sūtradhāra*, the conventional director of Indian drama. Both works have been adapted for Bhāgavatamēlam drama as well as for Kuchipudi and

Bharata Nāṭya dance-drama, although they were probably not written for the purpose of being so enacted. Similarly, some portions have long been included in musical concerts.

Tyāgarāja's fame spread during his lifetime and has steadily grown since his death in 1847, initially by way of *barikathā* performances. Since 1925, homage is annually paid to him at festivals known as *Tyāgarāja ārādhana*, primarily in Tiruvaiyāru, where he lived and where his *samādhi* (resting place) was erected, as well as in other locations. Some music societies (*sabhā*) maintain the tradition of reenacting Tyāgarāja's performance of *unchavritti*, the custom of collecting food alms while singing religious songs with his disciples, as he shunned the demands of worldly patrons. With the boldness of a creative genius and the authority of a sage advancing the

art and science of music, he celebrates the very experience of music time and again in his songs.

UNDERGROUND ECONOMY, DIMENSIONS

OF India's underground economy, or the "black" economy, as it is commonly referred to in India, has serious implications for India's social, political, and economic development. The underground economy is synonymous with illegality; incomes generated in the illegal sectors, on which direct taxes are evaded, constitute India's black economy. The underlying motives for generation of black income and its disposal in terms of consumption and investment usually differ from those of white incomes, but in some activities and in their convertibility, there are links between the two. The black economy, therefore, is not a parallel economy but one that is deeply intertwined with the white economy.

The level of tax compliance in India declined during the 1970s and 1980s, reflecting perhaps the growth of the black economy. Scams have become larger in magnitude and have increased in numbers. Despite being estimated at 40 percent of India's gross domestic product (GDP), the black economy has remained immune to precise mainstream analysis.

Black incomes are also identified as property incomes, profits, interest, rent, and dividends, rather than wage incomes as black incomes are generated through artificial escalation of costs or underreporting of production or sales or some combination of these; in other words, black incomes are generally generated by the propertied class. Illegal transfer payments such as bribes and tax-evaded incomes from capital gains are not to be included in the definition of black incomes, since that would lead to double counting.

The true economy of any country consists of a white and a black component. The importance of the black economy for a country can be gauged from its size relative to the size of the reported GDP. By its very nature,

assessing the size of the black economy is a difficult task. Noteworthy studies giving estimates of the size of the black economy in India are not strictly comparable, owing to the differences in the underlying methodologies and the corresponding differences in its coverage. However, the size of the black economy relative to the size of the white economy has been growing since the 1950s.

Consequences

The impact of the black economy on India's economy, society, and polity is too significant to be ignored. It vitiates data, thereby making it difficult to get a true picture of the economy. It has resulted in higher levels of unemployment, lower levels of human development, more skewed distribution of income, poorer quality of infrastructure, subversion of the political system, weakening of the institutions of democracy, and increasing problems of law and order, which result in poor governance.

Macroeconomic linkages. The black economy has strong macroeconomic linkages affecting all the major macrovariables. The black economy has rendered the information base of India's economy unreliable, which is crucial for policy making, as the data collected for national income accounting from the producing units are fudged in the presence of tax evasion. Incomes are often shown to be originating in agriculture to avoid taxation; therefore the GDP is underestimated.

The propensity for black income generation is greater in the tertiary sector than in the secondary sector, and virtually negligible in the agricultural sector. Thus sectoral composition of income as revealed by the official statistics is distorted. Income distribution and employment figures are substantially biased by the black economy. Furthermore, the growth of black incomes,

property incomes, and the size of India's service sector tend to boost each other and constitute a growing trinity.

At the macroeconomic level, the efficacy of fiscal policy has been severely dented. Government expenditure gets inflated due to leakages while the actual delivery of services suffers. The poor quality of education and health services provided by the government in the majority of cases is forcing people to move toward privately provided services. Revenues turn out to be lower so that the deficit becomes higher, resulting in inadequate allocations of infrastructure, both social and physical. Several studies indicate that revenues from tax and nontax sources are far below their potential at all tiers of the government, which results in rising borrowing and interest payments, fostering budgetary crises.

The rate of growth. In sharp contrast to the channels of white investment, many black channels of investment are generally unproductive and are in the nature of transfers. Speculation, hoarding of cash, smuggling, and capital flight abroad through fake invoicing of exports and imports are some such channels. These channels of black investments opened up the Indian economy even before the liberalization process began during the early 1990s, and the economy traversed along a lower trajectory of growth. The black economy can be shown to result in deficiency of demand, thereby slowing down the rate of growth. The high costs of conducting business because of poor infrastructure, bribery and kickbacks, and uncertainty have contributed to India becoming a high cost economy. The black economy has led to criminalization of India's society due to a nexus among politicians, bureaucrats, and businesspeople. It is often argued that funding of elections by big businesses helps entrench such an unholy relationship. Societal unrest mounts as disparities between groups widen, while growth and employment remain below that which should be achievable, and thus sound policies fail.

Remedies

There is no consensus concerning diagnosis or remedies for the menace of the black economy. The black economy continues to thrive, despite policy initiatives, because it is systemic, and there exists a nexus among the three groups: the corrupt politicians, the corrupt public functionaries, and the corrupt businesspeople.

The last of the Tax Reform Committees (Government of India, 2002) has suggested that the economics of tax evasion must be changed by reducing costs of complying with tax obligations, moderating tax rates, phasing out concessions, and increasing the use of technology in compiling information related to taxpayers,

reducing the scope for interface between taxpayers and tax administrators. The general perception has been to reduce government intervention in the economy and to rely more on market forces so as to reduce the incentives behind tax evasion.

In the wake of India's integration with the global economy, there is an urgent need for restoration of fiscal balance and improvement in the efficacy of economic policies to accelerate growth and reduce poverty. The government stands discredited regarding its ability to rein in corruption. The black economy is a serious issue that must be remedied, as it darkens India's image abroad and undermines the quality of public life at home.

UNITED STATES, RELATIONS WITH India's relations with the United States since independence in 1947 have varied between diplomatic hostility and cordiality, though never bordering on armed conflict. Their foreign policy perspectives and priorities during the cold war did not always coincide, leading to periodic tensions despite their common democratic value systems. The collapse of the Soviet Union and the end of the cold war in 1991, marked by the end of socialism and the commencement of dramatic economic reforms in India, generated a new era in Indo-U.S. relations. This has been especially spectacular in the areas of U.S. investment in India, economic collaboration, and defense technology cooperation. At the beginning of the twenty-first century, the relationship is cordial and cooperative between the countries that are now widely referred to as the world's largest and most powerful democracies.

Non-alignment and the Cold War

Indo-U.S. relations had a promising beginning under Franklin D. Roosevelt's administration, when the United States supported India's struggle for independence from the British. During World War II, the Atlantic Charter called for freedom from Japanese and German aggression and occupations throughout Europe and China; Roosevelt would have extended this to the British imperial occupation of India, arguing that there could not be two different standards of freedom for nations. But Winston Churchill adamantly refused to agree. After the tragedy of partition that coincided with Indian independence in 1947, Indo-U.S. relations cooled. In the 1950s, following the commencement of the cold war, relations between India and the United States were weakened by India's refusal to join the U.S. alliance in the East-West cold war struggle. India also rejected the American capitalist system of free markets and unlimited private sector profit. Instead, India embarked on a policy of economic socialism in a series of five-year plans within a democratic political framework, allowing for only a limited, regulated private sector.

Resisting U.S. pressure to join the proposed South-East Asia Treaty Organization (SEATO) in 1954, Prime Minister Jawaharhal Nehru declared that India would follow a policy of "non-alignment" between the Western bloc and the Soviet Communist bloc. India's most urgent need as a new state, Nehru insisted, was an era of peace unencumbered by military alliances. Nehru stated that it would be "a tragedy of infinite magnitude if we should be checked and balked and our policy should be set at naught because of the troubles and quarrels of others" (cited in Thomas, *The Defence of India*, p. 34). India also refused to join the Baghdad Pact, expanded in 1955 to the Central Treaty Organization (CENTO), for the same reason.

I. K. Gujral and Madeleine Albright. Former Indian prime minister I. K. Gujral (left) and Madeleine Albright, then U.S. secretary of state, meet in September 1997, New York City, before the session of the UN Council of Foreign Relations. With Gujral's stateside visit (which also included a private meeting with former U.S. president Bill Clinton) came meaningful diplomatic exchange, and the hope of improved relations between the two countries, in recent years complicated by a number of sensitive issues. PRESS INFORMATION BUREAU / FOTOMEDIA.

India's refusal to join the U.S.-sponsored military pacts against the Communist bloc caused an adverse reaction in the United States, which was in the grip of a strong anti-Communist fervor, led by Senator Joseph McCarthy, in the mid-1950s. There was an immediate condemnation by Secretary of State John Foster Dulles and Vice President Richard M. Nixon. Dulles called India "immoral" and "shortsighted," and claimed that remaining non-aligned in the face of the Communist threat was inconsistent with the United Nations Charter provisions on Collective Security. The United States then proceeded to arm Pakistan, which immediately joined all these pacts.

Despite the tensions raised by Nehru's refusal to join the U.S.-sponsored military alliances, there was no likelihood of the United States going to war against India, or even following an aggressive military policy of encirclement, as some Indians feared. And since the Indian political system was modeled on the pattern of Western political ideas and institutions, there could be no question of parliamentary democracy being subverted from this direction. What had not been foreseen, however, was

the indirect, and perhaps inadvertent, threat that would arise from the U.S.-Pakistan alliance. The military risk to India had escalated, not because of threats from the Soviet Union and China, but as a result of the American decision to arm Pakistan against these Communist giants. Nehru complained that Pakistan had not joined these pacts “because it expected some imminent or distant invasion or aggression from the Soviet Union. The Pakistan newspapers and the statements of responsible people in Pakistan make it perfectly clear that they have joined this Pact because of India” (cited in Thomas, *The Defence of India*, p. 37).

Through much of the cold war, relations between India and the United States were bedeviled by two sets of conflicting strains: There were common political values of democracy and freedom in both countries, but these were undermined by the tensions that arose from the U.S. arming of Pakistan. India insisted that these arms would only be used by Pakistan against India. The United States provided the most economic aid to India in the 1950s and 1960s, yet India pursued closer ties with China (until the Sino-Indian War of 1962) and with the Soviet Union. A sense of Indian “ingratitude” rankled many members of the U.S. Congress, as well as the State Department and the White House.

The United States and the Wars of India

American arms supplied to Pakistan under SEATO and CENTO included fighters, bombers, tanks, artillery, and other logistical facilities. India responded by purchasing similar weapon systems from Britain and France, escalating a major India-Pakistan arms race. The effect of these developments was that Indian perceptions of threat were almost exclusively riveted on Pakistan. Contingency defense plans were aimed at Pakistan and all defense purchases were undertaken with a view to offsetting the American arming of Pakistan.

The most serious repercussion of this preoccupation with the Pakistani threat was India’s neglect of its northern Himalayan borders, even though India’s relations with China were far from satisfactory because of oppressive Chinese actions in Tibet. Deteriorating Sino-Indian relations over the Tibetan question and disputes over their boundaries in the northeast and the northwest eventually led to a border war between the two countries in October 1962. Although the war occurred concurrently with the Cuban missile crisis between the United States and the Soviet Union, the Kennedy administration was quick to rush mountain guns and other non-lethal aid to India to help it fight at high altitudes. More substantial American military equipment to India was opposed by Pakistan, and consequently the United States called upon India to resolve the Kashmir conflict with

Pakistan before substantial military assistance could be advanced.

Pakistan’s wars with India in September 1965 over Kashmir, and in December 1971 over the demand for an independent Bangladesh out of East Pakistan, caused further tensions between India and the United States. U.S. arms, supplied to Pakistan only for use against potential Communist advances from the north, were used against India during the 1965 war. While this aging equipment was also used in the 1971 war, India had by then obtained substantial heavy Soviet artillery and tanks, and Pakistan was easily defeated in two weeks, leading to an independent Bangladesh. Events leading up to this two-week war in December 1971 caused substantial tension between India and the United States, aggravated by the conflicting personalities of Prime Minister Indira Gandhi and President Nixon. India wanted the United States to take swift action in ending the Pakistani military suppression of East Pakistan’s Bengali revolt that had led to the deaths of an estimated million civilians and the flight of some 10 million refugees to India. However, the United States did not wish to alienate the military regime of General Yahya Khan, because Pakistan had provided a secret channel to pursue rapprochement with Communist China, Pakistan’s ally.

This perceived emerging new triangular alliance among Pakistan, the United States, and China, and the need to take swift military action in East Pakistan, prompted India to sign a “Treaty of Peace and Friendship” with the Soviet Union in August 1971. The treaty carried some military clauses, which required the Soviet Union not to extend assistance to Pakistan in the case of military conflict, and that both sides would enter into consultations when either side was faced with immediate threats or armed conflict. With respect to the general purposes served, in the Indian case the treaty was primarily a response to the United States, an effort to neutralize its involvement in case of hostilities by making the consequences of any such involvement potentially a great power conflict. India then proceeded to resolve the East Pakistan conflict by armed force. In response to India’s use of force, the United States sent its nuclear carrier, the U.S.S. *Enterprise*, into the Bay of Bengal, in a show of gunboat diplomacy—a warning that India should not venture beyond the liberation of Bangladesh to overrun West Pakistan.

The new regional and global alignments that occurred during the 1971 crisis subsided over the next few years. India’s fears of an emerging Washington-Islamabad-Beijing alliance did not materialize. However, the aftermath of the 1971 Indo-Pakistan War generated discordant relations between the two countries during the prime ministership of Indira Gandhi. Her declaration of

a “National Emergency” between June 1975 and March 1977, suspending the fundamental rights in India’s democratic constitution, and her imposition of authoritarian rule in India caused new tensions in relations between the two countries, as these actions were widely condemned in the United States. An initial thaw began with a meeting between President Ronald Reagan and Indira Gandhi in Cancún, Mexico, in 1981, when a technology cooperation agreement was signed. The succession of Rajiv Gandhi as prime minister following the assassination of his mother in 1984 produced a further upswing in Indo-U.S. relations during the rest of the Reagan administration. These cordial ties continued to grow during successive Indian governments, headed first by the Congress Party, then the Janata Party, followed by two United Front coalitions, and then the Bharatiya Janata Party-led coalition government from 1998 to 2004.

India and the Wars of the United States

India supported various American diplomatic moves when North Korea invaded South Korea in June 1950. It voted for the United Nations Security Council’s resolutions condemning the invasion and for military actions to drive back North Korean forces, which were about to occupy all of South Korea. The aggression was perceived as a test of United Nations (UN) credibility, but as U.S. forces under General Douglas MacArthur began to roll back the North Korean forces to the 38th parallel that divided South and North Korea, India warned the United States that moving further would provoke China to enter the war. After Chinese forces invaded and began to drive back American forces, India played an important diplomatic role at the UN and served as a mediator between the United States and China in helping to end the Korean War.

India opposed the U.S. war in Vietnam from 1964 to 1974. Frequent public and private criticism by Indian officials and the media became a source of irritation in the United States especially since India was then receiving substantial American economic aid. The United States perceived the Vietnam War as part of its policy of containing the advance of communism. India saw it as a civil war and a struggle against foreign military occupation. The withdrawal of American forces from Vietnam did not end Indo-U.S. differences on policy in the region. There were differences of policy and allegiance between India and the United States when China engaged in two short border wars with Vietnam in 1979 and 1984, and when Vietnam invaded Cambodia in 1979 to overthrow the Khmer Rouge regime of Pol Pot. The Khmer Rouge was responsible for the deaths of about a million Cambodians, who were massacred or worked to death, between 1975 and 1979. India and the Soviet

Union supported the Heng Samrin regime that was installed by the invading Vietnamese forces. The United States and China opposed the regime. These dissensions between India and the United States over Southeast Asian conflicts passed with the end of the cold war in 1991.

The Soviet invasion of Afghanistan in December 1979 was interpreted very differently in the United States and in India. The United States perceived the invasion as part of a wider Soviet strategy to seize the oil fields of the Persian Gulf and to gain warm water ports on the Indian Ocean. India perceived the invasion as an overreaction by Moscow, aimed at preventing the replacement of the pro-Soviet Marxist regime in Kabul by a pro-American regime. The American-supported insurgency against Soviet forces in Afghanistan between 1979 and 1989 was of great concern to India because the United States renewed massive arms shipments to Pakistan, which had been cut off after the 1971 war. India had preferred to see the more friendly Soviet-backed Marxist government remain in Afghanistan, fearing the possibility of a Pakistani-sponsored radical Islamic government coming to power. This concern became a reality when the zealous Islamic forces of the Taliban seized control of Afghanistan by armed force, following the Soviet withdrawal of its forces in 1989 and the subsequent collapse of the Soviet Union.

Subsequently, India differed with the United States in its use of force in the former Yugoslavia in 1999, in Afghanistan in 2002, and in Iraq in 2003. India joined Russia and China in opposing a U.S.-led North Atlantic Treaty Organization (NATO) air war against Serbian forces in Kosovo. India’s permanent representative to the UN declared to the Security Council on 24 March 1999 that the attacks were in violation of the UN Charter and illegal because they were not authorized by the council. The problem in former Yugoslavia’s Muslim-majority province of Kosovo was not unlike that in India’s Muslim-majority state of Jammu and Kashmir, where an insurgency had raged for over a decade. The use of force in Kosovo in 1999 by an American-led NATO was invoked as an additional post hoc justification for India’s decision to test nuclear weapons earlier in May 1998. This difference with U.S. policy was short-lived, however, as there appeared to be no further effort to dislodge Kosovo from Serbia, which would have set a precedent for Kashmir. Subsequently, India welcomed the American use of force in Afghanistan, which removed the Islamic extremist Taliban regime. But India opposed the U.S. war against Iraq in 2003. Like much of the rest of the world, India saw this war as counterproductive against the terrorism conducted by nonstate actors such as al-Qaeda. However, India joined the United States in

its worldwide campaign to root out the sources of international and transnational terrorism.

The Aftermath of the Cold War

The intensified momentum for better Indo-U.S. relations was prompted by the end of the cold war. India rushed toward embracing the United States, particularly seeking military cooperation. This drive initially ran into some difficulties over India's failure to protect U.S. pharmaceutical patents, its purchase of cryogenic engines for its space program and nuclear reactors from Russia, both of which were perceived to advance India's nuclear weapons and missile programs, and India's testing of its short-range Prithvi and medium-range Agni missiles despite American opposition.

Such disputes generated lukewarm responses from the United States for establishing closer military ties, and growing suspicions in India that U.S. friendship with Pakistan was closer than that with India. By the turn of the twenty-first century, however, Indo-U.S. relations blossomed at all levels. A series of joint air, naval, and army exercises were conducted, and there has been close cooperation in the war against international terrorism by both sides, especially following al-Qaeda terrorist attacks on the World Trade Center in September 2001. India went through a similar experience on 13 December 2001, when the Lashkar-e-Toiba terrorist group, seeking independence for Kashmir, attempted to destroy India's parliament building in a suicide attack while it was in session. This experience strengthened India's commitment to the United States in its campaign against worldwide terrorism.

Meanwhile, Indo-U.S. economic ties continued to grow rapidly. The United States was India's main trading partner for more than two decades, and later became the leading foreign investor in India. Following liberalization and reforms in 1991, an avalanche of American corporations have rushed into India with newer investments. From the other side, India provides much of the software for American corporations and is the source of high-tech personnel for American industries. Further improvement in ties followed in the immediate aftermath of President Bill Clinton's visit to India in March 2000 and Prime Minister A. B. Vajpayee's trip to the United States in September 2000, and a number of new U.S. business investments in India were inaugurated during both visits. The volume of American trade with and investments in India, however, still remained overshadowed by U.S. economic ties with China.

A significant rift between the two countries followed India's decision to conduct a series of nuclear tests in May 1998. Those tests were swiftly followed in a tit-for-tat

fashion by Pakistan. This led to a series of technology sanctions by Washington in areas that may have direct or indirect benefits to India's nuclear and missile programs. Prime Minister Vajpayee requested that the United States lift sanctions on dual-use technologies; these were partially lifted in 1999, and most of them were removed by 2004.

Overall, four basic policy concerns continue to characterize U.S. policies in South Asia and affect its relations with India. First, it has been a long-standing American policy to attempt to contain regional nuclear proliferation in South Asia, the Middle East, and East and Central Asia. This goal failed when India conducted five nuclear tests in May 1998 followed immediately by Pakistan. However, no further tests have been conducted, and further proliferation has been contained. Second, the United States made strenuous efforts to prevent an India-Pakistan nuclear war following their nuclear tests in 1998; since there has been no nuclear war between India and Pakistan, the American policy appears to have succeeded. Third, following the terrorist attacks on New York's World Trade Center in September 2001, the United States has conducted a campaign to root out global transnational terrorism from havens in South Asia, especially Pakistan. India has provided full cooperation on this front. Fourth, the United States has sought to facilitate a resolution of the Kashmir dispute with Pakistan which continued to plague Indo-U.S. relations. Occasional friction over this issue has been relegated to the margins of the relationship, which is now based primarily on common political and economic values. With a strong democracy and a free market economy, India's relations with the United States are now on very firm ground.

Economic Relations

The most spectacular change in the relationship has been on the economic front. Although India's share of U.S. imports and exports is only about 1 percent of the total volume of American trade, it represents a significant proportion of India's external trade. The United States is India's largest trading partner, the source of 9 percent of Indian imports and the destination of 21 percent of Indian exports. In 2002 total Indian exports to the United States were about \$17 billion, of which about \$6 billion consisted of software exports. Merchandise exports included diamonds and gold jewelry, woven and knit apparel, textiles, fish and seafood, machinery, carpets, iron and steel, and pharmaceuticals. Indian imports from the United States included machinery (computers and components, gas turbines, and telecommunications equipment), electrical machinery (recording/sound media), medical and surgical equipment and instruments,

aircraft, spacecraft (small aircraft), precious stones (diamonds, not mounted or set), metals, jewelry, miscellaneous chemical products, organic chemicals, and plastic.

By 2003 several major American corporations had established subsidiaries and other facilities in India. A majority of General Electric's businesses worldwide have a presence in India, covering aircraft engines, broadcasting, capital services, lighting, medical systems. Some 19,000 General Electric professionals work in India, and the company set up its largest laboratory worldwide—the John Welch Technology Centre—in Bangalore. The multidiscipline laboratory covers research in hot-air gas paths, materials, design, and computer science. Other major U.S. corporations established in India include Whirlpool, Ford Motors, 3M, Microsoft, Intel, Texas Instruments, Sun Microsystems, Procter and Gamble, Oracle, IBM, Adobe Systems, and several others. They produce in India for the Indian and overseas markets. American banking and financial services such as Citicorp, GE Capital, and American Express have also established offices and operations in India. American corporations in the bioinformation and biotechnology fields have subsidiary operations in India.

India is the premier country for U.S. information technology (IT) services, with major corporations “outsourcing” its needs to Indian software engineers, who are able to perform the same tasks more cheaply than American software engineers. This business relationship has been aided by the large English-speaking high-tech workforce in India and the twelve-hour time difference between the two countries; software needs and problems can be sent to India at the end of the American working day to be resolved by highly qualified and less costly Indian technical staff by the end of their working day and the beginning of the next American workday. The arrangement has enabled round-the-clock collaborative operations between India and the United States. U.S. companies that have taken advantage of this unique outsourcing opportunity include American Express, Citicorp, Microsoft, Dell, Hewlett-Packard, HSBC, Morgan Stanley, AT&T, Reebok, GM, Boeing, Pepsi, and Coca-Cola. Outsourcing to India has caused some resentment within the U.S. labor force because of the loss of American jobs.

Investments by Indian companies in the United States grew rapidly in the 1990s. For example, India's United Breweries bought breweries in the United States, while companies such as Dr. Reddy's Laboratories and Ranbaxy bought pharmaceutical manufacturing units in the United States. Mahindra and Mahindra set up an automotive manufacturing unit. In the IT sector, Tata Infotech, Sathyam, Infosys, and WIPRO set up large operations in the United States.

Defense Cooperation

From strategic hostility and suspicion during the cold war, defense cooperation between India and the United States became the norm at the beginning of the twenty-first century. An India-U.S. Defense Policy Group, composed of senior defense officials and military officers, meets once a year in Washington to provide guidance and direction to potential collaborative efforts. A Joint Technical Group coordinates the transfer of technology and explores areas of scientific interaction between the two countries. An Executive Steering Group composed of the army, navy, and air force from both sides meets annually. Joint military exercises between the military services of the two countries have become commonplace.

While there is caution in the United States on the transfer of common civilian-military technologies in nuclear and space programs to India, defense technology cooperation has expanded in other areas. They include cooperation in three mission areas: aircraft technology, antitank systems, and technical manpower training.

The collaboration between Lockheed Martin Controls Systems of Binghamton, New York, and the Aeronautical Development Establishment of Bangalore, India, is one example of this growing cooperation in technology. Much of this revolves around the development of various systems for India's projected “Light Combat Aircraft.” A Joint Technical Group, composed of members of the U.S. Department of Defense and the Indian Ministry of Defence, meets regularly to coordinate defense research and production and logistical support. Cooperation and technical exchanges now extend to defense research and development organizations in the United States and the Defence Research and Development Organization in India. Scientists from the latter regularly visit U.S. defense industries and military installations to update themselves on the state of art of defense technology.

The Role of Indian Americans

Indian Americans have contributed significantly to the growth of cordial ties between India and the United States. According to the U.S. census of 2000, there are approximately 1.7 million American citizens of Indian origin, representing the various languages, religions, and regions of India. They belong mainly to a highly educated class of academics, doctors, engineers, corporate executives, and businesspeople. Almost 60 percent of all Indian Americans are college educated and earn an average median family income of \$60,000, compared to the national average of about \$39,000. The average median income of Indians working in the Silicon Valley IT sector in the 1990s was about \$125,000, with about 15 percent of the start-up companies there being initiated by Indian Americans.

With a vested interest in promoting close ties between their old and new homelands, Indian Americans have been active in supporting U.S. Congress members who support India in its various endeavors. In 2003 various Indian groups consolidated their political activities into an organization called the U.S. India Public Affairs Committee (USINPAC), modeled after the Jewish American lobbying group, the American-Israeli Public Affairs Committee. With financial contributions from the wealthy Indian American community, USINPAC has become a major factor in expanding the relationship between India and the United States. USINPAC lobbies to prevent policies that may have an adverse impact on India, and promotes exchange visits between American and Indian political leaders to foster mutual understanding. Indian Americans of various ethnic backgrounds, such as Gujaratis, Tamils, Maharashtrians, and Punjabis, also promote American trade and investments with their Indian states. Chief ministers and economic delegations from various Indian states visit the United States to advance the economies of their states. These lines of communication initiated by the Indian American community have further strengthened the India-U.S. relationship.

Prospects

The cordiality between India and the United States at the beginning of the twenty-first century appears irreversible. India is now part of the global economy, and its status has risen as a major diplomatic and economic player in world affairs. India's close relations with the United States have played an important part in the new, positive world image of India.

UPANISHADIC PHILOSOPHY The Upanishads are one of the world's great repositories of spiritual insight and wisdom. Composed orally by Indian sages as early as the ninth century B.C., they have attracted the attention of scholars and spiritual seekers the world over. They signal a personal, experiential, and at times mystical understanding of the cosmos, the divine, and the human self, which over the centuries many have found profound. Much of Hindu thought self-consciously sees itself as a development of Upanishadic teaching, which is regarded as *shruti*, divinely revealed truth carrying supreme authority. And outside Hinduism, thinkers as diverse as Dara Shikoh (the great-grandson of the Mughal emperor Akbar), Roberto de Nobili, Arthur Schopenhauer, and Ralph Waldo Emerson have all sung the praises of these texts. In fact, Max Müller, the German Indologist, referring to the Vedānta philosophy based on the Upanishads, spoke of it as "a system in which human speculation seems to have reached its very acme" (cited in Radhakrishnan and Moore, p. 37).

Etymological and Historical Contexts

The term *upanishad* is composed of the Sanskrit roots *sad* (sit), *upa* (near), and *ni* (a closed group) and represents an esoteric teaching imparted by a teacher to a group of students in search of sacred knowledge. The term also connotes the positing of correlations between entities and powers belonging to different spheres, and, through such equivalences, the drawing out of deeper meanings. Thus, for example, equivalences drawn between the human body and the cosmos point to notions of order, hierarchy, and balance. These connections are more suggestive and speculative than strictly logical, and represent poetic speculation rather than a rigorously applied method. Indeed, the Upanishads are explicit that such spiritual truths are not attainable through logical processes. "Not by reasoning is this apprehension attainable" (Katha Up, 1.2.4), for "words return (from Brahman) along with the mind, not attaining it" (Taittiriya Up, 2.9.1).

Such speculation follows certain intellectual and religious developments. The Upanishads both chronologically and thematically come at the end (*anta*) of the Vedas, and thus the teachings based on them are called

Vedānta in both senses of the word “end”: culmination, on the one hand, and the real meaning or fulfillment of Vedic teaching, on the other. What comes before them are the hymns and chants of the four Vedas: Rig Veda, Samur Veda, Yajur Veda, and Atharva Veda, collectively known as the Saṃhitās (collections). These are followed by the Brāhmaṇas, a set of ritual instructions having principally to do with the sacrifices offered to the gods. These sacrifices were elaborate and often expensive, and those who either could not afford them or were unwilling for various reasons to perform them retreated to the forest in order to meditate on the spiritual meanings of these hymns and rituals. These allegorical renderings came to be known as the Āraṇyakas, or forest books. It is out of this complex development that the Upanishads emerged as a set of philosophical reflections on the preceding Vedic literature. They denote a subjective and contemplative turn away from ritualism and priestcraft to ontological musings about the nature of reality and the place of humans within it. These reflections were often expressed in a set of pithy formulas like the famous “*tat tvam asi*” (that thou art), which by their very nature call out for explication. It was this explication that the gurus would provide to students whom they considered spiritually developed enough to absorb it. Hence the distinctly esoteric tone that the Upanishads bear, at least early in the pedagogical tradition, when they refer, for example, to the “truth of truth” (Bṛhad Up, 2.1.20) or “the supreme secret” (Kath Up, 3.17). It is quite clear from many such passages that the teachings were not meant for the untutored.

Classification

So great was the prestige attached to the genre that over two hundred works call themselves Upanishads, including texts outside the Hindu tradition like the Christopanishad and the Allopanishad (secret teachings about Allah), which were composed in the medieval period. The Muktika Upanishad provides a list of 108 Upanishads, which has come to be regarded as canonical, although recent scholarship has increased that number slightly. These can be divided into two categories: the Vedic Upanishads and the later Upanishads. In the first group are the thirteen that are traditionally considered the principal Upanishads. In rough chronological order, they are: Bṛhadāraṇyaka, Chāndogya, Īsa, Kena, Aitareya, Taittirīya, Kauṣītakī, Kaṭha, Muṇḍaka, Shvetāshvatara, Prashna, Maitri, and Māṇḍukya. Further classification can be done on the basis of sectarian orientation, textual features, and ritual development, but for our purpose, it is important to mention again that these Upanishads are all, though not exclusively, regarded as *shruti*, or authoritative scripture, and as *apauruṣeya*, or authorless, hence, revealed. They are traditionally attached to specific

*sākhya*s, or schools of Vedic interpretation. The former feature, that is, their revealed status, is not true—at least in terms of wide acceptance—of the later Upanishads, which are not as well known as the Vedic Upanishads, but are nonetheless important in their respective sectarian communities.

Central Teachings

Perhaps the most well-known teaching of the Upanishads is the equation of *brahman* and *ātman*, the ultimate reality with the transcendental self existing at the core of one’s being. *Brahman*, derived from the root *brh* (to grow or burst forth), was first identified with prayer and, given the importance of prayer and sacrifice in maintaining the cosmos, was soon seen as the primary cause of the universe. *Ātman*, which originally meant breath, came to be identified with the essence of man, his self or soul. This divine or real self, however, is sharply distinguished from the *jīva*, the empirical or embodied self, which is finite. The speculative genius of Upanishadic thought is to effect the equivalence of two seemingly different ideas, one referring to the outer material world, the other to the inner psychic one. This in a sense is a continuation of the earlier Vedic habit of seeking homologies or correlations between the individual and the cosmos. Now, however, it pushes further to a “nondual” (*a-dvaitic*) unity. The conception of *brahman*, being objective and referring to the external world, is by its very nature hypothetical and lacking in certainty. The conception of *ātman*, by contrast, is free of these defects, but, as commonly understood, it is finite and hence cannot encompass the whole of reality. When the two conceptions are combined, however, a third conception is born, which is richer in significance and meaning than the two considered individually. Like *brahman*, this new notion of *ātman-brahman* encompasses the whole world, but unlike it, it now acquires the certainty of personal existence. Like *ātman*, it is spiritual, but unlike *ātman* considered by itself, *ātman-brahman* is infinite. “That is the Upanishadic absolute—neither *brahman* or *ātman* in one sense, but both in another. . . . The enunciation of this doctrine marked the most important advance in the whole history of Indian thought,” says M. Hiriyanna (*Outlines of Indian Philosophy*, 1932, p. 58).

Various further accounts and descriptions are provided both of *brahman* and of *ātman*. *Brahman*, for example, may be regarded cosmically (*saguṇa*, with qualities) or acosmically (*nirguṇa*, without qualities). In the first case, *brahman* may be seen as evolving into the world, and the philosophical task becomes one of grasping the unity of the world in *brahman*. In the second, *brahman* is at most the logical ground of both subject and object, and the corresponding philosophical task becomes one of

deconstruction, that is, of negating all qualities that may be ascribed to *brahman*, as in the famous doctrine of “*neti, neti*” (not this, not that), where the sheer indescribability of the Absolute in language is highlighted (Bṛhad Up, 3.8.8ff.).

It is also in this second (*nirgunic*) interpretation that the doctrine of *māyā* makes its appearance—*māyā* being the empirical world of space, time, causation, and substance, which is taken to be real by the ignorant, but is not really real. Opinion is divided about the degree of unreality attached to *māyā*—whether it is absolutely or only relatively unreal compared to *brahman*. Upanishadic thought is, however, firm in its insistence on going beyond the world of *māyā*.

The imagination of the Upanishadic sages moved thus in speculative and transcendental realms, rather than in empirical or natural-scientific ones. Underlying the flux of spatiotemporal reality is an eternal, immutable, and psychic reality, just as there is a deeper, timeless, and infinite self underlying the vicissitudes of the empirical ego. The equation of *ātman* and *brahman* is not a mere philosophical or dialectical move, but rather an intuitive one arising out of direct experience of ultimate reality. At this level, the ultimate is experienced as *sat* (existence as such), *cit* (pure consciousness), and *ānanda* (bliss). This experience also brings one *moksha*, or release from the *samsāric* world of phenomenal existence. The ultimate thrust of Upanishadic speculation is thus not so much theoretical as practical and soteriological—deliverance from the empirical world and from the cycle of karma and rebirth.

The path to such deliverance requires great moral and spiritual purification and preparation. To see the Self, one must become “calm, controlled, quiet, patiently enduring, and contented” (Bṛhad Up, 4.4.23). Most of the Upanishads concur that the best way to move toward *moksha* is through the practice of yogic meditation. The Vedic Upanishads often highlight the difference between such meditation and ratiocination, and emphasize the efficacy of the former and the poverty of the later (Katha Up, 6.9–11; Svet Up, 1.3). It is, however, in the later Yoga Upanishads that the details of yogic practice and asceticism are most clearly spelled out (see the Yogatattva and the Sandilya Upanishads).

The Upanishads touch on a great many other topics, from the different states of consciousness through death and rebirth processes to the cultivation of the virtues and attitudes needed for *moksha*. This is as one would expect from a heterogeneous collection of material culled from various sources at different times. Later philosophical systems and particularly the schools of Vedānta attempt to systematize them into more unified philosophies, but

the Upanishads themselves are best regarded as spiritual texts, which, like the Bible in the Jewish and Christian traditions, serve as a wellspring for later developments. Even though in terms of composition they are remote in time, in terms of resonance and inspiration, they will always remain contemporary to spiritual seekers.

URBANISM Soon after arriving in India in 1950 to build India’s first planned capital city at Chandigarh, the architect Le Corbusier insightfully commented that “India hasn’t yet created . . . architecture for modern civilization” (cited in Kalia, *Chandigarh*, p. 87). Even in the twenty-first century, nearly 70 percent of India’s population still lives in over 500,000 villages, although about 300 million Indians currently live in cities, a number almost equal to the total population of the United States. Because of this urban-rural paradox, Jawaharlal Nehru, India’s first prime minister, observed, “However well we may deal with the towns, the problem of the villages of India will remain for a long time” (cited in Kalia, *Chandigarh*, p. 30).

The Ancient Cities

The Indus Valley Civilization (c. 2600–1900 B.C.) had nevertheless achieved a measure of urban sophistication, best reflected in the twin capital cities of Mohenjo-Daro and Harappa, as well as several other cities. Displaying a remarkable uniformity in urban planning, covering a wide geographical spread that stretched from the Arabian Sea to the foothills of the Himalayas and from the eastern border of Iran to the Ganges Valley near Delhi, the

Chandni Chowk Bazaar. Not far from the Red Fort (in the background), Chandni Chowk (Moonlight Square), the largest bazaar in Old Delhi. In the Mughal ruler Shah Jahan's time (1592–1666), it was the central commercial thoroughfare of Shahjahanabad, the vast capital city he had built after abandoning his other great capital, Agra. Today, Chandni Chowk is equally alive with activity, hopelessly congested with buyers and sellers. JYOTI M. BANERJEE / FOTOMEDIA.

more than 150 sites of the Indus Valley Civilization attest to the sophistication of building skills, the arts, and, possibly, a written language that has yet to be deciphered. Among the excavated cities, Mohenjo-Daro is the most pristine. Built on the gridiron system on the flat, hot floodplain of the Indus, some 300 miles (483 km) north of present-day Karachi in Pakistan, the city was planned with a broad north-south boulevard 30 feet (9 m) wide that was crossed at right angles every 200 yards (185 m) or so by smaller east-west streets that were studded with shops and food stalls, the blocks between them served by narrow curving lanes 5 to 10 feet (1.5–3 m) wide. Urban Indus houses presented blank walls to the main streets, much like today, the main entrances located behind the main streets on service lanes; interior courtyards provided light, air, and space for socialization; and windows were screened with grills of terra-cotta or alabaster. Many houses had a second story and a flat roof that served as a sleeping space in the hot summer months—a practice that continues today, although that is beginning to change with the emergence of multistoried apartment

buildings in most high-density cities. India's fast-growing economy, which has been stimulated by the information technology revolution and buttressed by the expanding privatization of the public sector, has improved the urban infrastructure, including the supply of electrical power, allowing the use of air-conditioning and other electrical appliances for a modern urban lifestyle.

Perhaps the most impressive feature of the ancient Indus cities, unrivaled until much later in Greek and Roman times, was the use of a sophisticated open sewer system along the sides of the streets, with catch-basins dug below sewer level to trap debris that might otherwise have clogged the drainage. These sewers were connected to the houses by an open gutter, also made of brick, into which emptied the house drains, which were often made of an enclosed system of clay pipes. Several of the houses had sit-down toilets that were connected to the sewers, and practically all houses had bathrooms with waterproof brick floors fitted with drains leading to the sewer pipes. The Indus cities displayed other architectural marvels and

Fatehpur Sikri. Now a UN World Heritage site, Fatehpur Sikri (City of Victory) was built during the second half of the sixteenth century by the emperor Akbar. The capital of the Mughal empire for approximately fourteen years, it is a complex of monuments and temples, all constructed in a uniform, awe-inspiring architectural style. AMAR TALWAR / FOTOMEDIA.

feats of civil engineering: a Great Bath with a sunken bathing pool approached by wooden steps set into asphalt (much like the bathing *ghats* at Varanasi), a granary, residences for high officials, and, of course, the citadel.

The next push toward urbanism in India was facilitated by the discovery of iron in modern Bihar around 1000 B.C., which accelerated the expansion of the Aryans by allowing them to clear the Gangetic forests, and facilitated their transition from a nomadic pastoral economy to a hybrid agricultural-pastoral one. A more enduring consequence of the Aryan expansion was that Brahmanical Hinduism was firmly implanted on Indian urban developments, the arts, and literature. Henceforth, all public works and architectural designs would be aimed at reinforcing the imperial authority of kings and celebrating gods and goddesses, invoking their blessings, depending on the royal religious preference. The Buddhist architects that preceded the Hindu architects provided historical continuity to temple architecture, which came to combine the best of traditions from the north and south. The resulting “free mixing” of ideas and cultures produced the miracle of temple architecture, which burst

into a passionate and almost frantic activity, raising temple after temple in classical India. Thirteenth-century India experienced the last of the best expressions of Hindu art before the force of Islam under the mighty Mughals swept across the subcontinent.

Islamic Influence

To celebrate the triumph of monotheistic Islam, the Delhi sultans and later the Mughals created an impressive complex of buildings outside Delhi, including the multistoried Qutb Minar, from whose rooftop the call for prayer was issued every day. Whereas Hindu buildings reflected nature in both their shapes and decorations, iconoclastic Islam prohibited Muslim artists and architects from using natural images, even though floral decoration was sometimes allowed. Instead, Islamic art and architecture produced pure geometric designs, reflecting the abstract definition of Allah. The Mughals, informed in their taste by Persian culture, produced the most impressive buildings, as well as erecting new cities to serve Allah and Islam in predominantly Hindu India. Mughal architecture received a new impetus during the

reign of Akbar (r. 1556–1605), whose tolerant religious spirit, mystical disposition, and artistic sense inspired a synthesis of Persian and Indian styles of architecture—thereby producing the Indo-Saracenic style that would later influence the British in their construction of New Delhi. From the 1500s, the Mughal emperors continued to build, not only in Delhi but also in their other capital of Agra, and in Punjab's Lahore, producing remarkable buildings, including Delhi's Jama Masjid and the two Red Forts at Delhi and Agra. To combat the intense heat of the subcontinent, the Mughals created magnificent gardens with terraces, stairways, running streams carrying cool water from the mountains to nearby lakes, and a complex system of fountains and cascades. At Delhi and Agra, special channels carried cooling water through the interiors of imperial buildings. In the 1600s, Shah Jahan built mosques and other buildings within his Red Forts. These buildings were made of imported Italian white marble, as was the magnificent Taj Mahal, the tomb that Shah Jahan had built for his wife Mumtaz, beside the river Jamuna at Agra.

