TOUR GUIDE: A PREFACE FOR USERS

During the time of the American Revolution, the writer Hector St. Jean de Crevecouer asked the fundamental question that has dogged Americans thereafter: "What then is this new man, this American." Countless students of American history have searched every aspect of political, economic, social, and cultural history to discover "this American." In doing so, they have often focused on the great ideas that inspired a "free people" and defined public interest since the inception of the United States; the great events that marked American history; and the great changes wrought by democratic, industrial, communications, and other revolutions shaping American life, work, and identities. And they have been right to do so. But more recently other students of history have insisted that finding the *real* American requires looking at the details of everyday life. Therein, they argue, Americans practiced what mattered most to them and gave meaning to larger concepts of *freedom* and to the great events swirling about them. The ways Americans at home and at work ordered their daily life have become the subject of numerous community studies and biographies of the so-called common man or woman that were created by combing through all manner of personal accounts in diaries, letters, memoirs, business papers, birth and death records, census data, material culture, popular song, verse, artistic expression, and, indeed, virtually any source about or by common folk.

But making sense of so much individual study and providing a clear path through the history of Americans in their daily life has waited on a work that brings together the many and diverse ways Americans ordered their individual worlds at home and at work. *The Greenwood Encyclopedia of Daily Life in America* promises such a synthesis; it also promises to find "this American" in what Americans ate, who they courted and married, how they raised their children, what they did at work, where they traveled, how they played, and virtually every aspect of social life that Americans made for themselves. As such, it brings to life "this American" on his or her own terms. It also suggests that by discovering the ordinary it becomes possible to understand that extraordinary phenomenon of the American.

Features and Uses

The Greenwood Encyclopedia of Daily Life in America is a reference work and guide that provides up-to-date, authoritative, and readable entries on the many experiences and varieties of daily life of Americans from the dawn of the republic through the first years of the twenty-first century. In spanning the roughly 250 years from the mid-eighteenth century to the new millennium, the four volumes of *The Greenwood Encyclopedia of Daily Life in America* employ both a chronological and a topical, or thematic, approach. Doing so invites many uses for the volumes as reference guides; as touchstones for inquiries to a host of questions about the social, cultural, economic, and political history of Americans and the nation; and, taken together, as a broad view of daily life in the United States.

Users can read the articles separately or as a running narrative, depending on interest and need. The organization of the work collectively according to time period and within each volume according to time period, geography, daily activity, and group allows readers to explore a topic in depth, in comparative perspective, and over time. Also, because each section of each volume opens with a synthetic overview for purposes of historical context, the material in each section becomes more readily linked to larger patterns of American social, cultural, economic, and political developments. By structuring the volumes in this manner, it becomes possible to integrate and apply the encyclopedia within modern and flexible pedagogical frameworks in the classroom, in the library, and in home-schooling settings.

Cross-referencing within the articles and the cumulative subject index to the encyclopedia found at the back of each volume together expand the reach of individual topics across time and in different places. Thus, for example, the discussion of marital patterns and habits in the antebellum period of the nineteenth century, which includes mentions of courtship patterns, marriage rites, family formation, parenting, and even divorce, easily bridges to treatments of the same topics in other periods. Likewise, a reader wanting to compare foodways as they developed over time might move easily from representations of the early American "down-home" cooking of a largely agricultural society, through the increased portability and packaging of foods demanded by an urbanizing society during the nineteenth century, to the recent preference for such paradoxes in food choices as fresh foods, exotic foods, and fast food in the post-industrial United States.

Readers might go backward as well as forward, or even sideways, in following their interests, looking for the roots and then growth and development of habits and practices that defined and ordered the daily lives of Americans. In doing so, they might discover that each successive modern society has had its own search for the simpler life by trying to recover and reproduce parts of a supposedly more settled and serene past. They also will discover not only the changes wrought by ever more modern means of production, transportation, communication, and social and economic organization but also some striking continuities. Old ways often continue in new days. Americans have been a people on the go from the beginning of the nation and have become more so over time. As such, staying in touch with

family and friends has ever been central to Americans' sense of place and purpose in organizing their lives. Whether carrying a daguerreotype image while heading west or to war in the nineteenth century, shooting photos with a Kodak camera from the late nineteenth century well into the twentieth century, or taking pictures with a video camera, a digital camera, or even with a cell-phone in the twenty-first century, Americans sought ways to keep visual images of the people, animals, possessions, and places that mattered to them. Letter writing also has become no less important a means of communication when the words move electronically via e-mail than when they were scratched out with a quill pen on paper. The encyclopedia provides a ready way to measure and map such social and cultural patterns and developments.

In its organization and with its reference supports, the encyclopedia encourages such topical excursions across time. Thus, the encyclopedia promises ways to an integrated analysis of daily life and of the core values, interests, and identities of Americans at any one time and over time.

Sidebars (found in volumes 3 and 4 and called Snapshots), chronologies, illustrations, and excerpts from documents further enrich each volume with specific examples of daily life from primary sources. They add not only "color" but also significant content by capturing the sense of a particular people or place in song, verse, speech, letters, and image and by giving voice to the people themselves. Readers thus engage Americans in their daily life directly.

The life and use of the encyclopedia extends beyond the physical volumes themselves. Because the encyclopedia derives much of its material from the vast resources of the Greenwood Publishing Group archive of works in ongoing series, such as the *Greenwood Press Daily Life Through History* Series and the *Daily Life in the United States* Series, to name the two most prominent, and on the many encyclopedias, reference works, and scholarly monographs making up its list, and on the many document-based works in its collection, the encyclopedia includes up-to-date and reliably vetted material. It also plugs into the *Greenwood Daily Life Online* database, which ensures a continuous expansion, enhancement, and refinement of content and easy searching capabilities. In that sense, *The Greenwood Encyclopedia of Daily Life in America,* like the American people, literally exists in a constant state of renewal to live beyond its original creation.

Organization and Coverage

The Greenwood Encyclopedia of Daily Life in America has a wide sweep in terms of time, topics, and themes related to the ordering of the daily lives of Americans. It also includes the many and diverse Americans, understanding that no one experience or people spoke or speaks for the variety of daily lives in the United States or explains even the unity of common experiences many different Americans have had and sought. That said, the encyclopedia is not a simple fact-by-fact description of every group or daily activity conducted in the United States. The encyclopedia

is consciously selective in topics and coverage, with an eye always to relating the most significant and representative examples of the daily lives of different Americans.

The coverage of particular people and topics varies due to the availability of sources by and about them. Thus, for example, such peoples as the Iroquois, Cherokee, and Lakota Sioux get more explicit notice than, say, the Shoshone, simply because they left a fuller record of their lives and were observed and written about, or painted or photographed, in their daily lives more fully than were some other Native peoples. Then, too, the daily life of immigrant peoples receives extensive coverage throughout the volumes, but the extent and depth of coverage varies due to the size of the group and, more important, due to the available source material about any particular group. Thus, for example, when combined, the several major governmental and foundation studies of eastern and southern European immigrant groups in industrial America in the late nineteenth and early twentieth centuries, the rich tradition of publishing ethnic newspapers, the relating of personal lives in memoirs and oral histories, and a conscious effort to recover an immigrant past by the children and grandchildren of the first generation all explain the wider focus on such groups as representative types for their day. We simply know much about such people at work and at home. Such coverage of some people more fully than others does not mean any one experience counts more than others. It is, rather, mainly a matter of the critical mass of information at hand.

The encyclopedia includes all age groups in its coverage, but, again, the documentary record is richer for people coming of age through their adult lives into retirement than it is for the very young or the very old. Then, too, more is known about the daily lives of the upper classes than the lower classes, the privileged than the underprivileged, and the free than the unfree. The encyclopedia boasts significant inclusion of the many diverse American people, irrespective of wealth, circumstance, race or ethnicity, religion, or any other marker, and, indeed, it makes special effort to embrace the fullest range and diversity of experiences of daily life from birth to death.

The four volumes, each of which was edited by a prominent specialist or specialists in the field, are arranged by time periods as follows.

- Volume 1: *The War of Independence and Antebellum Expansion and Reform, 1763–1861;* edited by Theodore J. Zeman
- Volume 2: *The Civil War, Reconstruction, and the Industrialization of America, 1861–1900;* edited by James M. Volo and Dorothy Denneen Volo
- Volume 3: *The Emergence of Modern America, World War I, and the Great Depression, 1900–1940;* edited by Francis J. Sicius
- Volume 4: *Wartime, Postwar, and Contemporary America, 1940–Present;* edited by Jolyon P. Girard

Each volume follows a similar format in that it organizes the material into seven principal topics, which are then generally divided into the following subtopics.

Those subtopics are sometimes arranged in a different order within the volumes due to emphasis, but they remain continuous throughout the encyclopedia.

1. *Domestic Life:* Covering such subtopics as Men, Women, Children, Pets, Marriage, and so on.
2. *Economic Life:* Covering such subtopics as Work, Trade, Class and Caste, Urban and Rural Experience, and so on.
3. *Intellectual Life:* Covering such subtopics as Science, Education, Literature, Communication, Health and Medicine, and so on.
4. *Material Life:* Covering such subtopics as Food, Drink, Housing, Clothing, Transportation, Technology, and so on.
5. *Political Life:* Covering such subtopics as Government, Law, Reform, War, and so on.
6. *Recreational Life:* Covering such subtopics as Sports, Music, Games, Entertainment, Holidays and Celebrations, and so on.
7. *Religious Life:* Covering such subtopics as Religion, Spirituality, Ritual, Rites of Passage, and so on.

Users are guided through this enormous amount of material not just by running heads on every page but also by *concept compasses* that appear in the margins at the start of main topical sections. These compasses are adapted from *concept mapping*, a technique borrowed from online research methods and used in *The Greenwood Encyclopedia of Daily Life*. The concept compasses will help orient readers in the particular volume they are using and allow them to draw connections among related topics across time periods. Following is an example of a concept compass:

DAILY LIFE IN THE UNITED STATES: 1960–1990

TIMELINE
OVERVIEW
DOMESTIC LIFE
ECONOMIC LIFE
INTELLECTUAL LIFE
MATERIAL LIFE
POLITICAL LIFE
RECREATIONAL LIFE
RELIGIOUS LIFE

The individual volumes also have several variations in their internal arrangements and coverage of topics that speak to the particular chronological period under review. Volume 1, for example, does not begin at a fixed date, as do the other volumes, and it covers a longer time period than any of the other volumes. Its primary

focus is on the period from the American Revolution through the Civil War, but it also looks back in time in its descriptions of many elements of daily life that continued from the preindustrial colonial period through the first rumblings of the so-called market revolution of the early nineteenth century. It does so to provide not only an understanding of the continuities in many aspects of life—from the ways people raised crops and livestock, manufactured and sold goods, organized family life, worshipped, and practiced the rituals of birth, marriage, and death, to name several—but also to mark the changes wrought by the age of revolutions that came with new understandings of political, economic, social, cultural, and even parental authority following the American Revolution. In the subsequent volumes, there is some overlap in terms of beginnings and endings for the chronological periods because social history does not have neat markers as does American political history with its election cycles. Each of the final three volumes covers roughly a half-century of time, reflecting the growing complexity of life in the modern era.

The encyclopedia covers the whole of the United States. The geography of the United States has expanded mightily over time, but the importance of geographical identity within the United States has varied at different times and more recently has declined. The first three volumes recognize the salience of regional variations in defining daily life and break the material, in varying degrees, into regions within the United States (e.g., Northeast, South, Midwest, Pacific West). But the fourth volume, covering the last half of the twentieth century—by which time a national market, telecommunications, and popular culture had done much to break down regional identities and create a national culture—discounts the importance of region in many areas of daily life. To be sure, as Volume 4 reveals, regional identities still persisted, even pridefully so, in "the South" and "the West" especially, but throughout the United States the rhythms of life moved in strikingly similar ways in a nation increasingly knit together by interstate highways, television, and, more recently, by the Internet and by a mass consumption economy and culture. Class, race, and occupation, more than regional cultures, now count more in defining daily life and social ties. Religion, too, matters much in ordering individual lives and distinguishing groups from one another in the United States, easily the most "churched" nation in the industrial world. In some cases, particular subtopics disappear from successive volumes because Americans at different times gave up particular ways of working and living or because the representative ways of working and living changed, from those of an agricultural world to those of an industrial and urban one and then to a postindustrial suburban one, for example.

Throughout the encyclopedia the most basic ways people arranged their daily life make up the principal content of the volumes. But the coverage of any topic is not constant. Take time, for example. It is useful to note that historically over time, *time* literally has been speeding up for Americans. Americans who lived by Nature's times of season and sunrise and sunset occupied a different world than people who have made time a commodity to be metered out in nanoseconds for purposes of productivity and even pleasure. The multiplicity of clocks and watches made possible by the industrial revolution, the imposition of factory time in the workplace, the dividing of the nation into time zones demanded by the railroads, the breakdown of time ordered by the moving assembly line, the collapse of time realized by

telecommunications and then the radio, and the more current compression of time by microchips in all manner of computers, cell phones, and gadgetry that seemingly now run daily life and work—all this change in understanding and managing time transformed not only the pace but also the direction of life. Each volume marks the changing of time, the ways people used their time, and the times. Thereby, the attention to matters of time becomes a topic of growing importance with each successive volume of the encyclopedia.

Finally, in terms of coverage and content, the encyclopedia combines a *macro* with the *micro* view of daily life. External factors such as wars, natural disasters (e.g., fires, floods, hurricanes and tornados, ice storms, and droughts), epidemic diseases, environmental transformation, economic and political change, and population movements profoundly affected how, where, and why people lived as they did and, indeed, even which people lived at all. The Revolutionary War and the Civil War, for example, uprooted countless people from their homes as armies tramped about, armies that also liberated enslaved people who then used the upheavals to run to freedom or to fight for it. Daily life for refugees, for the "freedpeople," for the losers of political power and economic advantage was altered to its core by war. Dealing with the loss of loved ones in the Civil War changed the ways many Americans approached the meaning and management of death—in embalming, in funerary practices, in memorializing the dead, in shifting family responsibilities in the wake of a parent's death. The total mobilization of World War II touched every American household, and the G.I. Bill that came with it opened up opportunities for education, home ownership, and medical benefits that helped make possible a middle-class life for many Americans. So, too, massive floods, such as the 1927 flooding of the Mississippi River basin, swept away people, possessions, and patterns of living across a wide swath. Government actions also influenced, even determined, people's daily life. The many New Deal programs that insured bank accounts; underwrote home mortgage loans; brought electricity to rural America; built dams for hydroelectric power and economic development; constructed roads, bridges, airports, and public buildings; encouraged the arts, music, and literature, and so much more left a physical, social, and cultural imprint that still matters in Americans' daily living. Thus, relating the *macrohistory* of larger historical events and developments to the ways such factors informed and influenced the *microhistory* of individual daily life is essential to understanding the dynamics and consequence of changes and continuities in the daily life of Americans. The panoramic perspective plots the landscape of social history, while the microscopic examination observes its many forms. All that said, the primary focus of this encyclopedia remains on what students of social and cultural history term "the infinite details" of Americans' social and material arrangements in their daily life. The title tells the tale.

The Greenwood Encyclopedia of Daily Life in America, in the end, still makes no claim to comprehensiveness in trying to bring in all Americans and all manner of life. No reference work dare do so. Recognizing such a limitation rather than retreating from it, this encyclopedia serves not only as an introduction to the varied and complex American peoples in their daily lives but also as an invitation to bring other peoples into view, which responsibility, one hopes, the students and teachers using this encyclopedia will assume.

A Note on the Conception and Creation of the Encyclopedia

The encyclopedia is the product of many hands. It is both a collective work and, in its separate volumes, also very much an individual one. The encyclopedia was developed collectively by editors at Greenwood Press, who originally sought to provide a companion encyclopedia to the very successful six-volume *Greenwood Encyclopedia of Daily Life,* which covered the world from prehistory to the end of the twentieth century. The editors at Greenwood also sought to capitalize on the many reference works and individual volumes Greenwood Press has published on various aspects of daily life in the United States. At Greenwood, Michael Herman conceived of the idea for such an encyclopedia and drafted the broad design for it. John Wagner then stepped in and in many essential ways translated idea into product. He helped recruit volume editors, managed relations with the editors by means of correspondence and providing sample materials and other forms of guidance, read the individual volumes for content and fit regarding the collective set, and managed the details of moving manuscripts to production.

Each author/editor assumed the primary, almost complete, responsibility for his or her individual volume. Early in the planning process, several author/editors gathered by correspondence and even in person to discuss the scope of the work, to mark off the time boundaries of the individual volumes, to agree on essential topics, and more. The general editor coordinated such discussions; guided the works in progress; read the individual volumes for content, coverage, and fit with the other volumes and overall purpose and design of the encyclopedia; and in other ways moved production along. It is important to note that each author/editor has assumed principal responsibility for the content of his or her volume, from selecting, arranging, and editing the articles, to getting permission to use materials, to providing the context for the articles, to fact-checking and proofreading the volume, to ensuring the highest quality in content and presentation. The general editor thus disclaims any responsibility for the specific content of or in any volume. The individual author/editor's name on the title page of each volume places the responsibility where it deservedly should rest, with the true creators. It also is important to note that in creating each volume, the author/editor did much more than compile, collate, and arrange materials derived from other sources. Each author/editor wrote the introductions to the respective volumes, the introductions to the subsections of each volume, the transitions within each article excerpting materials from other sources, the headnotes in each volume, and some of the text in each volume. Because of the uneven, or even nonexistent, source material on daily life for the two volumes treating the twentieth century, both Francis Sicius and Jolyon Girard wrote much original material. This was so much so in Girard's case that he became more author than editor of Volume 4.

In sum, then, the creation of this encyclopedia mirrors the American experience. It was, and is, an example of the nation's guiding principle of continuous creation as a people—e pluribus unum. It also is a recognition that people make history. We hope that by discovering the American people in their day-to-day lives and the life they have sought to create and live, readers will find that elusive "new man, this American" and themselves.

—Randall M. Miller

ACKNOWLEDGMENTS

In pulling together this volume, I had the opportunity to explore the everyday lives of Americans during this period and gain an appreciation for the momentous times that they lived in. It gave me a whole new perspective on the history of this period and how people went about their daily existence as this century progressed. I would first like to thank Randall Miller, my colleague at Saint Joseph's University, for the opportunity to participate in this project; and for the infinite patience he showed in guiding this novice editor through the process of putting together this volume, as well as the careful editing that helped make the volume stand out. I would also like to thank Dr. David Burton, also of Saint Joseph's, for his counsel as I progressed through this work. John Wagner, senior development editor at Greenwood Press, also receives my thanks for his patience and help in putting this work together. Finally, my deepest thanks go to three of the most important people in my life, without whom I would never have had the chance to come this far: my late father Joseph Zeman, who provided me with the lifelong thirst for knowledge; my mother Lucy Zeman, who was always there for me in good times and bad, and who always believed in me; and finally my uncle and godfather Theodore Drobnicki, who provided me with patience and a guiding hand. Thank you!

VOLUME EDITOR'S PREFACE

Volume 1 of the *Greenwood Encyclopedia of Daily Life in America* deals with the century that saw America move from 13 individual colonies to a nation. Americans fought for their independence from Britain and then began the process of creating governments, at the state and national levels, which would protect the rights of their citizens. As the nation grew, the ideals of the Revolution were compromised by the existence of slavery. Eighty-five years after the Declaration of Independence was adopted, the country was torn apart by civil war—a war that tested whether the proposition that "All men are created equal" meant only white men, or whether it also meant that blacks also had certain "inalienable rights." Women too began to call for an equal voice in the republic. The pace of life changed slowly as the United States moved into the nineteenth century, but the changes in technology, the pull of the west, the expansion of political parties, and improvements in the everyday lives of Americans from 1820 to 1861 saw the nation begin to move from an agricultural economy toward a manufacturing economy, and, with this, came a questioning of not only the economic basis for slavery but also its moral basis. The pace of life quickened for many with improvements in transportation, communications, and manufacturing, and ideas about the "proper sphere" for women, the nature of childhood, the character and functions of the family, public behavior, and so much more made America more "modern," especially in the growing towns and cities. Agriculture also grew in the expanse of land under cultivation, in the new methods of harvesting and processing crops, and in the size of operations. But "old ways" also persisted in many people's daily lives. The changes and continuities of America in its formative period as a republic are the subject of this volume.

Theodore J. Zeman
Saint Joseph's University

1

FROM COLONIES TO NATIONHOOD, 1763–1789

Chronology, 1754–1789

1754	June: Franklin's Albany Plan of Union
1754–1763	The French and Indian War
1756–1763	Seven Years' War
1759	September 18: The British take Quebec from the French
1760	October 25: King George II dies and is succeeded by his grandson George III
1763	February 10: The Peace of Paris ends the Seven Years' War
	May 7: Pontiac's Rebellion erupts
	October: George III signs the Proclamation of 1763, closing the west to settlement
1764	April 5: The Revenue Act (Sugar Act) becomes law
	The Rights of the British Colonies Asserted and Proved is published by James Otis
1765	March: The Stamp Act crisis begins
	May 30: The *Virginia Resolves* are passed
	First Circular Letter is dispatched
	July: Lord Rockingham becomes British prime minister
	August–October: Mob violence occurs in Boston and New York
	October 7–25: Stamp Act Congress meets in New York City
1766	March 18: Declaratory Act is passed by Parliament
1767	June 29: First Townshend duties become law
1768	January: John Dickinson publishes *Letters from a Farmer in Pennsylvania*
1769	Townshend duties are reissued
1770	April: Lord North becomes British prime minister
	March 5: Boston Massacre

	British regulars are withdrawn to Castle William in Boston Harbor
	April 12: Townshend duties are revoked
1771	Boston seethes with unrest, but Anglo-American commerce increases
1772	June 10: Irate colonials in Rhode Island burn the revenue cutter *Gaspee*
	November: *Boston Pamphlet* is released
1773	November 1772–July 1773: Committees of Correspondence are formed in many colonies
	December 16: Boston Tea Party
1774	March–June: Passage of the Coercive Acts, including the Boston Port Bill, the Quebec Act, and those measures known as the Intolerable Acts
	May 13: Lieutenant General Thomas Gage becomes the military governor of Massachusetts
	September: First Continental Congress adopts the Continental Association
	Powder Alarm
1775	April: Royal governor Josiah Martin dissolves the assembly in North Carolina
	April 19: Battles of Lexington and Concord Bridge in Massachusetts are followed by the British retreat to Boston
	May 10: Second Continental Congress meets in Philadelphia
	Fort Ticonderoga (New York) is taken by Ethan Allen and Benedict Arnold
	British Generals Burgoyne, Clinton, and Howe arrive in America
	June: Lord Dunmore of Virginia retreats to the ships of the Royal Navy
	June 17: Battle of Breed's Hill (Bunker Hill) and shelling of Charlestown, Massachusetts
	July: Congress drafts *The Declaration of Causes for Taking up Arms*
	George Washington of Virginia takes command of the Patriot army at Boston
	First U.S. flag approved by Congress (Margaret Manny's Flag of Union)
	November: Americans capture the British store ships *Nancy* and *Concord* and the troop ships *Anne, George, Lord Howe,* and *Annabella*
	Montreal taken by Richard Montgomery
	December: Battle of Great Bridge, Virginia
	December 30: Battle of Quebec
	Encampment of Patriot army at Boston (winter 1775–1776)
1776	January 15: Thomas Paine publishes *Common Sense*
	February: Battle of Moore's Creek Bridge, North Carolina
	March: First cruise of the Continental navy
	March 17: British evacuate Boston
	July 4: Congress drafts and publishes the Declaration of Independence
	August: Royal Navy shells New York
	August 27–30: Battle of Long Island (Brooklyn Heights), New York
	Patriots retreat to Manhattan over the East River

	September 16: Battle of Harlem Heights, New York
	September 22: Nathan Hale hanged as a spy
	October: Battle of Pell's Point (Pelham Bay), New York
	Patriots escape Manhattan by way of Kingsbridge
	October 28: Battle of White Plains, New York
	Falmouth (Portland, Maine) bombarded by the Royal Navy
	Attack on Charleston, South Carolina
	Battle of Valcour Island, New York
	November 16: Fort Washington, New York, falls
	Flag of the United States is recognized by the Dutch governor of St. Eustatius, West Indies
	Fort Lee, New Jersey, abandoned
	Patriots retreat across New Jersey
	December: Great New York fire
	December 26: Washington crosses the Delaware River and attacks the Hessians at Trenton, New Jersey
	First encampment of the Patriot army at Morristown, New Jersey (winter 1776–1777)
1777	January 3: Battle of Princeton, New Jersey
	April: Burning of Danbury, Connecticut
	Battle of Ridgefield, Connecticut
	June 14: Betsy Ross's stars and stripes flag approved by Congress
	July 5: Patriots abandon Fort Ticonderoga, New York
	August: Siege of Fort Stanwix, New York
	August 6: Battle of Oriskany, New York
	August 16: Battle of Bennington, Vermont
	September: Congress flees Philadelphia
	Saratoga campaign (Freeman's Farm and Bemis Heights), New York
	September 11: Battle of Brandywine (Chadd's Ford), Pennsylvania
	September 26: Howe captures Philadelphia
	October 4: Battle of Germantown, Pennsylvania
	October 17: Burgoyne surrenders to the Americans at Saratoga

	September 15: Battle of the Chesapeake (Virginia) Capes
	October 19: Cornwallis surrenders to Washington at Yorktown
1782	April: Battle of the Saintes (in the West Indies)
	Shawnee villages on the Great Miami River, Ohio, are destroyed
	Peace negotiations commence in Paris
	November: Final encampment of the Patriot army at Newburgh, New York (winter 1782–1783)

1783	September 3: Treaty of Paris ends the war
	Independence of the United States is recognized by Great Britain
1787	August–February: Shays's Rebellion
	May–September: Constitutional Convention held in Philadelphia
1788	December 1787–July 1787: States ratify the Constitution (North Carolina November 1789 and Rhode Island May 1790)

Overview

The conclusion of the French and Indian War in America in 1763 marked a critical period in the relationship between Great Britain and her colonies in North America. The British Empire was entering a period that would see it challenge its European rivals—the French, the Dutch, and the Spanish—for wealth and influence across the world. Britain would also become the first Western nation to be touched by the Industrial Revolution. In America, the colonies were thriving as a result of the defeat of the French and their Indian allies. With vast new territories available, Americans began to look to expand westward to exploit the untouched land that offered much promise. The lives that Americans led would be forever changed by the events over the next 27 years.

A GROWING AMERICA

At the beginning of the eighteenth century the number of people of European and African descent in the British North American colonies was about a quarter of a million. By the outbreak of the American Revolution 75 years later, there were 2.5 million people living in the 13 colonies. Between 1700 and 1760, 4,500 immigrants arrived in the colonies per year, which then increased to almost 15,000 a year in the period between 1760 and 1775. During the first 70 years of the century 275,000 African slaves were brought into the country along with about 50,000 English convicts brought in for heavy labor. Over 210,000 free whites entered the colonies at this time, more being women and children than had been the case in the early settlements of the previous century.

This growth in population introduced cultural changes that colonists only began to comprehend by the middle of the century. White women would marry in their twenties and on average would bear 5 to 10 children and hope to raise the majority of them to adulthood. Because many families both in the North and in the South lived in environments that provided great abundance, they had a better diet than their European brethren; the result was that many lived longer lives and enabled the colonial population to grow at a greater rate than those on the continent. The increase in immigration in the middle of the eighteenth century surged, even though the passage across the Atlantic was still a risky undertaking, with nearly 15 percent of immigrants dying during, or shortly after, their voyage.

During the eighteenth century about 80,000 Irish settled in the Delaware Valley, while about 40,000 Scots, many forced to leave as a result of the failed rebellions of 1715 and 1746, arrived in North Carolina where they eked out a living on small farms. A large number of Germans, about 90,000, began to arrive after 1720 to escape the poverty in their native land. Many of these *Deutsche,* later referred to as Dutch, settled on the rich farmlands about 20 to 100 miles west of Philadelphia in areas like Lancaster and Cumberland Counties, and would later move further into the lands of Ohio. Most belonged to Mennonite, Amish, Moravian, Lutheran, or smaller religious groups and lived a life working the land they had settled on, turning it into rich farmlands.

Many of the Scots-Irish, descendents of Presbyterian Scots who had been forced to live in Ireland during the 1600s, arrived in Philadelphia in search of religious freedom and land to farm. By the beginning of the Revolution in 1775 over 200,000 had come into America. When they found that land was not readily available, they headed into the western frontiers of Pennsylvania, Maryland, Virginia, and North Carolina and became squatters on Indian lands. Many of the tribes in these regions, the Tuscarora, Yamasee, Cherokee, and Catawba, had either temporarily moved to new hunting grounds, or had been decimated by disease and were unable to stop these incursions onto their lands. The Scots-Irish then began raising grain, livestock, and tobacco in the Shenandoah Valley, in North Carolina, and on the frontier of South Carolina without employing slaves to do the work. Another group that began to enter America during this time was the Huguenots, who fled France to escape religious persecution and came to the cities of Charles Town (Charleston), South Carolina, and New York where they were able to blend into the polyglot populations that existed in the colonies.

THE COLONIAL CITY

The cities and towns along the coast were vital connections to the rural communities and transatlantic peoples. Almost 25 percent of the jobs in the cities were tied into trades connected with commerce such as shipbuilding, insurance, warehousing, and rope and sail-making. Cities were also the centers of culture, politics, and material growth. Royal officials and many local leaders were based in cities, and changing fashions and cultural innovations from Europe came through the cities and towns of colonial America.

Most of the cities were small compared to their European counterparts. By 1750 Boston's population numbered over 16,000 and was slowly declining. By the beginning of the Revolution, New York's population stood at 22,000, and Philadelphia's had reached over 30,000; while Charles Town, South Carolina, and Newport, Rhode Island, had populations of about 10,000 by this time. Despite their small size when compared to cities like London or Paris, for the colonists these cities marked a distinct style of life than that which existed in the rural areas. The intermingling of many cultures took place in these cities during social or political gatherings. Houses were built side by side, many near the docks of the port cities where newly arrived immigrants and sailors mingled with merchants and townspeople. Even though the cities depended upon the countryside for their food, they were also able to obtain a wider variety of goods than their rural counterparts.

Only about five percent of the colonists lived in cities during the eighteenth century, but they served as a conduit that linked all the colonists with the outside world. Not only did they bring in the latest fashions and styles from Europe, but they also served as a link that brought in many of the cultural and intellectual ideas of the continent as well, such as the ideas of the European Enlightenment.

Within these cities and towns were a small number of families who lived at the apex of urban society. Many held royal appointments, or had obtained wealth through trade and commerce. Many merchants enjoyed the advantage of inherited wealth, or had married into wealth, and therefore could expect to enjoy better lives than the average colonist. Most of these elites emulated the lives of the landed gentry in England, living in large brick mansions or townhouses with brightly colored wallpaper and the latest furnishings from Europe. Many expanded their influence into other areas beyond mercantilism by investing in real estate, insurance, manufacturing, and banking.

Though they held a great deal of influence, the numbers of the elite were small, and most of the cities and towns in the colonies were made up of large numbers of middling families—shopkeepers, artisans, or merchants. Artisans made glassware, paper, guns, cabinets, and other household items. There were bakers, butchers, stonemasons, tailors, coopers, and blacksmiths, all of whom helped in the growth of the cities and towns in America. Even though these men for the most part were successful, they could not match the lifestyle of their rich townsmen. Most could expect to pay their debts, and possibly expand their business, but the chances of them moving into the hierarchy of society were small. Still, their lot was better than those at the bottom of society.

The poor of colonial society, particularly those in the North, were made up of recent immigrants, indentured servants, day laborers, orphans, and sailors. Many gravitated to cities, and experienced long periods of poverty due to a lack of available jobs, or a need for workers during economic downturns. In many cases wives and children had to supplement the income of the father by taking jobs as domestic servants, washerwomen, or wood haulers. Economic recessions or wars could exacerbate the problems of the poor, resulting in greater hunger and poorer health. Even though this "lower sort" were less numerous than the middling class, the cities and towns did not always have the necessary resources or affordable prices to care for the poor. Many of these people lived in overcrowded rental homes with inadequate food and fuel, and in many cases were unable to accumulate enough of these resources during the year to sustain them through periods of illness, accidents, confinement after childbirth, or economic fluctuations. In many cities, rural women who had lost their husbands came to the city to find work, many times working as domestic servants, running boardinghouses or shops, and even becoming prostitutes.

The remedy by some city governments to alleviate the plight of the poor was to raise taxes, but the wealthy resisted this, and payments to help the needy remained small. Poorhouses, workhouses, and asylums for orphans provided some relief, but not enough, and the growing needs of the poor led many colonists to fear those greater incidents of crime and the need for higher taxes to prosecute and punish criminals. Many felt that the government should take the responsibility for the problems of the poor.

THE GREAT AWAKENING

During the mid-1730s, clergymen and preachers began to remind the colonists about the dangers of materialism, the increase in poverty, the desire for luxuries, and the waning of religious faith. Many of these preachers began to appeal more to the hearts of their followers rather than their heads to get their message across, and the "Great Awakening," which continued into the 1740s, was underway. Those to whom the "Great Awakening" often appealed were women, and the younger sons of third- or fourth-generation settlers who would inherit the least land, and therefore faced uncertain futures. The revival emphasized the need for every person to break away from the constraints of the past and renew their relationship with God, to be born again. Many who were drawn to the revival were those who desired to break away from their families or communities to start a new life.

The ministers who spread the message of a renewal of the Puritan ideas of the absolute sovereignty of God, predestination, and salvation by God's grace alone attracted great audiences across the colonies. John and Charles Wesley, the founders of Methodism, visited Georgia and other colonies in the 1730s. George Whitefield from England, known for his powerful open-air sermons, made several tours through the colonies attracting great crowds. Gilbert and William Tennent drew crowds and interest for their zealous preaching and teaching. But the man most associated with the "Great Awakening" was the New England Congregationalist Jonathan Edwards whose descriptions of hell terrified his listeners but also tried to explain to detractors the need for emotion in religion to balance cold reason.

One byproduct of the "Great Awakening" was a division in existing congregations between those who were called "New Light" revivalists and "Old Light" traditionalists, and the founding of new ones. The traditionalists saw education as a hindrance to salvation, whereas revivalists saw education as a means to further religion, which led them to the establishment of schools to train "New Light" ministers. The "Great Awakening" had led to cultural upheaval in the colonies, but another movement would lead to changes that would change America from colonies, to a nation.

THE ENLIGHTENMENT

The Enlightenment was the product of the great scientific and intellectual discoveries in Europe during the seventeenth century, and led to the discoveries that revealed the "natural laws" that regulated the workings of nature. The power of human reason, not just religious faith, would be the driving force that would advance progress and knowledge in the world. Men and women were encouraged to look to their own intellect, not just to God, for how to live their lives and shape their societies. As a result, interest began to grow in education, politics, and government.

Many of the ideas of the Enlightenment were borrowed from Europe from men such as John Locke, Baron de Montesquieu, and Jean Jacques Rousseau, but Americans such as Thomas Jefferson, Benjamin Franklin, and James Madison would make their own contributions to Enlightenment thought in areas such as science, politics, and government. Another influence of the Enlightenment can be seen with the growing interest in science in America during this period. Benjamin Franklin's kite-flying experiment in 1752, which demonstrated that lightning and electricity were the same, won him international fame. His later development of the lightning rod was also of international note, and marked him as one of the world's leading scientists.

GROWING ESTRANGEMENT FROM ENGLAND

As Americans began migrating into the lands west of the Appalachian Mountains, tensions began to grow between the settlers and the Indian tribes and their allies the French. Believing that these settlers had no claim to the lands they were living on, the French began to fortify the lands they held in the Ohio Valley; the British began to do likewise. This all came to a head when the governor of Virginia sent a military force in the summer of 1754 under the command of a young militia colonel by the name of George Washington into the Ohio Valley to challenge French claims to that territory. In a confused fight, Washington killed a French emissary and was besieged by French and Indian forces in what is now the city of Pittsburgh in western Pennsylvania and was forced to surrender. This action led to the start of the French and Indian War, a conflict that would last from 1754–1763, and would stretch across the globe. Though the British and Americans suffered some early setbacks, they eventually defeated the French and their Indian allies. As a result colonists began to swarm into the lands of the Ohio Valley and beyond, ignoring the Proclamation of 1763 in which the Crown guaranteed to restrict

the number of white settlers entering onto Indian lands. This created great frustration in London, as it was seen as an act of disobedience by the colonies to ignore a proclamation of Parliament.

The colonists themselves felt that the contribution that they made to the war allowed them some say in how the new territories in the West should be handled. Another factor that manifested itself during this period was that the colonies had acted together during the war to fight a common enemy. Before this time each of the colonies had acted in accordance to their own interests, but now they began to look more upon the local governments to address local problems, not to London. Colonial assemblies had begun to wield more authority within the individual colonies than Parliament by the end of the war, and the colonists began to believe that it was their right to allow their local assemblies to make decisions affecting them. This questioning of the authority of Parliament over colonial matters would lead many colonial leaders to question the legitimacy of laws enacted in London. This view was to have significant consequences over the next 12 years as parliament attempted to reassert its right to govern the colonies.

THE GROWING CRISIS

The success of Great Britain in the French and Indian War was bought at a very steep price. The war had been waged in North America but had been conducted on a global scale. Britain now found itself in arrears, and there were many hardliners in Parliament who believed that the colonies should bear part of the burden of funding this war debt. One area that Parliament focused on was the illegal trade that was conducted in the colonies, as well as the practice of bribing officials to circumvent customs duties that were in place already. The governors of the colonies were told to be more aggressive in prosecuting those involved in such illicit activities. In Massachusetts, the governor issued what were known as Writs of Assistance, general search warrants that empowered officials to inspect ships and warehouses for contraband goods. James Otis, a prominent Massachusetts attorney, challenged the writs on the grounds that they violated the customary rights of private property, and that this privilege was superior to statutes that were passed by Parliament. However, many legal experts at the time rejected Otis's arguments, holding that parliamentary law and custom were equal. The writs themselves did not create much notice in the colonies as they were directed mostly against merchants and did not impact on the day-to-day lives of the common people.

That situation changed as the English government looked to pay for its national debt. What prompted the determination of many in Parliament to obtain more revenue from the colonies was the disproportionate amount of taxes that were paid by the English people compared to what the colonists paid. The common merchant or citizen paid up to one-third of his income in taxes as opposed to around five percent for his American cousin. The colonists were buying more and more expensive English goods, so it seemed that they had the wherewithal to pay their fair share.

Although there were calls for higher levies to be collected from the colonies, the prime minister in 1763, George Grenville, knew that higher taxes would create anger in the colonies. Thus he looked to the colonists to pay the cost of keeping troops in America for its defense—not to pay for the national debt. He hoped that this solution would be accepted by the colonists, and that this would defray the money that the government had to pay to keep the troops in the colonies. The reaction of the colonists, however, was not what Grenville had anticipated. Having inherited the suspicion of large standing armies from English civil law, the colonists were not happy with having to pay for one in their midst. Also, the colonists believed that the new hard-line being applied by Grenville's government was the first step in the colonies being reduced in status to mere satellites.

The Sugar Act of 1764 confirmed the fears of many colonists of the changed nature of their relationship with London. The Sugar Act was passed to bolster the earlier Revenue Act of 1762, which had been passed to prevent officials from accepting bribes to make appointments and to authorize British naval vessels to seize ships trading illegally with French merchants in the Caribbean. The Sugar Act was also meant to reinforce the Molasses Act of 1733, which had taxed foreign sugar at a higher price to keep English goods competitive. Now all colonial merchant ships had to maintain the proper paperwork to keep their cargoes and ships from being seized by crown officials at the various colonial ports. By tightening the laws governing trade, Parliament sought to make it more difficult for colonial merchants to practice their illicit dealings. There were now many who called for a boycott of English goods, and there were also calls by colonial governments for Parliament to repeal the act, but these calls did not have widespread appeal because the acts did not directly affect the lives of the common people in the colonies. Shortly after, Grenville had the Currency Act passed, which prohibited the colonies from printing and circulating any paper money after 1769. This measure was intended to stabilize the currency of the colonies, to the benefit of their English suppliers. Another act passed in 1765, the Quartering Act, allowed the army commanders to obtain funds from the colonial assemblies to build barracks or to house soldiers in public houses or taverns. Although it did not authorize the housing of troops in private homes, soldiers moved to the cities in great numbers, creating a situation that would lead to disaster.

To provide the funds necessary to maintain the British army in America, Grenville looked to a stamp tax, a source of revenue in England since 1694. Stamps would be required on certain trading commodities or documents circulated throughout the empire, and although the tax had been imposed before without much protest, its implementation in 1765 concentrated on all documents that were circulated in the colonies including newspapers, legal documents, and land titles. Up to this time the internal revenues circulated within America had been dealt with by the various colonial legislatures, with Parliament limited to external affairs. This practice was

American Revolutionary leader Patrick Henry's address in the House of Burgesses, May 1765. Oil on canvas by P. F. Rothermel. The Granger Collection, New York.

eliminated with the passage of the Stamp Act. Of the colonial assemblies, eight debated whether Parliament had the right to levy taxes on intercolonial trade, and many agreed that only the colonial assemblies had the right to tax internal trade. These assemblies had been integral in the appropriation of funds for the projects within each of the colonies, allowing the colonists a say in what their money was being used for. The Stamp Act led many to question whether it was lawful that Parliament tax without the colonies having representation in London. Prominent colonists like Benjamin Franklin called for colonial representation in Parliament. The idea was rejected by the government because the colonies were too distant to ensure effective representation.

Because of the scope of the documents and goods that were to be taxed, the Stamp Act potentially reached into the homes of a vast majority of ordinary people, unlike the previous measures passed by Parliament. Many agreed with Patrick Henry, a member of the Virginia House of Burgesses, who in May 1765 rose to give a speech that denied Parliament's right to tax the colonies. Henry argued that laws passed by that body need not be obeyed, because it was only the colonial assemblies who directly represented the colonists, and that as English citizens the colonists were entitled to the right of self-taxation. The House of Burgesses voted down the measure, but newspapers published his *Virginia Resolves*, and they were circulated widely throughout the colonies. At question was not only the effect of the tax on the colonists but also whether in fact Parliament had the right to tax people who were not represented in that body.

What followed were protests that involved people from every stratum of colonial society, which sowed the seeds that would prompt the colonies to revolt against the mother country and break away from the empire 10 years later. These groups were formed to bring the people together to rally support for the overturning of the Stamp Act, and returning the right to tax to the colonial assemblies. Merchants and tradesmen made up the core of many of these groups that spread throughout the colonies, and came to be known as the Sons of Liberty. There were others who joined the Sons of Liberty for other reasons, whether they were men of moderate means who wished to participate in politics, or the elite who hoped to control the anger that had begun to characterize the protests. As a result of the organizing efforts of the Sons of Liberty, delegates from nine colonies met in New York in October 1765 to draft a "Declaration of Rights and Grievances" that would delineate the limits of Parliament's power to rule the colonies. This Stamp Act Congress called for the repeal of the Stamp and Sugar Acts and restated the right of the colonists to tax themselves through their own assemblies.

In concert with these actions, merchants in New York called for an importation boycott of British goods. Other cities in America soon followed, as merchants and consumers signed agreements not to buy English goods and to produce domestic items to make up for the loss of English products. That there were many women involved in this movement added to the effectiveness of the protest. Despite the organization of the movement, and the attempts by the leaders to limit violence, the mobs began to become more destructive. There were some instances of physical violence, mainly the tarring and feathering of tax agents. Although the more conservative members of the movement condemned the actions of the mob, they were not above using the threat of mob violence to exert psychological pressure on these agents to stop their work. When violence was used, it was directed at the property of these persons, and the victims were carefully chosen. The actions of many of these urban crowds had their antecedents in English history when protests were held against the actions of the government in cities in England. Therefore, what the colonists were doing at this time was not new, but as their protests became more frequent, deference toward London began to dissipate.

The cry of "Liberty!" during the protests also found its roots in English history as it invoked the idea that the individual was protected from a government trying to deny right of life and property to its citizens. The colonists were familiar with the writings of philosophers of the period who called for people to be vigilant in protecting their rights from governments that tried to infringe upon them. Even though many colonists were engaged in protests against Parliament at this time, they had no thought of breaking away from the mother country. They refused to challenge Parliament's right to govern, or the king's right to rule; rather, they sought the repeal of laws that they saw as infringing on their rights as English citizens, and a return to the blessings enjoyed by loyal subjects under the English crown.

By the close of 1765, when the Stamp Act Congress's petition reached England, Grenville's government had been replaced by a more moderate one under the leadership of Lord Charles Rockingham. The new prime minister moved to have the Stamp Act repealed by Parliament so that the British economy could recover from the boycott of its goods by the colonists. However, hard-liners had heard of the violence that had taken place in America, and remained adamant that the colonies should be reminded that they were subservient to the authority of Parliament and the king. A compromise in March 1766 saw the repeal of the Stamp Act, but then the Declaratory Act was enacted, which made it clear that the colonies were obligated to follow the laws passed by Parliament. It was a mixed bag in terms of what the colonists had accomplished in their protest against London's efforts to gain more control in America. On the one hand, the ability of the colonies to come together to meet the crisis, and the success of the nonimportation movement, could be seen as a success. But the Declaratory Act made clear that the king's government would continue to impose its will on the colonies. It was clear that Parliament had suffered a temporary setback, and that the next confrontation would only worsen the bad feelings that had been engendered by this confrontation.

The next effort to bring the colonies to heel was led by Charles Townshend, who became prime minister in 1767. Townshend hoped to diffuse the power of the colonial governments by using taxes to pay the salaries of colonial governors, judges, and other officials who until then had been paid by the colonial assemblies. This would make these officials beholden to the government in London, not to the colonial governments. Townshend also sought to collect revenue from the colonies by taxing external trade and thereby hoped to avoid the protests over meddling with the internal working of the colonies. The enactment of the Townshend duties met with resistance in America, for the goods that were taxed—tea, glass, and paper—affected people across class lines.

Another factor was that Parliament had established a Board of Customs Commissioners to enforce the Townshend duties and prevent merchants from circumventing the taxes by smuggling their goods into American ports. Four Vice-Admiralty Courts were set up to hear cases against those whose goods were not listed on their manifests when they reached port. Cases were heard without the benefit of a jury, and judgments were made that gave every advantage to the prosecution.

One of the most prominent merchants caught and brought to trial was John Hancock of Boston. When it became known that his trial was being heard without a jury and that his defense lawyers were denied the means to defend him effectively, the court had to drop the case, as it was feared that riots would break out. What made Hancock's situation ominous in the eyes of many colonists was the fact that this man of means and influence had been caught in the web of laws set up by the Townshend Act. If it could happen to John Hancock, it could easily happen to anyone in America.

It now fell to the colonial leaders to determine what actions should be taken in response the Townshend duties. In February 1768, the radical faction in the Massachusetts General Court sent a message to the assemblies of the other colonies that urged a united resistance to the Townshend duties. This message was called the Circular Letter. It was designed to throw up an impregnable defense against taxation by Parliament in every colony and to make certain that colonial liberties were not undermined in the guise of imposing mere trade duties. The Virginia House of Burgesses followed with a circular letter of its own in March. Most Americans saw no fault with the circular letters as simple attempts to redress grievances with the Parliament, but by June the Sons of Liberty in Boston, at the instigation of Sam Adams, James Otis, and John Hancock, had mobbed royal officials and rioted in the streets. Officials in London moved to put down the violence. The secretary of state for the colonies, Lord Hillsborough, decided to take a firmer stand with the colonies by ordering the governor of Massachusetts to dissolve the General Court. He also dispatched four regiments of British regulars to Boston. Their presence was intended to intimidate the colonists into submission and to suppress dissent. They accomplished neither of these desired effects. After landing in the colony in October 1768, two of the four regiments were immediately detached for service in Halifax, Nova Scotia, leaving the remaining units woefully undermanned and generally incapable of effectively dealing with the Boston mobs.

THE FIRST VIOLENCE

The unremitting upheaval in Boston spread to the other colonies. In March 1769, the merchants of Philadelphia joined the boycott of British goods, and in May, the

Virginia House of Burgesses was dissolved by the royal governor for its continued opposition to taxation without representation. The burgesses met the next day at the Raleigh Tavern in Williamsburg and agreed to a boycott of British goods, luxury items, and even slaves. In New York, in January 1770, the Sons of Liberty clashed with 40 British soldiers over the public posting of antigovernment broadsheets. Several men on both sides were seriously injured. Parliament retaliated by ordering that all Americans accused of agitating on the topic of taxation be sent to England for trial. With the presence of nervous British troops, and the continuing violence of the mobs, it was only a matter of time before there was an incident that resulted in death.

Throughout the winter of 1769–1770, life in Boston was marked by numerous clashes in the streets between soldiers and civilians. Both sides waited for the one incident that would spill over into irreconcilable violence. Early in the winter a group of soldiers was accosted by a mob armed with clubs. One soldier received a significant wound from a blow served up with a bit of iron bar, and the mob was driven away only by the discharge of a musket into the air. Mobs of colonists and Liberty Boys, egged on by radical leaders, roamed the streets, spoiling for a fight. By the night of March 5, 1770, tensions had reached the boiling point when a lone sentry standing guard in front of the customhouse was pelted with snowballs by a group of children. Then a mob began to gather, which prompted the sentry to send for reinforcements. Captain Thomas Preston arrived with seven soldiers and they took up positions in front of the sentry. What happened next has been debated for over 230 years, and speculation has centered on members of the mob taunting the soldiers to "Fire," and one of the soldiers falling and his gun going off and without orders from Preston, the other soldiers fired their weapons into the mob. Eleven citizens were hit, and five of them died. One of them was a free African American sailor named Crispus Attucks, the first of many African Americans who would die later fighting on both sides during the Revolution.

The political leaders of the Boston mob labeled the incident a massacre, and demanded the arrest and trial for murder of the soldiers and their commander, Capt. Thomas Preston. Consequently, the soldiers were confined, but no one could be found to act in their defense. Finally, John Adams, cousin of Samuel Adams, and Josiah Quincy of Braintree, Massachusetts, volunteered to act as their attorneys. They provided a defense sufficient to acquit Preston and all of his men of murder, save two, who were convicted of manslaughter and branded upon the thumb as a punishment. Thereafter, Governor Thomas Hutchinson prudently withdrew the troops from the city streets to an island garrison in the harbor. But what had happened on that March night hardened the attitudes of those who may have believed that compromise with the government in London was possible. The next four years would see the colonies move closer to separation from the mother country.

In April 1770, Lord Frederick North became prime minister, and under his leadership the Townshend duties were repealed except the tax on tea, which Parliament retained in a symbolic act to demonstrate their

right to tax the colonies. Moreover, the customs facilities, regulations, and the royal officials needed to enforce them were left in place. The warships and troops sent to intimidate the colonials also remained on station. Ironically, very little English tea had been imported into the colonies in the decade before the passage of the Tea Act. The populous colony of Pennsylvania imported only 2,000 chests of tea annually, and New York used about the same. The southern colonies used tea in like proportion to their smaller populations. This was partially because Dutch smugglers swarmed in and out of most colonial ports with their own East Indian tea, thereby filling much of the demand. Only in Boston had the customs officials effectively succeeded in suppressing the illicit trade in tea. However, tea became a symbol for deeper grievances.

The next incident demonstrated the state of the deteriorating relations between the government in London and its subjects in America. In 1772, the Royal Navy cutter *Gaspee* intercepted the colonial packet *Hannah* in Narragansett Bay, but the master of the *Hannah,* inbound to Providence from New York City, refused to heave to and have his papers examined. The packet took advantage of a fresh wind and a shallow draft to elude the cutter, which ran aground. When word reached Providence about the cutter's predicament, eight longboats loaded with angry colonists set out for the stranded *Gaspee*. Once they reached the ship, they overwhelmed the small crew and set the cutter afire. Although a reward was offered for the apprehension of the marauders, they were never caught as they were likely shielded by the citizens of Providence.

In response to the further worsening relations with the mother country, colonial leaders began to form Committees of Correspondence in 1772 and 1773. The first of these was formed by Samuel Adams in Boston, a similar group was also formed in Virginia with members such as Thomas Jefferson, Richard Henry Lee, and Patrick Henry, and the other colonies followed suit. The importance of these committees was that they served as a mechanism for bringing the separate colonies together. This would prove to be an important first step in keeping the colonies informed of what was happening in each of them. It also served to introduce the leaders of the movement against England's attempts to gain greater control over America. This was important, as events at the end of 1773 would call for the colonies to come together to decide what their role in the empire should be.

Parliament renewed the Tea Act in 1773, and although it had rescinded all duties except the tax on tea, resentment was fostered in the colonies because the East India Company was given a monopoly on the sale of tea. By allowing the company to sell directly to its colonial agents, Parliament bypassed any middlemen, including the colonial merchants, in the resulting transactions. So low was the resulting price of tea that even smugglers could not sell it as cheaply as the company. By this ruse the Crown hoped to reaffirm the right of Parliament to tax the colonies as Americans submitted to the payment of the duty on the tea for the sake of their pocketbooks. Ships carrying the tea were turned away in all the colonial ports but Boston, where they could dock but not unload. On the night of December 16, 1773, as many as 8,000 people massed to listen to a speech given by Samuel Adams, which targeted the tea in the harbor as a symbol of British tyranny. After the speech a group of Bostonians, loosely disguised as Mohawk Indians beforehand and joined by torch-carrying rabble-rousers, boarded one of the three East Indiamen in the harbor and threw 350 chests of tea into the water. The demonstration, which was anything but spontaneous, has come to be known as the Boston Tea Party. Once again London offered a reward for the capture of the perpetrators, but as with the *Gaspee* incident, no one was caught.

Parliament responded with a series of bills that were aimed at stopping the violence that now was beginning to get out of hand and isolating Boston, which they saw as the source of the protest against the government's efforts to enforce its decrees. The first bill was the Boston Port Act, which closed the entire port as punishment and as a warning to the other colonies. It also called for Massachusetts to reimburse the East India Company for the lost tea and the Exchequer for the lost revenues. These retaliatory acts only served to strengthen the resolve of the radicals in Boston, and also gained them the support of their fellow colonists. Moral and material aid was sent to Boston from the other colonies, and a congress of colonial representatives was called for in town meetings and provincial congresses throughout America. It was becoming clear that both sides in the coming conflict were not going to back down any longer, and that both sides were headed for a showdown.

The closure of the port of Boston was followed by a series of acts known in Britain as the Coercive Acts of 1774, while the Americans called them the Intolerable Acts. The Massachusetts Regulating Act put the colony under martial law. The Government Act and the Administration of Justice Act ended colonial self-government there and freed army commanders from lawsuits brought into colonial ports. The symbol of this change was the replacement of Thomas Hutchinson as governor with Lieutenant General Thomas Gage. Two of the acts that united the colonies were the Quartering Act, which was opposed in all the colonies, and the Quebec Act, which recognized throughout Canada and the French communities the free exercise of Catholicism. This created fears among the colonists that a Catholic conspiracy was being hatched against Protestant New England and also that westward expansion was being blocked.

WAR BEGINS

In September 1774, every colony but Georgia sent representatives to the First Continental Congress in Philadelphia to discuss ways to deal with the crisis in Boston.

What the delegates decided to do was to establish the Continental Association that would renew the boycott against British goods, and also establish a committee to report on violations of the boycott. It was hoped that any merchant who violated the boycott would become unable to conduct any business. The nonimportation and nonconsumption provisions were ruthlessly enforced. The names of violators were made public through newspapers. It became clear that those who violated the provisions were still loyal to the Crown while those who followed the letter of the provisions were "Patriots" committed to liberty. The association also promoted the expansion of the militia system that would later provide the nucleus for the Continental army. It became clear to many as the crisis in Boston continued that it would only be resolved by force of arms. The Congress sent a Declaration of Rights to Parliament that condemned it for trying to tax the colonies without their consent, but it also reaffirmed the loyalty of the colonists to their king. While they waited for a reply, events in Boston took a dramatic turn that made reconciliation impossible.

On April 18, 1775, General Gage sent a force of about 700 men to seize the weapons stored by the militia in the town of Lexington, Massachusetts. Alerted by riders Paul Revere and William Dawes, the "Minutemen" began to gather in Lexington to confront the British force. The British commander ordered the militia to disperse, and they slowly did so, but then a shot rang out, from which side it came has remained a mystery, but the result was that both sides suffered casualties. The British marched on to the neighboring town of Concord where they were confronted by hundreds of militiamen. After an exchange of fire, the British began to withdraw, but their march back to Boston was a bloody one as the militiamen fired at them from the woods that lined the roads back to the city. The British suffered 273 casualties including 73 dead while the militia suffered 95 dead out of an estimated force of 4,000 that had answered the call to arms. The British now found themselves penned up in Boston as militiamen from all over New England began to converge on Boston.

The militiamen began to fortify Breed's Hill overlooking Charles Town on the north side of Boston, and they also began to fortify a neighboring eminence known as Bunker Hill on June 16, 1775. General William Howe sent a force to push the militia off the hills the next day. Having total disdain for what he considered an armed rabble, Howe sent his men straight at the militia on the hill believing that the mere sight of the regulars would scare the rebels away. The opposite occurred, and the militia inflicted over 1,000 casualties on the British, while suffering 450 killed and wounded themselves. The battle became known, incorrectly, as the Battle of Bunker Hill, when the bulk of the fighting actually took place on Breed's Hill nearby. As a result of the battles of Lexington and Concord and Breed's Hill, it was decided that a Second Continental Congress should be convened to determine what the colonies should do in response to these battles. This meeting would forever change the course of American history.

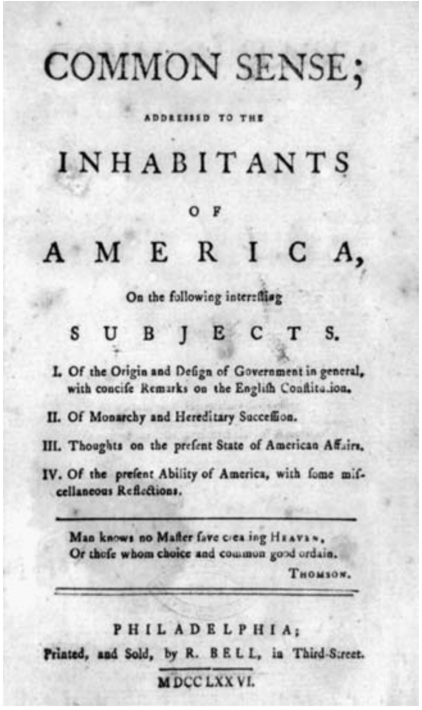
Meeting in May 1775 in Philadelphia, the Second Continental Congress now had delegates from all 13 colonies as Georgia had decided to send delegates to the meeting. Debate centered around what type of military force the colonies should raise to confront the British army, and who should be given command of those troops. There was still great suspicion of standing armies, and there were many who believed that the militias were sufficient to do the job. John Adams argued that the militias were not reliable in the face of regular troops, and that a "Continental army" should be created, along with designating a commander in chief and staff to form the nucleus of this new army. It fell to Virginia planter George Washington, a colonel in the Virginia militia, to fill the role as the army's commander. Washington was not a man of great military experience, but his intelligence and determination in the face of the many setbacks that would occur during the eight long years of the war would transform him into America's greatest leader, and its first president in 1789. Congress also drafted a *Declaration of Causes for Taking up Arms* to explain its actions as necessary to defend the rights of Englishmen and not as a bid for independence.

The Congress also created an intercolonial currency in an effort to fund the war and maintain the army. The fact that this currency was not backed by gold, and the inability of the Congress to tax the colonies to raise funds, would create a dire situation for Washington's army as the Congress was unable to pay for supplies and was powerless to force the colonies to send food to the army. The impotence of Congress to provide for the army over the eight years of the war would be Washington's greatest problem as he would have to use all his powers of persuasion to keep the army from melting away. It is a great testament to Washington—and even more to the men who served with him those grueling years—that they would endure the hardships that would have turned the fainthearted away and gain for America its independence.

INDEPENDENCE

There were those in Congress who still held out hope that reconciliation could be established if a petition was sent directly to the king asking for the British army to cease its hostilities, and for serious discussions over the grievances of both sides. The Olive Branch Petition was presented by Pennsylvania's John Dickinson on July 5, 1775, and the delegates voted to send it to the king. There were many in Congress, like John Adams, who believed it was a pointless gesture considering the events of the past year, but the radicals acquiesced to give the moderates a chance to see if peace was possible. The radicals felt that the colonies should declare their independence, and focus their energies on establishing an independent nation. John Adams and the radicals correctly gauged the mood of the king, for when he received the petition in August, he was enraged and refused to read it. Instead, the king authorized his government to send more troops to put down the rebellion. It was now time for the Congress to begin the process of breaking away.

One of the strongest voices for independence was Thomas Paine, an Englishman who was a recent immigrant to America, and was at the time of the convention a writer for the *Pennsylvania Magazine*. He had known Benjamin Franklin in London, and had also come to know many of the congressional delegates while they were in Philadelphia. He spent time discussing the issues of independence with these men as they met in the various taverns in Philadelphia. Having been inspired by these



COMMON SENSE;

ADDRESSED TO THE

INHABITANTS

OF

AMERICA,

On the following interesting

SUBJECTS.

I. Of the Origin and Design of Government in general, with concise Remarks on the English Constitution.

II. Of Monarchy and Hereditary Succession.

III. Thoughts on the present State of American Affairs.

IV. Of the present Ability of America, with some miscellaneous Reflections.

Man knows no Master save creating Heaven,
Or those whom choice and common good ordain.

THOMSON.

discussions, Paine published in January 1776 what is considered his masterpiece, *Common Sense*. In it, Paine argued that the time for America to declare its independence had arrived, and that holding on to loyalty to the Crown was foolish. The blood that had been spilled up to that time had pointed the way to freedom from the bonds of the past; it was time to start a new future. Paine used plain language to make clear to all Americans that reconciliation was no longer possible, and that independence would cast off the shackles of monarchy, and create for Americans and their children a new society, free from the tyranny of the old world.

Common Sense became a sensation throughout the colonies, and over 100,000 copies were sold. As members of Congress began debate on the subject of independence, Paine's work made their task easier because more people were now convinced that it was time to break away from England. For those conservatives who had held out hope for reconciliation, it became clear that they were now a minority voice in the debates on independence. New England's delegates were pushing for a resolution on the subject, and members of the Virginia delegation presented a resolution on June 7, 1776, which stated that the colonies were "free and independent states." Conservative members from New York, New Jersey, and Delaware managed to stall debate on the subject, but events were quickly overtaking them. A committee consisting of Benjamin Franklin, Thomas Jefferson, John Adams, Roger Sherman, and Robert Livingston began drafting a document that expanded on the Virginia resolution. What emerged was the Declaration of Independence, which stated that each person enjoyed rights from birth that could not be taken away by any government, and also stated that governments that violated those rights could be overthrown. The body of the document also listed the many violations that the king and his government had committed and stated that as a result of these abuses, Congress had no choice but to dissolve its ties with England, and turn to the people to govern.

Depiction of the signing of the Declaration of Independence by John Trumbull (painting in Capitol), Washington, D.C. Courtesy of the Library of Congress.

Debate on the Declaration of Independence began on July 1 and four colonies—Pennsylvania, New York, Delaware, and South Carolina—voted against the declaration. The next day, after more debate, Pennsylvania, South Carolina, and Delaware switched their votes. The declaration was approved on July 4, and 12 colonies signed the document, but the delegates from New York abstained, and Pennsylvania's John Dickinson, still believing in reconciliation, refused to sign it. One copy was signed by the delegates, then hidden, as they were aware of potential reprisals by Loyalists. The unsigned copy was sent to Philadelphia printer

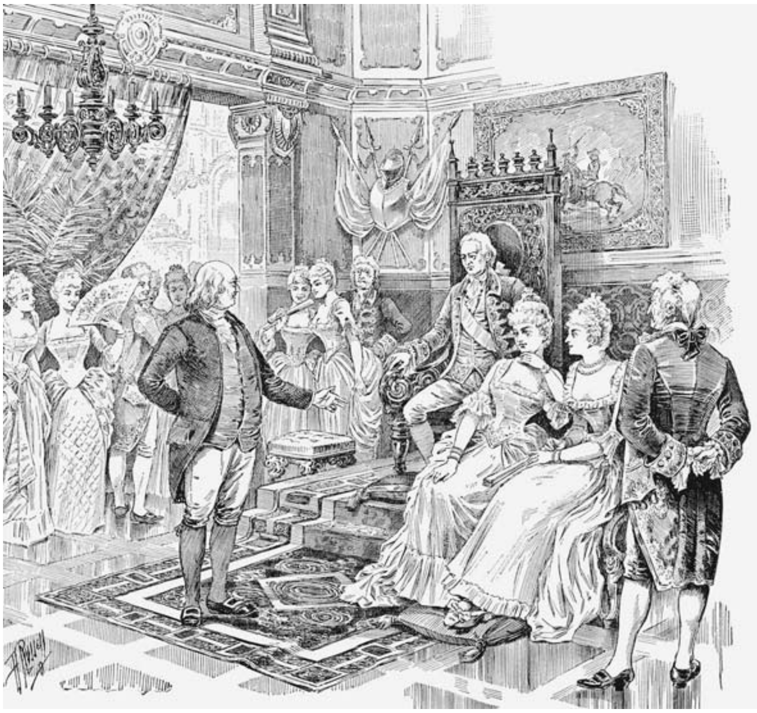
John Dunlap for printing. Copies soon spread throughout the colonies, and people read it with great avidity. There was now no turning back.

THE FIRST CAMPAIGNS

While Congress had been debating America's independence, Washington arrived outside of Boston to take command of the army in July 1775; what he found was not encouraging. Although the British army was trapped inside Boston, the condition of the army was appalling. Washington had been told that there were 20,000 men in the army around Boston, but when an actual count was taken, it turned out to be only about 16,000, and the supply of powder and ammunition was low. He also found that discipline was poor, that men came and went from camp whenever they pleased, and that there was not much respect from the men toward their officers. It was a situation that called for the institution of greater discipline, which meant that the men had to be drilled, had to obey their officers without question, and had to establish an effective system of supply.

Washington hoped to establish a Continental army that would be recruited from the militias from the colonies and be subject to the orders of Congress, and not their individual states. He hoped to maintain the army at 20,000 men, which although much smaller than the British army, would be big enough to confront them, and small enough that Congress could supply it. It was to turn out to be only a hope for the entire war. The numbers of men in the Continental army would constantly fluctuate throughout the conflict. Men would serve their one-year enlistments, then go home to their families feeling that their time of service had been fulfilled. The inability of the Congress to collect taxes, and to impel the states to supply the army, as well as its inability to pay the men, caused many men to opt for serving in the militia rather than the regular army. The fact that a small core of men stayed with the regular army throughout the war was a tribute to them, and to the loyalty that many of these men had to Washington as their commander. The army would consist of men from all walks of life, including some slaves who also fought to obtain their freedom. They would endure some of the most severe hardships throughout the eight years of the war, but they would remain and help pave the way for the establishment of a small regular army at the end of the war.

Washington's army would experience a mix of victories and defeats leading up to the Declaration of Independence in July 1776. Having trapped the British army in Boston, it became a question as to whether they could force the British out. Having established artillery emplacements overlooking Boston and its harbor, the Americans forced the British to evacuate the city, which was completed on March 17, 1776. It was a great victory, but it was tempered by the defeat of American forces sent to capture Canada in January 1775, which ended the dreams many Americans had for wresting control of Canada from Britain. Washington concentrated his army around New York to meet the next British move. Under the command of General Sir William Howe, the British drove Washington from Long Island on August 27,



Ben Franklin negotiating the American-French alliance with King Louis XVI. From woodcut.

1776; then on September 13 the Americans were driven off the island of Manhattan after suffering enormous casualties. The superiority of the Royal Navy allowed Howe to land his troops anywhere he wanted, and Washington had been forced to react to these maneuvers, and he and his army had not responded well. Washington made many tactical errors that left his flanks exposed, which the British exploited. His men behaved like amateurs as many ran at the sight of British troops and their fixed bayonets. Washington had attempted to rally the fleeing soldiers, but many just kept running, leaving Washington to question whether the men under his command were capable of ever becoming an effective force.

After losing almost 3,000 men in the campaign in New York, as well as vast stores of arms and ammunition, Washington retreated through New Jersey with Howe's army following through the fall of 1776. By December Washington had encamped his army along the Delaware River opposite Trenton, New Jersey. Howe had garrisoned the city with a force of Hessians, soldiers who were paid to serve with the British from the duchy of Hesse in Germany, and prepared his men for the winter. Washington, his army reduced to about 2,500 men and with many of their enlistments set to expire at the end of the year, decided to attack the Hessian outpost at Trenton on Christmas night. Despite terrible winter conditions, the army surprised the garrison and then followed that victory up with a defeat of a British force at Princeton on January 3. The result of these two victories was that many of the soldiers reenlisted, and therefore Washington's army was saved from extinction. It also forced Howe to evacuate New Jersey and pull his army back to New York for the remainder of the winter, but the year 1777 would prove to be one of the most crucial of the war.

General Howe decided that to defeat the rebels he would move part of his army by water south from New York to take the American capital of Philadelphia. He hoped that this action would not only force Washington's army into battle, but also force the Americans to the negotiating table. In June 1777, Howe attempted to bring his force up the Delaware River, but was driven away by the forts that guarded the river's entrance. He then took his ships south to the Chesapeake Bay and landed at Head of Elk, Maryland, on August 24. Washington marched his army south to meet the British and keep them from taking Philadelphia. On September 11 the two armies came together at Brandywine Creek in Delaware, and Washington, outflanked by Howe's army, was forced to withdraw, and after unsuccessfully trying to draw the Americans into a decisive battle, Howe occupied Philadelphia on September 26. It was an embarrassing campaign for Washington as Howe had outmaneuvered him and had occupied the capital without fighting a major battle. The situation in the north, however, led to a victory that would change the course of the war.

As Howe and Washington sparred in front of Philadelphia, Lieutenant General John Burgoyne was moving another British army south from Canada toward Albany, New York. Burgoyne's plan was that he would head south with 7,000 men, while Howe's army marched north from New York to meet him, and they would gain control of the Hudson River and cut off New England from the rest of the colonies. Initially the plan worked well as Burgoyne's men sailed down Lake Champlain in the beginning of June where they took the strategic Fort Ticonderoga from the Americans. Then they sailed down the lake until they needed to debark and march to Albany. The plan then began to go awry as Howe moved his forces to take Philadelphia, leaving Burgoyne's army on its own with no support. Also, the dense woods that Burgoyne's men had to move through slowed their progress to a crawl, and the New England militia gathered in great numbers to meet the threat posed to Albany. As the British hacked their way through the dense forests, the American militia felled trees to stop the British progress and fired at Burgoyne's men as they struggled to reach their goal.

On August 16, in an effort to retrieve supplies from the nearby town of Bennington, Burgoyne sent a detachment of Germans to take the stores in the town, and return to the army. When they reached the town, the Germans were swarmed upon by militia, and after a fierce fight, they were forced to surrender, suffering nearly 1,000 casualties. It was a stinging defeat and should have caused Burgoyne to take stock of his situation, as without reinforcements, pushing forward would be folly, but the advance continued and disaster was in the offing.

By the time Burgoyne had encamped his men on September 17, 7,000 Americans, under the command of Major General Horatio Gates, had a fortified position on Bemis Heights and also Freeman's Farm, which gave them a great advantage should Burgoyne send his men against it. The first Battle of Saratoga occurred on September 19, as Burgoyne sent 4,200 of his men against the American positions around Freeman's Farm, and wound up suffering over 600 casualties, while the Americans suffered about half that number. Then, on October 7, the second Battle of Saratoga took place as Burgoyne looked to dislodge the Americans from their positions on Bemis Heights. During the battle, Gates exercised little effective tactical command, and it fell to America's best combat general, Benedict Arnold, to turn the tide against the British that day. Although he would later become the most infamous traitor in American history, on this day, Arnold helped to win the battle for the Americans, and led to the surrender of what was left of Burgoyne's entire army, around 5,700 men, along with the arms and ammunition that had supplied it. It was a great victory, and led to the entry of a powerful ally, France, on the side of America.

The events that led France to enter into the war on the side of the Americans can be drawn directly to the man Congress had sent to negotiate an alliance, Benjamin Franklin. Already one of the most recognized people in Europe through his scientific work with electricity, Franklin entered France as a representative of one of the most dynamic ideas of the period, republicanism. Franklin's arrival in France in December 1776 had created a sensation; dressed in plain clothes, and striking a simple manner, he demonstrated the ideals of republican government and many flocked to meet him. Convincing the government of King Louis XVI was another matter as he and his ministers were only willing to support the Americans openly if they proved they could win on the battlefield. When news of the victory at Saratoga reached Paris in late 1777, the French decided that it was time to throw their lot in with the Americans and by May 4, 1778, Congress had approved a treaty of alliance with France that made the war an international struggle and, in time, would tip the scales in favor of America in its war with Britain. But it took time for French troops to arrive in America, and the Continental army needed to keep from disintegrating before that help could arrive.

The fact that the army still existed in the spring of 1778 was in itself a testimony to the men who served, and their loyalty to the cause of liberty. Following the occupation of Philadelphia, Washington tried to engage the British outside of Philadelphia in the community of Germantown on October 4, 1777, in hopes of achieving another Trenton-like victory. Although the battle started favorably, the complexity of the plan of battle frustrated the operation, and Washington was forced to withdraw. He moved his men into winter quarters outside of Philadelphia to a place called Valley Forge, from where he could keep a close eye on the British in the city. The conditions that winter would be forever remembered for the terrible cold, and the suffering of the men for lack of adequate clothing and food supplies. Washington constantly lobbied Congress, now meeting in York, Pennsylvania, to press the states to meet their obligations to supply his army, but Congress did not have the power to compel the states to follow its orders, so the men suffered through the winter. It would be memories of the inadequacy of Congress to prosecute the war effectively that would lead men like Washington to look for the formation of a strong central government when the Constitutional Convention came to Philadelphia in 1787.

Despite their suffering, the men managed to make do with what they had at hand, and managed to continue training to become an effective fighting force. The training came under the leadership of Major General Baron Friedrich von Steuben from Prussia. He came to Valley Forge with papers that claimed he was a general in the army of Frederick the Great of Prussia, and that he had come to train the men so they could fight in the European style. It later turned out that von Steuben's credentials were inflated, and that he had only reached the rank of captain in the Prussian army, but what was important was that he was able to adapt his instructions to the men so that they were able to see the importance of maneuvering as soldiers on the battlefield, and willing to obey orders with alacrity. The training of Steuben would pay great dividends on the battlefield during 1778, and his methods would be adopted by the American army for many years after the war into the new Republic in the 1790s. Steuben was not the only foreign officer to contribute to the American cause; there were others who came and offered valuable service during the war, such as Steuben's fellow German Baron Johann de Kalb, two Polish officers, Thaddeus Kosciuszko, an engineer who helped build the fortress at West Point, New York, as well as Count Casimir Pulaski, who helped train the American cavalry, and finally the most well known of the group, the Marquis de Lafayette, who would become close to General Washington, and who would become one of his most trusted confidants. These men all came to help the American cause and in doing so pointed the way to freedom in their own lands.

THE SOUTHERN CAMPAIGNS

In 1778 the British shifted their strategy for winning the war in America, and the new British commander, Lieutenant General Henry Clinton, began to concentrate his army to enact a new plan. In accordance with his strategy, the British army was pulled out of Philadelphia on June 18, 1778, and began a march through New Jersey to reach New York City. On June 28 in Monmouth, New Jersey, Washington's army caught up with Clinton's army and gave battle. For four hours, on one of the hottest days recorded, where temperatures reached around 100 degrees, Washington's newly trained army fought the British to a standstill. When the battle was over, the British resumed their march and left the field to the Americans. It was an important step in the development of the Continental army as it showed it could now stand and face the English in battle, and gave it pride.

Once his forces gathered in New York, Clinton decided that rather than trying to win the war in the North, he would send a large force against Savannah, Georgia, and then move to take Charleston, South Carolina—at that time one of the most important ports in America. Once Charleston had been captured, he would encourage Loyalists and slaves to join the British in destroying the rebellion. The threat of enlisting slaves and free blacks to the British effort was not new as it had been encouraged in Virginia in 1775 by the Royal Governor Lord Dunmore. Because of the fears that many southerners had of blacks killing entire families in retaliation for slavery, it was a grave threat to the safety of the southern colonies/states, and would engender much hatred toward the British and their loyalist allies. What Clinton did through all his planning was to begin what amounted to a civil war in the southern colonies, as old animosities between patriot gentry and recent loyalist Scotch immigrants would flare up, and old scores would be settled brutally by each side. The chaos that erupted led to hatreds that lasted for generations, and would be carried into America's Civil War 83 years later.

Clinton launched his campaign by taking Savannah on December 29, 1778, and then began to make preparations for a move against Charleston that began on February 11, 1780, and ended with the surrender of the city and its 5,400 men. It was a disaster for the Americans, and Clinton left his second in command, Lieutenant General Lord Cornwallis, and 8,000 men to gain control in the South and returned to New York. As British troops moved into the towns of South Carolina, they encouraged Loyalists to join them, then left them in control when they left, thus creating an explosive situation that only engendered bloodshed of the cruelest order. After the crushing defeat of General Gates's army at the Battle of Camden on August 16, 1780, Washington sent his most able subordinate, Major General Nathanael Greene, to command the southern American army. Greene was able to pull Cornwallis's army into the countryside of North and South Carolina in a campaign that allowed the Continental army to regain control over much of the South. Greene sent his subordinate, Brigadier General Daniel Morgan, on a separate assignment to destroy the cavalry of Lieutenant Colonel Banastre Tarleton, which he did at the Battle of Cowpens on January 17, 1781. In doing so, he denied Cornwallis's army its scouting force. Greene kept his army out of reach of Cornwallis, and led him on a chase across

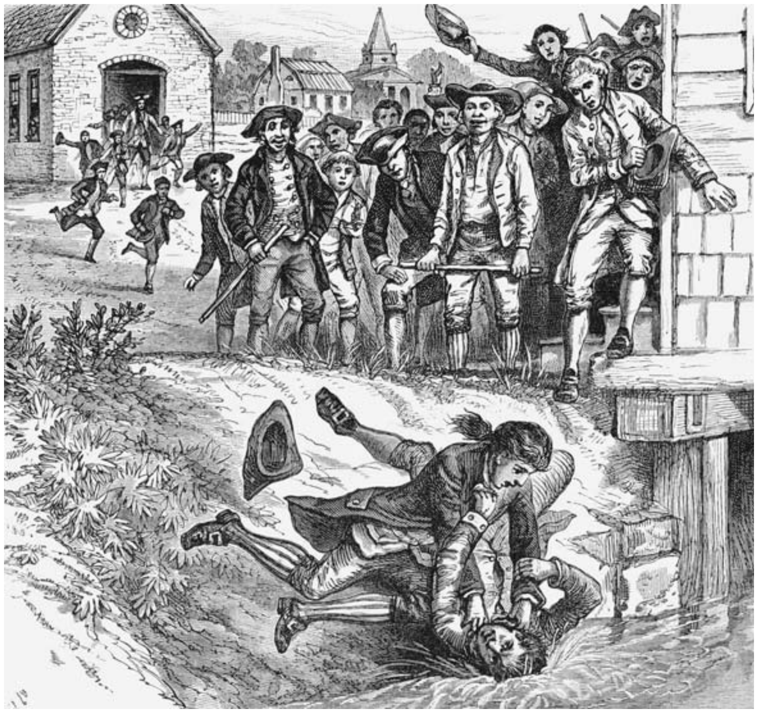
"Yorktown: Surrender" (1781). Fictional representation of British General Charles Cornwallis surrendering his sword to George Washington at Yorktown, Virginia, October 19, 1781. Steel engraving, nineteenth century. The Granger Collection, New York.

North and South Carolina, drawing the British further from their base of supply. By doing this, Greene was able to take back the South from the British, and frustrate British Loyalists there. Eventually Cornwallis decided to head to Virginia in August 1781 to refit and resupply his army of 8,000 men on the Yorktown Peninsula, and it was there that the war reached its climax.

Outside of New York, Washington and his army waited to attack the garrison there, but the French, led by Lieutenant General Jean Baptiste Comte de Rochambeau, convinced him that Cornwallis's army in Virginia should be the target of a combined operation with the French fleet under Admiral Francois Comte de Grasse. Preparations were made to march both armies to Virginia. Washington managed to trick Clinton into believing that New York was the focus of the combined American and French armies, and it wasn't until the combined forces reached Philadelphia that Clinton realized what was happening. De Grasse with 3,000 French troops embarked with his fleet, arrived off of Yorktown on August 30, and drove a smaller British fleet away in a series of naval battles on September 5–9; this gave the French control of the waters around Yorktown. Washington's and Rochambeau's troops began arriving from September 14–26 and on the 28th the investment of Yorktown began. Under the direction of the French, the allies slowly worked their way closer to the main British works until October 17 when Cornwallis, unable to break the siege and cut off from reinforcements, asked Washington for conditions of surrender. On October 19, the British garrison marched out of their positions and laid down their arms.

THE END OF THE WAR AND THE TREATY OF PARIS

Although the victory at Yorktown led many to believe that the war was over, operations continued against the British forces in New York and Charleston. In March 1782, King George III accepted the advice of his new prime minister, Lord Charles Rockingham, which was that, in order to prosecute the war effectively against France, and her allies Spain and Holland, the Americans should have their independence recognized, and negotiations for a treaty of peace were opened on April 12, 1782. While the negotiations were in progress, the British concentrated their remaining forces in America in New York, while Washington and his army remained outside



Protesters during Shays's Rebellion in Massachusetts, 1786–1787. Hand-colored engraving. © North Wind / North Wind Picture Archives—All rights reserved.

of the city to watch their activities. There were many in Congress who believed that with active operations over, the Continental army should be disbanded, but Washington opposed this as it was better that the British be shown that the Americans were negotiating from a position of strength as long as their army remained intact. On November 30, 1782, the Treaty of Paris, which officially recognized America's independence, was signed. It would become effective once Britain's war with France and Spain concluded. Congress ratified the treaty on April 15, 1783, and the war with Britain came to an end after eight years of hard struggle. The French and Spanish would sign the treaty on September 3, 1783, ending the global aspect of the war.

The Treaty of Paris granted the United States its independence from Great Britain, and extended its boundaries to the Mississippi River in the West. The British were to withdraw their troops from the frontier, and all debts were to be paid to creditors in sterling silver, which as time progressed would become a great problem for many states, and for individuals who owed money. It was hoped that with the conclusion of the war the American economy would quickly recover and that the debts incurred by the war could be paid off. What happened was that the country went into a depression as the debts that were owed from the Revolution needed to be paid and this led many states to raise their taxes to pay them off. Along with this, the British cut off trade between the United States and its Caribbean ports. A decline in the demand for tobacco forced many Chesapeake area planters to switch their crops to grain and strained the economy. Many states attempted to relieve the strain by printing large sums of paper money or passing stay laws that postponed the paying of debts owed by individual citizens. The problem with this was that the paper money became devalued, and the stay laws only led many merchants into further debt with their foreign suppliers. The situation was not helped by the national government, which at this time was operating under the Articles of Confederation.

CREATING THE GOVERNMENT

The Continental Congress had begun discussions on forming a central government, and what its powers should be during the war. Because of fears that they would throw off one tyranny for another, it was agreed that the Congress should have only limited authority. Many of the colonies had passed state constitutions that restricted the power of the governors in their states in an effort to keep political power in the hands of the people. What Congress proposed was the Articles of Confederation, which set up a weak central government that could not tax citizens directly, but had to request money and supplies from the 13 states. The Congress could declare war and negotiate treaties, print money, regulate Indian trade, decide disputes between states, and establish a postal system. By 1777 Congress had sent its draft for the new government to the states for their ratification, but under conditions established during the negotiations, all 13 states had to ratify the document. By 1779 12 of the states had ratified the Articles, but Maryland held out because it wanted Congress to have the power to regulate the lands in the West. Landlocked small states like Maryland were afraid that the larger states like New York and Virginia would lay claim to great tracts of this land, and then use their influence over the new lands to control the government. They demanded that the large states cede their land grants to Congress so that it could be distributed evenly; eventually New York and Virginia agreed, and Maryland signed the Articles of Confederation in March 1781.

The problem was that by the time the Articles of Confederation was ratified, the war was basically over, and any benefits that a stronger central government would have had in helping maintain the army in the field, and civilian economic and living conditions, were nullified. With the end of the war, there were many who looked to strengthen the powers of Congress to meet the problems that would face the new nation, two main problems being the debt incurred by the war and the authority of Congress to tax. Robert Morris, a wealthy Philadelphia merchant who had been responsible for keeping the Continental army going through loans he obtained during the war, became superintendent of finance for Congress, and he looked to strengthen America's currency to meet its debts. He managed to have a central bank, the Bank of North America, established where gold and silver from France and Holland could be kept, along with his own money. He also had certificates printed that were backed by the funds in the bank, and all army supply contracts were opened to bidding with the full credit of the Congress. Morris also wanted to create national revenue based on taxes, and even though many objected to giving Congress this power, 12 states passed the idea, but Rhode Island objected, thereby scuttling the plan.

It had been hoped that this national tax would allow the Congress to assume the debts that had been incurred as a result of the war. The government's credit would have been strengthened and a stable currency could have been introduced. Instead what happened was that the states themselves began paying off the debts that were owed to various creditors. Pennsylvania, New York, Maryland, and New Jersey had paid off most of their debt by 1786, and this created a situation whereby the states, not the central government, held most of the power, with the result that the Congress would have very little power to regulate the economy of the various states. Once there was an economic downturn, the Congress would have little ability to act. As it turned out, the weaknesses of the Articles of Confederation would soon become evident, and changes were going to become necessary.

The trouble over debtor relief began to manifest itself in 1786 as many small farmers and merchants were being squeezed by state legislatures, many of them controlled by creditors, off of their lands and out of their businesses. The demand that hard currency, gold or silver, be used to pay off debts was established by creditors. Debtors, who had no access to such specie, believed that paper currency should be accepted even if its value may be deflated because of great amounts in circulation. Some states passed laws that offered limited debt relief, but in other states like Pennsylvania, New York, New Hampshire, and Connecticut, there were debtor rebellions. The best known of these rebellions occurred in Massachusetts on January 25, 1787. Led by a former Continental army captain Daniel Shays, farmers in the western and central portions of the state came together to protest their treatment by local authorities, who in many cases had taken away their land for not paying their debts. About 1,500 men marched on the arsenal at Springfield to capture the ammunition stored there, but were met by the state militia that broke up the group with heavy artillery fire. Eventually most of the rioters were dispersed, and Shays was captured, but along with the other rebellions that were breaking out in the other states, it was clear that central authority was lacking and something had to be done.

There were many political leaders who believed that the Confederation was too weak to handle the crises that had occurred. The states were more concerned with their own problems, particularly debt and expansion. They would pass legislation that only affected them, and in many cases drafted bills that would retaliate against other states that destroyed any possibility of establishing a strong national economy. These men, known as Federalists, believed that only a strong central government could address the problems of the national debt, as well as sense of national unity. They believed that the states should come together and call for a meeting to revise the Articles of Confederation to establish an effective national government to meet the needs of the people. There had been some meetings that had been held to develop a better sense of interstate cooperation: In 1785, there had been a meeting at George Washington's estate of Mount Vernon between Virginia and Maryland over the development of a Potomac River canal; and at a meeting at Annapolis, Maryland, in September 1786 five mid-Atlantic states, Pennsylvania, Maryland, New York, Delaware, and Virginia, participated in a conference that called for a convention to be held the following year in Philadelphia to revise the Articles of Confederation. What resulted was the Constitutional Convention of May–September 1787, which would scrap the Articles of Confederation and put in its place a central government that would meet the crisis of the early American experiment.

Domestic Life

THE FAMILY IN COLONIAL AMERICA

In colonial America the family was the central social institution, one that served many functions. It was, for one thing, the center of education. Parents taught young children their first "letters" and their earliest religious precepts. Fathers taught their sons how to farm, repair tools, hunt, and fish. If the father was a skilled craftsman, he taught his son the trade. Girls learned from their mothers how to perform the many household tasks expected of colonial women—cooking, baking, sewing, candle-making, and spinning (Unger 1989, 62).

The family was also a "little commonwealth" within which people's lives were prescribed and regulated, and the agency through which acceptable social behavior was taught and enforced. The patriarchal system was deeply entrenched in Europe, and colonists carried it to America. It was reinforced by the father's control over family land and property. In the southern colonies, with their looser settlement patterns and their more abundant fertile land, this arrangement was probably not a serious problem for children. In early New England, however, where towns were limited in size and where fathers usually lived to old age, the patriarchal system could be galling. Grown sons were often forced to live in their parents' household, subject to continued patriarchal control, or became tenants on their father's land. Fortunately, New England sons had an escape route. By the beginning of the eighteenth century an ever larger number were leaving the crowded Massachusetts and Connecticut towns to move to cheap land in the Berkshire and Green Mountains, New Hampshire, and what is present-day Maine (Unger 1989, 62–64).

Relationships between parents and those beneath them were sometimes despotic, but by the eighteenth century a new family pattern had emerged that historian Philip Greven has characterized as "genteel." The new pattern, common in the eighteenth century, reflected the growing complexity of American society. Genteel families were prosperous, well educated, and generally less pious than others. They were bound together by affection as much as authority and were more child centered. These qualities, says Greven, had far-reaching effects. The children brought up in a genteel environment were more self-confident and independent minded than others. As adults, they were apt to be leaders and doers. Their relatively egalitarian upbringing may have played an important part in shaping later American society (Unger 1989, 64–65).

The biggest danger in studying the families of colonial British North America is that we may judge them using present-day standards or dismiss them as oddities of a long-abandoned past without understanding what role the family played in the context of the period. The composition and life of colonial families, on the whole, were continuations and adaptations of the settlers' Old World heritages and traditions. Most colonists were Christian in religion and European in culture, and the values and habits by which they organized their lives were not distinctly "American." Colonists adapted what they already knew and believed in their very new and different existence in the New World to create successful lives for themselves and their families. Both these European traditions and the difficulties and opportunities presented by life in the American lands during the eighteenth century helped to shape the family life in the colonies (Marcus et al. 2007, 81).

MARRIAGE

Most colonial era families were very large, first, as a necessary balance against the period's high childhood mortality rates as a guarantee that enough offspring would survive to work the family farms. Second, colonists shared the widespread beliefs that having many children honored God's will to be fruitful and multiply, made families prosper, and continued their lineage.

New England families were large compared to those in England because more children survived into adulthood, couples married at younger ages, and land for supporting large families was available. Especially in New England, people married young to procreate as soon as possible. Southern families too conformed to the colonial norm in being large, at least after the earliest Chesapeake years in which male indentured servants greatly outnumbered female ones. Indentured servitude virtually disappeared in Virginia during the eighteenth century and played a lesser role from the beginning in Maryland and the other Middle colonies, except Pennsylvania where many German "redemptioners" came in the mid-eighteenth century. Free southern white men and women married at even younger ages than in New England, but more children died because of the greater incidence of malaria and dysentery (Marcus et al. 2007, 81).

The Search for a Partner

A couple—husband and wife—stood at the core of the nuclear family just as it had in older, more traditional households. The minimal duties of each spouse remained the same as well: Both were expected to engage in normal and exclusive sexual union and to cohabit peacefully for life. The husband was responsible for directing the economic affairs of the family, the wife for maintaining the basic condition of the house and garden and the care of the personal needs of its inhabitants. Although romantic love and sexual attraction were certainly not inventions of the eighteenth century, their emergence as a primary ingredient in the selection of a partner for life is one of the hallmarks of the development of the affectionate family. Dependent on the ability of young people to choose for themselves, the struggle was not easily won, particularly where the economic functions of the family were paramount. Among landholding rural neighbors or wealthy merchant gentility, the marriage contract often bore many of the aspects of a twentieth-century corporate merger (Wolf 1993, 72).

This type of arranged marriage was prevalent in the first half of the eighteenth century. In colonial New England, discussion of marriage was not broached by parents whose children were of different social classes. Just as it was imperative to remain in the station in which God had placed one, so it was equally imperative to marry someone of the same class. Occasionally, men would marry "beneath them," as did the Reverend Michael Wigglesworth, a highly educated, socially prominent professor-clergyman who insisted on marrying his servant girl. He was able to do this because it was not his first marriage, and there seemed to be no family involved in the decision. But the community rarely condoned such unions. Since no one could marry without parental permission (and records tend to prove that parents did not give their permission for their children to marry beneath them), and since one could run away with one's forbidden beloved only to a lonely and dangerous wilderness or distant colony, elopements of "star-crossed" sweethearts of different classes seem to have been rare.

The reason behind what we would consider an unusual sequence of events in a courtship is the belief that the arrangement of a marriage began not as the natural culmination of love between a man and a woman but as a business negotiation between their families. This is not to say that the couple were not consulted; they were. And it was hoped and understood that love or affection would follow. There are records of young people who resisted the marriage proposed by their parents because they were already in love with someone else. However, the usual sequence of events found a reluctant bride or groom deciding at least to try to be fond of the mate chosen for him or her.

The courtship leading up to the contract consisted of business discussions over just what property the families of the bride and groom would contribute to the marriage. For a bride of property, the negotiations were especially critical, for any property she owned when she married would, by law, automatically become her husband's. Each family brought property or money to the couple's union, and the object of each was to get the other family to make a larger contribution. The father of the groom often deeded a portion of his land to the couple and sometimes agreed to build a house for them on the land. In many cases, a man of the second generation was forced to marry late because his father refused to turn over a deed to the land that had been promised him.

Once the marriage contract was drawn up, it was signed by all parties and was as legally binding as any other contract regarding property. If either of the parties decided he or she did not want to be married to the other and attempted to withdraw from the contract, the person could be, and was, sued for breach of contract. From the signing of the contract, the couple were considered married, though it was expected that they would refrain from sexual intercourse until after the wedding ceremony (Johnson 2002, 109–10).

This type of arrangement was typical in most of the colonies, and though some marriages could result in happy ones, there were also marriages that ended in disaster. When upper- and middle-class fathers aggressively sought to augment the family fortune by engineering advantageous marriages for their daughters without regard for their wishes, the results could be tragic, as they were for Anne Shippen of

Philadelphia. In 1781, her father, William Shippen III, wrote to his son, justifying his refusal to allow the marriage of "Nancy," as he called her, to her chosen lover, Louis Otto, and his insistence on her acceptance of a loveless and eventually disastrous union with Colonel Henry Beekman Livingston. "[Nancy] loves ye first & only esteems the last. L—will consummate immediately. O—not these 2 years. L—has 12 or 15,000 hard [twelve to fifteen thousand pounds English sterling, in cold cash]. O—has nothing now, but honorable expectations hereafter. A bird in hand is worth 2 in a bush" (Wolf 1993, 72).

This mercenary attitude was exhibited by many fathers when looking for a suitable partner for their daughters, but there were also fathers who exhibited a modicum of restraint. Other fathers allowed, if not by choice, at least the exercise of a veto. Eliza Lucas, an 18-year-old heiress in South Carolina, responded spiritedly to her plantation-owning father in 1740 when he proposed two suitors from whom she might choose. As to the "old Gentleman," she wrote, "the riches of Peru and Chili if he had them put together could not purchase a sufficient Esteem for him to make him my husband." She rejected the other candidate as well, although she knew him less well, hoping "…as I am yet but Eighteen [that] you will [put] aside the thoughts of my marrying for these two or three years at least." Eliza's father evidently acquiesced, and four years later, the young heiress agreed more willingly to accept the equally eligible Charles Pinckney, a wealthy, well-connected widower over 20 years her senior.

As the century progressed, however, there were more and more parents who themselves had married for "love," and who were therefore more prepared to share, if not abdicate, the fateful decision to a new generation. John Adams bemoaned his absence from home when his daughter seemed about to choose a young man whom Adams regarded as "a reformed rake." "Take care of how you dispose of your heart—I hoped to be at home and to have chosen a Partner for you." Then Adams appeared to remember that he was living in new times, and rephrased his thought: "Or at least to have given you some good Advice before you should choose" (Wolf 1993, 72–73).

Although many parents during this transitional period may have felt that the new trend would lead their children to marry for impractical reasons, their children could be as practical as any colonial father in choosing a suitable mate. When young men came to marry, they followed the old adage that it was as easy to fall in love with a rich girl as a poor one, and enough enterprising apprentices and farm laborers married "the boss's daughter" to suggest one way to improve one's station (Wolf 1993, 74–75).

Most people who left information on their criteria for a perfect mate chose a blend of features, both practical and romantic, beginning with "reasonable fortune" or "circumstances," and including such attributes as "similarity in taste," "liveliness of manner," and "gentle wit." Many partners who had chosen each other for love may well have enjoyed a degree of personal fulfillment unknown to their grandparents who were joined under the old system. The hundreds of thousands of lower- and middle-class couples in cities, towns, farming communities, and frontier societies were perhaps less secure than they might have been as subordinate members of large domestic households. On the other hand, their very isolation and need to rely on each other created conditions in which trust and shared authority and responsibility between husbands and wives could grow. As usual, more articulate across the years than any others, the Adams correspondence provides a picture of a lasting marriage of love and companionship, in a letter written by Abigail to John after almost 20 years of marriage. "In the domestik way, should I draw you the picture of my Heart," she wrote, "it would be what I hope you still would Love . . . I look back to the early days of our acquaintance, and Friendship, as to the days of Love and Innocence; and with an indescribable pleasure I have seen near a score of years roll over our Heads, with an affection brightened and improved by time" (Wolf 1993, 76–77).

Husbands and Wives

The actuality of married life for most folks was a long way from "happily ever after." Nothing in the change from dynastic house or domestic household to nuclear family automatically implied any change in the patriarchal nature of relationships within the home. While marriage was in itself a voluntary contract, once consummated, its terms required the subordination of the wife. Her property was his, her obedience his to command; if she worked for wages, they, like those of the children, belonged to him. In many places, she, like an apprentice, was legally subject to "reasonable correction," that is, corporal punishment. The introduction of romance as a proper consideration in choosing a partner for life did, however, change to some extent the expectation of equal behavior within the basically unequal relationship. A husband was asked to do more than support his wife economically: he was also asked to protect and cherish her, and to remain sober and faithful. He was even expected to take her opinions and interest into account when forming his decisions. By the end of the century, as divorce became possible, although difficult, in most states, abusive husbands were sometimes called upon to justify their actions. Many did by noting that they had been "provoked by her scolding." "Scolding," a contemporary term for nagging or arguing, was a serious fault in a wife, by the standards of the day probably as deserving of a beating as any other form of insubordination (Wolf 1993, 77–78).

Currier and Ives Lithograph depicting one of the Four Seasons of Life; Youth. The Granger Collection, New York.

Some women, however, seemed to have felt an implicit contradiction between affectionate marriage and patriarchal domestic arrangements. Sarah Harrison, a determined young woman of aristocratic southern background, insisted that the minister remove the word "obey" from the ceremony before she would proceed with her wedding to James Blair. She got her way. Another woman, Charity Barr, was willing to go public with the failure of marriage to meet her expectations. In 1785, when she left her husband, he took out a notice in a newspaper accusing her of "desertion without cause." She replied in the public forum as well, detailing his abuse of her, and adding, "If such cruel usage, *from a man who ought to have been her best friend,* be not sufficient cause for leaving him, she leaves the impartial to judge" [emphasis added]. In some ways the quarrels between married couples, complaints, and countercomplaints were merely a part of the eternal battle of the sexes common in folk tradition as well as in literature. There is no need to look for further significance in the name of an "exceedingly noisy" stream christened "Matrimony Creek" by the eighteenth-century crew that drew the dividing line between Virginia and Carolina (Wolf 1993, 78–79).

The changing nature of the home reallocated discretionary funds, putting more power and control into the hands of women whose customary responsibilities involved the maintenance of the house and its operations. Throughout the century, there were more frequent, bitter references to female extravagance as the cause for everything from domestic discomfort to financial ruin and the corruption of the moral virtue of the new Republic. In 1787, a popular Philadelphia magazine, the *American Museum,* published a critique of feminine extravagance by a "farmer" who blamed all the problems in the economy, personal and natural, on the teakettle. Drinking tea not only required family dependence on "market commodities," it wasted time as well. He vowed to reform his own household: "no one thing to eat, drink, or wear shall not come into my house which is not raised on my farm, or in the parish, or in the country except salt and iron-work, for repairing my buildings and tools—no tea, sugar, coffee, or rum. The tea kettle shall be sold" (Wolf 1993, 79–80).

His choice of the teakettle as the most important target in the battle over domestic morality was particularly telling. It was tea drinking—its ceremony and its equipage from pots to slop bowls to cups—more than any other single family ritual that symbolized the new domestic world in which women were in charge of a home that was the center of domestic life. During the century, tea and its accessories had become less and less expensive, and more and more available on some level to almost everyone. The mere drinking of the beverage itself became something family members did together in unceremonial fashion, male and female together, and this increased family togetherness was an important aspect of the change to the affectionate, nuclear home. It implied parents who might someday—over the teacups—discuss the affairs of the day and make joint decisions concerning family strategies and priorities, including those determining the education and future directions of the children (Wolf 1993, 80–81).

CHILDBEARING

In marriage a woman entered a cycle of pregnancy, birth, and nursing that set the bounds of her life for the remainder of her childbearing years. For many women, 20- to 30-month intervals stretched from the birth of one child to that of the next. During pregnancy a woman was expected to have amassed a set of "childbed linen."

A portion of this assemblage may have been handed down from her mother. The remainder was the product of the woman's own needle. As much ceremonial as pragmatic, the linens and infant wear were of the finest linen the family could afford and would be adorned with embroidery and lace (Volo and Volo 2002, 125).

Labor and delivery were not only momentous occasions for the family; they also were community events. At the first stage of labor, the husband would send for the midwife, who would be on hand for the birth and remain with the family for a brief interval afterward. Other female friends and relatives would also attend to assist in the birth. Samuel Sewall recorded the following events in his diary at the time of the birth of his 14th child: "My Wife had some thoughts the Time of her Travail might come, before she went to bed; But it went over. Between 4 and 5 a.m. I go to prayer, Rise make a Fire, call Mrs. Ellis, Hawkins. Mary Hawkins calls Midwife Greenlef." Later in the day he made a second entry: "My Wife is brought to Bed of a Daughter about two p.m." Two days later, his wife, Hannah, fell ill: "Sabbath-day night my wife is very ill and something delirious. Pulse swift and high." Four days later he noted: "Nurse Hill watch'd last night. Wife had a comfortable night" (Volo and Volo 2002, 125) (Thomas 1973, 459).

All children were breast-fed until they were weaned as toddlers. A mother who was incapable of producing enough milk for her child needed to find a "wet nurse" as a substitute. Nonetheless, the newborn infant was often given to another woman to nurse for the first few days. The nurse was also available to help with complications following childbirth. It was not uncommon for a nurse to remain with the mother and child for an extended interval.

This population increase in the house as labor progressed required that a large number of people be fed. One of the responsibilities of the expectant mother was to provide refreshment for those in attendance during the childbirth. "Groaning cakes," "groaning beer," and other items that would not spoil were made in advance of the expected event (Volo and Volo 2002, 125).

Samuel Sewall made note of a dinner that was given two weeks after the birth in appreciation to the women who attended his wife during the delivery: "My Wife Treats her Midwife and Women: Had a good Dinner, B'oiled Pork, Beef, Fowls; very good Roast-beef, Turkey-Pye, Tarts, Madam Usher carv'd, Mrs. Hannah Greenlef; Ellis, Cowell, Wheeler, Johnson, and her daughter Cole, Mrs. Hill our Nurses Mother, Nurse Johnson, Hill, Hawkins, Mrs. Goose, Deming, Green, Smith, Hatch, Blin. Comfortable, moderate weather; and with a good fire in the stove warm'd the room" (Volo and Volo 2002, 125) (Thomas 1973, 460–61).