The British Period

The British began their building efforts in India when Sir Thomas Roe, King James's ambassador, secured permission in 1619 for the East India Company to build its first factory (trading post) at Surat, a bustling city and principal port of the Mughal empire at the mouth of the Tapti River, the western gateway to India. From these humble beginnings, the British would ultimately culminate their imperial construction in the building of the British capital at New Delhi, when King George V declared, on the occasion of his coronation durbar at the Red Fort on 12 December 1911, that British India's capital was being shifted from Calcutta to a new site on Delhi's historic plain.

Among many myths surrounding the British Empire was the myth of imperial unity. Their search for an elusive imperial identity through the medium of architecture occupied the imagination of many a British administrator. Although this imperial impulse never became pervasive, it nevertheless achieved its most eloquent expressions in the building of the first British capital city at Calcutta and, even more so, in their second capital city at New Delhi. At the heart of this impulse was the British illusion that if imperial unity could be achieved in brick and stone in heterogeneous India, then perhaps such unity could be attained globally.

The British East India Company's Francis Day bought land in 1638 from the Hindu Vijayanagar kingdom, near the South Indian village of Mandaraz; in 1642 he built Fort St. George there, which came to be called Madras, British India's premier city and urban port on

the Coromandal coast. The archipelago of Bombay, which had been given to King Charles II as part of Catherine of Braganza's dowry in 1661, was handed over to the East India Company in 1668 for a nominal £10 annual rent. This transfer changed Bombay from a cluster of seven sleepy fishing villages into British India's western headquarters, displacing Surat and, in time, becoming a sprawling modern financial metropolis and the capital of Maharashtra. Soon after securing permission from Mughal emperor Alamgir in 1690 to trade in eastern Bengal, the British erected a factory on the Hugli River, a tributary of the Ganges that flowed into the Bay of Bengal. The site, located near a village shrine to the Hindu goddess Kālī, and from which *ghats* (steps) descended to the river, was thus named Kalighat, later corrupted by the British to "Calcutta." The English merchant Job Charnock, a member of the Bengal Council, drew his urban plan for British India's first imperial capital there.

The creation of the British Company presidencies of Bombay, Calcutta, and Madras marked the beginning of British experiments in urban planning in India. Many imposing structures still stand in these cities, enduring testimony to the power of the British Raj: in Calcutta (present-day Kolkata), the Governor's Mansion, modeled by Viceroy Lord Curzon after his Kedleston Hall; its Gothic High Court; neoclassical Town Hall; and the Renaissance-inspired Victoria Memorial. In Bombay (present-day Mumbai), the Gateway to India, born of Anglo-Indian parenthood, commemorates the visit of King George V in 1911, while the Central Telegraph Office, High Court, General Post Office, and Victoria Terminus (present-day Chatrapati Shivaji Maharaj Railway Station) show Gothic features. In Madras (present-day Chennai), several civic and public buildings, including a banquet hall, a museum, and the legislative assembly, represent Western classicism. Thereafter, the British built hill stations, civil lines, and cantonments—all in their efforts to sanitize and segregate Europeans in India and to establish British authority in India. However, it is at New Delhi that the architectural experiments of British Raj in India find their resolution in a style of architecture that is neither Indian nor European, but a complete fusion of the two traditions. Architect Edwin Lutyens's New Delhi represents a mutated but monumental style born of European classicism and Indo-Saracenic influences, and the city itself offers a place where colonial life was sanitized in the spacious symphony of Garden City greenery (the influence of Ebenezer Howard) and imperial power was celebrated in the grouping of public buildings in a monumental center with radiating axial vistas, ending in areas of open space and imposing buildings. To Prime Minister Jawaharlal Nehru, New Delhi was the worst example of British

sensibility and imperial arrogance; to British poet Lord Byron it was the Rome of “Hindoostan.”

Independent India

New Delhi remains the capital of independent India, and also the most ostentatious expression of the British Raj. Shortly after independence, Nehru censored New Delhi as “most un-Indian.” Nehru’s nationalist remark, made at the outset of India’s experiments in European modernist architecture, was to set the terms of the national debate on the character of India’s new cities and its post-colonial architectural style. Nehru felt that the average American or English urban planner could not understand the social background of India. Still, he realized that modern India could not be built without technology, and consequently he supported the creation of the Indian Institutes of Technology and Indian Institutes of Management (modeled after the Massachusetts Institute of Technology and Harvard Business School, respectively). But he insisted that Western technology must be fused with Indian cultural traditions, just as he had fused the political ideologies of communism and democracy to create democratic socialism as a means for leading India on the path of planned economic development.

To a degree, the British who planned New Delhi also were influenced by the ideas of Beaux Arts city planning, American style, which tended to group monumental public buildings in the urban center, leaving the rest of the city to green spaces. What Nehru objected to in New Delhi was not the “leafy capital” per se, for that represented village India, but the monumentality of its official buildings, decorated with classical motifs, attesting to the roots of the British Raj. It therefore followed that in post-colonial India, a new paradigm of planning and architectural style had to be invented. Prime Minister Nehru provided the imaginative shape to the new urban vision at Chandigarh, Punjab’s new capital: “Let this be a new town symbolic of the freedom of India, unfettered by the traditions of the past . . . an expression of the nation’s faith in the future” (cited in Kalia, *Chandigarh*, p. 21)

Arguably, Nehru’s greatest gift was his ability to bring to the surface, through his historical vision, images that fused traditional India with the modern world. He thus introduced a modernist discourse for the making of a nation state—a discourse that was to encourage his countrymen to develop a more encompassing sense of what constituted their world. Nehru said of Chandigarh: “It is the biggest example in India of experimental architecture. It hits you on the head, and makes you think” (cited in Kalia, *Chandigarh*, p. 29). The man who would deliver Nehru his urban dream was Le Corbusier, whose vision brought down old walls that had long imprisoned India, defying ancient prejudices. Le Corbusier opened the

doors of modernism’s golden age, which stretched from the 1920s through the 1960s, promising to make the world a better place through design. This was to be achieved, according to the menu of modernism, by providing plenty of unadorned open space, abundant natural light through large expanses of glass, and an intimate connection with the outdoors. In the 1960s, the experiment in modernism was expanded by American architect Louis Kahn in his seminal work on the Indian Institute of Management (1962–1974) at Ahmedabad. Modernism’s technological innovation and aesthetic self-expression were seen as the twin forces of urban design that could solve housing and other social problems. The ability of modernism to meet a surging housing demand and to revitalize decaying cities in postwar Europe was not lost on India, which itself was burdened with refugees as a result of the 1947 partition of the subcontinent.

From the struggle over rival visions of independent India’s future emerged a new understanding of the confluence of history and memory for India’s intellectuals, architects, urban planners, and political leaders. Partitioned India demonstrated two versions of history and ideology: Mahatma Gandhi’s vexed, sometimes mystical, attachment to villages as the source of ideals for building a new India competed with Nehru’s inclination toward modern cities. Nehru spent much of his career as a public figure trying to confront traditional India, and his Western training placed him in an oppositional—and sometimes advantageous—position to comment on the struggle over memory in Indian society. In his writings and speeches, Nehru presented a historical vision for India in which urbanism flourished and modern industry thrived.

Fifty years after its inception, the Chandigarh plan remains India’s inspiration in urban planning and renewal, repeated with mantralike regularity in its application, always with idiosyncratic variations to legitimize the enterprise as truly Indian. Through this process of repetition, the Chandigarh plan has been absorbed into the assimilative Indian tradition, first in Orissa’s capital of Bhubaneswar, then in Gujarat’s new capital of Gandhinagar, as well in the other new cities and in rebuilding of the old ones. However, after its first impact, the modern movement lost its way in India, resulting in idiosyncratic building designs. Still, the best Indian architecture, which represented the thoughtful synthesis of old and new, the fusing of regional and universal, and the blending of local craft with modern technology, would evolve after the masters of modernism had been consigned to history. Indian architects such as Charles Correa, B. V. Doshi, Raj Rewal, and others in their youth had fervently sought answers from the masters of modernism to build a new India; they now truly belong in a

new nation that is building monuments for the future and rapidly forgetting the burden of colonial rule and the deep religious and communal roots of the partition.

VAISHESHIKA According to Kanāda, the mythical founder of the system, *Vaisheshika* is the enumeration of everything in this world that has the character of being. Since the categories are numerous, the use of formal logic is essential to draw inferences, and in this respect *Nyāya* is its sister system.

Kanāda's *Vaisheshika Sūtra* presents a system of physics and metaphysics. Its physics is an atomic theory of nature, where the atoms are distinct from the soul, of which they are the instruments. Each element has individual characteristics (*viśeṣas*), which distinguish it from the other nonatomic substances (*dravyas*): time, space, soul, and mind. The atoms are considered to be eternal.

There are six fundamental categories (*padārtha*) associated with reality: substance (*dravya*), quality (*guṇa*), motion (*karman*), universal (*sāmānya*), particularity (*viśeṣa*), and inherence (*samavāya*). The first three of these have a real objective existence, and the last three are products of intellectual discrimination. There are nine classes of substances (*dravya*), some of which are non-atomic, some atomic, and others all-pervasive. The non-atomic ground is provided by the three substances, ether (*ākāśa*), space (*dīk*), and time (*kāla*), which are unitary and indestructible; a further four, earth (*prithivī*), water (*āpas*), fire (*tejas*), and air (*vāyu*) are atomic, composed of indivisible, and indestructible atoms (*anu*); self (*ātman*), which is the eighth, is omnipresent and eternal; and, finally, the ninth is the mind (*manas*), which is also eternal but of atomic dimensions, that is, infinitely small.

There are seventeen qualities (*guṇa*), listed in no particular order as color or form (*rūpa*), taste (*rasa*), smell (*gandha*), and touch (*sparsa*); number (*sankhyā*), size (*parimāna*), separateness (*prithaktva*), conjunction (*samyoga*), and disjunction (*vibhāga*); remoteness (*paratva*)

and nearness (*aparatva*); judgment (*buddhi*), pleasure (*sukha*), pain (*duḥkha*), desire (*icchā*), aversion (*dveṣa*), and effort (*prayatna*). These qualities are either physical or psychological.

Two atoms combine to form a binary molecule (*dvyanuka*). Two, three, four, or more *dvyanukas* combine into grosser molecules of *tryanuka*, *chaturanuka*, and so on. The other view is that atoms form dyads and triads directly to form the molecules for different substances. Atoms possess an incessant vibratory motion. The activity of the atoms and their combinations are not arbitrary but are based on laws that are expressed as the *adrishta*.

Molecules can also break up under the influence of heat. In this doctrine of heating of atoms, the impact of heat particles decomposes a molecule. Heat and light rays are taken to consist of very small particles of high velocity. The particles of heat and light may be endowed with different characteristics, and therefore heat and light can be of different kinds.

Ākāśa (ether), time, and space have no lower constituents. Of *ākāśa* the qualities are sound, number, dimension, separateness, conjunction, and disjunction. Thus, being endowed with qualities, and not being located in anything else, it is regarded as a substance. In as much as it has no cause, either homogeneous or heterogeneous, it is eternal. "Time" is the cause of the relative notions of priority, posteriority, or simultaneity and succession, and of late and soon, in as much as there is no other cause or basis for these notions. The *Vaisheshika Sūtras* clearly present the principle of cause (*kāraṇa*) and effect (*kārya*). Time and space are the efficient cause for all phenomena.

It is stated that there are two kinds of universals: higher and lower. The higher universal is Being, which

encompasses everything. Lower universals exclude as well as include, which means that the universals may be defined in a hierarchical fashion. The higher universal is akin to a superposition of all possibilities and it therefore anticipates the essence of the quantum theory.

VAJPAYEE, ATAL BIHARI (1924–), prime minister of India (1996–1998 and 1998–2004). A. B. Vajpayee was India's prime minister in the Bharatiya Janata Party–led coalition government of the National Democratic Alliance from March 1998 to April 1999. It fell in a vote of no-confidence in 1999 when the Dravida Munnetra Kazhagam (DMK) party refused to vote with its coalition partners. Vajpayee led the alliance to victory again in the general elections that followed in October 1999. He became prime minister when this coalition formed a government from October 1999 to May 2004. Vajpayee's coalition government lost the 2004 general elections to a Congress Party–led coalition government led by Sonia Gandhi, president of the party.

Vajpayee was born on 25 December 1924 in Gwalior, in what was then British India's Central provinces, now Madhya Pradesh. He attended college in Gwalior and Kanpur, and has a master's degree in political science. He first entered politics during the independence struggle as a member of the Rashtriya Swayamsevak Sangh (RSS), the extremist Hindu nationalist wing of the Hindu Mahasabha. He was a founding member of the Hindu right-wing Jana Sangh Party in 1951, a reconstituted version of the Hindu Mahasabha, which was banned from politics after one of its members, Nathuram Godse, assassinated Mahatma Gandhi in 1948. Vajpayee was a member of India's lower house of parliament, the Lok Sabha, and briefly of its upper house, the Rajya Sabha, since 1957. He was elected to Parliament at various times from constituencies in Uttar Pradesh, Gujarat, Madhya Pradesh, and Delhi.

Vajpayee became leader of the revamped Bharatiya Janata Party (BJP), and a coalition member of the Janata Party government led by Prime Minister Morarji Desai. This newly constituted alliance of parties under the banner of the Janata Party had ousted Indira Gandhi's Congress Party government in a national election following

Atal Bihari Vajpayee. Vajpayee in a private moment of reflection, the festival of Holi, March 2003. During his two terms as prime minister, his was the moderate face of Hindu nationalism, insisting that India remain a secular state. REUTERS / CORBIS.

her twenty-two-month “National Emergency” rule that suspended the democratic process in India from June 1975 to March 1977. Vajpayee had been jailed by the Indira Gandhi government during the Emergency. After the defeat of the Congress Party, he became external affairs minister in the Janata Party government of Prime Minister Desai.

Following the victory of the BJP-led coalition over the Congress Party in March 1998, newly appointed prime minister Vajpayee immediately gave the go-ahead for a series of nuclear tests in early May 1998. Pakistan countered promptly with nuclear tests of its own. BJP rule also ushered in a wave of Hindu nationalism, pushed by more extreme Hindu parties, the Vishwa Hindu Parishad, the Rashtriya Swayamsevak Sangh, and the Shiv Sena. There were attempts to redefine India as a Hindu state called “Hindutva,” against the opposition of the more secular parties, groups, and leaders in India. However, Vajpayee

appeared as the moderate face of Hindu nationalism, insisting that India remain a secular state.

Vajpayee's tenure as prime minister is best known for his efforts to bring about reconciliation with Pakistan through what came to be called "bus diplomacy." In February 1999 he took a well-publicized bus trip from Amritsar in Indian Punjab to Lahore in Pakistani Punjab and was greeted warmly by Pakistani prime minister Nawaz Sharif. This gesture of Indian goodwill and reconciliation fell apart two months later, when Pakistan launched an attack on Kargil in Indian Kashmir. The peace initiative by Prime Minister Vajpayee collapsed. Relations appeared to suffer a further setback when the perceived mastermind of the Pakistani attack on Kargil, General Pervez Musharraf, overthrew Sharif's civilian government and imposed military rule. In early 2004, Vajpayee made further conciliatory gestures toward Pakistan, declaring that he would like to see peace between India and Pakistan during his lifetime.

Economic growth at averages of 6 to 8 percent of the gross national product continued under Vajpayee's BJP-led coalition government, drawing further on the reforms introduced in 1991 by Congress Party minister of finance, Dr. Manmohan Singh. Even during the global economic recession of 1998–1999, India's growth continued at 5.8 percent. However, the defeat of Vajpayee's government by the Congress Party is attributed largely to its excessive commitment to high-tech development in India and the welfare of the rising Indian middle class, and the neglect of the masses of India's rural poor.

VANAPRASTHA. *See* **Hinduism (Dharma); Saṃskāra.**

VARANASI A city in the state of Uttar Pradesh, Varanasi (called Benares by the British) had a population of 1.1 million in 2001. The name Varanasi is derived from the two rivers, Varuna and Asi, that flow into the Ganga (Ganges) there. The city is located on the western bank of the Ganga, which flows from north to south in this area, and the city thus faces the morning sun. Many *ghats* (steps) lead from the high bank down to the river, where pilgrims bathe; the Manikarnika Ghat and the Dasavamedha Ghat are the most famous of these. Being the most sacred place of the Hindus, the city has many temples, including the Hanuman Temple, dedicated to the monkey god Hanuman, and the Durga Temple of the Mother Goddess Durgā. The most important of all is the Vishwanath Temple, dedicated to Lord Shiva, the patron of the city. The original Vishwanath Temple was destroyed by the Mughal emperor Aurangzeb, who had a mosque built at this site, which still occupies one of the most prominent locations of the city.

Many pious Hindus come to Varanasi when they believe they are near death, in order to be cremated on one of the "burning *ghats*" in the northern part of the city. The ashes of the dead are swept into the river, which is believed to have a self-purifying quality. In recent years the river has been polluted by many industrial effluents.

This sacred city was earlier known as Kashi. Its origins can probably be traced back to the eighth century B.C. The Buddha preached his first sermon in neighboring Sarnath, which is marked by its ancient Dharam Eka stupa. In addition to its ancient religious traditions, Varanasi is also known for its silk saris, which are coveted by Indian women everywhere. The saris are usually decorated with borders containing gilded threads, some with beautifully embroidered patterns.

The city is also home to one of India's most famous universities, Banaras Hindu University. When the Muslim University at Aligarh was started, Pandit Madan Mohan Malaviya, a leading Hindu politician, advocated the establishment of a Hindu university in Varanasi and received a great deal of support for it. The university was inaugurated in February 1916. The humanities have played an important role in its curriculum, but it has also gained a reputation as a center of science and technology. It is one of India's national universities, which are under the direct supervision of the president of India.

VARNA. See **Caste System**.

VARUṆA A powerful deity, Varuṇa is known in the Rig Veda as the universal ruler in charge of *rita*, cosmic law and order, and the personification of moral authority. He is an all-seeing, omniscient, celestial controller and exacting punisher of those who transgress his commandments (*vrata*). In hymns he is frequently invoked in the compound Mitravaruṇa along with his brother, Mitra, also one of the Ādityas, the sons of the goddess Aditi, “the Unbounded.” Mitra, a name cognate to ancient Iranian Mithra, meaning “friend,” shares the major features of Varuṇa, including kingship, but appears as a benign, restoring, and contractual side of divine sovereignty. Varuṇa, on the other hand, is the wielder of occult power (*māyā*) and the severe binder of sinners, capturing with nooses (*pāśha*) those who infringe upon *rita*, often inflicting diseases upon them. Hymns to Varuṇa invariably include pleas for forgiveness and release from his wrath, judgment, and bondage for any moral offense (*āga*). Like Mitra, Varuṇa may extend grace to the penitent. Release from one or another of his hundred nooses means not only cessation of disease or physical pain but also removal of the sin that brought on punishment. He is the dominant side of the pair, Mitra being addressed alone in a single Rig Vedic hymn, whereas a dozen are directed solely to Varuṇa.

Satya, or truth and exactitude in sacrifice, are within Varuṇa’s guardianship, and several Vedic sacrifices feature him, including *rājāsūya* (consecration of a king), *ashvamedha* (horse sacrifice), and *varuṇapraghāsa* (second of three seasonal sacrifices, a rite in which the sacrificer’s wife must confess sins). One of the priests essential to the Vedic soma cult is named Maitrāvaruṇa; he takes the pressed juice offered to Mitravaruṇa, the pair, as divine unity.

Sūrya, the sun, serves as eye of the all-observant Varuṇa, who as divine overseer also has spies (*spāśha*); the same word occurs for Mithra’s spies in the Avesta, indicating an Indo-Iranian antiquity for this feature of cosmic control. Since Varuṇa is associated with both the day and night sky, his spies are possibly stars. Cosmic waters above and below the earth, rivers, and rain are all within his domain.

During the Vedic period, Varuṇa as *samvāj* (king by his nature) gradually lost his position as all-powerful sovereign and greatest of deities to Indra, who is king by force,

by self-rule (*svarāj*). In the Sanskrit epics and Purāṇas, Varuṇa appears as a *lokapāla*, assigned to the west as one of the eight guardian deities. Still lord of the waters, now featuring the ocean, he is king of *nāgas*, or serpents. He may be seen in temple sculptures on his mount (*vāhana*), the *makara*, a crocodile-like composite creature. In addition to Varuṇānī, named in the Rig Veda, his legitimate wives in various Purāṇas include Gaurī and Jyeshthā, while Bhadrā, daughter of Soma and wife of Utathya, he captured by force. Among his sons were the *rishi* Vasishthā (fathered jointly with Mitra), Pushkara, and the great poet of the Rāmāyaṇa, Vālmīki, born according to one version when Varuṇa’s semen fell on a termite mound (*valmīka*).

Today, Varuṇa’s aide is sought when digging wells or in times of drought. If monsoon rains are late and crops are endangered, Vaidika Brahmans may be summoned to recite Rig Veda hymns in a Varuṇa *pūjā*. Although Varuṇa is now seldom credited, both *dharma* as cosmic law and *vrata* as human vow to observe *dharma* continue to be the focus of modern Hinduism, as they were for the development of the classical Dharma Sūtras and Dharma Shāstras.

VEDĀNGA JYOTISHA The earliest astronomical text from India, the *Vedānga Jyotisha* is attributed to Lagadha and has an internal date of approximately 1350 B.C. It is available in two recensions, one belonging to the Rig Veda and the other to the Yajur Veda (which, from the language used, appears to have been edited a

few centuries later). The text is dated from the statement that the winter solstice was at the beginning of the asterism Shra Vishthā (beta Delphini) and the summer solstice at the midpoint of Ashleshā.

According to the *Vedānga Jyotisha*, in a *yuga* there are 5 solar years, 67 lunar sidereal cycles, 1,830 days, 1,835 sidereal days, 62 synodic months, 1,860 *tithis*, 135 solar *nakshatras*, 1,809 lunar *nakshatras*, and 1,768 risings of the moon. It also provides ingenious rules to determine the positions of the *nakshatras*, the sun, and the moon at any time.

A lunar month is divided into 30 *tithis*. The solar day is divided into 124 parts and also into 603 *kalās*. The measurement of time, by the use of a clepsydra, was in the unit of *nādikā*, which was the sixtieth part of a day. The units used were chosen to allow for the use of integers in various calculations.

The *Vedānga Jyotisha* is a lunisolar system in which the movements of the moon across the *nakshatras* in the sky identify the days, and the position of the sun, tracked by its northward and southward course in the two halves of year (*ayana*), identifies the twelve months of the year. In this system, intercalary months need to be added and other corrections made in order to make the sun's northward course begin in the correct month.

Although the *Vedānga Jyotisha* says that the *yuga* of five years has 1,830 civil days and 62 lunar synodic months, actually the correct number of days is 1,826, and an additional day should be added to the 62 synodic months. The length of the year was measured from one winter solstice to another, and this was taken to be 366 days. Since the year was divided into six equal seasons of 61 days, the civil count of 1,830 was a convention. The number of civil days in the *yuga* was corrected in the two extra intercalary months that were employed.

Lagadha gives the ratio of the longest to the shortest day as 3:2. This is true for northwestern India, and one may conclude that he belonged to that region.

VEDĀNTA. *See Upanishadic Philosophy.*

VEDIC ARYAN INDIA The *Samhitās*—"collections" of hymns (*sūkta*) or, more comprehensively, ritual formulas (mantra)—constitute the oldest surviving literature of South Asia. They form the earliest category of texts belonging to the four divisions of the Veda (sacred knowledge), composed in the Sanskrit language. The *Samhitās* are the sources discussed in this article. (See the article "Brāhmaṇas" for a discussion of later Vedic texts, the Brāhmaṇas [in a broader sense comprising the Āraṇyakas and Upanishads], the subsequent category of Sūtras [Shrauta, Grihya, and Dharma Sūtras], and other auxiliary texts.)

The *Samhitās* and Brāhmaṇas came to be considered eternal, transcendental wisdom (*shruti*; literally, "hearing"), supernaturally "heard" or "seen" by ancient sages (*rishi*), the ultimate authority in Hinduism. Though each Veda thus comprises other texts besides (one or more) *Samhitās*, their plain names are often used to designate the respective *Samhitās*: Rig Veda = Rig Veda *Samhitā*. The fourfold division of the Veda results from the engagement of four groups of priests in the elaborate *shrāuta* rites ("based on the *shruti*"), which first took their codified shape in Yajur Veda.

Rig Veda—"knowledge of praise stanzas"—was the domain of the *hotar* priest and his assistants, who praised deities by reciting specific stanzas of the Rig Veda. Its 1,028 hymns total 10,417 stanzas. Most hymns were probably composed in the thirteenth century B.C. and the whole corpus collected by about 1100 B.C. The final redaction took place around 700 B.C., whereafter the text was handed down with extraordinary fidelity. Preserving extant poems by oral repetition replaced a living tradition of composing new poems.

The Rig Veda is divided into ten books. The oldest are the nuclear "family books" (II–VII), each ascribed to a family of poets descended from a particular sage: II, Gritsamada; III, Vishvāmitra; IV, Vāmadeva; V, Atri; VI, Bharadvāja; and VII, Vasishtha. Almost equally old is Book VIII, with hymns of the Kanva (1–66) and Angiras (67–103) families, and its supplement, the Kanva hymns (1–50) of Book I, though the rest of Book I is more recent. Book IX was created by extracting all the hymns addressed to God Soma from Books I through VIII. Book X is the most recent addition.

Sāma Veda—"knowledge of the melodies"—is the domain of the *udgātar* and other chanter priests. The *Samhitā*, preserved in two versions (Kauthuma and Jaiminīya), consists of text books (*ārcika*) with stanzas mostly taken from the Rig Veda, and of extensive song books (*gāna*) with melodies (*sāman*) set to the (variously altered) texts.

Yajur Veda—"knowledge of the muttered formulas," largely in prose—belonged to priests performing practical

operations. The earlier Saṃhitās of “Black Yajur Veda” (Maitrāyaṇīya, Katha, Kapishthala-Katha, and Taittirīya) include prose passages explaining the origin and symbolism of the *śrauta* ritual. In contrast, the younger “White Yajur Veda” separates its (Vājasaneyi) Saṃhitā from the ritual explanations in prose, which are collected in the most extensive of the existing Brāhmana texts, the Shatapatha-Brāhmana.

Atharva Veda—“knowledge of the *atharvan* priest”—contains charms for healing, love affairs, sorcery, and domestic (*grihya*) and royal rites. The next oldest collection after the Rig Veda, the Atharva Veda (and the latest hymns of the Rig Veda, which anticipate it) differs from the Rig Veda in language and content, and probably reflects the traditions of both earlier arrived Aryan immigrants and the indigenous population of India. It was initially excluded from the solemn ritual, but later became the Veda of the Brahman priest, whose main duty was to control that everything was done correctly and to “heal” eventual mistakes.

Background of the Vedic Aryans in South Asia and Beyond

The ancestry of the Vedic Aryans is understood today better than before. At the same time, it has become a heatedly debated and politicized issue. Opinions widely differing from the traditional “immigration hypothesis” are expressed especially by Hindu fundamentalists. These opponents maintain that the birthplace of the Aryan (and even other Indo-European) languages is India, and that Vedic Sanskrit was spoken in the Indus Valley, or Harappan, Civilization (2600–1900 B.C.). The forgotten Indus script is difficult to decipher in the absence of any translations, but its analysis leads to the conclusion that the language was Proto-Dravidian. This is supported by the presence of Dravidian loanwords in the Rig Veda and later Vedic texts and the survival of one Dravidian language (Brahui) in the Indus Valley. Most important, however, is the absence of the horse, both from excavated animal bones antedating 2000 B.C. in South Asia and from the otherwise rich gallery of animals in Harappan art. By contrast, the horse is frequently mentioned in the Rig Veda and was culturally important.

The Vedic language is archaic Sanskrit, or Old Indo-Aryan, the oldest phase of Aryan languages spoken in (ancient) India. *Ārya* (hospitable, noble) is the ethnic self-appellation of the authors of the Rig Veda, shared by the speakers of Avestan and Old Persian, the two varieties of Old Iranian (or “Irano-Aryan”), the oldest phase of Aryan languages spoken in (ancient) Iran. The original location of the Proto-Aryan or Proto-Indo-Iranian parent language is indicated by the many Proto-Aryan loanwords in the Finno-Ugrian protolanguage, which dispersed from

central Russia. The Rig Vedic hymns imply a long poetic tradition with refined style and metrics. They share numerous phrases with Zarathushtra’s Old Iranian poems. Some poetic formulas go back even to Proto-Indo-European. The phrase *śhrávas. . . ákshitam* (imperishable fame) has an exact etymological counterpart in ancient Greek, in the Homeric phrase *kléos áphthiton*.

Several terms related to wheeled vehicles reconstructable to the Indo-European protolanguage indicate that its speakers knew ox-drawn carts and wagons, which were invented around 3500 B.C. This gives a firm starting point for identifying the chain of archaeological cultures through which the various Indo-European languages eventually reached their historical seats. On this basis, Proto-Aryan was spoken in the Sintashta-Arkaim culture (c. 2200–1800 B.C.) in southern Russia between the Volga and Ural rivers. The earliest known horse-drawn chariots are from aristocratic graves of this culture.

The Indo-Aryan branch seems to have broken off with the Andronovo culture (c. 1800–1300 B.C.) that spread to Siberia and Central Asia. In Central Asia, Indo-Aryan speakers apparently took over the rule in the Bactria and Margiana Archaeological Complex (BMAC) in the first quarter of the second millennium. A similar BMAC-related takeover of power happened in Syria, where the Mitanni kingdom, famed for its horse-drawn chariots, had rulers with Indo-Aryan names (c. 1500–1300 B.C.).

Entrance of the Vedic Aryans to South Asia

Ceramics with BMAC origin came to the Swat Valley of north Pakistan around 1600 and again around 1300 B.C. These two waves of immigration most probably brought the poetic tradition of the Rig Veda to South Asia. These dates agree with the fact that the Rig Veda mentions bronze (*ayas*) but not iron. Iron came to South Asia around the eleventh century B.C. and is mentioned in the Atharva Veda.

River names occurring in the Rig Veda connect its oldest parts with the northwest and the Punjab. The “seven streams” are repeatedly mentioned; in X, 75 all the major rivers of the Indus system are enumerated. Eastern rivers (Yamuna and Ganga) are mentioned only a few times. In later Vedic literature the geographical horizon widens eastward and southward. Several river names seem to have had their referents in Afghanistan. Thus Rasā, corresponding to Avestan Ranhā, probably denotes the Amu Darya and may have a Proto-Aryan background in the Volga River, called Rhā in Greek sources. Sarasvati mostly denotes the North Indian Ghaggar-Hakra, but in VI, 61 Sarasvati evidently refers to the Argandāb River in the Afghan province of Kandahar, called Harahvaiti in

Avestan and Harahuvati in Old Persian. This was the birthplace of King Divodāsa.

The Vedic Aryans did not come to an empty country when they entered South Asia. The Harappan population is estimated to have been around 1 million. The walled Indus cities collapsed around 1900 B.C., and the Aryan war god Indra and his protégé, King Divodāsa, have long been blamed for this: according to the Rig Veda, they vanquished “black-skinned” enemies called Dāsa, Dasyu, and Pani, and destroyed their numerous strongholds.

However, chronological reasons alone make it difficult to accept this popular hypothesis, as King Divodāsa probably did not come to the Indus Valley before 1300 B.C. Moreover, the Dāsa forts are described as having circular and often multiple, concentric walls, while the Indus cities had a square layout. In the 1970s, a “temple fort” with three round concentric walls was discovered at the BMAC site Dashly-3 in Afghanistan. The battles against the Dāsas may therefore have taken place west of the Indus Valley.

Later Iranian and Greek sources place a tribe called Dasa or Daha and its subtribe Parna in Afghanistan and southern Turkmenistan, the very area of the BMAC. Two East Iranian languages have preserved the word *daba* (from earlier *dasa*) in the meaning “man, hero, human being,” which is often the basis of ethnic names. A wave of Early Proto-Iranian-speaking immigrants from the northern steppes may have preceded the Vedic Indo-Aryans in Central Asia (taking over the BMAC) and in South Asia. This earliest Aryan wave could be connected with the Late and Post-Harappan cultures in the Indus Valley (“Jhukar” in Sind, “Cemetery H of Harappa” in the Punjab), the Ganges-Yamuna Doab (the “Copper Hoards”), and with the early non-Vedic but Aryan languages of eastern India (Māgadhī). Their religion may have initiated Shākta Tantrism.

The Rig Veda mentions by name some thirty Aryan tribes and clans, major ones being the “five peoples.” Four of these, paired as Yadu and Turvasha, and Anu and Druhyu, seem to represent the first wave of Rig Vedic immigrants (c. 1600 B.C.). The fifth tribe, Pūru, together with its ally or subtribe Bharata—which has given India its later native name, Bhārat(a)—appears to have arrived later (c. 1300 B.C.), overpowering the earlier tribes. This immigration from Afghanistan over the Hindu Kush Mountains to the western side of the Indus was led by the Pūru king Purukutsa and the Bharata king Divodāsa.

Divodāsa’s son or grandson Sudās defeated the Pūru king and his many allies in the celebrated “battle of ten kings” (Rig Veda VII, 18) on the Ravi River in the Punjab. Sudās became the supreme ruler in the easternmost realm of the Rig Vedic period, the area around

Delhi later called Kurukshetra. The Pūrus stayed between the Jhelum and Ravi rivers, where Alexander conquered King Pōros (“descendant of Pūru”).

Vedic History after the Rig Veda

Iron and a new luxury ceramic called painted gray ware appeared in the Punjab and Haryana around 1100 B.C. and remained cultural characteristics of this area until about 400 B.C. Iron probably came with Old Iranian-speaking horse riders from Central Asia. It is possible that the Kuru kings, who now assumed power in Kurukshetra, the center of Vedic civilization immediately after the Rig Veda, belonged to this wave of immigrants: they share the name “Kuru” with the founder of the Persian Empire, Cyrus.

Economy and Society

Cattle breeding was the basis of Vedic economy. The cow was the most important domestic animal as the provider of meat and milk products; others included the horse, donkey, mule, camel, goat, and sheep, as well as dog and cat, and in the Yajur Veda, also elephant. Agriculture (with plow) was practiced mainly by the indigenous sedentary population. The main crop was barley; rice is mentioned from the Atharva Veda onward.

Early Vedic Aryans were much on the move and continually at strife with each other, cattle rustling being a favorite pastime. Horse-drawn chariots with two spoked wheels served for fighting, hunting (wild boars and antelopes), and racing. Rivers were crossed with boats and floats. The word *grāma*, which later means “village,” denotes in the Rig Veda “a group of wandering pastoralists and their camp,” also “a warring band.” People lived in their ox-drawn wagons, placed in a circle to provide a corral for the cattle at night. Actual buildings—called “house” (*griha*) or “hall” (*shālā*)—were lightly constructed with wooden beams and matted walls and roofs. Brick was not used for residential buildings, only for fire altars and hearths. Towns appear around 800 B.C. with the painted gray ware and start being referred to in Brāhmaṇa texts.

Goods traded by barter included salt, metals and metal objects (weapons, tools and vessels), grain, wool, thread and garments, goatskins and plants (soma, herbs). Cattle was the main means of payment. Kings rewarded poets with gifts of cattle, horses, and golden ornaments.

Some specialized craftsmen are mentioned in the Rig Veda, including carpenters, smiths, merchants, and fishermen. Post-Rig Vedic texts speak of potters (*kulāla*) with potter’s wheels, but they were considered non-Aryan and wheel-thrown dishes “demonic”: ritual vessels were handmade by Aryans.

Vedic society consisted of extended families headed by patriarchal “masters of the house” (*grihapati*), clans (*visb*) headed by chieftains (*visbpati*), and tribes ruled by kings (*rājan* or *kshatriya*), war leaders like the war god Indra, and peacetime rulers like God Varuṇa, who guarded social rules and punished offenders. By the Brāhmaṇa period, the administration was much more developed, with numerous dignitaries.

The Rig Veda distinguishes between the *Ārya varṇa* and the *Dāsa varṇa*, apparently a difference in skin color. In the late hymn X, 90, however, *varṇa* (color) denotes the four social classes—*brāhmaṇa* (priests), *rājanya* (nobility), *vaishya* (commoners), and *śūdra* (serfs)—as originating from the mouth, arms, loins, and feet of the primeval man (*puruṣa*), whom the gods sacrificed in the beginning, creating the world out of his body. This seems to reflect the surfacing of earlier local developments. The priestly claim for superiority and monopolization of the sacrificial ritual probably started from the royal high priests (*purohita*) important in the Atharva Veda.

Religious Ideas and Forms of Worship

Contrasting with the systematic and detailed descriptions of rituals in the Brāhmaṇas and Sūtras, the Rig Veda repeats over and over a few central myths and cultic acts but leaves many others quite obscure, as poetics favored veiled and indirect references. The hymns mainly praise gods, invite them to a sacrificial meal, and pray to them for long life, sons, cattle, victory in battle, or fame. Verbal art and liturgy was most important in the uniconic worship of gods. The truthfully spoken word had magic power, *brahman*: by means of his poems, God Brihaspati (in later Hinduism, the chaplain of the gods and the planet Jupiter), helping Indra, opened the cave of the demon Vala who had imprisoned the cows of the Dawn.

The Rig Vedic worship or sacrifice (*yajña*), which was modeled on human hospitality, was a very important ceremony for the Aryans, as their ethnic name indicates; it was guarded by God Aryaman, “hospitality” personified. After the sacrificer and the priests (who represented particular deities) had become purified and initiated, the sacrificial fire was kindled. Gods were invited to come and seat themselves on the grass strewn near the fire. Agni, the god of fire, conveyed the offerings to them, or functioned as their mouth and priest. Agni is one of the principal Vedic deities, worshiped in every house as its master. Offerings consisted of cakes and of portions of slaughtered animals put into fire, while other parts were eaten by the priests.

The most important offering substance was soma, the deified sacrificial drink, pressed out of the stems of a plant previously soaked in hot water. The juice was purified

with a woolen filter, and during this act lauded with Samur Vedic songs. The botanical identity of soma is controversial. Most likely, it was ephedra, still used as *haoma* by Zoroastrians, the followers of Zarathushtra. Ephedra contains ephedrine, a drug that enhances physical performance. Soma is the drink of the warrior. Poets, too, are inspired and kept awake by soma.

More than a quarter of the Rig Vedic hymns are addressed to Indra, the god of war and the principal drinker of soma. Indra’s greatest feat is the killing of Dragon Vritra (Obstruction) who had imprisoned the waters. Maruts, the storm winds, assisted Indra. Indra also helps in finding cattle captured by the enemy and in breaking enemy forts. He is said to have created the sun, the heaven, and the dawns.

Indra, however, is not the only king of the gods. (He has this function also in Hinduism and other Indian religions.) Mitra (personified “treaty of friendship”) and Varuṇa (personified “oath” or “true speech,” upholder of cosmic order—*rita*, later *dharmā*—and punisher of sinners) are worshiped as a dual deity of kingship. Mitra is associated with day (in Iran, Mithra was the sun god and the god of victory) and Varuṇa with night (conceived of as a heavenly ocean; in later Hinduism, Varuṇa is the god of ocean and the waters. As a dual divinity they represent the bright and the dark side of the single sun god, Savi-tar. Along with Aryaman, Bhaga (share [of booty], good fortune), and some other gods, they form a class of “abstract” deities called Ādityas, “sons of [Goddess] Aditi,” possibly created by Proto-Indo-Aryans under the inspiration of the Assyrian religion, where similar deities are worshiped as aspects of the chief god Assur. Likewise, the “Holy Immortals” were aspects of Zarathushtra’s Ahura Mazda “Lord Wisdom”—the Old Iranian counterpart of Varuṇa as the principal Asura.

As the title of Varuṇa, *asura* means “Lord,” but in other Vedic contexts and in later Hinduism it means “Demon,” an enemy of the “Gods,” usually called *deva* in the Veda. Zarathushtra rejected most of the earlier Indo-Aryan gods, so *daēva* means “demon” in Avestan. There are traces of some rivalry between the cult of Indra (worshiped with soma) and the cult of the twin gods called Ashvin or Nāsātya (worshiped with *gharma*, an offering of heated milk, or with *surā*, a beer made from milk and honey). The Ashvins drive their flying horse chariot around heaven with their beautiful sister-wife, Ushas, the goddess of Dawn. They function as healers and saviors of gods and men, like their Greek counterparts, the horse-man twins. The Dioskouroi, however, were also guardians of the dual kings of Sparta, so Mitra-and-Varuṇa may be partial doubles of the Ashvins, the original chariot gods. The horse sacrifice (*ashvamedha*) belonged to royal rites (in the Rig Veda as in the later

epics and after). Mitra-and-Varuṇa, Indra, and the Nāsatyas were all invoked as oath deities by the Mitanni king in a treaty with the Hittite king in 1380 B.C.

The main gods of later Hinduism appear with a lower profile as early as the Rig Veda. Rudra (Shiva) is feared for his arrows, while Vishnu assists Indra and crosses the universe with his three strides.

The late books I and X of the Rig Veda differ considerably, in language as well as in content, from the rest of the collection but anticipate the Atharva Veda and Brahmanism. Philosophical speculation starts with the mighty hymn of creation (*sat* and *asat*, X, 129). Sorcery spells contain archaic Indo-European traditions, likewise the hymns associated with domestic rituals, which remain the most enduring part of the Veda in India today. Harappan heritage is preserved in Vedic calendrical astronomy, attested for the first time in the marriage hymn (X, 85). The Rig Veda speaks of both burial and cremation as current modes of disposing of the dead, but cremation became the standard method. The funeral hymns (X, 10–19) are related to Yama, “the twin (with his sister Yamī),” the first man and first mortal, and the king of the dead, who has an Old Iranian counterpart in the Avestan Yima, the first king and first mortal. Yama seems to be an earlier double of Manu (man), the ancestor of the Vedic Aryans; both descend from the solar god Vivasvat. Several cultural and cultic layers can thus be traced in the Veda.

VINA The South Indian vina is also called *Sarasvatī vīnā* due to its association with the goddess Sarasvatī, who embodies the respect for learning that characterizes South Indian culture. In song lyrics and paintings, the goddess is depicted as a beautiful lady who delights in playing the vina. The modern vina dates from the early seventeenth century and belongs to the category of long-necked lutes. Its main resonator (*kudam*) and neck (*dandi*) are carved from jackwood. A removable resonator (made from gourd, wood, fiberglass, plastic, or papier-mâché) mainly serves to support the vina on the left knee of its player. The neck holds twenty-four frets and seven tuning pegs, and it is decorated by a dragon head (*yālī*). The characteristic sound of the vina is the result of several factors, including the black wax layer on which the “bell metal” frets are placed, the convex shape of the brass plate covering the wooden bridge, and the optional use of wire plectra.