Sometimes plans were disrupted. At the birth of their ninth child Sewall wrote: "My wife was so ill could hardly get home . . . at last my Wife bad me call Mrs. Ellis, then Mother Hull, then the Midwife, and through the Goodness of God was brought to Bed of a Daughter . . . Mrs. Elizabeth Weeden, Midwife. Had not Women nor other preparations as usually, being wholly supris'd, my wife expecting to have gone a Month longer" (Volo and Volo 2002, 126) (Thomas 1973, 264).

Death due to childbirth was a genuine fear, for it was the leading cause of mortality for women. Before the birth of one of her children, Anne Bradstreet composed a poem to her husband acknowledging the risk that loomed: "How soon, my Dear, death may my steps attend." She voiced her concern for the children she would leave behind and bid her husband, "These, O protect from step Dames injury." Husbands too worried. Benjamin Bang was concerned about his pregnant wife. In his diary he noted, "My dearest friend is much concerned being in and near a time of difficulty." He tried to bolster her and dissuade her frightful dreams. Of one such nightmare he wrote, "I put it off slightly for fear of disheartening her but directly upon it dreamed much the same myself of being bereft of her and seeing my little motherless children about me which when I awoke was cutting to think of" (Volo and Volo 2002, 126) (McElrath and Robb 1981, 179–80) (Shipton 1975, 480).

INFANT MORTALITY

Loss of a child was a frequent occurrence. During the first year of life, 1 in 10 infants did not survive, and 4 out of 10 children died before age 6. Common diseases that stole away these infants included measles, diphtheria, whooping cough, mumps, and chicken pox. Hannah and Samuel Sewall had 14 children and one child stillborn. Of the children, 7 died within 25 months of birth. Anne Lake Cotton gave birth to 9 children in 20 years. She lost her first child two months before the birth of her second child. The next four survived infancy (Volo and Volo 2002, 126) (Ulrich 1991, 129) (Dow 1911, 73).

Accidents claimed children too. Frontier households were bustling, cluttered places that were not always child-safe. Open fires, kettles of hot water, privy holes, unfenced ponds, and open wells were daily dangers to a toddler or a small child. Busy adults and older children could easily lose sight of one of the smaller children in a crowded household. Alice Walton returned from visiting her husband in the field to find her toddler missing. She questioned an older child, who responded, "It was here just now presently." The child was found drowned in an unfenced water hole. Nicholas Gilman's cousin "narrowly escaped drowning being fallen into a kettle of Suds." Fortunately, the mishap was seen, and the child was "pulled out by his heels" in time. Hannah Palmer's daughter was not so fortunate. While Hannah was still recovering from giving birth and grieving the loss of twin daughters who died five days prior, her daughter fell into a kettle of scalding water and died the following day (Volo and Volo 2002, 126–27) (Ulrich 1991, 157).

Some parents dealt with the tenuous presence of children with a certain emotional detachment. They avoided focusing intense care upon any single child. Whatever defenses they employed, the pain of loss, no matter how frequent, surely caused intense grief. Anne Bradstreet wrote several poems in memory of grandchildren lost in infancy. Grandson Simon Bradstreet lived but a month and a day: "No sooner come, but gone, and fal'n asleep, Acquaintance short, yet parting caus'd us weep." It was common for children to be compared to items of a frail and fleeting nature. Portraits of children often depicted them with a single blossom as a reminder of how transient their time on earth might be. Grandchild and namesake Anne Bradstreet expired at age three years and seven months. On this occasion Anne wrote:

I knew she was but as a withering flour,
That's here to day, perhaps gone in an hour;
Like as a bubble, or the brittle grass,
Or like a shadow turning as it was.
More fool then I to look on that was lent,
As if mine own, when thus impermanent. (Volo and Volo 2002, 127) (McElrath and Robb 1981, 187–88)

CHILD REARING

A woman's responsibilities were greatly added to by the burden of rearing a family. Fathers were responsible for the education of their children, and they were the ultimate authority in matters of discipline. Isaac Norris wrote of his two daughters, "They are a constant care as well as great amusement and diversion to me to direct their education aright and enjoy them truly in the virtuous improvement of their tender minds." Contemporary historian William Alexander noted, "A father only is empowered to exercise a rightful authority over his children, and no power is conferred on the mother." Mothers, however, attended to the everyday care of the children. This, of course, was in addition to their myriad other duties. After the birth of her second child, Esther Burr wrote in her 1756 journal, "When I had but one child my hands were tied, but now I am tied hand and foot…how shall I get along when I have got 1/2 dozen or 10 children I can't devise" (Fischer 1989, 508) (Alexander 1796, 343) (Swan 1995, 36).

Frontier children were expected to become productive contributors to the family as soon as they were able. Only in infancy were they treated simply as children with no responsibilities. As early as three years old, children were given simple chores. Not only did this help to instill a sense of responsibility, but it kept them occupied as well. Young children gathered goose feathers, picked berries, and helped process food. Older children plaited straw, weeded the garden, and knitted stockings (Volo and Volo 2002, 128).

Few children had toys; most children had to make do playing imaginatively with whatever was lying around the house, though lucky youngsters might have a wooden doll or other carved figure. Those who could walk would play hide and seek, blind man's bluff, hopscotch, skipping, marbles, and shuttlecock, using improvised wooden implements. In spring and summer they would explore their outside surroundings, and in winter skating was popular with older children. Infants were necessarily confined to the house (Middleton 1996, 255).

Playthings were few and simple. Boys played with marbles, balls, whistles, small boats, toy soldiers, wooden animals, and whatever else a loving father might carve from a piece of wood by a winter's fire. Girls mimicked their mother's activities playing with whatever bowls and spoons were not in use. They played with moppets or dolls made from scraps of fabric or pieces of wood. Many dolls were more like a log with a face than a baby's image. Outside, children used their imaginations and nature's playthings to fashion garlands of flowers, small boats of leaves and pods, and whistles from blades of grass. As children grew older, chores increased with ability and made greater demands on their playtime. A large, healthy family was a tremendous resource to a colonial farmer (Volo and Volo 2002, 128) (Middleton 1996, 253).

THE WORLD OF CHILDREN

The colonists did not see childhood as an age of innocence; play for its own sake was not an acceptable concept. For many colonists, especially of Calvinist faiths, children were believed to be inherently naughty and had to be taken in hand by stern but loving parents. As one minister noted, "there is in all children . . . a natural pride, which must in the first place be broken and beaten down." This approach was essential to instill a sense of obedience, responsibility, and self-control, without which no one could either survive the tempting of the devil or the inclemency of the environment. Corporal punishment consequently was first used frequently, except by Quaker parents, who not only disliked violence but believed that children, like the rest of humanity, were innately good.

Childhood therefore had one main purpose: to prepare a person for adult life with all its problems and responsibilities. Children were constantly told of the need to earn their living by the sweat of their brow. They were also repeatedly warned of the possible imminence of death. As one seventeenth-century schoolmaster commented to his class, "Remember death; think much . . . how it will be on the deathbed" (Middleton 1996, 253).

It was into this atmosphere that children were born and grew up. For the first few months children were dressed in swaddling clothes. These consisted of linen bound tightly round the body from the ankles to the neck. Parents feared that otherwise their offspring might not grow straight. Infants therefore wore the same clothing at night to prevent them from sleeping in the fetal position (Middleton 1996, 254).

The obsession with straightness stemmed from the premise that children were essentially uncivilized and had to be molded physically as well as morally. Humans, it was often noted, were the only occupants of the earth to walk in the upright position. Consequently, when the swaddling clothes were dispensed with after a few months, the next task was to prevent children from crawling and developing beastlike qualities. Various devices were used to affect this, the most popular being standing stools, go-carts, and leading strings. All were designed to speed the transition to walking.

Toilet training in contrast caused parents less concern. Living conditions were necessarily odoriferous even for the upper classes, not the least because most adults were lax about their own toilet habits. The dangers of disease from poor sanitation and lack of hygiene were not understood, and most people relieved themselves close to the house. Children simply copied their elders once they could walk.

The period of infancy lasted about six years, during which time boys and girls were dressed in identical garments, these being the easiest to wash and pass on from one child to the next. Few children could expect new clothes.

During these early years children were left mainly to their own devices, although under the watchful eye of an older child or servant. Parents were too busy running the farm or managing the household to spend much time with their offspring. Orthodox opinion held that too much affection was undesirable, since it made adults self-indulgent and children selfish. Hence even the cries of infants were largely ignored, since it was assumed they were either exercising their lungs or expressing their frustration at not being gratified in some excessive want. It was inconceivable that beings so young could know what was good for them.

Infants usually slept in a cot with their parents. As they grew, they were given beds in any convenient place. Houses were too small and space too precious to allow separate bedrooms—even in the homes of the affluent—until the end of the colonial period. Most children slept on a mattress that could be rolled up during the day. Everyone shared a bed. Even single adults slept with someone of the same sex for warmth and company. The modern obsession with privacy would have struck most provincials as strange.

Around the age of six decisive changes occurred. Boys were given breeches, while girls remained in skirts. This development was the prelude to another step on the road to adulthood. Both sexes began to be given tasks, the girls helping in the garden and kitchen, the boys doing light farm work. In New England and the Middle colonies most children would also receive some schooling for a few hours each morning.

As colonial society developed and land became scarcer, many boys around the age of 10 began an apprenticeship, normally lasting about 9 years, during which the apprentice lodged with the master. Though this may seem a harsh and unloving step on the part of the boys' parents, in most households the relationship between master and servant was similar to that between parent and child—stern but affectionate (Middleton 1996, 255).

A small proportion of boys from richer families progressed to a grammar school and even college in preparation for a career as a minister, lawyer, merchant, or simply as a way to establish social connections. The majority, however, stayed with their parents to help on the farm or in the workshop. Even the offspring of the wealthy would finish their education by their early teens unless they were destined for college. The boys then helped their fathers run their farms and plantations, or worked as clerks in their businesses. Middle-class girls remained with their parents, learning how to manage the household; girls from poorer families were sent to be maids. Life was necessarily a serious business.

Colonial society knew no such phenomenon as adolescence. Teenage boys and girls were expected to face up to the burdens of life, though it was recognized that they were not yet ready for life's main concerns: running a farm, having a family, and participating in public affairs. The young were seen as being still susceptible to temptation and irresponsibility because they had not yet shed the last traces of their childhood. Hence the emphasis was on achieving maturity as soon as possible, as this represented the key to making one's way in the world, both morally and materially (Middleton 1996, 256).

Regarding the upbringing of children, Cotton Mather, as in so many matters, was full of advice. He believed that parents should "consider how to enrich their minds with valuable knowledge; how to instill into their minds generous, gracious, and heavenly principles; how to restrain and rescue them from the paths of the destroyed, and fortify them against their peculiar temptations." Certainly the task could not be left to the young persons themselves for "tis the folly for them to pretend unto any Wit and Will of their own." In pursuit of his own advice, Mather questioned his six children every night, asking what they had done during the day, whether they had "sought the face of God and read His Word." At mealtimes Mather sought to make the conversation "facetious as well as instructive." Not a moment should be lost for improvement (Middleton 1996, 256–57) (Fox and Quitt 1980, 313).

Such accounts have led most writers to believe that the colonial family was less affectionate in its relationships than its modern counterpart, on the assumption that high infant mortality made emotional involvement pointless and that the main purpose of having children was, as always, economic. The actual evidence is conflicting. In the case of Mather, only 6 of his 15 children survived to adulthood. He was nevertheless a relatively indulgent parent, much more so than his father had been. As the eighteenth century progressed, attitudes among the wealthier classes began to change. Influential in this respect were the writings of John Locke, who argued in his *Essay Concerning Human Understanding* (1690) and *Some Thoughts Concerning Education* (1693) that example, experience, and environment, rather than precept or innate character, determined behavior. Locke still emphasized firm discipline but still believed that it should be moderated by a little indulgence to secure gratitude and affection. The child would then respond more readily to the challenge of adulthood. A sense of shame was generally most effective, for this would naturally induce a desire for self-improvement. Corporal punishment should be administered only as a last resort. The new attitude was reflected in depictions of the biblical prodigal son. Earlier versions stressed the folly and ruin that would result for children who defied their parents. By 1760, the emphasis was on the need for parental affection and forgiveness to prevent children leaving in the first place (Middleton 1996, 256–57).

Discipline, therefore, less frequently involved physical punishment, and more often employed appeals to love and reason. Since competition and a desire to succeed were human nature in the upwardly mobile family, emphasis was placed on the carrot rather than the stick. In 1783, Timothy Pickering advised parents that it was "doubtless far better to apply to the *natural ambition* than to the *fears* of a child: the latter will only make hardened rogues of the bold, and confound the tender hearted: while nothing is more animating than just applause" (Wolf 1993, 116).

On the very upper fringes of American society, children lived yet very different lives, not merely because of the wealth of their parents, but because of their attitudes as well. These seem, at first, modern in their permissiveness and lack of direction, but they actually spring from an older European tradition. Among the gentry, children were apt to be at once indulged and ignored—treated as amusing little pets when present, but left to the daily care of servants or slaves during the crucial years between three and seven. Since they were not yet old enough to be trained in culture and the social graces, their parents paid little attention to either the older notion that young children had souls to save or the more modern concept that they had minds to train. Memoirs of a Virginia woman, Eliza Custis, written in the early nineteenth century, reflect back on the mid-1770s when, at the age of three or four, she was encouraged to stand on a table, singing songs "which I did not understand" for her father and his gentlemen friends. As the men rolled "in their chairs with laughter" and even "the servants in the passage [joined] in their mirth," the mother, "who could not help laughing, used to retire and leave me to the gentlemen" (Wolf 1993, 116).

Families at the very lowest end of the economic scale had little in the way of time or resources to spend on children, however beloved. Time was money, and with both mothers and fathers involved in the economic struggle for daily life, young children were not only left to fend for themselves, but also often by the age of three or four expected to care for those younger than they. Most households lacked extra hands, and on isolated rural farms there was no recourse to neighbors who, in any event, would have been busy with their own concerns. The many cases of accidental childhood deaths reported in sensational manner by Benjamin Franklin in the *Pennsylvania Gazette* throughout the eighteenth century clearly involved situations where children left alone were trampled by animals, burned at open fireplaces, or scalded by tipped pots of boiling liquid at unprotected hearths. The reports were both rural and urban: The two "young" children frozen to death in January 1754 who "had been sent out early in the evening to bring home some sheep, but lost their way in the woods and were not found till the next day"; the Boston child whose mother "left it alone while she stepped out about some business" and was burned so badly that it died the next day; or, most symptomatic of all, the report in 1734 that on "Monday last a young child fell into a tub of water in Chestnut Street and was unhappily drowned before anybody perceived it." None of this presupposes a lack of love or affection, merely a scale of priorities in which the needs of children were ranked low, and their rearing subordinated to other, more pressing tasks (Wolf 1993, 116–17).

THE PLIGHT OF ORPHANS

Much of the discussion on children thus far has dealt with children whose parents possessed the wherewithal to supply their children with the minimum amount of care and attention. There were those children who found themselves without parents; either through the death of both the mother and father, or the inability of their parents to care for their children. For most of the colonial period, there were virtually no alternatives to inclusion in some family group, and community responsibility toward homeless children consisted mainly in making sure that they were placed in established households. The problem lay in finding a home to accept children who were too young to contribute fully to the domestic economy. Even kin were reluctant to take young orphans unless they had substantial financial resources to bring with them, and in most parts of colonial America, the children most likely to be thrown into dependence on the community were those from the bottom layer of society: the illegitimate children of destitute mothers and orphans of transient paupers or newly arrived immigrants who had no family ties or neighborhood associations.

The solution adopted by most communities was to borrow a system used in England since the early sixteenth century. A host family was guaranteed a return on its investment by the expedient of receiving a child as a "bound" servant. In effect the community traded the child and its services to a household head for the complete time of its minority. The money expended on a young and unproductive "extra mouth" would be recouped many times over through the value of its labor in the years ahead (Wolf 1993, 117–18).

Again, this exchange does not indicate insensitivity on the part of the community, but reflects the realities of everyday life in colonial America. A few indentures, as these contracts were called, attempted to guarantee that dependent children would receive the rudiments of reading, writing, and arithmetic and that when they were old enough, they would be taught a craft or skill. For example, George Pentworth, when not quite two years old, was bound out in Virginia in 1716 to serve until he was of age. In return, his master was to "oblige himself [and] his heirs, [to provide] 3 years schooling . . . that he may read well in any part of the bible [and] to instruct and learn him . . . that he may be able after his indented time to get his own living and to allow him sufficient meat, drink, washing, and apparel." This indenture was enlightened for its time. Most orphans were merely bound out as "servants," a designation entitling them to nothing beyond mere maintenance, the assurance of hard work, and a guarantee that they would never acquire the skills necessary to improve their lot in life (Wolf 1993, 118–19).

Material Life

A house is a physical structure; a home is the vision of life and family that it embodies. During the eighteenth century Americans molded and shaped their domestic space, within the technological limits of their times, not only to accommodate their daily habits, but also to fit the human values and relationships that were important to them.

These eighteenth-century Americans rarely discussed what they were doing, let alone what it meant. Few people bothered to record where they put the trash, how often or where they bathed, or where or with whom they made love. Nor did they explain even to themselves, perhaps, why it was important to live in a house that was "spacious and well furnished with linen and silverplate" yet unimportant that three or four persons, including guests, slept in the same room. They assumed those around them used the same objects, followed similar patterns, and attached the same meanings to them. It was only when travelers from another culture were surprised or confused by everyday habits that differed from their own that the mundane details of American living were recorded at all, and while their descriptions may have been factually correct, their value judgments were based on the traveler's own cultural expectations (Wolf 1993, 49–50).

For centuries, decent living as defined by English culture had required that animal and human living spaces be separate, that hearths and chimneys take the place of open fires and roof vents, and that there be some division of the house into rooms that served different purposes. By the beginning of the eighteenth century, respectable English farmers, craftsmen, and tradesmen had long participated in a domestic upheaval so deep and far-reaching that historians refer to it as the "consumer revolution." Even common homes came to be filled with objects of display, in number, kind, and variety previously reserved only for the very rich and powerful. A house became more than a shelter and a workshop: it became a family center where privacy, comfort, and leisure were expected parts of the daily routine.

The home became a measure of the owner's status in society. The owner was judged by the cost of the materials and fancy decoration of the home. From looking glasses to tableware, to cooking utensils and luxury fabrics, these became a measure of a person's place in society (Wolf 1993, 50–51).

THE HOME IN AMERICA

There was no typical eighteenth-century American home, just as there was no one kind of eighteenth-century American family. The domestic reality was a combination of physical necessity and cultural choice. First and foremost, the kind of house in which a family lived was dictated by its location in relation to the frontier. The number of people living in the backcountry was as great at the outbreak of the American Revolution as it had been in the late seventeenth century. The first settlers in the newly opened, isolated regions during the eighteenth century replicated the stages of housing typical of the previous century (Wolf 1993, 51).

Early Frontier Homes in Colonial America

Homes on the colonial frontier varied with the means and needs of the families who built them. Often initial construction was limited, and additions to enlarge the structure were attached as time and situation permitted. In New England, houses commonly followed one of three plans.

The one-room plan was the most basic pattern and the earliest type of house constructed in the colonies. It continued to be common for small and poorer dwellings and on the frontier into the eighteenth century. The front door of such a structure typically opened into a small vestibule, referred to as a "porch," which contained a steep, narrow staircase that traversed the width of the entry. Sarah Knight, an early eighteenth-century traveler, complained that such a stairway "had such a narrow passage that I had almost stopped by the bulk of my body." To one side of the vestibule was a doorway into the main room. Generally 16 feet by 18 feet, this room was known as the "hall" and it served as a combination kitchen, dining area, living area, and in some cases bedroom. It had a low ceiling and a double layer of boards on the floor. Some floors had a layer of sand between the boards, probably to act as insulation from the cellar's cold. Wainscoting was used from the early seventeenth century. Broad pine boards were beveled to cover the studs, but posts were exposed. As the century closed, molded pieces were attached to form the earliest paneled walls. The most prominent feature in the room was the large fireplace. The depth of the fireplace extended into the area behind the staircase. The upstairs consisted of a large sleeping area that had a sloping roof in a one-and-a-half-story house and a roof of full height in a two-story house (Volo and Volo 2002, 141–42).

The two-room house followed the plan of the one-room house with the addition of a second room to the other side of the chimney and porch. This was called the "parlor." Upstairs were two rooms known as the "hall chamber" and the "parlor chamber." On occasion there was a room projecting over the porch referred to as the "porch chamber." Prior to the nineteenth century, rooms were basically multipurpose. Furniture in first-floor rooms was often placed against the walls when not in use and moved into position as needed.

The lean-to plan was the two-room plan with the addition of a room at the rear of the house. This served as a separate kitchen and workspace for other domestic chores but might also accommodate a sleeping area. Above the lean-to was a loft that, as necessity dictated, may have been used for additional sleeping. The roof rafters leaned from one-story eaves at the back against the top of the wall of the main house. A cooking fireplace was also added at the back of the central chimney mass. A common lean-to house had as many as five fireplaces built into a single chimney stack.

During the cold northern winters, ewes, young calves, piglets, and hens were sometimes brought into the kitchen to save them from freezing. Lean-tos and single-boarded sheds provided little protection from bitter winds and heavy snow. In 1640, this practice saved the lives of a Massachusetts family when the reflection of a fire awakened a neighbor's hens: "Mr. Pelham's house . . . took fire in the dead of night by the chimney (and was) ready to lay hold upon the stairs. A neighbor's wife, hearing some noise among her hens, persuaded her husband to arise . . . he did and so espied the fire, and came running in his shirt, and had much to do to awake anybody, but he got them up at last, and saved all" (Volo and Volo 2002, 142).

Windows in seventeenth-century New England houses were few. Many of these homes probably had oiled paper or sliding board shutters rather than glazed windows. Letters to England urged emigrants to bring glass for windows. Windows of this period were diamond-shaped panes of glass arranged in a lattice pattern typical of those in medieval England. By 1650, glazed windows were commonplace in prosperous homes. Although the windows were relatively small, they were often grouped two, three, or four together to make a wide, horizontal window bank. First-floor windows were often of a casement style or a mixture of casement and stationary. Second-floor windows were frequently fixed units that did not open. To overcome the limited availability of light, much of the food preparation and other household chores were performed outdoors when weather permitted (Volo and Volo 2002, 142–43).

Entrance to the home was made through a heavy door made of two layers of boards, the outer of which ran vertically and the inside horizontally. It was studded with hand-forged nails driven through both and clenched on the inside. The door was supported on long wrought-iron strap hinges. The earliest hinges were made of wood. They had a leather thong that passed through a hole that lifted the latch on the inside. Later hinges were made from wrought iron. At night doors were further secured with a heavy wooden bar placed across the inside.

Sarah Knight described a primitive home she encountered on her journey: "This little Hut was one of the wretchedest I ever saw as a habitation for human creatures. It was supported with shores enclosed with Clapboards laid on lengthways, and so much asunder, that the Light came through' everywhere; the door tied on with a cord in the place of hinges; The floor the bare earth; no windows but such as the thin covering afforded."

In the Middle and southern colonies, frontier homes were often built of squared or rounded logs. While the Swedish are often given credit for introducing this construction to the colonies, it was embraced by German and Scots-Irish settlers, who did much to popularize it. Early log cabins were frequently only one room with both front and rear doors. Next to the large interior chimney was a ladder or steep stair that led to a loft. It was not unusual for the structure to later be enlarged to what was called a "saddle-bag" plan with a second room on the other side of the fireplace. The rooms seldom exceeded 24 feet in length, as it was difficult to find suitable timber of greater size and this was still reasonable to handle. Another plan, called the "dog-trot," created two rooms that were separate, each with a chimney on opposite ends. The space between was then covered, producing a long breezeway. This area was an ideal living space in warm weather, providing protection from the sun yet permitting the opportunity to capture what breezes there were. In winter it was a practical place to store curing pelts or unused traps (Volo and Volo 2002, 143).

The Dutch were some of the most skilled bricklayers in Europe. Naturally, they preferred to continue to use brick in the construction of their homes in America. The brick was laid in a variety of patterns, some of which were quite striking. Sarah Knight's description of a Dutch home in New York is typical of those of the period: "The Bricks in some of the Houses are of diverse Colors and are laid in Checkers, being glazed [they] look very agreeable." A brick kiln was built just below Albany as early as 1630. Albany had many step-gabled brick houses so characteristic of New Amsterdam, but the straight-lined gables prevailed in the more rural counties of New York. When brick was unavailable, the Dutch used whatever materials were at hand. Many houses along the lower Hudson River and in New Jersey were built of stone. Stones were gathered from fields or broken from ledges and bound together with mortar made from straw or hair and, when available, lime. Walls were very thick and ranged from one and a half to three feet thick. In the seventeenth century houses in the Hudson River Valley, with the exception of Albany, were one and a half stories high. Two-story houses were an eighteenth-century innovation (Volo and Volo 2002, 143–44).

Homes in Eighteenth-Century America

Whether small or large, simple or pretentious, eighteenth-century American houses varied tremendously in style from rural to urban and region to region according to the wealth and ethnic backgrounds of their builders, the available materials used, and the aesthetic fashion of the day. While seventeenth-century houses continued to dot the landscape, particularly in New England, their stylistic elements, such as overhanging second stories, tall gables, and leaded casement windows gave way to newer visual effects, often through remodeling. Builders who immigrated to the New World carried in their heads a picture of the latest styles of the Continent, and in their hands the skills by which they could reproduce those fashions.

Our romantic assumption that every colonial was his own builder is challenged by the knowledge that just about every settled area included professional house builders—carpenters, brick workers, and stonemasons—whose training guaranteed that the roof would stay up and the walls withstand the blasts of wind and weather. Communities experiencing a population explosion, or those that had suffered a catastrophic fire (a common occurrence in early eighteenth-century towns where seventeenth-century buildings of wood and with wooden chimneys still stood), appealed for builders (Wolf 1993, 55).

The continuing immigration of English-trained house carpenters and "joyners" to all of the colonies and the desire of American elites to keep up with European fashion led to the widespread adoption of Georgian-style houses during the eighteenth century. The essence of this style is balance and decoration based on the classical models of ancient Greece and Rome. Central doors are flanked by an equal number of windows on each side, and by matching openings on the second story. Another almost universal difference in the visual style of the eighteenth-century house lay in the changeover to wood-framed sash windows from the diamond-paned, lead-set casements of the earlier period. In 1705, a merchant from Newport, Rhode Island, visited Boston and noted that "sash windows are all the Fashion." Ten years later he had installed them in his own house, and by the 1730s they seem to have become the standard method of fenestration among those who could afford glass at all (Wolf 1993, 55–56).

Much of the regional variation in appearance of houses was due to the use of different building materials, for reasons both practical and cultural. The vast majority of houses throughout the colonies were built of wood, which was cheap and available everywhere; yet it was really only in New England that wood continued to be the universal choice of homeowners wealthy enough to have options. When brick acquired a high status value in the region after the Revolution, New England cities faced the front of their houses, but left the rest in traditional wood. Almost from the moment of settlement, those in the southern colonies who could afford it built in brick, as did the residents of urban centers like Philadelphia and New York, where the very real fear of fire was uppermost in the corporate mind. In Charleston, South Carolina, and the suburbs of Philadelphia, the distinctive appearance of stucco laid over brick was a side result of the additional warmth and weatherproofing it provided, while in eastern Pennsylvania it was availability that created the fieldstone tradition. On the other hand, tiles for roofing, although very expensive and heavy to transport, represented a cultural choice in places like New York, parts of Pennsylvania, and New Orleans where there were large numbers of settlers from European communities with a tile tradition. In other areas, slate roofs were the expensive alternatives for wealthy urbanites, while wood shingles covered the homes of most Americans until the technological advances of the nineteenth century made tin roofing ubiquitous (Wolf 1993, 56–57).

Although visitors to America in the early years of the republic would still have been intensely aware of a variety of architectural styles across the new nation, the ideology of the Revolution that emphasized an American connection to the republics of the ancient world had already begun to create a Federal "look" even more dependent on classical ideals than its Georgian antecedent had been. By the end of the eighteenth century, architectural professionalism and the publication of architectural handbooks helped to spread these new, more "national" ideas that, in time, became the hallmark of Federal America. As new houses proliferated, older houses were either remodeled or torn down, and the image of the American house took on a less regional appearance (Wolf 1993, 57).

The organization of a house for everyday living rests, in the end, less on the style of its exterior than the character of its interior arrangements. The house types of both the rural northern and southern colonies developed out of the options available from English patterns at the time the settlers emigrated, but local builders responded to different conditions of life in the two environments by creating plans that clearly distinguished the everyday lives of their inhabitants. When the realities of family and economic life in the regions diverged during the eighteenth century, the changes were mirrored in the common housing of their people (Wolf 1993, 58).

The Homes of New England

As eighteenth-century New England farmhouses were enlarged from the single-room dwelling of first settlements, they were built to provide for a household that, though large, contained no real outsiders. While the original "hall," with its great fireplace, remained the general gathering spot for sitting, eating, and, occasionally, sleeping, it shared a central chimney with a "parlor" or "chamber" where the farmer and his wife, and perhaps the newest baby, slept. This new room doubled as more formal space, where outsiders were entertained: If visitors stayed for a meal, it was taken here, in which case mere eating was elevated to the status of dining. A small entryway or lobby provided access to the parlor, the hall, and the staircase for the room or rooms above where most of the family slept and that served as a storage space for household goods and even occasional crops. What was unique about the New England farmhouse was the development of a full-blown "kyttchin" out of traditional unheated storage space present in English hall/parlor houses. While originally a shed off the back of the back of the hall, by the eighteenth century the "lean-to" extended across the whole back of the house and was actually incorporated into its basic framework. One end was frequently partitioned off for the storage of provisions and utensils, and the other end turned into a small bedchamber for the ill, the elderly, or women confined to childbed who might require attention. The central portion, however, acquired its own hearth and became the single location for food cooking and processing, moving such activities entirely out of the hall. An underground cellar for cool storage, meat salting, and dairying completed the innovations to the English model. By the second half of the century, the New England farmhouse had become the northern norm for "decent" country living. Anything less was substandard, as John Adams noted in 1767 when he visited a poor family in Braintree. The husband, wife, and five children occupied "one Chamber, which serves them for kitchen, cellar, dining room, Parlour, and Bed Chamber . . . There are the conveniences and ornaments of a life of poverty. These the comforts of the poor. This is Want. This is Poverty." By the 1790s, as New Englanders "hived out" west across the northern territories, they carried their traditional house plans with them, creating a familiar type that has become the modern system of nostalgic old-time domesticity (Wolf 1993, 58–60).

The Homes of the Southern Colonies

Southern families and farm life were established on a different basis from the very beginning, and their eighteenth-century houses developed traditional forms that were adapted to these particular patterns. Most southern farmers were a far cry from the great plantation owners, and their homes were nothing like our modern national image, based as it is on something like Tara in *Gone With the Wind.* They were described by contemporaries as "meane and Little," referring both to impermanent building techniques and to the fact that perhaps as many as half of all southern whites and nearly all blacks continued to occupy one-room houses right through the 1700s. The little houses of common southern planters were even smaller than those of far poorer New England contemporaries, since they lacked the second story usual in New England "hall" houses. In 1733, William Byrd commented on the "rudeness and remoteness" of the immediate backcountry. He felt "quite out of Christendom" and that local farmers admired the house "of a few rooms" that Byrd had had built for the manager of his estates there "as much as if it had been the Grand Visier's tent in the Turkish army." Nor was Byrd, admittedly something of a snob, prepared to accept the hospitality of his neighbors. He preferred sleeping out of doors to sharing a room where the family "all pigged loveyngly together" (Wolf 1993, 60).

Since southern servants were not part of this "loving" domestic scene, the final form of the multiroom southern farm was a physical manifestation of this cultural reality. Some houses retained a cross passage common to one type of older English plan, where the hall lay on one side and a room for storage and farm processing, known as a "downside" kitchen, lay on the other. More and more, however, the passage in the southern house served to separate the family that used the hall for a sitting room from the servants who worked in the processing room and slept above it in a separate loft. Eventually the segregation was quite complete. The Chesapeake farmer eliminated the passage entirely, and provided detached buildings for the "drudgeries" of cooking, washing, smoking, dairying, soap boiling, and all the other heavy domestic chores of preindustrial farm life. He also provided separate "quarters" for the laborers who, under the supervision of his wife, performed these tasks. As newly settled southern, backcountry regions adopted the economic patterns of the Chesapeake, they accepted its domestic arrangements as well (Wolf 1993, 60–61).

Homes of the Middle Colonies

In the Middle colonies—New York, New Jersey, and Pennsylvania—the diversity of population, family structure, and farming practice prevented the development of any single, clearly defined "machine" for daily living. Even where immigrants retained something of their Old World common culture, such as the very small number of the thousands of German immigrants to Pennsylvania who consciously chose to isolate themselves, they did re-create the *hofs* (barn/house complexes built around a courtyard) typical of their places of origin. The true distinctiveness of their homes was often a matter of decoration and style, rather than a radically different organization of space.

It was in the many small towns of eastern Pennsylvania, as well as among middle- and upper-class families of more urban areas and rural gentry throughout the colonies, where the Georgian home came to be the standard by the 1760s. This European import was more than the ideal exterior balance and classical decoration; it embodied an organization of interior space as well. A broad hall ran all the way through the center of the house with two rooms opening out on each side. A staircase led directly to an upstairs hall, also flanked by four rooms. Work spaces and servants' quarters could be attached to the back in urban areas, or located in separate dependencies on country estates. They could even be stuffed into the main body of the house—the kitchen in the cellar, servants in the third floor garrets, for example—without disturbing the basic symmetry of the arrangement. So perfectly was the Georgian plan adapted to the middle-class family who formed the fastest growing segment of the American population by the end of the eighteenth century that, in one form or another, it has continued to symbolize the American home right through the twentieth century (Wolf 1993, 61).

THE HOME BECOMES A SYMBOL OF SPECIALIZATION

Georgian houses, with their formal arrangement of front rooms around a central hall and back spaces appended or detached that were, in a sense, not a part of the plan at all, clearly separated "working" from "living" and "living" into neat compartments. As the century wore on, plans began to specify a function for each of these spaces: parlor or sitting room, dining room, office or study, bedchamber or back parlor. The priorities involved in determining what household activities required segregation differed radically from our own. There is little question that if we could only have one private room in our house it would be a bathroom or at least a water closet. Yet, while many colonial Americans used indoor facilities rather than resorting to the outdoor necessary—as indicated by the increased frequency of "wash basins, pitchers, chamber pots, and close stools" on lists of household furnishings—they were content to locate these intimate conveniences in bedchambers that they frequently shared with others (Wolf 1993, 62–63).

The most important room in the Georgian house, in terms of reflecting the changing concepts of everyday life among middle- and upper-class Americans of the eighteenth century, was the central hall. It not only maintained the segregation of function within the household by allowing access to each room without having to go through another, it performed the increasingly important task of preserving family privacy from the outside world. Privacy itself was not a concept that had had much currency in the seventeenth-century world of communal living, nor was it a luxury afforded to the majority in the eighteenth century. It was, however, implicit in the growing separation of household members as we have discussed it. The desire for solitary space is best expressed by Abigail Adams in a letter she wrote to John in 1776, while staying at her aunt's house:

> I have possession of my Aunts chamber in which there is a very convenient pretty closet with a window . . . a number of Book Shelves [and] pretty little desk or cabinet . . . where I write all my Letters and keep my papers unmolested by anyone. I do not covet my Neighbors Goods, but . . .
>
> I always had a fancy for a closet with a window which I could more peculiarly call my own. (Wolf 1993, 63)

Just as important as personal solitude, however, was a growing emphasis throughout the century on the withdrawal of the family as a whole from the rest of the world. The old one-room house allowed outsiders access to every activity of the household. Ordinary houses set off work space from living space but allowed for few subtle distinctions among visitors. The Georgian hall, however, separated callers from all household activities until they could be directed to the appropriate room, depending on the nature of their business and their degree of relationship to the family. Female intimates might be allowed upstairs to the wife's bedchamber, social inferiors who had business affairs to settle with the master might be taken to the office, servants or menials could be directed around the back, and those of equal social standing who were privy to household entertainments might attain the parlor or the dining room (or politely be turned away, when the family did not care to receive them). While few reacted as strongly as Mrs. Benjamin Harrison, who fainted when a local farmer appeared unannounced in her parlor, the hall helped prevent this kind of unexpected confrontation (Wolf 1993, 63–64).

HOUSEHOLD ITEMS

Just as rooms in houses became more specialized with regard to how they were used and who used them, so, too, did the furniture with which they were filled. It was not enough to own a table; now there were dining tables, breakfast tables, game tables, tea tables, and sewing tables, as well as candlestands and washstands. There were water pitchers, wine decanters, teapots, coffeepots, chocolate pots. There were forks and knives as well as spoons—enough for each person at the table to have his or her own set of utensils. Separate sleeping rooms also implied individual beds and personal bedding, at least enough to segregate adults from children, masters from servants (Wolf 1993, 63–64).

Many of the rapidly proliferating items were directly related to increased physical comfort. Comfort as a concept, like privacy, existed only for the wealthy at the opening of the eighteenth century. By the end of the period, however, it was not only available to a broad segment of Americans, but it also became one of the determinants in dividing the "civilized" from the "savage." The first entry of a family into the world of goods was usually marked by an increase in bedding and bedsteads, providing improved warmth and comfort at the basic level of rest. Next came chairs, and it is in their changes that we can mark the increasing emphasis on comfort as a goal of American domesticity. The hard, wooden nature of the originals was mitigated by extra cushions and padding; later on upholstered easy chairs became available to those who could afford them (Wolf 1993, 65–66).

Most of the increased ability to live an everyday life of tolerable comfort came about through the improvement and price reduction in personal consumer goods that had been around in the houses of the rich for centuries. The technological revolution that made possible our insistence on heat, light, and water as minimum necessities and turned the basic shelter of a house into the cozy domesticity of a home lay well ahead in the nineteenth century. Lighting never progressed beyond animal-derived oil or candles, and the very small number of oil dishes or candlesticks in household inventories suggests that most people went to bed when it got dark. Despite our myth of the colonial past, candles were rarely manufactured at home and they remained far too costly for the average American, particularly as they represented a continuing expense rather than a one-time purchase. In 1761, the president of Harvard College figured that a scholar who needed artificial illumination just five hours a day for study would need to spend the equivalent of eight dollars a month for "common" tallow candles, more than the initial outlay for a durable good like a chair or coverlet. Plumbing, of course, was almost unknown, and lugging water for household use from a well, spring, creek, or urban pump might involve some six thousand miles of walking (with heavy buckets) over the course of a lifetime (Wolf 1993, 66–67).

HOME COMFORT

There is no doubt that the difficulty in obtaining sufficient water contributed to a rather low level of cleanliness, by our standards; the good eighteenth-century homemaker was cautioned to be "frugal" and "prudent," but not necessarily clean. Upper-class houses probably maintained a higher level of cleanliness because there were servants to carry the water and do the wash, and travelers from these homes continually complained about the great variety of vermin that lurked in the rarely washed bedclothes of other people's houses. Few technologies, even very simple ones, were developed to deal with the situation. Broom corn was not widely available until the 1790s, so houses were inadequately swept; bedevilment by ants and roaches was the unpleasant, even unhealthy result. To complete the invasion of the insect world, there were no window screens to protect against a plague of mosquitoes and flies. The most ingenious device in the battle against these pests was to hang a wasp's nest from the ceiling, on the theory that, if left undisturbed, the wasps would attack the winged intruders rather than its residents. Wealthy southern households occasionally made use of a gauze curtain arrangement called a "pavilion" that surrounded the bedstead and was useful in the war against mosquitoes if not against bedbugs and other vermin, but this was far too expensive for most colonial budgets (Wolf 1993, 67).

There were times when cultural preferences triumphed over technological advances in consumer comfort. The standard means of heat in British homes was the open-hearth fireplace, and Anglo-American colonists built them as both a physical and symbolic manifestation of home and family. Yet in the far colder winters of the new continent, it was peculiarly ill adapted to serve its role. The English fireplace wasted fuel and was noticeably inefficient, lacking the refinement of even a rudimentary flue or damper. Most of the warmth went up the chimney and left all but the immediate vicinity cold and uninhabitable. A better technology was readily available. Settlers from Holland, Scandinavia, and Germany, where winters were cold and fuel scarce, had come to the New World from a background that made use of stoves rather than open hearths. Made of cast iron or sheet metal and decorated with tile or brick, these stoves offered efficient and frugal heating. They were noticed approvingly by English travelers in the Middle colonies throughout the eighteenth century, but they were rarely imitated. Benjamin Franklin decided that consumer resistance to the stove stemmed from the fact that there was "no sight of the fire which in itself was a pleasant thing," and designed his "Pennsylvania Fireplaces" with doors that could be left open to provide a view of the dancing flames. Still, while a modest number of "Franklin Stoves" came into use in the vicinity of Philadelphia in the 1760s, it was decades before fireplaces were generally replaced by stoves for utilitarian purposes (Wolf 1993, 67–68).

CONSUMER GOODS AS A SYMBOL OF PRESTIGE

True luxury by midcentury was no longer measured in the mere possession of consumer items, since they were available, at some level, to nearly everyone. Porcelain and its imitations were cheap enough to be purchased by those of very modest means. The inhabitants of Parting Ways, the small community of nearly destitute, free black families outside of Plymouth, Massachusetts, possessed a considerable number of mismatched, out of date, fancy ceramics, no doubt as gifts or "scavenged" from wealthy white neighbors or employers (Wolf 1993, 68).

On St. Simons Island in Georgia, the lifestyle at Cannon's Point Plantation exemplified the way in which consumer goods divided people by class even more importantly than by race. Generations of planters and their white overseers lived in more spacious housing than did the black slaves in the quarters, but while both overseers and slaves used knives, forks, chairs, and other objects unthinkable early in the century, they were of local production or the mismatched assortments that signified secondhand goods. The planters' furniture, tableware, paintings, and fabrics, on the other hand, were purchased abroad in the "European taste" and in matching sets (Wolf 1993, 68–69).

The consumer revolution was not entirely bloodless. As early as 1732 Benjamin Franklin cautioned against the acquisition of luxury household goods as a way of "buying into" the rank of gentlemen and as a threat to the virtues of simplicity, hard work, and frugality. Similar warnings concerning the loss of American simplicity sounded again and again throughout the century. One traveler at midcentury bemoaned his discovery that a common backwoodsman had "pretensions to fashion" in the ownership of a looking glass, when his reflection in a pail of water would have served as well. In the 1790s there was a particularly large outpouring of articles in the American press purporting to come from "honest farmers" condemning the life of luxurious living that seemed to be sweeping the new nation. Most were actually written by wealthy gentlemen whose own homes were elaborately built and richly furnished, but whose political philosophies saw the self-sufficient farmer in the wilderness as a symbol of the superiority of American simplicity over European decadence (Wolf 1993, 69).

Nostalgic longing for the plain life had virtually no effect on the growing American attachment to comfortable homes and consumer goods. By 1800, farmers or woodsmen—however remote, however impermanent their huts—would have considered it savage to eat from a common pot or squat on the floor. Though early eighteenth-century immigrants had crossed the ocean with a couple of chests containing clothing, and few tools of their trades, perhaps a knife or gun, it required the services of full Conestoga wagons to move their descendants, along with cook pots, bedding, teapots, and other necessities, across the prairies to the new frontier of the nineteenth century (Wolf 1993, 69–70).

FOOD AS A MARK OF NATIONAL IDENTITY

By the time of the American Revolution, America's diverse culinary landscape had coalesced into a rough but vaguely definable "American" mode of eating. Intensely regional cuisines, whose differences were further intensified by racial and ethnic differences—not to mention radically different environmental conditions—had gently converged by the nineteenth century. They did so under the increasing coastal trade and a homogenizing consumer revolution that had started to standardize material life, especially in the kitchen. These factors eventually helped early Americans pioneer a diet based on what they saw as frontier virtues of simplicity, self-sufficiency, pragmatism, and a measured lack of pretension. By the early nineteenth century American cookbooks, while not necessarily pouring off the presses, were nonetheless becoming useful items in American kitchens and, more importantly, offering middle-class women accessible recipes written, as popular example put it, "in the American mode" (McWilliams 2006, 5).

Understanding the power of food as a cultural arbiter in the new republic requires insight into its colonial history. In the light of the larger culinary trends that developed in British America, the post-Revolutionary unifying influence of food comes as something of a surprise. A survey of the diverse diets that evolved throughout the eighteenth century, after all, reveals regional habits embroidered into extremely different environmental, cultural, and agricultural backgrounds. These backgrounds, by virtue of their diversity, seemed to have little chance of finding common ground (McWilliams 2006, 5–6).

REGIONAL DIVERGENCE IN FOOD IN COLONIAL AMERICA

On one end of the North American spectrum, New England strove to replicate the culinary habits of idealized English traditions. The region's adaptation of mixed agriculture, the presence of geographical conditions that impeded the production of staple crops, and a population comprised of middle-class settlers all enhanced the widespread effort to embrace inherited customs and eat like proper English families. Typical households settled on modestly sized plantations, grew vegetable gardens and orchards, kept livestock for beef and dairy, seeded their fields with English clover grass, and cultivated as much English wheat, rye, and oats as precious labor and ample land would allow. Mixed farming demanded little foreign labor—certainly few slaves—and required minimal interaction with indigenous peoples. With their comparatively open access to the metropolis and relatively high literacy rates, New Englanders were also more likely than other colonists to import and rely on directives found in English cookbooks and farming manuals. Their successful approximation of English ways—in matters culinary as well as others—stands as one of the region's greatest accomplishments. It was an accomplishment, moreover, which made their diet as familiar as it could have been in a strange new world.

On the other end of the culinary spectrum, the lower southern colonies pioneered habits that reflected a nearly complete abandonment of traditional English eating customs. An overwhelming emphasis on extensive rice cultivation, a white population with little interest in replicating English culinary habits, a heavy reliance on slave labor, and routine interaction with Native American cultures led to a way of eating that many Europeans characterized as something just shy of barbaric. But not so the Carolinas, where colonists were more likely to tolerate and even embrace meals deriving from the indigenous population with whom southern colonists routinely dealt. "We were entertained," the English surveyor of Carolina John Lawson wrote, "with a fat boiled goose, raccoon, and ground nuts." On another occasion, Lawson consumed a stew made by "Congree Indians" that consisted of "three teal and a possum," politely pronouncing the dish "a curious ragoo." Despite the "curious" nature of the local cuisine, Lawson and other plantation-owning Carolinians willingly adopted many of its "wild" characteristics, noting that settlers were "never wanting of a good appetite" so long as they relied on "the adjacent woods" and rivers "well stored with fish." It's hard to imagine a proper New Englander entertaining these victuals with such flexible open-mindedness.

The region's strong adherence to slavery further affected southern eating habits and distinguished them from those of Europe and the northern colonies. With black slaves comprising a majority of the population in low country areas (in some places reaching 90%), and with masters letting slaves grow their own crops on garden plots (it was cheaper than importing food), African-based culinary traditions inevitably rose from the bottom up. Writing about "Guinea Corn," for example, the naturalist Mark Catesby noted how it was "propagated, and that chiefly by the negroes, who make a bread of it, and boil it in a matter of firmity." Once again, in terms of food, Carolina could not have been more different from New England.

Other regions of British America fell between these extremes. They did so by developing their own distinguishing features. The Middle colonies leaned in the New England direction. Pennsylvania in particular developed a cuisine commensurate with an economy based on extensive wheat and dairy farming, an ethnically diverse population, a multifaceted labor force that included slaves and servants, and an intricately connected urban-rural network of exchange. These factors combined with the region's Quaker-inspired foundation to support a mode of eating that stressed frugality and flexibility and inspired a diet that was measured but diverse, relying on beef, cheese, and bread but readily open to pork, scrapple, or corn mush. The Chesapeake Bay region—Virginia especially—hewed closer to the Carolina model. Settlers there fashioned a cuisine that reflected the region's overwhelming emphasis on tobacco, servants, and slaves. Extensive quantities of salted pork, cornmeal, wild game, and occasional supplies of vegetables and fruit allowed English colonists to approximate some aspects of traditional English cuisine while remaining comparatively dependent on the "Wild Woods" for food, thus reflecting the habits of their cohorts farther south (McWilliams 2006, 6).

A distinct medley of cuisines, and one that's still recognizable to this day, thus comprised the foodways of British America. While these original modes of diet persisted, a more cohesive American way of eating emerged in the years just preceding the American Revolution. The reason for this conversion centered on two main factors: the rise in intercoastal trade and the increasing availability of British goods. Intercoastal commercial activity developed in large part on the back of the rum and molasses trade that burgeoned between the mainland and Barbados after 1720. As merchants ferried these highly demanded goods up and down the East Coast, they began to trade foodstuffs as well. By the 1750s, it was more possible than ever before for British Americans to enjoy food from other regions. Okra, for example, made its way to Rhode Island. Virginia ham found a market in South Carolina. New England cod went to the Middle colonies. Pennsylvania sent pork and butter throughout the colonies. These few examples only scratch the surface of an expanding commercial trend. By the 1770s, regional ingredients had become, as a result of the increasingly systematic nature of intercolonial trade, much less limited to their respective regions. An intercolonial food exchange, in short, was underway (McWilliams 2006, 6–7).

Complementing the rising availability of what had once been strictly local ingredients was the growing uniformity of the colonial cooking experience. Utensils, recipes, and kitchen space throughout British North America began to look increasingly alike. The reasons had to do with supply, demand, and cultural imperatives.

"It is really possible," wrote a German visitor to the colonies in the 1750s, "to obtain all the things one can get in Europe in Pennsylvania." This observer was writing in reference to a commercial trend that historians have gone so far as to call a consumer revolution, and, although he was speaking of Philadelphia, he could just as easily have been referring to New York, Charleston, Newport, or Baltimore. With rising colonial incomes and declining prices of British durable goods, Americans after 1730 radically improved their standard of living to include, among their luxuries, expanded kitchens stocked with new stoves, English cooking tables, tables and chairs, and English cookbooks. This material transformation allowed English colonists to act upon a cultural influence that had nagged them throughout the colonial era. That is, they could finally approximate metropolitan life with some accuracy—something they had always wanted to do. As Benjamin Franklin put it in the late 1760s, colonists, "had not only a respect, but an affection, for Great Britain, for its laws, its customs, and its manners." He could also have accurately added "its food." Ironically, on the eve of what became the American Revolution, colonists were actually enjoying more access to more ingredients, as well as the English accoutrements that enabled them to Anglicize and refine—however modestly—the former relatively rugged cuisine (McWilliams 2006, 7).

FOOD IN POST-REVOLUTIONARY AMERICA

The American Revolution posed an unexpected problem. For all the colonists' success in replicating English eating habits during the consumer revolution, the Revolution ended the transition from provincial backwardness to metropolitan sophistication. Just when British North America was beginning to feel integrated into the cultural patterns of the empire, politics intervened and the empire imposed infringements that turned Americans into reluctant but committed revolutionaries. The victorious outcome of the American Revolution inspired political changes that rapidly redefined America—despite its 750,000 slaves—as the pinnacle of liberty. Historians have studied this transition thoroughly. Lost in their heavy emphasis on political transformation, however, is a profound cultural problem that had tremendous implications for the young American identity. The United States had a general idea, however, what its new cultural values should look like, but it had no idea what its new cultural values would be. In suggestive ways, colonists turned to food to seek answers.

Americans used food to strike a balance between refinement and ruggedness. Prompting his play *The Father* (1789), William Dunlap advertised the production as "a frugal plain repast" in contrast to the "high seasoned food" dished out by European dramatists. This description was more than an empty advertising slogan. Indeed, in America, thoughts about proper food clearly came to stress frugality, roughness, flexibility, and a radical openness to experimentation. American food, like the American people, was mythologized to be pragmatic, self-sufficient, adaptable, and without artifice, "homespun like the clothes that marked a true patriot." Whether any of this was the case is beside the point. But the fact that Americans began consciously to promote their food as a contrast to the excessive refinement of European cuisine highlights a critical aspect of national identity formation. Whereas many colonists, especially those in the northern colonies, had spent much of the colonial era trying to downplay British America's rugged (and thus provincial) character, Revolutionary-era Americans began to embrace it, although in a much more controlled fashion than they once had. Few white Americans were willing to champion the extreme culinary examples provided by the rural southern colonies, now states. Nevertheless, the fact remained that early Americans, consciously or not, promoted a mode of eating that owed much to the tolerance and flexibility enabling whites from Georgia to the Middle colonies to accept Native American and African influences on their diet and, in turn, transform English-inherited practices into American culinary creations. At the same time, they eschewed the refinement that New Englanders had long sought without (again, the goal was to strike a balance) fully rejecting it.

Instances of early Americans achieving this balance appeared in unlikely places and at unlikely times. Yet they occurred frequently enough to form a pattern. Patrick Henry, the great Revolutionary agitator, condemned Thomas Jefferson's predilection for fine French food, warning him never to "abjure his native victuals." European visitors to the early republic remarked repeatedly on the dining habits and attitudes of Americans in ways that suggested the Americans' proud adherence to a pragmatic mode of eating. The Duke of Liancourt wrote with astonishment about how easily Americans accepted Indian corn into their diet. It was, he explained, "the national crop . . . eaten three times a day." In rural areas, he went on, "fresh meat could not be regularly got, except in the shape of poultry or game; but the hog cost nothing to keep, and very little to kill and preserve. Thus the ordinary American was brought up on salt pork and Indian corn, or rye." Thomas Ashe in his *Travels in America in 1806* (1808) observed that Americans had no problem with salted meat, telling how one timber worker he met opined, "your fresh meat, that's too fancy." Even Charles Dickens, on a trip to the United States in the 1830s, commented on America's culinary pragmatism, writing about how he consumed a fine spread of "tea, coffee, bread, butter, salmon, shad, liver, steak, potatoes, pickles, ham, chops, black-puddings, and sausages," but that "dinner was breakfast again without the tea and coffee, and supper and breakfast were identical" (McWilliams 2006, 7).

These examples, with their deeply suggestive culinary opinions, show Americans walking a fine line between European refinement and provincial ruggedness and, in essence, defining their broader culture. Without consciously doing so, Americans were drawing on deeply ingrained elements of their diverse culinary heritage to forge a national identity that served them well as they moved west, confronted new "wild territories," and worked to "subdue the wilderness." The ruggedness of the colonial frontier, a characteristic of North America that British Americans once associated with the indigenous population, became an aspect that Americans could now, with the British model dissipating, embrace with measured enthusiasm. Likewise, the refinement of the idealized English (and European) diet was now a quality that Americans could overtly condemn (rather than, as they once had, praise) without completely dismissing its welcome trappings. Through the virtues that American food embraced—frugality, simplicity, pragmatism, unpretentiousness—the United States could grow into a sophisticated nation while avoiding the enervating habit of complacency into which the British had fallen. It could announce, as Thomas Jefferson did, "how unripe we yet are" all the while knowing ripeness, like an overly refined cuisine, was something to avoid. Most importantly, they could strike this balance by growing, cooking, and eating their own "American" food (McWilliams 2006, 7–8).

Intellectual Life

THE ENLIGHTENMENT

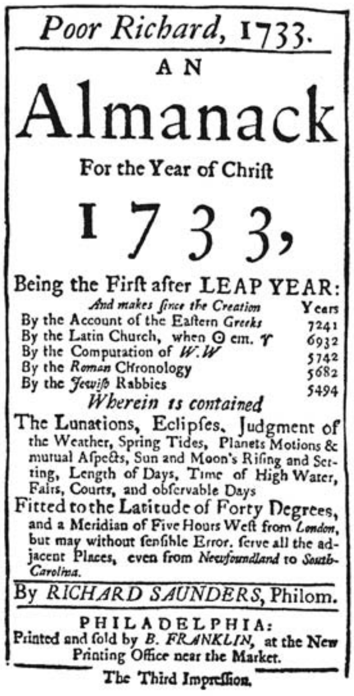
Through their commercial contacts, newspapers, and other activities, colonial cities became the centers for the dissemination of fashion and ideas. In the world of ideas a new fashion was abroad: the Enlightenment. During the seventeenth century, Europe experienced a scientific revolution in which the ancient view of an earth-centered universe was overthrown by the new heliocentric (sun-centered) system of Polish astronomer Nicolaus Copernicus. A climax to the scientific revolution came with Sir Isaac Newton's *Principia* (*Mathematical Principles of Natural Philosophy*, 1687), which set forth his theory of gravitation. Newton depicted a mechanistic universe moving in accordance with natural laws that could be grasped by human reason and by mathematics. He implied that natural laws governed all things—the orbits of the planets and also the orbits of human relations: politics, economics, and society. Reason could make people aware, for instance, that the natural law of supply and demand governed economics or that the natural rights to life, liberty, and property determined the liberty and functions of government (Tindall and Shi 2004, 141–42).

Much of enlightened thought could be reconciled with established beliefs—the idea of natural law existed in Christian theology, and religious people could reason that the rational universe of Copernicus and Newton simply demonstrated the glory of God. Yet when people carried Newton's outlook to its ultimate logic, as the Deists did, the idea of natural law reduced God to the position of a remote Creator—as the French *philosophe* Voltaire put it, the master clockmaker who planned the universe and set it in motion. In this view, evil in the world resulted not from original sin and innate depravity so much as it did from ignorance, an imperfect understanding of the laws of nature. Humanity, the English philosopher John Locke argued in his *Essay on Human Understanding* (1690), is largely the product of the environment, the mind being a blank tablet on which experience is written. The way to improve nature and human nature was by the application and improvement of Reason—which was the highest Virtue (Enlightenment thinkers often capitalized both words) (Tindall and Shi 2004, 142).

The Enlightenment in America

However interpreted, such ideas profoundly affected the climate of thought in the eighteenth century. The premises of Newtonian science and the Enlightenment, moreover, fit the American experience. In the New World people no longer moved in the worn grooves of the traditions that defined the roles of priest, or peasant, or noble. The experience of colonial settlement placed a premium on observation, experiment, and the need to think anew. America was therefore receptive to the new science (Tindall and Shi 2004, 142).

John Winthrop Jr., three times governor of Connecticut, wanted to establish industries and mining in America. These interests led to his work in chemistry and membership in the Royal Society in London. He owned probably the first telescope brought to the colonies. His cousin, John Winthrop IV, was a professional scientist and Harvard professor who introduced to the colonies the study of calculus and ranged over the fields of astronomy, geology, chemistry, and electricity. David Rittenhouse of Philadelphia, a clockmaker, became a self-taught scientist who built probably the first telescope in America. John Bartram of Philadelphia spent a lifetime traveling and studying American plant life, and gathered in Philadelphia an extensive botanical garden (Tindall and Shi 2004, 142–43).



Poor Richard, 1733.
AN
Almanack
For the Year of Chrift
1733,
Being the Firft after LEAP YEAR:
And makes fince the Creation Years
By the Account of the Eaftern *Greeks* 7241
By the Latin Church, when ☉ ent. ♈ 6932
By the Computation of *W.W* 5742
By the *Roman* Chronology 5682
By the *Jewifh* Rabbies 5494
Wherein is contained
The Lunations, Eclipfes, Judgment of the Weather, Spring Tides, Planets Motions & mutual Afpects, Sun and Moon's Rifing and Setting, Length of Days, Time of High Water, Fairs, Courts, and obfervable Days
Fitted to the Latitude of Forty Degrees, and a Meridian of Five Hours Weft from *London*, but may without fenfible Error, ferve all the adjacent Places, even from *Newfoundland* to *South-Carolina*.
By *RICHARD SAUNDERS*, Philom.
PHILADELPHIA:
Printed and fold by *B. FRANKLIN*, at the New Printing Office near the Market.
The Third Impreffion.

Benjamin Franklin epitomized the Enlightenment, in the eyes of both Americans and Europeans. Born in Boston in 1706, he was the son of a candle and soap maker. Apprenticed to his older brother, a printer, Franklin left home at the age of 17, bound for Philadelphia. There, before he was 24, he owned a print shop, where he edited and published the *Pennsylvania Gazette*. When he was 27 he brought out *Poor Richard's Almanacs*, filled with homey maxims on success and happiness. Before he retired from business at the age of 42, Franklin, among other achievements, had founded a library, set up a fire company, helped start the academy that became the University of Pennsylvania, and organized a debating club that became the American Philosophical Society.

Science was Franklin's passion. His *Experiments and Observations on Electricity* (1752) went through many editions in several languages and established his reputation as a leading thinker and experimenter. His speculations expanded widely into the fields of medicine, meteorology, geology, astronomy, physics, and other aspects of science. He invented the Franklin stove, the lightning rod, and a glass harmonica for which Mozart and Beethoven composed. The triumph of this untutored genius confirmed the Enlightenment trust in the powers of nature and reason (Tindall and Shi 2004, 143).

EDUCATION IN COLONIAL AMERICA

For the colonists at large, education in the traditional manners of society—even literacy itself—remained primarily the responsibility of family and church. The modern conception of free public education was slow in coming and failed to win universal acceptance until the twentieth century. Yet colonists were concerned from the beginning that steps needed to be taken lest the children of settlers grow up untutored in the wilderness (Tindall and Shi 2004, 143–44).

Conditions in New England proved most favorable for the establishment of schools. The Puritan emphasis on scripture reading, which all Protestants shared in some degree, implied an obligation to ensure literacy. The compact towns of that region made schools more feasible than among the scattered people of the southern colonies. In 1647 the Massachusetts Bay Colony enacted the famous "ye olde deluder Satan" Act (designed to thwart the Evil One), which required every town of 50 or more families to set up a grammar school (a Latin school that could prepare a student for college). Although the act was widely evaded, it did signify a serious purpose to promote education (Tindall and Shi 2004, 144).

The Dutch in New Netherland were as interested in education as the New England Puritans. In Pennsylvania the Quakers never heeded William Penn's instructions to establish public schools, but they did finance a number of private schools teaching practical as well as academic subjects. In the southern colonies efforts to establish schools were hampered by the more scattered populations, and in parts of the backcountry by indifference and neglect. Some of the wealthiest planters and merchants of the Tidewater sent their children to England or hired tutors. In some places wealthy patrons or the people collectively managed to raise some kind of support for "old field" schools or academies at the secondary level (Tindall and Shi 2004, 144–45).

The Establishment of Schools in America

Throughout the eighteenth century, academic education gained increasing currency as the key to opportunity for advancement in income and status. One father put it well, writing his son, who was failing to take advantage of his schooling, that "many Children capable of learning, are condemn'd to the necessity of Labouring hard, for want of ability in their Parent to give them an education." The response to this widely shared belief in schooling as a talisman for getting ahead was an explosion of plans, projects, and experiments in education, culminating in the nineteenth century in a unique "American system of public schools" that were free, compulsory, and universal. In the end, it changed the everyday life of all American children, demanding of them only one sort of work—book learning—and enclosing them tightly in the world of childhood, rigidly separated from the world of adults. While the eighteenth century groped only vaguely in this direction, a broad spectrum of educational experiences touched a far greater number and variety of children than ever before in Western history (Wolf 1993, 126–27).

Most were only lightly touched. In rural areas, children were dependent on parents and the availability of a teacher willing and able to carry education beyond the ABC level learned at home. Moreover, while parents might recognize the importance of literacy to future opportunities, real work came first, and farm boys were free to attend school only a few weeks or, at best, a few months a year during the intervals of planting and harvesting. In towns and cities, schooling was also occasional, although there was a ready supply of teachers and the seasonal nature of work was less pronounced. There is evidence that some town schools offered night classes for the convenience of apprentices who had to work during the day, and occasionally for craftsmen's daughters and servant girls as well. One innovative feature of these common schools, as they came to be called, was that they were often open to girls, either along with boys or in separate classes where the domestic skills of knitting and sewing were taught in addition to the elementary subjects learned by their brothers. There was a tuition charge for every child, either by the week, the "quarter," or sometimes by the subject, so that the breadth of the schooling received depended on the breadth of the parental pocketbook. As the century progressed and the value of schooling was more generally accepted, wealthy men offered scholarships so that "deserving poor" boys might attend local schools; even colonials of very modest means who died without heirs left a portion of their meager estates for the "education of the local poor." In some places there were special-interest philanthropies as well, including charity schools entirely devoted to groups of disadvantaged children such as blacks, Indians, Germans, or Lutherans (Wolf 1993, 127).

The Curriculum

The academic charge to these schools was that they teach pupils to "read perfectly, to write a legible hand, and figure to the rule of three," an arithmetic device for finding the unknown number when three known ones were given. Although we cannot know how well they succeeded in perfect reading, except to note that the method employed encouraged sounding out by letter and moving the lips—not recommended by today's speed-reading professionals—the diaries and account books left by adults whose education took place in common schools do not testify to outstanding teacher success (Wolf 1993, 127–28).

Another agenda lay behind purely academic goals: an expectation that, along with the three Rs, children would be inculcated with social values. Most important were "the first Principles of Virtue and Piety," taught through the use of textbooks whose reading and spelling lessons were heavily biblical and moral in content. In addition to these lessons in Christian morality, ladled out in huge doses throughout the century, children headed for such "mean" careers as shopkeepers, artisans, and traders received intensive practical training in social manners, since American educators believed, with some justification, that today's shopkeeper might be tomorrow's great merchant. The many books on conduct ignored the "overly genteel" or "foppish" manners of the upper-class drawing room, however, to focus on basic rules of behavior in the home, in school, in church, and on the streets. Consider this excerpt from Christopher Dock's book, *100 Necessary Rules for the Proper Behavior of Children*, published in 1764 and intended for an audience of children of German background: "When you wash your face and hands do not scatter water about in the room . . . do not wolf down your food . . . or overfill your mouth . . . do not run wildly nor [urinate] in the streets . . . use the handkerchief when spitting or blowing your nose." Americans, it seems, were extremely sensitive to the criticisms of genteel European travelers who found them noisy, rude, coarse, and unmannerly, and while defensively

denying that "foreign manners" were appropriate to the New World since "the refinement of manners in every country should keep pace exactly with the increase of its wealth [and the greatest evil in America is] an improvement of taste and manners which its wealth cannot support" (Wolf 1993, 128).

Beginning during the Revolution, the importance of educating the citizenry for its part in Republican government became a favorite theme of both politicians and educators. The *New England Primer*, published throughout the eighteenth century with a picture of King George as a frontispiece, removed his crown and relabeled him as "John Hancock," "Samuel Adams," or "George Washington" after 1776. In 1777, Pennsylvania required its schoolmasters and officers of academies and colleges to swear an oath of allegiance to the United States, and other states followed suit. By 1779, Thomas Jefferson had formulated an elaborate plan for a system of public schools in Virginia to prepare the "best and the brightest" for careers in public service. In the years following the war, schemes of general education proliferated, with rationales stressing the advantages to the nation of an educated public and placing patriotic indoctrination of children on a par with teaching them basic academics, morality, and manners. The most famous and influential of the educational writers was Noah Webster (1758–1843), author of *An American Dictionary of the English Language* (1828). Himself an example of the New American, Webster argued tirelessly that a good education should instill patriotism, and produced numerous textbooks that were designed to "implant science, virtue, and the principle of liberty to alter the European pattern and achieve American goals." He saw the two basic principles of the republic as providing the right to an education and a chance to earn upward mobility. Of course, his insistence on the necessity of using good American books instead of English imports did nothing to hurt sales of his own works (Wolf 1993, 128–29).

As the numbers and influence of upwardly mobile colonial families grew continuously throughout the eighteenth century, the market for schooling expanded as well. Educational entrepreneurs flourished, advertising their services in local newspapers and appealing to the snobbery of a prospective clientele by emphasizing their recent arrival from London, the cultural hub of the world to Americans. More importantly, a new type of educational institution was developed, flexible enough to send its graduates on to the university for polish, or directly into the more advanced levels of the social and business world. Known as academies, these schools made their appearance in the cities, large towns, and more heavily populated parts of the colonies after the middle of the century. They accepted both day students and boarders, so that their benefits were available to families who lived outside the urban areas, and they occupied roughly a position in the educational hierarchy that middle schools and high schools do today (Wolf 1993, 129–30).

Based on a model proposed by Benjamin Franklin to the Philadelphia Common Council in 1750, there were literally hundreds of these institutions chartered by the end of the century. Although the actual curriculum varied from academy to academy, most attempted to combine the courses of the Latin schools with those of private teachers. Franklin recognized that this was overambitious: "As to their STUDIES," he wrote, "it would be well if they could be taught *every Thing* that is useful, and *every Thing* that is ornamental: But Art is long, and their time is short. [They should learn] those Things that are most likely to be *most useful* and *most ornamental*." He then went on to outline, in several closely packed pages, a list of subjects that had taken several lifetimes to master. The Phillips Academy at Andover, Massachusetts, proposed to offer, in 1778, what was probably a more realistic curriculum that became fairly standard for these types of schools: "the English, Latin, and Greek languages, Writing, Arithmetic, Music, and the Art of Speaking; also practical Geometry, Logic, and any other of the liberal Arts and Sciences, or Languages, as opportunity and ability may hereafter admit" (Wolf 1993, 130).

Educational Opportunities for Girls

The expectation of a certain degree of cultural polish for substantial urban and rural men of business had its repercussions for women, since the sloppy education of a child, whether male of female, reflected on the social standing of the family. A refined young girl had to learn the arts and skills of gentility as well as those of domesticity to preside creditably in the parlor or at the dining table of her ambitious husband. Upward mobility from generation to generation often meant that mothers lacked the necessary skills—Abigail Adams was a terrible speller—to prepare their daughters for the more sophisticated lives they would lead. Private schooling began to be available for girls by the 1730s to give them a good grounding in the elements of reading, writing, arithmetic, and English literature. This was usually regarded as "sufficient literacy," and they did not proceed to the classics, which were thought to be not only unnecessary for women, but also downright pernicious to their femininity. Instead, they received further career instruction for their role as wives. A recurring advertisement in the Philadelphia newspapers offered children of both sexes writing, arithmetic, and "the true grounds of English spelling" while the schoolmaster's wife provided the girls with additional instruction in penmanship, French, singing, and "playing on the spinet," and his sister, "lately arrived from London," specialized in dancing and "all sorts of needlework" (Wolf 1993, 130–31).

Private schools for girls, 60 years later, had proliferated all along the eastern seaboard from Boston to Charleston. Like the Quaker-run Westtown, or the Moravian Seminary in Bethlehem, they were based on the models for boys' academies, sometimes operating separately, sometimes as divisions of their brother institutions. Many of these schools were boarding schools that attracted girls from all over the United States and the West Indies, indicating how seriously parents regarded the proper education of their daughters for their occupations as wives and mothers. After all, sending a girl away from the shelter of home was not an action to be taken lightly.

Although the goals of literacy, morality, manners, and patriotism formed the basis of the education given to both sexes, the subjects for girls continued to stress particularly feminine accomplishments, and the ideals of the new republic were expressed in the mottos and decorations they stitched into their compulsory samplers rather than in poems, essays, and valedictory speeches. One small indication remains to us of possible dissatisfaction with the female status quo. In 1800, a young Maryland girl carefully embroidered on her sampler, "Patty Polk did this, and she hated every stitch she did in it. She loves to read much more." Patty's rebellion only extended so far: she *did* work the sampler regardless of her feelings and we can only speculate about the habits of the mother or teacher who encouraged her to put these sentiments in so permanent a form (Wolf 1993, 131).

Religious Life

RELIGION IN COLONIAL AMERICA AND THE GREAT AWAKENING

During the early eighteenth century, the new currents of rationalism stimulated by the Enlightenment aroused concerns among orthodox believers in Calvinism. Many people seemed to be drifting away from the old moorings of piety. Despite the belief that the Lord had allowed great Puritan and Quaker merchants of Boston and Philadelphia to prosper, there remained a haunting fear that the devil had lured them into the vain pursuit of worldly gain, deism, and skepticism. And out along the fringes of settlement, many of the colonists were unchurched. On the frontier people had no minister to preach or administer sacraments or perform marriages. According to some ministers, these pioneers had lapsed into a primitive and sinful life, little different from the "heathen" Indians. By the 1730s, the sense of religious decline provoked a revival of faith, which became known as the Great Awakening (Tindall and Shi 2004, 145).

In 1734–1735, a remarkable spiritual revival occurred in the congregation of Jonathan Edwards, a Congregationalist minister in Northampton, in western Massachusetts. One of America's most brilliant philosophers and theologians, Edwards entered Yale at age 13, and graduated as valedictorian four years later. In 1726, Edwards was called to the Congregational Church in Northampton. There he found the town's spirituality at a low ebb. More people frequented taverns than churches, and Christians, he believed, had become preoccupied with making and spending money. Religion had also become too intellectual, thereby losing its emotional force. "Our people," he said, "do not so much need to have their heads stored [with new knowledge] as to have their hearts touched." His own vivid descriptions of the torments of hell and the delights of heaven helped rekindle spiritual fervor among his congregants. By 1735, Edwards could report that "the town seemed to be full of the presence of God; it never was so full of love, nor joy." To judge the power of the Awakening, he thought, one need only observe that "it was no longer the Tavern" that drew local crowds, "but the Minister's House" (Tindall and Shi 2004, 145–46).

About the same time, William Tennent, an Irish-born Presbyterian revivalist, set up a "Log College" in Neshaminy, Pennsylvania, for the education of ministers to serve the Scotch-Irish Presbyterians living around Philadelphia. The true catalyst of the Great Awakening, however, was a 27-year-old English minister, George Whitefield, whose reputation as a spellbinding evangelist preceded him to the colonies. Congregations were lifeless, he claimed, "because dead men preach to them." Too many ministers were "slothful shepherds and dumb dogs." His objective was to restore the fire of religious fervor to American congregations. In the autumn of 1739 Whitefield arrived in Philadelphia and began preaching to large crowds. After visiting Georgia, he made a triumphal procession northward to New England, drawing great crowds and releasing "Gales of Heavenly Wind" that blew gusts through the colonies.

Possessed of a golden voice, Whitefield enthralled audiences with his unparalleled eloquence. Even the skeptical Benjamin Franklin, who went to see Whitefield preach in Philadelphia, found himself so carried away that he emptied his pockets into the collection plate. Whitefield urged his listeners to experience a "new birth"—a sudden, emotional moment of conversion and salvation. By the end of his sermon, one listener reported, the entire congregation was "in utmost Confusion, some crying out, some laughing, and Bliss still roaring to them to come to Christ, as they answered, *I will, I will, I'm coming, I'm coming*" (Tindall and Shi 2004, 146).

Jonathan Edwards took advantage of the emotions stirred up by Whitefield to spread his own revival gospel throughout New England. In 1741, Edwards delivered his most famous sermon at Enfield, Massachusetts. Entitled "Sinners in the Hands of an Angry God," it represented a devout appeal to repentance. Edwards reminded the congregation that hell was real and that God's vision was omnipotent, his judgment certain. He noted that God "holds you over the pit of hell, much as one holds a spider, or some loathsome insect, over the fire, abhors you, and is dreadfully provoked... he looks upon as worthy of nothing else, but to be cast into the fire." When he finished, he had to wait several minutes for the congregation to quiet down before leading them in a closing hymn. Such was the power of the Word plainly preached to the people (Tindall and Shi 2004, 146–47).

THE EFFECTS OF THE GREAT AWAKENING

Everywhere the fragmenting force of the Awakening brought splits, especially in the more Calvinistic churches. Presbyterians divided into the "Old Side" and "New Side" and Congregationalists into "Old Light" and "New Light." New England religious life would never be the same. The more traditional clergy were undermined as church members chose sides and either dismissed their ministers or deserted them. Many of the "New Lights" went over to the Baptists, and others flocked to Presbyterian or, later, Methodist groups, which in turn divided and subdivided into new sects (Tindall and Shi 2004, 147).

New England Puritanism disintegrated amid the ecstatic revivals of the Great Awakening. The precarious balance in which the founders had held the elements of emotionalism and reason collapsed. In consequence, New England attracted more and more Baptists, Presbyterians, Anglicans, and other denominations, while the revival frenzy scored its most lasting victories along the frontiers of the Middle and southern colonies. In the more sedate churches of Boston, moreover, the principle of rational religion gained the upper hand in a reaction against the excesses of revival emotion. Boston ministers such as Charles Chauncey and Jonathan Mayhew reexamined Calvinist theology and found it too forbidding and irrational that people could be forever damned by predestination (Tindall and Shi 2004, 147–48).

In reaction to the taunts that the "born-again" revivalist ministers mocked learning, the Awakening gave rise to the denominational colleges that became so characteristic of American higher education. The three colleges already in existence had originated from religious motives: Harvard, founded in 1636, because the Puritans dreaded "to leave an illiterate ministry to the church when our present ministers shall lie in the dust"; the College of William and Mary, in 1692, created to strengthen the Anglican ministry; and Yale College, in 1701, set up to educate the Puritans of Connecticut, who felt that Harvard was drifting from the strictest orthodoxy. The College of New Jersey, later Princeton University, was founded by Presbyterians in 1746. In close succession came King's College (1754) in New York, later renamed Columbia University, an Anglican institution; the College of Rhode Island, later renamed Brown University, Baptist; Queens College (1766), later known as Rutgers, Dutch Reformed; and Congregationalist Dartmouth (1769), the outgrowth of an earlier school for Indians. Among the colonial colleges, only the University of Pennsylvania, founded as the Philadelphia Academy in 1754, arose from secular impulse.

The Great Awakening, like the Enlightenment, set in motion powerful currents that still flow in American life. It implanted in American culture the evangelical crusade and the emotional appeal of revivalism. The movement weakened the status of the old-fashioned clergy and encouraged believers to exercise their own judgment, and thereby weakened the habits of deference generally. By encouraging the proliferation of the denominations, it heightened the need for toleration of dissent. But in some respects the counterpoint between the Awakening and the Enlightenment, between the principles of spirit and reason, led by different roads to similar ends. Both movements emphasized the power and right of individual decision making, and both aroused millennial hopes that America would become the promised land in which people might attain the perfection of piety or reason, if not both (Tindall and Shi 2004, 148).

Economic Life

AN AGRICULTURAL SOCIETY

Agriculture was the foundation of the colonial economy. On the eve of the Revolution it employed 80 percent of the working population and created most of the wealth produced. A majority of American cultivators were small farm owners, yeomen, engaged in mixed agriculture—growing corn, rye, wheat; raising cattle, horses, hogs; planting fruit trees, potatoes, and vegetables. The farmer's own family consumed most of these products, but, except on the frontier, where distances to markets and particularly poor transportation made it impossible, farmers usually had some surpluses for sale to customers in nearby towns or even overseas. The farmer's labor force usually consisted entirely of himself and his family (Unger 1989, 84).

NEW ENGLAND FARMING

Many regional differences grew up and persisted in colonial agriculture. New England farmers faced such rocky soil almost everywhere except in the Connecticut Valley, it was said that they had to shoot the seed into the ground with a gun. Yankee farmers could seldom do more than provide for the needs of their own families and a small group of artisans, officials, and professionals in each town who did not tend the soil. Connecticut produced some surplus livestock, grain, and dairy products for export, and Rhode Island raised horses for the Caribbean trade. But with these exceptions, New England agriculture had only local importance (Unger 1989, 84).

Wealth was not the vision that drove the eighteenth-century New Englander to plow before sunrise, nor his wife to her butter churn. It was an ideal of self-sufficiency that envisioned a life lived entirely off the production of the household, assisted when necessary by mutual exchanges of goods and services among close neighbors who were often kin as well as friends. Americans provided many romantic verbal pictures of such idealized rural existence, particularly by an admiring naturalized citizen, Hector St. Jean de Crevecoeur, in his collection of *Letters from an American Farmer* (1782). In a typical vignette, he tells of a farmer who is unable to plow his fields because of sickness or accident: "In due time we invite a dozen neighbors, who will come with their teams and finish it all in one day. At dinner we give them the best victuals our farm affords;...pies, puddings, fowls...nothing is spared that can evince our gratitude." In the evening, he continues, the young folks arrive to "partake of the general dance" (Wolf 1993, 158–59).

In real life, self-sufficiency was elusive and virtually impossible for most New England farmers, particularly as the eighteenth century wore on. There were so many items that had come to be considered necessary for even a "barely decent" way of life—coffee, tea, sugar, ceramics—that could not be produced at home or even in the neighborhood and had to be purchased for cash. Many New Englanders became farmer-artisans, acquiring the skills to make goods like shoes, cloth, or pottery in the off-season that could be sold for money. The preferred way to obtain cash, however, was to convert raw farm materials into marketable goods. Depending on where they lived, New England farmers processed and sold maple syrup, maple sugar, brandy, liquor, and cured and barreled beef and pork. Cattle not only produced meat, but also dairy goods. New England butter, while judged pretty poor in taste, was plenty good enough for the slaves in the West Indies for whom it was intended, since it could be kept for up to three years if preserved in a saltpeter-salt-sugar solution instead of just brine. By the end of the century, the people of Goshen, Connecticut, were annually exporting up to 400,000 pounds of cheese deemed as good as that of Cheshire in England. This business made them, in the opinion of one traveler, "more wealthy than any other collection of farmers in New England." Sheep became more important throughout the eighteenth century, particularly in places like Nantucket and Martha's Vineyard, where the Gulf Stream moderated the bitter northern winter, while the farmers around Narragansett, Rhode Island, used their land to develop a special breed of saddle horses—small, hardy, and fleet of foot (Wolf 1993, 159).

LUMBERING AND FISHING IN NEW ENGLAND

Two other rural occupations that began the eighteenth century as part-time, off-season money producers for farmers in New England had become, by the close of the period, large, well-organized businesses in their own right. One of these was the lumber industry, which by 1750 employed full-time loggers in Maine and New Hampshire to ship firewood and building timber south of Boston. The prices were good, some even said exorbitant, and the market was year-round since it took 10 cords of wood a year to supply cooking and heating fuel for a single house. It was almost impossible to work at lumbering and farming at the same time, since, as one contemporary observer noted, "The best season for sawing logs is in the spring, when rivers are high: this is also the time for plowing and planting. He [who] works in the sawmill at that time must [therefore] by [*sic*] his bread and clothing, and the hay for his cattle." While the individual farmer-artisan continued to apply the lumber from his own woodlot to a variety of woodworking crafts such as the making of bowls, barrels, or shingles for a cash return, it was the large-scale lumber industry that supplied most of the needs for urban construction and shipbuilding (Wolf 1993, 159–60).

Fish, however, became the major export from New England during the eighteenth century. The farmer-fisherman had become the fisherman-farmer by the time of the Revolution, as more than 1 in 10 New Englanders earned his living primarily from the sea. Independence in fishing began on a community model: both the locally built sloops from Cape Cod and the processing of their catch were worker-owned and -operated enterprises. The daily life of fishermen was no easier than for full-time farmers. Separated from their families for weeks or even months, their backbreaking technology embraced nothing more sophisticated than lines cast out and drawn in hand-over-hand, hoisting fish that weighed well over 40 pounds. Self-sufficiency became less possible with fishermen during the century as larger boats meant longer trips, so that the season overlapped with the farming season. Large merchants took over the business and organized the annual catch, which was cured, sorted, packed, and shipped abroad (Wolf 1993, 160).

As a special breed of fisherman, whalers were even more dependent on the market economy. They were gone from their farms for years at a time, and returned with products—whale oil and spermaceti—that were not basic necessities of life, but were used in the rapidly growing worldwide market for consumer goods in finishing leather, making soap, and producing high-quality candles. As the consumer market grew after 1750, the whaling fleet kept pace, sending out as many as 250 ships a year by 1770. Nantucket and New Bedford grew prosperous on their strange catch, as Providence did on fish, or Goshen on cheese, but these were local opportunities and developments. For the most part, New England farmers scrounged around doing a little of this and a little of that, sending most of their sons off in search of better opportunities and richer land. No single product so pervaded the whole region that the daily bread of the poor tenant or the fortune of the rich yeoman was measured by its market price (Wolf 1993, 160–61).

FARMING IN THE MIDDLE COLONIES

New York, New Jersey, and Pennsylvania were the "bread colonies," harvesting large surpluses of wheat from their fertile fields. They converted this grain to flour in the region's many gristmills and exported much of it to the Caribbean or southern Europe. In addition, the bread colonies exported potatoes, beef, pork, and other farm products (Unger 1989, 84–85).

In many ways, the farmers of the Middle colonies had the best of both worlds. Like southern planters, the fertility of their soil and the extent of their lands allowed them to develop agriculture as a highly profitable industry. The geography and climate encouraged the exploitation of diversified staple crops that were part of the settlers' heritage, and provided both food for their families and marketable goods for the other mainland colonies, the islands, and Europe. Their seasons were similar to those of New England, only better, the winters shorter, the summers warmer. Where it required 125 acres to provide modestly for a family of five in New England, 90 acres supported the same number of people more generously in the Middle colonies. To the north, farmers could expect to reap 10 to 15 bushels of wheat per acre. Pennsylvania farmers could average 20 to 30 bushels, and if Long Island farmers were conscientious about manuring their fields, they could achieve 40 to 50 bushels (Wolf 1993, 171).

The importance of wheat on the world market made it the primary staple of the Middle colonies, where the farmer could expect that "the first crop of wheat will fully pay him for all the expense he has been at, in clearing up, sowing, and fencing his land; and at the same time, increases the value of the land eight or ten times the original cost," according to a contemporary observer. The vision of profits made agricultural innovators of many eighteenth-century farmers in Pennsylvania, although throughout the entire century the basic tools for earning a living on the frontier continued to be knives and axes, sickles and scythes, hoes and flails. Yet even among these simple tools, American "improvements" were in evidence by the time of the Revolution. For example, a new style of axe, its weight perfectly balanced between the blade and poll (flat edge), its handle the length and curve exactly fitted to the height and swing of the axe man, could fell three times as many trees in the same time as a European axe. Other inventions or innovations like the seed drill, the grain cradle, and new plow and wagon designs were dreamed up in Pennsylvania workshops, to be exploited by entrepreneurial farmers. Although at midcentury most farmers still "sowed grains successfully on the same land without manuring it until it was exhausted and left it fallow," within a few decades they were experimenting with the use of artificial fertilizer, particularly gypsum and lime, so that it was reported in 1775 that between the Susquehanna and Schuylkill Rivers, "every farmer has a Limkiln burnt for the dressing of his land" (Wolf 1993, 171–72).

Although the eighteenth-century plow was essentially part of traditional wood technology, Middle colony farmers were more likely to use them rather than New Englanders, reinforcing their vulnerable cutting edges with bits or strips of iron. While harvesting remained a slow process, even after the development of the grain cradle, which cut and gathered the grain simultaneously, threshing was "mechanized" by horses plodding their heavy, slow path around and around, treading out the wheat from the chaff, long before farmers to the north gave up relying on the flail wielded by manpower alone. For hauling and transportation there were two-wheeled carts convertible to sleds in the winter, and heavy four-wheeled wagons requiring teams of horses to pull them, forerunners of the covered wagons that became the mobile homes and moving vans of the nineteenth-century pioneers. Called "Conestoga wagons" after the township in which they were developed, they used matched heavy draft horses specially bred in the same region and known by the same name to pull them. In New England, on the other hand, four-wheeled vehicles were practically unknown before the Revolution, nor were draft horses common. It was Old World oxen that provided muscle power on northern farms, where draft animals existed at all (Wolf 1993, 172).

The need for animal power as part of the farm economy suggests the crucial shortage of labor that plagued many successful farmers in the Middle colonies. Like their southern neighbors, their farms were large enough to require more hands than the typical family could provide; like those to the north, the crops that were most suited to their environment did not recommend the use of slaves as the solution to their labor problems. While successful planters in the south came to rely more and more on slavery and less and less on indenture throughout the eighteenth century, agricultural entrepreneurs in New York, Pennsylvania, and, to some extent, New Jersey developed a complex and widespread system of tenancy (Wolf 1993, 172–73).

TENANT FARMING

To be a tenant was, by definition, to live and work on someone else's land and to pay for the privilege in cash, goods, or services. Beyond that, there were as many different ways of tenancy as there were landless people. For some, it was a poor and meager life with little hope for future improvement, scarcely a step from indenture, and even less secure. Often designated "inmates," these unfortunates either shared the owner's house or lived in shacks on the property. They were often required to do other work besides their chores on the farm, particularly if the farmer had some skill in a craft like weaving and saw it as a means to a second income. In this case, the tenant might also be a weaver and his wife and children spinners, as laborers in the field and servants in the owner's house. Where wheat was the staple crop, there were many months when there was little to do in the fields, and the cottagers were expected to spend most of their time in such craft production. Although, theoretically, the tenant had the freedom to improve his own lot as well as that of his employer, the year-round obligations of two occupations often left him with little time to "bury his own turnips, attend to business, in town, or plow his flax patch" (Wolf 1993, 173).

Still other tenants were sole possessors of their farms, living in the main house and holding long-term leases good for one, two, or even three "lives." These properties were often like the "pretty farms" Peter Kalm noticed as he sailed up the Hudson in 1749, with hundreds of acres of field, wood, garden, and orchard; handsome Georgian houses with the latest in domestic technology and consumer style; and good barns and stables. Tenants on such properties paid rents that varied from "four live fat hens and a day's riding [work for the owner]" to substantial payments in wheat or cash, and were almost indistinguishable in lifestyle from prosperous owners. The tenant elite on Claverack and Livingston manors in New York, for example, even had their own exclusive social club where they "clung together, wining, dining, and playing" (Wolf 1993, 173–74).

FARMING IN THE UPPER SOUTH

The Chesapeake region, encompassed by the colonies of Virginia and Maryland, was British America's great tobacco-growing area. By the mid-eighteenth century, tobacco cultivation had moved from the tidewater to the Piedmont Plateau where the soils were fresher and more productive, leaving the remaining coastal farmers to switch to grain. The Piedmont farmers faced more difficult transportation problems than their tidewater predecessors. Located above the "fall line," where the westward-flowing streams dropped sharply to the coastal plain, they could not put their crops directly aboard ship. Instead, they sold their tobacco to local merchants who packed the leaves into huge hogsheads and rolled them to towns like Richmond or Petersburg, which lay along the fall line. There the hogsheads could be loaded aboard seagoing vessels for shipment to foreign buyers.

Throughout the eighteenth century the output of Chesapeake tobacco increased at a fairly steady pace. By the 1770s, Maryland and Virginia were shipping about 100 million pounds annually for the pipe smokers and snuff-takers of England, Scotland, and continental Europe—tobacco worth £1 million, or about $50 million at the current rate of exchange. The Chesapeake region also became a major grain exporter, with the crop largely going to the south of Europe or the West Indies (Unger 1989, 85).

Between the great plantation owners and the poorest tobacco grower lay many layers of inequality that marked the everyday lives of the farmers on the Chesapeake. They were all dependent on tobacco, since it was the currency of their region, but those without the land or capital needed to invest in large-scale production were less and less able to compete. Small landowners with perhaps a few slaves or servants eked out a living from year to year, while as many as one-third of the farmers had no property of their own at all, but lived as tenants on holdings rented from others, either for cash or "a share of the crop." William Holte, who arrived in Maryland around 1700, was such a tenant farmer. When he died, 10 years after arriving in the New World, he owned £4 of property: a blanket, two iron pots, some old furniture, two cows with calves, and two small hogs. In addition, there was a crop of 1,750 pounds of tobacco worth another £5, barely enough to cover his rent, taxes, clothing, and the repayment of several loans he had incurred in compiling even this small number of possessions (Wolf 1993, 165).

Such poor farmers followed the same routine as their wealthy neighbors and shared their vision of the ideal life as well, but they did the physical work themselves alongside a single slave or perhaps a son. During the 1730s in the face of increased competition, both Maryland and Virginia passed laws requiring the inspection of tobacco in the hogsheads for the purpose of grading it and ensuring quality control. The methods of small producers often resulted in crops of poorer quality, perhaps so poor they were labeled "trash" by the inspectors and were refused shipment entirely. In these cases the crops were burned at the warehouse, as the hoped-for profit of 15 months of unremitting labor went "up in smoke." After midcentury the smaller tobacco growers in the eastern counties were almost completely squeezed out, moving west to the Piedmont to start the cycle all over again, or turning to the staple production of wheat and cattle that could find a ready market in the West Indies (Wolf 1993, 166).

FARMING IN THE LOWER SOUTH

Rice was the major crop of the South Carolina lowlands, although some was also grown in North Carolina and Georgia. Requiring vast amounts of water, as well as a long growing season, rice was suited mostly to the swampy coastal regions of the most southerly colonies and proved highly profitable there. In 1710, South Carolina exported 1.5 million pounds. By 1770, the rice-growing colonies, with South Carolina far in the lead, exported almost 84 million pounds. Most of it went to England, but the sugar plantations of the Caribbean, the other mainland colonies, southern Europe, and, through Britain, northern Europe as well were also large consumers of American rice.

The lowland areas of South Carolina and Georgia also produced indigo, a blue dye mostly used for coloring woolen cloth. The crop was introduced in the 1740s by Eliza Lucas Pinckney, an enterprising young woman newly arrived from the Caribbean island of Antigua. Helped by a British government subsidy (bounty) of six pence a pound, the production of indigo quickly leaped. Though never as important as rice, by 1770 almost 600,000 pounds of indigo, valued at over £130,000, were being shipped from the port of Charleston each year.

One other extract of the southern mainland deserves mention—naval stores. This term includes the tar, pitch, resin, and turpentine extracted from the pine trees of coastal Carolina (and also New Hampshire) and widely employed in the shipping and paint industries. Britain itself did not produce these products and was forced to turn to Scandinavia and the Baltic regions for its supply, a circumstance that made it vulnerable to a shortage, especially in time of war. To meet this danger, British officials encouraged naval-store production by offering a bounty for pitch-tar and resin in 1704. The industry soon took off. By 1770, North Carolina was exporting naval stores worth about £35,000 a year, almost all of it to Great Britain (Unger 1989, 85).

THE PLANTATION ELITE

Successive generations of white planters who established permanent homes in the southern colonies built on the concept of land as capital, crops as cash, and agriculture as a business leading to wealth and power. As in any modern business, very few succeeded wildly, many enjoyed modest prosperity, and many more failed to achieve even a small share of the economic prize. It was the tiny number of successful agricultural entrepreneurs, however, who shaped the dreams, although never the reality, of the everyday lives of the majority of southern farmers. It was the great planters who came to control their neighbors economically and politically, who represented what became "the South" to most northerners who had never been there, and who wrote their region into the Constitution with far-reaching effects on the events of the next century (Wolf 1993, 161–62).

The most frequently articulated goal for the successful planter was to live the life of a gentleman, but this was not in any way synonymous with a life of indolence or ease, requiring the active management of huge plantations of up to 20,000 acres, mass-producing tobacco or rice for sale on the international market. The owner never ran the machinery—hoe, scythe, or flail—but worked hard planning, overseeing, and financing the business. He engaged in a rational and systematic search for the best and most salable products, devoting time and energy to research and development. He set the standards for the methods of production: when and how to plant, tend, harvest, and prepare for markets, down to the technical requirements of his particular staple; the exact moment for "topping" the tobacco plants, and whether or not to flood the rice fields. When he organized the production of food, clothing, and the shoes, tools, and implements of everyday life on the plantation, it was not in search of independence or self-sufficiency, but because it was cheaper to produce these things at home than it was to buy them. When the business grew large enough, it was he who dispersed its manufacture, creating several smaller, self-contained units with separate overseers and workers either grouped close together or scattered across a county or even a colony. He took responsibility for arranging transportation, dealing with customers, and obtaining the financial credit necessary to the operation of any large business. When the weather was bad and the crop failed, or when the crop was too good and the market was glutted, he faced the headaches of an inadequate "cash flow" and a rising tide of debt to London or Scottish merchants and bankers who were his creditors (Wolf 1993, 162).

If there were the headaches, so, too, were there rewards. Although at the beginning of the century, the ideal of becoming part of the English gentry was already fast fixed as the goal of southern planters, the best of them were described by one continental visitor as living only "in a sordid manner" with a greater variety of food, and larger, more comfortable dwellings than those around them. By the time of the Revolution, the top of the class could take pride in the description of an English visitor who wrote: "[Southern] Planters live more like country gentlemen of fortune than any other settler in America . . . many of their houses would make no slight figure in the English counties . . . furniture, wines, dress, etc. . . . in the midst of a profusion of rural sports and diversions, and in a climate that seems to create rather than check pleasures, [they are] just such planters, as foxhunters in England make farmers." The relatively recent acquisition of their possessions was evident in the reminiscences of a native Virginian, looking back and commenting, "In 1740, I don't remember to have seen such a thing as a Turkey or Wiltton Carpets, the whole furniture of the Roomes Elegant and every Appearance of Opulence" (Wolf 1993, 162–63).

Along with the crystal, china, and silver plate, fine clothes in the London fashion, handsome carriages, and well-bred racehorses came the other advantages of success: the exercise of political power, the genteel education of sons and daughters by private tutors, grand tours of Europe, and summer escapes to American spas in the mountains or to the seaside resorts to the north. Most notably, however, success permitted utter indulgence in the famous "southern hospitality," where dozens of guests complete with retinues of slaves were housed, fed, and entertained at the host's expense. Richard Lee, for example, not only held several summer "fish feats" and "barbeques" along the banks of the river each year, but also threw occasional "bashes" at the Lee Hall during the winter, like the opulent four-day ball attended by 70 guests in January 1774 that became legendary in the annals of plantation social life (Wolf 1993, 163).

SLAVERY IN AMERICA

Of the estimated 7.7 million Africans transported to the New World between 1492 and 1820, over half arrived between 1700 and 1800. The Atlantic slave trade would later be condemned by statesmen and general opinion as a crime against humanity. But in the eighteenth century it was a regularized business in which European merchants, African traders, and American planters engaged in complex bargaining over human lives, all with the expectation of securing a profit. The slave trade was a vital part of world commerce. Every European empire in the New World utilized slave labor and battled for control of this lucrative trade. The *asiento* (an agreement whereby traders subcontracted to a foreign power the right to provide slaves to Spanish America) was an important diplomatic prize. Britain's acquisition of the *asiento* from the Dutch in the Treaty of Utrecht in 1713 was a major step in its rise to commercial supremacy. In the plantation economies of the British Empire in the eighteenth century, free laborers working for wages were atypical and slavery the norm. Slave plantations contributed mightily to English economic development. The first mass consumer goods in international trade were produced by slaves—sugar, rice, coffee, and tobacco. The rising demand for these products fueled the rapid growth of the Atlantic slave trade (Foner 2006, 122).

In the eighteenth century, the Caribbean remained the commercial focus of the British empire and the major producer of revenue for the Crown. But slave-grown products from the mainland occupied a larger and larger part of Atlantic commerce. A series of triangular trading routes crisscrossed the Atlantic, carrying British manufactured goods to Africa and the colonies, colonial products, including tobacco, indigo, sugar, and rice to Europe, and slaves from Africa to the New World. Areas where slavery was only a minor institution also profited from slave labor. Merchants in New York, Massachusetts, and Rhode Island participated actively in the slave trade, shipping slaves from Africa to the Caribbean or southern colonies. The slave economies of the West Indies were the largest market for fish, grain, livestock, and lumber exported from New England and the Middle colonies. In 1720, half the ships entering or leaving New York Harbor were engaged with trade from the Caribbean. Indeed, one historian writes, "The growth and prosperity of the emerging society of free colonial British America ... were achieved as a result of slave labor." In Britain itself, the profits from slavery and the slave trade stimulated the rise of ports like Liverpool and Bristol and the growth of banking, shipbuilding, and insurance. They also helped finance the early industrial revolution (Foner 2006, 113–14).

Overall, in the eighteenth century, Atlantic commerce consisted primarily of slaves, crops produced by slaves, and goods destined for slave societies. It should not be surprising that for large numbers of free colonists and Europeans, freedom meant, in part, the power and right to enslave others. As slavery became more and more entrenched, as the Quaker abolitionist John Woolman commented in 1762, so too did "the idea of slavery being connected with the black color, and liberty with the white" (Foner 2006, 114).

The Slaves' Voyage to America

For slaves, the voyage across the Atlantic (known as the Middle Passage because it was the second, or middle, leg in the triangular trading routes linking Europe, Africa, and America) was a harrowing experience. Since a slave could be sold in America for 20 to 30 times the price in Africa, men, women, and children were crammed aboard vessels as tightly as possible to maximize profits. "The height sometimes, between the decks," wrote one slave trader, "was only eighteen inches, so that the unfortunate human beings could not turn around, or even on their sides . . . and here they are usually chained to the decks by their necks and legs." Olaudah Equiano, who later described "the shrieks of the women and the groans of the dying," survived the Middle Passage, but many Africans did not. Diseases like measles and smallpox spread rapidly, and about one slave in eight perished before reaching the New World. Ship captains were known to throw the sick overboard to prevent the spread of epidemics.

Only a small proportion (perhaps 5%) of slaves carried to the New World were destined for mainland North America. As late as 1700 only about 20,000 Africans had been landed in Britain's colonies there. In the eighteenth century, however, their numbers increased steadily. By 1770, due to importation but also increasingly the result of natural reproduction of the slave population, around one-fifth of the estimated 2.3 million persons (not including Indians) living in the colonies that would soon become the United States were Africans and their descendants (Foner 2006, 115).

Slavery in the Chesapeake Region

By the mid-eighteenth century, three distinct slave systems were well entrenched in Britain's mainland colonies: tobacco-based plantation slavery in the Chesapeake; rice-based plantation slavery in South Carolina and Georgia; and nonplantation slavery in New England and the Middle colonies. The largest and oldest of these was the tobacco plantation system of the Chesapeake, where more than 270,000 slaves resided in 1770, nearly half the region's population. On the eve of the Revolution, Virginia and Maryland were as closely tied to Britain as any other colonies and their economies were models of mercantilist policy. They supplied the mother country with a valuable raw material, imported large amounts of British goods, and were closely linked in culture and political values to the metropolis. The period after 1680 witnessed a rapid shift from indentured servitude to slavery on the region's tobacco plantations. In the eighteenth century, the growing world demand for tobacco encouraged continued slave imports. When tobacco prices fell in the early part of the century, some planters shifted to grain production. But tobacco remained their primary source of wealth (Foner 2006, 116).

As Virginia expanded westward, so did slavery. By the eve of the American Revolution, the center of gravity of slavery in the colony had shifted from the tidewater (the region along the coast) to the Piedmont further inland. Most Chesapeake slaves, male and female, worked in the fields, but thousands labored as teamsters, boatmen, and in skilled crafts. Numerous slave women became cooks, seamstresses, dairy maids, and personal servants. The son of George Mason, one of Virginia's leading planters and statesmen, recorded that his father's slaves included "coopers, sawyers, blacksmiths, tanners, shoemakers, spinners, weavers, knitters, and even a distiller." Slavery was common on small farms as well as plantations; nearly half of Virginia's white families owned at least one slave in 1770. Because there is little "economy of scale" in tobacco growing—that is, enlarging the size of the producing unit does not lower the costs and maximize productivity—Chesapeake plantations tended to be smaller than in the Caribbean and daily interactions between masters and slaves were more extensive (Foner 2006, 115–16).

Slavery laid the foundation for the consolidation of the Chesapeake elite, a landed gentry that, in conjunction with merchants who handled the tobacco trade and lawyers who defended the interests of slaveholders, dominated the region's society and politics. Meanwhile, even as the consumer revolution improved the standard of living of lesser whites, their long-term economic prospects diminished. As slavery expanded, planters engrossed the best lands and wealth among the white population became more and more concentrated. Slavery transformed Chesapeake society into an elaborate hierarchy of degrees of freedom. At the top stood large planters, below them lesser planters and landowning yeoman, and at the bottom a large population of convicts, indentured servants, tenant farmers (who made up half the white households in 1770), and, of course, the slaves (Foner 2006, 116–17).

With the consolidation of a slave society in the Chesapeake, planters filled the law books with measures enhancing the master's power over his human property and restricting blacks' access to freedom. Race took on more and more importance as a line of social division. Whites increasingly considered free blacks dangerous and undesirable. They lost the right to employ white servants and to bear arms, were subjected to special taxes, and could be punished for striking a white person, whatever the cause. In 1723, Virginia revoked the voting privileges of property-owning free blacks. When the Lords of Trade in London asked Virginia's governor to justify discriminating among "freemen, merely upon account of their complexion," he responded that "a distinction ought to be made between their offspring and descendents of an Englishman, with whom they never were to be accounted equal." Because Virginia law required that freed slaves be sent out of the colony, free blacks remained only a tiny part of the population—less than 4 percent in 1750. "Free" and "white" had become virtually identical (Foner 2006, 117).