Of the seven strings, four are fitted on the top of the neck, and three along the side facing the player. The four melody strings are tuned to the tonic (middle and lower *sā*) and its fifth (lower *pā* and one octave below); these notes are arranged in the descending order from the player’s point of view (*sā-pā-sā-pā*).

Three auxiliary strings constitute a kind of drone whenever the basic note (*sā*), its higher octave, and the fifth (*pā*) between them are sounded. In addition, these strings are used to indicate the cyclic pattern (*tāla*) that applies to any particular composition or improvisation. All these features and techniques account for the fact that in Sanskrit, this type of vina is referred to as a complete instrument (*sarva vādya*), one that is self-sufficient, as it expresses the melodic and rhythmic aspects of music even in the absence of an accompanist.

A few traditional vina exponents sing along with their instrument in order to highlight the lyrical aspect of a song. The repertoire of a vina player (*vāinika*) is essentially the same as that of a vocalist, but unlike the human voice, a vina has a range of 3 1/2 octaves. Most performers prefer to tune it to a key note between E and F. Its playing technique involves slides (horizontal pull) and deflection (vertical pull) in order to produce subtle nuances such as microtonal shades (*sbruti*) and a variety of embellishments. A fretless type of vina (*chitravīnā*) was earlier known as *gōttuvādya*, which implies that it is played with a gliding “rod.”

The *tānam* is a speciality of all vina players and involves the elaboration of a *rāga* in a pulsating manner. This musical expression of bliss (*ānantam*) during *tānam* is also achieved by singing the syllables “ā-nan-tam-tā-nam” in various combinations. Embellishments and grace notes (*gamaka*) serve to intertwine melodic phrases in a pleasing

manner. Such continuity is greatly valued by the discerning listener (*rasika*). Although music of such high density requires much skill, a good vina performance conveys the legacy of composer-poets like Muttusvāmi Dīkshitar: his song (*kṛiti*) in praise of Mīnākshi invokes the beautiful goddess who plays music on the vina with ten different types of embellishments (*dashavidha gamaka*).

VISHNU AND AVATĀRAS The god Vishnu, a relatively minor figure in the Vedas (which hold many but not all of the primary roots of Hindu tradition), emerges in the Sanskrit epics and Purāṇas to become one of the pair of most powerful male deities. As sectarian Shaivas are those whose primary devotional allegiance is to Shiva, Vaishnavas are worshipers of Vishnu in one or more of his manifestations. In many ways, Vishnu represents an entire pantheon of gods assembled under one name, a supreme being with multiple incarnations popularly known as *avatāras*. Historically, these numerous divine beings had obscure but sometimes colorful origins in regional clan deities and cults of deified heroes. Gradually they were gathered under the umbrella designation of Vishnu and regarded as his appearances with various names, mythologies, and rituals. Alongside Shaivas on one hand and devotees of many forms of Devī, the goddess, on the other, Vaishnavas represent the core of the Hindu devotional tradition. Although many Hindus concentrate faith in one god as supreme deity, Hinduism has always been comfortable with devotees who worship in temples, shrines, and home altars that embrace more than one sacred being.

Vishnu in the Vedas

Of the more than one thousand hymns of the Rig Veda, Vishnu is addressed in only five, and his name appears fewer than a hundred times in all the others. Yet his most celebrated feat, the taking of three great strides, the last extending beyond human comprehension and presumably embracing the three cosmic levels of earth, midspace, and

Narasimha. Massive stone sculpture from Hampi depicting the fourth avatar of Vishnu, the all-powerful Narasiṃha (half-man, half-lion) sent to slay the errant ruler Hiranyakashipu. Regardless of what form his manifestation takes, Vishnu's pervasiveness in Indian culture is never far from mind. K. L. KAMAT / KAMAT'S POTPOURRI.

heaven, endows him with a permanent reputation for all-pervasiveness. He is associated with major Rig Vedic deities, including Indra, whom he assists in the conquest of the powerful demon of obstruction Vritra, and with whom he drinks the sacred soma offering. Detailing *yajña*, sacrifice, Brāhmaṇa texts direct the sacrificer to take three strides to reach heaven and the highest light. In so doing, the sacrificer becomes both Vishnu and the sacrifice (Shatapatha Brāhmaṇa 1.9.3.9–10). Such a homology of the god, worshiper, and sacrifice assures Vishnu a prominent and lasting role in a religion that focuses on ritual. Communication between gods in heaven and humans on earth is secured by identifying Vishnu with the *yūpa*, at once the sacrificial pole and a cosmic *axis mundi*.

In addition to myths featuring Indra, Soma, and Agni, Vishnu also plays a part in various accounts, from the Rig Veda to the Brāhmaṇas, of a boar and a dwarf, prefiguring two of the famous *avatāras* narrated in greater detail in

subsequent Sanskrit epics and Purāṇas. A central motif in these developing myths is cosmogony, the creation or rescuing of the earth from chaos or the Asuras (enemies of the gods) through sacrifice, often personified in the form of Prajāpati, Lord of creatures. For example, the Asuras, unaware of Vishnu's talent for a three-step across the universe, are fooled when they readily consent to give up as much of the earth as the dwarf can lie upon or cross in three strides. And the boar, called Emūsha in some variants, stars as an "earth-diver" type of creator who raises out of primeval waters the entire earth on his tusk. Two other early myths involve Prajāpati and either a fish or a tortoise, yet another pair of *avatāras* of Vishnu that achieved widespread popularity in post-Vedic texts.

At the close of the Vedic textual period, most Upanishads paid scant attention to Vishnu. The early Brihadāraṇyaka placed Vishnu in a creative role, alongside Prajāpati and other deities, as overseers of ritual impregnation. In the later Kaṭha Upanishad, Vishnu's highest step occurs with the first mention of the term for rebirth, *samsāra*: one with proper knowledge of the self attains that heaven from which he will not be reborn. But more significantly, by the third century B.C., the Mahā-Nārāyaṇa Upanishad, book 10 of the Taittirīya Āraṇyaka, connected Vishnu with cosmic Purusha, Prajāpati, time personified as Kāla, order, truth, the highest light, and in fact the Absolute, *brahman*. Among all these associations with supreme cosmic entities was inserted Nārāyaṇa, a Rishi and son of Dharma who became known as "Purusha Nārāyaṇa" in the Shatapatha Brāhmaṇa (e.g., 12.3.4.1). The identification of Vishnu with Nārāyaṇa proved to be momentous in post-Vedic theological circles that led to the establishment of sectarian Vaishnavism.

Vishnu in Epics and Purāṇas

In the last half of the first millennium B.C., Vishnu and Shiva came into prominence, each expressing a range of essential myths, rites, and symbols of the past, both Vedic and non-Vedic. Over the succeeding centuries, they were joined by an array of local, regional, and eventually pan-Indian goddesses who also achieved status in popular worship. Aspects of Vedic Vishnu that served best to highlight him in a new age that produced epic roles in the Sanskrit Mahābhārata, Harivaṃsha, and Rāmāyaṇa included his role as the sacrifice, and particularly as the sacrificial victim Purusha-Prajāpati, the primal person whose body became the distributed cosmos. As cosmic pole (*skambha*), Vishnu was everywhere present as essential cosmic energy. To the scattered earlier cosmogonic folklore of the boar, fish, tortoise, and dwarf were added weightier cycles of two great heroic figures, Krishna and Rāma, who became the most famous of all manifestations. In the system of *avatāras* that emerged well into

Vishnu as Boar. Kavi mural of the third avatar, Vishnu's reincarnation as a boar to save the earth from raging flood waters. Hindus believe that whenever injustice or disorder rules the universe, God will assume an earthly form to reestablish *dharmā* (balance). K. L. KAMAT / KAMAT'S POTPOURRI.

the first millennium A.D., these two, in widely separate ways, were considered to be descents of Vishnu into the human world to restore *dharmā*, sacred order, in a time of lawlessness and chaos. Each appears at the shift of an age, or *yuga*, within the great cycle of time, and each is said to be the ideal king for the new age.

Multiple cults of regional clan leaders and deified heroes, some of them thought to be Rishis, appear to have formed, reformed, and coalesced during the period of composition of the Mahābhārata, about 500 B.C. to A.D. 200. The great epic reveals the names of Vāsudeva, Nārāyaṇa, Krishna, Bala-Rāma, Nara, and Hari, as well as communities known as Bhāgavatas (worshippers of Bhagavan, the

Vishnu Sanskarana. Carving of Vishnu, c. 1147. In Hinduism, the worship of Vishnu (“all preserving one”) is frequently associated with *sanskar* (sacraments or rituals) that mark a new stage of life. NATIONAL MUSEUM / FOTOMEDIA.

Lord), Pāñcarātras, and others, but gives no transparent view of their developing relationships. The Nārāyaṇīya section in book 12 provides some degree of focus. But the words of Krishna in the Bhagavad Gītā (c. 200 B.C.)—verses often considered the essence of the Mahābhārata in its portion of the sixth book—declare a divine mission and provide a rationale employed later in the concept of *avatāras*: “For the preservation of good and destruction of evil . . . I come into being in age after age” (Gītā 4.8). The relationship of the warrior Arjuna’s charioteer, Krishna, to the god Vishnu is complex and certainly mystifying to Arjuna. In a crucial moment, transcendent Vishnu reveals his bodily form in the terrifying splendor of a thousand suns, and Arjuna beholds all the gods and the fiery dissolution of the universe. Quickly he begs for the mercy of normal human vision and then learns that it is only through steadfast devotion (*bhakti*) that such a theophany occurs and god himself may be entered (Gītā 11.3–55).

In other epic passages, including the Harivaṁsha, and in the Purāṇas, particularly the Vishnu and Bhāgavata, Krishna is portrayed quite differently, as a valiant warrior dispatching monsters and demons, and then again as the cowerd Gowpāla and lover of *gopīs*, milkmaids who represent the adoring souls of humans, more often found languishing in separation from the god than relishing his

embrace. In sculpture, wood carvings, and later medieval paintings, Krishna is seen conquering the serpent Kāliya, hoisting up Mount Govardhana in a rescue mission, or as a lithe, dark blue figure, surrounded by cattle and rolling hills, enchanting all with his flute, but crowned and still royal. The Gītā Govinda, a twelfth-century Sanskrit devotional poem by Jayadeva, provided a name for the *gopī* favored by the dark lord, and a cult of Rādhā and Krishna was born. Krishna’s many heroic deeds are recited with great affection, and in fact his entire life fascinates his devotees, including his childhood antics. Bāla-Krishna stealing butter from the pantry is a favored scene. Another episode echoes the revelation to Arjuna: Krishna’s mother looks into her child’s mouth when she thinks he has been eating dirt and discovers the entire universe, earth, moon, and stars.

Rāma, prince of Ayodhya, is hero of the Rāmāyaṇa, perhaps the earlier of the two epics. His character is more focused and transparent than that of Krishna. Popularly known to Vaishnavas as Rāmacandra, he is portrayed as a handsome blue figure, crowned, an arrow in one hand, bow in the other. Vishnu’s descent in this instance of the *avatāra* series is to restore the rightful kingdom to Rāma, who has been unjustly exiled, and to defeat the usurping demon Rāvaṇa, king of Lanka. The epic centers on Rāma and Sītā as ideal man and wife, each the model of virtue, truth, and beauty. Rāma’s heroic younger brother, Lakshmaṇa, and monkey allies championed by Hanuman are crucial in a war to rescue the abducted Sītā. The Sanskrit Rāmāyaṇa traditionally attributed to Vālmīki was followed by other, substantially different regional versions in several languages, including Tamil, Hindi, and Bengali between the twelfth and sixteenth centuries. Before tens of thousands of devotees, the Hindi Rāmāyaṇa of Tulsīdās is dramatized annually as the Rām-Līlā.

Although some Purāṇas maintain longer catalogs, a classical list of ten *avatāras* of Vishnu endures, often beginning with Matsya, the fish. A well-known myth in the Shatapatha Brāhmaṇa features an unnamed tiny fish, cared for by Manu, that grows into a giant fish strong enough to save Manu from a universal flood by towing him in a boat. In the Mahābhārata, the Matsya, and other Purāṇas, this fish is identified either as Brahmā or Vishnu, and rescue from world annihilation now entails all beings, with Manu in charge of a new creation in which the Vedas must be heard anew. Paintings illustrating Purāṇa manuscripts charmingly show four personified Vedas and seven Rishis alongside Manu and family, all bobbing in a boat on an endless sea that represents an interlude between destruction and a new creation.

Kurma, the tortoise incarnation of Vishnu, also has Vedic cosmogonic origins. In the *agnicayana* sacrifice, a live tortoise, symbol of the three worlds and life-sap, was

buried as foundation for the fire altar. In epics and Purāṇas, Kurma lies at the bottom of the cosmic ocean with Mount Mandara based on his back like an *axis mundi*. In the myth of the churning of the ocean, warring gods and demons employ the great serpent Vāsuki as churning rope to twirl this pole and produce from an ocean of milk fourteen cosmic treasures, including *amrita*, the drink of immortality, and the goddess Lakshmi.

Again the Vedic tradition is one source for the boar *avatāra*, Varāha, widely represented in early iconography. The assimilation of indigenous myths and cults of a sacred boar into Vedic tradition and thence into the Vaishnava pantheon is illustrated in an association of Varāha with every aspect of the sacrifice. He is shown either upright on his hind legs or standing on all fours. Often a naked young girl is suspended from one tusk, a symbol of Prithivī, the goddess Earth, brought up by the boar who dove to the bottom of the sea to rescue her.

Unlike the other great male god, Shiva, who appears in at least as many fearful and demonic guises as gracious and benign ones, the incarnations of Vishnu are almost always benevolent. One exception is his descent as Narasiṃha, the man-lion. This curious mixture came about when a clever demon, Hiraṇyakashipu, extracted a boon from Brahmā that no weapon could harm him, that he could not be killed by man or beast, by day or night, inside or outside his dwelling. The demon's son, Prahlāda, a passionate devotee of Vishnu, enraged his father, who tried every means to kill the boy. Vishnu therefore dispatched this troublesome demon by his own hands, appearing as a man-lion, at twilight, on the threshold. Usually depicted with fierce lion face, Narasiṃha is often shown in a macabre scene, Hiraṇyakashipu stretched across his lap being disemboweled.

The dwarf in the Shatapatha Brāhmaṇa who tricked the Asuras into giving up the world by recapitulating Rig Vedic Vishnu's three great strides across the cosmos now receives a name, Vāmana. Yet another demon, Bali, is fooled by the innocent-looking but wide-striding dwarf. Vāmana is often pot-bellied as a dwarf but lithe and virile when conquering.

Parashu-Rāma, Rāma-with-battle-ax, presents the anomaly of a Brahman priest who is a fierce warrior wielding a deadly weapon. His myths center on the perpetual struggle for supremacy between the two primary classes, Brahmans and Kshatriyas, priests and warriors. Depicted with his right hand holding an ax given by Shiva, Parashu-Rāma recalls the mythic annihilation of a warrior class that temporarily usurped sovereignty and inverted cosmic order.

Even the Buddha was drawn into the orbit of Vishnu. Just as Buddhists co-opted several Hindu gods (Indra was said to have become a Buddhist convert), so did Vaishnavas submerge the Buddha into one more incarnation of Vishnu. According to one source, Vishnu deliberately deceived and punished those incapable of knowing god. The Mahābhārata and several Purāṇas list Hanṣa, the goose, Brahmā's mount, instead of the Buddha.

These nine *avatāras* are said to have descended in times of distress to rescue or re-create the world. That leaves only the tenth of the classic set, a Vishnu still to come. At the close of our current Kali *yuga*, worst of the four ages, Kalki will arrive to initiate the Krita *yuga*, the golden age restored once again. As an eschatological figure akin to both ancient Iranian Saoshyant and the Buddha Maitreya, he is to appear with flaming sword on a white horse, riding to end chaos, reestablish order, and reward or punish all according to their deeds.

Of the ten, it is Krishna and Rāma who emerged as such powerful magnets of devotion that worshipers often dismiss all others and think of one or the other instead of Vishnu. But regardless of manifestation, Vishnu's pervasiveness is never far from mind. Nammālvār, most famous of the twelve Tamil Vaishnava poet-saints of South India in the seventh to tenth centuries, spoke of Tirumāl (Vishnu) coming to him "happily, all grace, my lord who became fish, tortoise, man-lion, dwarf, wild boar, and who'll soon be Kalki, occupied me, became all of me, my lord dark as raincloud" (trans., A. K. Ramanujan).

The iconography of Vishnu that began with temple sculpture in the late centuries B.C. and flourished between the fourth and sixth centuries A.D. continued with coins and on to medieval paintings. Frequently he is youthful in appearance, dark blue, a *shrīvatsa* in his chest hair marking him as the favorite of Shrī-Lakshmi, his four hands holding a conch and lotus, with discus and mace as weapons. A prize from the churning of the ocean is the *kaustubha* jewel worn by Vishnu. Often he appears on Garuḍa, his eagle or hawk mount, a well-winged (*suparna*) figure in his own right, whose career echoes that of the Vedic eagle who carried a hero to steal soma. Garuḍa is known as the enemy of serpents, *nāgas*. But another theriomorphic mount for Vishnu is the cosmic serpent Shesha, known as Ananta, endless, a coil floating upon the ocean as foundation for the sleeping god. A recurrent scene depicts Vishnu lying asleep on Shesha, Lakshmi tending his feet, while a lotus sprouts from his navel to reveal the creator god Brahmā. In the late and synthetic Purāṇic theology of Trimūrti, a triune godhead, Brahmā creates, Vishnu preserves, and Shiva destroys each temporary world. Another conflation was Hari-Hara, Vishnu, and Shiva as one being performing all functions. The *shālagrāma* stone found in many home

shrines is a fossil ammonite from a sacred river. It is pervaded by the god and therefore is Vishnu.

Lakshmī, at Vishnu's feet or by his side on Gupta coins, is his wife but also the famed goddess of good fortune, wealth, prosperity, and beauty. By the close of the Vedic texts, Lakshmī had merged with Shrī, an older Vedic goddess with similar characteristics. Vishnu's divine consort may also be known as Padmā, the lotus. In South Indian temples the god is often flanked by Shrī-Lakshmī and Bhū or Bhūmi, a variant of Prithivī, the earth. The goddess remained subordinate until such texts as the Lakshmī Tantra of the Pāñcarātra Āgamas promoted her to equality, even identity with Vishnu. Here, Lakshmī-Nārāyaṇa becomes as arresting and complicated a manifestation as Shakti-Shiva among other texts and rituals of Tantra. The Tamil Shrī Vaishnava treatises of the twelfth and later centuries and the emergence of Rādhā in the Gītā Govinda from Bengal, also in twelfth century, assured a permanent place for goddesses and feminine powers within Vaishnava tradition. In the fourteenth and later centuries, the popularity of openly erotic poems of Vidyāpati, Sūrdās, Caṇḍīdās, and the Sahajiyā mysticism of Bengal meant a more intricate demonstration of the Lord's love play (*rāsa līlā*) with the human soul, and a counterpoint to those such as Caitanya, who stressed his experience of Krishna's absence.

Vishnu in Faith and Practice

Vishnu as godhead and his principal *avatāras*, Krishna and Rāma, are most readily discernible in the context of *bhakti*, devotional movements in which the *bhakta*, devotee, fervently seeks the presence of god. To be with god—really to return to him, since the body of Purusha-Nārāyaṇa is the source of all being—is a desire that remains unqualified by time, as evidenced in the widespread belief in Vishnu's heaven, Vaikuṅṭha, on the Ganges River flowing from Mount Meru (or in variants, within the deepest ocean). *Moksha* is the sought-after release from further rebirths, but living for eternity in the presence of Lord Vishnu is a far higher reward for devotion. In funerary rituals Rāma may be invoked in several ways, including a chant “the name of Rāma is *satya*, truth!”

The mythology of manifestation according to the Bhagavad Gītā and several Purāṇas is one statement of Vishnu's pervasive nature. But the attempt to explain the relationship between the one and the many, a supreme being with multiple forms that do not exhaust his totality, was approached by different communities from several perspectives from the fifth century B.C. The highest being could be disclosed as unitary, two-, three-, four-, five-, or even sixfold, each expression supported by

cosmology and mythology, including agricultural and pastoral symbols of sun, rain, earth, plows, pestles, and cattle. Vedic Purusha is again recalled, the primal being in four parts, three of them remaining unmanifest (Rig Veda 10.90.3). The doctrine of *vyūhas* emerged from the Pāñcarātra school, perhaps under the influence of Sāṃkhya philosophy, with its division of consciousness and matter, *purusha* and *prakṛiti*. An early branch envisioned four *vyūhas*, arrangements or emanations, proceeding from the supreme Vishnu as an aggregate of deified heroes: Saṃmkarshaṇa (Bala-Rāma), Vāsudeva, Pradyumna, and Aniruddha. Another perspective noted five by including Sāmba or Shāmba, and still another counted triads in pairs. Krishna devotees centered upon Vāsudeva as Krishna, the other four being his brother, two sons, and a grandson. By the time of the Vishnu and Bhāgavata Purāṇas, many of these cosmological perspectives had melded into a more uniform background for the doctrine of *avatāras* and proliferation of *bhakti*.

As Shankara was the great eighth-century monistic philosopher of Advaita Vedānta and impersonal *brahman*, so were Yāmuna, and in particular, his successor, Rāmānuja, the principal architects of what came to be known as Vishishtādvaita, the qualified nondualism school of Vedānta. Rāmānuja was an eleventh-century student of Vedānta whose personal experience of Vishnu and Shrī-Lakshmī brought realization of *brahman* as a limitless being with whom an individual soul could unite. Passionate devotion to the point of complete self-surrender, *prapatti*, later became the hallmark of many South Indian Shrī Vaishnavas. Eventually this movement split into northern and southern subsets. The former stressed Sanskrit texts and cooperative grace, whereas the latter relied on Tamil hymns and the irresistible grace of god, a conviction that one is rescued by god alone without human effort. As chief priest of the Ranganatha temple in Shrirangam, Rāmānuja systematized Vaishnava *devapūjā*, divine worship, and traveled widely to disseminate theological and liturgical reforms that became fundamental to the overall success of *bhakti* in Hinduism.

A list of 108 sacred sites for Vaishnava pilgrims includes Shrirangam, Tirupati, and even Vaikuṅṭha, heaven. Among celebrated festivals are birthdays for Krishna and Rāma, Holi, and special times to honor regional poet-saints who made manifestations of Vishnu accessible in Tamil, Kannada, Marathi, Braj, Bengali, or a score of other languages.

VISHWA HINDU PARISHAD (VHP) Established in 1964 by a Hindu nationalist party, the Rashtriya Swayamsevak Sangh (RSS), the Vishwa Hindu Parishad (VHP, or World Hindu Council) was created to campaign for an end to the slaughter of cows, a central demand of Hindu activists, who consider the cow a sacred embodiment of Hinduism. The VHP is also a religious and voluntary social service organization that espouses a broader agenda of reform to eradicate various perceived ills of Hindu Indian society. An important underlying ideological motif of the VHP’s program is to unify Hindus politically throughout the world, in order to establish a powerful global Hindu voice.

The broader agenda of the VHP includes its stated desire to abolish the consequences of caste divisions in Indian society. It wishes to emulate other world religions by instituting greater rigor and homogeneity in religious practices, as well as to defend traditional Indian cultural values. A central dimension of the VHP’s aims and sociopolitical activities is to oppose the conversion of Hindus to other faiths and to encourage the return of converts to the Hindu fold (“homecoming”).

Individual VHP organizational service units (*sevakaryas*) adopt a holistic approach, combining religious and sociocultural activities, such as the study of Sanskrit, the classical language of the ancient Hindu texts. They organize gatherings of religious leaders and perform sacerdotal rites to propagate Hinduism. The VHP considers the participation of religious leaders (Dharmacharyas and Shankaracharyas) under its auspices as a crucial element of its activities, as it allows Hindu leaders to speak with a single voice on subjects like the ban on cow slaughter and the construction of a new Rāma temple. The VHP also provides voluntary social services and has pioneered one-teacher schools for deprived rural communities. It helps in the upkeep of rural Hindu temples and trains priests. The VHP operates in virtually all the 770 districts of India and more than two dozen countries abroad.

The VHP’s opposition to religious conversion has brought it into sharp conflict with various Christian churches. The VHP is evidently willing to intervene

physically to prevent Christian missionaries from undertaking religious or welfare activities that it construes as part of religious conversion. Missionary groups, who have been protesting the disruption of their activities, argue that the right to proselytize is fundamental to their faith and is guaranteed by India's Constitution. A turning point for the VHP was the mass conversion to Islam of India's deprived Dalit community (formerly called "untouchables") in the southern district of Meenaksipuram in 1992. That episode galvanized the VHP into action in a campaign to bring the converts to Islam and other faiths back to the Hindu fold.

During the 1990s the VHP acquired notoriety by spearheading the campaign to build a temple for the Hindu deity, Lord Rāma, at the site in Ayodhya of the Babri Masjid, a mosque constructed in the sixteenth century by the Mughal emperor Babur. The controversy over the site was revived in 1989 when Prime Minister Rajiv Gandhi reopened it for worship by Hindus, after decades of quarantine, hoping thereby to head off conflict between Muslims and Hindus. The conflict, however, escalated, and the mosque was demolished by a Hindu mob in December 1992.

The VHP and its allies argue that an ancient Rāma temple must have stood at the site, was destroyed to make way for the mosque, and must therefore be reinstated. Indians remain divided over the issue. Supporters of the previous coalition government led by the Bharatiya Janata Party (BJP), allied to the VHP, backed the claim, while critics, both secular and Muslim, regarded attempts to destroy any ancient historical monument as a real danger to Indian secularism and tolerance. At least two other mosques, known to have replaced significant temples, are regarded as potential flash points that could provoke religious passions. The VHP insists that few major Hindu temples in northern India survived Islamic rule and that the temples at Ayodhya, Varanasi, and Mathura must be "restored" to allow Hindus to worship there.

In 2001 fifty-nine Hindu pilgrims, including forty women and children, returning from the controversial Rām Janmabhoomi ("Rām birth") temple site in Ayodhya, were attacked and burned to death by a Muslim mob at Godhra station in Gujarat. Retaliatory Hindu mob violence against Muslims followed, and it is believed that various elements of the Sangh Parivar political organization, including the VHP, participated. More than one thousand Muslims were killed. Witnesses allege that members of the VHP, the Bajrang Dal (the youth wing of the RSS), BJP state legislators, and Gujarat state government ministers were involved in the murderous riots that resulted in the killing of innocent Muslims. The events in Gujarat polarized public opinion in India. Nevertheless, anxious Hindus in Gujarat voted overwhelmingly to

ensure a resounding victory for the BJP in the state elections that year.

Critics of the VHP view their militant Hindu politics as responsible for instigating intolerance, as well as encouraging violence against religious minorities. The VHP also stands accused of active involvement in the demolition of the Babri Masjid in Ayodhya in 1992. The VHP dismisses its detractors as prone to "appeasement" of unjust demands from India's religious minorities, and it insists that the rise of Hinduism is irresistible after centuries of repression by monotheistic invaders.

VIVEKANANDA, SWAMI (1863–1902), *Hindu religious leader*. Born Narendranath Dutta in Calcutta (Kolkata), Vivekananda studied philosophy at the Scottish Churches College of Kolkata and became a disciple of Sri Ramakrishna Paramhansa, the head priest of the Dakshineswar Temple. Ramakrishna was a mystic who taught the unity of all religions, an idea that Vivekananda propagated worldwide. In 1893 Vivekananda was invited to attend the World Parliament of Religions, convened in Chicago, as a representative of Hinduism. In his opening speech on 11 September he expressed the hope that the bell which rang at the welcome ceremony had sounded the death knell of all fanaticism. He addressed the parliament several times. In one of his speeches he praised Buddhism as the fulfillment of Hinduism. He advocated a synthesis of the intellect of Hinduism's Brahman with the heartfelt message of the Buddha. Though a Hindu monk, Vivekananda did not stress the renunciation of this world or the quest for individual salvation. He instead made a plea for active social work, seeing God in the poor (*daridra narayan*). As a philosophical justification for this approach, he emphasized Karmayoga, that is, the path to salvation by active work in this world in selfless devotion, without looking to the fruits of one's actions.

The respect that Vivekananda had earned in the West made a great impact on his contemporaries in India, who had been used to the British denigration of Hinduism as

a ragbag of superstitions. He thus became a national hero who fired the imagination of young India. Some of the Indian nationalists then also used the idea of Karmayoga as justification for terrorist attacks on the British colonial rulers, but Vivekananda had never intended to inspire violent methods. His main source of inspiration was the Vedānta philosophy of the Upanishads. He reinterpreted Indian traditions so as to fit with modern ideas. Praising the Brahman ideal of service and the spurning of the profit motive, he constructed an Indian socialism. In this way he influenced Indian politicians of various schools of thought, including the great Liberal, Gopal Krishna Gokhale, and the fervent socialist, Jawaharlal Nehru, who acknowledged his debt to Vivekananda in later years. Vivekananda praised the Hindu spiritual tradition but was an ardent critic of Hindu practices such as untouchability, which he characterized as a social custom not justified by religion.

As an instrument for both the propagation of his ideas and active social work, Vivekananda founded the Ramakrishna Mission, named after his spiritual mentor, in 1887. At that time Vivekananda and other followers of Ramakrishna had taken monastic vows. Although most Hindus do not believe in conversion, the Ramakrishna Mission did accept disciples from all over the world who were not born as Hindus. Vivekananda's trips to several Western countries paved the way for the global spread of the Ramakrishna Mission. The Mission has published the eight volumes of his collected works, which contain his books on Bhakti Yoga, Jnana Yoga, Raja Yoga, and Karma Yoga, as well as his numerous speeches.

WARS, MODERN India has fought four open wars and been involved in several near and minor armed conflicts with its neighbors. India has large standing armed forces and also possesses nuclear weapons. Arguably these are a result of insecurities arising from a history of conflicts that it has been involved in, some whose origins lie in forming a nation comprising scores of ethnic and linguistic groups. The disputes with Pakistan are said to center on Jammu and Kashmir, but as the record shows, the causes of disagreements between the two countries could be more elemental. In the case of China, the dispute is over their border and is yet to be resolved.

Indo-Pakistan War: The First Round

Britain's Independence of India Act of 1947 created the dominions of India and Pakistan, and while the rulers of the over five hundred princely states were asked to work out arrangements with the two new nations, none had the option of remaining independent. Pakistan assumed that the Muslim-majority Kashmir would accede to it, but witnessing the carnage of partition, the maharaja, a Hindu, vacillated. To force his hand, a tribal army attacked the state on 22 October, and the ruler decided to accede to India. India launched a massive airlift on the morning of 27 October, flying in troops to defend the state. Pakistani army regulars, allegedly on leave, led the attack, notwithstanding claims that they were Azad (free) Kashmir forces who had revolted against the maharaja.

The Valley of Kashmir was quickly cleared of the invaders, but through 1948, India and Pakistan were locked in combat across the entire state. In the north, British officers of the Gilgit Scouts handed over the territory to Pakistan. But the battle focused on Indian efforts to secure Ladakh in the northeast, while Pakistan

attempted to prevent the Indians from recapturing a strategic sliver of territory stretching from Muzaffarabad to Mirpur, cushioning its Punjabi heartland. It was only in July 1948, when a United Nations commission reached the subcontinent, that Pakistan conceded that its regulars had been involved, but only since earlier that year.

The British generals and a unified British commander-in-chief, Field Marshal Claude Auchinleck, who still headed the two armies, were able to manipulate and moderate the conflict to some degree. Essentially it was an infantry war of mortars, machine guns, and some artillery. India used light tanks to capture the crucial Zoji La Pass and open the road to Leh and used the Indian air force continuously, but Pakistan could not use its air force because of the issue of its legitimacy as a combatant in Kashmir.

When it became clear that neither side could advance beyond what they held by the autumn of 1948, the two sides accepted a cease-fire that became operational at midnight on 31 December 1948.

The Sino-Indian Border War of 1962

The entire 2,520 miles (4,056-km) Sino-Indian border is considered disputed by Beijing, while New Delhi argued that a customary line defined it. Attempts by both sides to militarily establish the border as they perceived it have led to clashes since 1959. The ill-equipped and poorly led Indian army was ordered by the government to undertake a "forward policy" to establish posts behind the Chinese positions. The Chinese bided their time and launched an attack on Indian positions in the North-East Frontier Agency and in Ladakh on 22 October 1962.

Tiger of Mysore Mural. Wall mural depicting a battle between the British and Tipu Sultan (the “Tiger of Mysore”) at the Daria Daulat Bagh, Srirangapattana, 1784. After a series of bloody skirmishes, the British finally killed Tipu Sultan in 1799 and took control of South India. T. S. SATYAN.

An Indian brigade readying to occupy the Thag La ridge across the Namka Chu River was wiped out and the monastery town of Tawang captured. On 16–17 November, after a lull of some three weeks, the Chinese moved against the supposedly strong Indian defenses at Se La and Bomdi La to the east, using infiltration tactics reminiscent of the Korean War. The Indian division was routed, bringing the Chinese within sight of the plains of Assam. Further east, the Indian forces fought with great determination in the Walong area, but were also forced to retreat in some disorder. The Indian army performed better in Ladakh, where they conceded ground to the Chinese only after a tough fight, on some occasions to the last man. Indians used light tanks here, but did not commit the combat strength of the Indian air force during the war for fear of Chinese retaliation.

India sought military help from the United States and the United Kingdom, but the Chinese shrewdly declared a unilateral cease-fire on 20 November and in most cases withdrew to their original positions before any significant assistance arrived. Though fighting was limited, the war, particularly the collapse in the east, was a major

trauma that led India to embark on a major expansion and reequipment of its forces.

Indo-Pakistan War: The Second Round, August–September 1965

The second Indo-Pakistan war began with a clash in the southern extremity of their land border in the Rann of Kutch in February 1965, and through the summer there were heightened tension and clashes across the cease-fire line in Kashmir. But beginning in August, Pakistan initiated Operation Gibraltar, an invasion of the state by thousands of irregulars. Their aim was to converge on Srinagar and stage a “popular” uprising, which failed to take place; those guerrilla forces that did not retreat were captured or killed. The tough Indian reaction, which included the capture of the strategic Haji Pir Pass and several other Pakistani posts in Kashmir, compelled the Pakistanis to up the ante.

On 1 September, a Pakistani armored division moved toward Akhnur, to cut Indian forces in western Kashmir and threaten links with the valley. Pakistan hoped to

localize the conflict within the Jammu and Kashmir state, as had been the case in the 1947–1948 war. But the Indians had other ideas; to relieve pressure in the north, they launched on 6 September a three-pronged attack toward Lahore and also moved against Sialkot. The Indian plans were, however, poorly executed. The Indian air force was not told of the Lahore thrusts, and the Pakistani air force disrupted the central Indian spearhead, striking at Indian air bases and causing considerable damage.

Pakistan had audacious plans of its own, and after blocking the southern thrust against Lahore, they counterattacked with the aim of capturing a vital bridge on the Beas River linking Amritsar with the rest of India. But the badly led Pakistanis floundered at Khem Karan, and the attacking force was trapped and destroyed. By mid-September, Pakistan had expended most of its ammunition, and India's advantage of size would have come into play; strong Chinese pressure and poor advice from army headquarters, however, persuaded India to accept a cease-fire on 22 September. Both sides returned the territory they had captured through an agreement signed at Tashkent in early 1966.

Indo-Pakistan War: The Third Round, The Bangladesh War of 1971

The refusal of Punjabi-dominated West Pakistan to accept the victory of the Awami League, the principal party of East Pakistan, in the first general election of the country in early 1971 led to the latter declaring itself as an independent Bangladesh. Beginning on 25 March 1971, the Pakistani army sought to restore authority through a brutal campaign, killing hundreds of thousands of people. Some 10 million refugees fled across the border to India, along with many Bengali leaders. Led by Bengali officers of the Pakistani army, a Mukti Bahini (Liberation Force) launched a guerrilla war against the Pakistani forces in East Pakistan/Bangladesh.

India began to assist this force and to prepare for a general war. As the battle lines were being drawn, India signed a friendship treaty with the Soviet Union on 9 August 1971; meanwhile, U.S. secretary of state Henry Kissinger's secret visit to China, via Pakistan in July 1971, cemented the already existing U.S. tilt toward Islamabad. By the end of November, fighting along the border intensified, and Indian forces entered East Pakistan/Bangladesh at several points.

On 3 December, in a bid to ease Indian pressure, the Pakistani air force launched a series of air strikes against Indian airfields in the west, leading to open war. The Pakistani commander in Bangladesh planned to keep screening forces on the border and build up cities as strong points that could hold out for two months or so.

The initial Indian plan was to advance on four fronts across the riverine terrain, occupying positions short of the capital, Dhaka. But as the confused Pakistanis pulled back, Indian generals sensed opportunity, and two of the thrusts reached the gates of the city by 14 December; two days later, the 91,000-strong Pakistani army surrendered. The dispatch of a nuclear-powered carrier group to the region by U.S. president Richard M. Nixon was to little avail.

The Pakistani army had vague plans for an offensive in the west to help the beleaguered forces in the east. The plan to capture Poonch failed, but Pakistani forces captured Chamb again. But the anticipated big offensive, however, did not take place. Indian forces were put off-balance by contradictory orders on whether they should take the offensive or remain on the defensive. The limited offensives that did take place yielded insignificant gains because of poor leadership. Unlike the war of 1965, this conflict saw considerable naval action. The Indian navy conducted two daring raids on Karachi, bombed Chittagong harbor, and sank a Pakistani submarine, though it lost a frigate off Gujarat.

Under the Simla Agreement in 1972, prisoners of war were exchanged and captured territory returned, except in Jammu and Kashmir, where the cease-fire line was replaced by a Line of Control (LOC), through which both sides kept their respective gains: Pakistan in Chamb, and India in Ladakh.

The Indian Peacekeeping Force in Sri Lanka, 1987–1990

India sent in a division-sized force in September 1987 as part of an accord with Sri Lanka. Their job was to enforce a peace with the Liberation Tigers of Tamil Eelam (LTTE), a separatist group that India had earlier backed. However, the effort soon involved India in combat operations against the LTTE, which expanded to a guerrilla war across the northern and eastern parts of the island and sucked in another three Indian divisions. A change in government led to a Sri Lankan request for an Indian withdrawal in March 1990, which took place after India had lost some 1,100 soldiers.

The Siachen War

The officials who determined the LOC in 1972 did not anticipate one problem when they terminated the line at a point NJ 9842: the agreement did not stipulate the location of the line for the remaining about 60 miles (100 kilometers) of glaciated terrain before it reached the border with China. In the early 1980s, Pakistan began to issue maps with the border running northeast to the Karakoram Pass, incorporating the Saltoro range and Siachen Glacier. India refused to accept this, sending

reconnaissance parties to occupy the Saltoro range on the western side of the glacier in April 1985, thereby preempting a similar Pakistani plan. Since that time, an autonomous conflict has raged there, primarily in the form of artillery duels, though a greater proportion of Indian losses have been caused by avalanches, altitude sickness, and frostbite, since the forces occupy altitudes up to 20,000 feet (over 6,000 m). An agreement between the two sides to withdraw from the area has been pending implementation since 1989.

The Kargil War of May–July 1999

This miniwar, the first face-to-face conflict between two nuclear-armed powers anywhere, began when India discovered a shallow Pakistani incursion on the LOC near Kargil in early May 1999. India's initial efforts to push back the well-entrenched Pakistanis failed. After a buildup, a counteroffensive was launched in June with the help of massed artillery and the Indian air force, but the main thrust consisted of near-suicidal enveloping infantry attacks on Pakistani strong points. India strictly confined the area of fighting to the locale of the incursion. The Pakistanis maintained that the intruders were mujahideen (Muslim guerrilla fighters) and even refused to reclaim the remains of 279 soldiers buried by the Indians, who in turn lost 524 dead. A U.S.-brokered agreement persuaded Pakistan to pull out, and India declared the war to have ended on 26 July.

Minor Wars and Near Wars, 1947–2002

The 100-hour war to liberate Hyderabad in September 1948 was termed a "police action," but it was conducted as an orthodox military operation codenamed "Polo." Surrounded by Indian territory, the state was run by the Muslim nizam, who declared independence in 1947, despite being told by the British that this was not an option. The state had a fairly large army, including armored car regiments and a large levy of paramilitary *razakars*, or Islamic volunteers. India used a roughly division-sized force as well as combat aircraft beginning 13 September 1948, and the state forces surrendered on 17 September.

After independence, remnants of the Portuguese empire—Goa, Dadra, and Nagar Haveli—were a sore point for Indian nationalists, who tried to use Gandhian tactics to liberate them, but failed. In 1961 Prime Minister Jawaharlal Nehru, despite pressure from the United Kingdom and the United States, gave the go-ahead for a military operation. Given the imbalance of forces, Operation Vijay was virtually uncontested. It began on 17 December and ended in a day, since the Portuguese put up only token resistance.

In 1986–1987, two major exercises nearly triggered conflicts with Pakistan and China, respectively. Exercise

Brasstacks, an Indian military exercise that concentrated a huge amount of armor in Rajasthan, led to precautionary Pakistani deployments in Punjab, setting off a train of events that nearly led to war, as well as a veiled Pakistani nuclear threat in January–February 1987. Exercise Chequerboard was designed to test Indian abilities to move forces from their bases in the plains to the Sino-Indian border in the east. Unsure of its purpose, the Chinese mobilized, and the two forces came face to face in the Tawang region, the site of the Indian disaster in 1962. Some deft diplomacy defused the crisis by May 1987.

In a show of force linked to a series of demands after the 13 December 2001 terrorist attack on its Parliament, India mobilized its army for a punitive strike against Pakistan. By the time the Indian forces were ready, however, Pakistani leader Pervez Musharraf delivered a speech, on 12 January 2002, outlining steps to break Islamabad's terrorist links. A second alarm came in May 2001, after terrorist killings of relatives of Indian army personnel at Kalu Chak, near Jammu; it was defused by U.S. intervention after Pakistani leaders declared that they would end infiltration across the LOC "permanently."

WAVELL, LORD (1883–1950), viceroy of India (June 1943–March 1947). Field Marshal Lord Archibald Wavell was commander-in-chief of British India's forces prior to his appointment as Britain's penultimate viceroy of India. Born at Colchester, the son of an army officer who first brought him to India as a child, Wavell was educated in Winchester College and also graduated from Sandhurst, returning to serve in India at

the age of twenty. At the start of World War I, he worked in the War Office, but was soon shipped over to fight in Ypres, Belgium, where he lost an eye.