Slavery in the Carolinas and Georgia

Further south, a different slave system based principally on rice production emerged in South Carolina and Georgia. The Barbadians, who initially settled in South Carolina in the 1670s, were quite familiar with African slavery, but their first victims were the area's native population, many of whom they enslaved and sent to the West Indies. The early Carolina economy focused on the export to the Caribbean of Indian slaves and to England of deerskins and furs obtained from the Indians.

As in early Virginia, frontier conditions allowed leeway to the colony's small population of African-born slaves, who farmed, tended livestock, and were initially allowed to serve in the militia to fight the Spanish and Indians. As in Virginia, the introduction of a marketable staple crop—in this case rice—led directly to economic development, the large-scale importation of slaves, and a growing divide between white and black. South Carolina was the first mainland colony to achieve a black majority. By the 1730s (by which time North Carolina had become a separate colony), two-thirds of its population was black. In the 1740s, another staple, indigo (a crop used in producing blue dye), was developed. Like rice, indigo required large-scale cultivation and was grown by slaves (Foner 2006, 117).

Ironically, it was Africans, familiar with the crop at home, who taught English settlers how to cultivate rice, which then became the foundation of South Carolina slavery and of the wealthiest slave-owning class on the North American mainland. Since rice production requires considerable capital investment to drain swamps and create irrigation systems, it is economically advantageous for rice plantations to be as large as possible. Thus, South Carolina planters owned far more land and slaves than their counterparts in Virginia. Moreover, since mosquitoes bearing malaria (a disease to which Africans had developed a partial immunity) flourished in the watery rice fields, planters tended to leave plantations under the control of overseers and the slaves themselves (Foner 2006, 117–18).

In the Chesapeake, field slaves worked in groups under constant supervision. Under the "task" system that developed in eighteenth-century South Carolina, individual slaves were assigned daily jobs, the completion of which allowed them time for leisure or to cultivate crops of their own. In 1762, one rice district had a population of only 76 white males among 1,000 slaves. Fearful of the ever-increasing population majority, South Carolina's legislature took steps to encourage the immigration of "poor Protestants," offering each newcomer a cash bounty and occasionally levying taxes on slave imports, only to see such restrictions overturned in London. By 1770, the number of South Carolina slaves had reached 100,000, well over half the colony's population.

Rice cultivation also spread into Georgia in the mid-eighteenth century. The colony was founded in 1733 by a group of philanthropists led by James Oglethorpe, a wealthy reformer whose causes included improved conditions for imprisoned debtors and the abolition of slavery. Oglethorpe hoped to establish a haven where the "worthy poor" of England could enjoy economic opportunity. The government in London supported the creation of Georgia to protect South Carolina against hostile Indians and the Spanish in Florida. Initially, the trustees who controlled the colony banned the introduction of both liquor and slaves, leading to continual battles with settlers, who desired both. By the 1740s, Georgia offered the spectacle of colonists pleading for the "English liberty" of self-government so they could enact laws introducing slavery. In 1751, the trustees surrendered the colony to the Crown. The colonists quickly won the right to an elected assembly, which met in Savannah, Georgia's main settlement. It repealed the ban on slavery (and liquor), as well as an early measure that had limited land holdings to 500 acres. Georgia became a miniature version of South Carolina. By 1770, 15,000 slaves labored on its coastal plantations (Foner 2006, 118).

Slavery in the Northern Colonies

Compared to the plantation regions, slavery was far less central to the economies of New England and the Middle colonies, where small farms predominated. Slaves represented only a minor part of these colonies' populations, and it was unusual for even rich families to own more than one slave. Sections of Rhode Island and Connecticut did develop large tobacco and livestock farms employing slave labor, but northern slaves were far more dispersed than in the southern colonies. Nevertheless, slavery was not entirely marginal to northern colonial life. Slaves worked as farmhands, in artisan shops, in loading and unloading ships, and as personal servants. In the early eighteenth century, about three-quarters of the urban elite owned at least one slave. But with slaves so small a part of the population that they seemed to pose no threat to the white majority, laws were less harsh than in the plantation colonies. In New England, where in 1770 the 17,000 slaves represented less than 3 percent of the region's population, slave marriages were recognized in law and slaves could bring suits in court and testify against whites—rights unknown elsewhere in the colonies.

Slavery had been present in New York from the earliest days of Dutch settlement. With white immigration lagging behind that of Pennsylvania, the colony's Hudson Valley landlords, small farmers, and craftsmen continued to employ considerable amounts of slave labor in the eighteenth century. As New York City's role in the slave trade expanded, so did slavery in the city. In 1746, its 2,440 slaves amounted to one-fifth of New York City's total population. Some 30 percent of its laborers were slaves, a proportion second only to Charleston among American cities. Most were domestic workers, but slaves worked in all sectors of the economy. In 1770, about 27,000 slaves lived in New York and New Jersey, 10 percent of their total population. Slavery was also a significant presence in Philadelphia, although the institution stagnated after 1750 as artisans and merchants relied increasingly on wage laborers, whose numbers were augmented by population growth and the completion of the terms of indentured servants. In an urban economy that expanded and contracted according to the ups and downs of international trade, many employers concluded that relying on wage labor, which could be hired and fired at will, made more economic sense than a long-term investment in slaves. Still, by the time of the American Revolution, slaves still worked on New Jersey and Pennsylvania farms and on "iron plantations" in the Pennsylvania countryside (Foner 2006, 119).

THE BEGINNING AFRICAN AMERICAN CULTURE

The nearly 300,000 Africans brought to the mainland colonies during the eighteenth century were not a single people. They came from different cultures, spoke different languages, and practiced many religions. The term "melting pot," which describes the forging of a new cultural identity from diverse Old World backgrounds, is usually applied to European immigrants who settled in America. But the greatest melting pot in American history was a making of the African American people from the diverse Africans transported in the Middle Passage. Slavery threw together individuals who would never otherwise have encountered one another and who had never considered their color or residence on a single continent a source of identity or unity. Their bond was not kinship, language, or even "race," but slavery itself. The process of creating a cohesive culture and community took many years, and proceeded at different rates in different regions. But by the nineteenth century, slaves no longer identified themselves as Ibo, Ashanti, Yoruba, and so on, but as "African." In music, art, folklore, language, and religion, their cultural expressions emerged as a synthesis of African traditions, European elements, and new conditions in America.

For most of the eighteenth century, the majority of American slaves were African by birth. For many years, they spoke African languages and practiced African religions. Advertisements seeking information about runaways often described them by African origin ("young Gambia negro" or "new Banbara negro fellow") and spoke of their bearing on their bodies "country marks"—visible signs of ethnic identity in Africa. Indeed, during the eighteenth century there was a "re-Africanization" of black life in the colonies, as the earlier creoles (slaves born in the New World) came to be outnumbered by large-scale importations from Africa. Compared to the earliest generation of slaves, the newcomers worked harder, died earlier, and had less access to freedom. Charles Hansford, a white Virginia blacksmith, noted in a 1753 poem that he had frequently heard slaves speak of their desire to "reenjoy" life in Africa:

I oft with pleasure have observ'd how they
Their sultry country's worth strive to display
In broken language, how they praise their case
And happiness when in their native place…
How would they dangers court and pain endure
If to their country they could get secure! (Foner 2006, 119–20)

African American Cultures in the Colonies

By the mid-eighteenth century, the three slave systems in British North America had produced distinct African American cultures. In the Chesapeake, because of a more healthful climate, the slave population began to reproduce itself by 1740, creating a more balanced sex ratio than in the seventeenth century and making possible the creation of family-centered slave communities. Because of the small size of most plantations and the large number of white yeoman farmers, slaves here were continuously exposed to white culture. They soon learned English, and many were swept up in the religious revivals known as the Great Awakening (Foner 2006, 120–21).

In South Carolina and Georgia, two very different black societies emerged. On the rice plantations, slaves lived in extremely harsh conditions and had a low birthrate throughout the eighteenth century, making rice production dependent on continued slave imports from Africa. The slaves seldom came into contact with whites, and enjoyed far more autonomy than elsewhere in the colonies. The larger structure of their lives was governed by slavery, but they were able to create an African-based culture. They constructed African-style houses, chose African names for their children, and spoke Gullah, a language that mixed various African roots and was unintelligible to most whites. Despite a continuing slave trade in which young single males predominated, slaves slowly created families and communities that bridged generations (Foner 2006, 121–22).

The experience of slaves who labored in Charleston and Savannah as servants and skilled workers was quite different. These assimilated more quickly into Euro-American culture, and sexual liaisons between white owners and slave women produced the beginnings of a class of free mulattos. In the northern colonies, where slaves were owned in small units and lived in close proximity to whites, they enjoyed more mobility and access to the mainstream of life than further south. But they had fewer opportunities to create a stable family life or a cohesive community (Foner 2006, 122).

Resistance to Slavery

The common threads that linked these regional African American cultures were the experience of slavery and the desire for freedom. Throughout the eighteenth century, blacks risked their lives in efforts to resist enslavement. Colonial newspapers, especially in the southern colonies, were filled with advertisements for runaway slaves. Most fugitives were young African men who had arrived recently. In South Carolina and Georgia, they fled to Florida, to uninhabited coastal and river swamps, or to Charleston and Savannah, where they might pass for free. In the Chesapeake and Middle colonies, fugitives tended to be slaves familiar with the white culture, who, as one advertisement put it, could "pretend to be free."

What Edward Trelawny, the colonial governor of Jamaica, called "a dangerous spirit of liberty" was widespread among the New World's slaves. The eighteenth century's first slave uprising occurred in New York City in 1712, when a group of slaves set fire to houses on the outskirts of the city and killed the first nine whites who arrived on the scene. Subsequently, 18 conspirators were executed; some were tortured and burned alive in a public spectacle meant to intimidate the slave population. During the 1730s and 1740s, continuous warfare involving European empires and Indians opened the door to slave resistance. In 1731 a slave rebellion in Louisiana, where the French and Natchez Indians were at war, temporarily halted efforts to introduce the plantation system in that region. There were uprisings throughout the West Indies, including the Virgin Islands, owned by Denmark, and the French island of Guadalupe. On Jamaica, a major British center of sugar production, communities of fugitive slaves known as "maroons" waged outright warfare against British authorities until a treaty in 1739 recognized their freedom, in exchange for which they agreed to return future escapees (Foner 2006, 122).

On the mainland, slaves seized the opportunity for rebellion offered by the War of Jenkins' Ear, which pitted England against Spain. In September 1739, a group of South Carolina slaves, most of them recently arrived from the Congo where some, it appears, had been soldiers, seized a store containing numerous weapons at the town of Stono. Beating drums to attract followers, the armed band marched southward toward Florida, burning houses and barns, killing whites they encountered, and shouting "Liberty." (Florida's supposedly tyrannical Spanish rulers offered "Liberty and Protection" to fugitives from the British colonies.) The group eventually swelled to some 100 slaves. After a pitched battle with the colony's militia, the rebels were dispersed. Some 40 were killed, but others managed to reach Florida, where in 1740 they were armed by the Spanish to help repel an attack on St. Augustine by a force from Georgia. The Stono Rebellion led to a severe tightening of the South Carolina slave code and the temporary imposition of a prohibitive tax on imported slaves. In 1741 a group of New York City slaves, evidently assisted by a few whites, plotted to burn part of the city, seize weapons, and either turn New York over to Spain, or set sail for the Spanish islands. The plot was uncovered and 35 conspirators were executed (Foner 2006, 122–23).

Dramatic events like revolts, along with the constant stream of runaways, disproved the idea, voiced by the governor of South Carolina, that "slaves had no notion of liberty." In eighteenth-century America, dreams of freedom knew no racial boundary. When white colonists rose in rebellion against British rule, tens of thousands of slaves would seize the opportunity to strike for their own liberty (Foner 2006, 123–24).

COLONIAL INDUSTRY

Besides the 80 percent who tilled the soil, perhaps 5 percent of the colonial workforce were full-time craftsmen, "mechanicks," or artisans in the cities, towns, and villages. In addition, thousands of rural colonists produced finished or semifinished goods at home for sale on a part-time basis. Almost all colonial manufactured goods were produced by hand. In many colonial farmhouses women spun wool and linen fiber into yarn and then wove it on hand looms into cloth. Farm women also molded candles from wax extracted from bayberries. They churned butter and made cheese with milk from the family cow, and pressed cider from apples and perry from pears. Rural men also used the home as a workshop. Farmers often devoted the long winter evenings to carving ax handles, gunstocks, and other wooden products (Unger 1989, 86).

In the towns, full-time craftsmen using hand tools—knives, chisels, augers, saws, and planes—manufactured items for their customers in their workshops. Every colonial town of any size had a long list of craftsmen. Coopers made the barrels that packaged colonial flour, tobacco, sugar, rum, and other bulk goods. Wheelwrights turned out wheels for carts, wagons, and coaches. Cordwainers produced shoes; blacksmiths made nails, horseshoes, shovels, and edged tools; tanners produced the leather that others made into shoes, aprons, saddles, and other items. Every growing colonial village needed housing, and the demand was met by carpenters, masons, bricklayers, and various laborers. As communities became richer and more populous, colonial craftspeople became ever more skilled. By the eve of the Revolution they were producing beautiful silverware and furniture. In addition, the small cities were full of barbers, wig makers, tailors, milliners, and other skilled providers of goods and services for the prosperous (Unger 1989, 86–87).

In only a very few industries do we encounter something resembling a modern factory with hired labor, expensive machinery, and the separation of the workplace from the home. With waterpower widely available, mills with waterwheels and machinery, often made of wood, sprang up in every colony to do especially heavy work. Few settled localities existed where there were no sawmills to cut boards and gristmills to grind grain into flour. The millers of grain, particularly, were often the community's news center. In many rural areas millers also ran general stores where they sold the produce they acquired from the farmers who paid them in "country pay" to mill their grain. A few of the most successful grain millers—"merchant millers"—established large-scale operations and overseas markets for their flour (Unger 1989, 87–88).

COMMERCE

Commerce or trade was the final and, next to agriculture, the most important leg of the colonial economy. Ultimately, it was foreign markets that drove the colonial economy. Even though a fast-growing population at home consumed most of what local farmers and artisans produced, foreign buyers provided the means for raising the colonial economy above the subsistence level. Commerce sustained the bread colonies, which relied on the Caribbean market to absorb their surplus grain and provisions. Without markets in Britain and Europe, tobacco, rice, indigo, and naval-store colonies would have been far poorer. Both overseas and intercolony trade supported the shipbuilding, sail-making, and rope-making industries and encouraged flour milling, lumbering, barrel-making, and iron manufacturing (Unger 1989, 88).

Exports helped Americans pay for the sophisticated luxury goods they could not produce themselves. The better grades of paper, hardware, pottery, and cloth, as well as wines, the latest books, fine furniture, and scientific instruments, could only come from Britain, the Continent, or the Wine Islands. To pay for these goods, Americans needed coin or commercial credit from sales of their own goods abroad. Unfortunately, colonial trade relations were out of balance geographically. England needed the tobacco, rice, indigo, and naval stores of the Chesapeake region and the Carolinas; these colonies, accordingly, easily earned the credits needed to pay for what they imported. The English did buy some pig iron, lumber, furs, and ships from the northern colonies, but the major northern products—fish, grain, and cattle—were not wanted in Britain because it produced its own. Because each year the northern colonies bought more from Britain than they sold to it, they were forced to find other customers whose purchases would offset the British deficit (Unger 1989, 88–89).

The Caribbean served this role. In the West Indies black slaves, working for several thousand rich European planters, concentrated all their energies on growing sugar cane for the European market. The islanders' total neglect of almost everything but sugar made them excellent customers for cheap food, horses, lumber, and barrels from the northern colonies. By 1700, hundreds of vessels from northern ports sailed to the islands each year; the ships were laden with provisions, flour, and dried fish to feed the slaves and their masters, and with lumber, hoops, and staves to build structures and to package sugar, rum, and molasses.

Once he had found buyers for his miscellaneous cargo, the New England or Middle-colony merchant accepted payment in several forms. One form was coin, and the colonies acquired a wide assortment of shillings, doubloons, guilders, and pieces of eight in the West Indies. But molasses and sugar were also acceptable. These products could be consumed directly at home, or the molasses could be converted into rum, and in that form traded with the Indians for furs or exported overseas. The trader could also accept bills of exchange on England. These were certificates that the planters received when they sold their sugar in England, and they represented credits that could be used like cash to pay for English goods or to pay debts to English creditors. With their holds full of molasses and perhaps a little West Indian cotton or citrus fruit, and the captain's strongbox stuffed with coin or bills of exchange, the ship sailed home to Boston, Newport, New York, or Philadelphia (Unger 1989, 89).

The slave trade also helped make up the trade deficit with the mother country. Most of the slaves carried from Africa to the Americas in the eighteenth century were transported by the French, the British, or the Dutch. But some were carried by slavers out of Boston and Newport. The typical New England slave trader sent a small vessel to the west coast of Africa with a cargo of rum distilled from West Indies molasses. On the African coast the Yankee captain rendezvoused with a trader from London or Bristol and exchanged some rum for British goods, such as iron, cloth, gunpowder, cheap jewelry, and glass beads. With this mixed stock he bought slaves from an African middleman and loaded the human cargo aboard his vessel. He then returned to the Caribbean where he sold them for the same coin, molasses, or bills of exchange that other cargo brought. Only a small proportion of the slaves removed from Africa were transported to the Carolinas or the Chesapeake on the mainland (Unger 1989, 89–90).

Over the years the ingenious merchants of the northern colonies developed many other trading route patterns. As the eighteenth century advanced, merchants from New York and Philadelphia, especially, began to invade the direct carrying trade with Britain, a route that British merchants had previously monopolized. The intercolonial coastal trade was also profitable. Hundreds of sloops, schooners, brigs, and other small sailing ships plied the waters along the Atlantic bringing Philadelphia flour to Charleston or Salem, or Yankee codfish to Annapolis or Savannah. Ships from the northern colonies also traded with Spain and Portugal—handling most of the rice, fish, flour, and other commodities that went to those places, and the wine, salt, and cash that came back. Colonial merchants also made money insuring vessels embarking on long voyages, a business later taken over by marine insurance companies (Unger 1989, 90).

THE CITY IN AMERICA

Britain's mainland colonies were overwhelmingly agricultural. Nine-tenths of the population resided in rural areas and made their livelihood from farming. Colonial cities like Boston, New York, Philadelphia, and Charleston were quite small by European standards, serving mainly as gathering places for agricultural goods and for imported items to be distributed to the countryside. Nonetheless, the expansion of trade encouraged the rise of port cities, home to a growing population of colonial merchants and artisans (skilled craftsmen) as well as an increasing number of the poor. In 1770, with some 30,000 inhabitants, Philadelphia was "the capital of the New World," at least its British component, and, after London and Liverpool, the empire's third busiest port. The financial, commercial, and cultural center of British America, its growth rested on the economic integration with the rich agricultural region nearby. Philadelphia merchants organized the collection of farm goods, supplied rural storekeepers, and extended credit to customers. They exported flour, bread, and meat to the West Indies and Europe (Foner 2006, 108–9).

THE TRADES

The city was also home to a large population of furniture makers, jewelers, and silversmiths serving wealthier citizens, and hundreds of lesser artisans like weavers, blacksmiths, coopers, and carpenters. The typical artisan owned his own tools and labored in a small workshop, often his home, assisted by family members and young journeymen and apprentices learning the trade. The artisan's skill, which set him apart from the common laborers below him in the social scale, was the key to his existence, and gave him a far greater degree of economic freedom than those dependent on others for a livelihood. "He that hath a trade, hath an estate," wrote Benjamin Franklin, who had worked as a printer before achieving renown as a scientist and statesman (Foner 2006, 109).

Despite the influx of British goods, American craftsmen benefited from the expanding consumer market. Most journeymen enjoyed a reasonable chance of rising to the status of master and establishing a workshop of their own. Some achieved remarkable success. To cite one example: born in New York City in 1723, Myer Myers, a Jewish silversmith of Dutch ancestry, became one of the city's most prominent artisans. Myers produced jewelry, candlesticks, coffeepots, tableware, and other gold and silver objects for the colony's elite, as well as religious ornaments for synagogues and Protestant churches in New York and nearby colonies. He used some of his profits to acquire land in New Hampshire and Connecticut. Myers's career reflected the opportunities colonial cities offered to skilled men of diverse ethnic and religious backgrounds (Foner 2006, 109–10).

THE ELITE OF COLONIAL AMERICA

Most free Americans benefited from economic growth, but, as colonial society matured, an elite emerged that, while neither as powerful nor as wealthy as the aristocracy of England, increasingly dominated politics and society. Indeed, the gap between rich and poor grew rapidly in the eighteenth century. In New England and the Middle colonies, expanding trade made possible the emergence of a powerful upper class of merchants, often linked by family or commercial ties to great trading firms in London. There were no banks in colonial America. Credit and money were in short supply, and mercantile success depended on personal connections as well as business talent. By 1750, the colonies of the Chesapeake and the Lower South were dominated by slave plantations producing staple crops, especially tobacco and rice, for the world market. Here, great planters accumulated enormous wealth. The colonial elite also included the rulers of proprietary colonies like Pennsylvania and Maryland (Foner 2006, 110–11).

America had no titled aristocracy as in Britain (although one aristocrat, Lord Thomas Fairfax, did take up residence in Virginia in 1734). It had no system of legally established social ranks or family pedigrees stretching back to medieval times. Apart from the DeLanceys, Livingstons, and van Rensselaers of New York, the Penn family in Pennsylvania, and a few southern planters, it had no one whose landholdings, in monetary value, rivaled those of the British aristocracy. But throughout British America, men of prominence controlled colonial government. In Virginia, the upper class was so close-knit and intermarried so often that the colony was said to be governed by a "cousinocracy." Members of the gentry controlled the vestries, or local governing bodies, of the established Anglican Church, dominated the county courts (political as well as judicial institutions that levied taxes and enacted local ordinances), and were prominent in Virginia's legislature. In the 1750s, seven members of the same generation of the Lee family sat in the House of Burgesses.

Eighteenth-century Virginia was a far healthier environment than in the early days of settlement. Planters could expect to pass their wealth down to the next generation, providing estates for their sons and establishing family dynasties. Nearly every Virginian of note achieved prominence through family connections. The days when self-made men could rise into the Virginia gentry were long gone; by 1770, nearly all upper-class Virginians had inherited their wealth. Thomas Jefferson's grandfather was a justice of the peace (an important local official), militia captain, and sheriff, and his father was a member of the House of Burgesses. George Washington's father, grandfather, and great-grandfather had been justices of the peace. The Virginia gentry used its control of provincial government to gain possession of large tracts of land as western areas opened for settlement. Grants of 20,000 to 40,000 acres were not uncommon. Robert "King" Carter, a speaker of the House of Burgesses, acquired 300,000 acres of land and 1,000 slaves by the time of his death (Foner 2006, 111).

THE ANGLICIZATION OF THE UPPER CLASS IN AMERICA

Wealthy Americans tried to model their lives on British etiquette and behavior. Somewhat resentful at living in provincial isolation—"at the end of the world," as one Virginia aristocrat put it—they sought to demonstrate their status and legitimacy by importing the latest London fashions and literature, sending their sons to Britain for education, and building homes equipped with fashionable furnishings modeled on the country estates and townhouses of the English gentry. Their residences included large rooms for entertainment, display cases for imported luxury goods, and elaborate formal gardens. Some members of the colonial elite, like George Washington, even had coats of arms designed for their families, in imitation of English upper-class practice. Desperate to follow an aristocratic lifestyle, many planters fell in debt. William Byrd III lived so extravagantly that by 1770 he had accumulated a debt of £100,000, an amount almost unheard of in England or America. But so long as the world market for tobacco thrived, so did Virginia's gentry (Foner 2006, 111–12).

Throughout the colonies, elites emulated what they say was England's balanced, stable social order. Liberty, in their eyes, meant, in part, the power to rule—the right of those blessed with wealth and prominence to dominate over others. They viewed society as a hierarchical structure in which some men were endowed with greater talents than others and destined to rule. The social order, they believed, was held together by webs of influence that linked patrons and those dependent on them. Each place in the hierarchy carried with it different responsibilities, and one's status was revealed in dress, manners, and the splendor of one's home. "Superiority" and "dependence," as one colonial newspaper put it, were natural elements of any society. An image of refinement served to legitimate wealth and political power. Colonial elites prided themselves on developing aristocratic manners, cultivating the arts, and making productive use of leisure. Indeed, on both sides of the Atlantic, elites viewed work as something reserved for common folk and slaves. Freedom from labor was the mark of a gentleman (Foner 2006, 113).

THE MIDDLING ORDER IN AMERICA

The large majority of free Americans lived between the extremes of wealth and poverty. Along with racial and ethnic diversity what distinguished the mainland colonies from Europe was the wide distribution of land and the economic autonomy of most ordinary free families. The anonymous author of the book *American Husbandry*, published in 1775, reported that "little freeholders who live upon their own property" made up "the most considerable part" of the people, especially in the northern colonies and the nonplantation parts of the South. Altogether, perhaps two-thirds of the free male population were farmers who owned their own land. England, to be sure, had no class of laborers as exploited as American slaves, but three-fifths of its people owned no property at all.

By the eighteenth century, colonial farm families viewed land ownership almost as a right, the social precondition of freedom. They strongly resented efforts, whether by Native Americans, great landlords, or colonial governments, to limit their access to land. A dislike of personal dependence and an understanding of freedom as not relying on others for a livelihood sank deep roots in British North America. These beliefs, after all, accorded with social reality—a wide distribution of property that made economic independence part of the lived experience of large numbers of white colonists (Foner 2006, 114).

THE POOR IN AMERICA

Poverty emerged as a visible feature of eighteenth-century colonial life. Although not considered by most colonists part of their society, the growing number of slaves lived in impoverished conditions. Among free Americans, poverty was hardly as widespread as in Britain, where in the early part of the century between one-quarter and one-half of the people regularly required public assistance. But as the colonial population expanded, access to land diminished rapidly, especially in long-settled areas. In New England, which received few immigrants, the high birthrate fueled population growth. With the supply of land limited, sons who could not hope to inherit farms were forced to move to other colonies or to try their hand at a trade in the region's towns. By midcentury, tenants and wage laborers were a growing presence on farms in the Middle colonies.

In colonial cities, the number of wage earners having no property subsisting at the poverty line steadily increased. In Boston, one-third of the population in 1771 owned no property at all. In rural Augusta County, carved out of Virginia's Shenandoah Valley in 1738, land was quickly engrossed by planters and speculators. By the 1760s, two-thirds of the county's white men owned no land and had little prospect of obtaining it unless they migrated farther west. Taking the colonies as a whole, half of the wealth at midcentury was concentrated in the richest 10 percent of the population (Foner 2006, 113).

Attitudes and policies toward poverty in colonial America mirrored British precedents. The better-off colonists generally viewed the poor as lazy, shiftless, and responsible for their own plight. Both rural communities and cities did accept responsibility for assisting their own. But to minimize the burden on taxpayers, poor persons were frequently set to labor in workhouses, where they produced goods that reimbursed authorities for their upkeep. Their children were sent to work as apprentices in local homes or workshops. Most communities adopted stringent measures to "warn out" unemployed and propertyless newcomers who might become dependent on local poor relief. This involved town authorities either expelling the unwanted poor from an area or formally declaring certain persons ineligible for assistance. In Essex County, Massachusetts, the number of poor persons warned out each year rose from 200 in the 1730s to 1,700 in the 1760s. Many were members of families headed by widowed or abandoned women (Foner 2006, 114).

Political Life

THE STRUCTURE OF COLONIAL POLITICS

British immigrants to America brought with them the political ideas, customs, and practices of the mother country. On the local level, for example, both the town in New England and the vestry in the South were political units transplanted from England. The colonial sheriff and the justice of the peace resembled the same officials in England, and there was an obvious parallel between Parliament and the colonial legislatures. Beginning with Virginia in 1619, settlers were empowered one-by-one to set up legislatures in each of the British mainland colonies. These were given different names in different colonies (General Court, House of Burgesses, General Assembly), but they served the colonies much as Parliament served England. And like Parliament, most colonial legislatures had a lower and an upper house (Unger 1989, 66).

Each colony also had a chief executive, the equivalent of the Crown. In royal colonies (in 1776, New Hampshire, Massachusetts, New York, New Jersey, Maryland, Virginia, North Carolina, South Carolina, and Georgia) the governor was appointed by the British sovereign. When the royal governor—or, more likely, his deputy the lieutenant governor—came to America, he represented the royal power. In proprietary colonies (Pennsylvania and Delaware, and New York, Maryland, and the Carolinas before they became royal colonies) the governor represented the proprietor, the man who held the original charter. Only in Connecticut and Rhode Island was the governor elected by the local enfranchised citizens. No matter how he was chosen, the governor usually could veto acts by the colonial legislature, much as, in theory at least, the English sovereign could veto acts of Parliament (Unger 1989, 66–67).

As time went on, the governors were forced to give up some of their power to the assemblies. At first British authorities refused to consider these bodies true legislatures. One British official described them as only "so many Corporations at a distance, invested with an Ability to make Temporary By Laws for themselves." But in time, encouraged by the growing colonial population, the distance from England, the official British policy of ignoring restrictions on the colonies to allow them to prosper and thus enrich England, and British inefficiency in administering colonial affairs, the colonial legislatures expanded their powers. Early in the eighteenth century the colonial lower houses forced the governors to allow them to debate freely without executive interference, to judge the qualifications of their own members, to exclude crown officials from their deliberations, and to meet when and for as long as they wished. Most important, they forced the governors to surrender to them "the power of the purse."

Gaining the right to control the purse strings required a long battle. When representative government was first established in the colonies, governors received an annual lump-sum appropriation from the legislature. The governors disbursed these funds as they saw fit. The system gave them the power to pursue policies without any check by the legislature. By the middle of the eighteenth century, however, the assemblies had stopped the lump-sum grants; instead, they earmarked appropriations for specific periods. They also began to pay the governors' salaries for a single year—and only at the end of it—to guarantee their good behavior. In several colonies these efforts to control the governors touched off furious battles. By the 1750s most of these struggles had been decided in favor of the legislatures (Unger 1989, 67).

By the end of the colonial era the provincial assemblies were miniature parliaments exercising almost all the hard-won rights of their English model. These rights included control over taxation, expenditures, the salaries of officials, military and Indian affairs, and everything that affected religion, education, and what we today would call welfare. The legislatures' power was not unlimited, however. Governors continued to veto laws they opposed. And even if the governor approved a measure, it could be "disallowed" by the Privy Council in England. Especially during the early years of the eighteenth century, however, the English government did little to restrain the colonial assemblies, and during this period of "salutary neglect" much real political power slipped into the hands of the colonists (Unger 1989, 67–68).

REPRESENTATION AND VOTING IN AMERICA

Although the framework of the colonial governments was similar to that of Great Britain, political power was more widely diffused in the colonies than in Britain. The upper houses of the colonial legislatures, the councils, were appointed and were composed of landed gentlemen, prosperous lawyers, and rich merchants. But membership was not hereditary, as it was in the English House of Lords.

More significant was the broad electorate that chose the colonial lower houses. By modern standards the colonial franchise was severely limited. Slaves, of course, could not vote, nor could indentured servants. At times some women exercised considerable public authority. For example, in the seventeenth century "Mistresse Margaret Brent, Spinster" ran her own plantation, and, as executor of the estate of Leonard Calvert, proprietor of Maryland, virtually ruled that colony's affairs. But neither Margaret Brent nor any other colonial female had the right to vote. Even free white adult males had to own land or buildings, or lease them for a long period, to qualify as voters. This was only one side of the picture, however. Property was so easily acquired and so widely held in America that the election laws disqualified relatively few free adult males from voting. Furthermore, traditional requirements linking church membership to voting privileges were undermined by the growing diversity of religions in America. The end result was a relatively broad franchise. In various Rhode Island towns in the mid-eighteenth century, for example, 60 percent or more of the total adult male population was eligible to vote. In some New York districts up to 80 percent of all adult males had the vote. In Massachusetts, according to Governor Thomas Hutchinson, "anything with the appearance of a man" was allowed to exercise the franchise.

Though many ordinary people could vote, colonial officials were not carbon copies of the colonial population. Members of the colonial assemblies were richer, better educated, and of higher status than their constituents. Colonial voters generally preferred to send the local squire, a prosperous merchant, or a rising young lawyer to the House of Burgesses or House of Assembly rather than a farmer, craftsman, or shopkeeper. Local officials were also members of the elite southern vestries who appointed their own successors and were dominated by the "squirearchy" of rich planters, who resembled the country gentry of England. Nor was the town, the basic governmental unit in New England, entirely democratic. Virtually all adult males participated in the town meeting, but town leaders were generally men of high status.

On the other hand, political deference—submission to social superiors—was decidedly weaker in America than in England. When the local squire ran for office, he had to campaign hard and promise to abide by the wishes of the voters. Candidates were expected to act democratically and avoid aloofness. During election campaigns they made it a point to mingle with the electors and offer them "refreshment," liquid or otherwise. When Colonel George Washington of Fairfax County, Virginia, ran for the House of Burgesses in 1774, he provided the "Freeholders and Gentlemen" of Alexandria with a "hogshead of Toddy." After the returns were in, he threw a victory party for the voters that was "conducted with great harmony."

Nor did representatives—once elected—forget their constituents. Colonial legislatures and governments were surprisingly responsive to the will of the citizens. By 1705, for example, the Virginia legislature had acquired a Propositions and Grievances Committee that received public petitions proposing new laws. The committee would pass along the worthiest suggestions to the House of Burgesses, which then could act as it saw fit.

In sum, colonial government was neither predominantly democratic nor predominantly aristocratic; it displayed both tendencies. Democracy as we know it did not exist anywhere in the seventeenth- and eighteenth-century world, nor was it wanted as a form of government. But as political institutions were transferred from England to America, they were changed in ways that allowed greater popular freedom and self-determination (Unger 1989, 68).

THE AMERICAN REVOLUTION

The Peace of Paris of 1763, which ended the French and Indian War (1754–1763), made Britain the unchallenged worldwide trading empire. The ministry in

London had never before attempted to rule an overseas empire of such size and complexity as the one it had just acquired from France. Although the British had an established military, naval, and colonial administration, it was under great pressure, for the empire had almost instantly outgrown the structure of government (Adams and Vannest 1935, 77) (Pearson 1972, 7).

The struggle with France for North America had required the cooperation of the colonials and the British army to a degree never before experienced. However, the effort was marred by ill feelings created during the initial tactical phases of the conflict. The crown officials felt that they should have been met with gratitude for defending the colonies. Instead, the provincial legislatures resisted their propositions and treated the British military with disdain, ridicule, and even contempt. In this regard the French wars, and the French and Indian War in particular, represent formative episodes in the history and culture of the United States.

British army officers "never tired of reminding one another that the American colonists made the world's worst soldiers." They viewed the colonials as "the dirtiest, most contemptible, cowardly dogs" that could be conceived, who needed to learn "how a war should be fought." Yet many of the initial military successes against the French were directly attributable to the ceaseless determination of the provincial forces raised by the New England colonies. Provincial forces also stopped an army of French regulars from splitting the British colonies in half in 1755 at the battle of Lake George. This victory served to counter the severe psychological impact of the concurrent defeat of General Edward Braddock and his regulars on the Monongahela River, where only the cool response of the Virginia militia and the decisive actions taken by George Washington saved the majority of the survivors from total annihilation. Each success on the battlefield by colonial forces increased their sense of self-importance and lowered the prestige of the royal government and the British military in their eyes (Anderson 1981, 395) (Beard and Beard 1927, 227) (Wahll 1999, 124).

The Crown found the colonials shortsighted, selfish, and even maliciously insubordinate. A British officer wrote, "I have been greatly disappointed by the neglect and supineness of the assemblies of those provinces, with which I am concerned. They promised great matters and have done nothing whereby, instead of forwarding, they have obstructed the service." The

citizens of Massachusetts were particularly incensed by critical comments like these because they had answered every call by the Crown to assault the French with a laudable immediacy. Their frontier settlements bordering Canada had borne the brunt of Indian attacks, abductions, and scalpings. In the final years of the struggle one-third of all the able-bodied males in Massachusetts were in the army, and a large portion of these men died in service of wounds, neglect, or exposure. Public debt in the colony skyrocketed, and local taxes almost doubled (Wahll 1999, 354) (Koebner 1965, 94) (Leach 1986, 25–30).

Although colonial enthusiasm for fighting the French made the failure of British arms seem less disastrous, it would be an error to claim, as many Americans did, that the provincials alone had won North America for the empire. By 1763, both the regulars and the provincials had gained knowledge, discipline, and experience in warfare. However, their mutual antagonism caused respect for royal authority in the colonies to shrink to such a small measure in the interim that Parliament felt the need to exert its full authority to keep the colonists in subjection (Volo and Volo 2003, xiv).

Meanwhile, young King George III allied himself to Prime Minister George Grenville and First Lord of Trade Charles Townshend. Grenville was openly hostile to the colonial governments in America, especially with regard to the strict enforcement of the trade statutes, including the full range of duties and taxes envisioned by Townshend. A "growing interest in colonies as markets rather than as sources of raw materials . . . implied that the colonies would be constrained permanently to buy more than they sold—an economic grievance which did a great deal to link colonial planters and merchants to colonial politicians." Many Anglo-Americans came to fear that they would become perpetual debtors to the financial interests in England, living and dying in poverty regardless of their personal resolve to labor, invest, and save (Robson 1966, 8).

The Grenville program for America astounded the governing classes on both sides of the Atlantic. Yet the ministry believed that the colonials would not seriously resist these changes to their traditional political and economic status. The architects of public change rarely understand beforehand the extent of the economic, social, or political innovations their actions have turned loose. In this case the Crown grossly underestimated the reaction of the American people. Nonetheless, Grenville intended that the laws regulating trade and revenue be enforced to the letter. To that end, he sent British army officers to command the frontier outposts, Royal Navy warships to patrol the American coastline, and an army of petty bureaucrats to collect the revenue and man the government offices. In each of these acts the colonials perceived that they were the targets of imperial condescension, distrust, and animosity.

In this manner the American Revolution, like other civil upheavals before and since, began as a conservative movement calling for a return to former times. The colonials had a powerful case on their side, rooted in the British constitution and established by the precedent of more than a century of colonial self-government. They also had numerous proponents of their position—mostly moderate Whigs—to speak for them in Parliament. However, revolutions often begin by sounding orthodox, traditional, or nostalgic in their rhetoric. Handbills, broadsides, pamphlets, editorials, letters, and petitions circulated throughout the colonies. Speeches were made, sermons were preached, and enthusiastic crowds harangued public officials. In this way an essentially economic dispute between two factions of the same empire evolved into a political and military confrontation that would rip it apart. The increased commerce and contact among the colonies over the eighteenth century also made events and interests in one colony the concern of others so that a British policy directed at one activity—such as regulating and taxing the sugar trade—became the interest of all (Volo and Volo 2003, xv).

WHIGS AND TORIES

Prior to 1764 American colonists had generally accepted the doctrine that Parliament could pass acts regulating trade and imposing duties on imports. They had nullified any act that proved too irritating by smuggling, by producing enumerated goods clandestinely, or by simply ignoring the law. The importance of the reaction to the Stamp Act and Townshend Acts was that they raised to prominence a group of extraordinary radical leaders from within the provinces. After 1764 the voices of this new, more radical group were raised above the normal background of discontent common to the colonial middle classes (Volo and Volo 2003, 53).

During the 1760s colonial newspapers began to identify particular persons or groups as Whigs and Tories based on their positions on the political issues of the day. These appellations were extended from similar ones used in Britain, but they generally failed to describe the true political philosophy of either the Patriots or the Loyalists in America. A colonial newspaper explained that the term *Whig* was first given to the Presbyterians in Scotland who were forced to survive on buttermilk whig—or whey—when they were persecuted by the established church in the seventeenth century. The term *Tory*, applied to the Anglican churchmen, originally referred to Irish highwaymen who lived by plundering innocent travelers. “Whig and Tory, then, are used only with allusion to the originals,” claimed the editor. “Such as trust to our common dictionaries for an explanation, will only deceive themselves” (Callahan 1963, 68).

AGITATORS

The most influential agitators were those whose activities led directly to the Revolution, and they can be divided into two relatively distinct groups—one in the political arena and the other physically active in the streets. The first group attempted to radicalize the political process in the colonies by launching opposition campaigns in the legislatures and by influencing that fraction of the press that was friendly to the American cause. These men manipulated provincial legislation or cast votes meant to confound the ministry in London. Their stock in trade was logical arguments, dignified resolutions, and politely worded petitions. They were generally outspoken and wrote letters, pamphlets, and editorials about the American point of view to marshal political support for the movement among the middle and upper classes of the population. They attacked George III by disparaging his ministers in their speeches and pamphlets "a time-honored way of making the Crown reverse course while still preserving intact the dignity and independence of its sovereignty." Prominent among this group were James Otis, John Dickinson, and Patrick Henry (Schama 2001, 108).

Other radicals took a more physically active role in the conflict by inciting street demonstrations among the working classes or taking to the streets themselves at the head of groups of ruffians known as "the mob." They attempted to hijack the political dispute between the colonies and the parent state for their own ideological or social purposes. Their stock in trade consisted of the rabble and ruffians of the streets, a liberal coat of tar and feathers, and the threat of the torch. The active arm of their efforts was the Sons of Liberty. Notable among these radicals were Samuel Adams and John Hancock in Boston, and Isaac Sears and Alexander McDougall in New York City (Volo and Volo 2003, 55).

Although the political radicals are portrayed and remembered by historians as "founding fathers," the influence on the Revolution of those persons who were willing to "take to the streets" and openly confront the British authorities at the tip of a bayonet cannot be underestimated. The shift from speaking and writing to shouting and shoving was "a startling violation of decorum in an age when body language spoke volumes about authority and its vulnerability." By going beyond humble supplication, the insurgents gave an effective spur to the American cause by evoking a cry of anguish from their intended targets that was heard all the way in London (Schama 2001, 76).

THE LOYALIST PARTY

While companies of armed Patriots were rallying from every part of the country to repel the regulars, thousands of Americans of a more dignified character were practicing their own form of obstinate loyalty to the king. The formation of a Loyalist party, or Tory resistance, has been largely dismissed by generations of American historians as reactionary. Early writers, devoted to portraying the activities of the Patriots as necessary and appropriate in light of the democratic institutions that followed in the wake of the Revolution, simply ignored the existence of widespread support for royal authority among many Americans (Volo and Volo 2003, 58).

In the absence of dynastic disputes, loyalty was the normal and expected condition of colonial society, exhibited by the vast majority of Americans throughout the eighteenth century. As the patriot radicals strove to convert men's opinions to suit a new order of society, Loyalists tended to pursue their lives and business with a quiet but determined allegiance to the continuance of the existing order. Supporting the loyalist cause was the natural conservatism of those who found prosperity under the king. That same conservative spirit undoubtedly dissuaded many Loyalists from taking action against the unbridled mobs that formed about them, and they shuddered at the thought of speaking out too forcefully, lest the "gathering storm . . . should burst on their own heads." It was obvious that the vocal patriot mob would show no mercy to any person who spoke for the king or against the American cause. As a result, the majority of Loyalists "preserved for the most part an arrogant silence toward the arguments of the opposition" and kept their political opinions to themselves (van Tyne 1999, 7).

Loyalists generally came from those elements of colonial society considered to be Tories before 1775. Among these were the colonial officeholders, whose own incomes, and those of their relations and friends, depended on the continuance of the old order. Most of the Anglican clergy had loyalties similar to those of the crown officials. There were also those persons who were naturally conservative in their views, or who were honestly convinced that Parliament had a right to tax the colonies. Finally, there were the factional Tories like the DeLancey family, whose position was simply a reaction to that of their traditional political enemies, the Livingstons, who took the patriot side (Volo and Volo 2003, 59).

TORY RADICALS

It was not in the nature of the most conservative among the Loyalists to act as radicals and agitators. Not until the outbreak of hostilities did a whole new cadre of activists, fearful of being ruled by the mob, arise in support of the Crown. As the siege of Boston progressed through the summer and fall of 1775, many persons who wished to remain neutral were driven from their homes in the countryside by the more radical elements among the rebel Patriots. Timothy Ruggles, chosen as a counselor to Lieutenant General Thomas Gage, was attacked in the night, and his horse had its tail cropped and was painted over its entire body. Israel Williams, an elderly Tory, was tied in a chair by a mob. With the doors and chimney of his house closed, a fire was set in the fireplace, and the poor old man was smoked for several hours before being released. Daniel Leonard, another Tory adviser, avoided the mobs but had several musket balls shot through the windows of his sleeping chamber in the night (Volo and Volo 2003, 59).

Milder methods were also used to display the crowd's displeasure with those deemed Loyalists. A prominent officeholder in Massachusetts, Thomas Oliver, was forced to submit to a public haranguing by a mob of 4,000 people who surrounded his house.

The Reverend Edson was ignored by his congregation when he stood to read a psalm, and they refused to sing with him during the service. Even Sir William Pepperell, son-in-law of the colonial hero from the days of the French and Indian War, was denounced by his neighbors, who vowed to "withdraw all connection, commerce and dealings with him." The judges of the King's Court in Great Barrington were ordered by the Patriots to leave the district, which they immediately did. Persons chosen to serve as jurors in the King's Court refused to appear fearing their names would be published in the American press as enemies of the patriot cause (van Tyne 1999, 39).

Against all of this violence and intimidation, Lieutenant General Thomas Gage issued a proclamation that promised the arrest and prosecution of those found to have participated in antigovernment activities. Yet those persons loyal to the Crown who resided outside the town of Boston soon found themselves also outside Gage's protection, their situation quickly becoming intolerable. Consequently, the city of Boston was soon filled to overflowing with civilians seeking the protection of the army and navy. Here Tory activists canvassed for support up and down King Street, in the homes of well-disposed merchants, or along the wharves (Volo and Volo 2003, 60).

Many of the merchants of Boston had supported the Patriots, opposing the duties imposed by Parliament, because they hoped to increase commercial intercourse within the colonies, and very few refused to sign the boycott agreements. However, after the imposition of the Boston Port Act in 1774, this same body of merchants generally refused to join the Continental Association. Moderates among the Bostonians attempted, at a meeting at Faneuil Hall, to have the Committee of Correspondence censured or dismissed, but their proposals failed to be carried by those assembled there (van Tyne 1999, 32–33).

There followed a campaign of broadsides containing the names of 123 disaffected persons, published by the Patriots, along with the loyalists' occupations and places of business. Stars were placed near the names of those who were not born in America. Tax collectors, treasurers, and government clerks were distinguished by exclamation points. Of the names, 14 were of crown officers, and 63 were merchants and traders. The remainder were portrait painters, lapidaries, coachmakers, jewelers, bookbinders, and other craftsmen who owed their livelihood to the aristocracy. The prominence given to these persons was quite unwelcome (van Tyne 1999, 33–34).

The majority of Boston Loyalists assembled in the coffeehouses of the town, where their numbers were large enough to protect them if they spoke their minds. Nonetheless, they limited their public declarations to tavern talk and anonymous letters in the Tory press. British officials in London gave speeches and made positive statements about the determination of the government to support those who remained loyal to the king. These also appeared in the press. "This encouragement was welcomed by the Tories who as a rule either received no encouragement or, if they did, it was not sufficiently backed up by the British government." When Washington forced the British army to evacuate Boston in 1776, many of the most loyal colonials and their families took ship with them. These Loyalists were deposited in Halifax, Nova Scotia, where they either found transportation to England or remained as residents (Callahan 1963, 65).

Military Life: The Makeup of the American Army

THE MILITIA

For most Englishmen and Americans, "the most noxious tool of impending tyranny" was a standing army. Throughout British history, standing armies had brought increased levels of taxation, repression, or civil strife. By comparison, reliance on a militia for defense was considered a sign of a healthy and vigorous society in which citizens took on the responsibilities of actively safeguarding "property, liberty, and life itself" (Martin and Lender 1982, 8–9).

In America, independent companies of riflemen and rangers patrolled the backwoods areas of the colonies, but a well-regulated and trained militia provided the most practical solution to the defense needs of most settlements. There remains the cherished romantic concept of the militia as a mythical army of self-trained and self-armed warriors springing from the colonial soil in times of trouble. This picture hardly aligns with the facts. The colonial militia system was a carefully constituted organization, established in all the colonies by the middle of the century, and tested in the French and Indian Wars. While less than adequate to substitute for a regular army, the militia was able to defend the settlements, drive back the Indians, and hold open the newly abandoned lands for European acquisition. Such a force might have served before Lexington and Concord, but after 1775 the Revolution changed from a popular uprising into a very real war. The reality of continuing to rely on the militia for the prosecution of a political and social revolution quickly proved a disastrous illusion (Volo and Volo 2003, 100) (Gavin 1996) (Mahon 1958, 254).

A British surgeon at Boston in 1775 wrote of the patriot militia assembled there: "This army . . . is truly nothing but a drunken, canting, lying, praying, hypocritical rabble, without order, subjection, discipline, or cleanliness; and must fall to pieces of itself in the course of three months." An optimistic French spy reported, however, that the militia were "stronger than others thought. It surpasses one's imagination. . . . Nothing frightens them." The young men from the backcountry "were proud of their Indian-like dress and even wore leggings and breechclouts to church." A Tory minister, Jonathan Odell, wrote a poem describing the patriot militia that he saw gathering in New Jersey in 1775 (Commager and Morris 1975, 152–53) (Martin and Lender 1982, 32–33) (Calloway 1999, 18).

From the back woods, half savages came down
And awkward troops paraded every town.
Committees and conventions met by scores:
Justice was banished, Law turned out of doors;
Disorder seemed to overset the land;
Those who appeared to rule, the tumult fanned. (Callahan 1963, 127)

The weaknesses of the militia were obvious when it was used as a regional defense. John Adams wrote disparagingly of the militia raised to defend against Governor Tryon's raid on Connecticut in 1777. "[T]he stupid, sordid, cowardly, terrified country people let them [the British] pass without opposition" (Kwasny 1996, 125).

Ironically, even as the Patriots relied less on the militia and more on Continental regulars, the fighting became "more of a partisan war for which the militia's style of fighting was better suited." A Hessian officer wrote, "In the open field the rebels are not of much count, but in the woods they are redoubtable." A British officer also noted their "agility in running from fence to fence and thence keeping up an irregular, but galling fire on our troops." The constant string of raids and skirmishes that came to characterize the war in New Jersey, in particular, forced the British to maintain their combat readiness at all times in the face of small groups of militia. Outpost duty became continuous for the regulars, and the British could not quietly enjoy their winter quarters even in the cities. A regular noted that "being out almost every day harassed the garrison much." No small group of soldiers or train of provisions was safe outside the British lines. A Scottish officer wrote, "As the rascals are skulking about the whole country, it is impossible to move with any degree of safety without a pretty large escort, and even then you are exposed to a dirty kind of tiraillerie [skirmishing]" (Kwasny 1996, 125–26) (Cumming and Rankin 1975, 145) (Robson 1966, 153).

THE LOCAL MILITIA COMPANY

The heart of the militia was the local company. Company strengths from province to province varied from 70 to 200 men. The companies were in some measure bound by kinship ties, but it was mostly neighbors who served in the same unit. Local command was invested in a captain, subalterns, and sergeants. The officers were usually elected by the men—a facet of the Patriot army that seemingly frustrated many professional army officers. The overall command structure and the level of authority of individual militia leaders generally lacked clear definition, but their authority came from the provincial congress. Traditionally, the militia was prohibited from serving for long periods far from home or outside the colony, and in a largely agricultural and artisanal world that required daily attention, the men remained reluctant to leave their homes in time of danger to fight in other localities. These characteristics of the militia caused great difficulties for Congress when it attempted to establish the authority of the Continental army (for information on this topic see Anderson 1984; Anderson 1981, 395–417; Hirsch 1988, 1187–1212; Mahon 1958, 1676–1794; Morton 1958, 75–82; Shy 1963, 175–185; Radabaugh 1954, 2).

PROVINCIAL FORCES

Most of the colonies had formal provincial units, recruited into regiments, paid by the colony, and established to replace the less formal militia units in major operations. By 1775, provincial forces had become permanent organizations with their own cadre of officers and a fixed chain of command. During the Revolution these provincial forces slowly evolved into state troops and the officers were numbered prominently among those given authority by Congress. However, the changing, patchwork organization of the Patriot army, with its overlapping chains of command, competing systems of supply, and confusing terms of enlistment, posed severe problems for the Patriots throughout the war. Washington actually commanded three different army organizations during his tenure as commander in chief. The first was the Army of Observation, composed of the militia companies that besieged the British in Boston. The second was the Army of the United Colonies with its one-year enlistments, which was soundly defeated by the British in New York in 1776. Its remnants, pursued through New Jersey, when attached to the Continental army were nonetheless able to rout the Hessians at Trenton and the British regulars at Princeton. Finally, there was the Continental army established by the Congress in 1777, with its better organized departments, means of transportation, and ancillary units (Volo and Volo 2003, 102).

Throughout the war the armed forces of the United States would retain components from among the militia, the state forces, and the Continental regulars. Added to these were many local volunteers that turned out as the spirit moved them to be brigaded into temporary formations. Washington decried the reliance on well-disposed, but generally undisciplined and untrained volunteers, considering them no more dependable than "a broken staff" (Ward 1952, 253).

THE CONTINENTAL ARMY

In the fall of 1776, Congress decided to formalize the army structure in an act known as the 88 Battalion Resolves. This number of battalions (actually regiments) was arrived at by estimating the male population of the colonies. The provincial manpower quotas and regimental organization were little changed from those devised by Washington, but the number of regiments established in each state was modified somewhat. The details surrounding the organization of the Continental army thereafter changed constantly, but the basic regimental structure remained throughout the war (Volo and Volo 2003, 102).

In 1777 the organization was increased to 110 infantry regiments. The four regiments of light dragoons authorized in 1776 were retained, but the artillery was reorganized into just four regiments and a single regiment of artillery artificers to provide prepared charges and repair the carriages. The several independent companies of riflemen and rangers from the frontier regions remained active. A corps of engineers was cobbled together, and wagoners, teamsters, provisioners, and a small hospital staff were placed under the Quartermaster's Department. The resulting organization of infantry, dragoons, riflemen, artillery, and ancillary units was to be known as the Continental army (for more information see Schultz 1982).

INFANTRY

Each line regiment had 8 companies of 76 privates, instead of the 10 companies of 56 privates that characterized the British foot regiments. Each company was divided into two platoons commanded by lieutenants. Washington also proposed the creation of 32 field officers and 64 noncommissioned officers (NCOs) per regiment, which would give the men a greater density of leadership than their British counterparts, who had 21 field officers and 48 NCOs per unit. This was thought to improve the deployment and maneuver of the less highly drilled American infantry. Moreover, the regimental commanding officers would remain with their units, while the general officers would act independently. This was not the case in British units, where colonels were often absent and where lieutenant colonels, or majors, were sometimes detached to command brigades. This sometimes left an entire British regiment commanded by a senior captain (Volo and Volo 2003, 103–4).

ARTILLERY

The Continental artillery was under the overall command of Colonel Henry Knox. His ability and foresight in organizing the artillery was remarkable. With only the knowledge acquired by his reading, Knox recommended a basic train of mobile artillery consistent with that used in Europe. He envisioned an entire train of artillery composed of brass pieces, including 100 3-pounders, 50 6-pounders, and 50 12-pounders, plus a smaller number of 18- and 24-pounders for general support and siege work. This was not possible before France entered the war (Volo and Volo 2003, 104–5).

Trained artillery crews were difficult to find. The greatest deficiency in the Continental artillery during the war was in *bombardiers* and *matrosses*. While any group of infantrymen could be drafted to move a piece, working a gun safely required the cooperation of a knowledgeable and qualified team. Shells had to have their fuses carefully timed, and the guns themselves were unforgiving; they could explode if improperly loaded, killing the men nearest them. The gunner needed to know how to vary the angle of the barrel and charge of powder to hit targets at great range. Many gunners were detached from the ships of the navy, where experienced men were more likely to be found. Moreover, artillerymen were a prime target for sharpshooters because of their value to the opposing army (Volo and Volo 2003, 105–6).

During the eighteenth century there was a shift from a battlefield dominated by cavalry to a battlefield dominated by infantry drawn up in massed formations and supported by artillery. The tactic of supporting these infantry with mobile artillery was devised by Gustavus Adolphus of Sweden and was refined by Frederick the Great of Prussia. There was little doubt that the offensive firepower of the infantry supported by improved and more mobile artillery was going to severely inhibit the tactics available to horsemen in the Revolution (Townshend 1997, 23–24).

DRAGOONS

In March 1776, Congress authorized 3,000 horsemen formed into four regiments of Continental Light Dragoons, one each in Pennsylvania and Connecticut, and two in Virginia. The actual number of dragoons raised was not half that envisioned. Each regiment was composed of 6 troops of only 30 men. In a letter to the Marquis de Lafayette, Nathanael Greene, who was uncomfortable with an under-strength mounted arm, warned, "Enlarge your cavalry or you are inevitably ruined." His warning was validated when the British suddenly fell upon Washington's flanks at both Jamaica Pass (Long Island) and Chadd's Ford (Brandywine), although in both cases a few mounted vedettes were detailed specifically for this purpose (Herr and Wallace 1984, 18).

Considered elite troops, light dragoons were armed, equipped, and trained to be equally effective as light cavalry and as light infantry. To this end they were issued swords, pistols, and carbines. Light dragoons wore uniforms typical of the rest of the army, or short coatees, to which were added leather helmets to protect the head from sword blows, and leather breeches and knee-high boots to protect their legs from chafing on their horse furniture and stirrups. They wore none of the armor common to heavy cavalry, but they still required remounts, saddles, bridles, holsters, and other equipment unique to horsemen. The dragoons were continually plagued by deficiencies in equipment, and the troopers often provided their own horses, horse furniture, and pistols. They sometimes carried tomahawks in lieu of swords (for more information see Loescher 1977; Hayes 1975).

Dragoons were assigned as mounted vedettes, scouts, raiders, escorts, and couriers; but the bulk of their work was as foragers, advance or rear guards in the column of march, or as skirmishers on the battlefield. General Washington's life guard initially included a troop of dragoons and a company of light infantry drawn from the army on a rotational basis. It was later organized into a permanent establishment of 60 men, half of whom were dragoons. Von Herr's *Marechaussee* (military police) served as provost guards and executioners. These dragoons were widely feared and hated by the troops of their own army, and served on the flanks and rear of the battle line to prevent desertions (Volo and Volo 2003, 107–8).

There were no significant mounted charges during the Revolution and few hand-to-hand combats from the saddle. Some historians subscribe to the theory that the topography of America was simply unfriendly to sweeping maneuvers and charges by horsemen. However, this circumstance does not seem to have inhibited the cavalry during the American Civil War. In 1778, Polish Count Casimir Pulaski was made a major general and commander of all cavalry. Pulaski attempted to make the dragoons into a more traditional mounted force, training them with lances and brigading small units into larger formations. The American dragoon officers resented this imposition. One challenged a Polish comrade of Pulaski to a duel after being unhorsed in practice. Pulaski was killed in action in October 1779, in an ill-advised mounted charge against the British entrenchments at Savannah. The organization that he envisioned for the Continental cavalry died with him (Volo and Volo 2003, 108–9).

Many southern militia companies and volunteers, such as those led by Francis Marion and Andrew Pickens, came to war mounted and could not be made to give up their horses to serve on foot. These volunteers laid claim to the traditional status of mounted aristocrats while avoiding the less desirable duties of infantrymen. Although they were not used as cavalry in the classical sense, these "mounted troops were indispensable" in the southern campaigns of 1780–1781. They raided British supplies, cut off isolated units, and strangled communications. Their manner was undisciplined, their tactics with respect to Loyalists were heavy-handed, and their equipment was largely improvised. Nineteenth-century historians may have exaggerated and distorted their contributions to the war, but it is certain that these mounted irregulars were effective in galling the British to distraction (Purcell and Burg 1992, 141) (Gerson 1967, 272).

THE LEGION

An entirely new formation, known as the legion, was developed during the American war. This structure teamed dragoons with light infantry, who would sometimes ride double to cover great distances. The light infantry provided defense and firepower, while the dragoons provided flexibility and speed in the attack. Before his death, Pulaski formed a legion recruited from among British deserters and prisoners of war, but afterward it reverted to the role of light infantry. The Pulaski Legion proved to be more of a hazard to its friends than to the enemy, due to "its routinely destructive behavior…[and] it enjoyed little success at any of its assigned tasks" (Purcell and Burg 1992, 363).

The most effective legions were the Partisan Legion of Light Horse Harry Lee and that of William Washington, the commander in chief's cousin. Lee had three troops of horse (one composed of Oneida Indians) and two companies of light infantry; Washington's legion was similarly composed from the 1st Dragoons and the remnants of the 3rd Dragoons, which had been massacred at Tappan, New York. The British legion of Banastre Tarleton, a green-clad unit composed mostly of Loyalists, seems to have been the equal of all the American organizations (for more information see Gerson 1966).

The legions of Lee and Tarleton both wore dark green uniforms, and the leaders took care to make use of any mistaken identification. At Haw River, North Carolina, Lee was able to convince 400 mounted Loyalists under Colonel John Pyles that he was Tarleton! When the Loyalists dropped their guard and formed on parade to honor him, Lee's men fell upon them, killing 90 men and wounding or capturing the rest. Not one American was hurt. Tarleton, on the other hand, boldly rode into a patriot supply depot, identified himself as Lee, drew provisions for his horses and men, and signed a receipt before he quietly rode away.

Lee's and Tarleton's troopers clashed almost daily in small affairs, occasionally killing or wounding a man or horse. Such duty was tedious, nerve-racking, and very hard on both men and horses. Cavalrymen faced this form of small war, or *petite guerre*, more often than their comrades in the infantry or artillery. Hours spent sitting picket duty on a horse in the dark, on a lonely road waiting to be attacked by a lurking enemy, fell short of the gallant cavalry charges portrayed in the schoolbooks and novels of the next century.

Lee and Tarleton never came face to face. However, at Cowpens in South Carolina, the horsemen of William Washington and those of Tarleton came together with saber-clashing bravado in a brief but indecisive clash. They hacked at one another for a short time like medieval champions amid their entangled comrades, but were separated in the heat of battle. The clash was not rejoined because Tarleton's men fled the field (Volo and Volo 2003, 109).

Tarleton had a similar experience in 1781 at Gloucester Point while escorting a foraging party with the 16th Dragoons. He observed a squadron of French horsemen (hussars) of the legion of the Duc de Lauzen pursuing them. He charged the leading elements of the French in a narrow lane, sword in hand, but the confines of the pathway prevented any sword-to-sword action. Just as the two leaders were about to come into contact, Tarleton fell from his horse. Only the quick action of his men saved him from being captured. The arrival of American infantry forced the British to withdraw (Morrissey 1995, 41–42).

RECRUITS AND VOLUNTEERS

Only men between the ages of 16 and 60 were formed into units for training. This range of ages may leave the reader with an inaccurate picture of what the Revolutionary army looked like. Provincial armies were composed of adult males in the prime of life rather than of old men and young boys. Studies suggest that the average age of men serving in the army was just under 26, with 80 percent under 35 and less than 2 percent, many of them officers, over 55. Almost all of these men were true volunteers, unlike the soldiers of European armies, who may have been impressed or conscripted (Anderson 1984, 44, 231).

BLACK SOLDIERS

Free blacks and black slaves from the southern plantations were welcomed into the British army in 1775 by Lord Dunmore, the governor of Virginia. They were formed into the governor's Ethiopian Regiment for service against their former masters. Dunmore hoped to attract 2,000 black slaves to military service with the promise of freedom at the conclusion of hostilities. Although the northern colonies, particularly Rhode Island and Connecticut, made similar proposals to blacks willing to serve in the Patriot army, southern landowners were horrified by Dunmore's action (Volo and Volo 2003, 110).

In the northern colonies many blacks were free men, but in the southern colonies almost all were slaves. The enlistment of slaves "violated the property rights of their masters," and there was a fear that the army might become a "refuge for runaway slaves." Georgia and South Carolina were the only states to refuse to enlist blacks. Elsewhere, any blacks wishing to volunteer for the Patriot army were required to present evidence that they were free men, a requirement knowingly overlooked by many manpower-hungry recruiters. Those blacks found to have served "while a fugitive" were routinely denied pensions after the war (Volo and Volo 2003, 110) (Quarles 1996, 13) (Raphael 1991, 288–89).

There is little evidence that either Loyalists or Patriots refused to serve with black soldiers in battle. Several small groups of former slaves were reported to have raided patriot plantations in Virginia while under the command of white officers. At the battle of Great Bridge, one-third of the 400 British troops involved were of African heritage, and they were observed to serve with distinction, bravely attacking the fortified positions of their former masters even in defeat. Runaways captured in arms against the Patriots were sent to the lead mines of southwestern Virginia or were sold in the West Indies (Volo and Volo 2003, 110) (Quarles 1996, 19–32).

Many black soldiers and their families were taken aboard ship at Norfolk when Dunmore abandoned the mainland, but they were poorly treated and forced to serve as drudges aboard ship. Many enlisted as sailors, far from a unique experience for the manpower-hungry Royal Navy, which recruited among many races and nationalities around the world. The remains of a young British seaman, buried in his uniform coat, that was unearthed in an all-black cemetery in Manhattan in the 1980s is a silent testament to the extent of their service (Volo and Volo 2003, 110–11).

Most of the former slaves who volunteered to serve with the British simply disappeared into history. Hundreds may have died of a fever, possibly smallpox, reported to have swept the confines of the ships in the weeks before Dunmore burned Norfolk and sailed north. Thomas Jefferson claimed that 27 of the 30 slaves who fled his plantation to fight for the British died of smallpox or "putride fever." It has been estimated that the number of fatalities among blacks who fled to the British was approximately equal to the total incurred by white Patriots during the course of the war (Volo and Volo 2003, 11) (Raphael 1991, 298).

"Washington Crossing the Delaware" by Emanuel Leutze. Courtesy of the Library of Congress.

New England enrolled more men of African descent than any other region of the country because there was a good sized population of free blacks in the seaport towns. Seamen of many races and ethnic backgrounds were a common sight in New England, and a good number of blacks served as sailors aboard American privateers. A contemporary observer noted that there were no regiments from New England that did not have some black soldiers. Estimates of blacks in New England regiments run as high as eight percent. Rhode Island had the largest proportion of blacks among its soldiers, and Connecticut had the greatest absolute number. The First Rhode Island Regiment enrolled almost 200 black light infantrymen, and the members of the 2nd Company of the 4th Connecticut Regiment of the Continental Line were all of African descent. The state outside New England with the largest enrollment of blacks was Virginia (Volo and Volo 2003, 111) (Raphael 1991, 284) (Quarles 1996, 73–74).

Dorothy Dudley noted in the journal of her stay with the Patriot army, "There is an element in our camp life not to be overlooked—I mean the negroes, many of them slaves, who, heart and soul, enter into the interests of our country and render valuable service both in tent and field. It was a colored soldier, you know, who shot Major Pitcairn at Bunker Hill. Many of them are scattered through the ranks of the army, and in the hospitals and camp faithfully fill offices of many kinds." The contemporary painter John Trumbull included two blacks in his famous painting of the death of Dr. Joseph Warren at Bunker Hill, and it is known that Salem Poor, Cuff Whitemore, and 14 other unnamed black soldiers fought there (Volo and Volo 2003, 111) (Dudley 1971, 36).

The typical black enlistee served as a private in a patriot infantry regiment. A small number served with the artillery, and only rarely was one found in the elite mounted service, usually as a servant. Former slaves fought in every major engagement of the war. Many of the black soldiers served as orderlies, or were assigned to noncombatant functions such as wagoners, farriers, guards for the stores, ditch diggers, or artillery dragropemen. Blacks who served in the Patriot army were due the same wages, enlistment bounties, clothing allowances, food, and pensions given to white soldiers (Volo and Volo 2003, 111–12).

Many black soldiers received postwar pensions under legislation passed late in the century, but others remain unknown to history because they enlisted without surnames. Petitions to the state or federal government for emancipation or pension benefits included the names of James LaFayette and Saul Matthews, who served as spies; Caesar Tarrant, who served as a harbor pilot; and Richard Pointer, who fought off Indians on the frontier. Jeru Grant served as a teamster. Ned Griffin claimed emancipation for having served in the place of his master, William Kitchen, at the battle of Guilford Courthouse; and Lambo Latham and Jordan Freeman died defending Fort Griswold in Connecticut. Men like these were just as much heroes in the cause of freedom as Crispus Attucks, who died in the Boston Massacre; Salem Poor, who shot Major Pitcairn; or Prince Whipple, who crossed the Delaware with Washington at Trenton (Volo and Volo 2003, 111–12) (Raphael 1991, 282–85).

The acceptance of black soldiers in the army was not universal, and "a pattern of exclusion" quickly developed. General William Heath of New England noted, "For my own part I must confess I am never pleased to see them [blacks] mixed with white men." After the first flush of the war, Congress encouraged all soldiers to reenlist at the end of their terms, "Negroes excepted, which the Congress do not incline to enlist again." New Hampshire refused to accept black reenlistments, and New Jersey required all black soldiers in its regiments to turn in their weapons and continue service as noncombatants, or not at all. Furthermore, Congress ordered all blacks found loitering near the camps to be seized and confined. The fate of such persons is absent from the record (Volo and Volo 2003, 113) (Quarles 1996, 13, 15) (Cumming and Rankin 1975, 158).

Men of African heritage seem to have fought well on the battlefield. Historian Benjamin Quarles has noted, "Since Negro soldiers fought side by side with whites, rather than in separate organizations, there was no battle in which black Americans were conspicuous as a racial group." Nathanael Greene's regiment of black soldiers from Rhode Island came closest to being distinct as a race-based unit. A French officer described them as "most neatly dressed, the best under arms, and the most precise in [their] maneuvers." They were one of six units of predominantly white light infantry that served with great skill at Newport in August 1778. Greene's black regiment was specifically commended for holding its position against three determined assaults by the British and the Hessians (Volo and Volo 2003, 113) (Raphael 1991, 284, 297) (Quarles 1996, 79–80).

Black troops also made up part of the French forces that came as American allies from the West Indies. The Count d'Estaing's army of 3,600 had more than 500 blacks, recruited largely in Santo Domingo. Designated Volunteer Chasseurs, they served under white officers during the siege of Savannah and prevented the success of a British counterattack at a pivotal point in the operation. When the French fleet abandoned the siege of the city, the Volunteer Chasseurs went with them, and they played no further role in the Revolution on the mainland (Volo and Volo 2003, 114).

BOYS AT WAR

Those under the age of 16 played an important part in the revolution. Most served as fifers and drummers in the army, trumpeters in the cavalry, and powder boys in the artillery. Lieutenant Colonel Harry Lee was greatly moved when the unarmed teenage trumpeter of his dragoon regiment was shot down in a road by one of Tarleton's riders. Nonetheless, even youngsters of 10 or 12 who had lived on the frontier might be experienced enough with firearms not to waste a shot in haste at an enemy. Hunting for food and defending against Indian attack made a knowledge of firearms and their use imperative. At a time when most European armies pointed their muskets in the general direction of the enemy rather than aiming directly at them, some American youngsters might be considered "expert marksmen" by comparison (Coggins 1967, 9).

Many boys enlisted and fought on board privateers or on the ships of the Continental or Royal Navy as cabin boys, cook's helpers, or powder monkeys. Many more boys went to sea than served on land simply because it was common practice in coastal towns to apprentice as a seaman at an early age. Powder monkeys of 10 or 12 years were particularly important on warships, where they brought ammunition from the powder magazines below the waterline to the gun decks during battle (Volo and Volo 2003, 114).

THE SIZE OF ARMIES

Modern researchers estimate that about half the military-age men in the population, 100,000 individuals, served in the Continental army, provincial forces, or militias during the war. General Washington never personally commanded more than 25,000 troops. Only eight times during the war did the Continental army as a whole show more than 20,000 men. Army strength varied with the seasons. As winter approached, many men would wander away from the camps to sit before the warm hearths of their own homes, and spring planting kept many men from returning to the army until late in the season. This was frowned upon by the officers, but the army was always happy to see the men return. The fighting force may have been augmented during some campaigns by volunteers who turned out in ad hoc formations. This was certainly true during the Saratoga campaign, where the appearance of Burgoyne's army of invasion drew patriot volunteers with great enthusiasm (Risch 1981, 26) (see also Lesser 1976).

The best estimate of the average size of the army under Washington is less than 10,000. He may have had 25,000 to defend New York City, but he certainly had fewer than 7,000 for the Trenton/Princeton Campaign of December 1776. A return from July 1778 showed 16,782 rank and file fit for duty in White Plains, New York. This is the largest absolute number under Washington's direct command for which there is hard evidence, but these troops were actually arranged in six divisions spread in an arc that swept across parts of New Jersey, Westchester County, and Connecticut with a radius of 42 miles from New York City. No division was actually strong enough to prevent a determined outbreak by the British, nor were they close enough to each other to provide meaningful support. Washington has been criticized by students of military strategy for dispersing his troops so widely (Volo and Volo 2003, 114–15).

The Americans were successful in driving the British from New England, but throughout the war detachments of various size were required to maintain their authority. Patriot forces became somewhat scattered by the need to stem the aggressive moves of the Royal Navy along the New England coastline and to contain the operations undertaken by the loyalists' regiments in Westchester. Moreover, in 1780 many units in the army were dispatched to the southern campaign, leaving Washington with a considerably smaller command. In 1781, he was able to field fewer than 8,500 men, and at Yorktown his immediate command was only about 5,000 Americans.

The combined armies of Richard Montgomery and Benedict Arnold that attacked Montreal and Quebec in the winter of 1775–1776 were estimated at 2,500 men. At Camden and Charleston, the Patriots lost two complete armies documented to contain almost 5,000 men each, one under Horatio Gates and the other under

Benjamin Lincoln. The patriot forces in the South, under Nathanael Greene, were thereby devastated, but continued to recover by the timely arrival of detachments from the North and by the operations of the militia that appeared from the back-country, foothills, and swamps of the Carolinas.

Among these were the irregular forces of Thomas Sumter, Francis Marion (the Swamp Fox), and Andrew Pickens, which harassed the British in Georgia and South Carolina after the fall of Savannah and Charleston. All three local leaders were daring, creative, and skillful, and they understood that those practicing partisan warfare must attack, avoid being pinned down, and quickly melt back into the countryside when faced with overwhelming strength. The volatile nature of these organizations makes estimating their number difficult.

The actual strength of the Patriot army, therefore, is almost impossible to measure accurately, leaving the student with only an estimate of its numbers based on its effective strength. It is safe to say that the Patriots were able to maintain an army big enough to oppose the operations of the British at most points. It is one of the failures of British strategy that their military strength was never again overwhelmingly focused on just one part of the colonies as it was at New York in 1776 (Volo and Volo 2003, 115).

RECRUITING REBELLION

The initial outpouring of patriot volunteers in 1775 and early 1776 quickly slowed as it became obvious that the war would drag on for some time. The recruits to the Continental army of 1777 were at first asked to enlist for the duration of the war. Colonial laws regarding enlistments in previous wars had traditionally limited enlistments to one year. Washington understood that he could not effectively campaign with his troops on the verge of leaving the army each winter. Yet he warned Congress that long enlistments would hamper recruitment. A three-year term, or the duration of the war, should it prove shorter, was therefore considered an acceptable compromise for Continental service.

The rules that controlled military life were known as the Articles of War. All recruits signed them when they enlisted and pledged to live by them while in service. In signing, the recruit voluntarily gave up some of his civil liberties for the sake of military order and discipline. The initial articles of the Continental army were based on earlier versions common to provincial service, but they were found deficient in deterring misbehavior among the men. In an attempt to improve discipline, Congress strengthened them. The new version had 76 clauses that defined the soldier's rights and obligations under military law and provided a uniform structure to the courts of military justice. Congress raised a number of minor acts, such as looting, to capital crimes and increased the maximum corporal punishment from the biblical limit of 39 lashes to a full 100 (Volo and Volo 2003, 116).

Many enlistees initially refused to sign the congressional version of the articles because they considered themselves provincial troops governed only by the militia regulations of their states. This was particularly true of the troops from Connecticut, who were supported in their refusal by General David Wooster. Washington would have none of this, sending one regiment of Connecticut cavalry home at a critical moment in the New York campaign because they refused to do fatigue duties. He wrote, "Men accustomed to unbounded freedom, and no control, cannot brook the restraint which is indespensible [*sic*] to the good order and government of an army; without which licentiousness, and every kind of disorder triumphantly reigns." However, with time, this peculiarity of Continental service seems to have worked itself out, and free uniforms, bounties, and increased pay for Continental soldiers seem to have overcome any lingering objections to signing the Articles of War (Volo and Volo 2003, 116) (Raphael 1991, 312).

Only once did any of the patriot forces refuse to serve while under arms. This was because their three-year enlistments had run out in January 1781. Several regiments of Pennsylvania infantry, having suffered from cold and hunger at the Morristown encampment, began an orderly march home. General Anthony Wayne initially charged them with mutiny, but the troops had not been paid for months and had indeed served out their terms. The mutiny briefly threatened the existence of the main army as two British agents among the men tried to spread the disagreement to other units. Nonetheless, cooler heads prevailed, and the troops were furloughed until the terms of their enlistments were worked out. The British agents were hanged as spies. Ironically, most of the Pennsylvania men reenlisted (Volo and Volo 2003, 116–17).

PUNISHMENTS

The Articles of War were read periodically to all the troops at mass formations so that no man could claim ignorance of them. Regimental courts-martial were held almost weekly, and those charged with infractions were judged by a panel of officers drawn from the companies. Punishments were publicly inflicted before the entire regiment or brigade as a deterrent to further violations. Gambling, fighting between the men, bad language, petty theft, and discourteous behavior to officers were considered offenses warranting the lash, hanging by the thumbs, standing upon a wooden peg with the bare foot, or straddling a rail for some hours. Each punishment was designed to chastise, but not to permanently debilitate the miscreant (Volo and Volo 2003, 117–18).

Desertion, cowardice, treason, murder, disobedience of direct orders, mutiny, sleeping on watch, looting, rape, and homosexuality could bring death, usually by hanging. James Thacher, a surgeon with the Patriot army, noted, "Five soldiers were conducted to the gallows, according to their sentence, for the crimes of desertion and robbing the inhabitants. A detachment of troops and a concourse of people formed a circle round the gallows, and the criminals were brought in a cart, sitting on their coffins, and halter [*sic*] about their necks. While in this awful situation, trembling on the verge of eternity, three of them received a pardon from the commander-in-chief. . . . The other two were obliged to submit to their fate" (Volo and Volo 2003, 118) (Thacher 1998, 161).

PROVISIONING THE ARMY

When Congress authorized the creation of the Continental army, it put aside the colonial regulations and set a uniform daily food allowance for the entire force. This allowance "compared favorably with that allowed the British soldier," and remained in effect with little change for the duration of the war.

Congress fixed the components of the daily ration as follows:

> 1 pound of beef, or 3/4 pound pork, or 1 pound salt fish, per day. 1 pound of bread or flour per day. 3 pints of pease or beans per week, or vegetables equivalent, at one dollar per bushel for pease or beans. 1 pint of milk per man per day, or at the rate of 1/72 of a dollar. 1 half pint of rice, or one pint of Indian meal per man per week. 1 quart of spruce beer or cider per man per day, or nine gallons of molasses per company of 100 men per week. 3 pounds candles to 100 men per week for guards. 24 pounds of soft or 8 lbs. of hard soap, for 100 men per week. (Volo and Volo 2003, 176) (Risch 1981, 189n)

The combination of daily and weekly allowances with monetary values in the regulations leaves the actual day-to-day diet of the American soldier somewhat obscured. In the summer of 1776, the daily ration was valued at a little over 8d (pence) New York currency, but in a single year, inflation had brought its value to 3s (shilling) 4d (40d)—a 400 percent increase. The rising cost of food simply did not permit the purchase of many of the items listed in the ration. Moreover, the substitution of plentiful foodstuffs for scarce ones required the specific authority of Congress, and this power was not granted until 1778 (Volo and Volo 2003, 176).

Until 1777, the Subsistence Department was directed by Commissary General Joseph Trumbull, who provided a more generous allowance of salt pork, fresh beef, and beer than that prescribed. As the Middle Department became almost depleted of provisions by the constant operations of the army in eastern Pennsylvania and New Jersey during 1777, the provisioning of even the minimum uniform allowances became infrequent. The discrepancies among those rations the men received, those to which they were entitled, and those to which they had become accustomed became a constant source of grumbling (Volo and Volo 2003, 176–77).

Beef and flour were generally plentiful "in such an extensive and abundant country" unless their transportation failed, but men could not maintain their health on an unremitting diet of bread, meat, and water. Fresh vegetables, cider, and vinegar were necessary to prevent scurvy and maintain good health. Washington wrote, "Our soldiers, the greatest part of the last campaign [1777], and the whole of this [winter], have scarcely tasted any kind of vegetable, had but little salt, and vinegar, which would have been tolerable substitute for vegetables. . . . Neither have they been provided with proper drink. Beer and cider seldom comes [*sic*] within the verge of the camp, and rum in much too small quantities" (Volo and Volo 2003, 177) (Fitzpatrick 1931–1939, vol. 8, 441) (Risch 1981, 206).

There was a great deal of waste among the soldiers. The men were ordered to combine their meat and vegetables into stews and soups in company kettles provided for the purpose, but most ignored the orders, choosing to roast the meat over open fires, thereby losing a good deal of caloric value in the wasted drippings. Heavy iron kettles, abandoned on the march, often dotted the landscape. Excess fresh beef, taken from the cattle herds that followed the army, and salt pork in opened barrels were often thrown away or left uneaten until they putrefied. Barrels of flour, once opened and allowed to be wetted, became moldy, or unscrupulous bakers took the surplus and sold it to the local population (Volo and Volo 2003, 177–78).

The soldiers could supplement their diet by purchasing food from local farmers or from sutlers who stocked such items. With little money to buy provisions, the soldiers sold their metal buttons or carried their flour allowance into the country to trade for other foodstuffs. Dorothy Dudley noted, "Many have had opportunity to work at their trades of shoemaking, tailoring, and the like, or add to their income by selling such things as nuts, apples, and cider, which make a little variety in their daily diet." However, the officers considered this commerce a pretext for malingering and an opportunity for the soldiers to defraud the local inhabitants. Washington understood the scope of these problems and took steps to offset them, but it is clear "that his orders brought no permanent improvement in conditions" (Volo and Volo 2003, 178) (Dudley 1971, 57–58) (Risch 1981, 193).

The period during which food was most scarce occurred immediately after the army evacuated New York City in November 1776. Left behind in the retreat from New York were thousands of barrels of foodstuffs. At Fort Lee alone, 1,000 barrels of flour had been abandoned because there were not enough wagons to transport them. This left the army facing the winter with as little as five days' rations. This was the most severe shortage of food during the war, but there was plenty of wheat to purchase in Pennsylvania. With Washington's army consuming 200 barrels of flour daily, Commissary General Trumbull estimated that 20,000 barrels of flour could be had from Philadelphia—enough to supply the army for more than half a year.

However, the lack of the barrels proved to be of greatest concern to the Quartermaster's Department. The demand for foodstuffs placed a great strain on the ability of the countryside to produce enough barrels to transport such huge quantities of wheat flour, pease, meal, cider, vinegar, beer, salt beef, and salt pork safely. Moreover, the barrels had to be watertight, and those used for beef or pork could not be reused for flour. The New York Committee of Safety took steps to increase the supply of these containers by exempting from their enlistments all the coopers in the counties south of Albany (Volo and Volo 2003, 178).

Bread

The Patriots utilized "hard bread," or biscuit, quite as often as the British when on campaign. The Commissary Department put many of the bakers' ovens in Connecticut into the full-time production of hard bread for the Patriot army. The cakes, or crackers, could be carried in the haversacks of the men, and several days' rations would neither spoil nor crumble. Private Martin recalled that, even newly baked, the biscuits were "nearly hard enough for musket flints." Nonetheless, when he had the opportunity to freely pilfer a cask of biscuits, he took "as many as I could . . . a dozen or more in all, and . . . I stowed them away in my knapsack" (Volo and Volo 2003, 179) (Scheer 1962, 23).

In 1777 Congress appointed Christopher Ludwick, "a skillful, patriotic German baker," as the director of baking for the Continental army, with the idea of furnishing freshly baked bread for the troops. Ludwick promptly took over the ovens near Morristown, New Jersey, and began the erection of "public ovens" in Pennsylvania and New Jersey. By the end of 1779, Ludwick was producing 1,500 loaves of fresh bread daily, but he felt that the process was wasteful of flour. He recommended that only hard bread be issued as a ration. Washington supported Ludwick, and ordered him to establish hard bread production at West Point. Here Ludwick produced a daily supply of 6,000 to 8,000 pounds of hard bread until 1781 (Volo and Volo 2003, 179) (Risch 1981, 196).

Congress then intended to stop the issue of loose flour to each man in the ration. However, Washington was quick to point out that the flour could be mixed with a little water and baked on a flat stone by the individual soldier into a "firecake" with little trouble. Unless the soldier was an accomplished fireside cook, the cake came out either soggy or burned around the edges. In any case, it definitely lacked flavor, being described as tasting like wallpaper paste or an old cedar shingle (Volo and Volo 2003, 179).

As an alternative to a constant diet of hard bread, Washington recommended that each brigade make fresh bread in camp by erecting temporary ovens made of local stone and mortar, and he ordered that portable ovens made of sheet iron be procured from the iron foundry at Ringwood, New Jersey. Although designed to travel with the army, these ovens were of considerable size; only two could be carried in a wagon. By the end of 1778 one metal bread oven had been assigned to each brigade, and bakers had been found from among the men to operate them. However, Christopher Ludwick had been correct, and fresh bread simply could not be made in camp efficiently. The army thereafter reverted to a hard bread ration in the field (Volo and Volo 2003, 179) (Risch 1981, 195).

Meat

Meat, either salted or fresh, made up the bulk of the army ration. Initially there was little concern over the ability of the provinces to supply enough livestock to meet the needs of the army. New England was, at the time, a region noted for its production of hogs and cattle. The export of salted pork and beef was a thriving industry there before the war. The most productive areas of hog and cattle breeding were solidly in the control of the Patriots and out of the reach of the British. However, it was found that even these resources became strained. The demands of two armies—the Main army, with Washington in Pennsylvania, and the northern army in New York, poised to receive an attack from Canada—drew a constant supply of meat from the same region, placing the supply of livestock under tremendous pressure. Livestock was driven to within a few miles of where it was needed and slaughtered there with greater efficiency and less cost than salting and packaging the meat and moving it by wagon. Ultimately, live cattle and hogs were secured from western New Jersey, Delaware, Maryland, and Pennsylvania until the supply was exhausted (Volo and Volo 2003, 180).

Salt

Because the Commissary Department initially had planned to preserve its meat near where it was raised, most of the salt imported into the country was directed to New England, and a slaughterhouse and curing facility were erected at Medford, Massachusetts. However, as the seat of war shifted to New Jersey, and then to the south, the difficulty of transporting hundreds of casks of salted meat many hundreds of miles became apparent. Thereafter, Congress ordered that the meat be preserved in the southern states, particularly North Carolina, to which large shipments of salt from the West Indies were directed for that purpose.

Pork was favored over beef for salting because it was easier to preserve, and it tasted better than preserved beef. Salt beef sometimes tasted so bad that the soldiers referred to it as "salt horse." Veteran soldiers sometimes declined a piece of fresh beef for a good piece of salt pork, but recruits had to learn to ignore the overwhelming salty favor and appreciate its nutritional qualities. The amount of salt used in the preserving of pork was staggering, often equaling the weight of the meat itself. Salt pork needed to be soaked to remove some of the salt before it could be used, but it could last unspoiled for a long time in a properly sealed barrel. However, once the barrel was opened, it needed to be cooked quickly or it would spoil (Volo and Volo 2003, 180).

Pork was also made into bacon, and large amounts of bacon were shipped north from the southern states. Bacon was a common colonial foodstuff with a taste that was highly acceptable to most soldiers. It was made from the sides or flanks of the hog, kept in a slab, soaked in brine, and finally cured in a smokehouse. This operation flavored the meat and also retarded the growth of bacteria, so that bacon could be kept for long periods of time even under adverse conditions. Thick slices could be cut from the slabs over several days with little noticeable deterioration of the remainder. Several cooked slices of thick bacon could be placed in a haversack, wrapped in an oilcloth, and carried on the march without spoiling for several days. With this bacon and 8 or 10 hard bread crackers, the soldiers of the army could freely maneuver away from their supply lines for several days (Volo and Volo 2003, 180–81).

Foraging

Whether British or Patriot, soldiers were death to a farmstead. Acres of potatoes, cribs full of corn, fruit orchards, chicken coops, hog pens, gardens green with vegetables, and stocks of hay all went in short order once foragers arrived. Some part of the army was detailed to forage almost every day, usually protected by a detail of mounted dragoons and light infantry. Well-disposed patriot or loyalist families understood the terrible necessity of providing food for the troops who championed their cause, but they often found their larders plundered by both sides and their own families facing privation or worse. A once prosperous region could also be laid waste by runaway slaves, deserters, and other civilians searching for provision for themselves (Volo and Volo 2003, 184–85).

Joseph Plumb Martin described an incident that arose from a search for Tory refugees at Westchester, a village some miles east of the King's Bridge in Bronx County.

> We found no enemy in this place, but . . . here was a plenty of good bread, milk and butter. We were hungry as Indians, and immediately "fell to, and spared not," while the man of the house held the candle and looked at us as we were devouring his eatables. I could not see his heart . . . but I could see his face and that indicated pretty distinctly what passed in his mind. He said nothing, but I believe he had as like his bread and butter had been arsenic as what it was. We cared little for his thoughts or maledictions; they did not do us half so much hurt as his victuals did us good. (Volo and Volo 2003, 184–85) (Scheer 1962, 140)

CLOTHING

In the eighteenth century, militiamen were expected to supply most of their own arms, accoutrements, and clothing. This resulted in a wide array of individualized equipment, which was practical but lacked any hint of uniformity. Some of the militia officers may have had military uniforms, but the common soldiers did not. George Washington silently campaigned for the appointment as commander in chief by wearing his provincial uniform from the French and Indian War to Congress each day. Many officers arrived in Boston in 1775 in provincial uniforms. Colonel William Prescott wore a dark blue uniform lapelled and faced in a military manner. While supervising the construction of entrenchments in the heat of the day, he discarded his uniform coat and put on a banian, a light linen coat much like a long robe. "His hat and wig were laid aside; his bald head glistened with sweat, as he went about . . . encouraging his men or driving them to their labor with sharp commands" (Ward 1952, 81).

Evidence suggests that initially there was a little uniformity of dress among the rank and file, each man wearing what he thought best for his own comfort and circumstance. The backcountry militia companies commonly wore the same garments in which they pursued their daily life on the frontier. This would include a linen shirt and a waistcoat of wool or linen, covered with an outer garment of heavier linen known as a hunting frock, which was usually held closed with the same belt that held a knife or hatchet. The choice of wool or linen outerwear was made according to the season, but most men dispensed with woolen coats in favor of a warm woolen blanket. In an army destitute of traditional woolen uniforms, lying "on the cold and often wet ground without a blanket and with nothing but thin summer clothing was tedious" (Coggins 1967, 73).

A leather ammunition pouch, a powder horn, a haversack, and a canteen were worn on straps that crossed the chest. The straps were ordinarily of white or black leather, and the soldiers carried white pipe clay or a black ball of wax to maintain their appearance. Black wax was also used on shoes, boots, and cartridge boxes as waterproofing. Ammunition was made up into cylindrical paper cartridges for ease of distribution and loading, and a powder horn, if used at all, was only for priming powder. The haversack was usually of heavy white linen. In it the soldier carried his meager lot of personal items, such as a Bible, a razor, and a bowl or cup, as well as several days' cooked or dry rations (Volo and Volo 2003, 188).

WEAPONS: LONG ARMS AND SIDEARMS

In the eighteenth century almost all military firearms were based upon a standard smoothbore flintlock technology. Most firearms, including pistols, fired a generally large lead ball between .63 and .75 caliber and weighing almost an ounce, but more than half a dozen different calibers were used during the war. The effective range of muskets remained under 100 yards, while the visually intimidating pistols were useful only at very close quarters. Rifle fire, by comparison, was particularly accurate even at ranges of 300 to 400 yards (Volo and Volo 2003, 149).

For a rifle to be fired accurately, the soldier needed a good deal more time to load it than if firing a musket. The rifleman precisely measured his powder for the range of his target, and he laboriously seated his ball in a leather or linen patch driven down the spiraled grooves inside the barrel that gave the ball a stabilizing spin like that of a well-thrown football. A well-aimed shot taken every two minutes was considered good marksmanship for riflemen, and virtually ensured a hit on a man-sized target with every shot at 100 yards (Volo and Volo 2003, 149–50).

Musket fire at three rounds per minute, using prepared paper cartridges containing the powder charge and ball, was the standard rate of fire among trained regulars. Four rounds per minute was an ideal to which most commanders aspired, and two per minute was what they actually achieved in the heat and confusion of battle. The musket ball was also rammed home, but it was looser fitting in the smooth barrel from which it came hurling with the same precision as a poorly hit golf ball, slicing and hooking through the air. Since musket fire lacked precision, in a great volley of fire taken simultaneously, it was hoped that some portion of shot would fall among the ranks of the enemy. The training essential for the individual musket-man was in quickly reloading and obeying his officers' commands on when, where, and at what angle to fire.

The difference between the rate of fire of the musket and the rifle left the rifleman exposed to sudden rushes by light troops or Indians as he engaged in the cumbersome process of reloading his weapon. For this reason riflemen often shifted their position after firing, or worked in pairs so that one might be loaded at all times. As the war progressed, it became common practice to team musket-men with riflemen so that the quicker-loading muskets could protect the slower but more accurate rifles (Volo and Volo 2003, 150).

Most general officers carried light stabbing swords known as "court swords" or "hunting swords" that were symbols of their rank and not designed for serious hacking. Field officers usually supplied themselves with more practical weapons designed for cutting or slashing. A pistol or two might be clipped to the officer's belt or held in holsters fitted to the saddle of his horse. Most of the regular infantry were issued a bayonet in lieu of a sword, and the militia usually supplied themselves with a knife, and a hatchet or tomahawk. Some elite units carried swords as part of their regular equipment. Swords were carried by the cavalry along with a pair of pistols and a carbine. Grenadiers, light infantry, and some NCOs carried short cutting swords known as hangers. After the battle at Trenton, John Greenwood noted the need "to disarm the [Hessian] prisoners of their swords, with one of which every man was provided" (Volo and Volo 2003, 150) (Coggins 1967, 44).

By fixing a bayonet to the muzzle of his musket, a soldier changed it from a firearm to a long spear. Jeremy Black, a British historian of eighteenth-century warfare, has noted that "the introduction of the socket bayonet helped to change the face of the European battlefield." The combination of the two weapons (musket and bayonet) led to a degree of tactical flexibility and increased firepower unimagined in the previous century, when battlefields were dominated by a combination of musketeers, pikemen, and cavalry (Volo and Volo 2003, 150–51) (Black 1999, 156–57).

The American colonial tradition with regard to its militia was rooted in the obsolete deployment of pikemen, and NCOs continued to carry a seven- to eight-foot-long spontoon as a symbol of their rank. Largely because bayonets were not available, Washington, who understood their usefulness, ordered folding pikes to be manufactured for the militia. However, few if any were issued. Americans were not initially encouraged to attack with the bayonets even when they had them. The colonial bayonet drills placed their emphasis on receiving the enemy rather than making charges. The Patriots simply did not possess the discipline to maintain the linear formations employed in such attacks. Only at Stony Point, New York, did the Patriots exhibit the discipline needed to bring off a successful bayonet attack. Despite the use of bayonets, pikes, swords, knives, hatchets, and tomahawks, hand-to-hand fighting on the battlefield was relatively uncommon, and it was remarked upon by contemporary observers when it occurred. Most casualties in the Revolution were caused by musket shot or artillery fire (Volo and Volo 2003, 151).

SHELTER FOR THE MEN

When Washington arrived at Boston in 1775, he found the Patriot army housed in a wide variety of makeshift wooden and canvas shelters, which he described in a letter to Congress:

> Some are made of boards, and some of sail-cloth. Some partly of one and partly of the other. Again others are made of stone and turf, brick or brush. Some are thrown up in a hurry; others curiously wrought with doors and windows, done with wreaths and withes, in the manner

> of a basket. Some are your proper tents and marquees, looking like the regular camp of the enemy. In these are the Rhode Islanders, who are furnished with tent-equipage, and everything in the most English style. (Volo and Volo 2003, 195) (Risch 1981, 140)

Washington almost immediately devised a plan to erect 120 barracks near Boston, each to house 100 men. The barracks were to be 90 by 16 feet in size, and their cost was estimated at £100 each. Meanwhile, steps were taken to house the troops in private residences and public buildings. When the British evacuated Boston, the patriot militia melted back into the countryside or transferred to the city of New York. Nonetheless, barracks at Cambridge and Dorchester Heights were completed in 1776, but the owners of the land on which they were built began to dismantle the vacant buildings as early as 1779, to convert the lumber to their own use.

As the scene of the war shifted, Washington again became concerned with providing proper shelters in which his troops might pass the winter months of 1776–1777. Boards and shingles, bricks, stone, lime, and other materials were procured by the Quartermaster's Department, and three companies of carpenters, each consisting of 30 men, a captain, and other officers, were raised from among the soldiers of the army. Barracks were constructed for about 2,000 troops near the Hudson River at Peekskill and Fishkill. Each building was 36 feet long, 19 feet wide, and had side walls 7 feet in height. However, the corps of carpenters proved too few to erect all the housing that had been planned, and more than 100 militiamen were assigned to help on the project (Volo and Volo 2003, 195).

Throughout the war, additional permanent barracks (as opposed to temporary wooden huts) were raised by the Patriots at Trenton, Albany, West Point, and other places. Major General Schuyler wrote, "They [the soldiers] are crowded in vile barracks, which, with the natural inattention of the soldiery to cleanliness, has been productive of disease, and numbers are daily rendered unfit for duty." Private Joseph Plumb Martin noted that his barracks had "rats enough, had they been men, to garrison twenty West Points" (Volo and Volo 2003, 195) (Coggins 1967, 145–46).

Shelter was almost nonexistent when soldiers were in the field on active campaign. Private Martin wrote:

> The soldiers' whole time is spent in marches, especially night marches, watching, starving, and in cold weather, freezing and sickness. If they get any chance to rest, it must be in the woods or fields, under the side of a fence, in an orchard or in any other place but... a comfortable one, lying on the cold and often wet ground. (Volo and Volo 2003, 196) (Coggins 1967, 76)

Martin's journal provides detailed descriptions of how the soldiers built their own winter quarters. His regiment constructed satisfactory wooden huts in Connecticut in 1778 with little supervision from its officers. The quartermaster simply issued axes, handsaws, froes (for splitting shingles), augers (for drilling holes), mallets, and other hand tools, and set them to work. These huts had no foundations or wooden floors, and they were built directly on the ground with whole logs interlocked at the corners, in the manner of a frontier cabin (Volo and Volo 2003, 196).

In 1779, with the army in winter camp in Morristown for the second time, every facet of the construction process seems to have been more carefully supervised. The organization of the camp was so controlled that "no one was allowed to transgress . . . on any account whatever." The huts were constructed of tree trunks notched at the corners. The spaces between the logs were filled with a mixture of clay, mud, and straw known as chinking. The roof was covered with large wooden slabs made by riving, splitting lengthwise modest lengths of green logs. Riven roofing was considered quicker and easier to make than common shingles, and it required only a skeleton of rafters for support. A timber chimney plastered in clay, or one of stone if it was available, was centered on one of the short walls, and a door or window was made by sawing through the logs. The soldiers built their own huts and those of their officers (Volo and Volo 2003, 196) (Scheer 1962, 168).

Sergeant Major (later Ensign) Benjamin Gilbert of Brookfield, Massachusetts, detailed the difficulty of providing a sound chimney for his hut: "We built a chimney and it smoked like the Devil." On the following day, he noted, "We altered our chimney and it carried smoke very well." A few weeks later, he wrote again, "We pulled down our chimney and began to build anew. . . . We got our chimney up so high as to build a fire [the same day]." The increased height of a chimney improved its ability to draw away the smoke that generally filled the hut from the ceiling to within a few feet of the floor. A poorly designed chimney was inefficient in producing heat and left the choking men with red and watering eyes (Volo and Volo 2003, 196–97) (Symmes 1980, 60–61).

The huts built by the troops at Morristown were 12 feet wide, 16 feet long, and had 7-foot sidewalls. They were supposed to house 12 to 18 men each. Surgeon James Thacher noted that the "soldiers, without nails, and almost without tools, except the ax and saw, provided for their officers and themselves comfortable and convenient quarters, with little or no expense to the public." The design of these huts remained the standard for winter quarters for the remainder of the war. Barracks and huts were used as winter quarters only (Volo and Volo 2003, 197) (Risch 1981, 150).

Tents

The active campaigning season usually began in the late spring and ran into the early winter. The soldiers were, therefore, under some sort of canvas shelter for most of the year, under a wide variety of weather conditions ranging from dry heat to wet, snowy cold. When on the move, the soldiers used a canvas wedge tent, which was carried in the baggage wagons. Sometimes called the common tent, the wedge tent was formed of sheet canvas stretched over a horizontal bar some six or seven feet long, supported at both ends by an upright pole of about the same length. One end of the wedge was split up the center into two flaps, which could be opened and fixed back to provide ventilation, or tied closed in foul weather. The whole tent was sewn in one piece (Volo and Volo 2003, 197–98).

The rectangular floor space of a common tent was about six feet square. The wedge shape, which varied somewhat between armies, usually allowed a man of medium height to stand erect only in the very center under the crossbar, but six men could easily find room to store their meager equipment and sleep on the floor.

Other fabric structures set up about the encampment might include the diminutive bell tents for protecting the stack of muskets; horsemen's tents, which were much like the wedge but had an additional area at the rear for saddles and tack; wall tents, which were used for stores, headquarters, or temporary hospitals; and marquees, which were oval in outline and usually reserved for general officers. Tents provided protection from moderate rainfall, and they broke the wind somewhat. However, they did little to shelter the men in downpours, and could be ripped from their moorings by high winds (Volo and Volo 2003, 198).

Mounted men carried four-foot squares of painted canvas to protect their horse furniture, and each foot soldier was expected to have a piece of oilcloth the size of his blanket to use as a ground cloth or makeshift sleeping bag. Their main purpose was to prevent the morning dew from wetting everything and to help retain the men's body heat. Special tents of painted canvas were used for storing powder (Volo and Volo 2003, 198–99).

One of the responsibilities of the quarter guard of the army was to ensure that the tents stayed in place in high winds. They were also expected to be the first to fight fires that might break out among the canvas structures in the camp. For this reason cooking fires were always placed away from the sleeping area (Volo and Volo 2003, 199).

There were also dangers from which cloth tents could not shelter the troops. An NCO noted the danger of lightning in his diary for July 1, 1779:

> In the afternoon we had a very hard shower of rain and extreme hard thunder one clap of which struck in our regiment [in camp on Constitution Island] and not one company in our regiment but that had some men hurt. . . . One man . . . was struck dead on the spot and seven more rendered unfit for duty. There was five and thirty that was struck. . . . After the lightning left our regiment it ran down the road and crossed the river on the [West Point] chain up to Fort Clinton. Struck two men there. (Volo and Volo 2003, 199) (Symmes 1980, 54)

Like many other strategically important materials in the colonies, fabric for the construction and repair of tents was in short supply. Canvas duck was the principal textile used in the manufacture of tents, and almost 22 yards of the material were needed to make one common tent. As early as 1775, Congress took steps to develop a secure source of canvas. In 1776, "country linen fit for tents" was selling at the absurd price of 3s 6d per yard. A secret committee of Congress was assigned the task of importing canvas and stout linen sailcloth from France or Holland, and bounties were authorized for the development of domestic sources of hemp, flax, and cotton. Nonetheless, the stocks of textiles in the colonies were quickly used up. There was such a shortage of canvas that some members of the Marine Committee half jokingly feared that the ships of the navy might be "stripped of sails so that the soldiers might have tents" (Volo and Volo 2003, 199) (Risch 1981, 147).