Wavell was assigned to Field Marshal Allenby's staff in 1918, and two decades later to the command of British forces in the Middle East, but he failed to anticipate the swift power of General Erwin Rommel's tank corps, and was ordered in June 1941 to switch his command in North Africa with Field Marshal Claude Auchinleck's in India. Since Wavell's India command included the British 18th division, which in the following year surrendered Singapore to the Japanese, he was blamed by many for that loss as well. His battlefield wounds and losses appear to have predisposed Wavell for the rest of his life to long, lugubrious interludes of silence. Jawaharlal Nehru and Mahatma Gandhi distrusted him; others considered him too "wooden."

Prime Minister Winston Churchill chose Wavell to be India's viceroy in 1943, when Lord Linlithgow finally stepped down after six years at that post, precisely for all the reasons that India's Congress leaders feared, mistrusted, and disliked him. Churchill wanted Wavell to hold the line against any and all political demands from Congress for concessions of any kind as long as the war lasted. He felt certain, of course, that good soldier Wavell agreed. But Wavell, whose intellectual interests included poetry and the classics, wanted, in fact, to try his hand at diplomacy, which as viceroy he thought only appropriate. He had ideas about bringing Mahatma Gandhi and M. A. Jinnah together for a summit meeting at his vice-regal mansion in Simla, hoping to persuade them to work out their differences and agree to a new formula he toyed with for Hindus and Muslims sharing power. Student of Herodotus and Thucydides that he was, and knowing well from his own bitter experience the painful cost of all combat, Wavell hoped to bring peace to sorely troubled and conflicted India. But when Churchill heard of Wavell's idea, he vowed that only "over his dead body" should any approach to Gandhi be made during the war.

By the end of 1943, Bengal's dreadful famine had claimed more than one and a half million lives. Wavell tried his best to secure shipments of grain to relieve that starving province, knowing as he did that 6 million tons of wheat were floating nearby inside a fleet of British storage vessels, their holds full of food for "emergency" British military needs only, as Churchill's tight-fisted minister of war transport, Baron Leathers, coldly informed Wavell.

In the summer of 1945, after Germany surrendered, Wavell released all his Congress prisoners from jail and convened the Simla summit he had dreamed of holding

two years before. Gandhi, Jinnah, and Nehru all went up, as did lesser party leaders, but no agreement could be reached. Then Britain held its first postwar elections and Churchill lost his seat, as did most of his Tory colleagues. Prime Minister Clement Attlee's Labour Party moved into London's halls of power, determined to end Britain's exorbitant imperial expenditures as quickly as possible. Now, however, instead of appearing too eager to launch a plan of peace and political reform, Wavell proved too cautious and outdated for both Attlee and Sir Richard Cripps, Attlee's Chancellor of the Exchequer, who looked for a much younger and more genial viceroy to effect the swift transfer of power they had in mind. Their choice was dashing Dickie Mountbatten, the king's cousin.

WEAPONS PRODUCTION AND PROCUREMENT

All armed forces need to replace their aging weapons systems after they complete their life cycles. For India, the MiG-21 aircraft and T-59 tanks, and its sole aircraft carrier, need replacement. The problem of bloc obsolescence is acute in India because its major weapons systems, mainly ex-Soviet in origin, were procured in the 1960s and now require urgent replacement. Current generation weapons systems, incorporating the latest available technology, are naturally costlier than the equipment being replaced. The paucity of resources had inhibited long-term planning by the Indian defense establishment, leading to a "bunching" of expensive requirements. The MiG-21 variants, for example, were imported from the Soviet Union in the 1960s at around U.S.\$500,000 apiece; the MiG-29 fighters were obtained in the mid-1980s for \$14 million; and the Su-30 fighter bombers currently being inducted cost about \$30 million each.

Missiles on Display at Annual Republic Day Parade. Many accuse recent Indian leaders of an obsession with nuclear weapons and missile technology, at the expense of defense research and the adequate production of aircraft and other weaponry. INDIA TODAY.

Difficult decisions consequently need to be made whether the successor weapons systems should be indigenously developed or procured from abroad, or whether aging equipment should be refurbished, if possible, to extend its service life. Inadequacy of funds inhibits ideal acquisition decisions. The refurbishment option is therefore becoming more viable for India as the costs of state-of-the-art equipment rise astronomically.

Issues Involved

Weapons acquisition decisions in India are not simple. Political factors restrict the choice of external suppliers. The initial unavailability of Western arms, due to political factors, led to India's dependence on the Soviet bloc; currently some 70 percent of the major weapons systems in India's armed forces are of Soviet origin. The end of the cold war, however, has created a buyer's market. Arms supplier nations are vying with each other to sell any type of armaments for purely commercial considerations. But problems remain, as occurred when the United States and other Western nations imposed sanctions on India after its nuclear tests in May 1998. Not only did they withdraw

from negotiations for supplying new equipment, but also from contractual obligations to supply spares and ancillaries and to undertake repairs to equipment already supplied. India had similar experiences in September 1965, during the second Indo-Pak War, when the United States stopped all supplies of military equipment to India.

Therefore, the achievement of a maximum degree of self-reliance and self-sufficiency has long been a hallowed goal of India's defense establishment. In furtherance of this objective, a decision was taken by the Government of India in the mid-1990s to launch a ten-year self-reliance plan, designed to raise defense expenditure on acquisitions from indigenous sources. A three-pronged approach, involving indigenization of vital spare parts, upgrading of existing systems by life-extension programs, and indigenous design and development of high-technology weapons systems, was launched.

The Indian Bureaucratic Process

A major problem in the Indian situation is that weapons equipment must perform in very different

terrains over wide temperature variations, ranging from -22° Fahrenheit (-30° C) in the Himalayan heights to 122° Fahrenheit (50° C) in the Rajasthan Desert. A make or buy decision has then to be made after consulting Defence Research and Development to ascertain whether they can develop the weapons system within an acceptable time frame. Extensive debates take place to arrive at a pragmatic solution. If the decision taken is to produce the equipment indigenously, the defense laboratory is identified and tasked to develop a model, freeze the design, develop a prototype, and conduct user trials.

Should it be decided, however, to procure the equipment from abroad, suitable suppliers must be identified by a literature search; the military attachés serving abroad are also tasked to identify suitable suppliers. The actual selection of a particular weapons system involves two stages. A technical evaluation of the various systems is made by Services Headquarters. Later, the short-listed suppliers are requested to send in price quotations. The commercial terms for inducting the equipment are then placed before a Price Negotiation Committee, which enters into negotiations and ultimately signs the contract with the selected supplier. These contracts often incorporate clauses for the transfer of technology and the indigenous manufacture of the equipment.

The Department of Defence Production was set up in 1962, following the Sino-Indian border conflict. In 1965 the Department of Defence Supplies was created to forge closer links with the civil sector, in order to promote the indigenous production of imported defense stores and new stores required by units in the public sector. This department was merged into the Department of Defence Production in 1984 to form the Department of Defence Production and Supplies.

Defense production in the public sector is organized in forty ordnance factories and eight public sector undertakings, incorporated as limited companies under the law. In addition to the armed forces, these units cater to the needs of the paramilitary forces and the police. The ordnance factories are divided into five operating divisions: ammunition and explosives; weapons, vehicles, and equipment; materials and components; armored vehicles; and ordnance equipment. They also produce items for the civil market, like textiles, leather goods, and sporting arms and ammunition. An aggressive effort is being made to export their products. The eight defense public sector undertakings produce a wide variety of goods for the armed forces, including aircraft, electronic goods, heavy vehicles, naval vessels, missiles, and special alloys.

The Defence Research and Development Organisation (DRDO) was created in 1958 by amalgamating the existing technical development establishments in the

services. The Department of Defence Research and Development, established in 1980 to enhance self-reliance in defense systems, now has forty-nine laboratories engaged in developing defense technologies and covering disciplines like aeronautics, armaments, electronics, combat vehicles, engineering systems, instrumentation, missiles, advanced computation and simulation, special materials, naval systems, life sciences, training, information systems, and agriculture. It employs over 5,000 scientists and around 25,000 other scientific, technical, and supporting personnel, making it the largest scientific establishment in India. Some of its notable achievements are development of the Lakshya pilotless target aircraft, the Nishant remotely piloted vehicle, airborne electronic warfare systems, the Agni-I land/rail mobile missile, and the PACE parallel processing super-computer. Its major projects under development include the Light Combat Aircraft and its Kaveri engine, the Trishul surface-to-air missile, different warheads for the Prithvi short-range missile, the BRAHMOS supersonic cruise missile, electronic warfare systems for the three services, and various types of sonars and battlefield surveillance radars. Several of the technologies developed by DRDO have civil applications, such as agricultural practices in high-altitude areas, malaria control, high-altitude medicine, nuclear medicine, and radio-pharmaceuticals.

A symbiotic linkage exists between the Defence Production and Supply Department and the DRDO; consequently, a weakness in one affects the other. The DRDO is headed by the scientific adviser to the defense minister, and the combination of advisory and line functions offends a basic principle of public administration. Quality control is also carried out in-house by the user services, which again offends a basic administrative principle that external checks are necessary to ensure integrity in any activity. How effective the newly constituted Defence Procurement Organisation will be to address these weaknesses remains to be seen. But the lack of accountability in the processes of indigenous research and development and defense production is worth highlighting, as it incorporates a single developer (DRDO), a single buyer (the armed forces) and a single funder (the government). There is regrettably no credible legislative oversight available over these activities. Parliamentary committees like the Public Accounts Committee, which undertakes examination of past procurement cases, or the Estimates Committee, which examines budget estimates, and the Standing Committee on Defence are unable to exercise any effective checks over defense acquisitions.

Role of Private Industry

A change in official Indian attitudes toward the private sector has occurred with the steady liberalization of the

economy and the impact of globalization. Greater participation by Indian private industry is thus being sought, and such companies are now eligible to apply for licenses to manufacture a wide range of defense items and to seek foreign direct investment, to the extent of 26 percent of their business.

For indigenization of spares, a serious problem regarding all ex-Soviet equipment, the Department of Defence Production and Supplies has set up technical committees to identify the needs of the user services, take up indigenization activities, and ensure timely supply of defense equipment and stores. Sample rooms are also being maintained in metropolitan cities to familiarize the civil industry with the requirements of the armed forces. Civil industry clearly expects to play a larger role in future defense production.

Conclusions

India has been most fortunate, compared to other developing countries, in having internal stability and a democratic system of government that has taken deep roots; one of its manifestations is the firm control of the civilian leadership over the military apparatus. The civilian bureaucracy, however, is largely untutored in dealing with complex military issues, including defense acquisitions, research and development, and domestic production of weapons systems. The discovery of several major cases of corruption in the purchase of foreign weapons has led to great caution in the procurement process, which at times seems to be paralyzed. This has also resulted in the defense research and defense production establishments functioning below par and paying altogether too much attention to nuclear weapons and missile technology. Inadequate attention has been paid to the reform of the defense apparatus, despite a plethora of reports and sensible suggestions having been made to achieve this objective. Consequently the Indian weapons procurement and production processes are as yet performing less efficiently than they should.

WELLESLEY, RICHARD COLLEY (1760–1842), governor-general of India (1798–1805). Richard Colley Wellesley, Earl Mornington and Marquess Wellesley, was born into the English "ascendancy" in Ireland. First elected to the British House of Commons in 1784, his introduction to Indian affairs came with his appointment in 1793 to the Board of Control, the link between the government and the East India Company. He became governor-general of the company's possessions in India in 1798. Before leaving for India he had been warned by the directors of the company not to get involved in wars, as they were too expensive and were arousing the Indian rulers against the British traders. Wellesley, an eighteenth-century pleasure-loving aristocrat, was contemptuous of the bourgeois merchants who controlled the company, but he was also the first of the great nineteenth-century imperialists who believed that territorial power in India would give Great Britain an enormous advantage over her European rivals. He was personally ambitious, in search of fame in India that would assure him a place in British politics. He had a degree of freedom from London to pursue his own policies in India that later governors-general did not have, since it took four months for an action in India to become known in England and another four or six months for approval or disapproval to reach Calcutta (Kolkata). Wellesley believed that the British position in India was threatened by an alliance between Tipu Sultan, the ruler of Mysore, with the French; by the Maratha chieftains who had established themselves in western and central India; and by the ruler of the state of Awadh, who realized that the British were becoming a threat to his power. Wellesley dealt with these hostile powers by defeating them in battle, then forcing them to give

territory to the British, making them pay for the cost of the wars, forbidding them to have any dealings with foreign powers, and permitting British officials, or “Residents,” to live in their territories to keep watch on what was happening. During these years of decisive action, Wellesley’s brother, Arthur, later the great Duke of Wellington, was in charge of many of the important military campaigns. While bitterly criticized by the directors of the East India Company, Wellesley was supported by the British government, and he later became foreign secretary and lord-lieutenant of Ireland, but in neither post did he enjoy the success he had had in India, where he could correctly claim that he had created an empire for the British.

Martin (reprint, New Delhi: Inter-India Publications, 1984), is a sampling of an immense correspondence. P. E. Roberts, *India under Wellesley* (London: G. Bell, 1929) provides a military and political history. Iris Butler, *The Eldest Brother: The Marquess Wellesley, the Duke of Wellington’s Eldest Brother* (London: Hodder and Stoughton, 1973) is a biography.

WOMEN AND POLITICAL POWER Indian women became politically active in 1889 when some elite women started to attend meetings of the Indian National Congress. Inspired by the task of social rejuvenation, they established girls’ schools and raised consciousness against child marriage and *purdah* (the seclusion of women), while expressing solidarity with male nationalists. These social goals were expanded by the Women’s Indian Association (1918) and the All-India Women’s Conference (1927) to include a demand for women’s suffrage and the right to hold elected office. Idealists like Dr. Muthulakshmi Reddi introduced legal measures in the Madras Assembly to promote women’s education and health care. Congress president Sarojini Naidu helped to pass a resolution in 1930 supporting female suffrage and equal rights. When thousands of women joined the *satyagraha* campaigns against colonial rule, they gained the respect of Mahatma Gandhi, Jawaharlal Nehru, and the entire nation. After India’s independence in 1947, several women held powerful administrative positions. Rajkumari Amrit Kaur was appointed union minister for health; Sarojini Naidu was governor of Uttar Pradesh; Prime Minister Jawaharlal Nehru’s sister, Vijaya Lakshmi Pandit, served as India’s ambassador to the Soviet Union; and Shareefah Hamid Ali was a member of the United Nations commission on women’s status.

Legislators and Administrators

In 1950 the Constitution of the Republic of India granted universal suffrage, allowing millions of women to vote without restrictions of any kind. While there have been many women cabinet ministers since 1947, women legislators have been seriously underrepresented in village councils (*panchayats*), state assemblies, and Parliament. In 1967 women constituted 5.9 percent of the Lok Sabha (Parliament’s lower house); thirty years later, they held only 7 percent of the seats. In 1974 the Committee on the Status of Indian Women declared this underrepresentation to be undemocratic and conducive to further gender inequality. However, no remedial action was taken until 1992–1993, when Constitutional Amendments 73 and 74 reserved one-third of *panchayat* and town council seats for women. In June 1996, Prime Minister Deve Gowda’s United Front government introduced a bill reserving 33 percent of the seats in Parliament to women. However, due to differences amongst his coalition allies, the bill was not passed. Meanwhile, a Women’s Reservation Bill was introduced in Parliament, supported by leftist and regional Dravidian parties. Polls showed that 75 percent of Indian voters supported affirmative action for women. Yet, the Bharatiya Janata Party (BJP) and its allied parties, especially the Shiv Sena, blocked its enactment; their anxiety over the prospect of a contingent of 180 women in Parliament was evident when Prime Minister Atal Bihari Vajpayee called the bill “revolutionary legislation.” Twenty-five women’s organizations staged mass demonstrations in favor of the Reservation Bill in May 2003, but it remained in limbo. In February 2005, the new government led by the Congress Party and its socialist allies announced that a revised bill would be introduced giving women 33 percent of the seats in central and state legislatures. Within this quota, the socialist parties support a further reservation for Dalit, backward caste, and minority women. Women’s associations have also focused on increasing female representation in village *panchayats* and other local bodies.

Despite women’s comparative lack of leverage within India’s state and central legislatures, they have been politically active through various parties, voluntary women’s associations, a broad spectrum of nongovernmental organizations, as well as administrative services. Top-ranking women administrators have effected many reforms at the local level, and the number of mid-level female officials has increased steadily, with women scoring highly in the competitive examinations for the administrative services. As more talented women enter the bureaucratic “steel frame” that still governs India, they may provide fresh solutions to the country’s ancient problems.

Women Supporters of the BJP Protest Rising Prices. Though most political parties in India now actively court the female vote, many feminist organizations accuse them of mere lip service, claiming they include women only in ways that do not fundamentally challenge their traditional roles within the family. INDIA TODAY.

Gender in Politics

In December 1974 the United Nations Committee for the Status of Women published their report *Towards Equality*, revealing that although professional Indian women had made strides, the vast majority of Indian women lagged behind men in nutrition, education, and employment, and that the female-male ratio in the population was alarmingly low. Census records show a continuing decline in the number of Indian women: in 1991 there were 945 females to every 1,000 males; in 2001 the ratio had dropped to 927 females to 1,000 males. This decline can be attributed to regressive manifestations of patriarchy in a modernizing society, and not simply to ancient traditions. New technologies, such as amniocentesis through which the sex of a fetus is revealed, have increased female feticide; and although sex-discriminatory abortion is illegal and expensive, it is practiced often by the educated and affluent in large cities. Unfortunately, *Towards Equality* coincided with Indira Gandhi's "National Emergency" (1975–1977), an era when all civil rights were curtailed in the name of national security. Women activists mobilized against the Emergency's harsh "voluntary" sterilization programs, as well as other

common offenses such as "custodial rape" by police officers, marital rape, and instances of "bride burning" by in-laws angered by insufficient dowries.

Although Indira Gandhi was admired for being a powerful woman leader, she gave scant attention to women's issues. After the 1970s, the new feminists charged politicians with ignoring women's rights in their preoccupation with economic development. They accused all political parties, including left-wing groups with progressive views, of subsuming gender under the umbrella of "minority" rights. While women's issues are often addressed through various bureaucracies, they rarely receive adequate attention from politicians. Especially after 1989, gender has become of secondary interest to a nation focused on religious and caste controversies. Yet, these issues are interrelated, since minority women are more likely to be exploited and sexually abused than women of the Hindu upper castes. In the 2002 Gujarat riots, thousands of Muslim women were raped; and the widespread sexual exploitation of working class and Dalit women has been documented by the All-India Democratic Women's Association. Despite the seriousness of these problems,

Indira Gandhi's model of ungendered politics has become a blueprint for her male and female successors.

Women Politicians

Elite women have been elected to the highest positions, often carving out these spaces as chaste wives, widows, mothers, daughters, and daughters-in-law. Female politicians of many parties embrace these domestic identities in the public arena for electoral advantages. Most offer to "cleanse" the body politic, like Rabri Devi (Rashtriya Janata Dal, wife of Lalu Prasad Yadav) of Bihar, whose speeches were laced with colorful, domestic imagery. Only a few, like chief minister Sheila Dixit of Delhi, have conveyed an active interest in women's issues while participating in India's patriarchal political game.

Thus, Indira Gandhi rose to power as Jawaharlal Nehru's daughter, and Congress Party president Sonia Gandhi achieved popularity as the assassinated prime minister Rajiv Gandhi's widow and the daughter-in-law (*babu*) of the Nehru-Gandhi clan. The BJP's moral arbiter, Sushma Swaraj, is the wife of Swaraj Kaushal, governor of Mizoram; Vasundhara Raje is a dutiful *babu* of former Jaipur rani Gayatri Devi. All-India Dravida Munnetra Kazhagam chief minister Jayalalitha advertises herself as "Ammamma," the loyal widow of the charismatic star and political Tamil Nadu idol M. G. Ramachandran. Madhya Pradesh chief minister Uma Bharti is a self-styled ascetic (*sadhvi*) and "daughter" of Hindutva. The same phenomenon is visible in Pakistan, where Benazir Bhutto rose to power after her father's hanging; in Bangladesh where Sheikh Hasina Wajed entered politics after her husband, Sheikh Mujibur Rahman, was assassinated; and in Sri Lanka, where Chandrika Kumaratunga follows her parents' ministerial footsteps.

Scandals around corruption are common in India, and a few women politicians have been notorious for complicity in nefarious schemes; among these are Tamil Nadu's Jayalalitha and Uttar Pradesh's former chief minister Mayavati. Like their male counterparts, not all women politicians have proven trustworthy, due to the pervasive climate of opportunism in politics. Perhaps the solution to gender equality lies not in the public, corruptible centers of political power, but rather in the idealism of anonymous women administrators who honestly strive to serve India. One such leader is Sheila Rani Chankatt, who in her short stint in 1988 as the collector of Pudukottai, Tamil Nadu, made her district 100 percent literate by working with the National Literacy Mission; retrained sex workers as diamond cutters; and organized unskilled women workers for higher wages. Indian women have learned to play the political game skillfully, but gender

justice will be achieved only through the enduring work of honest women in political office.

WOMEN'S EDUCATION It is ironic that although Indians have deified knowledge as the goddess Sarasvatī, Indian women have been relegated to educational subservience throughout India's long history. Education means power, which in India remains largely in male hands. The earliest British educational surveys in Madras presidency in 1822 brought to official attention the relative absence of girls in formal schools. In 1881 the Hunter Educational Commission noted that a mere .2 percent of the women in British India were literate, although as in all early colonial surveys, investigators focused solely on school enrollment and failed to count the girls taught informally at home. On the eve of independence in 1947, literacy rates for both genders were abysmally low at 6 percent (female) and 22.6 percent (male). Since then, they have plodded forward slowly but surely, and there has been a noticeable improvement since the 1980s. Thus, in 1961 the literacy rates were 15.3 percent (female) and 40.4 percent (male); in 1981 they rose to 28.5 percent (female) and 53.5 percent

Literacy Classes for Rural Women in Rajasthan. A late-twentieth-century study by the U.S. Department of Commerce estimated that fewer than 40 percent of women in India were literate. Although the results of the study varied greatly among Indian states, they suggest that there are possibly upwards of 200 million illiterate women in India today. AMAR TALWAR / FOTOMEDIA.

(male); and in 2001 they had risen to 54.3 percent (female) and 76 percent (male). However, women's education still shuffles far behind that of men, with the disparities greater in a state like Bihar, where rates are 33.6 percent (female) and 60.3 percent (male), than in Kerala, where they are 87.9 percent (female) and 94.2 percent (male). The last century's goal for women was to educate better mothers and wives for the nation. However, some of the urban literate classes have begun to acknowledge that women are a national resource that India cannot squander away in this competitive era of globalization and computer technology.

Education in Early India

For much of Indian history, education involved the oral and written transmission of sacred texts, and the acquisition of survival and craft skills. Among some

adivasis (aboriginals) like the Birhor of Jharkhand, for example, there was greater gender parity in learning the skill of toolmaking. However, Sanskritization and Westernization as "civilizing" agents have today marginalized women's vestigial rights among many tribal communities, which have been integrated into the mainstream society and economy. Artifacts from the literate Indus Civilization (6000–1650 B.C.) include icons of goddesses and the female genitalia (*yōmi*), while some seals suggest that there may have been priestesses in an arboreal religion. The inhabitants clearly revered the female in nature, a vision of divinity that persists across India today. However, male power was also venerated, and no evidence exists of a matrilineal society. The absence of gendered spaces in the houses and public buildings do indicate that women had freedom of movement, but we have no information yet as to how and where education took place.

The arrival of patriarchal Aryan groups in the early second millennium B.C. profoundly shaped Indian notions of gender equity. Their most revered skill was the oral transmission of the Vedas (Books of knowledge) to propitiate the gods. Known as *śruti* (revelations that are heard), this form of oral learning became central to the acquisition of knowledge, although these Sanskrit hymns were later also written in the Devanāgarī script. At first, some women initiates, who wore the sacred thread of the twice-born upper castes, recited the Vedas. The Rig Veda (1500–100 B.C.) attests to some *brahmvādinis* (women bard-poets) like Lōpamudra and Ghōsha. Even as late as 800 B.C., there were spirited female savants like Gārgi and Maitreyi in the Brahadaranyka Upanishad, and Sāvitrī in the Mahābhārata.

From this point, due to geopolitical reasons leading to patriarchal ascendancy, the Vedas became the exclusive preserve of male Brahman caste priests, and women's learning became subsidiary to that of men. However, women were permitted to know the "remembered" secondary scriptures (*smṛiti*), including the Mahābhārata and Rāmāyaṇa epics, and later texts like the Dharma Shāstras (law books) and Purāṇas (Ancient tales), the latter containing myths about Hindu deities. Boys were taught in open air classes around a tree, or on the open verandas (*pyāls*) of buildings. Meanwhile, higher caste girls often sat away from the public eye, in rooms adjacent to the *pyāls*, where they studied the *smṛiti* and nonreligious subjects like arithmetic.

Thus, around 525 B.C., we hear of learned women such as Queen Mahāgotāmi, the Buddha's foster mother, who struggled to establish the first order of nuns. Learned female ascetics like Mitta and Patacāra composed the Thērigātha, a revered hymnal section of the Buddhist Pali canon. Jainism's followers also revere an early female *tirthankara* (ford crosser) or teacher, and Jainism

encouraged women ascetics. However, over time, misogyny crept into texts, which scorned female sexuality and downgraded women's intellect. South Indian Dravidian society appears to have respected accomplished women during the Tamil Sangam era (200 B.C.–A.D. 500). Sangam poetry was composed by some 470 poets, including 154 women sages like Auvaīyār. Moreover, despite male dominance, women's power is seen in three of the five Tamil epics, which revolve around learned women.

By the first century A.D., as society absorbed new immigrants across racial lines, Brahmans reinforced gender and caste hierarchies in texts like the *Mānava Dharmashāstras* (Laws of Manu). This work praised women's domestic duties and denounced their sexual proclivities. Artisan groups transmitted craft skills, and both working and elite castes transmitted their oral traditions across generations. However, the lowest castes were excluded from literacy, while women's education became largely informal and haphazard. After the sixth century, in the medieval climate of invasions, wars, and feudalism, elite women retreated further into the domestic arena, instructed informally at home until the nineteenth century.

Medieval Women's Education

Despite such patriarchal norms and prejudice, there were still scores of women poet-saints and writers in the medieval centuries. Thus, Āndāl, Kāraikkal Ammaiyār, Akkamahādevī, Gangāsati, Lallā, and Mīra have left a legacy of devotional (*bhakti*) compositions in the regional languages. Moreover, one class of educated South Indian women attended schools in public with boys. They were the lower caste temple dancers (*dēvadāsīs*) who were rarely Brahman women. *Dēvadāsīs* were ritually married to the shrine's deity in South India during the first millennium A.D., and they were the repositories of Indian traditions of dance and music. By the seventeenth century, however, many became court dancers and courtesans outside the norms of female domesticity. Governor Munro's survey of schools in South India in 1822 revealed that, except for the *dēvadāsīs*, no other girls studied on the *pyals* in the company of boys.

The prophet Muhammad's wife and daughter were literate and powerful, but despite this and the Islamic belief in salvation through the written Qur'an, Muslim women's educational lot in India was not substantially different. Islam was introduced into the subcontinent by patriarchal groups who kept their women in domestic seclusion within female quarters (*zenānā*). If women ventured outside, they wore a veil (*pardab*). Those women who defied the *pardab* were prevented from rising to power. Thus, Sultana Raziya (thirteenth century A.D.), the sole Muslim queen in India, was deposed quickly by men. Aristocratic women were often instructed by female teachers (*ustād*

bis) in the *zenānā*, and some have left records, like the Mughal princess Gulbadan (sixteenth century), who wrote an elegant royal biography in Persian. Like Hindu *dēvadāsīs*, Muslim courtesans (*tawāif*) were taught to read and write. The *tawāif* Mahlaqa Bai Chanda (eighteenth century) wrote lyrical Urdu songs. Ordinary Muslim boys and girls studied the Qur'an at mosque schools (*madrassas*), but often this consisted of rote chanting of the sacred verses. In this era, conservative Muslim and Hindu patriarchs often feared that a literate girl would write love letters and become promiscuous.

In North India, Muslim and Hindu women wore the restrictive *pardab*. In South India, elite Muslim women wore *pardab*, while Hindu women lived in domestic seclusion but enjoyed greater freedom of movement. As an important deterrent to female attendance in formal schools, *pardab* became the subject of discussion among elite women reformers in the twentieth century. The other major obstacle to girls' education was the custom of early marriage among Hindus and Muslims. Muslim women reformers were divided on *pardab* and the extent to which it should be practiced. Shareefa Hamid Ali and Dr. Rahamatunnissa Begum felt that it injured girls' health and prevented their attendance in schools. Nazar Sajjad Hyder initially argued that parents would more readily send their veiled daughters to school, but she later opposed *pardab*. In 1914 the Begum of Bhopal convened a Muslim Women's Educational Conference in Allahabad, and philanthropists began schools for girls, raising the female literacy rate.

Colonial Era

European conquest led to the political decline of Indian states, and indigenous schools decayed. Catholic missionaries began schools to teach Christianity in Goa and elsewhere from the sixteenth century, while Protestant evangelicals founded schools in southern, eastern, and western India beginning in the eighteenth century, notable for their attempt to bring girls to school without caste distinctions. The early colonial state's interest in education was cursory, but it supported missionary endeavors, and British officials gauged educational competence through literacy and school enrollment. Henceforth, oral and informal learning became less significant. When the British Parliament gave the East India Company a large grant in 1813 to promote education in India, evangelicals arrived in droves to proselytize in schools. Women missionaries assiduously began elementary classes for girls, who learned English through the Bible and converted to Christianity. Indian rulers like the Rānis Lakshmibai and Parvatibai of Travancore gave financial support to missionaries for their educational work. In 1849 the government subsidized a Calcutta (Kolkata)

girls' school, founded by J. E. D. Bethune, Ram Gopal Ghosh, and Jaikissen Mookherjee. In 1854 Charles Wood's Despatch on Education launched a new policy of granting aid to private schools. Promptly, Gopal Kistnah Pillai asked for a grant for his girls' school in Madras (Chennai). However, the first major breakthrough for girls' secular and high school education occurred in 1877. Mary Carpenter, the eminent educator, advised the government to establish secular teacher training centers in the presidency capitals of Calcutta, Bombay (Mumbai), and Madras. She used the guidelines of a similar school started in Madras by the Maharaja of Vijayanagaram.

Child marriages were a major impediment to girls' education. Among the higher Hindu castes, girls were married before puberty, until which time they might attend municipal or mission schools. After their nuptials, at the age of eleven or twelve, girls no longer attended public classes; if lucky, they were taught at home. Until the 1930 Sarda Act raised the age of marriage for girls to fourteen years, female literacy did not substantially improve. Christian converts educated their daughters, however, so their literacy rates were higher. This goaded Hindu reformers, whose daughters had not studied at mission schools, and they sent their daughters to schools with a secular curriculum. In 1904 Annie Besant wrote *The Education of Indian Girls*, which laid the curricular foundation for girls' schools. Reform organizations like the Prārthanā Samāj, Ārya Samāj, Rāmākrishnā Society, and the Theosophical Society started schools that taught Indian culture as well as Western subjects like geography and hygiene.

Indian nationalists worked to legalize compulsory education and to increase government funding for schools. The paucity of women teachers and doctors led to the establishment of teachers' training institutes and colleges such as the Lady Hardinge Medical College for Women in Delhi in 1916 and Queen Mary's College in Madras in 1914. Besant also worked to start a Women's University at Adyar in 1916, while women reformers started occupational training institutions for working-class women.

Independence Era

Since 1947 the Indian government has tried to provide incentives for girls' school attendance through programs for midday meals, free books, and uniforms. This welfare thrust raised primary enrollment between 1951 and 1981. In 1986 the National Policy on Education decided to restructure education in tune with the social framework of each state, and with larger national goals. It emphasized that education was necessary for democracy, and central to the improvement of women's condition. The new policy aimed at social change through revised texts, curricula, increased funding for schools, expansion

in the numbers of schools, and policy improvements. Emphasis was placed on expanding girls' occupational centers and primary education; secondary and higher education; and rural and urban institutions. The report tried to connect problems like low school attendance with poverty, and the dependence on girls for housework and sibling day care. The National Literacy Mission also worked through female tutors in villages. Although the minimum marriage age is now eighteen for girls, many continue to be married much earlier. Therefore, at the secondary level, female dropout rates are high.

Indian women's education has, however, certainly improved since independence. Many urban women are highly educated in the sciences, medicine, computer technology, and the social sciences. India now has missions of female doctors, nurses, teachers, and social workers. Yet, in most important fields, girl students are outnumbered, and women professionals do not often receive equal pay, even though Indian women scientists, for example, are among the world's most talented. Such gender disparities in education will continue until girls are valued as highly as boys; until patriarchy and sexual predation are reduced; and until female feticide and infanticide, reflected in the sex disproportion of India's population, disappear.

WOMEN'S INDIAN ASSOCIATION On 8 May 1917 in Adyār, Madras, a multiethnic group of women established the Women's Indian Association (WIA), India's first major feminist organization, which remains in operation today. The WIA's success can be attributed to its secular agenda for women of all sects, classes, and castes, and to its initial effective use of the organizational framework of the Theosophical Society, whose president, Annie Besant, was chosen as the first WIA president. The honorary secretaries were Margaret Cousins, a teacher and Irish suffragist; Dorothy Jinarajadasa, the Irish wife of a Sri Lankan Theosophist; Ammu Swaminathan and Malathi Patwardhan. Borrowing the idea of a cross-cultural association from the Tamil Māthar Sangam (Tamil Women's Organization) formed in 1906 by Indian and European women, Margaret Cousins sounded out her proposal to a gathering of Theosophists at Adyār after her arrival in 1915. The founders included S. Ambujammal, Dr. Muthulakshmi Reddi, Mangalammal Sadasivier, Saralabai Naik, Herabai Tata, Dr. Poonen Lukhose, Kamaladevi Chattopadhyaya, Begam Hasrat Mohani, and Dhanavanti Rama Rao. Describing themselves as the "daughters of India," its mothers and wives, their objectives were to guide the nation; serve the poor; promote women's education and compulsory universal primary education; abolish child marriage; raise the age of sexual consent to sixteen for women; win female suffrage; and attain the female right to elected office. The WIA was one of the first organizations to boldly connect Indian women's social and sexual subjugation with patriarchy, poverty, and political disenfranchisement.

Reform and Early Women's Groups

A primary goal of most women's *samājs* (associations) in India has been to improve women's educational conditions and to remove customs like early marriage,

enforced widowhood among Hindus, and the Muslim *pardab* (veil), all of which were mental and physical impediments to women's health. One of the earliest groups was the Ārya Mahila Samāj (Ārya Women's Association), founded by Pandita Ramabai (1858–1922) in 1881. Early Hindu reform organizations, like the Brahmo Samaj, Prārthana Samāj, and the Ārya Samāj promoted women's education, while condemning early marriage and enforced widowhood. In 1896 Justice M. G. Ranade (1842–1901) and his wife Ramabai (1862–1924) started the Ladies Social Conference, a secular forum for women's issues, within the Indian National Congress.

Effective changes in the status of women would occur only when educated women began their own associations. Sectarian groups included Stri Zarothoshti Mandal (Parsi Women's Organization) in 1900 in Bombay; the Young Women's Christian Association; and the Anjuman-e-Khawatin-e-Islam (Association for Muslim Women) in 1915, associated with the All-India Muslim Women's Conference. A regional women's group was the Andhra Mahila Sabha (Andhra Women's Club; 1910), founded by Virēsalingam Pantulu (1848–1919), a male reformer who worked to educate girls and to promote widow remarriage.

However, a truly national feminist organization was possible only with the emergence of a sizable number of educated women. Between 1902 and 1912, the girls' school enrollment doubled in Madras presidency, especially after reformers started schools that taught Indian culture. The Tamil Māthar Sangam (Tamil Women's Organization) met intermittently in Madras (Chennai) city (1906) and in Kanchipuram (1907, 1914). In 1908 its Tamil, Malayali, Telegu, Marathi, and English-speaking members attended an all-India Ladies' Congress (*parishad*) in Madras with a strong feminist agenda, according to Rajkumari Amrit Kaur, later president of the All-India Women's Conference (1927), India's third feminist organization. The WIA drew its initial membership from the Ladies' Congress, and its founders were doubtless aware of the Bharata Stree Mahāmandal (Great Society of Indian Women), which Sarladevi Chaudrani, a niece of Rabindranath Tagore, founded in Allahabad in 1910. However, the Mahāmandal's goals remained unfulfilled.

Women's Suffrage

On 18 December 1917, the WIA sent a delegation led by Sarojini Naidu (1879–1949) to Edwin Montagu, secretary of state for India. Representing themselves as Indian women who had awakened to their civic responsibilities, they requested female suffrage on a par with men in the

expanded provincial legislatures as a part of the forthcoming Government of India Act of 1919. Naidu had earlier appealed for support from the Indian National Congress. She sought to calm male fears that women would try to usurp authority, emphasizing that their maternal instincts would inspire the nation's children. The imperial Southborough Franchise Commission in London did not sanction their request, although they won the support of Sir C. Sankaran Nair. Sarojini Naidu, Annie Besant, and Herabai Tata then appealed their case in London, and the provincial legislatures were later authorized to decide individually. Thus, with the help of some male nationalists on the councils, a few women were enfranchised, first in Madras in 1920, and in Bombay in 1921.

In 1926 the WIA sent five delegates to the Congress of International Women Suffrage Alliance in Paris. It encouraged its members to stand for election as magistrates and supported Muthulakshmi Reddi in 1928. She was elected to the Madras Legislative Council and was chosen as its deputy president. As India's first woman legislator, Reddi introduced legislation to improve women's education, raise the age of marriage to fourteen for girls through the Sarda Act of 1930, aid programs for women's health, and end the controversial system of *dēvadāsi* (slaves to the god) dedication to temples in 1929.

The second struggle to expand female suffrage began in 1930 in preparation for the Government of India Act of 1935. Unlike the new feminist organization, National Organization of Women of India (1925), the WIA followed the National Congress stand against separate electorates for minorities and women. In the next decades, WIA members spoke passionately about their agendas, and although they disagreed with individual Congress members, they joined in the struggle for India's independence led by Mahatma Gandhi.

Social Service

By the end of 1918, the WIA had thirty-three self-governing local branches, dedicated to the service of a sisterhood of women of all creeds, castes, and classes. Although its leaders aspired to attract women of all castes, it remained an elite organization for years; however, it finally became a significant national organization for women. In 1920 Margaret Cousins began to edit a quarterly newsletter, *Stri Dharma* (Women's duty), first in English, but later with Tamil and Hindi sections. The journal developed into a monthly after a few years. *Stri Dharma* publicized the WIA and its agenda against child marriages and the Muslim *pardab*. Its membership increased noticeably; by 1924 there were 51 branches and 2,500 members across India, and by 1926, it was the largest Indian women's organization, with over 4,000 members and 80 branches.

The WIA held free elementary classes, as well as classes on hygiene, child welfare, and vocational skills. Its ideals of service facilitated the establishment of the Avvai Home for girls, which Dr. Reddi started in 1930, and its members also worked with the vocational programs in Madras Seva Sadan. The WIA provided the framework for medical help to the poor by Drs. Reddi, Lukhose, and Rahamatunissa Begam. Since independence, the WIA has continued to serve India's women through numerous regional branches.

WORLD BANK (WB), RELATIONS WITH

India was one of the forty-four original signatories to the agreements reached at Bretton Woods that established the International Bank for Reconstruction and Development (IBRD) and the International Monetary Fund (IMF). It was also one of the founding members of the International Finance Corporation (IFC) in 1956 and the International Development Association (IDA) in 1960. India later became a member of the Multilateral Investment Guarantee Agency in January 1994.

IBRD lending to India commenced in 1949 with a loan to the Indian railways; the first investment by the IFC in India took place in 1959, and by IDA in 1961

(a highway construction project). The World Bank has been India's largest source of external capital and, in turn, India has been the largest borrower from the World Bank, with loans accounting for 11.4 percent of total lending by June 2003. During this period, the World Bank had lent India a total of \$60 billion in 441 projects, almost equally divided between the IBRD and the IDA, which constituted nearly 8 percent of IBRD lending and 20.7 percent of IDA lending. India's share of IFC loans has been somewhat less: \$2.7 billion for 162 enterprises; 4.6 percent of total lending, including syndications.

During the 1950s, the IBRD was India's sole source of World Bank borrowings. By the end of the decade, India's mounting debt problems became an important factor in the launch of the IDA, the soft loan affiliate of the World Bank (WB) group. As India increasingly turned to a state-dominated economic model, the WB was skeptical, but mindful of the hypersensitivity of Indian policy makers, it refrained from overt criticism. These reservations notwithstanding, the imperatives of the cold war and India's pivotal position as a democratic role model for newly independent countries, distinct from Communist China, as well as the high quality of India's interlocutors ensured continuous support by the industrialized countries.

By the mid-1960s, India's economic problems were compounded by back-to-back failures of the monsoons. With the specter of famine looming, the WB mounted an ambitious mission in 1966 (in conjunction with the U.S. Agency for International Development [U.S. AID] and the IMF) to persuade India to undertake sweeping policy reforms. This attempt, popularly known as the "Bell mission," recommended both internal and external liberalization, currency devaluation, and a focus on agriculture. Except for agriculture (which was instigated by U.S. AID and even more by some Indians themselves), this highly visible attempt at policy reform by the WB proved to be a singular failure. The episode left a deep mark on both Indian policy makers and the WB. While the latter became much more deferential to India's sensibilities in the next two decades, Indian policy makers also became much more cautious in undertaking ambitious policy reforms.

By the end of the 1960s, the United States, until then India's largest source of external resources, sharply cut its bilateral aid program. Since then, the WB emerged as the most important source of official long-term finance. During the 1960s and 1970s, the IDA accounted for nearly three-fourths of all WB lending to India and, in turn, India was by far the largest recipient of IDA funds, accounting for more than two-fifths of all its lending. The subsequent decade, with China joining the WB in 1980 and accordingly entering its own claims to limited IDA resources, the worsening economic fortunes of

Africa, and India's better performance, saw a sharp decline in India's share in IDA. Instead, its share of IBRD lending grew sharply in the 1980s, buoyed by its improving creditworthiness and the Indian government's waning inhibitions with regard to nonconcessional borrowing. Prior to the launch of the economic liberalization program in 1991, the WB accounted for nearly a third of India's long-term debt and 60 percent of official debt.