Many of the army's tents were lost during the evacuation of New York in 1776 because of a lack of transportation. The shortage was made worse when the reserve store of tents at Danbury, Connecticut, was burned by the British in 1777. Washington shortly thereafter authorized the use of wedge tents only. This allowed "one soldier's tent for the field officers of each regiment, one for every four commissioned officers, one for eight sergeants, drummers, and fife players, and one for every eight privates" (Volo and Volo 2003, 199) (Risch 1981, 148).

Thereafter, the number of men assigned to each tent fluctuated between six and eight, and while this seems a crowded condition, the space allotted by this system was not unreasonable. It must be remembered that at least one-third of the army was constantly on guard duty, and the ranks of the men became thinner as the campaign season continued, due to sickness and battle casualties. Although six to eight men may have drawn a single tent at the beginning of the campaign, as few as four privates may have actually had to share it at any time. An NCO noted in June 1779, "I drawed a tent [all] to myself [because] Sergeant Wing went to hospital." In 1781, a conservative estimate showed that 3,000 tents were available for the American army of 12,000 and Washington's army of 5,000 at Yorktown had a total of 2,000 common tents to share among them (Volo and Volo 2003, 199–200) (Symmes 1980, 53).

CAMP LIFE

The science of setting up an encampment was called castramentation, derived from *castra,* the Latin word for a camp. An officer from each regiment was designated as the castramentation officer. He had the task of finding suitable ground, from within the area that the army commander chose, for the encampment of his regiment. A standard plan of encampment by brigade was followed, but some regiments with less able officers were too often allotted poor, wet, or rocky ground. The regimental camp was broken down into long lanes or streets of tents. In the textbook scheme the NCOs were given positions at the ends of the company streets, and the lowest-ranking officers were billeted some small distance from the troops to maintain social distinction and inhibit fraternization. By this method a hierarchy of housing passed through the entire camp, with the highest-ranking officers placed farther and farther from the troops, but always within easy access to them. The artillery, cavalry, and riflemen had camps of their own, separate from the line troops (Volo and Volo 2003, 200).

Private Joseph Plumb Martin provided evidence that the grand scheme of company streets set out in a grid was not always followed.

> At a place in New Jersey called Basking Ridge . . . it was cold and snowy; we had to march all day through the snow and at night take up our lodgings in some wood[s], where, after shoveling away the snow, we used to pitch three or four tents facing each other, and then join in making a fire in the center. Sometimes we could procure an armful of buckwheat straw to lie upon, which was deemed a luxury. (Volo and Volo 2003, 200) (Scheer 1962, 166)

Soldiers also took the step of raising their tents off the ground and filling the space between the canvas and the ground with flagstones or pieces of sod. Sergeant Major

Gilbert noted that although orders were issued against the practice, "We raised our tent two foot from the ground and made walls with flaggs." Gilbert was a sergeant at the time (1778), and his diary repeatedly noted the raising of tents with "flaggs" and "boards." Moreover, he noted, in April 1778: "We built a chimney to our tent." Certainly the individualization of the common tents must have distracted from the orderly lines of tents suggested by the regulations (Volo and Volo 2003, 200–201) (Symmes 1980, 29, 53).

DEALING WITH ARMY LIFE

The regimen of daily life in the camps allowed little in the way of free time. Drill, fatigue duty, cutting trees and brush, collecting firewood and water, foraging, and service at the outposts consumed most of the soldiers' day. Just keeping warm and supplied with dry clothes required a great deal of effort. Nonetheless, individuals and groups did find some time for entertaining activities. Writing letters and journals, reading, whittling, and drawing were common entertainments. Simple musical instruments were played in camp. Games such as checkers (draughts), chess, and dice were popular with small groups, as were card games. Board games, common in civilian life, were often drawn on a simple piece of canvas, and stones, bones, and corncobs served as game pieces. Gambling was strictly forbidden by the Articles of War, but the prohibition was almost impossible to enforce. Dorothy Dudley, who lived in camp with the Patriot army, noted in her diary, "There has been a good deal of card playing and gambling of various kinds. The enforced quiet of the soldiers has been irksome, and they enliven the monotony in any way they can devise" (Volo and Volo 2003, 201) (Dudley 1971, 57).

KEEPING CLEAN

The Patriot army was often described, even by its own officers, as filthy and nearly naked. This should not be taken too literally by students of the period. An eighteenth-century man was considered naked if he appeared in public dressed only in his smallclothes. Certainly the Patriots were ragged in their appearance, but they probably had more of their bodies covered than most persons who are considered fully clothed today. No free white male of the eighteenth century would appear in public in his shirtsleeves without a waistcoat. Those doing heavy work wore a smock or apron. Only slaves and indentured servants appeared in their shirts, and it was improper for even male slaves to go without shirts (Volo and Volo 2003, 201).

Personal cleanliness was a serious and ongoing problem in the army. Eighteenth-century persons tolerated a good deal more dirt, grime, and odor than people today. Outer clothing was brushed or sponged clean rather than washed. The bedding used by the soldiers was made of straw-filled ticking fabric that seemingly bred vermin and lice. Young John Greenwood noted in his journal:

> I had the itch so bad that my breeches stuck to my thighs, all the skin being off. There were hundreds of vermin on me owing to a whole month's march and having been obliged for the sake of keeping warm to lie down at night among the soldiers who were huddled close together like hogs. . . . When I arrived at my father's house in Boston, the first thing done was to bake my clothes [in the oven to destroy the vermin] and then to annoint [*sic*] me all over with brimstome [*sic*] [powdered sulfur]. (Volo and Volo 2003, 201–2) (Coggins 1967, 45–46)

Soap was issued to each regiment as part of the weekly ration. The men were expected to use the soap not only to clean their bodies but also to launder their smallclothes. For every 100 men, 24 pounds of soft soap or 8 pounds of hard soap was issued weekly, an allowance that fell well below what was needed to maintain cleanliness. The soldiers also sold their allowance of soap in the countryside to obtain additional foodstuffs. Washington issued numerous orders on sanitation, health, and the policing of the camps and barracks. "His soldiers, however, persisted in being woefully oblivious of the need to maintain sanitary surroundings" (Volo and Volo 2003, 202) (Risch 1981, 193).

HEALTH

The sciences of medicine and health care were in a woefully backward state in the eighteenth century. Many of the most closely held precepts of medicine, such as bleeding victims to produce a cure, were rooted in erroneous or fanciful premises concerning how the human body worked. Moreover, the concept of germs as the cause of infection was unknown, and infection was thought to be associated with bad odors and mists that crept along the ground. With sober sincerity, doctors pronounced miasmic fogs the cause of epidemic diseases. Visual cleanliness and an inoffensive smell were considered adequate in terms of sanitation, and pleasing fragrances were thought to balance out the evil effects of offensive odors.

Disease was the great killer of soldiers in eighteenth-century armies. Fever and dysentery were more dangerous than firearms and bayonets, and generals feared that sickness would overcome their armies in the field. For this reason the Patriot army—at least the Continentals—was inoculated against smallpox by 1777. This procedure should not be confused with the modern form of inoculation. All those soldiers who had not previously been exposed to the disease were given a mild case by having the scabs of a man infected with cowpox rubbed into scratches made on their skin. This commonly caused a few pockmarks, a mild fever, and a temporary disability. The inoculation itself was dreaded by the men, who did not properly understand the process, but it was seldom fatal among men in good health. The precaution taken by the

Patriots was a major innovation in military science and an advancement in health care (Volo and Volo 2003, 203).

The most feared epidemic disease for an army, however, was "putrid fever" or "camp fever," which was typically a form of typhoid or typhus passed through the water supply. There was no inoculation for this, and doctors had no clue to the source. Other diseases, such as scurvy, pleurisy, pneumonia, and the "bloody flux," seem to have decimated the army periodically. Surgeon James Thacher noted, "Their diseases . . . are so malignant, that it is feared they will baffle all the skill of the physician." Sulfur was sometimes burned to fumigate the huts, and items were washed in vinegar in an effort to stem the spread of these diseases (Volo and Volo 2003, 203) (Thacher 1998, 145).

Scurvy, most common among seamen, also attacked the army. It was thought to originate from a prolonged diet of highly salted provisions and bad water. In fact, the main cause of scurvy was a deficiency of vitamin C, which could be made up by adding fresh vegetables and fruits to the diet. It was a terribly disabling affliction, and without treatment could cause death. William Hutchinson experienced the ravages of the disease and lived to write about it. His descriptions of its symptoms are some of the most graphic recorded in the eighteenth century.

> I found myself taken with a pain under my left breast . . . [M]y armpits and hams grew black but did not swell, and I pined away to a weak, helpless condition, with my teeth all loose, and my upper and lower gums swelled and clotted together like a jelly, and they bled to that degree, that I was obliged to lie with my mouth hanging over the side of my bunk, to let the blood run out. . . . [W]ith fresh provisions and fomentations of herbs I got well . . . in eighteen days. (Volo and Volo 2003, 203) (Hutchinson 1794, 286–89)

HOSPITALS AND THE TREATMENT OF THE SICK

Wounded men, without the benefits of any painkillers save rum, faced a miserable end if infection or gangrene set in. Heavy, slow-moving bullets shattered the bones of arms and legs, injuries requiring amputation. Brave fellows whose skulls proved "too thick for a ball to penetrate" might linger in extreme agony with "no parent, wife or sister, to wipe the tear of anguish from their eyes, or to soothe the pillow of [inevitable] death." Soldiers prayed to be killed cleanly in battle rather than return with a major wound. The child's saying "Cross my heart and hope to die" was originally a soldier's prayer for a quick death on the battlefield by a bullet aimed at the straps of his equipment crossing his chest. One man, having received an apparently nonfatal bayonet wound to the thigh, died in agony three years later of the infection that set in. Nonetheless, Dr. Thacher noted that if the "patient is athletic and has not sustained a very copious loss of blood . . . he [might] eventually recover, which is to be ascribed principally to the free use of the lancet [bleeding] and such abstemious living [fasting] as to reduce him to the greatest extremity" (Volo and Volo 2003, 204) (Thacher 1998, 113, 255).

Thacher described a military field hospital at the battle of Saratoga, staffed by 30 surgeons and their assistants:

> This hospital is now crowded with officers and soldiers from the field of battle; those belonging to the British and Hessians, are accommodated in the same hospital with our own men, and receive equal care and attention. The foreigners are under the care and management of their own surgeons.... The English surgeons perform with skill and dexterity, but the Germans, with few exceptions, do no credit to their profession ... [being] uncouth and clumsey ... [and] destitute of all sympathy and tenderness towards the suffering patient. Amputating limbs, trepanning fractured skulls, and dressing the most formidable wounds ... a military hospital is particularly calculated to afford examples for profitable contemplation, and to interest our sympathy and commiseration.... Mutilated bodies, mangled limbs and bleeding, incurable wounds [are] no less revolting ... [than the] miserable object languishing under afflicting diseases of every description ... the awful harbingers of approaching dissolution [death]. (Volo and Volo 2003, 204) (Thacher 1998, 112–13)

NURSING

There was no formal corps of nurses (male or female) to staff the hospitals. Surgeons' mates did all they could in this regard. Following an outbreak of smallpox among the troops, Washington ordered commanding officers of regiments to "assist Regimental Surgeons in procuring as many women of the army as can be prevailed on to serve as nurses." He also noted that they would be "paid the usual price," suggesting that there was at least an informal arrangement for nursing staff (Volo and Volo 2003, 204–5) (Fitzpatrick 1931–1939, vol. 9, 497).

General Washington also specified the duties to be performed by these women:

> The nurses, in the absence of the [surgeons'] mates, administer the medicine and diet prescribed for the sick according to order; they obey all orders they receive from the matron; not only to be attentive to the cleanliness of the wards and patients, but to keep themselves clean; they are never to be disguised with liquor; they are to see that the close-stools or pots are ... emptied as soon as possible after they are used.... [T]hey are to see that every patient, upon his admission into the hospital is immediately washed with warm water; and that his face and hands are washed and head combed every morning ... that their wards are swept over every morning or oftener if necessary and sprinkled with vinegar three or four times a day; nor are they ever to be absent without leave from the physicians, surgeons, or matron. (Volo and Volo 2003, 205) (Raphael 1991, 110–11)

WAR ON THE FRONTIER

The American Revolution was characterized by brutal and violent warfare on the frontiers. Almost from the onset of hostilities, the British military determined to wage war by inciting the Indians to attack the outlying settlements. "The proximity and interconnectedness of Indian and colonial communities throughout large areas of North America gave the backcountry warfare of the Revolution a face-to-face nature that heightened its bitterness" (Volo and Volo 2003, 295) (Calloway 1999, 4).

Initially both Loyalists and Patriots put themselves forward as the legitimate heirs to the Native American alliances forged by the British during the French wars. The Patriots faced a more difficult task in trying to bring the Indians to their side. Their agents came to the tribes too late and with too few presents to cement many friendships. British agents, already established among the Indian nations, were more successful than congressional ones in bringing the frontier tribes to their cause (Volo and Volo 2003, 295–96).

Many tribes openly aligned themselves to the Crown at the beginning of the conflict because they thought the British would quickly win the war or because they had formed a hatred of the patriot settlers in the previous decade. The Scots-Irish settlers in particular had a long history of illegally occupying Indian land, "hewing their way through the woods, killing Indians when it suited them, and developing a righteous indignation against the restraining orders which came from the government." The frontier people "were Indian haters first, last, and always. For them, all Indians lived by murder and deserved death on sight." Some Patriots used the Revolution as an excuse to continue their murderous ways under the guise of a crusade for political rights (Volo and Volo 2003, 296) (Wright 1951, 224) (Hurt 1996, 67).

The British agents reportedly did all in their power to "induce all the nations of Indians to massacre the frontier inhabitants of Pennsylvania and Virginia and paid very high prices in goods for the scalps the Indians brought in." From their base near Detroit, British agents Charles Langlade and Colonel Henry "Hair Buyer" Hamilton played a diplomatic tug-of-war over the Great Lakes tribes with the main American agent at Fort Pitt, Colonel George Morgan. At Fort Niagara, Sir Guy Johnson oversaw the effort to convince the Indians of western New York to take up arms against the Patriots. With the added influence of his cousin, Sir John Johnson, and of the Mohawk war leader Joseph Brant, Sir Guy was able to bring four of the six nations of the Iroquois Confederacy to the British side (Volo and Volo 2003, 296).

Sir John Johnson, son of the late Sir William Johnson, actively joined the Tories of his Royal Greens and Brant's Indians in the field. He was one of the most active loyalist leaders on the frontier. The father and son team of John and Walter Butler were also particularly active in harassing the settlements with their Tory Rangers. Dressed in short, dark green coatees, Indian leggings, and moccasins, and carrying tomahawks and muskets, Butler's Rangers accompanied the Indians in raids throughout New York and Pennsylvania (Swiggett 1933).

The Crown's agents among the Indians were effectively opposed only by the Rev. Samuel Kirkland, a Congregational missionary to the Iroquois. An ardent Patriot, Kirkland was able to win the help of the Oneida and Tuscarora for the Patriots by appealing to them on religious grounds, suggesting that the Crown would force the Anglican religion upon them if the Patriots lost. With the exception of Kirkland's successful appeals, only by threatening the tribes with massive retribution could the agents of Congress hope to maintain Indian neutrality. Colonel Morgan told the tribes at Fort Pitt, "If the foolish people who have struck us so often, will grow wise immediately they may yet avoid destruction." Otherwise, the Patriot army would "trample them into dust." However, Morgan found that some of the tribes "were determined not to listen." They viewed his attempts to negotiate a neutrality "with increasing contempt." However, time would demonstrate that the Indians had failed to correctly gauge the resolve of the Patriots (Volo and Volo 2003, 296–97) (Hurt 1996, 76–77).

The Indians were assured by the British agents that they need not fear to "take up the hatchet against the Americans." Convinced that the Redcoats would defeat the Patriots as they had the French, the Indians undertook a series of frontier raids that demoralized the residents of the settlements. The attack on Wyoming Valley, Pennsylvania, in July 1778, by Iroquois warriors and loyalist rangers under the command of Major John Butler was one of the worst of these raids. It was closely followed by the burning of Cherry Valley, New York, by a mixed force of Indians and Loyalists under Captain Walter Butler. These attacks in particular seem to have been pivotal in moving Congress to action. Immediately thereafter the Board of War concluded that a major operation against the Indians could not be avoided (Volo and Volo 2003, 297) (Hurt 1996, 65).

FOOD

It was not until 1796, when Amelia Simmons published *American Cookery*, that the first cookbook written by an American author appeared. Prior to that, American cooks referred to English works for culinary guidance. Cookbooks had been published in the colonies since 1742 but, like *The Compleat Housewife* by Eliza Smith, first printed in London in 1727, these were wholesale reprints of older English works. The only acknowledgment of its American audience in the 1772 Boston edition of Susannah Carter's *The Frugal Housewife* was the inclusion of two plates engraved by Paul Revere. Hanna Glasse's *The Art of Cookery Made Plain and Easy* was one of the best-selling cookbooks in 1776, and it was an essential reference for several prominent Americans. George Washington and Thomas Jefferson each owned a copy. Benjamin Franklin, an avid proponent of "American cookery," had recipes from the Glasse book translated into French in preparation for his trip to Paris in 1776 (Volo and Volo 2003, 255).

No mention was made in these books of squash, cranberries, pumpkins, or other items introduced to the colonists by Native Americans. Although certain American ingredients such as turkey, tomatoes, chocolate, and vanilla had made their way into English works by the mid-eighteenth century, their appearance in cookbooks was in no way in deference to American tastes. It merely showed the evolution of English taste. In some cases these ingredients were identified with other European countries. Ironically, the beans commonly referred to in English works as "French beans" were, in fact, American. Glasse's instructions on how "To dress Haddocks after the

Spanish-way" required the inclusion of American "love apples [tomatoes], when in season" (Volo and Volo 2003, 255–56) (Glasse 1805, 239).

RECEIPT BOOKS

Recipes, or receipts, as they were known, were copied by hand and kept in booklet form for future reference. These receipt books included far more than foods, and contained formulas for household cleaning agents, cosmetic aids, and medicine. New receipts were shared within a community or could be copied from almanacs, publications that reached a much wider proportion of the population than cookbooks, which were generally owned only by the wealthy.

Diarists and letter writers commonly documented special meals served at holidays and feasts, but little was ever written about the mundane, day-to-day fare upon which most people survived. Although they appeared on eighteenth-century menus, the average colonial never tasted ice cream or enjoyed lemon tarts. Citrus fruits, like lemons, oranges, and pineapples were available only in seaport towns, and even then their high cost was prohibitive to the average pocketbook. Pineapples brought home by seamen were left on the front steps of the home as a symbol of hospitality and welcome. Their distinctive shape was sometimes incorporated into ornaments and door knockers (Volo and Volo 2003, 256).

Some insight into dining patterns can be gained from soldiers who interacted with the local residents. A patriot colonel, a prisoner taken at Fort Washington, was paroled and billeted with a family in Flatbush, New York. While the accommodations were very clean, he initially found it difficult to adjust to the meager fare of the poor family. He recalled, "A sorry wash was made of a sprinkling of bohea, and the darkest sugar on the verge of fluidity, with half-baked bread, and a little stale butter, constituted our breakfast. At our first coming, a small piece of pickled beef was occasionally boiled for dinner, but to the beef, which was soon consumed, there succeeded clippers or clams; and our unvaried supper was supon or mush, sometimes with skimmed milk, but more generally with buttermilk blended with molasses, which kept for weeks in a churn, as swill is saved for hogs. I found it, however, after a little use, very eatable; and supper soon became my best meal." Thomas Anderson escaped from the prison ship *Jersey* and traversed Long Island, making his way to safety. He recorded the kindness of a woman in Suffolk County. "I had nothing more to say than to apprise her that I was penniless. In a few moments she placed on the table a bowl of bread and milk, a dried blue fish roasted, and a mug of cider" (Volo and Volo 2003, 256) (Ellet 1859, 112, 121–22).

DIET

Menus reflected the season's bounty and maintained a strongly regional character. Economics was also a key factor. Affluent residents in cities and on plantations dined on far more sophisticated fare than the average rural farmer. A British traveler visiting Virginia plantations in 1775 reported that the breakfast table was replete with "roasted fowls, ham, venison, game, and other dainties. Even at Williamsburg it is the custom to have a plate of cold ham on the table; and there is scarcely a Virginia lady who breakfasts without it." This could scarcely be considered a typical breakfast for those scraping out a living on a frontier farmstead, or providing for a retinue of apprentices and journeymen in a household dedicated to trade. Moreover, it was not unusual for breakfast to include leftovers from the previous evening's meal. This was not simply a thrifty practice; it was extremely practical in the days before modern refrigeration (Volo and Volo 2003, 257) (Randel 1973, 65).

Rural farmsteads produced almost all the foodstuffs required for daily use. Meat that was raised for consumption was supplemented by game. What was not to be consumed immediately was preserved by drying, smoking, pickling, or salting. Autumn's harvest brought with it several weeks of intensive labor during which nature's bounty was preserved. To survive the winter, a family needed barrels of salted pork, crocks of corned beef, and racks of smoked or sugar-cured ham, bacon, and sausage. Root vegetables such as beets, cabbage, carrots, onions, parsnips, potatoes, radishes, turnips, and winter squash were stored in root cellars, or packed in straw and stored in barrels. The straw acted as a barrier to prevent the spread of spoilage to the entire barrel. Carrots were often buried in boxes of sawdust. Other vegetables, such as corn, beans, and peas, were dried (Volo and Volo 2003, 257).

Green corn was preserved by turning back the husk, leaving only the last, very thin layer, and then hanging it in the sun or a warm room to dry. When it was needed for cooking, it was parboiled and cut from the cob. Sweet corn was parboiled, cut from the cob, dried in the sun, and stored in a bag that was kept in a cool, dry place. It could also be dried in the husk and then buried in salt. Whole string beans, and slices and strips of squash and pumpkin, were strung on a thread and hung to dry. Vegetables could also be preserved by making them into catsups and relishes. "Catsup" was the general name given to sauces that were made from vegetables and fruits. Cabbage was made into sauerkraut by pickling (Volo and Volo 2003, 357–58).

While city dwellers had access to more exotic foods and imports than country residents, they were far removed from the land's natural bounty of game, fruits, and berries. They were dependent upon rural producers to supply them with fresh foodstuffs. It was not uncommon for city residents to maintain small garden patches or fruit trees to supplement their market purchases (Volo and Volo 2003, 258).

COOKING

When the colonists first settled in America, they cooked much in the manner of the Native Americans who taught them. As time went on, they adapted their traditional ways of cooking to the foods that were available. European and native cooking techniques thereby evolved with time and the availability of cookware. It would be an error to think that cooking was done over the flames of the fire. Fireplace cooking was best accomplished by using the heat of hot coals produced at the back of the fireplace. Coals were produced by burning hardwoods, like oak and hickory, rather than resinous woods, like pine and spruce, that flamed brightly but quickly lost their heat. A family farmstead carved from a stand of pine trees, therefore, might be hard pressed to provide the proper wood for heating and cooking.

Boiling was the most common method of cooking. A boiling pot required little attention, thus allowing the busy housewife to attend to her myriad other duties. It also required only one pot that could be hung in the fireplace from a lugpole or crane. Cooking temperatures were adjusted by raising or lowering the pot through the use of pothooks, chains, or a mechanical trammel. Stews, thick soups, and porridges were commonly made by this method, and a pot of dried beans or peas might be found soaking in warm water on the hearth at almost any time of day.

Roasting was also popular. The problem with this method was that the food needed constant attention to assure even cooking. The task of turning the roast often fell to a small child. A roast or bird could be hung vertically from a pair of cords fastened inside the chimney. When twisted, the cords wound and unwound around each other for quite some time and with an amazing regularity that more evenly cooked the meat. Very wealthy families sometimes had a weighted clock-work device for the purpose of rotating meats. Reflector ovens, which reflected the fire's heat to the back of the roast as it turned, were less expensive than more intricate devices. They contained a hinged door at the back that could be opened to permit basting, and a place for a tray to collect the drippings. Meat might also be broiled on a gridiron placed over coals on the hearth apron (Volo and Volo 2003, 258).

Roasting often lost the fats and drippings of the meat to the flames. Today we shun fatty meats, but maintaining the caloric count of fatty foods was important in a time when food resources were limited. Frying retained the juices of the meat and was done in long-handled, three-legged skillets called spiders. Frying pans were also used to cook food other than meats in oil, fat, lard, or butter. Flat disks of cornmeal, wheat flour, bread dough, and the meats of acorns or chestnuts were sometimes prepared in this manner into hoecakes or journey cakes. Batters of many types and spoon breads were dropped into boiling oils to cook them. Oil and lard were more easily preserved than butter, which, if unsalted, turns rancid very quickly in the absence of cool temperatures (Volo and Volo 2003, 259).

Baking was done in an oven built into the fireplace. Sometimes bake ovens were separate structures built outside the home and covered with a little wooden roof that extended a few feet in front of the oven. In either case, a fire was built in the oven and kept burning until the bricks were hot. Every baker had her own method of knowing when the proper temperature had been reached. The coals and ashes would then be swept out, the flue closed, and the food placed within. Mrs. Smith of Sharon, Connecticut, recalled to her children, "[B]y five o'clock [in the morning] the bread was ready to be molded, the hickory coals were lying in great glowing mass on the oven bottom, casting a brilliant light over its vaulted top and sending such a heat into my face when I passed by the oven mouth that it caused me to think then, as it always does, of Nebuchadnezzar's fiery furnace, seven times heated" (Volo and Volo 2003, 259) (Smith 1901, 229).

The majority of the baking was done once a week to best utilize the labor represented in the vast amount of firewood required to heat the oven. Breads would be baked in the hottest oven, followed by meat pies, fruit pies, and more delicate pastries. Baking could also be done in lidded cast-iron pots. These pots, sometimes called Dutch ovens by students of the period, had short legs that permitted them to sit on coals in front of the fire. The heavy lids of these pots had a raised rim that permitted the placing of coals on top of the pot. In this way the food received heat from both above and below. All types of pies could be conveniently baked in such an oven (Volo and Volo 2003, 259).

BEVERAGES

Since the quality of water was always questionable, most meals were served with beer or cider. Rural housewives brewed what was known as "small" beer every week or so, and it was consumed shortly after brewing. "Strong" beer was brewed annually in the fall, and in most cases it was made by those with expertise in the craft. Cider was an excellent way to preserve the apple harvest. The liquid from the pressed fruit was allowed to ferment naturally in jugs or barrels in the cool of the cellar until it was mildly alcoholic. Cider that was served in taverns usually had a slightly higher alcoholic content than that made at home because sugar was added during the fermentation process. New Englander Josiah Bartlett evidenced a regional preference among ciders when he wrote to his wife from Philadelphia, "I am sorry to hear there is like to be a scarcity of cider, as I sensibly feel the want of it here, where there is always a scarcity or rather where they never use much of it, and what is made is very inferior to the New England cider. If you will purchase a few barrels . . . I should be glad of a little (after so long fasting from it) when I return home" (Volo and Volo 2003, 259) (Meltzer 1987, 79).

THE BOYCOTT OF TEA BEFORE THE REVOLUTION

The boycott of tea was one of the most popular endeavors of Patriots during the years leading to the Revolutionary War. Eschewing tea became a badge of honor among many colonial households, although it was not always easy to abstain from this popular beverage. Throughout the colonies hundreds of women pledged to forgo the use of the unjustly taxed leaves. Newspapers waged campaigns against tea. To dissuade people from using the brew, some boycott leaders and patriot newspapers circulated stories that tea was a poisonous brew, responsible for stomach ailments and nervous disorders. They asserted that tea bred lice and fleas. It was even suggested that the tea was prepared for export by being pressed into its container by the bare, dirty feet of Chinese workers. Prior to the boycott of the Continental Association, tea was commonly served in the morning as part of breakfast or in the late afternoon as a social event. Colonials preferred their tea strong and brewed it dark. Bohea was so popular that the name came to be used as a slang term for tea itself. Lighter teas, such as Souchong and Hyson, comprised only about 10 percent of the colonial imports. The tax on tea was mainly felt by the more affluent colonists, for whom tea drinking had become a social ritual (Volo and Volo 2003, 260) (Larabee 1964, 8, 28, 144) (Raphael 1991, 17).

In upper-class households, to properly serve tea, a hostess needed a profusion of ancillary items in addition to the teakettle, teapot, and teacups. Serving tea required the right tea table, canisters, bowls, saucers, spoons, strainers, a milk or cream pitcher, sugar container, sugar tongs, and a slop bowl. Few common people could afford the tea, let alone the paraphernalia needed to serve it in proper form. Custom even dictated the arrangement of the serving pieces. On a round table the cups and saucers would be arranged in a circle. On a rectangular table, the drinking vessels would be lined up in rows. In either case, the teapot was the centerpiece of the arrangement, flanked by the sugar and creamer on one side and the slop bowl on the other (Volo and Volo 2003, 261).

Substitutes for Tea

The colonial housewife experimented with a variety of native plants in an effort to find a palatable substitute for tea. Made from the four-leaf loosestrife plant, "liberty tea" was extremely popular. The stalks were stripped of the leaves and boiled. The leaves were placed in an iron kettle and basted with the liquor from the stalks. Finally, the leaves were oven dried. Over time the term "liberty tea" has been applied to any of the homegrown tea substitutes devised by creative colonists (Volo and Volo 2003, 261).

Ribwort, strawberry, elderberry, blackberry, and currant leaves were used as substitutes, as were sassafras, dittany, sage, and thoroughwort (boneset). Some teas also included flowers, such as the blossoms of linden, elder, red clover, chamomile, violets, and roses. Other teas came from the bark of sassafras or willow trees, or from twigs of the sweet gum, seeds of fennel and dill, and the fruit of the rosebush, commonly known as rosehips. In the Carolinas a plant that thrived in the sandy soil yielded Yeepann tea. Oswego tea, which bore the name given to it by the Native Americans who originally introduced it to the colonists, was popular in the mid-Atlantic region. It was brewed from bee balm leaves and flowers, lemon balm, and mint. Hyperion tea was made from raspberry leaves. An advertisement of the day boasted, "The use of

Hyperion or Labrador tea is everyday coming into vogue among people of all ranks" (Volo and Volo 2003, 261) (Earle 1969, 181).

Forsaking their beloved tea was difficult for many. Lois Peters beseeched her husband, "I should be glad of a little tea among the rest of my wants." Baroness Frederica von Riedesel, wife of a Hessian general, sensed the depth of the colonial passion for tea during her stay in a Virginia tavern. As she prepared tea for herself and her husband, she noted that the woman of the house "watched greedily, for the Americans loved tea very much, but had decided not to drink any more, because the tea tax was the cause of the war" (Volo and Volo 2003, 261) (Guthman 1980, 35) (Williams 1976, 228).

A Boston newspaper contained the following verse in support of the tea boycott:

Throw aside your Bohea and your green Hyson tea,
And all things with a new fashioned duty;
Procure a good store of the choice Labradore
For there'll soon be enough here to suit ye;
These do without fear, and to all you'll appear
Fair, charming, true, lovely and clever;
Though the times remain darkish,
Young men may be sparkish,
And love you much stronger than ever. (Volo and Volo 2003, 261) (Larabee 1964, 27–28)

In the absence of tea, many colonists turned to coffee. Between 1770 and 1790 coffee consumption in the American colonies increased more than sevenfold. In 1774 John Adams reported in a letter to his wife the following conversation upon his arrival at the home of the Hudsons' after a long journey. He said to Mrs. Hudson, "Madam! Is it lawful for a weary traveler to refresh himself with a dish of tea, provided it has been honestly smuggled, or paid no duties?" She replied, "No, sir! We have renounced all tea in this place, but I'll make you coffee." Adams noted that he had drunk coffee every afternoon thereafter and "borne it very well." He concluded, "Tea must be universally renounced, and I must be weaned" (Volo and Volo 2003, 262) (Raphael 1991, 17) (Williams 1976, 228).

Coffee, like tea, was imported, but it never became the symbol of protest that tea was. Once trade became interrupted by the war, coffee, too, became difficult to acquire. A variety of nuts and grains were parched and boiled in an attempt to find a suitable substitute. Rye grain and chestnuts were the most common choices. Mrs. Smith recalled drinking "wheat coffee (which was all we could get in those days, and a poor substitute it was for good Mocha)." The *New York Gazette and Weekly Mercury* hoped to inspire women to forgo tea, reporting that a group of New Hampshire women "made their breakfast upon rye coffee" (Volo and Volo 2003, 262) (Smith 1901, 229) (Norton 1980, 159).

Chocolate was another popular warm beverage among affluent colonists. It was imported in blocks. To make a pot of chocolate, a quantity was shaved from the block and boiled in water. Milk and sugar were added according to taste. The supply of chocolate, too, soon fell victim to the war (Volo and Volo 2003, 262).

SHORTAGES

As Britain cut off the regular channels of trade to the American colonies, certain commodities became increasingly difficult to obtain. Sugar, salt, and molasses quickly fell into short supply. West India molasses nearly doubled in price. Medicine and pins were almost impossible to obtain. The shortages were exacerbated by merchants who sought to profit from the situation. In July 1777, such opportunism turned a group of Massachusetts women into a raging mob. Abigail Adams wrote, "You must know that there is a great scarcity of sugar and coffee, articles which the female part of the state is very loath to give up, especially whilst they consider the scarcity occasioned by the merchants having secreted a large quantity" (Volo and Volo 2003, 262) (Williams 1976, 264).

A similar situation occurred when a merchant's wife sought to avoid conflict by offering sugar for $4.00 a pound. An outraged group of 22 women, escorted by 2 soldiers, seized the sugar and distributed it at a considerably reduced price. Small dramas like these took place until the merchants' stockpiles were exhausted. "Some stores have been opened . . . and the coffee and sugar carried into the market and dealt out by pounds" (Volo and Volo 2003, 262–63) (Williams 1976, 264).

Colonists tapped their personal resourcefulness and natural resources to discover replacements for scarce and highly taxed foodstuffs. Sugar was used mainly by families of wealth. It came in very hard cones, called loaves, that weighed 8 to 10 pounds each. The sugar, having a consistency of hard candy, would be removed from the loaf into usable quantities by the use of a sugar nipper. Less affluent colonials made greater use of molasses, which also was imported but less expensive. In some areas, sugar and molasses were replaced by maple syrup or maple sugar produced domestically and sold for about a quarter of the price of a white loaf sugar. Honey was another alternative sweetener, but it was seasonal and not widely available. Adaptive cooks discovered that juice squeezed from cornstalks could be used as a sweetener. When dried and boiled, pumpkin pulp was found to be a substitute for molasses. Bakers wishing to sweeten a cake batter often used chopped apples, dried blueberries, pumpkin, or squash. Such ingredients added flavor as well as a bit of sweetening (Volo and Volo 2003, 263).

The difficulty of importing molasses caused a secondary shortage in the availability of rum. The average American drank almost four gallons of rum annually, a practice that colonials hoped to maintain during the war years, not in pursuit of inebriation but because rum was thought to fortify the drinker and help prevent disease. With the shortage of molasses, the price of rum soared. Some innkeepers were so outraged by the enormous increase in the price of rum that they agreed to buy no more until the price was reduced (Volo and Volo 2003, 263) (Schlesinger 1957, 590).

Salt

The lack of salt was a particularly serious problem. Salt was one of the main means of preserving meat. Congress intervened in the salt shortage, advising provincial authorities "to regulate the price." The local authorities also offered bounties for its production. Many seaside communities erected salt pans—long, covered troughs through which seawater slowly flowed. Throughout the process of passing from pan to pan, the heat of the sun evaporated the water, leaving a thick paste of sea salt that was appropriate for preserving provisions (Volo and Volo 2003, 263) (Berkin 1996, 180–81).

When a New Jersey woman received a bushel of salt as a gift from her sisters, she noted, "Being so rich, we thought it our duty to hand out a little to the poor around us, who were mourning for want of salt; so we divided the bushel, and gave a pint to every poor person who came for it—having an abundance for our own use." Alternatives to salt as a preservative were sought, and a lye extracted from walnut ashes was discovered to be an effective preservative, although it did little to improve the flavor of the food (Volo and Volo 2003, 263–64).

Foraging and raiding troops were responsible for shortages in rural areas. Loyalist raiders targeted the salt pans of the Patriots for destruction. They pillaged rebel homes, taking valuables, clothing, and food. On a farm in North Carolina, "They immediately entered and plundered the house of everything, carrying away also the corn and wheat." In Philadelphia, the Hessians "plunder[ed] at a great rate, such things as wood, potatoes, turnips &c." The nineteenth-century historian Mrs. Elizabeth F. Lumis Ellet recorded, "During the summer, families through the country, near the scene of warfare, lived chiefly on roasted corn, without bread, meat or salt." Murderous gangs of Loyalists so devastated the Carolinas that it prompted a verse:

> Carolina, South and North,
> Was filled with pain and woe:
> The Tories took their neighbors' worth,
> And away a Whig must go. (Volo and Volo 2003, 264) (Ellet 1859, 185, 215, 217) (Crane 1994, 66)

The residents of Redding, Connecticut, at first welcomed the proximity of "the dusty battalions" of friendly troops in their winter encampment, but they came to look at their presence with mixed emotions:

> A few months' acquaintance opened their eyes to some of the ways of the soldiers, and caused them to speed the army in the spring as heartily as they welcomed them in the autumn. The soldiers . . . plundered the neighboring farmers, whether Whig or Tory, with the utmost impartiality. To them a well-stocked poultry-yard or a pen of fat porkers offered irresistible inducements. . . . [U]nder cover of night droves of fat cattle . . . were killed and eaten with as little formality as they were taken. (Volo and Volo 2003, 264) (Hurd 1881, 595)

Shortages were often only regional. In need of flour, Lois Peters wrote to her husband, Nathan, that "there is flour to be bought very cheap at [New] York and it is very scarce here. If you could send me a barrel by Mr. Safford, I should be very glad." After providing medical aid to some gondola men and their wives, Mrs. Morris of Burlington, New Jersey, set about engaging one of the grateful recipients of her charity to deliver into British-held Philadelphia "a quarter of beef, some veal, fowl and flour" for her aged father and sisters in the city. Two nights later, the man returned "with a letter, a bushel of salt, a jug of molasses, a bag of rice, some tea, coffee and sugar and some cloth for coats for [her] poor boys," all of which were available in the city (Volo and Volo 2003, 264) (Guthman 1980, 35) (Ellet 1859, 68–69).

A poem by "Anonymous Molly Gutridge" summed up the concerns brought on by these shortages.

For salt is all the farmer's cry,
If we've no salt we sure must die.
We cannot get bread nor yet meat.
We see the world is nought but cheat....
These times will learn us to be wise.
We now do eat what we despis'd.
I now have something more to say.
We must go up and down the Bay.
To get a fish a-days to fry.
We can't get fat were we to die. (Volo and Volo 2003, 264–65) (Williams 1976, 264–65)

Flour

Abigail Adams painted a desperate picture of privation and need in Massachusetts when she wrote to her husband in 1777:

I wish the men of war [were] better employed than in taking flour vessels since it creates a temporary famine. Here, if I would give a guinea for a pound of flour I don't think I could purchase it. There is such a cry for bread in the town of Boston as I suppose was never before heard, and the bakers deal out but a loaf a day to the largest families. There is such a demand for Indian corn and rye, that a scarcity will soon take place in the country....The meat that is carried to market is miserably poor. (Volo and Volo 2003, 265) (Rhodehamel 2001, 302)

Leonard Gansevoort Jr. of Albany wrote to Leonard Bronk of Coxsackie in 1778, seeking his assistance in the face of dwindling supplies: "[R]especting the Flour which I spoke to you about. I would be glad if you would let me know whether you have it to spare. I am greatly in Want of it as I have not any." Gansevoort continued to rely on Bronk to help him, and in 1782 he wrote, "Hard times. I have no butter and am now obliged to send my Negro down to you for some. He has money to pay for whatever he can get....Polly says she wants vinegar. If you can help her to some you will do her kindness. We want a great many things for the Winter...which are most necessary." Four months later he wrote again, "Polly begins to grow uneasy whenever she looks at her little store of butter. If you can help her...you will greatly oblige" (Volo and Volo 2003, 265) (Beecher 1973, 23, 45, 46).

Lois Peters took a more proactive approach, writing to her husband, "[B]utter and cheese [were] never so high here since my remembrance as now. Cheese [is] six pence and butter nine and ten pence per pound. So if you could send some money by my brother, I could . . . buy me a cow and I think it would be very profitable." New Englander Juliana Smith, writing about her Thanksgiving celebration in 1779, details other shortages and how resourceful cooks coped with them. "All the baking of pies & cakes was done at our house and we had the big oven heated and filled twice each day for three days before it was all done. . . . Neither love nor (paper) money could buy raisins, but our good red cherries dried without the pits, did almost as well and happily Uncle Simeon still had some spices in store" (Volo and Volo 2003, 265–66) (Guthman 1980, 43) (Smith 1901, 292–95).

"Of course we have no roast beef. None of us have tasted beef this three years back as it must all go to the army, and too little they get, poor fellows," she wrote. For the feast Juliana's family was able to get "a fine red deer, so that we had a good haunch of venison on each table. These were balanced by huge chines of roast pork at the other ends of the tables. Then there was on one a big roast turkey and on the other a goose, and two big pigeon pasties . . . [and] an abundance of good vegetables of all sorts" (Volo and Volo 2003, 265–66).

Juliana also noted, "Our mince pies were good although we had to use dried cherries. . . . The pumpkin pies, apple tarts and big Indian pudding lacked for nothing save appetite. . . . Of course we had no wine. Uncle Simeon has still a cask or two but it must be saved for the sick, and indeed, for those well, good cider is a sufficient substitute. There was no plum pudding but a boiled suet pudding stirred thick with dried plums and cherries was called by the old name and answered the purpose." She was further delighted with a new vegetable that her Uncle Simeon had grown from seeds imported from England just before the war, and her uncle hoped to have enough the following year for everyone. "It is called Sellery [*sic*] and you eat it without cooking" (Volo and Volo 2003, 266).

THE COST OF FOOD

Food prices rose and shortages continued throughout the war. When a city was occupied or after the countryside had been ravaged by the armies, what little was left commanded enormous rates. In 1780, Abigail Adams reported the rampant inflation in Boston: "Beef, eight dollars per pound; mutton, nine; lamb, six, seven and eight. Butter twelve dollars per pound; cheese, ten. Sheep's wool, thirty dollars per pound; flax twenty." In Philadelphia, with its surrounding countryside stripped almost bare by two competing armies of foragers, "[P]rovisions are so scarce with us now, that Jenny gave 2s 6d per lb. for mutton this morning—The people round the country do not come near us with anything, what little butter is bought is 7s 6d." Mary Bartlett of Kingston, New Hampshire, noted the extravagant prices: "molasses found at six pence per gallon . . . New England rum five shillings per gallon, West India seven and six pence per gallon, cotton wool four shillings per pound, Bohea tea ten shillings per pound, and other things in proportion" (Volo and Volo 2003, 266) (Williams 1976, 264) (Crane 1994, 65) (Meltzer 1987, 78).

COMMUNITY EVENTS

Gatherings in rural communities were grounded in agricultural activities such as barn raisings, logging bees, and harvest activities. It was common for the women of the community to gather to supply a community need, such as cloth for the local minister's family. One woman who attended a spinning bee "did the morning work of a large family, made her cheese, etc. and then rode more than two miles, and carried her own wheel, and sat down to spin at nine in the morning, and by seven in the evening spun 53 knots, and went home to milking" (Volo and Volo 2003, 269) (Ulrich 1989, 226–27).

The custom of spinning bees was seized upon by promoters of boycotts who sought to commandeer the practice and to convert it to a political statement. Spinning bees took on a new meaning as women gathered together to spin not solely for charity but also to demonstrate their commitment to shun imported fabrics and their passion for home manufactory. However, "the planting and the harvests of the absent soldiers must take precedence of those who remained at home." The papers of the Smith family describe a series of "husking bees" that took place in 1777. The corn of a local "patriot who was absent in the service of his country" was brought to the largest barn in the town. There "[m]en and women, bond and free, boys and girls, 'quality' and 'commonality,' natives and refugees, all toiled together," the work "made as pleasurable as possible by songs and story telling" (Volo and Volo 2003, 269–70) (Smith 1901, 263–64).

These assemblages provided sufficient manpower for arduous or tedious labor, but they also created an excuse for a social gathering, such as this one during an otherwise bleak and serious period:

> After the evening's task was done and all had adjourned to the house, the different social grades sorted themselves apart.... In the broad and high basement were the slave quarters, where in front of blazing logs in wide fireplaces, they roasted potatoes in the ashes, and partook of apples, nuts and cider.... In the great kitchen, in whose fireplace an ox might have been roasted whole, another set enjoyed themselves in a similar manner; and in the generous dining-room...[a] more sumptuous repast was served. After the supper, reels and contra-dances, where the feet beat merrily to the entrancing strains of..."Caius Tite's" fiddle, gave a sportive finish to an evening which after all was done, had not been a long one, for all must be up and toiling again by daybreak or before. (Smith 1901, 264–65)

SEWING

Sewing was always a very important activity. The household needed bed linens and towels, clothing required mending, and growing children always needed something larger. Although sewing was a regular part of her routine chores, spinning and needlework could be a welcome opportunity for a woman to sit down and relax while still being productive. Sewing could be brought along while visiting and done while socializing. The simplicity of the task allowed it to be done by the limited light of the fire at night. Elementary sewing, such as mending and hemming, required little attention and permitted a woman to converse or to listen to someone reading (Volo and Volo 2003, 270).

Mastery of the needle was essential for all women; indeed; young girls were taught needle skills at an early age and were expected to master them. Many samplers, handed down as family treasures, demonstrate tremendous skill even though they were wrought by prepubescent girls. Young Sally Wister proudly made a note in her journal of a conversation she had with a light dragoon officer who was quartered on her family's property. "Observ'd my sampler, which was in full view. Wish'd I would teach the Virginians some of my needle wisdom; [he said] they were the laziest girls in the world." Surely the officer was flattering Sally. Even women who could afford to have servants do their sewing needed some skill so that they could instruct the servants and direct the work. Women of means also had the free time and the financial means to engage in what is referred to as fancywork. They made decorative items such as bed hangings, Bible covers, chair seats, and pot holders with involved designs done in embroidery, crewel, and tambour work (Volo and Volo 2003, 270) (Wister 1995, 46).

Once hostilities opened, women turned away from producing such luxuries and toward more basic needle skills, such as sewing shirts or knitting stockings for the troops. Awareness of the need to be productive was strong. Dorothy Dudley wrote in 1775: "[M]y life for a time runs in a different current from its wont. Our hands are soldiers' property now; jellies are to be made, lint to be scraped, bandages to be prepared for waiting wounds. Embroidery is laid aside and spinning takes its place. Oh, there is such urgent need for economy!" A young woman given refuge in the home of Major General Israel Putnam noted, "My amusements were few; the good Mrs. Putnam employed me and her daughters constantly to spin flax for shirts for the American soldiery; indolence in America being totally discouraged." John Smith, detained with his father on their journey to New Haven by a snowstorm, noted, "As no one could be allowed to remain idle in such times of pressing need, my father and I helped to mold bullets for the soldiers' muskets, while gentle Mrs. Reeve sat busily knitting on yarn stockings for their feet" (Volo and Volo 2003, 271) (Dudley 1971, 35) (Ellet 1859, 51) (Smith 1901, 306).

An event at the Morristown camp illustrates the sweeping commitment of patriot women to productivity.

> I was never so ashamed in all my life. You see, (we three wives) thought we would visit Lady Washington, and as she was said to be so grand a lady, we thought we must put on our best bibbs and bands. So we dressed ourselves in our most elegant ruffles and silks, and were introduced to her ladyship. And don't you think we found her knitting and with a (check) apron on! She received us very graciously, and easily, but after the compliments were over, she resumed her knitting. There we were without a stitch of work, and sitting in State, but General Washington's lady with her own hands was knitting stockings for herself and her husband! (Volo and Volo 2003, 271) (Braken 1997, 48–49)

As the afternoon progressed, Mrs. Washington took the opportunity to remind her visitors that it was very important "that American ladies should be patterns of industry for their country." She appealed to them, saying, "We must become independent by our determination to do without what we cannot make ourselves. Whilst our husbands and brothers are examples of patriotism, we must be patterns of industry." Nonetheless, some domestic handiwork was mandated by law because the troops were in desperate need of clothing. Several states set production quotas for towns. The residents of Hartford, Connecticut, for example, were required to produce 1,000 coats and waistcoats and 1,600 shirts (Volo and Volo 2003, 271) (Braken 1997, 49) (Gunderson 1996, 67).

READING

For those of sufficient wealth to enjoy a bit of leisure time, reading was a popular pastime. Affluent diarists often briefly noted that they spent time reading. Reading was also enjoyed as a group activity, and it was common for one person to read while others listened and worked on sewing or knitting (Volo and Volo 2003, 271–72).

With the exception of newspapers, almanacs, sermons, and political pamphlets, most reading material in the colonies, at the beginning of the Revolution, was imported from London. One rare exception was John Dickinson's *Letters from a Farmer in Pennsylvania*. Sales of this 1768 work were so strong that it may well be considered a best seller. Thomas Paine's *Common Sense* (1776) and John Trumbull's *M'Fingal* (1775–1782) were the only two other publications to attain such popularity. Other popular works were generally of British origin. These included Oliver Goldsmith's *The Vicar of Wakefield* (1766), Laurence Sterne's *Tristram Shandy* (1759–1767), Daniel Defoe's *Robinson Crusoe* (1719), Lord Chesterfield's *Letters to His Son* (1774–1775), and Dr. John Gregory's *A Father's Legacy to His Daughters* (1774) (Volo and Volo 2003, 272) (Randel 1973, 181).

Lucinda Lee Orr spent two months visiting family in Virginia in 1782, during which time her social life was a whirlwind of visits to different plantations, dinners, teas, and parties. Nonetheless, Lucinda spent a fair amount of time reading. She had a great passion for novels, which were somewhat more popular in the South than in the North. Writing to her friend Polly, Lucinda noted that she had read *The History of Lady Julia Mandeville*. "I was much affected. Indeed, I think I never cried more in my life reading a novel; the style is beautiful, but the tale is horrid." In certain quarters, novels were thought to be too stirring for female minds. Lucinda may have agreed. "I have for the first time in my life just read Pope's *Eloiza*. . . . [C]urioussity [*sic*] led me to read it. . . . [T]he Poetry I think beautiful, but do not like some of the sentiments. Some of *Eloiza* is too amorous for a female I think." Lucinda also reported, "Mrs. A. Washington has lent me a new novel called *Victoria*. I can't say I admire the tale, though I think it prettily told." She read *Malvern Dale*, which she fancied was "something like *Evelina*," and passed an evening reading *Belle Strattagem* to her guests (Volo and Volo 2003, 272) (Earle 1962, 192–93).

Sally Wister, a 15-year-old Quaker, made several notations of having "read and work's in turns," one person reading aloud while others worked. She reported that one evening a dragoon officer billeted in her home outside Philadelphia "took up a volume of Homer's Illiad [*sic*], and read to us." To her delight, "He [read] very well, and with judgment." She was overjoyed to have been brought "a charming collection of books" that included *Joseph Andrews*, *Juliet Grenville*, *Caroline Melmoth*, and some of *Lady's Magazine* (Volo and Volo 2003, 272) (Wister 1995, 38–39, 40, 50).