The share of WB debt in India's total external debt has been around a quarter since 1980. Non-concessional IBRD debt peaked at about 37 percent of total WB debt in 1990, in part due to faster repayment schedules of IBRD debt and a postliberalization drop in IBRD lending. The latter was the result of several factors: sanctions imposed after India conducted nuclear tests in 1998, which curbed new IBRD loans; the slow pace of policy reforms that reduced the supply of new loans in certain sectors; and mounting transaction costs of IBRD lending that reduced the demand for new loans in other sectors.

Despite India's salience in the WB's loan portfolio and the WB's importance in India's external borrowings, these financial flows were, in the aggregate, modest for India's economy, comprising less than 1 percent of gross national product and seldom more than a couple of dollars per capita. However, their relative importance has been greater in certain sectors and time periods. In particular, the WB has been one of India's most reliable sources of external financing when the country suffered balance of payments problems, such as in the 1960s, after the first and second oil shocks, and in 1990–1991.

Lending Portfolio

In its early decades, WB lending to India was largely in support of India's five-year plans that concentrated on infrastructure (railways, dams) and development finance companies. The heyday of WB lending to India was during the 1970s and 1980s. More than three-fourths of lending in this period was in energy, agriculture and rural development, and industry. In the 1970s, India's emphasis on agriculture and poverty rhetoric dovetailed well with the WB's own lending priorities. India's large size and its need for external capital also meshed well with the WB's emphasis on expanding lending volumes. With many of the WB's other poor borrowers plagued by political instability and weak administrative capacity, India offered a convenient sponge to absorb WB resources and meet its annual lending targets.

The early 1980s were pivotal years for the WB. Its greater emphasis on liberal economic policies, however, did not lead to any significant changes in its stance

toward India. Even though, as the decade progressed, India's dirigiste economic policies were increasingly at odds with those espoused by the WB, India's standing as a valued customer of the IBRD grew. The outset of the debt crisis meant there were few large creditworthy borrowers in the IBRD's portfolio. Indeed, the WB even increased its overall lending volume for the industrial sector, with some of its largest loans to public sector manufacturing enterprises (e.g., \$545 million in two loans to Indian Petrochemicals Limited), science and technology development, and sectoral and subsectoral industrial restructuring. The WB also continued to pour money into sectors with unsound policies and corrupt institutions, especially irrigation and power.

Near the end of the decade, India's bargaining position weakened as the strains in India's political and economic fabric became more pronounced. The absence of alternative sources to service India's external debt, coupled with the emergence of Eastern Europe as a region deserving of the WB's resources, altered the relationship. The WB pressed India to take more loans in social sectors, especially education and health, as well as to implement policy reforms, but was rebuffed.

The lending portfolio changed sharply after the 1991 macroeconomic crisis. In the immediate aftermath, India became one of the last important WB borrowers to partake of structural adjustment lending, which supported policy reforms in finance, taxation, and the investment and trade regime. With the abatement of the crisis, lending shifted away from public enterprises in electricity and irrigation to a focus on health and education. By the late 1980s, the WB had begun to warn India that its level of IDA lending would depend on its receptivity to loans in the social sectors. In the second half of the 1980s, the social sectors accounted for barely 7 percent of total WB lending. A decade later, between 1996 and 2000, they accounted for nearly a third of all lending. Communicable diseases (particularly HIV/AIDS and tuberculosis) emerged as a new focus of lending.

A second shift occurred in sharply reduced lending for "hard" infrastructure projects. In part, this was due to the decidedly lackluster outcomes in infrastructure sectors where the WB long had involvement, such as irrigation, railways, and power. The precipitating factor was the protracted controversy surrounding the WB's support of the massive Narmada irrigation project, which involved the construction of dams and irrigation canals and concomitant large-scale resettlement of displaced people. The project became a cause célèbre for international nongovernmental organizations (NGOs), thus forcing the WB to have its first ever external review of an ongoing project. The resulting report was strongly critical of the project's implications for displaced populations and the

environment. The WB ceased disbursements in 1993, and eventually the Indian government simply canceled the loan in 1995. An important consequence was that the WB became much more risk averse with regard to infrastructure projects. Although infrastructure-related lending revived by the end of the 1990s (especially for roads), its attempts to implement innumerable safeguards multiplied transaction costs, dampening demand for such loans.

Another change occurred in the level of lending, with a greater focus on subnational lending through state-level adjustment loans. These loans sought to improve the fiscal health of states, by improving expenditure priorities and taxation. This shift was facilitated in part by the decision of the central government to give the states a greater share in external loans, unlike the past, when the money went into a central pool, and concerned states received only a marginal increase in additional resources. The WB's increasing poverty focus and its recognition that the locus of poverty-related policies and implementation was situated at the state level were additional factors.

The World Bank's Impact on India

As with any borrower, it is not easy to get a simple bottom line on the WB's effects on India. At the most fundamental level, it has contributed to augmenting India's foreign exchange resources and level of investment. Although most attention is placed on the transfer of resources (especially long-term concessional resources), these are just one element of a multifaceted relationship. Much of the WB's lending to India has been for investment projects, and it was through these projects that it played an active technical assistance role, improving the quality of engineering and training, propagating new technical doctrines (such as the Training and Visit system in agricultural extension), developing strategies to reduce the incidence of corruption, setting up organizational competencies, and so on. The WB nurtured and supported organizations that have emerged as some of India's strongest, be it in finance (Industrial Credit and Investment Corporation of India) or power (National Thermal Power Corporation, or NTPC). In other cases, as with the Indian railways, despite an extensive long-term commitment that spanned over four decades and loans totaling \$1.5 billion (the most made by the WB to a single entity), the WB's influence on policies was limited, and it finally gave up. Similarly, although its lending to NTPC and Indian Farmers Fertilizers Cooperative built excellent organizational capabilities in the power and fertilizer sectors respectively, these were undermined by the inability to change the policy environment. While its protracted involvement in agriculture did produce some good results (such as in agriculture extension and the dairy sector), the

substantial lending for irrigation and agricultural credit through National Bank for Agricultural and Rural Development produced few results.

For most of its history, the WB's project performance in India outperformed its global portfolio. However, and somewhat paradoxically, in recent years, even as India's growth rate accelerated, the performance of the WB's India portfolio fell below its global average. The mediocre project performance was particularly apparent in sectors like water supply, power, and environment, while social sectors and industry did better. There has also been a substantial opportunity cost of nonlending (especially in infrastructure), the result of increasing transaction costs in borrowing from the WB as a result of the "Christmas tree"-like profusion of lending criteria over the 1990s.

There are four areas in which the WB made important but less heralded contributions. First, externally it played an important role as an advocate for India and a coordinator of aid flows. It organized, and has since coordinated, the Aid India Consortium since 1958, the sole institutional mechanism coordinating official flows to India. The Aid India Consortium was renamed the India Development Forum in 1993, signaling that official flows had become less important for India, and thus the importance of this institution waned. The WB played a critical diplomatic role in settling a major dispute between India and Pakistan regarding the sharing of the waters of the Indus River, and the resulting Indus Water Treaty of 1960 has stood the test of time despite the fractious relationship between the two countries. In recent years, the WB (along with the Asian Development Bank) has attempted to build epistemic communities of policy makers in South Asia through conferences and workshops, which might also help build bridges across the region.

Second, the WB also frequently played an important coordinating role within India, both among central government agencies as well as between central government agencies and state governments. The lack of strong central coordinating mechanisms in India and the inevitable interagency rivalries of bureaucracies have meant that as an outsider with seemingly deep pockets, the WB has often been a constructive informal peacemaker, while advancing its own interests. Third, the WB has also acted as an "agency of restraint." The covenants and conditionalities in many of its loans—at times at the urging of its Indian counterparts—often helped limit welfare-reducing political discretion in areas such as procurement to tariffs and expenditure priorities. Of course, in some cases, these restraints also served to advance the interests of the institution's major shareholders.

Finally, the WB also provided India with a range of public goods, both directly from its own substantial

research, as well as indirectly for agricultural research through the Consultative Group on International Agricultural Research system. Moreover, it played a socialization role as an ideas intermediary, helping push advances in knowledge from the mundane (bidding procedures) to the ideological, reflecting its intrinsic ethos and governance. It has been an important contributor to applied economics research in India, although for many years the government of India did not allow its reports to be publicly circulated. By not investing more in vernacular languages, the WB severely circumscribed the dissemination (and influence) of its intellectual products. On the other hand, an important mechanism that enhanced the diffusion of the WB's ideas was the number of Indian economic reformers who worked in the WB and then returned home. In fact, there have always been steady numbers of Indian civil servants working with or in the WB for short to medium periods, who collectively serve as a mechanism of influence.

Evaluating the Relationship

While many in India (especially on the left) have always been suspicious about the WB and its ideological baggage, the overall relationship between the WB and India has been characterized by symmetry and equality (despite some notable exceptions). The relationship was particularly symbiotic in the first quarter century. As the first history of the WB put it in 1971, "No country has been studied more by the World Bank than India, and it is no exaggeration to say that India has influenced the Bank as much as the Bank has influenced India." The reality has been that the WB has treated India more favorably than most other borrowers. The perceived sophistication of Indian policy makers, their ability to articulate programs (as distinct from their ability or willingness to implement them), and the caution that inevitably comes in dealing with a large country all played a role. India's democracy, the exigencies of the cold war, extreme poverty, and eloquent political and economic interlocutors long made India the best argument for foreign aid for many years. On the flip side, criticisms of India would have weakened the general case for development aid. India's assigned role as an aid showcase added to the constraints the WB felt in pressing India for policy change.

The WB's limited leverage were also due to the reality that its resources were quite modest relative to the size of Indian economy, whether that money was seen in per capita terms or as a percent of both total government expenditures and gross domestic investment. This insignificance was due to both demand and supply. On the demand side, India's economic policies always relied primarily on domestic resources. The rare episodes when this was not the case (such as the mid-1960s and 1990–1991)

simply reaffirmed these policies subsequently. As for the supply side, the IBRD side of WB lending was limited by concerns over India's creditworthiness. At the same time, IDA lending was both constrained by the IDA's own limited resources and by politically imposed limits on India's share of those same resources.

However, even within the confines of these limited resources, there were reasons internal to the WB that may have limited the institution's leverage. In particular, until well into the 1980s, the WB's anxiousness to commit the annual tranches of IDA availabilities by the end of each fiscal year frequently limited its leverage on Indian policy. A view that the foreign exchange gap and aid shortages contributed to India's growth also played into this. When it came to balancing lending against policy insistence the WB acted as if foreign exchange was critical and therefore untouchable. During the 1980s, while the WB shifted its emphasis to stress policy reforms and greater economic liberalization, it continued to lend to poorly governed public sector institutions in India and was muted in its criticism of India's closed economy. The WB itself admitted that throughout the 1980s its management did not address "India's disappointing policy record for fear of jeopardizing a strong lending relationship with a sensitive client." Internally, however, the WB's senior management had been concerned about India's policies and launched a series of collaborative reports with the Indian government on trade and industrial reform. These reports laid the groundwork for India's later policy reform agenda and were an important factor in the relatively smooth implementation of trade and industrial reforms in the early 1990s.

The WB's relationship with India has also been affected by India's federal system. As with other international organizations, its dealings were principally with the central government. Of course many of its projects were at the state level. However, selection of state projects was done largely on project and sector grounds, rather than on the basis of the overall policy stance of the state itself. WB loans were part of overall plan resources; hence a state with a WB project received only a small fraction of additional resources. And the central government's preoccupations—getting more foreign exchange—mattered little to state governments. Cash-strapped states therefore did not put a priority on their contributions of counterpart resources to WB projects, leading to projects delays and poor disbursement rates.

Changes in the 1990s led the WB to focus on state-level adjustment loans. This led to a paradox: even as the WB's overall resources became much less important for India, they became much more important for cash-strapped states, leading to an increase in the WB's

influence. However, by 2004, outcomes in the three states where the WB focused its efforts—Andhra Pradesh, Karnataka, and Uttar Pradesh—were modest. Indeed, the WB's showcase, the Chandrababu Naidu-led government in Andhra Pradesh, performed poorly on the very fiscal criteria that had been the *raison d'être* of these loans, and its electoral defeat in 2004 dealt a blow to the WB's reform strategies.

Ultimately, the sheer size and complexity of India and its democratic polity means that there are limits to what any outside actor can do—for better or for worse. Both its critics and the WB itself give the institution too much importance. The dilemma faced by the WB is exemplified by its involvement with the notorious Narmada project or its cessation of lending to the Indian railways, or nonlending to states like Bihar. In the first case, although the WB earned the opprobrium of NGOs, much of the problems lay with the borrowers, especially the concerned state governments. The fact that WB financing was barely a fifth of overall cost reduced its leverage. As NGOs, who had been severely critical of the WB, realized after India canceled the loan in 1995, their actual targets were more vulnerable to pressure when there was external funding through the WB than when there was not. In the case of Indian railways or Bihar, the WB has struggled with two competing pressures—lend to sectors and regions where the need is greatest and potential economic and social rates are highest or lend to where implementation outcomes are likely to be most successful. In the past, well-intentioned efforts to stay engaged and try for incremental change have often simply exacerbated the problem. Perhaps the single biggest error the WB has made in India has been its failure to realize that nonlending might serve the country better.

WORLD TRADE ORGANIZATION (WTO), RELATIONS WITH India is one of the twenty-three original contracting parties to the General Agreement on Tariffs and Trade (GATT). It thus automatically became a member of the World Trade Organization (WTO), which replaced GATT on 1 January 1995, following the completion of the Uruguay Round of negotiations in 1994.

India has been an active participant in all rounds of GATT negotiations, notwithstanding its declining share in world trade through most of the post-World War II period. In the post-WTO era, India continues to be an important voice in discussions to launch a new round of multilateral trade negotiations. The thrust of India's position has been to ensure a fair distribution of rights and obligations between developed and developing countries and to address the developmental concerns of poor countries. Its negotiating strategy has, however, evolved with its overall trade and development strategy and policy orientation. Its earlier strategy was largely defensive, in line with its import substitution policies. But the initiation of economic reforms following the balance of payments crisis of 1991 altered India's views on the opportunities, benefits, and threats of engaging in the multilateral trading system and has led to the adoption of a more forward-looking negotiating strategy.

GATT and India: The Pre-Uruguay Round Years

India played an important role in international trade negotiations under the auspices of GATT. Time and again it played the role of a leader and spokesperson for developing countries, along with Brazil. For instance, as early as 1963, India initiated an action program to expand exports by less developed countries to the developed countries. This program called for a standstill on all new tariff and nontariff barriers, the elimination of all GATT illegal Quantitative Restrictions (QRs), the removal of all duties on tropical primary products, and a schedule for reducing and eliminating tariffs on semiprocessed and processed products. But often such efforts bore little success.

However, India's overall approach to the multilateral trading system during the pre-Uruguay Round period was ambivalent and protectionist. It was driven by an ideology of import substitution and foreign exchange conservation and was underpinned by its belief in a new international economic order. India was an advocate of

special and differential treatment to developing countries and unilateral concessions by developed countries. This defensive approach was evident in the continued high levels of tariff and nontariff protection in India, despite successive rounds of GATT negotiations. In 1990 India's import weighted average tariff rate stood at 87 percent, its unweighted average tariff at 128 percent, and its highest tariff rate at 355 percent, much higher than rates in other developing countries. In addition, 65 percent of all its imports and 90 percent of its manufacturing imports were subject to nontariff barriers in 1990. Moreover, India repeatedly invoked GATT Article 19(B), which permitted the maintenance of QRs for balance of payments reasons. Agriculture and textiles, which were two major sectors of export interest to India, remained outside GATT agreements. Concessions given under special and differential treatment arrangements like the Generalized System of Preferences were heavily qualified, discriminatory, and often nonsubstantive. Overall, India viewed GATT as an international forum to address asymmetries in the balance of economic power between developed and developing countries rather than a forum to liberalize its trade policies and integrate with global trade.

The Uruguay Round of Negotiations

The Uruguay Round of negotiations introduced textiles and agriculture as well as several new issues like intellectual property rights, services, and trade-related investment measures into the multilateral trading system. India, along with Brazil, led a group of developing countries against the inclusion of these new issues. It feared that industrialized countries would make commitments in textiles and agriculture subject to developing country concessions in such areas. However, India eventually had to agree to negotiate on these new issues as part of the Uruguay Round.

India made far more substantive commitments to reduce tariff and nontariff barriers on merchandise trade under the Uruguay Round than in all earlier rounds. Its relatively more liberal approach in this round was made possible by the far-reaching trade reforms introduced in the country beginning in 1991. In its Uruguay Round commitments, India increased the percentage of bound tariff lines for all products from a mere 6 percent in the pre-Uruguay Round period to 67 percent following the Uruguay Round. It bound its tariffs on 62 percent of all nonagricultural tariff lines, which included a large number of important products like iron and steel, chemicals, and machinery. It further committed to reduce its bound rate on all industrial products by 40 percent, from an import weighted average tariff rate of 71.4 percent to 32.4 percent, and committed to reduce tariffs on 2,701

industrial product lines. In agriculture, India bound 81.4 percent of its agricultural imports from the rest of the world. However, India remained largely defensive in the agricultural sector owing to food security and livelihood concerns. The bindings in agriculture were set at very high levels, at rates of 100 percent for primary products, 150 percent for processed products, and 300 percent for edible oils. Moreover, some tariffs that had been bound at zero before the Uruguay Round were renegotiated and were set at higher levels to afford a greater degree of protection to sensitive products. Inclusive of industrial and nonindustrial products, India offered to reduce its basic duty by roughly 30 percent. The duty reductions were to be made over a period of six years.

India has thus far adhered to its tariff binding and reduction commitments. It brought down its applied import-weighted average tariff rate on industrial products from 54 percent in the pre-Uruguay Round period to 33 percent in 1996–1997, further to 30.3 percent in 1998, and to 29 percent in 2001–2002 and most recently to around 20 percent. It has reduced its applied tariffs for a large number of industrial products and has brought them close to their bound levels. However, in agriculture, tariff reductions have been less substantive, with the difference between bound and applied rates remaining at more than 50 percent for 656 out of 673 tariff lines as late as 2000. The slower pace of trade liberalization in this sector has been due to concerns about potential adverse effects on rural employment, livelihoods, and food security.

India also made substantive commitments to reduce nontariff protection in the Uruguay Round. It agreed to phase out QRs on all goods except for some 600 items or product lines for security reasons. As per the Agreement on Agriculture, it also committed to tariff its nontariff barriers on agricultural imports. But due to concerns about the potential adverse impact on domestic producers and on the balance of payments, India took recourse to GATT Article 18:B to maintain QRs on some products. The latter was, however, ruled inconsistent with India's WTO obligations following a dispute filed against India by the United States in 1996, and India had to agree to phase out all its QRs (on 1,429 product lines) by 31 March 2001, earlier than originally scheduled. In line with the WTO decision, India removed QRs on 714 items by 1 April 2000 and the rest by 1 April 2001, covering both bound and unbound products.

Under the General Agreement on Trade in Services (GATS), India's approach was highly conservative. It scheduled only a few services for negotiations and did not table important services, such as energy and distribution services, where there is great interest on the part of developed countries to enter the Indian market. Even

within the scheduled sectors, India's market access and national treatment commitments were very limited in scope and more restrictive than prevailing policies. The revised offers made by India in January 2004 as part of the ongoing GATS negotiations are not substantively different and remain subject to numerous restrictions. Today, the wedge between India's GATS commitments and existing policies is even greater, given the considerable autonomous liberalization undertaken in the 1990s in many of India's service sectors. India's main market access interest within services has been the movement of service suppliers; India wants to secure increased and predictable market access for the temporary movement of its service providers and was earlier influential in developing the GATS annex on this mode of supply. More recently, India has been pushing for secure market access for the cross-border supply of services, a mode which covers trade in services through business process outsourcing, which is of growing interest to India. It has formed developing country coalitions and presented bold proposals on both these GATS modes of supply.

The issue of intellectual property rights and the resulting agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPs) aroused much debate in India. While the agreement had no major implications for India in the area of copyrights, trademarks, and designs, as domestic legislation in the latter areas were already in conformity with the TRIPs agreement, in the area of patents India had several concerns. The foremost concern was about the likely impact of amendments in domestic patent legislation due to the TRIPs agreement (given differences between the two in terms of coverage, duration, working of patents, and compulsory licensing provisions) on the Indian pharmaceutical sector and on public health and equity objectives. It was feared that the introduction of product patents for pharmaceuticals (as opposed to process patents, which was the case in India) would lead to higher drug prices and benefit developed country pharmaceutical firms at the expense of domestic generic drug manufacturers in developing countries. Moreover, in the Indian view, there was no convincing link between stronger intellectual property rights legislation and innovation, investment, technology transfer, and quality. A second concern was that patent protection to plant varieties and microorganisms under the TRIPs agreement would lead to "bio-piracy" and plundering of the ecological wealth of developing countries like India as well as monopoly over seed and fertilizer trade and production by Western multinationals. The fear was that such protection would ultimately raise input prices for developing country agricultural producers, would limit their ability to indigenize to suit local conditions, and could potentially have adverse environmental effects.

Notwithstanding such concerns and much domestic opposition, India has taken steps to bring its domestic legislation into conformity with the TRIPs agreement. India's Patents Act of 1970 has undergone three amendments, the latest being at the end of 2004. The main changes include the extension of patent protection to a period of twenty years for all inventions, the specification of a list of nonpatentable innovations, including seeds, plants, species, traditional knowledge, and other items for which innovations may not classify as inventions, clarification of what constitutes the working of patents, conditions for the grant of compulsory license, including on grounds of national and public health emergencies, and introduction of product patents. India has also introduced the Protection of Plant Variety and Farmer's Right Act as a *sui generis* system for protecting plant and animal life. However, the basic concerns and debates over the TRIPs agreement continue in India, and have also shaped India's position on this agreement in the post-Uruguay Round discussions.

According to various studies, India was expected to be among the main developing-country beneficiaries of the Uruguay Round agreement, mainly due to the elimination of nontariff barriers. The coverage ratio for nontariff barriers on Organization for Economic Cooperation and Development (OECD) countries' imports from India was estimated to decline from 29.4 percent to 5.1 percent across all products. The bulk of this reduction was due to improved market access in textiles and clothing and agriculture, following the phasing out of the Multi Fibre Agreement (MFA) by 2005 and the elimination of nontariff barriers in agriculture. Quantitative exercises indicated an increase in exports of .3 percent of the value of India's 1992 exports due to liberalization of agricultural trade and of 7.4 percent due to elimination of the MFA. The gains were not as significant in other areas. For instance, committed tariff reductions averaged a mere 2.4 percent and affected only 5 percent of all merchandise exports by India to OECD countries. In the area of services, the gains were limited, given the lack of substantive commitments by all countries in India's main area of export interest, namely, movement of service suppliers. Any gains were, however, finally contingent on the implementation of commitments by the developed countries and on India's ability to capitalize on the improved market access opportunities by introducing domestic structural and policy reforms to remove supply-side constraints and compete more effectively in world trade.

Post-Uruguay Round Developments

In the various Ministerial Conferences that have taken place since the Uruguay Round, India's focus has been on three issues. These are: the implementation of the

Uruguay Round commitments in agriculture and textiles to ensure that the gains promised to developing countries in that round are realized; ensuring greater sensitivity to equity and developmental concerns of developing countries in the context of TRIPs; and preventing further widening of the WTO mandate. In the course of these Ministerials, India has also been very influential in shaping the outcome of discussions and the introduction of new frameworks and proposals.

In agriculture, India has pushed strongly for the implementation of subsidy reduction commitments made in the Uruguay Round by the developed countries. In preparation for the Cancún Ministerial in September 2003, India was instrumental in forming a new alliance of developing countries (G-22), including important developing countries like Brazil, South Africa, China, and Egypt, which rejected the framework on agriculture that was put forward by the European Union and the United States just prior to the Cancún meetings. The collapse of the talks at Cancún was in large part due to the G-22's insistence on implementation issues in agriculture. India was a key player in this coalition, fostering unity among the group despite the divergent interests of its member countries and despite divisive tactics by the developed countries to fragment the coalition. It also helped in framing an alternative proposal by the developing countries on agriculture and garnered the support of the smaller and poorer developing country coalition, the G-90 grouping.

In the July 2004 discussions in Geneva to develop a framework agreement, India again played a leading role within the G-22 alliance. It pushed for provisions such as safeguard measures, the adoption of less than full reciprocity in tariff reductions, exemptions from *de minimis* subsidy reductions for resource-constrained farmers in poor countries, and explicit recognition in the framework on agriculture of the food security, livelihood, and rural and social development concerns of developing countries. India was also one of the members of a new group that emerged during the July 2004 discussions, the Five Interested Parties Group (including Brazil, the United States, the European Union, and Australia), which consisted of countries with both offensive and defensive interests in agriculture. India played an important role within this group in helping forge a last-minute consensus on the July framework agreement, particularly in the context of agriculture, thus keeping the Doha Round alive.

India has also voiced implementation concerns in textiles. It criticized the fact that during the 1995–2005 transition period of this agreement, developed countries had phased out quotas on textile and clothing products which did not face binding quotas and that over 95 percent of

India's textile and clothing trade would remain unintegrated until the final year of transition. Moreover, India also voiced concerns about unilateral changes introduced by certain importing countries on rules of origin, repeated antidumping investigations on India's textile exports, and selective liberalization of quotas under preferential bilateral arrangements, which further eroded any market access gains realized in this sector by India. It pushed successfully for the scheduled elimination of the MFA on 1 January 2005. Its textile and clothing exports are expected to grow significantly in the post-MFA regime.

There has also been some concern in India with regard to the nonagricultural market access negotiations. Although India has not opposed these discussions, it has expressed concerns about the formula that will be adopted for reductions in industrial tariffs from the Uruguay Round levels. It has opposed proposals for larger reductions on industrial products that are subject to higher tariffs, and proposals for zero duties on selected products. This opposition stems from concerns about possible adverse effects on certain emerging manufacturing sectors and on labor-intensive small-scale industries, with implications for employment and poverty. India has also lobbied for credit to be given to developing countries for autonomous liberalization in recognition of the fact that significant reductions in applied tariffs have been undertaken unilaterally by many developing countries since the Uruguay Round in the context of trade reforms.

With the backing of developing countries like South Africa and Brazil, India has argued the need to interpret and implement the TRIPs agreement in a manner that gives member countries the right to protect public health and promote access to medicines for all. India lobbied actively to introduce flexibility provisions under the TRIPs agreement in the area of public health and medicines and was finally successful in realizing the Declaration on TRIPs and Public Health at the Doha talks. This declaration gives members the right to grant compulsory licenses, to determine the grounds on which to grant these licenses, and to determine what constitutes a national health emergency. Before the Cancún Ministerial, India, along with the United States, Brazil, South Africa, and Kenya, also succeeded in introducing a provision under the TRIPs agreement that would allow developing countries to import generics from earmarked countries in case of public health emergencies. This was seen as a major victory for developing countries and their generic manufacturers, although how such a provision will operate in practice and its implications for the Indian pharmaceutical industry are not yet clear.

India has also made two other demands in the post-Uruguay Round discussions on TRIPs. The first is

to extend geographic indicators to products other than wines and spirits in view of India's export interests in products like basmati rice. The second is to introduce restrictions on the misappropriation of biological and genetic resources and traditional knowledge from developing countries. However, its primary focus under TRIPs has been the issue of affordable access to medicines and equity in public health.

India differs from the major developed countries concerning the scope of future WTO negotiations. It has insisted that the scope of WTO negotiations be restricted to the built-in agenda of the Uruguay Round and the implementation of commitments made in the previous round. It strongly opposed the inclusion of labor and environmental standards and the four Singapore issues of investment, competition policy, transparency in government procurement, and trade facilitation under the WTO framework. As part of the G-22 alliance, it was instrumental in the dropping of three of the four Singapore issues as part of the July 2004 framework agreement.

Future Strategies and Policy Directions

India's approach to the WTO negotiations has been largely issue- and cause-based and very much driven by coalition dynamics and alliances, often at the expense of its own strategic interests. On several occasions, India's firm public stand on issues has attracted criticism from developed country negotiators and the media. For instance, it was widely blamed for "scuttling" the launch of a new round at Doha, and was termed by one observer as the "fallen hero of a lost third world cause" (Panagariya).

Overall, critics contend that India has often espoused the cause of developing countries at the expense of its own interests in WTO negotiations. In future WTO negotiations, India needs to adopt a more strategic approach. It must dovetail its negotiating strategy into its overall economic liberalization and trade reform program. It needs to use its multilateral engagement in the WTO to facilitate meaningful policy reform, such as by ensuring that domestic opening generates payoffs in terms of increased market access abroad. The latter would also enhance India's credibility as a bargainer. Given the extent of trade liberalization and market opening that has occurred in India since the Uruguay Round, India needs to solidify these policies through multilateral commitments to lock in its reforms and to signal the credibility of its policy orientation.

XAVIER, FRANCIS (1506–1552), Jesuit missionary to India. Francis Xavier was born in 1506 in the Pyrenees kingdom of Navarre. At eighteen he went to the University of Paris, where nine years later he joined the faculty and came under the influence of Ignatius Loyola, who was planning to start the Society of Jesus. Xavier was one of the first six to join Loyola.

Eventually Xavier was commissioned by King John III of Portugal to Christianize his eastern colonies. Xavier left for India on 7 April 1541. As papal nuncio, he was given supreme authority over all missions and churches already in existence. He landed in Goa on 6 May 1542.

Late in 1542, he went to Madras (Chennai), converting the Parava fisher people in great numbers. though their acquiescence was not necessarily spiritually motivated. Harassed by pirates at sea and powerful vested interests on the land, they readily agreed to become Christians in return for the protection of the king of Portugal. Xavier had no fluency in any of the local vernacular languages, so he memorized the Creed, the Lord's Prayer, the Ave Maria, and the Ten Commandments. His method was to gather the people of a village together on Sundays. "We begin," Xavier wrote, "with a profession of faith." He would then recite the Creed and the Commandments and the people would respond in a "mighty chorus . . . with their arms folded on their breasts in the form of a cross," affirming that they believed (Firth, p. 59). In such a fashion, in one month, he baptized as many as ten thousand. After a year, Xavier turned his attention to the west coast, journeying through Travencore to Cochin. Here he repeated his efforts. Everywhere he went he endeavored, but without much success, to train Indian workers, both ordained and lay, to provide for the spiritual nurture of the young Christian community. In addition, he instructed his fellow Jesuits to "build schools

in every village, that the children may be taught daily." Remarkably, the Parava remain Christian to this day.

Subsequent to his work in India, Xavier attempted, but failed, to enter China, and he died of a fever on 2 December 1552 off the south coast of China. He

St. Francis Xavier. St. Francis Xavier's remains as preserved at the Catholic Basilica of Bom Jesus in Goa. Xavier is regarded as one of the greatest of Christian missionaries; his travels covered many thousands of miles in a dozen years. TIME LIFE PICTURES / GETTY IMAGES.

was eventually buried in Goa and was canonized to sainthood in 1622.

YAJÑA “Sacrifice,” or *yajña*, is the key word in a Vedic worldview that dominated South Asian religion for the entire first millennium B.C. Derived from *yaj* (to sacrifice, worship), *yajña* has an Avestan counterpart *yasna*, indicating an Indo-Iranian pre-Vedic origin. In the highly influential Purusha hymn, Rig Veda 10.90, the self-sacrificing cosmic being Purusha creates not only the world and classes of beings but also the institution of *yajña* and the first cosmic laws. Sacrifice for Vedic poets and ritualists became the crucial link between human and divine worlds. *Karman*, ritual “work” in *yajña*, was declared a human responsibility, and sacrifice evolved into a complex, highly sophisticated instrument by which the cosmos itself was ritually renewed.

Early in the first millennium B.C., Vedic tradition divided ritual activity into *shrauta* sacrifices based on *sbruti*, the revealed Vedas, and *grihya* ceremonies based on *smriti*, or human tradition. The former apparently had priority, and Shrauta Sūtras of numerous Vedic schools systematized sacrifices already described in the Saṃhitās, Brāhmaṇas and Āraṇyakas of the orally transmitted Vedic texts. Grihya Sūtras of the same schools provided domestic guidelines. These Sūtras listed sacrifices that could be performed on one fire in the home, some with assistance from a *purohita* (domestic priest), or great sacrifices requiring three fires and as many as sixteen or seventeen priests. The latter included soma sacrifices, with the *agnishṭoma*, an initial soma offering, as paradigm. Once a sacrificer (*yajamāna*) and his wife (*patnī*) performed the five-day *agnishṭoma* (known today among Vaidika Brahmans of Andhra simply as *yajña* to declare its priority), the couple may then go on to further soma *yajñas* such as the *agnicayana* and *vājapeya*. When one of the pair dies, all of the dozen or more implements, *yajñapātra* or *yajñāyudha* (literally, “sacrificial weapons”) go to the fire-god Agni in the funeral pyre.

Beginning with Brāhmaṇa texts (e.g., Shatapatha Brāhmaṇa 11.5.6.1) and continuing on to the authoritative law code of Manu (3.67–74), an important reduction of sacrifice to a manageable yet spiritually satisfying scale arrived with stipulation of five daily “great” *yajñas* (*mahāyajña*) to be made by a householder without priestly assistance. *Yajñas* to *devas* (gods), *brahman* (the Veda), *pitris* (ancestors), *manushya* (humans), and *bhūtas* (supernatural beings) could be accomplished simply by adding a stick to the ritual fire, reciting a Vedic verse, offering water, giving alms to a Brahman or beggar, scattering leftover grains for crows or ants.

In the post-Vedic era of classical Hinduism, the solemn *shrauta* schedule of *yajña* gradually gave way to *devapūjā*, the worship of images of deities in households, roadside shrines, and increasingly elaborate public temples with priestly staff. Aside from innumerable goddesses of rural and urban theistic Hinduism, the two principal male deities, Vishnu and Shiva, both demonstrate strong connections with *yajña*. Vishnu is pervader of the universe, like the sacrificial pole (*yūpa*), and Shiva is Sthāṇu, that same *axis mundi*. Both gods also have mythic links to the cult of soma, although it is only Shiva, famously excluded from Daksha’s *yajña*, who succeeds in destroying the sacrifice.

In contemporary India, elaborate sectarian rituals, often labeled “Vedic” *yajñas* or *yāgas* to acquire prestige, have little to do with authentic Vedic ritual.

YĀJNAVALKYA, Indian astronomer, perhaps of the second millennium B.C. Yājñavalkya is one of the foremost figures in the earliest period of Indian astronomy. There is no unanimity about his time, which has been estimated in an indirect manner. His time was considered to have been around 800 B.C., based on the dating of the Shatapatha Brāhmaṇa—a voluminous prose text from his school, which serves as a commentary on Vedic ritual—by nineteenth-century philologists. These philological theories have been called into question by new archaeological data, and his true period may be the second millennium B.C.

Yājñavalkya's parents were Brahmaratha and Sunandā. He studied first in the hermitage of Vaishampāyana and later with Bāshkala and Uddālaka. He is credited with the authorship of the Shukla (White) Yajurveda. He is also credited with the school that put together the Shatapatha Brāhmaṇa. Many dialogues of Yājñavalkya with his disciples and with rival sages are preserved in the Vedic literature. Legends connect him to the sun; this may be a slanted reference to his discovery of two important facts about the motions of the sun.

In the Shatapatha Brāhmaṇa, Yājñavalkya advances two important theories: first, that a cycle of ninety-five years is required to reconcile the lunar and the solar years (indicating that the length of the year was known to a great degree of accuracy); second, that the circuit of the sun is asymmetric in its four quarters. The proportion for the two halves of the year described by him is 176:189. It is interesting that this proportion is also used in describing the asymmetry of the two halves in the Angkor Wat temple in Cambodia (c. 1150). Yājñavalkya's astronomy is very important in the history of ideas because it pushes the recognition of the ninety-five-year lunisolar cycle and the asymmetry of the year to a much earlier time than has been supposed.

Yājñavalkya's astronomy belongs to a period in which astronomical knowledge was part of ritual. Complicated geometrical altars were built to represent the year, with facts about the year expressed in terms of number or area within the altar design. Yājñavalkya is a major figure in early Vedic thought, renowned for his stress on the correspondence between the outer world and the inner world. Many of his dialogues form a part of the narrative of the

Brihad-Āraṇyaka-Upanishad, in which he mentions a preliminary version of the Purāṇic system of cosmology.

YAJUR VEDA The Yajur Veda is one of four primary Saṃhitās (anthologies) of Vedas, India's most ancient textual authority. The oldest, decidedly seminal Veda, the Rig Veda—1,028 hymns composed in the final centuries before 1000 B.C.—became a source of mantras, cited with additional material in three later Vedas: Yajur, Samur, and Atharva Veda, all compiled within two or three centuries. An "inside" perspective of Vedic heritage, including those Vedic Brahmins still tasked today with memorizing and reciting Vedas as oral traditions, understands the four Saṃhitās as unitary ("the Veda"), eternal, without human or divine origin, and therefore without literary chronology as recognized by "outside" historians and linguists.

The great system of sacrifices at the heart of Vedic religion depended upon invocations of deities and ritual prescriptions of the Yajur Veda, literally "knowledge of the *yajus* (sacrificial formulas)," and the melodies of the Samur Veda, literally "knowledge of the *saman* (chant)." Together with the Rig Veda, they form a "triple Veda," following a traditional predilection for triads. A fourth Saṃhitā, the Atharva Veda, was added as an important ancient compendium of hymns regarding popular religious practices not directly related to the sacrificial calendar. Four major priests were assigned to these four Vedas, the *bota*, *adbvāryu*, *udgata*, and *brahman*, for the Rig, Yajur, Samur, and Atharva Vedas, respectively. Each has essential ritual roles, but it is the *adbvāryu*, reciting from the Yajur Veda, who functions as executive priest, assigning sacrificial duties and mantras to the *yajamana* (sacrificer-patron) and other priests. In great *shrauta* sacrifices, including paradigmatic soma and animal offerings, the *adbvāryu* may direct sixteen or seventeen priests in an arena outside the sacrificer's home. Or the *adbvāryu* may direct actions inside the home in new- and full-moon-day sacrifices, with the *yajamana* alone or with one to three other priests in the *grihya* (domestic) schedule patterned after that of

the *śrauta*. In either case, portions of the Yajur Veda are incorporated into ritual handbooks for procedures.

Over the centuries, the four Vedas were orally transmitted and edited by numerous schools known as *śakhas* (branches). The Yajur Veda text generated the largest number of schools in two divisions: the older Krishna (Black) Yajur Veda, with four Saṃhitās (Taittiriya, Maitrayani, Kathaka, and Kapishthala-Katha); and the younger Vajasaneyi Saṃhitā, also known as the Shukla (White) Yajur Veda, with two closely related schools, Madhyamdina and Kanva. Whereas the texts of the latter were composed, and are still recited today, in verse only, those of the various Krishna Yajur Veda schools are mixed, with prose passages among metrical ones. Almost the same rites are provided by each school, although length of coverage, schedule order, and even emphasis in the subcontinent vary considerably.

The major difference between the two Yajur Vedas, Krishna (Black) and Shukla (White), concerns *brāhmaṇas*. Every Veda has a prose genre known as *brāhmaṇa*, a discourse with rules concerning particular mantras or ritual actions, along with explanations of their meanings. For example, in his schedule of memorized texts, a Vedic student born into the Taittiriya *śakha* first learns the Taittiriya Saṃhitā (= Krishna Yajur Veda), which includes numerous *brāhmaṇa* passages throughout (although he then goes on to memorize an equally lengthy text known as the Taittiriya Brāhmaṇa, followed by the briefer Taittiriya Aranyaka and Taittiriya Upanishad). On the other hand, a student born into the Madhyamdina *śakha* learns the metrical Shukla Yajur Veda (= Vajasaneyi Saṃhitā) without any *brāhmaṇa* explanations, those having been collected in a separate text known as the Shatapatha Brāhmaṇa, the next assignment for memorization.

YOGA The Yoga tradition is extremely old. Yogic postures are depicted on the third millennium B.C. seals of the Harappan period. The Rig Veda speaks of the visions (*dhi*) of harmony stretched on the loom of cosmic existence.

Yoganarayana Stone Sculpture. Narasimha, the fourth avatar of Lord Vishnu, who cast off his fiery nature in deep meditation or yoga mudra. From remains of Hampi, capital of the Hindu kingdom of Vijayanagar, c. sixteenth century. NATIONAL MUSEUM / FOTOMEDIA.

This task was compared to harnessing of the plow (*yuga*). The mind is compared to the flutterings of a bird, indicating its union in the heart with the divine. The Rig Veda asserts that the universe is stationed within the heart, suggesting the yoking of it with the individual's body.

The goal of Yoga is self-transformation and transcendence, achieved by yoking the body and mind with the spirit within. This yoking may be viewed as an interiorization of the ritual that is more commonly done externally.

By the time of the Bhagavad Gītā, the most popular text of Yoga, the teachings are already very ancient. The Mokshadharma section of the Mahābhārata has a longish description of Yoga. Other texts that may belong to the first part of the first millennium B.C. and that also describe Yoga are the Katha, the Shvetāshvatara, and the Maitrayāniya Upanishads. Around 150 B.C., the teachings were codified by Patanjali in his Yoga Sūtra (Aphorisms of Yoga), which is now termed Classical Yoga. An important early commentary on this text is Vyāsa's Yoga Bhāshya.

The Purāṇas (Ancient tales) also teach Yoga. Another encyclopedic work is the Yoga Vāsishtha, which teaches a nondualistic Jñāna Yoga of seven stages. Yoga teachings are a part of the Tantras of Shakti, the Āgamas of Shiva, and the Saṃhitās of Vishnu worship.

Hatha Yoga is a later development within the Yoga tradition, credited to Gorakshanātha of the eleventh century. The major texts of this Yoga, which has become very popular in the West, are the Hatha Yoga Pradīpikā, the Gheranda Saṃhitā, and the Shiva Saṃhitā. An important early Tamil text on Yoga is Tirumandiram.

Patanjali's Yoga Sūtra speaks of a system of eight limbs:

1. Moral restraint (*yama*), comprising nonharming (*ahimsā*), truthfulness (*satya*), nonstealing (*asteya*), chastity (*brahmacharya*), and noncovetousness (*aparigraha*)
2. Discipline (*niyama*), consisting of purity (*shaucha*), contentment (*santosha*), asceticism (*tapas*), self-study (*svādhyāya*), and devotion to the Lord (*īshvara-pranidhāna*)
3. Posture (*āsana*)
4. Breath control (*prāṇāyāma*)
5. Sense withdrawal (*pratyābhāra*)
6. Concentration (*dhāranā*)
7. Meditation (*dhyaṇa*)
8. Absorption (*samādhi*).

Several kinds of Yoga are described in the texts. These include Jñāna-Yoga, or the path of knowledge; Sāṅkhya-Yoga, or the path of union through transformation of the elements within the psychical person; Karma-Yoga, the path of selfless action; Bhakti-Yoga, the path of devotion; Mantra-Yoga, the path of sacred sound; and Hatha-Yoga, the path of self-transformation using the arduous path of physical purification.

Breath control, or *prāṇāyāma*, is fundamental to yogic practice. Vedic books speak of five kinds of breath (*prāṇa*) that mediate the various processes in the body. These may be viewed not only as inhalation and exhalation but also as electric and chemical currents coursing through the body. The five main breaths are: *prāṇa*, associated with inhalation and with the regions of heart and head; *apāna*, associated with exhalation and with the navel and the lower abdomen; *udāna*, located at the throat and associated with speech and other functions; *samāna*, the midcurrent located at the abdomen and chiefly responsible for digestion; and *vyāna*, the diffuse current pervading the entire body.

The Hatha Yoga texts speak of seven (in some texts, as many as thirteen) *chakras* (centers of energy) in the body:

1. *Mūlādhāra chakra*, at the bottom of the spine, is associated with the coiled energy of *kundalini* and is portrayed as a lotus of four petals. This *chakra* is

associated with the earth element, the sense of smell, and the lower limbs.

2. *Svādhiṣṭhāna chakra*, at the genitalia, is associated with the water element, the sense of taste, and the hands. It is shown as having six petals.
3. *Manipūra chakra*, at the navel, is associated with the fire element, the sense of sight, and the digestive tract. It is portrayed as having ten petals.
4. *Anāhata chakra*, at the heart, is associated with the air element, the sense of touch, and the reproductive organs. It is shown with twelve petals.
5. *Vishuddhi chakra*, at the throat, is associated with the ether, the sense of hearing, the skin and the mouth, and is shown as having sixteen petals.
6. *Ājñā chakra*, at the center of the eyebrows, is associated with the mind and the sense of individuality (*ahamkāra*). It has two petals.
7. *Sahasrāra chakra*, at the crown of the head, is viewed as having a thousand spokes or petals. It is associated with pure consciousness.

The exertions of the yogi make it possible for the kundalini (representing the natural energy of the individual) to rise up and ultimately pierce through to the highest *chakra*. This joining of the kundalini at the *sahasrāra chakra* is called the union of Shakti and Shiva, respectively representing body and consciousness. Before reaching the top, the kundalini must pierce through three particularly difficult knots or hurdles (*granthi*) at the first (at the base of the spine), the third (at the navel), and the fifth (at the throat) *chakras*. These points are called Brahmā, Vishnu, and Rudra *granthis*.

The physical body is supposed to be enveloped in an energy sheath, which is the subtle body (*sūkṣma śarīra*). The energy flows around through 72,000 channels (*nādis*) that are described in the Upanishads. The three main pathways down the spine are the *sushumnā* at the center, with the *idā* and the *pingalā* to the left and right of it. The *idā* is associated with cooling (and the moon) and the *pingalā* with heating (and the sun).

In recent decades, the popularity of Yoga has spread around the world. It is practiced for its health benefits as well as its promise of mastery of mind and body through the advanced practice of meditation.

ZOROASTRIANISM A religion founded on the teachings of the prophet Zoroaster, who lived in ancient Persia (now Iran), Zoroastrianism is practiced by about 100,000 people worldwide. Most of its adherents live in India (and are also called Parsis). A smaller number are in Iran; and many Indian and Iranian Zoroastrians migrated to and now live in Britain, the United States, Canada, Australia, South Africa, and other countries. One of the world's oldest monotheistic religions, Zoroastrianism has influenced other monotheistic religions. Its main tenets are rather simple—it espouses three virtues of good thoughts, good words, and good deeds, realization of which enables one to win the battle between good and evil.

Zoroaster, or Zarathustra, is believed to have lived around 1500 B.C. in eastern Iran, in what is now the Russian steppes. Like the Buddha after him, Zoroaster sought to understand the reasons for death and suffering and the origin of evil. He had a deep longing for justice and for a moral law that would allow humankind to lead a good life in peace. In search of answers, he meditated in a mountain cave for ten years. When he received enlightenment, he descended from the mountain and sought to promote a new way of life among his tribesmen. He preached monotheism in a land that followed an aboriginal polytheistic religion, and he was therefore attacked for his teaching. Zoroaster eventually gained the royal patronage of King Vishtasp, resulting in a substantial following for his faith. Zoroastrianism was already over a millennium old when the first Persian Empire was established by Cyrus of the Achaemenid dynasty. It was propagated in various Persian empires by the Achaemenids, then the Parthians who ruled from 247 B.C. onward, and the Sassanians who overthrew the Parthians in A.D. 224. When Muslim invaders entered Persia around A.D. 650, a small number of Zoroastrians fled to India. Zoroastrians were

free to practice their religion in India and, though small in number, made important contributions to Indian society.

The sacred text of the Zoroastrians is the Zend-e-Avesta. One part of the Avesta consists of the Gathas, which are songs or hymns composed by Zoroaster. The Gathas are abstract sacred poetry, directed toward the worship of the one God, the understanding of righteousness and cosmic order, the promotion of social justice, and individual choice between good and evil. The Gathas have a general, even universal vision. The remaining parts of the Avestas were written perhaps centuries after the Gathas, and they deal with laws of ritual and practice and with the traditions of the faith.

One central theme in Zoroastrianism is the battle between good and evil in human life. In nature, there exist two opposing forces—*spenta-mainyu* (the good mind) and *angre-mainyu* (the wicked mind)—which are in continuous conflict. A person's soul is caught between them and is pulled by each side. To help the soul balance itself between these two forces, it is given a rudder in the form of a tail. This tail has three layers of feathers, which reminds one of the path of good thoughts, words, and deeds, by which the soul is able to make spiritual progress. Every soul has a free will to choose either to obey divine universal natural laws or to disobey them. If these divine laws are obeyed, the soul will be able to attain union with God. This remote event, toward which all creation moves, is called *frasbo-kereti*.

In short, every individual has the twin spirits of good and evil in his or her mind, forming a dual nature. When individuals exercise the better mind, they create life and draw God and his divine powers toward themselves. When they choose to use the evil mind, they enter a state of spiritual death. Confusion descends upon them

and they rush toward wrath and bloodlust. An individual's duty is to play his or her part in this great cosmic battle between good and evil, with each individual's life serving as the battlefield. Every decision made and every choice of thought, word, and deed, is weighed in the balance.

Upon physical death (which is seen as the temporary triumph of evil), the soul will be judged at the "Bridge of the Separator," where the soul, it is believed, will receive either its reward or punishment, based upon the balance of its thoughts, words, and deeds. If found righteous, the soul will ascend to the abode of joy and light. If wicked, it will descend into the depths of darkness and gloom. The latter state, however, is a temporary one, as there is no eternal damnation in Zoroastrianism. Thereafter, there is a promise of a series of saviors who will appear in the world to complete the triumph of good over evil. Evil will be rendered ineffective. There will then be a general last judgment of all the souls awaiting redemption, followed by the resurrection of the physical body, which will once again meet its spiritual counterpart, the soul. Time, as we know it, will cease to exist, and life, it is believed, will remain in a perfect state of joy.

Individual responsibility is another key theme in Zoroastrianism. Salvation for the individual depends on the sum of his or her thoughts, words, and deeds, and no intervention by any divine being may alter this. No costly material sacrifices or rituals will change the way the individual is judged. Making their own choices, individuals alone must bear responsibility for their souls. A life of active good toward others (people, animals, nature) is critical, giving individuals a simple creed to follow—good thoughts, good words, and good deeds.

Further, adherents are encouraged to lead a good and prosperous life, and monasticism, celibacy, fasting, and the mortification of the body are anathema to the Zoroastrian faith. Such practices are believed to weaken the individual and thereby lessen his or her power to fight evil. Zoroaster saw pessimism and despair as sins, in fact, as a submission to evil. In his teachings, the individual is encouraged to lead an active, industrious, honest, and above all, a happy and charitable life. Since this world created by God (Ahura Mazda) is essentially good, the individual should live well and enjoy its bountiful gifts, though always in moderation (as the states of excess and deficiency are deemed to be the workings of a hostile spirit).

It is perhaps difficult to appreciate the originality and courage of Zoroaster's thought today. Many prophets have appeared in later times with similar proclamations. But Zoroaster's religion was radically different from anything humankind had previously believed. Instead of

a religion based on fear, Zoroaster's religion exalted the free and rational mind. Later religions—Judaism, Christianity, and Islam—all borrowed from Zoroaster's teachings. They all grew to attract millions of believers, while Zoroastrianism declined. Today, the Zoroastrian religion is probably familiar only to scholars of religion and to its adherents in South Asia, Iran, and the West.

In terms of customs, Zoroastrians have been incorrectly called fire worshipers. They do not worship fire, but fire has special significance. It is regarded as giving light, warmth, and energy and is therefore vital to life. Parsi places of worship (temples) have altars that contain fire and are called fire-temples. Eight principal fire-temples in India include four in Mumbai and four in the State of Gujarat (two in Surat, one in Udwada, one in Navsari). There are no caste divisions and no religious restrictions concerning food for Zoroastrians. A Zoroastrian child is formally initiated into the religion at a *navjote* or thread ceremony, which takes place between the ages of seven and nine. Zoroastrians continue to debate whether a child with one non-Zoroastrian parent can be initiated into the religion—orthodox members oppose this, while reformists favor the issue. Conversion is not practiced, and though some reformists suggest allowing children of non-Zoroastrian parents to be initiated into the Zoroastrian religion, this issue has not been seriously considered.

Zoroastrianism is one of the world's oldest religions, and the influence of its core tenets may be detected in all three Abrahamic religions. Though Zoroastrians (Parsis) have been prominent in Indian society, the number of Zoroastrians has been declining at the beginning of the twenty-first century.

Selected Edicts of King Ashoka

Introduction

King Ashoka (r. 268–231 B.C.), Priyadarśī in the Edicts, the third of the Mauryan kings, left behind on rock and pillar edicts the oldest Indian written documents of any historical significance. In addition to their historical importance, the edicts also contain a number of personal statements believed to have been drafted by Ashoka himself. For this reason, more is known about the personality of Ashoka and his administration and policy than any other ancient Indian ruler. His story was a remarkable one. After a decade as a typical Indian king he had, after the Battle of Kalinga, a change of heart and embarked on a new policy. While not abjuring force entirely, he established a social policy marked by high ethical content. To enforce this policy he created a class of officials called *dharma-mahāmātra*, “Officers of Righteousness.” It is believed that Ashoka became a Buddhist, although he supported other religious sects. The Pāli canon was codified at a great Buddhist council held at Ashoka’s capital, Pataliputra, and he sent missionaries to Ceylon. It was during his reign that Buddhism ceased to be an Indian sect alone and began to be a universal religion. Rock Edict VIII tells of how Ashoka was converted to his new policy and how his life changed. Rock Edict VI explains how he was available to officials day and night, no matter what he was doing, as his highest calling was the welfare of his subjects.

Rock Edict VIII

SOURCE: *The Edicts of Asoka*. Edited and translated by N. A. Nikam and Richard McKeon. Chicago: The University of Chicago Press, 1959, p. 37.

In the past, kings used to go on pleasure tours (*vihār-yātrās*). On these tours, they hunted and indulged in other pastimes.

King Priyadarśī, however, became, enlightened in wisdom (*sambuddha*) ten years after his coronation. Since then his tours have been moral-tours (*Dharma-yātrās*).

He visits priests and ascetics and makes gifts to them; he visits the aged and gives them money; he visits the people of rural areas, instructing them in Dharma and discussing it with them.

King Priyadarśī takes great pleasure in these tours, far more than could result from other tours.

Rock Edict VI

SOURCE: *The Edicts of Asoka*. Edited and translated by N. A. Nikam and Richard McKeon. Chicago: The University of Chicago Press, 1959, pp. 37–38.

King Priyadarśī says:

In the past, state business was not transacted or reports made at all hours of the day. I have therefore made

arrangements that officials may have access to me and may report on the affairs of my people at all times and in all places—when I am eating, when I am in the harem or my inner apartments, when I am tending to the cattle, when I am walking or engaged in religious exercises. I now attend to the affairs of the people in all places. And when a donation or a proclamation that I have ordered verbally, or an urgent matter which I have delegated to my high officials, causes a debate or dispute in the Council, this must be reported to me immediately, at all hours and in all places. These are my orders.

I am never completely satisfied with my work or my vigilance in carrying out public affairs. I consider the promotion of the people’s welfare my highest duty, and its exercise is grounded in work and constant application.

No task is more important to me than promoting the well-being of all the people. Such work as I accomplish contributes to discharging the debt I owe to all living creatures to make them happy in this world and to help them attain heaven in the next.

I have ordered this edict on Dharma inscribed in order that it may endure forever and in order that my sons, grandsons, and great-grandsons may follow it for the welfare of all. This is difficult to do, however, without devoted and sustained work.

Selections from the Autobiography of Mahatma M. K. Gandhi

Introduction

Mohandas Karamchand Gandhi was born on October 2, 1869, at Porbandar in what is now the state of Gujarat, India. He was married to Kasturbai and they had four sons. From 1888 until 1891 he studied law in England and was called to the bar but traveled to South Africa in May 1893 to practice law. Subsequently, he developed his strategy of nonviolent noncooperation, *Satyagraha* (truth force), to fight government policies. He returned to India in January 1915 and in 1917 he started a *Satyagraha* movement against the indigo growers of Champaran in Bihar and then against the mill owners of Ahmedabad. In 1919 he called for a national *hartal* (strike) against the British and supported the Khilafat Movement. By 1920 he had become the most important leader of the Indian National Congress. His *An Autobiography: The Story of My Experiments with Truth*, written in the 1920s, is one of the enduring records of a political leader. Gandhi was not only a political leader, he was also a social reformer.

One of Gandhi’s concerns was the institution of child marriage, which he opposed. This was courageous as he had been married at the age of thirteen. The passage “Child Marriage” recounts Gandhi’s marriage to

Kasturbai of which, in retrospect, Gandhi felt ashamed. He relished the marriage when it occurred but in the fullness of time came to regard it as a shameful event and he later became highly critical of his father for his childhood marriage. He criticized the extravagant way Hindus were married but, above all, he was tormented by his carnal lust in his early years. This was especially so when Gandhi left his sick father to engage in sex with his pregnant wife. During that time his father died. His newborn child also died and the death of his father and the death of his child became linked in his mind. In "Playing the Husband" he recounts his early relationship with his wife and how he had to establish his authority as a husband. Gandhi believed he was saved from the sin of carnal pleasure by his separation from his wife due to his sojourn to England and the Indian custom of the wife spending time with her family.

For Gandhi the most important aspect of his *Satyagraha* strategy was *ahimsa*, or nonviolence. When he began the *Satyagraha* struggle in Kheda district, Gujarat, on 22 March 1918 he expected the campaign for nonpayment of taxes to be conducted in a disciplined manner on the basis of his credo of love and justice. He was not satisfied with the way the campaign was carried out by the peasants, and accordingly he realized he had made a "Himalayan miscalculation." He decided, therefore, to raise a corps of disciplined *satyagrahi* who would spearhead any future civil disobedience movement strictly on the basis of discipline and nonviolence.

The Indian National Congress, which had been founded in 1885, was led by Western-trained lawyers who took a constitutional path in their fight for independence. It was remarkable that Gandhi became the recognized leader of the Congress in such a short period of time and that he changed the ethos of the organization and the whole independence movement to reflect his own nativist mores. In "Congress Initiation" he relates how he was responsible for the creation of a new constitution for the party and in "The Birth of Khadi" he recounts the way in which he and the members of his ashram learned how to spin *khadi* and how an untouchable, Gangabehn Majumdar, searched for a spinning wheel for him. One was located in Vijapur in Baroda State as recounted in "Found at Last." In "An Instructive Dialogue" Gandhi presents the mill owners' viewpoint about *khadi* through a reported conversation with Umar Sobani, a mill owner. Gandhi explained his rationale for the production of *khadi* and how it would provide work for women.

In "Its Rising Tide" Gandhi reports his success in establishing noncooperation and nonviolence as the official policies of a number of organizations, such as regional Congress parties and the Khilafat movement, where he had to discuss whether Islam forbade its adherents from following nonviolence. At the 1920 special session of the Congress at Calcutta the Congress supported noncooperation but also adopted a controversial

resolution calling for independence, *Swaraj*, a resolution that was adopted "At Nagpur" where Gandhi also discusses Hindu-Muslim unity, untouchability, and *khadi*.

In "Farewell" he recounts his relationship with the Congress and how all his major activities were conducted through the Congress. He reaffirms his belief that there is no other God than Truth and that Truth is *ahimsa*. It reveals how idealistic Gandhi was and how committed he had become to his ideals of purity of heart. For him this entailed his belief in "Ahimsa in mind, word, and deed."

Child Marriage

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 8–11.

Much as I wish that I had not to write this chapter, I know that I shall have to swallow many such bitter draughts in the course of this narrative. And I cannot do otherwise, if I claim to be a worshipper of Truth. It is my painful duty to have to record here my marriage at the age of thirteen. As I see the youngsters of the same age about me who are under my care, and think of my own marriage, I am inclined to pity myself and to congratulate them on having escaped my lot. I can see no moral argument in support of such a preposterously early marriage.

Let the reader make no mistake. I was married, not betrothed. For in Kathiawad there are two distinct rites,—betrothal and marriage. Betrothal is a preliminary promise on the part of the parents of the boy and the girl to join them in marriage, and it is not inviolable. The death of the boy entails no widowhood on the girl. It is an agreement purely between the parents, and the children have no concern with it. Often they are not even informed of it. It appears that I was betrothed thrice, though without my knowledge. I was told that two girls chosen for me had died in turn, and therefore I infer that I was betrothed three times. I have a faint recollection, however, that the third betrothal took place in my seventh year. But I do not recollect having been informed about it. In the present chapter I am talking about my marriage, of which I have the clearest recollection.

It will be remembered that we were three brothers. The first was already married. The elders decided to marry my second brother, who was two or three years my senior, a cousin, possibly a year older, and me, all at the same time. In doing so there was no thought of our welfare, much less our wishes. It was purely a question of their own convenience and economy.

Marriage among Hindus is no simple matter. The parents of the bride and the bridegroom often bring themselves to ruin over it. They waste their substance, they waste their time. Months are taken up over the preparations—in making clothes and ornaments and in preparing budgets for dinners. Each tries to outdo the other in the number and variety of courses to be prepared. Women, whether they have a

voice or no, sing themselves hoarse, even get ill, and disturb the peace of their neighbours. These in their turn quietly put up with all the turmoil and bustle, all the dirt and filth, representing the remains of the feasts, because they know that a time will come when they also will be behaving in the same manner.

It would be better, thought my elders, to have all this bother over at one and the same time. Less expense and greater *eclat*. For money could be freely spent if it had only to be spent once instead of thrice. My father and my uncle were both old, and we were the last children they had to marry. It is likely that they wanted to have the last best time of their lives. In view of all these considerations, a triple wedding was decided upon, and as I have said before, months were taken up in preparation for it.

It was only through these preparations that we got warning of the coming event. I do not think it meant to me anything more than the prospect of good clothes to wear, drum beating, marriage processions, rich dinners and a strange girl to play with. The carnal desire came later. I propose to draw the curtain over my shame, except for a few details worth recording. To these I shall come later. But even they have little to do with the central idea I have kept before me in writing this story.

So my brother and I were both taken to Porbandar from Rajkot. These are some amusing details of the preliminaries to the final drama—*e.g.* smearing our bodies all over with turmeric paste—but I must omit them.

My father was a Diwan, but nevertheless a servant, and all the more so because he was in favour with the Thakore Saheb. The latter would not let him go until the last moment. And when he did so, he ordered for my father special stage coaches, reducing the journey by two days. But the fates had willed otherwise. Porbandar is 120 miles from Rajkot,—a cart journey of five days. My father did the distance in three, but the coach toppled over in the third stage, and he sustained severe injuries. He arrived bandaged all over. Both his and our interest in the coming event was half destroyed, but the ceremony had to be gone through. For how could the marriage dates be changed? However, I forgot my grief over my father's injuries in childish amusement of the wedding.

I was devoted to my parents. But no less was I devoted to the passions that flesh is heir to. I had yet to learn that all happiness and pleasure should be sacrificed in devoted service to my parents. And yet, as though by way of punishment for my desire for pleasures, an incident happened, which has ever since rankled in my mind and which I will relate later. Nishkulanand sings: 'Renunciation of objects, without the renunciations of desire, is short-lived, however hard you may try.' Whenever I sing this song or hear it sung, this bitter untoward incident rushes to my memory and fills me with shame.

My father put on a brave face in spite of his injuries, and took full part in the wedding. As I think of it, I can even today call before my mind's eye the places where he sat as he went through the different details of the ceremony. Little did I dream then that one day I should severely criticize my

father for having married me as a child. Everything on that day seemed to me right and proper and pleasing. There was also my own eagerness to get married. And as everything that my father did then struck me as beyond reproach, the recollection of those things is fresh in my memory. I can picture to myself, even today, how we sat on our wedding dais, how we performed the *Saptapadi*, how we, the newly wedded husband and wife, put the sweet *Kansar* into each other's mouth, and how we began to live together. And oh! that first night. Two innocent children all unwittingly hurled themselves into the ocean of life. My brother's wife had thoroughly coached me about my behaviour on the first night. I do not know who had coached my wife. I have never asked her about it, nor am I inclined to do so now. The reader may be sure that we were too nervous to face each other. We were certainly too shy. How was I to talk to her, and what was I to say? The coaching could not carry me far. But no coaching is really necessary in such matters. The impressions of the former birth are potent enough to make all coaching superfluous. We gradually began to know each other, and to speak freely together. We were the same age. But I took no time in assuming the authority of a husband.

Playing the Husband

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 11–14.

About the time of my marriage, little pamphlets costing a pice, or a pie (I now forget how much), used to be issued, in which conjugal love, thrift, child marriages, and other such subjects were discussed. Whenever I came across any of these, I used to go through them cover to cover, and it was a habit with me to forget what I did not like, and to carry out in practice whatever I liked. Lifelong faithfulness to the wife, inculcated in these booklets as the duty of the husband, remained permanently imprinted on my heart. Furthermore, the passion for truth was innate in me, and to be false to her was therefore out of the question. And then there was very little chance of my being faithless at that tender age.

But the lesson of faithfulness had also an untoward effect. 'If I should be pledged to be faithful to my wife, she also should be pledged to be faithful to me,' I said to myself. The thought made me a jealous husband. Her duty was easily converted into my right to exact faithfulness from her, and if it had to be exacted, I should be watchfully tenacious of the right. I had absolutely no reason to suspect my wife's fidelity, but jealousy does not wait for reasons. I must needs be for ever on the look-out regarding her movements, and therefore she could not go anywhere without my permission. This sowed the seeds of a bitter quarrel between us. The restraint was virtually a sort of imprisonment. And Kasturbai was not the girl to brook any such thing. She made it a point to go out whenever and wherever she liked. More restraint on my part resulted in more liberty being taken by her, and in my getting more and more cross. Refusal to speak to one another thus became the order of the day with us, married children. I think it was quite innocent of Kasturbai to have taken those liberties with my restrictions.

How could a guileless girl brook any restraint on going to the temple or on going on visits to friends? If I had the right to impose restrictions on her, had not she also a similar right? All this is clear to me today. But at that time I had to make good my authority as a husband!

Let not the reader think, however, that ours was a life of unrelieved bitterness. For my severities were all based on love. I wanted to *make* my wife an ideal wife. My ambition was to *make* her live a pure life, learn what I learnt, and identify her life and thought with mine.

I do not know whether Kasturbai had any such ambition. She was illiterate. By nature she was simple, independent, persevering, and with me least, reticent. She was not impatient of her ignorance and I do not recollect my studies having ever spurred her to go in for a similar adventure. I fancy, therefore, that my ambition was all one-sided. My passion was entirely centred on one woman, and I wanted it to be reciprocated. But even if there were no reciprocity, it could not be all unrelieved misery because there was active love on one side at least.

I must say I was passionately fond of her. Even at school I used to think of her and the thought of nightfall and our subsequent meeting was ever haunting me. Separation was unbearable. I used to keep her awake till late in the night with my idle talk. If with this devouring passion there had not been in me a burning attachment to duty, I should either have fallen a prey to disease and premature death, or have sunk into a burdensome existence. But the appointed tasks had to be gone through every morning, and lying to anyone was out of the question. It was this last thing that saved me from many a pitfall.

I have already said that Kasturbai was illiterate. I was very anxious to teach her, but lustful love left me no time. For one thing the teaching had to be done against her will, and that too at night. I dared not meet her in the presence of the elders, much less talk to her. Kathiawad had then, and to a certain extent has even today, its own peculiar useless and barbarous *Purdah*. Circumstances were thus unfavourable. I must therefore confess that most of my efforts to instruct Kasturbai in our youth were unsuccessful. And when I woke from the sleep of lust, I had already launched forth into public life, which did not leave me much spare time. I failed likewise to instruct her through private tutors. As a result Kasturbai can now with difficulty write simple letters and understand simple Gujarati. I am sure that, had my love for her been absolutely untainted with lust, she would be a learned lady today; for I could then have conquered her dislike for studies. I know that nothing is impossible for pure love.

I have mentioned one circumstance that more or less saved me from the disasters of lustful love. There is another worth noting. Numerous examples have convinced me that God ultimately saves him whose motive is pure. Along with the cruel custom of child marriages, Hindu society has another custom which to a certain extent diminishes the evils of the former. Parents do not allow young couples to stay together long. The child-wife spends more than half her time at her father's place. Such was the case with us. That is to say, during the first five years of our married life (from the

age of 13 to 18), we could not have lived together longer than an aggregate period of three years. We would hardly have spent six months together, when there would be a call to my wife from her parents. Such calls were very unwelcome in those days, but they saved us both. At the age of eighteen I went to England, and this meant a long and healthy spell of separation. Even after my return from England we hardly stayed together longer than six months. For I had to run up and down between Rajkot and Bombay. Then came the call from South Africa, and that found me already fairly free from the carnal appetite.

'A Himalayan Miscalculation'

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 469–471.

Almost immediately after the Ahmedabad meeting I went to Nadiad. It was here that I first used the expression 'Himalayan miscalculation' which obtained such a wide currency afterwards. Even at Ahmedabad I had begun to have a dim perception of my mistake. But when I reached Nadiad and saw the actual state of things there and heard reports about a large number of people from Kheda district having been arrested, it suddenly dawned upon me that I had committed a grave error in calling upon the people in the Kheda district and elsewhere to launch upon civil disobedience prematurely, as it now seemed to me. I was addressing a public meeting. My confession brought down upon me no small amount of ridicule. But I have never regretted having made that confession. For I have always held that it is only when one sees one's own mistakes with a convex lens, and does just the reverse in the case of others, that one is able to arrive at a just relative estimate of the two. I further believe that a scrupulous and conscientious observance of this rule is necessary for one who wants to be a Satyagrahi.

Let us now see what that Himalayan miscalculation was. Before one can be fit for the practice of civil disobedience one must have rendered a willing and respectful obedience to the state laws. For the most part we obey such laws out of fear of the penalty for their breach, and this holds good particularly in respect of such laws as do not involve a moral principle. For instance, an honest, respectable man will not suddenly take to stealing, whether there is a law against stealing or not, but this very man will not feel any remorse for failure to observe the rule about carrying head-lights on bicycles after dark. Indeed it is doubtful whether he would even accept advice kindly about being more careful in this respect. But he would observe any obligatory rule of this kind, if only to escape the inconvenience of facing a prosecution for a breach of the rule. Such compliance is not, however, the willing and spontaneous obedience that is required of a Satyagrahi. A Satyagrahi obeys the laws of society intelligently and of his own free will, because he considers it to be his sacred duty to do so. It is only when a person has thus obeyed the laws of society scrupulously that he is in a position to judge as to which particular rules are good and just and which unjust and iniquitous. Only then does the right accrue to him of the civil disobedience of certain laws in well-defined

circumstances. My error lay in my failure to observe this necessary limitation. I had called on the people to launch upon civil disobedience before they had thus qualified themselves for it, and this mistake seemed to me of Himalayan magnitude. As soon as I entered the Kheda district, all the old recollections of the Kheda Satyagraha struggle came back to me, and I wondered how I could have failed to perceive what was so obvious. I realized that before a people could be fit for offering civil disobedience, they should thoroughly understand its deeper implications. That being so, before restarting civil disobedience on a mass scale, it would be necessary to create a band of well-trying, pure-hearted volunteers who thoroughly understood the strict conditions of Satyagraha. They could explain these to the people, and by sleepless vigilance keep them on the right path.

With these thoughts filling my mind I reached Bombay, raised a corps of Satyagrahi volunteers through the Satyagraha Sabha there, and with their help commenced the work of educating the people with regard to the meaning and inner significance of Satyagraha. This was principally done by issuing leaflets of an educative character bearing on the subject.

But whilst this work was going on, I could see that it was a difficult task to interest the people in the peaceful side of Satyagraha. The volunteers too failed to enlist themselves in large numbers. Nor did all those who actually enlisted take anything like a regular systematic training, and as the days passed by, the number of fresh recruits began gradually to dwindle instead of to grow. I realized that the progress of the training in civil disobedience was not going to be as rapid as I had at first expected.

Congress Initiation

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 486–488.

I must regard my participation in Congress proceedings at Amritsar as my real entrance into the Congress politics. My attendance at the previous Congresses was nothing more perhaps than an annual renewal of allegiance to the Congress. I never felt on these occasions that I had any other work cut out for me except that of a mere private, nor did I desire more.

My experience of Amritsar had shown that there were one or two things for which perhaps I had some aptitude and which could be useful to the Congress. I could already see that the late Lokamanya, the Deshabandhu, Pandit Motilalji and other leaders were pleased with my work in connection with the Punjab inquiry. They used to invite me to their informal gatherings where, as I found, resolutions for the Subjects Committee were conceived. At these gatherings only those persons were invited who enjoyed the special confidence of the leaders and whose services were needed by them. Interlopers also sometimes found their way to these meetings.

There were, for the coming year, two things which interested me, as I had some aptitude for them. One of these was the memorial of the Jalianwala Bagh Massacre. The Con-

gress had passed a resolution for it amid great enthusiasm. A fund of about five lakhs had to be collected for it. I was appointed one of the trustees. Pandit Malaviyaji enjoyed the reputation of being the prince among beggars for the public cause. But I knew that I was not far behind him in that respect. It was whilst I was in South Africa that I discovered my capacity in this direction. I had not the unrivalled magic of Malaviyaji for commanding princely donations from the potentates of India. But I knew that there was no question of approaching the Rajas and Maharajas for donations for the Jalianwala Bagh memorial. The main responsibility for the collection thus fell, as I had expected, on my shoulders. The generous citizens of Bombay subscribed most liberally, and the memorial trust has at present a handsome credit balance in the bank. But the problem that faces the country today is what kind of memorial to erect on the ground, to sanctify which, Hindus, Musalmans and Sikhs mingled their blood. The three communities, instead of being bound in a bond of amity and love, are, to all appearance, at war with one another, and the nation is at a loss as to how to utilize the memorial fund.

My other aptitude which the Congress could utilize was as a draftsman. The Congress leaders had found that I had a faculty for condensed expression, which I had acquired by long practice. The then existing constitution of the Congress was Gokhale's legacy. He had framed a few rules which served as a basis for running the Congress machinery. The interesting history of the framing of these rules I had learnt from Gokhale's own lips. But everybody had now come to feel that these rules were no longer adequate for the ever increasing business of the Congress. The question had been coming up year after year. The Congress at that time had practically no machinery functioning during the interval between session and session, or for dealing with fresh contingencies that might arise in the course of the year. The existing rules provided for three secretaries, but as a matter of fact only one of them was a functioning secretary, and even he was not a whole-timer. How was he, single-handed, to run the Congress office, to think of the future, or to discharge during the current year the obligations contracted by the Congress in the past? During that year, therefore, everybody felt that this question would assume all the more importance. The Congress was too unwieldy a body for the discussion of public affairs. There was no limit set to the number of delegates in the Congress or to the number of delegates that each province could return. Some improvement upon the existing chaotic condition was thus felt by everybody to be an imperative necessity. I undertook the responsibility of framing a constitution on one condition. I saw that there were two leaders, *viz.*, the Lokamanya and the Deshabandhu who had the greatest hold on the public. I requested that they, as the representatives of people, should be associated with me on the Committee for framing the constitution. But since it was obvious that they would not have the time personally to participate in the constitution-making work, I suggested that two persons enjoying their confidence should be appointed along with me on the Constitution Committee, and that the number of its personnel should be limited to three. This suggestion was accepted by the late Lokamanya and the late

Deshabandhu, who suggested the names of Sjts. Kelkar and I. B. Sen respectively as their proxies. The Constitution Committee could not even once come together, but we were able to consult with each other by correspondence, and in the end presented a unanimous report. I regard this constitution with a certain measure of pride. I hold that, if we could fully work out this constitution, the mere fact of working it out would bring us Swaraj. With the assumption of this responsibility I may be said to have made my real entrance into the Congress politics.

The Birth of Khadi

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 489–491.

I do not remember to have seen a handloom or a spinning wheel when in 1908 I described it in *Hind Swaraj* as the panacea for the growing pauperism of India. In that book I took it as understood that anything that helped India to get rid of the grinding poverty of her masses would in the same process also established Swaraj. Even in 1915, when I returned to India from South Africa, I had not actually seen a spinning wheel. When the Satyagraha Ashram was founded at Sabarmati, we introduced a few handlooms there. But no sooner had we done this than we found ourselves up against a difficulty. All of us belonged either to the liberal professions or to business; not one of us was an artisan. We needed a weaving expert to teach us to weave before we could work the looms. One was at last procured from Palanpur, but he did not communicate to us the whole of his art. But Maganlal Gandhi was not to be easily baffled. Possessed of a natural talent for mechanics, he was able fully to master the art before long, and one after another several new weavers were trained up in the Ashram.

The object that we set before ourselves was to be able to clothe ourselves entirely in cloth manufactured by our own hands. We therefore forthwith discarded the use of mill-woven cloth, and all the members of the Ashram resolved to wear hand-woven cloth made from Indian yard only. The adoption of this practice brought us a world of experience. It enabled us to know, from direct contact, the conditions of life among the weavers, the extent of their production, the handicaps in the way of their obtaining their yarn supply, the way in which they were being made victims of fraud, and, lastly, their ever growing indebtedness. We were not in a position immediately to manufacture all the cloth for our needs. The alternative therefore was to get our cloth supply from handloom weavers. But ready-made cloth from Indian mill-yarn was not easily obtainable either from the cloth-dealers or from the weavers themselves. All the fine cloth woven by the weavers was from foreign yarn, since Indian mills did not spin fine counts. Even today the outturn of higher counts by Indian mills is very limited, whilst highest counts they cannot spin at all. It was after the greatest effort that we were at last able to find some weavers who condescended to weave Swadeshi yarn for us, and only on condition that the Ashram would take up all the cloth that they might produce. By thus adopting cloth woven from

mill-yarn as our wear, and propagating it among our friends, we made ourselves voluntary agents of the Indian spinning mills. This in its turn brought us into contact with the mills, and enabled us to know something about their management and their handicaps. We saw that the aim of the mills was more and more to weave the yarn spun by them; their cooperation with the handloom weaver was not willing, but unavoidable and temporary. We became impatient to be able to spin our own yarn. It was clear that, until we could do this ourselves, dependence on the mills would remain. We did not feel that we could render any service to the country by continuing as agents of Indian spinning mills.

No end of difficulties again faced us. We could get neither spinning wheel nor a spinner to teach us how to spin. We were employing some wheels for filling perarns and bobbins for weaving in the Ashram. But we had no idea that these could be used as spinning wheels. Once Kalidas Jhaveri discovered a woman who, he said, would demonstrate to us how spinning was done. We sent to her a member of the Ashram who was known for his great versatility in learning new things. But even he returned without wresting the secret of the art.

So the time passed on and my impatience grew with the time. I plied every chance visitor to the Ashram who was likely to possess some information about handspinning with questions about the art. But the art being confined to women and having been all but exterminated, if there was some stray spinner still surviving in some obscure corner, only a member of that sex was likely to find out her whereabouts.

In the year 1917 I was taken by my Gujarati friends to preside at the Broach Educational Conference. It was here that I discovered that remarkable lady Gangabehn Majmundar. She was a widow, but her enterprising spirit knew no bounds. Her education, in the accepted sense of the term, was not much. But in courage and commonsense she easily surpassed the general run of our educated women. She had already got rid of the curse of untouchability, and fearlessly moved among and served the suppressed classes. She had means of her own, and her needs were few. She had a well seasoned constitution, and went about everywhere without an escort. She felt quite at home on horseback. I came to know her more intimately at the Godhra Conference. To her I poured out my grief about the charkha, and she lightened my burden by a promise to prosecute an earnest and incessant search for the spinning wheel.

Found at Last!

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 491–494.

At last, after no end of wandering in Gujarat, Gangabehn found the spinning wheel in Vijapur in the Baroda State. Quite a number of people there had spinning wheels in their homes, but had long since consigned them to the lofts as useless lumber. They expressed to Gangabehn their readiness to resume spinning, if someone promised to provide them with a regular supply of slivers, and to buy the yarn spun by them. Gangabehn communicated the joyful news to

me. The providing of slivers was found to be a difficult task. On my mentioning the thing to the late Umar Sobani, he solved the difficulty by immediately undertaking to send a sufficient supply of slivers from his mill. I sent to Gangabehn the slivers received from Umar Sobani, and soon yarn began to pour in at such a rate that it became quite a problem how to cope with it.

Mr. Umar Sobani's generosity was great, but still one could not go on taking advantage of it for ever. I felt ill at ease, continuously receiving slivers from him. Moreover, it seemed to me to be fundamentally wrong to use mill-slivers. If one could use mill-slivers, why not use mill-yarn as well? Surely no mills supplied slivers to the ancients? How did they make their slivers then? With these thoughts in my mind I suggested to Gangabehn to find carders who could supply slivers. She confidently undertook the task. She engaged a carder who was prepared to card cotton. He demanded thirty-five rupees, if not much more, per month. I considered no price too high at the time. She trained a few youngsters to make slivers out of the carded cotton. I begged for cotton in Bombay. Sjt. Yashvantprasad Desai at once responded. Gangabehn's enterprise thus prospered beyond expectations. She found out weavers to weave the yarn that was spun in Vijapur, and soon Vijapur Khadi gained a name for itself.

While these developments were taking place in Vijapur, the spinning wheel gained a rapid footing in the Ashram. Maganlal Gandhi, by bringing to bear all his splendid mechanical talent on the wheel, made many improvements in it, and wheels and their accessories began to be manufactured at the Ashram. The first piece of Khadi manufactured in the Ashram cost 17 annas per yard. I did not hesitate to commend this very coarse Khadi at that rate to friends, who willingly paid the price.

I was laid up in bed at Bombay. But I was fit enough to make searches for the wheel there. At last I chanced upon two spinners. They charged one rupee for a seer of yarn, *i.e.*, 28 *tolas* or nearly three quarters of a pound. I was then ignorant of the economics of Khadi. I considered no price too high for securing handspun yarn. On comparing the rates paid by me with those paid in Vijapur I found that I was being cheated. The spinners refused to agree to any reduction in their rates. So I had to dispense with their service. But they served their purpose. They taught spinning to Shrimatis Avantikabai, Ramibai Kamdar, the widowed mother of Sjt. Shankarlal Banker and Shrimati Vasumatibehn. The wheel began merrily to hum in my room, and I may say without exaggeration that its hum had no small share in restoring me to health. I am prepared to admit that its effect was more psychological than physical. But then it only shows how powerfully the physical in man reacts to the psychological. I too set my hand to the wheel, but did not do much with it at the time.

In Bombay, again, the same old problem of obtaining a supply of hand-made slivers presented itself. A carder twanging his bow used to pass daily by Sjt. Revashankar's residence. I sent for him and learnt that he carded cotton for stuffing mattresses. He agreed to card cotton for slivers, but demanded a stiff price for it, which, however, I paid. The yarn

thus prepared I disposed of to some Vaishnava friends for making from it the garlands for the *pavitra ekadasbi*. Sjt. Shivji started a spinning class in Bombay. All these experiments involved considerable expenditure. But it was willingly defrayed by patriotic friends, lovers of the motherland, who had faith in Khadi. The money thus spent, in my humble opinion, was not wasted. It brought us a rich store of experience, and revealed to us the possibilities of the spinning wheel.

I now grew impatient for the exclusive adoption of Khadi for my dress. My *dboti* was still of Indian mill cloth. The coarse Khadi manufactured in the Ashram and at Vijapur was only 30 inches in width. I gave notice to Gangabehn that, unless she provided me with a Khadi *dboti* of 45 inches width within a month, I would do with coarse, short Khadi *dboti*. The ultimatum came upon her as a shock. But she proved equal to the demand made upon her. Well within the month she sent me a pair of Khadi *dbotis* of 45 inches width, and thus relieved me from what would then have been a difficult situation for me.

At about the same time Sjt. Lakshmidas brought Sjt. Ramji, the weaver, with his wife Gangabehn from Lathi to the Ashram and got Khadi *dbotis* woven at the Ashram. The part played by this couple in the spread of Khadi was by no means insignificant. They initiated a host of persons in Gujarat and also outside into the art of weaving handspun yarn. To see Gangabehn at her loom is a stirring sight. When this unlettered but self-possessed sister plies at her loom, she becomes so lost in it that it is difficult to distract her attention, and much more difficult to draw her eyes off her beloved loom.

An Instructive Dialogue

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 494–496.

From its very inception the Khadi movement, Swadeshi movement as it was then called, evoked much criticism from the mill-owners. The late Umar Sobani, a capable mill-owner himself, not only gave me the benefit of his own knowledge and experience, but kept me in touch with the opinion of the other mill-owners as well. The argument advanced by one of these deeply impressed him. He pressed me to meet him. I agreed. Mr. Sobani arranged the interview. The mill-owner opened the conversation.

'You know that there has been Swadeshi agitation before now?'

'Yes, I do,' I replied.

'You are also aware that in the days of the Partition we, the mill-owners, fully exploited the Swadeshi movement. When it was at its height, we raised the prices of cloth, and did even worse things.'

'Yes, I have heard something about it, and it has grieved me.'

'I can understand your grief, but I can see no ground for it. We are not conducting our business out of philanthropy. We do it for profit, we have got to satisfy the shareholders.'

The price of an article is governed by the demand for it. Who can check the law of demand and supply? The Bengalis should have known that their agitation was bound to send up the price of Swadeshi cloth by stimulating the demand for it.'

I interrupted: 'The Bengalis like me were trustful in their nature. They believed, in the fullness of their faith, that the mill-owners would not be so utterly selfish and unpatriotic as to betray their country in the hour of its need, and even to go the length, as they did, of fraudulently passing off foreign cloth as Swadeshi.'

'I knew your believing nature,' he rejoined; 'that is why I put you to the trouble of coming to me, so that I might warn you against falling into the same error as these simple-hearted Bengalis.'

With these words the mill-owner beckoned to his clerk who was standing by to produce samples of the stuff that was being manufactured in his mill. Pointing to it he said 'Look at this stuff. This is the latest variety turned out by our mill. It is meeting with a widespread demand. We manufacture it from the waste. Naturally, therefore, it is cheap. We send it as far North as the valleys of the Himalayas. We have agencies all over the country, even in places where your voice or your agents can never reach. You can thus see that we do not stand in need of more agents. Besides, you ought to know that India's production of cloth falls far short of its requirements. The question of Swadeshi, therefore, largely resolves itself into one of production. The moment we can increase our production sufficiently, and improve its quality to the necessary extent, the import of foreign cloth will automatically cease. My advice to you, therefore, is not to carry on your agitation on its present lines, but to turn your attention to the erection of fresh mills. What we need is not propaganda to inflate demand for our goods, but greater production.'

'Then, surely, you will bless my effort, if I am already engaged in that very thing,' I asked.

'How can that be?' he exclaimed, a bit puzzled, 'but may be, you are thinking of promoting the establishment of new mills, in which case you certainly deserve to be congratulated.'

'I am not doing exactly that,' I explained, 'but I am engaged in the revival of the spinning wheel.'

'What is that?' he asked, feeling still more at sea. I told him all about the spinning wheel, and the story of my long quest after it, and added, 'I am entirely of your opinion; it is no use my becoming virtually an agent for the mills. That would do more harm than good to the country. Our mills will not be in want of custom for a long time to come. My work should be, and therefore is, to organize the production of handspun cloth, and to find means for the disposal of the Khadi thus produced. I am, therefore, concentrating my attention on the production of Khadi. I swear by this form of Swadeshi, because through it I can provide work to the semi-starved, semi-employed women of India. My idea is to get these women to spin yarn, and to clothe the people of India with Khadi woven out of it. I do not know how far this movement is going to succeed, at present it is only in the incipient stage. But I have full faith in it. At any rate it can do no harm. On the contrary to the extent that it can add to

the cloth production of the country, be it ever so small, it will represent so much solid gain. You will thus perceive that my movement is free from the evils mentioned by you.'

He replied, 'If you have additional production in view in organizing your movement, I have nothing to say against it. Whether the spinning wheel can make headway in this age of power machinery is another question. But I for one wish you every success.'

Its Rising Tide

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 497–500.

I must not devote any more chapters here to a description of the further progress of Khadi. It would be outside the scope of these chapters to give a history of my various activities after they came before the public eye, and I must not attempt it, if only because to do so would require a treatise on the subject. My object in writing these chapters is simply to describe how certain things, as it were spontaneously, presented themselves to me in the course of my experiments with truth.

To resume, then, the story of the non-co-operation movement. Whilst the powerful Khilafat agitation set up by the Ali Brothers was in full progress, I had long discussions on the subject with the late Maulana Abdul Bari and the other *Ulema*, especially, with regard to the extent to which a Musalman could observe the rule of non-violence. In the end they all agreed that Islam did not forbid its followers from following non-violence as a policy, and further, that, while they were pledged to that policy, they were bound faithfully to carry it out. At last the non-co-operation resolution was moved in the Khilafat conference, and carried after prolonged deliberations. I have a vivid recollection how once at Allahabad a committee sat all night deliberating upon the subject. In the beginning the late Hakim Saheb was skeptical as to the practicability of non-violent non-co-operation. But after his skepticism was overcome he threw himself into it heart and soul, and his help proved invaluable to the movement.

Next, the non-co-operation resolution was moved by me at the Gujarat political conference that was held shortly afterwards. The preliminary contention raised by the opposition was that it was not competent to a provincial conference to adopt a resolution in advance of the Congress. As against this, I suggested that the restriction could apply only to a backward movement; but as for going forward, the subordinate organizations were not only fully competent, but were in duty bound to do so, if they had in them the necessary grit and confidence. No permission, I argued, was needed to try to enhance the prestige of the parent institution, provided one did it at one's own risk. The proposition was then discussed on its merits, the debate being marked by its keenness no less than the atmosphere of 'sweet reasonableness' in which it was conducted. On the ballot being taken the resolution was declared carried by an overwhelming majority. The successful passage of the resolution was due not a little to the personality of Sjt. Vallabhbhai and

Abbas Tyabji. The latter was the president, and his leanings were all in favour of the non-co-operation resolution.

The All-India Congress Committee resolved to hold a special session of the Congress in September 1920 at Calcutta to deliberate on this question. Preparations were made for it on a large scale. Lala Lajpat Rai was elected President. Congress and Khilafat specials were run to Calcutta from Bombay. At Calcutta there was a mammoth gathering of delegates and visitors.

At the request of Maulana Shaukat Ali I prepared a draft of the non-co-operation resolution in the train. Up to this time I had more or less avoided the use of the word non-violent in my drafts. I invariably made use of this word in my speeches. My vocabulary on the subject was still in process of formation. I found that I could not bring home my meaning to purely Moslem audiences with the help of the Samskrit equivalent for non-violent. I therefore asked Maulana Abul Kalam Azad to give me some other equivalent for it. He suggested the word *ba-aman*; similarly for non-co-operation he suggested the phrase *tark-i-mavalat*.

Thus, while I was still busy devising suitable Hindi, Gujarati and Urdu phraseology for non-co-operation, I was called upon to frame the non-co-operation resolution for that eventful Congress. In the original draft the word 'non-violent' had been left out by me. I had handed over the draft to Maulana Shaukat Ali who was traveling in the same compartment, without noticing the omission. During the night I discovered the error. In the morning I sent Mahadev with the message that the omission should be made good before the draft was sent to the press. But I have an impression that the draft was printed before the insertion could be made. The Subjects Committee was to have met the same evening. I had therefore to make the necessary correction in the printed copies of the draft. I afterwards saw that there would have been great difficulty, had I not been ready with my draft.

None the less my plight was pitiable indeed. I was absolutely at sea as to who would support the resolution and who would oppose it. Nor had I any idea as to the attitude that Lalaji would adopt. I only saw an imposing phalanx of veteran warriors assembled for the fray at Calcutta, Dr. Besant, Pandit Malaviyaji, Sjt. Vijayaraghavachari, Pandit Motilalji and Deshabandhu being some of them.

In my resolution non-co-operation was postulated only with a view to obtaining redress of the Punjab and the Khilafat wrongs. That however, did not appeal to Sjt. Vijayaraghavachari. 'If non-co-operation was to be declared, why should it be with reference to particular wrongs? The absence of Swaraj was the biggest wrong that the country was labouring under; it should be against that that non-co-operation should be directed,' he argued. Pandit Motilalji also wanted the demand for Swaraj to be included in the resolution. I readily accepted the suggestion and incorporated the demand for Swaraj in my resolution, which was passed after an exhaustive, serious and somewhat stormy discussion.

Motilalji was the first to join the movement. I still remember the sweet discussion that I had with him on the

resolution. He suggested some changes in its phraseology which I adopted. He undertook to win the Deshabandhu for the movement. The Deshabandhu's heart was inclined towards it, but he felt sceptical as to the capacity of the people to carry out the programme. It was only at the Nagpur Congress that he and Lalaji accepted it whole-heartedly.

I felt the loss of the late Lokamanya very deeply at the special session. It has been my firm faith to this day that, had the Lokamanya been then alive, he would have given his benedictions to me on that occasion. But even if it had been otherwise, and he had opposed the movement, I should still have esteemed his opposition as a privilege and an education for myself. We had our differences of opinion always, but they never led to bitterness. He always allowed me to believe that the ties between us were of the closest. Even as I write these lines, the circumstances of his death stand forth vividly before my mind's eye. It was about the hour of midnight, when Patwardhan, who was then working with me, conveyed over the telephone the news of his death. I was at that time surrounded by my companions. Spontaneously the exclamation escaped my lips, 'My strongest bulwark is gone.' The non-co-operation movement was then in full swing, and I was eagerly looking forward to encouragement and inspiration from him. What his attitude would have been with regard to the final phase of non-co-operation will always be a matter of speculation, and an idle one at that. But this much is certain—that the deep void left by his death weighed heavily upon everybody present at Calcutta. Everyone felt the absence of his counsels in that hour of crisis in the nation's history.

At Nagpur

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 500–502.

The resolutions adopted at the Calcutta special session of the Congress were to be confirmed at its annual session at Nagpur. Here again, as at Calcutta there was a great rush of visitors and delegates. The number of delegates in the Congress had not been limited yet. As a result, so far as I can remember, the figure on this occasion reached about fourteen thousand. Lalaji pressed for a slight amendment to the clause about the boycott of schools, which I accepted. Similarly some amendments were made at the instance of the Deshabandhu, after which the non-co-operation resolution was passed unanimously.

The resolution regarding the revision of the Congress constitution too was to be taken up at this session of the Congress. The sub-committee's draft was presented at the Calcutta special session. The matter had therefore been thoroughly ventilated and thrashed out. At the Nagpur session, where it came up for final disposal, Sjt. C. Vijayaraghavachariar was the President. The Subjects Committee passed the draft with only one important change. In my draft the number of delegates had been fixed, I think at 1,500; the Subjects Committee substituted in its place the figure 6,000. In my opinion this increase was the result of hasty judgment, and experience of all these years has only confirmed me in

my view. I hold it to be an utter delusion to believe that a large number of delegates is in any way a help to the better conduct of the business, or that it safeguards the principle of democracy. Fifteen hundred delegates, jealous of the interests of the people, broad-minded and truthful, would any day be a better safeguard for democracy than six thousand irresponsible men chosen anyhow. To safeguard democracy the people must have a keen sense of independence, self-respect and their oneness, and should insist upon choosing as their representatives only such persons as are good and true. But obsessed with the idea of numbers as the Subjects Committee was, it would have liked to go even beyond the figure of six thousand. The limit of six thousand was therefore in the nature of a compromise.

The question of the goal of the Congress formed a subject for keen discussion. In the constitution that I had presented, the goal of the Congress was the attainment of Swaraj within the British Empire if possible and without if necessary. A party in the Congress wanted to limit the goal to Swaraj within the British Empire only. Its viewpoint was put forth by Pandit Malaviyaji and Mr. Jinnah. But they were not able to get many votes. Again the draft constitution provided that the means for the attainment were to be peaceful and legitimate. This condition too came in for opposition, it being contended that there should be no restriction upon the means to be adopted. But the Congress adopted the original draft after an instructive and frank discussion. I am of opinion that, if this constitution had been worked out by the people honestly, intelligently and zealously, it would have become a potent instrument of mass education, and the very process of working it out would have brought us Swaraj. But a discussion of the theme would be irrelevant here.

Resolutions about Hindu-Muslim unity, the removal of untouchability and Khadi too were passed in this Congress, and since then the Hindu members of the Congress have taken upon themselves the responsibility of ridding Hinduism of the curse of untouchability, and the Congress has established a living bond of relationship with the 'skeletons' of India through Khadi. The adoption of non-co-operation for the sake of the Khilafat was itself a great practical attempt made by the Congress to bring about Hindu-Muslim unity.

Farewell

SOURCE: Gandhi, Mohandas K. *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957, pp. 503–505.

The time has now come to bring these chapters to a close.

My life from this point onward has been so public that there is hardly anything about it that people do not know. Moreover, since 1921 I have worked in such close association with the Congress leaders that I can hardly describe any episode in my life since then without referring to any relations with them. For though Shradhdhanandji, the Deshabandhu, Hakim Saheb and Lalaji are no more with us today, we have the good luck to have a host of other veteran

Congress leaders still living and working in our midst. The history of the Congress, since the great changes in it that I have described above, is still in the making. And my principal experiments during the past seven years have all been made through the Congress. A reference to my relations with the leaders would therefore be unavoidable, if I set about describing my experiments further. And this I may not do, at any rate for the present, if only from a sense of propriety. Lastly, my conclusions from my current experiments can hardly as yet be regarded as decisive. It therefore seems to be my plain duty to close this narrative here. In fact my pen instinctively refuses to proceed further.

It is not without a wrench that I have to take leave of the reader. I set a high value on my experiments. I do not know whether I have been able to do justice to them. I can only say that I have spared no pains to give a faithful narrative. To describe truth, as it has appeared to me and in the exact manner in which I have arrived at it, has been my ceaseless effort. The exercise has given me ineffable mental peace, because, it has been my fond hope that it might bring faith in Truth and Ahimsa to waverers.

My uniform experience has convinced me that there is no other God than Truth. And if every page of these chapters does not proclaim to the reader that the only means for the realization of Truth is Ahimsa, I shall deem all my labour in writing these chapters to have been in vain. And, even though my efforts in this behalf may prove fruitless, let the readers know that the vehicle, not the great principle, is at fault. After all, however sincere my strivings after Ahimsa may have been, they have still been imperfect and inadequate. The little fleeting glimpses, therefore, that I have been able to have of Truth can hardly convey an idea of the indescribable luster of Truth, a million times more intense than that of the sun we daily see with our eyes. In fact what I have caught is only the faintest glimmer of that mighty effulgence. But this much I can say with assurance, as a result of all my experiments, that a perfect vision of Truth can only follow a complete realization of Ahimsa.

To see the universal and all-pervading Spirit of Truth face to face one must be able to love the meanest of creation as oneself. And a man who aspires after that cannot afford to keep out of any field of life. That is why my devotion to Truth has drawn me into the field of politics; and I can say without the slightest hesitation, and yet in all humility, that those who say that religion has nothing to do with politics do not know what religion means.

Identification with everything that lives is impossible without self-purification; without self-purification the observance of the law of Ahimsa must remain an empty dream; God can never be realized by one who is not pure of heart. Self-purification therefore must mean purification in all the walks of life. And purification being highly infectious, purification of oneself necessarily leads to the purification of ones' surroundings.

But the path of self-purification is hard and steep. To attain to perfect purity one has to become absolutely passion-free in thought, speech and action; to rise above the opposing currents of love and hatred, attachment and

repulsion. I know that I have not in me as yet that triple purity, in spite of constant ceaseless striving for it. That is why the world's praise fails to move me, indeed it very often stings me. To conquer the subtle passions seems to me to be harder far than the physical conquest of the world by the force of arms. Ever since my return to India I have had experiences of the dormant passions lying hidden within me. The knowledge of them has made me feel humiliated though not defeated. The experiences and experiments have sustained me and given me great joy. But I know that I have still before me a difficult path to traverse. I must reduce myself to zero. So long as a man does not of his own free will put himself last among his fellow creatures, there is no salvation for him. Ahimsa is the farthest limit of humility.

In bidding farewell to the reader, for the time being at any rate, I ask him to join with me in prayer to the God of Truth that He may grant me the boon of Ahimsa in mind, word and deed.

Jawaharlal Nehru's Speech on the Assassination of Mahatma M. K. Gandhi

Introduction

Jawaharlal Nehru (1889–1964) was one of Mahatma Gandhi's most devoted followers and this speech he gave on Air India Radio on the day that Gandhi was assassinated is one of his most sensitive and one of his finest. Along with his "Tryst with Destiny" speech, given to mark India's independence in August 1947, this talk must rank as one of his most memorable and one of the elevated speeches of history. At this time of tragedy, when Nehru was visibly brokenhearted, he called for the continuation of Gandhi's teachings of love for others, for nonviolence, and for living up to the great principles by which he lived his life. Nehru and Gandhi were so different in many ways, not least of which was their attitude toward modernization. Nehru was a Utopian Marxist who believed in socialistic planning and industrialization while Gandhi had little faith in either. Yet Nehru, like so many people, was devoted to Gandhi from the time that he first followed Gandhi in "National Week" in 1919 to protest the Black Acts. For Nehru as well as for many others, Gandhi was an enigma and his ways and methods were sometimes hard to comprehend. But time and again, as during the Salt March of 1930, Nehru recognized the brilliance of Gandhi's tactics in Indian eyes and followed him devotedly. For some thirty years Nehru would seek Gandhi out or, as he put in his broadcast, he would "run to him and seek solace from him." This devotion of Nehru (himself one of the great figures of history) to Gandhi, and his depiction of the role that Gandhi played for him and for India and the world is sensitively portrayed in this broadcast.

them, and assures them of her largess. She drives away bad dreams and opens the gates of darkness. In another hymn, Rig Veda VI:6,7 Usha delivers men from the power of curses. She is a young maiden dressed gaily and reveals her bosom to mortals. The sun follows her as a lover and she is known as the wife and beloved of Sūrya, the sun god. The lovely goddess brings wealth, long life, fame, and glory.

Rig Veda I:113 Usha the Dawn

Selections from Hindu Texts

Introduction

The Rig Veda, consisting of 1,028 hymns, is the oldest of the four collections of the Vedas, from the Sanskrit word *vid* (to know). The other Vedas are the Yajur Veda, the Sama Veda, and the Arthava Veda. Each of the four Vedas consists of two parts, the Saṃhitā, consisting of hymns and incantations used in rituals and sacrifices, and the Brāhmaṇa, offering exegeses on ritual. The Rig Veda, composed over several centuries by generations of poets, marks the beginning of Hindu religious–philosophical thought. From the worship of many gods such as Usha and Indra, the concept of monism—as represented by the Upanishads—arises. Hinduism offers guidance to every aspect of life and for every stage of life. The special characteristic of Hinduism is the concept of the transmigration of souls. Doing one’s duty is the key to living a virtuous life and this can be expressed in devotion to god. These ideas are expressed in the readings that follow.

The poems dedicated to the Goddess Usha, the Goddess of Dawn, are among the most beautiful in the Vedas. She is the subject of twenty hymns and her name is invoked 300 times in the Saṃhitā. In Rig Veda I:48 she is referred to as “Daughter of the Sky, the Lady of Light.” She was also called the mother of the gods. She tends to everything, rouses man and animals to activity, encourages

Selections from the Upanishads

Introduction

The Upanishads, literally “to sit down in front of,” are philosophical ideas of the Vedic Indo-Europeans created in dialogue form and transmitted by gurus to students. They were memorized by rote learning, hence they are called *smritis* as opposed to the *śrutis*, which were Vedic texts to be recited and heard. Collectively, they are also called Vedānta, “the end of the Vedas.” They are not concerned with rituals or sacrifices but with abstract speculations about truth and reality, the knowledge of which would enable a person to attain release (*moksha*) from the cycle of birth and rebirth. They revolve around the concepts of *Brahman* (the Absolute) and *ātman* (the Self or individual soul). They are mostly written in prose although a few are in verse. They are pre-Buddhist and the earliest were written in archaic Sanskrit but some are later compositions. There are 108 extant dialogues but Shankara (8th century), who expounded the monism of Vedānta through his “Brahman is reality, the world is illusion, and the soul is God,” wrote commentaries on twelve of the thirteen Upanishads considered to be the original treatises. Each Upanishad was attached to a Brāhmaṇa, a supplement of a Veda. Representing different philosophic schools, some of the Upanishads expound monistic ideas, some stress the worship of a personal god, and others focus on the practice of yoga.

Yājñavalkya the sage had two wives, Maitreyi and Katyayani, and when—in the “Fourth Brāhmaṇa”—he wished to make a settlement on them and depart on another phase of his life as an ascetic, his favorite wife Maitreyi asked him whether she would be immortal if the settlement he made on her would make her wealthy. When he replied that wealth would not bring immortality she asked him, therefore, what was the good of wealth? Instead he should give her knowledge. He was touched by this reply and informed her that she should see, know, perceive, and hear the *ātman*. Once she had understood that there was only consciousness of the Self and that nothing else was real then she would achieve immortality. With that he departed, content that his message—that the only reality was the one when the soul had joined in unity with the Absolute—had been understood.

Throughout the Upanishads the soul of the individual is identified with the soul of the universe and is considered the only reality. There were many ways to achieve understanding of this and renunciation was one of them. A life of asceticism was not absolutely necessary to achieve salvation—even rulers could realize Brahman—but if a mind was filled with material cares then it was very difficult. Thus, the renouncing of all pleasures, including the joy of family, was one of the ways to achieve salvation. This is the message of the “Fifth Brāhmaṇa.”

In the “Sixth Brāhmaṇa,” the delightful conversation between the learned lady Gārgī and Yājñavalkya instructs her not to think too much and not to ask too many questions. This offers the Upanishadic message that salvation comes through an abstract and instinctual understanding of the reality of Brahman and not through sacrifices and good works. This reflects the Upanishadic method of explanation of the path to salvation. The nature of the *ātman* was not expressed in concrete terms but in negative ones as “not this, not that” (*neti, neti*). It was a totally abstract entity that could not be assailed. This is seen in the “Seventh Brāhmaṇa,” which heralded that an understanding of the path of salvation would lead to the freedom from all desires and that, in turn, would lead to unity with Brahman in a state of bliss that existed before creation itself.

Śvetatāku is one of the most familiar interlocutors in the Upanishads and his dialogues in the ninth through fourteenth khandu are some of the most endearing, most celebrated, and most cited. Śvetatāku was a conceited youth who had studied with brahmins for twelve years. In one renowned dialogue he was instructed to fetch a fig, to divide it, to divide the seeds, and to explain what he saw. When he said nothing, he was informed that what he missed was the essence of the fig and that the whole world had it as its soul. That was reality, *ātman*, and that too was Śvetatāku. In the parable of the salt in the water he was asked to place some salt in water and come back the next morning and explain where the salt was. When he said he could not find it he was asked to sip the water from two ends and the middle. He said that it was always the same but was told that it contained the finest essence which was the whole world, which was *ātman*, which was Śvetatāku.

The Fourth Brāhmaṇa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas. 2d ed., rev. London: Oxford University Press, 1931, pp. 98–102.*

The conversation of Yājñavalkya and Maitreyī concerning the pantheistic Soul

1. ‘Maitreyī!’ said Yājñavalkya, ‘lo, verily, I am about to go forth from this state. Behold! let me make a final settlement for you and that Kātyāyanī,’

2. Then said Maitreyī: ‘If now, sir, this whole earth filled with wealth were mine, would I be immortal thereby?’

‘No,’ said Yājñavalkya. ‘As the life of the rich, even so would your life be. Of immortality, however, there is no hope through wealth.’

3. Then said Maitreyī: ‘What should I do with that through which I may not be immortal? What you know, sir—that, indeed, tell me!’

4. Then said Yājñavalkya: ‘Ah (*bata*)! Lo (*are*), dear (*priyā*) as you are to us, dear is what you say! Come, sit down. I will

explain to you. But while I am expounding, do you seek to ponder thereon.’

5. Then said he: ‘Lo, verily, not for love of the husband is a husband dear, but for love of the Soul (*Ātman*) a husband is dear.

Lo, verily, not for love of the wife is a wife dear, but for love of the Soul a wife is dear.

Lo, verily, not for love of the sons are sons dear, but for love of the Soul sons are dear.

Lo, verily, not for love of the wealth is wealth dear, but for love of the Soul wealth is dear.

Lo, verily, not for love of Brahmanhood (*brabma*) is Brahmanhood dear, but for love of the Soul Brahmanhood is dear.

Lo, verily, not for love of Kshatrahood (*ksatra*) is Brahman dear, but for love of the Soul Kshatrahood is dear.

Lo, verily, not for love of the worlds are the worlds dear, but for love of the Soul the worlds are dear.

Lo, verily, not for love of the gods are the gods dear, but for love of the Soul the gods are dear.

Lo, verily, not for love of all is all dear, but for love of the Soul all is dear.

Lo, verily, it is the Soul (*Ātman*) that should be seen, that should be hearkened to, that should be thought on, that should be pondered on, O Maitreyī. Lo, verily, with the seeing of, with the hearkening of the Soul, this world-all is known.

6. Brahmanhood has deserted him who knows Brahmanhood in aught else than the Soul.

Kshatrahood has deserted him who knows Kshatrahood in aught else than the Soul.

The Worlds have deserted him who knows the worlds in aught else than the Soul.

The gods have deserted him who knows the gods in aught else than the Soul.

Beings have deserted him who knows beings in aught else than the Soul.

Everything has deserted him who knows everything in aught else than the Soul.

This Brahmanhood, this Kshatrahood, these worlds, these gods, these beings, everything here is what this Soul is.

7. It is—as, when a drum is being beaten, one would not be able to grasp the external sounds, but by grasping the drum or the beater of the drum the sound is grasped.

8. It is—as, when a conch-shell is being blown, one would not be able to grasp the external sounds, but by grasping the conch-shell or the blower of the conch-shell the sound is grasped.

9. It is—as, when a lute is being played, one would not be able to grasp the external sounds, but by grasping the lute or the player of the lute the sound is grasped.

10. It is—as, from a fire laid with damp fuel, clouds of smoke separately issue forth, so, lo, verily, from this great Being (*bbūta*) has been breathed forth that which is

Rig-Veda, Yajur-Veda, Sāma-Veda, [Hymns] of the Atharvans and Āngirases, Legend (*itibāsa*), Ancient Lore (*purāna*), Sciences (*vidyā*), Mystic Doctrines (*upanīṣad*), Verses (*śloka*), Aphorisms (*sūtra*), Explanations (*anuvyākhyāna*), and Commentaries (*vyākhyāna*). From it, indeed, are all these breathed forth.

11. It is—as of all waters the uniting-point is the sea, so of all touches the uniting-point is the skin, so of all tastes the uniting-point is the tongue, so of all smells the uniting-point is the nostrils, so of all forms the uniting-point is the eye, so of all sounds the uniting-point is the ear, so of all intentions (*saṅkalpa*) the uniting-point is the mind (*manas*), so of all knowledges the uniting-point is the heart, so of all acts (*karma*) the uniting-point is the hands, so of all pleasures (*ānanda*) the uniting-point is the generative organ, so of all evacuations the uniting-point is the anus, so of all journeys the uniting-point is the feet, so of all Vedas the uniting-point is speech.

12. It is—as a lump of salt cast in water would dissolve right into the water; there would not be [any] of it to seize forth, as it were (*iva*), but wherever one may take, it is salty indeed—so, lo, verily, this great Being (*bbūta*), infinite, limitless, is just a mass of knowledge (*vijñāna-ghana*).

Arising out of these elements (*bbūta*), into them also one vanishes away. After death there is no consciousness (*na pretya samjñā 'sti*). Thus, lo, say I.’ Thus spake Yājñavalkya.

13. Then spake Maitreyī: ‘Herein, indeed, you have bewildered me, sir—in saying (*iti*): “After death there is no consciousness!”’

Then spake Yājñavalkya: ‘Lo, verily, I speak not bewilderment (*moha*). Sufficient, lo, verily, is this for understanding.

14. For where this is a duality (*dvaita*), as it were (*iva*), there one sees another; there one smells another; there one hears another; there one speaks to another; there one thinks another; there one understands another. Where, verily, everything has become just one’s own self, then whereby and whom would one smell? then whereby and whom would one see? then whereby and whom would one hear? then whereby and to whom would one speak? then whereby and on whom would one think? then whereby and whom would one understand? Whereby would one understand him by whom one understands this All? Lo, whereby would one understand the understander?’

The Fifth Brāhmana

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, pp. 112–113.

The practical way of knowing Brahma—by renunciation

Now Kahola Kaushītakeya questioned him. ‘Yājñavalkya,’ said he, ‘explain to me him who is just the Brahma present and not beyond our ken, him who is the Soul in all things.’

‘He is your soul, which is in all things.’

‘Which one, O Yājñavalkya, is in all things?’

‘He who passes beyond hunger and thirst, beyond sorrow and delusion, beyond old age and death—Brahmans who know such a Soul overcome desire for sons, desire for wealth, desire for worlds, and live the life of mendicants. For desire for sons is desire for wealth, and desire for wealth is desire for worlds, for both these are merely desires. Therefore let a Brahman become disgusted with learning and desire to live as a child. When he has become disgusted both with the state of childhood and with learning, then he becomes an ascetic (*muni*). When he has become disgusted both with the non-ascetic state and with the ascetic state, then he becomes a Brahman.’

‘By what means would he become a Brahman?’

‘By that means by which he does become such a one. Aught else than this Soul (*Ātman*) is wretched.’

Thereupon Kahola Kaushītakeya held his peace.

The Sixth Brāhmana

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, pp. 113–114.

The regressus to Brahma, the ultimate world-ground

Then Gārgī Vācāknvī questioned him. ‘Yājñavalkya,’ said she, ‘since all this world is woven, warp and woof, on water, on what, pray, is the water woven, warp and woof?’

‘On wind, O Gārgī.’

‘On what then, pray, is the wind woven, warp and woof?’

‘On the atmosphere-worlds, O Gārgī.’

‘On what then, pray, are the atmosphere-worlds woven, warp and woof?’

‘On the worlds of the Gandharvas, O Gārgī.’

‘On what then, pray, are the worlds of the Gandharvas woven, warp and woof?’

‘On the worlds of the sun, O Gārgī.’

‘On what then, pray, are the worlds of the sun woven, warp and woof?’

‘On the worlds of the moon, O Gārgī.’

‘On what then, pray, are the worlds of the moon woven, warp and woof?’

‘On the worlds of the stars, O Gārgī.’

‘On what then, pray, are the worlds of the stars woven, warp and woof?’

‘On the worlds of the gods, O Gārgī.’

‘On what then, pray, are the worlds of the gods woven, warp and woof?’

‘On the worlds of Indra, O Gārgī.’

‘On what then, pray, are the worlds of Indra woven, warp and woof?’

‘On the worlds of Prajāpati, O Gārgī.’

‘On what then, pray, are the worlds of Prajāpati woven, warp and woof?’

‘On the worlds of Brahma, O Gārgī.’

‘On what then, pray, are the worlds of Brahma woven, warp and woof?’

Yājñavalkya said: ‘Gārgī, do not question too much, lest your head fall off. In truth, you are questioning too much about a divinity about which further questions cannot be asked. Gārgī, do not over-question.’

Thereupon Gārgī Vācāknvī held her peace.

The Soul of the Unreleased after Death

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, pp. 140–141.

3. Now as a caterpillar, when it has come to the end of a blade of grass, in taking the next step draws itself together towards it, just so this soul in taking the next step strikes down this body, dispels its ignorance, and draws itself together [for making the transition].

4. As a goldsmith, taking a piece of gold, reduces it to another newer and more beautiful form, just so this soul, striking down this body and dispelling its ignorance, makes for itself another newer and more beautiful form like that either of the fathers, or of the Gandharvas, or of the gods, or of Prajāpati, or of Brahma, or of other beings.

5. Verily, this soul is Brahma, made of knowledge, of mind, of breath, of seeing, of hearing, of earth, of water, of wind, of space, of energy and of non-energy, of desire, of anger and of non-anger, of virtuousness and of non-virtuousness. It is made of everything. This is what is meant by the saying “made of this, made of that.”

According as one acts, according as one conducts himself, so does he become. The doer of good becomes good. The doer of evil becomes evil. One becomes virtuous by virtuous action, bad by bad action.

But people say: “A person is made [not of acts, but] of desires only.” [In reply to this I say:] As is his desire, such is his resolve; as his resolve, such the action he performs; what action (*karma*) he performs, that he procures for himself.

6. On this point there is this verse:—

Where one’s mind is attached—the inner self
Goes thereto with action, being attached to it alone.
Obtaining the end of his action,

Whatever he does in this world,
He comes again from that world
To this world of action.

—So the man who desires.

The Soul of the Released

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by*

George C. O. Haas. 2d ed., rev. London: Oxford University Press, 1931, pp. 141–144.

Now the man who does not desire.—He who is without desire, who is freed from desire, whose desire is satisfied, whose desire is the Soul—his breaths do not depart. Being very Brahma, he goes to Brahma.

7. On this point there is this verse:—

When are liberated all
The desires that lodge in one's heart,
Then a mortal becomes immortal!
Therein he reaches Brahma!

As the slough of a snake lies on an ant-hill, dead, cast off, even so lies this body. But this incorporeal, immortal Life (*prāṇa*) is Brahma indeed, is light indeed.'

'I will give you, noble sir, a thousand [cows],' said Janaka, [king] of Videha.

8. [Yājñavalkya continued:] 'On this point there are these verses:—

The ancient narrow path that stretches far away
Has been touched by me, had been found by me.
By it the wise, the knowers of Brahma, go up
Hence to the heavenly world, released.

9. On it, they say, is white and blue
And yellow and green and red.
That was the path by Brahma found;
By it goes the knower of Brahma, the doer of right
(*punya-kri*),
and every shining one.

10. Into blind darkness enter they
That worship ignorance;
Into darkness greater than that, as it were, they
That delight in knowledge.

11. Joyless are those worlds called,
Covered with blind darkness.
To them after death go those
People that have not knowledge, that are not awakened.

12. If a person knew the Soul (*Ātman*),
With the thought "I am he!"
With what desire, for love of what
Would he cling unto the body?

13. He who has found and has awakened to the Soul
That has entered this conglomerate abode—
He is the maker of everything, for he is the creator of all;
The world is his: indeed, he is the world itself.

14. Verily, while we are here we may know this.
If you have known it not, great is the destruction.
Those who know this become immortal,
But others go only to sorrow.

15. If one perceives Him
As the Soul, as God (*deva*), clearly,
As the Lord of what has been and of what is to be—
One does not shrink away from Him.

16. That before which the year
Revolves with its days—
That the gods reverse as the light of lights,
As life immortal.

17. On whom the five peoples
And space are established—
Him alone I, the knowing, I, the immortal,
Believe to be the Soul, the immortal Brahma.

18. They who know the breathing of the breath,
The seeing of the eye, the hearing of the ear,
(The food of food), the thinking of the mind—
They have recognized the ancient, primeval Brahma.

19. By the mind alone is It to be perceived.
There is on earth no diversity.
He gets death after death,
Who perceives here seeming diversity.

20. As a unity only is It to be looked upon—
This indemonstrable, enduring Being,
Spotless, beyond space,
The unborn Soul, great, enduring.

21. By knowing Him only, a wise
Brahman should get for himself intelligence;
He should not meditate upon many words,
For that is a weariness of speech.

22. Verily, he is the great, unborn Soul, who is this [person] consisting of knowledge among the senses. In the space within the heart lies the ruler of all, the lord of all, the king of all. He does not become greater by good action nor inferior by bad action. He is the lord of all, the overlord of beings, the protector of beings. He is the separating dam for keeping these worlds apart.

Such a one the Brahmans desire to know by repetition of the Vedas, by sacrifices, by offerings, by penance, by fasting. On knowing him, in truth, one becomes an ascetic (*muni*). Desiring him only as their home, mendicants wander forth.

Verily, because they know this, the ancients desired not offspring, saying: "What shall we do with offspring, we whose is this Soul, this world?" They, verily, rising above the desire for sons and the desire for wealth and the desire for worlds, lived the life of a mendicant. For the desire for sons is the desire for wealth, and the desire for wealth is the desire for worlds; for both these are desires.

That Soul (*Ātman*) is not this, it is not that (*neti, neti*). It is unseizable, for it cannot be seized. It is indestructible, for it cannot be destroyed. It is unattached, for it does not attach itself. It is unbound. It does not tremble. It is not injured.

Him [who knows this] these two do not overcome—neither the thought "Hence I did wrong," nor the thought "Hence I did right." Verily, he overcomes them both. What he has done and what he has not done do not affect him.

23. This very [doctrine] has been declared in the verse:—
This eternal greatness of a Brahman
Is not increased by deeds (*karman*), nor diminished.
One should be familiar with it. By knowing it,
One is not stained by evil action.

Therefore, having this knowledge, having become calm, subdued, quiet, patiently enduring, and collected, one sees the Soul just in the soul. One sees everything as the Soul.

Evil does not overcome him; he overcomes all evil. Evil does not burn him: he burns all evil. Free from evil, free from impurity, free from doubt, he becomes a Brahman.

This is the Brahma-world, O king,' said Yājñavalkya.

[Janaka said:] 'I will give you, noble sir, the Videhas and myself also to be your slave.'

24. [Yājñavalkya continued:] 'This is that great, unborn Soul, who eats the food [which people eat], the giver of good. He finds good who knows this.

25. Verily, that great, unborn Soul, undecaying, undying, immortal, fearless, is Brahma. Verily, Brahma is fearless. He who knows this becomes the fearless Brahma.'

The Ninth Khaṇḍa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, p. 246.

The unitary World-Soul, the immanent reality of all things and of man

1. 'As the bees, my dear, prepare honey by collecting the essences of different trees and reducing the essence to a unity,

[2.] as they are not able to discriminate "I am the essence of this tree," "I am the essence of that tree"—even so, indeed, my dear, all creatures here, though they reach Being, know not "We have reached Being."

3. Whatever they are in this world, whether tiger, or lion, or wolf, or boar, or worm, or fly, or gnat, or mosquito, that they become.

4. That which is the finest essence—this whole world has that as its soul. That is Reality. That is Ātman (Soul). That art thou, Śvetaketu.'

'Do you, sir, cause me to understand even more.'

'So be it, my dear,' said he.

The Tenth Khaṇḍa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, pp. 246–247.

1. 'These rivers, my dear, flow, the eastern toward the east, the western toward the west. They go just from the ocean to the ocean. They become the ocean itself. As there they know not "I am this one," "I am that one"—[2] even so, indeed, my dear, all creatures here, though they have come forth Being, know not "We have come forth from Being." Whatever they are in this world, whether tiger, or lion, or wolf, or boar, or worm, or fly, or gnat, or mosquito, that they become.

3. That which is the finest essence—this whole world has that as its soul. That is Reality. That is Ātman (Soul). That art thou, Śvetaketu.

'Do you, sir, cause me to understand even more.'

'So be it, my dear,' said he.

The Eleventh Khaṇḍa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, p. 247.

1. 'Of this great tree, my dear, if some one should strike at the root, it would bleed, but still live. If some one should strike at this middle, it would bleed, but still live. If some one should strike at its top, it would bleed, but still live. Being pervaded by Atman (Soul), it continues to stand, eagerly drinking in moisture and rejoicing.

2. If the life leaves one branch of it, then it dries up. It leaves a second; then that dries up. It leaves a third; then that dries up. It leaves the whole; the whole dries up. Even so, indeed, my dear, understand,' said he.

3. Verily, indeed, when life has left it, this body dies. The life does not die.

That which is the finest essence—this whole world has that as its soul. That is Reality. That is Ātman (Soul). That art thou, Śvetaketu.'

'Do you, sir, cause me to understand even more.'

'So be it, my dear,' said he.

The Twelfth Khaṇḍa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, pp. 247–248.

1. 'Bring hither a fig from there.'

'Here it is, sir.'

'Divide it.'

'It is divided, sir.'

'What do you see there?'

'These rather (*iva*) fine seeds, sir.'

'Of these, please (*aṅga*), divide one.'

'It is divided, sir.'

'What do you see there?'

'Nothing at all, sir.'

2. Then he said to him: 'Verily, my dear, that finest essence which you do not perceive—verily, my dear, from that finest essence this great Nyagrodha (sacred fig) tree thus arises.

3. Believe me, my dear,' said he, (3) 'that which is the finest essence—this whole world has that as its soul. That is Reality. That is Ātman (Soul). That art thou, Śvetaketu.'

'Do you, sir, cause me to understand even more.'

'So be it, my dear,' said he.

The Thirteenth Khaṇḍa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, p. 248.

1. ‘Place this salt in the water. In the morning come unto me.’

Then he did so.

Then he said to him: ‘That salt you placed in the water last evening—please bring it hither.’

Then he grasped for it, but did not find it, as it was completely dissolved.

2. ‘Please take a sip of it from this end,’ said he. ‘How is it?’
‘Salt.’

‘Take a sip from the middle,’ said he. How is it?’

‘Salt.’

‘Take a sip from that end,’ said he. ‘How is it?’

‘Salt.’

‘Set it aside. Then come unto me.’

He did so, saying. ‘It is always the same.’

Then he said to him: ‘Verily, indeed, my dear, you do not perceive Being here. Verily, indeed, it is here.

3. That which is the finest essence—this whole world has that as its soul. That is Reality. That is Ātman (Soul). That art thou, Śvetaketu.’

‘Do you, sir, cause me to understand even more.’

‘So be it, my dear,’ said he.

The Fourteenth Khaṇḍa

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, p. 249.

1. Just as, my dear, one might lead away from the Gandhāras a person with his eyes bandaged, and then abandon him in an uninhabited place; as there he might be blown forth either to the east, to the north, or to the south, since he had been led off with his eyes bandaged and deserted with his eyes bandaged; [2] as, if one released his bandage and told him, “In that direction are the Gandhāras; go in that direction!” he would, if he were a sensible man, by asking [his way] from village to village, and being informed, arrive home at the Gandhāras—even so here on earth one who has a teacher knows: “I shall remain here only so long as I shall not be released [from the bonds of ignorance]. Then I shall arrive home.”

3. That which is the finest essence—this whole world has that as its soul. That is Reality. That is Ātman (Soul). That art thou, Śvetaketu.’

‘Do you, sir, cause me to understand even more.’

‘So be it, my dear,’ said he.

Liberation into the Real Brahma By Relinquishment of All Desires, Mental Activity, and Self-Consciousness

SOURCE: *The Thirteen Principal Upanishads. Translated from the Sanskrit with an outline of the philosophy of the Upanishads and an annotated bibliography by Robert Ernest Hume. With a list of recurrent and parallel passages by George C. O. Haas.* 2d ed., rev. London: Oxford University Press, 1931, pp. 442–443.

30. *Om!* One should be in a pure place, himself pure (*śuci*), abiding in pureness (*sativa*), studying the Real (*sat*), speaking of the Real, meditating upon the Real, sacrificing to the Real. Henceforth, in the real Brahma which longs for the Real, he becomes completely other. So he has the reward (*phala*) of having his fetters cut; becomes void of expectation, freed from fear in regard to others [as fully] as in regard to himself, void of desire. He attains to imperishable, immeasurable happiness, and continues [therein].

Verily, freedom from desire (*niṣkāmatva*) is like the choicest extract from the choicest treasure. For, a person who is made up of all desires, who has the marks of determination, conception, and self-conceit, is bound. Hence, in being the opposite of that, he is liberated.

On this point some say: “It is a quality (*guṇa*) which by force of the developing differentiation of Nature (*prakṛti*) comes to bind the self with determination [and the like], and that liberation results from the destruction of the fault of determination [and the like].”

[But] it is with the mind, truly, that one sees. It is with the mind that one hears. Desire, conception, doubt, faith, lack of faith, steadfastness, lack of steadfastness, shame, meditation, fear—all this is truly mind.

Borne along and defiled by the stream of Qualities, unsteady, wavering, bewildered, full of desire, distracted, one goes on into the state of self-conceit. In thinking “This is I” and “That is mine” one binds himself with himself, as does a bird with a snare! Hence a person who has the marks of determination, conception, and self-conceit is bound. Hence, in being the opposite of that, he is liberated. Therefore one should stand free from determination, free from conception, free from self-conceit. This is the mark of liberation (*mokṣa*). This is the pathway to Brahma here in this world. This is the opening of the door here in this world. By it one will go to the farther shore of this darkness, for therein all desires are contained. On this point they quote:—

When cease the five
[Sense-] knowledges, together with the mind,
And the intellect stirs not—
That, they say, is the highest course.’

Sanskrit and Hindi Pronunciation Guide

Long vowels have lines above them: ā, ī, and ū are pronounced as the “a” in *bar* or *calm*, the “i” in *machine*, and the “u” in *rule* or *soon*.

Diphthongs e, o, ai, and au are also long, pronounced: “e” as the “a” in *take* or the “e” in *prey*; “o” as in *so* or *go*; “ai” as “ai” in *aisle* or “i” in *time*; “au” as in “ow” in *how* or *cow*.

Short vowels are a, i, and u and pronounced: “a” as “u” in *up* or *cut*; “i” as “i” in *sin* or *bit*; and “u” as “u” in *pull* or *bull*.

Consonants

Pronounce “c” as “ch” in *chin* and “g” as “g” in *gun*.

Aspirates “dh,” “gh,” and “bh” pronounce as in *roundhouse*, *doghouse*, and *clubhouse*.

Aspirates “th” and “ph” pronounce as in *pothole* and *shepherd*.

Ś and ṣ are both pronounced as “sh” in *shape*.

abhisheka: Ancient Brahman ritual to consecrate a king.

Ādityas: Early Vedic deities.

adivasis: Tribal peoples.

Agni: Vedic Aryan god of fire.

ahimsa: Nonviolence.

Ajivika: Early monastic sect, similar to Jains.

Akbar: “Great” Mughal emperor.

amir: Muslim prince or commander of troops.

aparigraha: Hindu vow of poverty.

arhat: Buddhist monk who has achieved great wisdom.

Arjuna: Brave Aryan Pandava brother, whose charioteer was Krishna.

Artha Shāstra: “Science of Material Gain,” ancient Brahman textbook on polity.

Aryan: Indo-European linguistic group or early tribal invaders of North India.

Aryavarta: Land of the Aryans; North India’s Punjab to Delhi.

asat: Ancient Rig Vedic “Unreal,” or untrue; nebulous or demonic.

Ashoka: Mauryan emperor.

Ashrama: One of four stages in a good Hindu’s life; also a rural community.

ashvamedha: Vedic royal horse sacrifice.

Ashvins: Vedic Hindu twin gods.

Atharva Veda: Late Vedic Saṃhitā, containing medicinal remedies.

ātman: Ancient Vedic breath, later self; finally Soul, identical to Vedāntic Brahman.

Aurangzeb: Mughal emperor.

avatāra: Earthly emanation of Vishnu, nine of which have appeared, the tenth yet to come.

avidya: Ignorance.

Ayodhya: Ancient North Indian Hindu Temple city, recent center of communal conflict.

azad: Free.

Babur: First great Mughal emperor.

bagh: Garden.

Bande Mataram: “Hail to thee, mother!,” first national anthem of India.

- Bania:** Hindu merchant caste of Gujarat.
- Bhadralok:** Bengali intellectuals, “gentle learned people.”
- Bhagavad Gītā:** “Song of the blessed one,” philosophic dialogue between Arjuna and Krishna from the longer epic Mahābhārata.
- bhakti:** Hindu devotion to a personal god.
- Bharata:** Sanskrit name for India; name of an ancient Aryan tribe and of Rāma’s brother.
- Bharatiya Janata Party (BJP):** “Indian People’s Party,” a political party.
- Bhīma:** Ancient Pandava brother hero.
- Bhoodan:** “Gift of land,” original appeal launched by Vinoba Bhave.
- Bimbisara:** Buddha’s royal patron, king of Magadha.
- Bindusara:** Second Mauryan emperor, father of Ashoka.
- bodhi:** Enlightenment.
- bodhisattva:** Mahayana Buddhist heavenly being, whose “essence is True Enlightenment.”
- Brahmā:** Vedic god of creation.
- Brahmacharya:** Celibate studenthood *asbrama*, the first “stage” of a devout Hindu’s life.
- Brahman:** Sacred utterance; hence, Hinduism’s highest class of priests who control religious mantras, reciting Vedic texts from memory; also transcendental Brahman, the Upanishadic divine principle, equated to *ātman* in Vedānta texts.
- Brāhmaṇas:** Ancient commentaries on Vedic Saṃhitās.
- Brahmi:** Ancient alphabet and script in which Sanskrit Vedic and Hindu texts were first written.
- Brihadāranyaka Upanishad:** “Great Forest” Upanishadic text, perhaps the most ancient to survive.
- Buddha:** The Enlightened One.
- caste:** Portuguese term for India’s *jati* (birth) and *varṇa* (class) systems.
- chaitya:** Sacred spot, or shrine, carved into ancient Buddhist and Jain caves.
- chakra:** Wheel, found in the middle white band of India’s flag; Ashoka’s “Wheel”; also Mahatma Gandhi’s cotton hand-spinning “wheel.”
- chakravartin:** Universal Hindu emperor, for whom the “Wheel of Law” turns.
- Chalukya:** Ancient Central and South Indian Hindu dynasty; later period.
- Chandragupta I and II:** First and third emperors of the later Gupta dynasty.
- Chandragupta Mauryan:** First emperor of the ancient Mauryan dynasty.
- Charaka:** Ancient Indian physician, author of an important medical text.
- Chatrapati:** Ancient Hindu monarch of the “Four Quarters” of the universe.
- Cholas:** Ancient South Indian maritime dynasty, greatest Hindu bronze artists.
- Dalits:** Formerly “Untouchables,” or “Outcaste” peoples, named Harijans by Mahatma Gandhi.
- danda:** “Rod” used to punish lazy students or neighboring kingdoms, ancient India’s weapon for retaining and expanding a raja’s power.
- dandaniti:** Art of government.
- Darshana:** “View” or “vision” of an icon of a Hindu god, saintly being, or mahatma; also the term used for each of the classical schools of Hindu philosophy.
- Dasa:** Initially pre-Aryan “dark-skinned” peoples of the Indus Valley, later “slave.”
- Deva:** Vedic Aryan god—“Shining One.”
- dēvadāsi:** “Slave of the God,” temple dancers, orphan girls abandoned, left to be reared by Brahman priests, for whom they danced and performed other services.
- Devanagari:** “City of god”—the script in which most modern Indo-European languages, including India’s national language, Hindi, are written.
- Devī:** Hindu goddess.
- Dharma:** Hindu religion, law, duty, truth, or responsibility; a Sanskrit term of many meanings.
- Dharma Shāstra:** Ancient Hindu legal textbook, among which the Manava Dharma Shāstra (Manu’s law text) is most famous.
- Dhimmis:** “Peoples of the Book,” including Jews and Christians, specially protected by Muslim monarchs as long as they paid the extra *jizya* “head tax.”
- dhruva-pada:** Rhythmic musical form.
- dhyana:** Yogic meditation.
- diwan:** Prime minister to a Muslim sultan or emperor, originally “court.”
- diwani:** Revenue-collection powers granted by Mughal emperors to provincial officers.
- Draupadi:** Epic polyandrous wife of all five Pandava brothers.
- Dravidian:** Family of South Indian languages that include Tamil, Telugu, Malayalam, and Kanarese; a South Indian “nationalist” movement which has tried to unite all peoples who speak those tongues.
- dukkha:** Sorrow or suffering, the Buddha’s first noble truth of universal human pain.
- Durgā:** Mother goddess, Hinduism’s fiercest “Mother,” who wears a necklace of skulls.
- Dyaus:** Rig Vedic “Father Sky,” one of the most ancient Hindu gods.

- Elephanta:** Ancient Hindu rock-carved caves on an island off Mumbai (Bombay).
- Epic Age:** Hinduism's great epics, Mahābhārata and Rāmāyaṇa, were composed in North India between about 1000 B.C. and the dawn of the common era.
- Eucratides:** Early Bactrian Greek king who invaded Northern India.
- Euthydemus:** Bactrian Greek king who invaded India's North-West Frontier.
- Fahsien:** Chinese Buddhist monk who traveled through India during the Gupta era.
- feringi:** "Polluted" foreigner, a term often used by high caste Hindus.
- Gaṇeṣha:** One of the most popular Hindu gods, the elephant-headed son of Shiva and Pārvatī.
- Gaṅgā:** River goddess.
- Gayatri:** Rig Vedic morning sacred verse to the rising Sun god.
- ghats:** "Steps," usually of stone, leading into a river's water from Hindu temples along its bank, where worshipers bathe before praying, or as in Varanasi, the "burning *ghats*" where corpses are consumed by flame; also used for the mountain ridge along Southwest India, the "Western Ghats."
- gopī:** Milkmaid, usually a Hindu cowherd's daughter, devoted to fluting Krishna, the most perfect and beloved of Vishnu's *avatāras*.
- gōpura:** South Indian Hindu temple gate tower, usually high enough to be seen for miles.
- gotra:** Hindu Brahman exogamous sect.
- grama:** Village.
- Gupta dynasty:** Classical "Golden Age" of Hindu unification (c. A.D. 320–550).
- Gurjara-Pratiharas:** One of the last great Hindu dynasties of North India.
- Gurmukhi:** Unique cursive script used by Sikhs.
- guru:** Hindu teacher or preceptor; semidivine leader of the Sikhs, starting with Guru Nanak and ending with Guru Govind Singh.
- Guru Granth Sahib:** Sikh scripture, kept in Amritsar's Golden Temple.
- Hara:** Great Hindu god Shiva; ancient northern "capital" of Indus Valley, Harappa.
- Hari:** Great Hindu god Vishnu, disciples of whom are called Vaishnavites.
- Harihara:** Sculptured syncretism of Vishnu and Shiva, classical Hindu attempt to integrate artistically its two most popular male gods; royal founder of South India's Vijayanagar dynasty (Harihari I, r. A.D. 1336–1357).
- Harijan:** "Child of God," the term used by Mahatma Gandhi for "Untouchables."
- Harsha Vardhana:** Powerful king of Kanauj (r. A.D. 606–647).
- Hastinapura:** Ancient Vedic Aryan city.
- Hinayana:** "Lesser Vehicle" early form of Buddhism.
- Hsieun Tsang:** "Master of the Law," Chinese Buddhist pilgrim.
- Hyder Ali:** Muslim ruler of Mysore.
- Indra:** Great Vedic god of war.
- Isha Upanishad:** One of the most sacred Upanishads, of "the Lord-Isha."
- Islam:** Faith of the prophet Muhammad; Arabic, "surrender" to the will of Allah.
- Jahangir:** Great Mughal emperor (r. A.D. 1605–1627).
- Jain:** A follower of the faith of Mahāvīra, Jainism.
- Jajmani system:** A rural Hindu Indian system of exchange based on patronage and barter.
- Jallianwala Bagh:** A garden in Punjab's Amritsar, where some 400 Indian nationalist Sikhs and Hindus were massacred by British-led troops in April 1919.
- Jana:** Ancient Aryan tribe.
- Jatakas:** Mythical "birth" stories and folktales of previous "lives" of the Buddha.
- Jati:** "Birth" group, misnamed "caste," within which Hindus traditionally marry.
- jina:** "Conqueror," one of the titles given to the founder of Jainism, Mahāvīra.
- jiva:** Soul, very important to the Jain faith.
- jizya:** Head tax imposed by Muslim rulers on Dhimmis ("Peoples of the Book").
- Kailasanatha Temple:** Shiva's celestial palace carved out of the rock mountain at Ellora.
- Kālī:** Mother goddess ("Black") worshiped by millions of Hindus.
- Kālidāsa:** Greatest ancient Indian poet-dramatist, author of *Shakuntala*.
- kalpa:** A period within traditional Hindu-Jain cyclical cosmic aeons of time.
- Kāma:** Hindu god of love.
- karma:** To "do," or "act," actions bearing fruit similar to, or based upon, parent deeds.
- Karma Yoga:** "Discipline of Action," a Hindu path to salvation expounded in the Bhagavad Gītā.
- khadi:** Hand-spun cotton and woven cotton cloth, such as Mahatma Gandhi made.

- khalifa:** Muslim caliph or emperor, whose restoration was demanded by pan-Islamic leaders.
- Khalsa:** Sikh army of the “Pure.”
- Krishna:** Most popular *avatāra* of Vishna, pastoral Hindu god, whose name means “Black.”
- Kshatriya:** Hindu warrior; the second highest Hindu “class” (*varṇa*) among four.
- Lakshmaṇa:** Brother of Rāma.
- Lakshmī:** Mother goddess.
- lok:** People.
- Lok Sabha:** “House [Assembly] of the People”—Lower House of Parliament in New Delhi.
- Madhya Pradesh:** “Middle Province,” a large state of Central India.
- Mahābhārata:** “Great-Bharata,” the longer epic Sanskrit poem of ancient India.
- maharaja:** “Great-King,” the title taken by monarchs who conquered several rajas.
- mahatma:** “Great-Soul,” the only title Mahatma Gandhi ever had.
- Mahāvīra:** “Great Hero,” the title name of the founder of Jainism.
- Mahayana:** “Greater Vehicle” of later Buddhism, post-common era.
- Maheshvara:** “Great God,” the term often used for Shiva.
- mandala:** “Circle” or ring.
- mansabdar:** Mughal official, whose rank was usually associated with a number of horsemen for whom he was responsible, obliged to bring ready for battle, whenever the emperor called.
- mantra:** A sacred utterance, e.g., a syllable, “*Om*,” or god’s name, “*Ram, Ram*,” or phrase, as the Upanishadic equation of *ātman* and Brahman, “*Tat tvam asi*”—“thou art That One.”
- Maurya dynasty:** North Indian Jain–Buddhist imperial unification, (c. 324–184 B.C.).
- maya:** Illusion, used for material things of this world by Vedāntic philosophers.
- moksha:** “Liberation” or “release” from worldly pains of the here and now and reincarnation, a devout Hindu’s ultimate goal; sometimes called “*neti, neti*,” (“not this, not that”).
- mudra:** Hand gesture, hundreds of which are used as one code of classical Indian dance.
- nabob:** British corruption of Mughal *nawāb*.
- Naga:** Snake-spirit or tribe.
- Nanak:** Guru founder of Sikhism.
- Narasimha:** Man-lion *avatāra* of Vishnu.
- Nataraja:** Shiva depicted in bronze sculpture or other art forms as “King of Dance.”
- Nātya Shāstra:** Classic Hindu textbook of music, dance, and drama, attributed to the ancient sage Bharata.
- nawāb:** Mughal provincial governor, or viceroy, or deputy.
- netaji:** “Leader,” the title used by Subhash Chandra Bose.
- nirvāna:** “Blowing out,” the ultimate goal of “extinction” for Buddhist monks.
- Nyāya:** Ancient Hindu school of philosophy focusing on salvation through “logic.”
- om:** Sacred Sanskrit syllable of cosmic unity.
- Ophir:** Ancient West Indian port or region from which ivory, gold, and peacock feathers were shipped to King Solomon.
- Orissa:** Indian state, named Kalinga during the Mauryan era, conquered by Ashoka.
- padishah:** Mughal “emperor.”
- padmāsana:** Classical dance and Yogic lotus position.
- Pallavas:** South Indian “robber” dynasty, from fourth century B.C.
- Panchamas:** “Fifths,” a term used for “Untouchables,” who fall below the four-class Hindu system.
- panchayat:** Village “council of five,” usually Brahman, Kshatriya, or Vaishya elders.
- panchayati raj:** Ideal of rural democracy, an experiment launched in 1959 in India’s Rajasthan state, to help in its economic planning for agricultural development.
- Panch Shila:** “Five principles,” including peaceful coexistence, Prime Minister Nehru’s ideal foreign policy, initially agreed upon in a 1954 treaty with China regarding Tibet.
- Pandavas:** Five virtuous sons of Pandu—Yudhishtira, Bhīma, Arjuna, Nakula, and Sahadeva, the heroes of the epic Mahābhārata, who defeat their Kaurava cousins at Kurukshetra.
- Parsis:** A small, enlightened Zoroastrian community, expelled from Persia in the seventh century A.D., settling mostly in Bombay (Mumbai), leaders in politics, law, and the arts.
- Pārvatī:** Shiva’s consort, popular Hindu mother goddess.
- Pashupati:** Shiva as “Lord of Beasts.”

- Pataliputra:** Ancient capital of the Mauryan empire, modern Patna, capital of Bihar.
- peshwas:** Chitpavin Brahman prime ministers of Poona (Pune).
- pir:** Muslim holy Sufi.
- prakriti:** “Woman”; also primeval “matter,” in the Sāṅkhya school of Hindu philosophy.
- Punjab:** “Land of Five Rivers.”
- Pur:** Ancient fortified city.
- Purāṇas:** Ancient “tales,” mythical stories of many incarnations of popular Hindu gods.
- pardah:** Hiding female Muslim faces and bodies behind usually dark cloth veils and robes.
- purusha:** “Man,” the original Vedic sacrificial Being from which the four Hindu *varṇas* emerged, Brahmans from his mouth, Kshatriyas from his arms, Vaishyas from his thighs, Shudras from his feet; in the Sāṅkhya (“Numbers”) school of classical Hindu philosophy, Purusha (“Man” or “Spirit”) is the first of 25 numbered “matters,” the other 24 emerging from Prakriti (“Woman”).
- Purva Mimamsa:** “Early inquiry” school of ancient Hindu philosophy, focuses on re-creating the ancient Vedic fire altar and performing its annual ritual sacrifice.
- Pushyamitra Shunga:** Martial founder of the Shunga dynasty (184–72 B.C.).
- Quaid-i-Azam:** “Great Leader,” honorific title reserved for M. A. Jinnah, father of Pakistan.
- Qurʿan:** Sacred “book” of Islamic scripture, Arabic message of God heard by the prophet Muhammad.
- Rādhā:** Krishna’s most beloved consort.
- rāga:** Series of five or more musical notes on which a classical Indian melody is based.
- Raj:** “Rule,” hence government, used for the British Empire of India, “The Raj.”
- raja:** Ancient Indian king, later exalted to “Great King,” maharaja, and “King of Kings,” rajaraja.
- Rajaraja Chola:** “King of Kings” of the South Indian dynasty (r. A.D. 985–1016).
- Rāma:** Ideal heroic Hindu king; popular incarnation (*avatāra*) of Vishnu.
- Rāmāyaṇa:** The shorter Sanskrit epic poem, the story of Raja Rāma and his beloved wife Sītā.
- Ram Rajya:** Hinduism’s mythical “Golden Age,” when Raja Rāma ruled over Ayodhya.
- Rashtrakuta:** “Country Lord” dynasty established in eighth century A.D. in Central India.
- Rishi:** Rig Vedic sage.
- rita:** Vedic cosmic order of the true.
- Rudra:** Rig Vedic (“Howler”) god, later associated with Shiva.
- Rukmini:** Krishna’s consort.
- ryot:** Agricultural laborer.
- sabha:** Council chamber or assembly.
- Salt March:** Led by Mahatma Gandhi in opposition to the British tax on salt, March–April 1930.
- Samadhi:** Deep Yoga meditation.
- Sāma Veda:** Vedic prayer hymnal, probably the third Saṃhitā compilation.
- Saṃhitā:** Four ancient compilations of Vedic prayers: Rig, Yajur, Sāma, Atharva.
- Sāṅkhya:** “Numbers” school of classical Hindu philosophy.
- saṃsāra:** Cycle of birth and death; life in this world of pain and sorrow.
- Samudra Gupta:** Second Guptan emperor (r. A.D. 335–375).
- sangha:** Buddhist monastic order.
- Sarasvatī:** Goddess of the Sarasvati River, sister of Gaṅgā.
- sarkar:** District; later expanded to mean the entire British administration.
- Sarvodaya:** “The uplift of all,” Gandhian socialism.
- sat, satya:** Vedic “Real,” and “True” or “Truth.”
- sati:** “True One,” euphemism used for a Hindu widow immolated on her husband’s funeral pyre, abolished by the British in 1829, but recently revived in Rajasthan.
- satyagraha:** “Hold fast to truth,” Mahatma Gandhi’s term for his nonviolent, noncooperation movements, first launched in South Africa, later as nationwide protests in India.
- sepoy:** Indian “police” first hired by Portuguese, later by the British, also used as soldiers.
- Shah Jahan:** Mughal emperor (r. A.D. 1628–1658).
- Shaivism:** Hindu worship of Shiva, the “Great God” (Maheshvara).
- Shakti:** Mother goddess “Power,” whose undying force invigorates all male gods, each of whom thus needs a female consort; Shiva’s first consort.
- Shakuntala:** Kālidāsa’s greatest Sanskrit drama; its heroine’s name.
- Shariʿa:** Islamic law.
- shastri:** Teacher.

- Shī'i:** Heterodox Islamic sects, followers of Ali.
- Shiva:** Hinduism's "Great God," "King of Dance," "Lord of Beasts," master of Yogic power.
- shreni:** Hindu merchant or artisan guild.
- shruti:** "Heard"—sacred Vedic texts, from the Rig Veda through Brāhmaṇa commentaries, and Upanishadic Vedānta.
- Shudra:** One of the lowest *varṇa* (class) of Hinduism's four Ashramas, usually a landless menial laborer.
- Sikh:** "Disciple," of the gurus (great teachers) of Sikhism.
- Sītā:** Rāma's consort, the ideal Hindu wife.
- sitar:** Classic stringed musical instrument, usually made of lacquered gourds.
- Soma:** Vedic god of divine nectar.
- stupa:** "Gathered" mound of earth and brick over some of the Buddha's ashes, worshiped by monks who circumambulate it in a clockwise direction.
- Sufism:** Mystical "third" sect of Islam, most appealing to lower class or outcaste Hindus.
- Sunni:** Orthodox Islamic faith of the majority of Muslims.
- swadeshi:** "Of our own country," goods made by Indian nationalists, rejecting British imports.
- swaraj:** "Of our own rule," the battle cry for independence, demanding "home rule" or "freedom," raised by early revolutionary leaders of India's National Congress.
- tabla:** Classic Indian musical drum set, covered with tightly drawn hide, the fast-moving fingers of skilled drummers tapping out rhythmic tālas to accompany a sitar player's *rāga*.
- tāla:** Rhythmic figure, the second most important element (after *rāga*) of classic Indian music.
- Tamil Nadu:** South India's "Land of the Tamils" state, formerly Madras.
- Tantrism:** Esoteric form of Hinduism, sexually orgiastic in nature, obscure in its ancient origins.
- tapas:** Heat generated during Yogic meditation.
- tapasya:** Self-purification through intense prolonged "suffering."
- Tat:** "That One," the transcendental monistic essence, Brahman, of Upanishadic Vedānta.
- Theravada:** "Teachings of the Elders," the earliest form of Buddhism.
- Thugi:** Ritual murder by strangulation, performed by gangs of Thugs, Hindu worshipers of Mother goddesses Kālī and Durgā, outlawed by the British in 1828.
- Tipu Sultan:** Enlightened Muslim ruler of Mysore, defeated by Lord Wellesley in 1799.
- Tīrthānkara:** "Ford-crosser," worshiped by Jains, the last (24th) of whom was Mahāvīra.
- ulama:** Muslim learned elite, plural of *alim*.
- Umā:** Hindu Mother goddess.
- Umma:** Universal Islamic brotherhood of Muslims.
- untouchables:** Lowest class of Hindus, also called Outcastes, or Harijans, now Dalits.
- Upanishad:** "To sit down in front of," esoteric teachings of Vedānta philosophy.
- vaidya:** Āyurvedic traditional Hindu physician.
- Vaisheshika:** "Atomic" or "individual characteristics" school of traditional Hindu philosophy.
- Vaishnavism:** Hindu worshipers of Vishnu, whose many *avatāras* include Krishna, Rāma, and the Buddha.
- Vaishya:** Merchant or landowning third "class" (*varṇa*) in Hinduism's social hierarchy.
- Varṇa:** Hindu "class," traditionally only four, though an outcaste fifth was later added.
- Varuṇa:** Rig Vedic god of "Universal Law and Order" (initially *rita*, later *dharma*).
- vazir:** Muslim ruler's premier.
- Vedānta:** "End of Vedas," Upanishadic philosophy, last of six classical schools of Hindu philosophy.
- Vedas:** Earliest Sanskrit ritual prayers and sacred books of "knowledge" (*vid*).
- vihara:** Monastic cells for living quarters carved out of mountain escarpments by Buddhist and Jain monks in Northeast India, in the state for which they are named—Bihar.
- vina:** "Lute," classic Hindu musical instrument, with a long fingerboard and gourd body.
- Vishnu:** Shares with Shiva the greatest popularity among a majority of Hindu worshipers of male divinities; devotees often marking their foreheads with a chalk or lime-white V.
- Yajur Veda:** Probably the second compilation (Saṃhitā) of ancient Vedic prayers.
- Yama:** Vedic god of death.
- Yoga:** "Discipline," probably the most ancient Indian school of philosophy, pre-Aryan in its Indus Valley origins, emerging later as the unifying discipline of all six classical schools of traditional Hindu philosophy, always associated with Shiva.

Yogis: Hindu, Buddhist, and Jain practitioners of Yoga, known to have sat in lotus positions from very ancient times, meditating deeply in the forests of North India.

zakat: Islamic tax imposed on all Muslims.

zamindar: Initially temporary Mughal land-revenue collectors, later made more wealthy and powerful as permanent landlords throughout Bengal by the British.

zenānā: Hindu women's secluded quarters in rural as well as urban homes, usually completely hidden from the eyes of strangers passing on lanes or roads outside.

Zoroastrianism: Religion of India's Parsis, most of whom still live in Mumbai.

general bibliography

- Ahmed, Akbar S.** *Islam under Siege*. Cambridge, U.K.: Polity Press, 2003. One of the most insightful studies of Islam by one of Pakistan's most brilliant scholar-diplomats, a living bridge between superficially incompatible civilizations.
- Allchin, B., and F. R. Allchin.** *The Birth of Indian Civilisation: India and Pakistan before 500 BC*. Harmondsworth, U.K.: Penguin, 1968. Very good general introduction to the Indus Valley culture and its archaeological excavations and treasures.
- Anand, Mulk Raj.** *Untouchable*. New Delhi: Orient Paperback, 1970. Also: *Coolie*. Delhi: Hind Pocket Books, 1972. Two excellent novels by one of India's greatest writers of the last century.

- Bittansen, Thomas.** *The Saffron Wave*. Princeton, N.J.: Princeton University Press, 1999. One of the best introductions to the emergence and alarming growth of India's Hindutva politics.
- Bose, Subhas Chandra.** *The Indian Struggle*. Kolkata: Chatterjee, 1952. The autobiography of Bengal's greatest revolutionary nationalist and one of India's nationalist heroes, elected twice to serve as president of the Indian National Congress.
- Brass, Paul.** *Ethnicity and Nationalism*. Newbury Park, Calif.: Sage, 1991. An excellent introduction to an important aspect of India's complex history.
- Brown, Judith M.** *Gandhi: Prisoner of Hope*. New Haven, Conn.: Yale University Press, 1989. An insightful biography of India's greatest saintly leader and social reformer.
- Brown, Percy.** *Indian Architecture*. 3rd ed. Vol. I: *Buddhist and Hindu Periods*. Vol. II: *Islamic Period*. Mumbai: Taraporevala's, 1956. Brilliantly comprehensive text with splendid photographs.
- Brown, W. Norman.** *The United States and India, Pakistan, Bangladesb*. 3rd ed. of *The United States and India and Pakistan*. Cambridge, Mass.: Harvard University Press, 1972. Still among the best single volume introductions to South Asia since the emergence of India

- and Pakistan as independent states, with an excellent chapter on the birth of Bangladesh.
- Chadda, Maya.** *Building Democracy in South Asia*. Boulder, Colo.: Lynne Rienner, 2000. Excellent analysis of this important subject.
- Chaudhuri, Nirad C.** *The Autobiography of an Unknown Indian*. Berkeley: University of California Press, 1968. A classic memoir of life in British India's Bengal by one of young India's most precocious Anglo-Indian authors.
- Coomaraswamy, Ananda K.** *The Dance of Shiva*. Rev. ed. New York: Noonday Press, 1957. A brilliant brief survey of India's artistic riches and cultural genius.
- Copland, Ian.** *The British Raj and the Indian Princes: Paramountcy in Western India, 1857–1930*. London: Longman, 1982. Excellent analysis of a regal subject.
- Davies, Philip.** *The Penguin Guide to the Monuments of India*, vol. 2: *Islamic, Rajput, European*. Penguin: London, 1989. Vol. 1, by George Mitchell, covers Buddhist, Jain, and Hindu monuments of India. Both volumes are very clear architectural guides.
- Edgerton, Franklin, trans.** *The Bhagavad Gita*. Cambridge, Mass.: Harvard University Press, 1972. Wonderful translation of Hinduism's most famous religio-philosophic text.
- Embree, Ainslie T., ed.** *The Hindu Tradition*. New York: Modern Library, 1966. An excellent primary source book of Hinduism with brief introductions to each text by its editor. Dr. Embree has also edited *Sources of Indian Tradition*. 2nd ed. New York: Columbia University Press, 1988. The best comprehensive primary source book of India's great traditions.
- Forster, E. M.** *A Passage to India*. New York: Harcourt, Brace & World, 1952. Brilliant fictional account of Indo-British relations and racial conflict during the Raj. Also see the fascinating memoir of his service to an Indian prince, *The Hill of Devi*, New York: Harcourt Brace, 1953.
- Gandhi, Mohandas K.** *An Autobiography: The Story of My Experiments with Truth*. Translated by Mahadev Desai. Boston: Beacon Press, 1957. Fascinating primary source insight into the mind of India's greatest religious and political leader, and the history of his evolution.
- Gandhi, Rajmohan.** *Rajaji: A Life*. New Delhi: Penguin, 1997. The best biography of C. Rajagopalachari, the only Indian to serve as governor-general, written by his grandson, also a grandson of Mahatma Gandhi, whose brief biography he wrote as well: *The Good Boatman*, New Delhi: Viking, 1995.
- Gandhi, Sonia, ed.** Vol. I: *Freedom's Daughter: Letters between Indira Gandhi and Jawaharlal Nehru, 1922–39*. London: Hodder & Stoughton, 1989. Vol. II: *Two Alone, Two Together: Letters between Indira Gandhi and Jawaharlal Nehru, 1940–1964*. London: Hodder & Stoughton, 1992. These two volumes of primary sources of recent Indian history are sensitively introduced by the editor, who, as of 2005, presides over India's Congress Party. They provide insights into the lives of Nehru, India's first prime minister, and his daughter, Indira, India's third prime minister, each of whom led India's Congress Party governments for more than fifteen years.
- Hambly, Gavin.** *Cities of Mughul India*. Photographs by Wim Swaan. New York: G. P. Putnam's Sons, 1968. Beautiful photos of Delhi, Agra, and Fatehpur Sikri accompany excellent descriptions of those great Mughal capitals.
- Hardy, P.** *The Muslims of British India*. Cambridge, U.K.: Cambridge University Press, 1972. An illuminating study of an important chapter in recent South Asian history.
- Hawley, John Stratton, ed.** *Sati, the Blessing and the Curse: The Burning of Wives in India*. New York: Oxford University Press, 1994. Excellent anthology of articles on *sati*.
- Hume, Robert Ernest, trans.** *The Thirteen Principal Upanishads*. 2nd ed. London: Oxford University Press, 1979. Excellent translation of the most important sources of Vedāntic Indian philosophy.
- Ikram, S. M.** *Muslim Civilization in India*. Edited by A. T. Embree. New York and London: Columbia University Press, 1964. Valuable introduction to Islam in India and its powerful impact.
- Inden, Ronald.** *Imagining India*. Oxford: Basil Blackwell, 1990. An excellent and insightful study.
- Irving, Robert Grant.** *Indian Summer: Lutyens, Baker and Imperial Delhi*. New Haven, Conn., and London: Yale University Press, 1981. A fine history of New Delhi with beautiful photographs.
- Jaffrelot, Christophe.** *The Hindu Nationalist Movement in India*. New York: Columbia University Press, 1996. A scholarly study of modern India's populist Hindutva movement.
- Kālidāsa.** *Shakuntala and Other Writings*. Translated by Arthur W. Ryder. New York: E. P. Dutton, 1959. Translations of Kālidāsa's greatest play and several of his beautiful poems.
- Karve, D. D., trans.** *The New Brahmins: Five Maharashtrian Families*. Berkeley: University of California Press, 1963. Insightful primary source of recent social

- history of Maharashtra and changes brought by British rule to its old Brahman families.
- Kopf, David.** *British Orientalism and the Bengal Renaissance: The Dynamics of Indian Modernization, 1773–1834*. Berkeley: University of California Press, 1969. Valuable history of the early impact of the British East India Company on India's Bengal.
- Kramrisch, Stella.** *Manifestations of Shiva*. Philadelphia: University of Pennsylvania Art Museum, 1981. A remarkable study of ancient Indian art by one of its greatest scholars.
- Low, D. A., ed.** *Soundings in Modern South Asian History*. Berkeley: University of California Press, 1968. An excellent compilation of scholarly studies on recent Indian history. Dr. Low has also edited *Congress and the Raj*, London: Macmillan, 1977.
- Ludden, David.** *Contesting the Nation: Religion, Community and the Politics of Democracy in India*. Philadelphia: University of Pennsylvania Press, 1996. A very fine scholarly study.
- Madan, T. N.** *Modern Myths, Locked Minds: Secularism and Fundamentalism in India*. New Delhi: Oxford University Press, 1997. An illuminating study of India's most important intellectual conflict.
- Majumdar, R. C., H. C. Raychaudhuri, and K. K. Datta, eds.** *An Advanced History of India*. London: Macmillan, 1961. Comprehensive history of Indian politics and culture. Professor Majumdar et al. also edited a much more detailed and comprehensive eleven-volume *History and Culture of the Indian People*, Mumbai: Bharatiya Vidya Bhavan, 1951–1966.
- Marshall, P. J.** *Bengal: The British Bridgehead, Eastern India, 1740–1828*, pt. 2 of vol. 2: *New Cambridge History of India*, edited by Gordon Johnson. Cambridge, U.K.: Cambridge University Press, 1987. Excellent scholarly history of Greater Bengal under the British East India Company's Raj.
- Martin, Briton.** *New India, 1885*. Berkeley: University of California Press, 1969. Excellent history of the origins and emergence of India's National Congress.
- McLeod, Hew.** *Sikhism*. Harmondsworth, U.K.: Penguin, 1997. An excellent summary of Sikhism and its history.
- Mistry, Rohinton.** *A Fine Balance*. London: Faber and Faber, 1995. A fictional account of India (Bombay) in the mid-1970s under Indira Gandhi's "State of Internal Emergency."
- Naipaul, V. S.** *India: A Wounded Civilization*. New York: Vintage Books, 1978. A sensitive appreciation of India's many problems by one of her greatest diaspora authors. His *India: A Million Mutinies Now*, London: Heinemann, 1990, is even more insightful and provocative.
- Narayan, R. K.** *Swami and Friends*. East Lansing: Michigan State College Press, 1954. *Bachelor of Arts*. Mysore: Indian Thought Publications, 1965. *My Days*. New York: Viking, 1974. *The Financial Expert*. East Lansing: Michigan State College Press, 1953. *The Guide*. New York: Viking, 1958. Some of the best novels by South India's greatest author of the last century.
- Nayar, Kuldip, and Khushwant Singh, eds.** *Tragedy of Punjab: Operation Bluestar and After*. New Delhi: Vision Books, 1984. A brilliant anthology of Punjab's recent political traumas and tragedy.
- Nehru, Jawaharlal.** *Toward Freedom*. New York: John Day, 1941. Nehru's brilliantly written autobiography, a primary source of India's freedom struggle and recent history by its first prime minister. His *Discovery of India*, also published in New York by John Day in 1946, is a rich and wide-ranging history by one of recent India's best authors, as well as its greatest premier-statesman.
- O'Flaherty, Wendy D.** *Hindu Myths*. Harmondsworth, U.K.: Penguin, 1975. Fascinatingly original study of Hinduism's mythology. Also see her *Asceticism and Eroticism in the Mythology of Siva*.
- Pearson, M. N.** *The Portuguese in India*, pt. 1 of vol. 1: *New Cambridge History of India*, edited by Gordon Johnson. Cambridge, U.K.: Cambridge University Press, 1987. Excellent scholarly account of this important chapter in Indian history.
- Perkovich, George.** *India's Nuclear Bomb*. Berkeley: University of California Press, 1999. Accurate history of India's development as a nuclear-armed power.
- Raychaudhuri, Tapan.** "The Mughal Empire," in "The State and the Economy," in *The Cambridge Economic History of India*, vol. I, edited by T. Raychaudhuri, and I. Habib. Cambridge, U.K.: Cambridge University Press, 1982. A brilliant history of the Mughal economy.
- Robinson, Francis.** *Separatism among Indian Muslims: The Politics of the United Provinces' Muslims, 1860–1923*. London: Cambridge University Press, 1974. An excellent study of a difficult subject.
- Rothermund, Dietmar.** *An Economic History of India*. London: Croom Helm, 1988. A good general survey of India's economic history. Also see his *The Phases of Indian Nationalism and Other Essays*, Mumbai: Popular Prakashan, 1970.
- Rowland, Benjamin.** *The Art and Architecture of India. Buddhist, Hindu, Jain*. Harmondsworth, U.K.: Penguin, 1953. Classic work of India's early art history with remarkable plates.

- Rushdie, Salman.** *Midnight's Children*. New York: Knopf, 1981. Brilliant novel of partition's aftermath.
- Scott, Paul.** *The Raj Quartet*: Book I: *The Jewel in the Crown*. London: Heinemann, 1966. Book II: *The Day of the Scorpion*. 1968. Book III: *The Towers of Silence*. 1971. Book IV: *A Division of the Spoils*. 1975. Vivid, compelling, broad-ranging account of the last decades of the British Raj, which though written as fiction is truly historic in its content.
- Seal, Anil.** *The Emergence of Indian Nationalism*. Cambridge, U.K.: Cambridge University Press, 1968. A very fine scholarly study.
- Sen, Amartya, and J. Dreze.** *India: Development and Participation*. New Delhi: Oxford University Press, 2002. A brilliant study of India's recent economic development and many flaws.
- Seth, Vikram.** *A Suitable Boy*. New York: Harper Perennial Library, 1993. Set in post-partition India in the 1950s, this expansive novel traces the lives of four extended families.
- Singh, Khushwant.** *A History of the Sikhs*. 2 vols. Princeton, N.J.: Princeton University Press, 1963. An excellent general history of the Sikhs, written by one of its most brilliant authors.
- Sisson, Richard, and Stanley Wolpert, eds.** *Congress and Indian Nationalism: The Pre-Independence Phase*. Berkeley: University of California Press, 1988. Edited papers initially presented at a centenary celebration of the birth of India's National Congress at the University of California, Los Angeles, in 1985.
- Spear, Percival.** *Twilight of the Moghuls*. Cambridge, U.K.: Cambridge University Press, 1951. An excellent history of Delhi during the decline of Mughal power. See also his *The Nabobs: A Study of the Social Life of the English in Eighteenth-Century India*. London: Oxford University Press, 1963.
- Stewart, Gordon.** *The Marathas 1600–1818*, pt. 2 of vol. 4: *New Cambridge History of India*, edited by Gordon Johnson. Cambridge, U.K.: Cambridge University Press, 1993. Wonderful account of Maratha history.
- Tagore, Rabindranath.** *Gitanjali and Fruit-Gathering*. New York: Macmillan, 1919. The poems for which India's first Nobel Prize winner, and greatest Bengali author and dramatist, won his Nobel Prize in literature.
- Talbott, Strobe.** *Engaging India: Diplomacy, Democracy and the Bomb*. Washington, D.C.: Brookings Institution, 2004. A frankly refreshing memoir of a difficult diplomatic engagement.
- Thapar, Romila.** *A History of India*, vol. 1 of 2 vols. Harmondsworth, U.K.: Penguin, 1966. A very fine early history by one of India's greatest historians. Professor Thapar's later works include: *Interpreting Early India*, Delhi: Oxford University Press, 1992; her edited *Recent Perspectives of Early Indian History*, Mumbai: Popular Prakashan, 1995; and *Ancient Indian Social History: Some Interpretations*, London: Sangam, 1996.
- Thomas, Raju G. C.** *Democracy, Security and Development in India*. New York: Palgrave Macmillan, 1996. A most astute study of three interrelated aspects of modern India's power.
- Trautmann, Thomas R.** *Kautilya and the Arthashastra*. Leiden: Brill, 1971. Excellent translation and history of India's most ancient text on imperial administration and power politics.
- Tully, Mark, and Satish Jacob.** *Amritsar: Mrs. Gandhi's Last Battle*. London: Jonathan Cape, 1985. Very fine historical account of the tragic attack in Punjab that triggered Prime Minister Gandhi's assassination.
- Wallace, Paul, ed.** *Regions and Nations in India*. New Delhi: Oxford University Press, 1985. An excellent compendium of scholarly articles, edited by a brilliant historian.
- Wheeler, Mortimer.** *Civilizations of the Indus Valley and Beyond*. New York: McGraw-Hill, 1966. A good introduction to the Indus Valley digs, with excellent photos of the major sites and artifacts.
- Wiser, William H., and Charlotte Viall Wiser.** *Behind Mud Walls, 1930–1960*, with a sequel: *The Village in 1970*. Berkeley: University of California Press, 1971. Classic anthropological study of village India.
- Wolpert, Stanley.** *A New History of India*. 7th ed. New York and Oxford: Oxford University Press, 2004. *India*, 3rd ed. Berkeley: University of California Press, 2005. *Nehru: A Tryst with Destiny*. New York and Oxford: Oxford University Press, 1996. *Gandhi's Passion: The Life and Legacy of Mahatma Gandhi*. New York and Oxford: Oxford University Press, 2001. *Tilak and Gokhale: Revolution and Reform in the Making of Modern India*. Berkeley: University of California Press, 1962.

Note: **Bold** page numbers indicate main discussions. *Italic* page numbers indicate figures and tables. Colons separate volume numbers from page numbers. Color inserts are abbreviated as “col. ins.” plus the volume number.