Generally, even young women's taste in reading material favored religious, philosophical, or practical topics rather than fiction or humor. Mercy Otis Warren, herself a writer of poetry and plays, counseled her niece, Rebecca Otis, "Throw away no part of your time, in the perusal of…the puerile study of romance.…[L]eave your leisure to improve your taste, to cultivate your mind, and enlarge your understanding by reading." Young Lucinda Lee Orr cautioned a friend, "[R]ead something improving. Books of instruction will be a thousand times more pleasing (after a little while) than all the novels in the world. I own myself I am too fond of novel-reading; but by accustoming myself to reading other books I have become less so. I have entertained myself all day reading *Telamachus*. It is really delightful and very improving." Anna Rawle Clifford of Philadelphia wrote in her journal, "Reading French this morning. We have got into *Telamachus*, which is much more interesting than the little fables we were reading before." Anna Rawle Clifford had a particular treat when she spent the day "in looking over the magazines from New York which Benjamin Shoemaker had brought down in the morning." She also reported, "I amuse myself in the evening with Rochefoucault's moral maxims" (Volo and Volo 2003, 272–73) (Kerber 1980, 240, 253) (Earle 1962, 193) (Evans 1975, 290, 291).

Among the most popular practical works of the period were Jonathan Edwards's *Sermons* (1739–1742), John Witherspoon's works on the Gospels, George Whitfield's *Domestic Medicine or the Family Physician*, Bishop Burnet's *History* (1724–1734), Alexander Pope's *Essay on Man* (1734), Joseph Priestley's *Experimental Philosophy*, and Clarendon's *History of the English Rebellion*. Wealthy patrons also sought to anchor their libraries with reference works such as Duhamel's *Husbandry* (1768), Bailey's or Johnson's *Standard Dictionary*, or the *Dictionary of Arts and Sciences*. *The Frugal Housewife and Complete Woman Cook* was popular among women (Volo and Volo 2003, 273) (Schouler 1906, 122–23).

PRIVATE COLLECTIONS

Only those of comfortable means could afford to own books. Booksellers in larger cities, like Henry Knox of Boston, had to diversify their offerings if they were to enjoy financial success. They often advertised that they carried ledgers, account books, and stationery; books on divinity, history, law, physics, and surgery; schoolbooks on mathematics, grammar, the classics, and geography; and Bibles. A nineteenth-century study of printing calculated that there were, however, more than 50 booksellers in the colonies. Philadelphia led the way with 21. Boston had 17. New York had 4. New Haven and Charleston each had 3. Newburyport, Salem, Newport, Providence, Hartford, Lancaster, Germantown, Wilmington, Annapolis, and Savannah each had 1. Many southern aristocrats had developed an appetite for the accumulation of literary works, and some private plantation libraries were impressive in their size and breadth of subject matter. Thomas Jefferson drew up a list of titles for "the common reader" of his own class "who has not leisure for any intricate or tedious study" that comprised 379 volumes worth more than £100 "in plain bindings" (Volo and Volo 2003, 273) (Randel 1973, 181) (Middleton 1952, 3).

LITERARY CLUBS

One area of Connecticut seems to have been particularly ripe with avid readers and inquiring minds. Prominent residents of Sharon founded the Sharon Literary Club in January 1779. The purpose of the organization was "to promote a taste for the study of *Belles Lettres* (fine writing) and of logic, and to gain some skill in the useful Freeman's *Art of Debate*." Literary clubs of this type were very popular during the nineteenth century, but this must have been quite unusual in its time (Volo and Volo 2003, 274) (Smith 1901, 270–71).

Meetings were held on every Monday evening throughout the year, except from May to the end of September. They would commence with selected readings from books that the members were supposed to be pursuing, such as Caesar's *Commentaries on the Gallic Wars,* Plutarch's *Life of Hannibal,* and Fenelon's *Telemachus* (1699). The readings were then subject to the criticisms of the club's members. After the meeting ended, refreshments were served. This was sometimes followed by an hour of dancing. There were 17 dwellings mentioned as hosting meetings. At alternate meetings the club was mainly a debating society for the men (Volo and Volo 2003, 274).

In October 1779, the club established a publication so that the talents of the members might be cultivated in writing as well as reading and speech, and each was expected to make a periodic contribution. The *Clio* was a "Literary Miscellany" issued bimonthly. It contained odes, essays, proverbs, puzzles, sketches, and jokes. "The large, coarse-textured sheets of foolscap [were] ruled down the center of each page to form two columns, and the several sheets are tied together by cords of braided, home-spun, unbleached linen thread." The pages were "legibly written in the script of different hands." The contents compared favorably with those of printed literary periodicals of the day. Absent from the paper was any commentary on political issues. This is very odd, considering that the community strongly supported the patriot cause (Volo and Volo 2003, 274–75) (Smith 1901, 277–78).

NEWSPAPERS

Newspapers enjoyed a broader readership than books. The newspapers of the time differed greatly from the daily papers of today. Most were published weekly. Subscriptions were costly. Exclusive of postage or carrier fees, weekly papers averaged

8s a year. Readers of one publication often exchanged their paper with subscribers of another. Colonial papers carried local "news" but also copied articles that appeared in other publications in other cities that may have been weeks old. The news was anything but "late breaking." A report of an important battle or a measure passed in Parliament was more likely to have arrived by a courier or traveler. To fill space, newspapers relied on prose and poetry heavy with sentimentalism, reflection, and affectation of virtue, often copied from London magazines to give the publication an air of sophistication (Volo and Volo 2003, 275).

Newspapers commonly accepted the contributions of patrons who fancied themselves writers. As political tensions heightened, flowery verses were replaced by Whig rhetoric or Tory recriminations. Local political and religious leaders took up the pen to rouse public opinion to one cause or the other. Using classical pseudonyms such as "Lucius" and "Brutus," young men, often collegians, were welcomed contributors who passionately spread patriotic fervor. Publications such as *Rivington's Gazetteer* became vehicles for loyalist propaganda, while others, such as Boston's *New England Chronicle,* promptly changed its name to the *Independent Chronicle* and added to its bannerhead "An Appeal to Heaven" with the "figure of a Continental soldier on one side . . . and a scroll 'Independence' on the other" (Volo and Volo 2003, 275) (Schouler 1906, 153).

Newspaper editors controlled the tenor of their publications, and those who supported positions unpopular in the region they served suffered harsh consequences that ranged from lost revenue to broken presses. Some Tory papers folded. In Boston the Tory editor of *The Chronicle* closed his doors and fled to England. After 72 years of publication, the colonies' oldest paper, the *News-Letter,* printed its last issue in 1776. Some newspapers with a divided readership sought to maintain their income by trying to be objective and neutral, but impartiality was often viewed as a lack of patriotic spirit. Many truly objective publications suffered as much as those blatantly pro-British. The *Boston Evening Post* prided itself on presenting both sides of controversial issues, but following the events at Lexington and Concord, it suspended publication (Volo and Volo 2003, 275–76).

Some newspaper editors changed their politics completely. The *Massachusetts Spy,* printed by Isaiah Thomas, initially took a bipartisan position, but shifted support to the patriot party after the fighting at Lexington. When the British occupied New York, John Gaine moved the *New York Mercury* to Newark, New Jersey, to avoid persecution by the regulars. When he returned to the city, he renamed the publication the *Gazette and Weekly Mercury* and gave it a decidedly Tory slant (Volo and Volo 2003, 276).

James Rivington's *Gazetteer* started out maintaining a neutral position, but was stormed twice by Liberty Boys for printing pro-Tory articles. After Lexington, Rivington felt obliged to place the following public notice:

As many publications have appeared from my press which have given great Offense to the Colonies, and particularly to many of my fellow Citizens; I am therefore led, by a most sincere regard for their favorable Opinion, to declare to the Public, that Nothing which I have ever done, has proceeded from any Sentiments in the least unfriendly to the Liberties of this

Continent, but altogether from the Ideas I entertained of the Liberty of the Press, and of my duty as a Printer. I am led to make this free and public Declaration to my Fellow Citizens, which I hope they will consider as a sufficient Pledge of my Resolution, for the future, to conduct my Press upon such Principles as shall not give Offense to the Inhabitants of the Colonies in general, and of this City in particular, to which I am connected by the tenderest of all human Ties, and in the Welfare of which I shall consider my own as inseparably involved. (Volo and Volo 2003, 276) (Randel 1973, 211)

The *Gazetteer* eventually had to cease publication for a time, but resumed throughout the British occupation of New York as the *Royal Gazette*. Ironically, Rivington experienced a good deal of personal popularity in the city in the postwar years.

In Philadelphia the *Evening Post* began by supporting the patriot party. When the British took the city, it joined two other city newspapers in promoting the Tory position. Once the British pulled out, the paper resumed its pro-patriot stance. This was too much for most readers, who resented any publication that could undergo such frequent and dramatic ideological changes, and the publication's readership declined dramatically (Volo and Volo 2003, 276).

It was not unusual for women to be newspaper publishers. Margaret Draper continued the publication of the *Boston Newsletter* after the death of her husband in 1774. An advocate of Tory politics, the paper continued in print until the evacuation of the British from the city. Mary Katherine Goddard assumed control of the *Maryland Journal and Baltimore Advisor* from her brother, and published the newssheet from 1775 to 1784.

As the war raged on, printers were faced with a severe shortage of paper, which prior to the nineteenth century was produced from rags. Rag paper is acid free, sturdy, long-lived, and does not yellow. Many eighteenth-century documents, written on this paper, are in better condition than those more than a century younger printed on wood pulp paper. While rag paper mills existed in both Massachusetts and Pennsylvania, the scarcity of cloth fiber seriously curtailed paper production. In some cases collectors went door-to-door to obtain fabric remnants. This naturally caused the price of newspapers to rise considerably and, in some cases, the quality of the paper to diminish (Volo and Volo 2003, 276–77).

ALMANACS

A number of almanacs enjoyed widespread popularity from colonial times through the Revolution and into the nineteenth century. Franklin's *Poor Richard's Almanac*, which was published from 1732 to 1757, is without a doubt the most famous one of the colonial period, but it was not the only one. Almanacs were printed as pamphlets. They contained a mixture of practical suggestions for managing the home or farm, vague weather forecasts, sagacious maxims for living, and appealing stories for entertainment. In addition to a chronicle of dates, and calculations of the phases of the moon, eclipses, and tides, a typical issue might contain "a prescription for using asses' milk to cure consumption, a poem on the universe, together with receipts for making quince wine, and for the cure of worms in sheep, or of the swollen head for young turkeys." The *Boston Almanac* also printed stage distances between chief towns, the civil list of the Massachusetts province, and the dates of court sessions. This combination of utilitarian and recreational reading made the almanac very popular with the sensible American (Volo and Volo 2003, 277) (Schouler 1906, 140).

Like other native publications during the war, almanacs showed their Whig or Tory support. Portraits of John Hancock, George Washington, and other patriot leaders appeared in issues, accompanied by suitable lyrics or acrostics. One almanac printed the "Speech of Galagacus to the North Britons," in which he incited his army to fight for their liberties. A bookseller advertising in the *Independent Chronicle* argued, "This speech alone breathes such a spirit of heroism and liberty that it ought to be read by every friend of his country, and is alone worth treble the price of the almanac." Almanacs that continued in print during the Revolution included Gleason's *Bickerstaff's Boston Almanac* (1766), Rivington's *New Almanack & Ephemeris* by "Copernicus" (1775), and Rittenhouse's *Maryland, Virginia and Pennsylvania Almanac* (1791) (Volo and Volo 2003, 277) (Schouler 1906, 141).

PAMPHLETS

The most influential and widely read medium of communication of the day was the pamphlet. Thomas Paine's *Common Sense* (1776) is the best illustration of the effectiveness of this printed form. No other work of patriotic fervor was so well received or so widely quoted by the American public. Pamphlets were more affordable than books, and their ability to respond to the immediacy of an issue made them highly desirable. Theological discourses and sermons, printed in pamphlet form, were particularly popular. Well-advertised pamphlets of this genre included *Heaven upon Earth*, *A Penitential Crisis*, *The Whole Duty of Women*, *The Religious Education of Daughters* (1787), and *Serial Sermons for the Days of the Week* (Volo and Volo 2003, 278).

GAMES AND WAGERING

Not all recreational time was spent in lofty pursuits. In higher social circles an evening might well be spent playing chess, checkers, or backgammon. Cards were widely denounced from the pulpit, but both men and women of leisure passed a great deal of time playing card games. Tokens in the shape of fish or other animals, fashioned in bone or ivory, were often used in place of coins as table stakes. Whist and cribbage were particularly popular.

There was a genre of board games involving dice and token pieces moving about a predetermined path, similar to the modern children's game Chutes and Ladders. Very popular as tavern games, these included Snake and The Game of Goose. Wagers were made and forfeits were added to the pot according to the play of the game. Other games, such as Shut the Box and Shove Ha'penny, utilized real boards and mechanical devices. Many of these involved wagers on every round or turn. A good deal of money might be in the pot at the end of the game (Volo and Volo 2003, 278).

Despite the unfavorable attitude toward wagering, men of the Revolutionary era were passionate gamblers. They would bet on virtually anything: dice, cards, elections, horse races, shooting matches, or the fall of a leaf. The Marquis de Chastellux had the opportunity to observe a popular diversion and gambling opportunity. He came upon the Willis Ordinary, which he described as "a solitary place." He was surprised to find there a "numerous assembly, and was informed it was a cockfight. [A] diversion…much in vogue in Virginia" (Volo and Volo 2003, 278) (Morris 1922, 43).

HORSE RACING

Horse racing was much favored by those in the upper classes, and regular race courses were maintained. A traveler in Virginia, Thomas Anbury, noted: "At Williamsburg there is a very excellent course of two, three, or four mile heats." Races were held throughout the colonies before the Revolution, and match races between two contestants were advertised and well attended by all classes of people with money to bet. Well before the identification of the modern quarter horse breed, Anbury was quite amazed at the colonial fascination for racing horses over a course just a quarter-mile long. He wrote:

> Near most of the ordinaries there is a piece of ground cleared in the woods…where there are two paths about six or eight yards asunder which the horses run in. I think I can say without the slightest exaggeration…that even the famous Eclipse could not excel them in speed.…These [quarter horses] are trained to set out in this manner at the moment of starting. It is the most ridiculous amusement imaginable, for if you happen to be looking another way, the race is terminated before you can turn your head.…[V]ery considerable sums are billeted on these races. Only in the interior parts of this province are these races held, for they are very much laughed at and ridiculed by the people in the lower parts, about Richmond and other great towns. (Volo and Volo 2003, 278–79) (Morris 1922, 28)

The love of horse racing led to an interest in breeding racing stock, particularly of horses tracing their lineage to one of three Arabian stallions of the previous century: the Byerly Turk, the Darley Arabian, and the Godolphin Arabian. These horses were the foundation sires of thoroughbred racing in Britain. The famous Eclipse, mentioned by Anbury, traced his lineage to the Darley Arabian, and was the sole ancestral sire of all American racing thoroughbreds. Horses were also developed for the more personal diversions offered by hunting and saddle riding. Outstanding horseflesh was extensively bred in Virginia, Pennsylvania, Maryland, and Connecticut. The Morgan breed, whose sire was an outstanding stallion born during the Revolution, was not identified until after the war (Volo and Volo 2003, 279) (Volo and Volo 2000, 132–33).

LOTTERIES

Churches and colleges, as well as towns, seized on the gambling mania as a vehicle for raising capital. Public lotteries were held to fund construction and to pay off public debt. New York held a lottery in 1780 to fund fire buckets for the city. The following year another was held to raise funds to relieve the plight of needy loyalist refugees. Lotteries were even held to help fund the patriot military. One such was organized by Benjamin Franklin to pay for cannons for the army. The success of public lotteries inspired private parties to hold their own lotteries, which offered books, furniture, jewelry, real estate, and the like rather than cash prizes. Deceitful practices led to legislation that severely limited lotteries, and even reputable organizations had to file documents in advance that detailed the method of the drawing, the names of the managers, the number of tickets and the number of prizes, and the amount to be deducted from each award, which generally ranged from 12.5 to 15 percent of the pot (Volo and Volo 2003, 279–80).

PUBLIC HOUSES

The differences between inns, taverns, and ordinaries are lost on students of the period today, but they seem to have been clear enough at the time. In an era before the demonization of alcohol as the cause of social ills, taverns were a popular gathering place for men of all classes. Some served food, and all served liquor. The bar, which was often secured by a slatted gate after closing, was generally the center of attention. Johann David Schoepl wrote, "I stopped at the Tavern Formicola which was naturally much crowded. . . . Every evening there came generals, colonels, captains, senators, delegates, judges, doctors, clerks and gentlemen of every weight and caliber to sit around the fire, drink, smoke, sing, and swap anecdotes or political theories. Very entertaining, but Formicola's not being a spacious house, I found the crowd embarrassing" (Volo and Volo 2003, 280) (Morris 1922, 55).

The taverns of Philadelphia had a particularly unsavory reputation as tippling and disorderly houses, filled with drunks and prostitutes, respectively. The Indian King was the oldest and most reputable of the city's public houses, and it was here that Benjamin Franklin and his associates met. Other prominent taverns included the Crooked Billet and the City Tavern. The Tun Tavern was the main source of volunteers for the newly formed corps of American marines. In New York City, Bolton's Tavern was renowned for its food. It was here that Washington gathered with his chief officers for a farewell glass of wine at the conclusion of the war. Fraunces Tavern was another establishment of high repute in the city. Boston's Green Dragon was used by the Order of Masons as a meeting place, and the patriot agitators Joseph Warren, Samuel Adams, James Otis, and Paul Revere often met there to solidify their arguments against British rule. In Virginia, Gadsby's Tavern was popular with the residents of Alexandria, and Christina Campbell's, Chauning's, and the Raleigh

Tavern were popular with the members of the House of Burgesses in Williamsburg (Volo and Volo 2003, 280).

Inns and ordinaries furnished lodging and food to travelers. Accommodations were designed for male travelers only. While traveling, the Marquis de Chastellux complained, "They make nothing in America at an inn of crowding several people into the same room." Few places offered private quarters, and the weary traveler often had to share a room as well as a bed with another guest. Ladies who traveled at this time prearranged their journey, making provisions to stay with relatives, friends, or friends of friends. When this was not possible, a lady would write to a clergyman, who would arrange for lodging with a suitable family. Larger inns often had one spacious public room that could be rented for a concert, lecture, or ball, or for use by sleigh ride parties stopping for supper and dancing. The prominence of these places and their convenience to travelers made them obvious choices for public auctions, meetings, and political rallies (Volo and Volo 2003, 280–81) (Schouler 1906, 80).

Prior to the war, many public houses bore names such as The King's Arms or The Royal George in honor of the Crown. As tensions heightened, many changed their names to less politically charged ones, such as The Punch Bowl or The Bull's Head, not to alienate any patrons. Following the siege of Boston even the British Coffee House was rechristened the American Coffee House. In Tory strongholds the retention of a British name generally advertised the politics of the patrons who frequented the establishment (Volo and Volo 2003, 281).

DANCING

An extremely popular diversion, which was enjoyed equally by men and women, rich or poor, was dancing. Rural dances often took the form of an informal frolic composed of square dances and reels held after a community gathering. In cities, more formal balls were held. The Marquis de Chastellux described a ball that took place in Philadelphia in 1780.

> At Philadelphia, there are places appropriated for the young people to dance in. . . . A manager or Master of Ceremonies presides at the methodical amusements; he presents to the gentlemen and lady dancers, billets folded up containing each a number; thus fate decides the male or female partner for the whole evening. All the dances are previously arranged and the dances are called in their turns. These dances, like the toasts we drink at table, have some relation to politics; one is called *The Successful Campaign*, another *Bourgoyne's Defeat*, a third *Clinton's Retreat*. The managers are generally chosen from among the most distinguished officers of the army. (Volo and Volo 2003, 281) (Earle 1962, 213–14)

Some managers may have been carried away by their military habits. A story was told of "a young lady who was figuring in a country dance, having forgot her turn through conversing with a friend, [the manager] came up to her and called out loud, 'Give over, Miss, take care what you are about. Do you think you come here for your pleasure?' "

Balls were so much a part of the social life of the "genteel class" that they were even held by the officers during military encampments. Nathanael Greene recalled a particular visit by Washington. "We had a little dance at my quarters.... His Excellency and Mrs. Greene danced upwards of three hours without once sitting down.... Upon the whole, we had a pretty little frisk." Following the alliance with France, Henry Knox wrote, "We had... a most genteel entertainment given by self and officers.... We had above seventy ladies... and between three and four hundred gentlemen. We danced all night—an elegant room, the illuminating fireworks, &c. were more than pretty" (Volo and Volo 2003, 281–82) (Earle 1962, 214) (Tebbel 1954, 140).

THEATER

Stage acting was a late arrival to the colonies. Religious prejudices against theatrical entertainment greatly limited its appeal. It was not until September 5, 1752, in Williamsburg, Virginia, that the first dramatic performance ever given by a regular company of actors in an auditorium was presented in the English colonies. Audiences in Maryland and Virginia were more open to theater than those in New England with their Puritanical heritage, but gradually attitudes toward stage performances changed. By 1761 a regular theater was opened in New York City under the patronage of Governor DeLancey despite vigorous opposition by the assembly and the city's religious leaders. By 1772, performances were commonly given once or twice a week in both New York and Philadelphia. The strong religious beliefs of Puritan New England supported laws that strictly forbade theatrical performances, especially the comedies and farces of playwrights like Sheridan and Molière. More serious works, like the plays of Shakespeare or Thomas Mallory, attracted less bitter criticism, but still fell under the proscription. Many Britons disagreed with colonial bans, and asserted that an act of Parliament allowing public exhibitions had the effect of overriding such provincial prohibitions. Theatricals thus became identified with the Tory cause, and attracted passionate acrimony from among the most conservative Whigs. Once war broke out, many plays and other frivolous amusements were prohibited by local laws throughout the colonies. While the British were in possession of Boston, New York, and Philadelphia, performances were given for officers and Tory sympathizers. One such performance was *The Blockade of Boston*, a play written by General Burgoyne to mock the Continental troops (Volo and Volo 2003, 282).

LECTURES

In some communities elocution plays were executed as a series of readings that eventually merged into the complete recitation of a play or of a whole opera. Presented as a public speaking exercise, these performances, or lectures, were a means of circumventing local theatrical bans. Nonetheless, the lecture was an established and legitimate form of amusement that was sometimes advertised as a philosophical experiment "for the entertainment of the curious." Lectures were generally presented as a vehicle to expand the mind. One lecture in Philadelphia was touted as a discourse on "pleasant and useful geography," in which the figure and motion of the earth and the moon's effect on the tide and wind were revealed. Some lecturers conducted experiments with electricity that perpetuated, expanded, and popularized Franklin's work of midcentury. Others produced suction with a vacuum pump, presented botanical or zoological information, or pretended to show how iron could be heated by cold water (Volo and Volo 2003, 282) (Schouler 1906, 110).

MUSIC

Audiences also gathered for musical performances. Balls, concerts, recitals, and chamber performances were commonly done by subscription, and they attracted a "very polite company." In larger cities a series of performances might take place weekly over a period of six or eight weeks, in what was referred to as a concert hall. These concerts could be vocal solos, duets, or occasionally a chorus. Instrumental performances on the violin, French horn, hautboy (oboe), or harpsichord were popular. On a special occasion of public note, a regimental band might perform. Occasionally concerts were given as benefits for a local music teacher or church organist who arranged and conducted the performance himself. Most musical performances were private affairs at social gatherings in homes where young ladies and gentlemen demonstrated their talents to the guests (Volo and Volo 2003, 283).

PHYSICAL ACTIVITIES

Outdoor pastimes included a form of bowling, quoits, shooting, horseback riding, fishing, hunting, ice skating, and swimming. Benjamin Franklin was renowned for his swimming ability, as a young man even teaching swimming in England. Social class dictated the degree of organization and flamboyance of any physical activity. Horseback and carriage riding was done individually or in parties. In warm weather carriage parties might be the prelude to a picnic where, in addition to the food, participants enjoyed fishing, kite flying, and games of blindman's buff or of forfeit. Winter brought sleighing and skating parties that sometimes culminated in an evening of dinner and dancing at a local inn (Volo and Volo 2003, 283).

Naturally, once fighting broke out in an area, all frivolous activities ceased. The war, however, tended to move from one region of the colonies to another over eight years. After the active fighting moved on, many resumed the amusements they had enjoyed prior to the war. A high social life flourished in areas under British control, which ignored local bans and social correctness. Rebecca Franks of Philadelphia wrote of her stay in New York in 1778, "You have no idea of the life of con-tinued [*sic*] amusement I live in; I scarce have a moment to myself.... I have a ball this evening at Smith's where we have one every Thursday.... [Y]ou [can] chose [*sic*] at either Plays, Balls, Concerts or Assemblys" (Volo and Volo 2003, 283–84) (Earle 1894, 30–31).

FASHION

The way people dressed in the eighteenth century identified their social class and often their profession as well. Fashion defined the person, and people did not aspire to dress outside their class. A somber suit of sturdy woolen broadcloth was the standard daily wear for most professional men, such as lawyers, doctors, clerks, and public officials. Black was the choice for almost all clergymen. Warm weather brought out suits of lighter colored linen. Ostentatious colors and impractical fabrics, characteristic of gaudy young aristocrats known as Italian Macaronis, were generally used by the upper classes only at the most fashionable social gatherings. The term *Macaroni* was applied to an outlandish style of male dress made popular in Europe in midcentury. It appears in a derisive context in "Yankee Doodle," which was written by a British officer in 1757 and set to a tavern tune by the Americans, who adopted it, along with the tune "Chester," as an unofficial national anthem.

Yankee Doodle went to town,
A'riding on a pony.
Stuck a feather in his hat,
And called it Macaroni. (Volo and Volo 2003, 287–88)

People living in the rural areas of the colonies were much less affected by the extremes of fashion. Since they generally had to rely on homespun linen and wool, they were more concerned about practicality than style. Nonetheless, on the eve of the Revolution, prosperity had propagated a small social class in the colonies that was infatuated with fashion and finery. Styles mimicked those found in London or Paris, and affluent city dwellers anxiously awaited the arrival of "fashion babies" to learn what was in vogue across the ocean. These dolls were meticulously dressed, male and female, in the latest fashions and were the precursors of the printed fashion plates of the next century. Colonists of means became accustomed to importing the finest wools, linens, silks, satins, brocades, and other products of British mills. Listings of fabrics for sale made up perhaps the single greatest category of newspaper advertisements (Volo and Volo 2003, 288).

WIGS

The wig (periwig or peruke) was a symbol of rank and position among merchants, planters, clerics, and professionals. Wigs were common among the fashionably attired, particularly in urban areas, and the hair could be arranged to suit a wide spectrum of tastes. Popular styles included the "bag wig," in which long hair was tied into a "tail" at the back and secured in a small silk bag. Dandies favored the "cadogan," which secured the long hair in two places. The "square wig" had hair that fell in a loose, shoulder-length, page style that was greatly favored by judges and clergy. Most men preferred the more conservative "major bob," which kept the hair close to the head and was accentuated by two or three rows of tight curls at the temples. Apprentices or other men of lower station generally chose the "minor bob," a bushy style with a center part and secured tail (Volo and Volo 2003, 288).

The cost of a wig varied with the quality of its construction and the materials used. Complexity and quality were a symbol of a person's social status. Therefore, there was no effort made to conceal the fact that one wore a wig. A contemporary wigmaker's advertising claimed:

> To ecclesiastical perukes he gives a certain demure, sanctified air; he confers on the tye-wigs of the law an appearance of great sagacity and deep penetration; on those of the faculty . . . he casts a solemnity and gravity that seems equal to the profoundest knowledge. His military smarts . . . [endow] the wearer [with] a most warlike fierceness. (Volo and Volo 2003, 288) (Bullock and Tonkin 1959, 16)

A wig of high-quality human hair might cost as much as £3. Less expensive wigs made of the hair of cow, goat, or horse could be purchased for as little as 10s. Colors favored in the eighteenth century included white, black, grizzle (a mix of white and black), brown, and flaxen. Reds, like auburn and chestnut, were less fashionable. Maintaining the wig could be costly, and the more complex styles had to be professionally reworked every couple of weeks. Simpler styles could be brushed and cleaned much like one's own hair, and curling irons and ceramic rollers that looked like scissors and pieces of chalk, respectively, could be heated and used to set curls.

To ensure a good fit and to increase comfort, many wig wearers shaved their heads. They often wore a simple turned-up cap when relaxing indoors, working in their shop, or taking an informal walk. These caps could be of simple linen or fancy brocade, and they were often embroidered by a loved one as a gift. Some members of the upper classes affected an oriental style by wearing turbans while lounging at home or talking with neighbors. It was not uncommon for a man to greet guests in his home dressed in a banian (a formal robe) and an embroidered cap.

Many men of high social rank did not follow the fashion of wearing wigs during the Revolutionary period, and those of the patriot party generally eschewed wigs entirely. These men would dress their own hair in the prevailing style. Most men of the yeomanry queued or clubbed their hair, wearing the tail tied with a ribbon or in a black silk bag. For more formal occasions they might turn a pair of curls at the temples, and would grease their hair and dust the coiffure with white powder (Volo and Volo 2003, 289).

HAIR HALF-A-YARD HIGH

Women in the colonies generally did not wear wigs, although they did add in hairpieces to provide extra volume to their own hair or to enhance an arrangement with curls. This was in sharp contrast to the fashion in Europe, where some ladies sported hairstyles of such outlandish width and height that the hair had to be supported by wire frames and wads of wool or tow padding. The back hair was strained up in a maze of loops or short curls. All was kept in place with globs of pomade, dusted with white powder, and surmounted with lace, ribbon, pom-poms, gauze, beads, jewels, flowers, or feathers. By the last quarter of the eighteenth century these towers, or "talematongue," had risen until some structures measured half a yard in height. The style, like that of the male Macaroni, was farcical and the subject of many caricatures (Volo and Volo 2003, 289).

Colonial women, however, endeavored to create certain elements of that look. The fashionably high forehead that was accentuated by the absurd hairdos of European gentry, was achieved by severely brushing the hair back to reveal a full face. Additional height was achieved with padding. A Salem, Massachusetts, hairdresser advertised in 1773: "Ladies shall be attended to in the polite constructions of rolls such as may tend to raise their heads to any pitch they desire." A Philadelphia newspaper of the same period carried an advertisement by a wigmaker that he had created a hair roll that weighed only three ounces, compared to the former eight ounces. The remainder of the long tresses were secured back in some way or worn tightly curled. Prepubescent girls usually wore their hair loose. A Hessian officer made note of women's hairstyles during the war. "They friz their hair every day and gather it up on the back of the head into a chignon at the same time pulling it up in the front . . . sometimes, but not often, they wear some light fabric on their hair" (Volo and Volo 2003, 289–90) (Earle 1969, 295) (Schouler 1906, 90) (Earle 1894, 31).

Overdone hairstyles, like men's wigs, quickly dropped out of favor when the war began, as can be seen in a poem by a patriot urging moderation with respect to hairstyles.

Ladies you had better leave off your high rolls
Lest by extravagance you lose your poor souls
Then hand out the wool, and likewise the tow
'Twill clothe our whole army we very well know. (Volo and Volo 2003, 290) (Earle 1969, 292)

Women

HOMESPUN

The political fracture with England also spawned a fashion break. Colonists who once anxiously awaited news of the latest styles from the homeland shunned English fashion. Eliza Wilkinson noted in a letter, "[N]ever were greater politicians than the several knots of ladies, who met together. All trifling discourse of fashions, and such low little chat was thrown by, and we commenced perfect statesman." Although the importation of cloth from France or Holland would not violate the boycott, whimsy and ostentation in dress were abandoned. As anti-British sentiment grew, many of even the wealthiest colonists became resolved either to make or to buy coarser American cloth as a statement of their devotion to the cause. It became a matter of genuine pride for a woman to use the spinning wheel on behalf of her country. Just as Daughters of Liberty agreed to drink no tea, they also swore to wear no garments of foreign make (Gilman 1969, 17).

Spinning bees became so popular that it was not uncommon to see groups of women carrying their spinning wheels through the streets as a political statement. At Rowley, Massachusetts, "Thirty-three respectable ladies of the town met at sunrise with their wheels to spend the day at the house of the Rev'd Jedekiah Jewell, in the laudable design of a spinning match. At an hour before sunset, the ladies there appearing neatly dressed, principally in homespun, a polite and generous repast of American production was set for their entertainment." Even Martha Washington served as an active supporter of the movement. She told a friend that she kept 16 spinning wheels in constant operation at Mount Vernon. Although these were probably powered by her slaves, Martha was not beyond spinning for herself (Volo and Volo 2003, 290–91) (Holliday 1968, 111).

The *Massachusetts Gazette* of November 9, 1767, contained a poem that suggested that women might renounce marriage to any man who did not join the ladies in their boycott of British manufactures.

First then, throw aside your topknots of pride,
Wear none but your own country linen,
Of Economy boast, let your pride be the most,

To show clothes of your own make and spinning.
What if home-spun they say, is not quite so gay,
As brocades, yet be not in a passion.
For when once it is known, this is much worn in town,
One and all will cry out—'Tis the fashion.
And as one and all agree that you'll not married be

To such as will wear London factory,
But at first sight refuse, 'till e'en such you do choose
As encourage our own manufactory. (Volo and Volo 2003, 291) (Holliday 1968, 160) (Williams 1976, 229–30)

The continued desire for finer fabrics called for resourcefulness. Some families attempted to grow their own mulberry trees and cultivate silkworms. However, the silk-making process required too much labor to support any large-scale commercial production of fabric. Fringe-and-lace maker James Butland advertised in the August 1774 issue of the *Pennsylvania Packet* that "any person having silk of their own may have it manufactured into . . . silk stockings, sewing silk, ribbons &c." Tory Louisa Susannah Wells wrote an account of her discomfort in America. She complained, "I used to darn my stockings with the ravellings of another, and we flossed out our old silk gowns to spin together with cotton to knot our gloves." Martha Washington showed two of her own dresses of cotton striped with silk with great pride, explaining that the silk stripes in the fabrics were made from the unravellings of brown silk stockings and old crimson damask chair covers (Volo and Volo 2003, 291) (Swan 1995, 18–19) (Williams 1976, 258–59).

Simplicity of dress and the use of fabrics of home manufacture became synonymous with patriotic fervor. Dorothy Dudley attended a reception given by General Washington and his wife in January 1776 and recorded the event in her diary. She noted, "Of course simplicity of dress was noticeable—no jewels or costly ornaments—though tasteful gowns, daintily trimmed by their owner's own fingers, were numerous." In less formal situations Martha Washington chose to dress with great frugality. When she arrived at her husband's winter quarters in a private home at Morristown, she was initially mistaken by the homeowner for a domestic "in a plain russet gown with a white handkerchief neatly folded over her neck" (Volo and Volo 2003, 291–92) (Dudley 1971, 56) (Ellet 1859, 73).

As the conflict dragged on, the use of homespun became somewhat less voluntary. Temperance Smith of Connecticut noted, "[T]he extractions of the Mother Country had rendered it impossible for any but the wealthiest to import anything to eat or to wear, all had to be raised and manufactured at home from bread stuffs, sugar and rum to the linen and woolen for our clothes and bedding." Lois Peters wrote to her husband, "You talked of sending back…some old shirts.…I stand in great need of them to clothe my children. New [clothing] is not to be had and what I shall do I can't tell." Lois Peters bemoaned the fact that she could not meet her husband's request to send him new shirts. "[T]here is not a yard of hollon [Holland linen] to be had here" (Volo and Volo 2003, 292) (Smith 1901, 226–27) (Guthman 1980, 16, 32–33).

Those who lived behind British lines had no difficulty in obtaining imports, particularly if they were willing to supply desperately needed fresh produce in exchange. Rebecca Franks of Philadelphia was visiting New York in 1778 when she wrote of New York society, "The Dress is more ridiculous and pretty than anything I ever saw—great quantity of different colored feathers on the head at a time. The Hair dress'd very high.…I have an afternoon cap with one wing, tho' I assure you I go less in the fashion than most of the Ladies—[There is] no being dress'd without a hoop" (Volo and Volo 2003, 292) (Earle 1894, 31).

Once independence was declared and the separation of colony and mother country became established, some people felt less compelled to display their patriotic fervor by abstaining from imported articles. A Hessian officer observed that when the women in New York "go out, even though they be living in a hut, they throw a silk wrap about themselves and put on gloves. They also put on some well made and stylish little sunbonnet…[they] have fallen in love with red silk or woolen wraps." He speculated that "the wives and daughters spend much more than their incomes allow. The man must fish up the last penny he has in his pocket.…Nearly all articles necessary for the adornment of the female sex are very scarce and dear. For this reason they are wearing their Sunday finery. Should this begin to show signs of wear I am afraid that the husbands and fathers will be compelled to make peace with the Crown if they would keep their women folk supplied with gewgaws" (Volo and Volo 2003, 292) (Earle 1894, 32).

Some enterprising people realized that this returning taste for articles of dress and luxury presented an opportunity for great profit. In January 1779, Benjamin

Franklin's daughter noted, "There never was so much dressing and pleasure going on in the capital." General Wayne received a letter echoing this sentiment. "[E]very lady and gentleman endeavors to outdo each other in splendor and show." General Greene remarked that the luxury of Boston was "an infant babe" to that of Philadelphia. With avarice a stronger motive than patriotism, a new business, referred to as the Illicit Trade, persisted on Long Island during the entire war. Smugglers bought goods in the city of New York under the guise of offering them for sale to the King's loyal subjects on Long Island. The goods were, however, secretly loaded onto small vessels that were then "run" across Long Island Sound, to be delivered to certain dealers who were willing to pay the high prices in anticipation of a large profit for themselves. Lois Peters's husband was serving with the Patriot army in New York when she wrote, "It is almost impossible to buy cloth here for one shirt. Hope you will be able to buy all you can that is a good penn'worth" ("Penn'worth," a contraction of "penny's worth," was used to indicate good value). (Volo and Volo 2003, 292–93) (Ellet 1859, 164) (Earle 1894, 34) (Guthman 1980, 29).

The cunning of profit seekers spawned many frauds and schemes related to scarce goods. Sometimes the owner of a well-filled store on Long Island would conspire with whaleboat men to carry off his goods at night and convey them to Connecticut for their mutual financial advantage. The next day the claim of a rebel raid was asserted, and suitable rewards were offered by the appropriately indignant merchant.

While government policy prohibited any intercourse with the enemy, some officials, knowing there was little likelihood they could eliminate the activity, simply shared in the profits. At other times, provincial committees sought out illicit traders. In need of clothing for the troops, the state of New York was forced to employ secret agents to enter into a clandestine arrangement to procure British cloth. Connecticut dabbled in unlawful traffic until the popular outcry became unbearable. Even the British took part when it seemed in their best interest. In 1778, Governor Tryon used an intermediary to offer rum, sugar, and tea in exchange for American beef.

The British commandant in New York employed every possible means to restrict the illicit trade. Those wishing to transport goods out of the city were examined to ascertain their loyalty to the king and were required to have a permit that specifically detailed every article purchased. Stories circulated of victimized shoppers who, having made a purchase on impulse that was not listed in their permit, had their items seized by watchful guards, motivated by their ability to confiscate contraband and turn it to their own use (Volo and Volo 2003, 293).

Even when prohibited goods were not expropriated, the guards were given a share of their value as a reward for vigilance. Even this was not without its conspiracies. The owner of a boat loaded with another man's imports would set out from Long Island and conspire with the crew of an American privateer to have it captured. The goods would then be taken to a New England port, where the Admiralty Court would condemn and sell them, sometimes at outlandish prices. Later, the conspirators would divide the profits. By this means British merchandise became available without violating any prohibitions. In Norwich, Connecticut, auction sales "of a variety of European and other goods by piece or pattern" were held twice weekly (Volo and Volo 2003, 231) (Ellet 1859, 128).

WOMEN EMBRACE THE CAUSE OF REVOLUTION

It did not take much convincing for some women to join the patriot effort, and it became somewhat fashionable in certain circles to do so. On January 31, 1770, almost four years before the Boston Tea Party, a group of 426 women of Boston signed an agreement not to drink any tea until the tax upon it was repealed. Even nine-year-old Susan Boudinot embraced the pledge. While a guest in the home of New Jersey's loyalist governor, William Franklin, the young girl was offered a cup of tea. Susan accepted the refreshment, curtsied, raised the cup, and threw the liquid out the window (Volo and Volo 2003, 231) (Berkin 1996, 175).

Editors of patriot newspapers, always searching for propaganda pieces, began capitalizing on the "spinning bee." Women had long participated in spinning bees, usually held at the minister's home, to spin fiber that would later be made into cloth for his personal wardrobe. Following the imposition of the Townshend duties in 1767, this traditional activity, now redirected to the purposes of the boycott by producing cloth, was given prominence in certain papers and exalted as having the most patriotic of motivations. The *Boston Evening Post* reported, "[T]he industry and frugality of American ladies must exhaust their character in the eyes of the world and serve to show how greatly they are contributing to bring about the political salvation of a whole continent" (Volo and Volo 2003, 231) (Kerber 1980, 42).

Many members of the clergy promoted such domestic activities. Congregational ministers in New England were particularly active in emphasizing the frugality, economy, and industry characteristic of traditional Puritanism. Peter Oliver, a Loyalist, charged that rebel ministers preached "manufactures instead of Gospel. They preached about it and preached about it, until the women and children, both within doors and without, set their spinning wheels a whirling in defiance of Great Britain. The female spinners kept on spinning for 6 days of the week; and on the seventh, the parsons took their turns and spun out their prayers and sermons to a long thread of politics." Jack Smith, a college student at the time of the Revolution, noted, "There was no hesitation about preaching political sermons in those days. Ministers would have deemed themselves to have entirely failed their duty, had they not expressed their views in regard to what was right and wrong on public questions" (Volo and Volo 2003, 232) (Raphael 1991, 108) (Smith 1901, 301–2).

In urban areas across the colonies, young women began to assemble with their spinning wheels in daylong demonstrations of patriotic fervor. A New York teenager, Charity Clarke, wrote to an English cousin that "[h]eroines may not distinguish themselves at the head of an Army," but "armed with spinning wheels," women could contribute to the preservation of colonial liberties. For women in rural areas and those of limited means, spinning was less a trendy expression of patriotic ideals than a more genuine domestic necessity; yet the symbolism of the act could be considerable. A Connecticut farm girl, Betsy Foote, noted in her diary in 1775 that she had carded wool all day and spun 10 knots of wool in the evening. This was a likely day's work for a young woman at any time, but Betsy added to her entry, "and felt Nationly into the bargain" (Volo and Volo 2003, 232) (Norton 1980, 169).

What began as symbolic support for an economic and political ideal quietly crept into a way of life. Dorothy Dudley summed up the situation in a letter in 1776: "This year had been one of severe trial for us all. Of course there has been reason for great economy both in household and dress. Tea is a comfort put from us with resolution, though its absence from our tables is cuttingly felt by many. As far as possible we patronize only home manufactures, and ourselves use the spindle to diminish the necessity for foreign material" (Volo and Volo 2003, 232) (Dudley 1971, 67).

As the war raged on, women engaged in a variety of activities to support the troops in the field. Many of their methods capitalized on domestic skills and were almost an extension of their household work. The family papers of Helen Evertson Smith reveal that "[s]pinning yarn and knitting stockings, preparing bandages and scraping lint, filled every patriotic woman's every moment that could be spared from the daily cares of her family." Some of these endeavors took on the form of community action. The Literary Club of Sharon, Connecticut, for instance, passed a resolution that at debating meetings, "all of the women and such of the men as were not engaged in speaking or reading are expected to knit stockings or do some other work to help [the] brave and suffering soldiers in their desperate struggle to gain Liberty" (Volo and Volo 2003, 232–33) (Smith 1901, 263, 275).

On a spring evening in 1777, Mrs. Smith invited her neighbors to come to her home with "every pewter dish they could spare." By the evening's end "many gallons of good bullets had been made from the cherished pewter articles, which had been melted and merrily run through bullet molds." For many evenings following this event, there were "trencher bees" at which young men "cut and shaped maple and poplar wood into dishes, which the women made smooth by scraping with broken glass, and polished with the clean white sand of powdered limestone." ("Trenchers" were wooden bowls and plates common in the eighteenth century.) Undoubtedly these ladies possessed some imported china dishes that they could have used instead of these wooden replacements. However, they may have been hesitant to use such fragile items, knowing that under the restraints of war they would be impossible to replace if broken, and impossible to use without seeming less than fully dedicated to the patriotic cause (Volo and Volo 2003, 233) (Smith 1901, 245).

CLOTHING FOR THE SOLDIERS

Women of prominence used their position to rouse support for the troops. In June 1780, Ester Reed of Philadelphia published a broadside, *The Sentiments of an American Woman*, which declared that American women were resolved to do more than dispatch "barren wishes" for the army's success. She desired women to be "really useful," like the "heroines of antiquity." Drawing upon role models of strong women from the Old Testament, Roman and Greek legends, and a history of female monarchs on the English throne to argue her case, Reed outlined a plan for women to donate the money now saved by shunning imports to the American troops. The broadside proved to be highly inspirational. Within three days after it appeared, 36 prominent women of Philadelphia met to develop a strategy to actualize the scheme. The ladies began a fervent campaign to solicit funds, which were to be known as "The Offering of the Ladies." No donation was too small, and no one was excluded from their appeal, including servants. By the completion of the campaign in July, more than $300,000 in Continental dollars had been collected from 1,600 individual supporters (Volo and Volo 2003, 233) (Norton 1980, 178–79).

The endeavor garnered considerable notoriety in the press that helped in spreading the plan. Reed and the other organizers wrote to prominent women in neighboring regions, imploring them to implement a similar effort. Women's associations in New Jersey, Maryland, and Virginia took up the challenge, and many variations of the idea were initiated. Geography and limited financial resources prevented all the campaigns from having the same degree of success as that in Philadelphia, but they did raise additional funds (Volo and Volo 2003, 233–34).

Reed's original plan called for the donations to be presented to Martha Washington, who would see that they reached the soldiers and would not be spent on items that Congress should be supplying to the army during the normal course of its operation. By the time the collection was completed, however, Mrs. Washington had returned to Virginia, and Reed had to deal with General Washington himself. The general was concerned that giving funds to the soldiers directly might cause "irregularities," "disorders," and "discontent" among the troops, and he countered with a plan of his own to use the money to supply the soldiers with much-needed shirts. He suggested that the ladies make the shirts themselves, to eliminate the cost of seamstresses. Recognizing that Washington would not yield in his opinion, the ladies altered their plan (Volo and Volo 2003, 234).

Reed died before the process was completed. However, under the guidance of Sarah Franklin Bache, country linen was purchased, and the women commenced to put their needles to work. The Marquis de Chastellux, a general officer with the French army in America, described a visit to Bache's house: "She conducted us into a room filled with work lately finished by the ladies of Philadelphia. This work consisted neither of embroidered tambour waistcoats, nor of network edging, nor of gold and silver brocade. It was a quantity of shirts for the soldiers of Pennsylvania. The ladies bought linen from their private purses, and took pleasure in cutting them out and sewing them. On each shirt was the name of the married or unmarried lady who made it, and they amounted to twenty-two hundred." Bache once told Washington, "We wish them to be worn with as much pleasure as they were made" (Volo and Volo 2003, 234) (Ellet 1859, 254) (Norton 1980, 187).

WOMEN AND THE TROOPS

There are countless instances of women bringing food and supplies to the troops and providing aid to the wounded when the army was encamped nearby. The diary of Elizabeth Drinker, a Quaker, contains a number of entries similar to this one:

"[W]ent this afternoon in the rain . . . with a jug of wine-whey and a tea-kettle of coffee for the wounded men." Many such endeavors were casually recorded with equal brevity in diaries, journals, and letters written during the natural flow of women's daily activities. Such deeds were not portrayed as acts of radical patriotism nor feats of heroism. They were recorded simply as the fulfillment of a woman's natural duty to her community (Volo and Volo 2003, 234) (Crane 1994, 65).

Yet it was not always easy to reach the needy troops. A contemporary observer recounted how the resourceful women of Charleston managed to deliver supplies to patriot troops outside the British-held city. "The women would often procure passes [from the British] to go to their farms or plantations in the country. They seized this occasion for carrying forth supplies of cloth, linen, and even gunpowder and shot to their countrymen. . . . These commodities were concealed beneath their garments; and, in preparation for their departure, the dimensions of the good women were observed sensibly to increase. At length it was noticed by the officers on guard, that the lady, who when she left the city was of enormous bulk, would return reduced to a shadow . . . [and] a jury of spinsters was provided and the fat ladies were taken into custody" (Volo and Volo 2003, 234–35) (Ellet 1859, 224–25).

Many towns served as storage facilities for supplies for the troops. Here, too, it was the women who took charge. "Almost all of the able bodied male inhabitants more than seventeen years of age were enrolled in the armies, and the work pertaining to the stores was carried on by the women and children under the direction of a few old men." The British raid on Ridgefield, Connecticut, must have dealt a huge emotional and economic blow to those charged with overseeing the stores. "[A] large quantity of the public stores had been deposited in the Episcopal church, and the first work of the soldiers was to remove them into the street and burn them. . . . In a few hours eighteen hundred barrels of pork and beef, seven hundred barrels of flour, two-thousand bushels of wheat, rye, oats, and Indian corn, clothing for a regiment of troops, and seventeen hundred and ninety tents were burned. The smoke arising from the destruction of this property was strangulating and filled the whole air, while the streets ran with the melted pork and beef" (Volo and Volo 2003, 235) (Smith 1901, 311) (Hurd 1881, 642).

Having a husband away at war increased the physical burden of an already demanding lifestyle even when families were safe from marauding troops. A man, who was a child during the war, remembered: "My mother had the sole charge of us four little ones. . . . When my father was permitted to come home [on leave], his stay was short. . . . Sometimes we wondered that [Mother] did not mention the cold weather, or our short meals, or her hard work, that we little ones might be clothed, and fed, and taught. But she would not weaken his hands, or sadden his heart, for she said a soldier's life was harder than *all*" (Volo and Volo 2003, 235) (Williams 1976, 255–57).

Temperance Smith recalled what life was like after her husband, a parson, left to minister to the troops.

> I had no leisure for murmuring. I rose with the sun and all through the long day I had no time for aught but my work. So much did it press upon me that I could scarcely divert my

thoughts from its demands, even during the family prayers. . . . I should have been sending all my thoughts to heaven for the safety of my beloved husband and the salvation of our hapless country. Instead of which I was often wondering whether Polly had remembered to set the sponge for the bread or to put water on the leach tub, or to turn the cloth in the dying vat, or whether the wool had been carded for Betsy to start her spinning wheel in the morning, or Billy had chopped light wood enough for the kindling, or dry hard wood enough to heat the big oven, or whether some other thing had not been forgotten of the thousand that must be done. (Volo and Volo 2003, 235–36) (Smith 1901, 226–27)

The letters between Captain Nathan Peters and his wife, Lois, provide an insight into the adversity faced by the wives of the men who went to serve in the army. When Nathan, a saddler and leather worker, set out in 1775 to respond to the fighting around Boston, he left his pregnant wife to care for a small child of less than a year, to manage their home, and to run their business. From the beginning, Lois found that continuing what she referred to as "the Trade" was not going to be easy. She complained, "I can't collect one penny." She soon asked Nathan to "send home a power of attorney" so she could pursue clients who were avoiding their debts to him. Lack of cash confounded her operation of the saddler's shop, and Lois sought Nathan's approval for an arrangement with a journeyman, who agreed to work in the shop and take his pay in board and stock for his labor on completed saddles. "It is so difficult to carry on the Trade that I see no way possible at present, for we can't get our plush nor trimming without money." Two months later she wrote, "[I] have done the best I could to carry on the Trade but can't any longer for want of stock of all kinds" (Volo and Volo 2003, 236) (Guthman 1980, 10, 15, 21, 24).

While trying to run the business, Lois constantly made shirts to send to her husband despite the difficulty in getting the necessary fabric. "I shall send by [H]errick 1 cake of chocolate and some of my good old cheese." Lois also continued to manage the homestead. "I have been very much put to it to get help to cut our hay. I am like to have it all cut today. The drought has been very severe and the grass is very poor." In another letter she wrote, "I have got my corn harvested and have about eighty bushel[s]" (Volo and Volo 2003, 236) (Guthman 1980, 19, 20, 25).

As both Christmas and the birth of their child drew near, Lois's situation grew worse. "I shall hope that you will by that time be home and see about your business yourself for I am almost tired of the fatigue of it. I have nobody to do one chore for me only what I hire. [I] should think it would be well to send Joseph [Joseph Crary, Lois's brother] home if he is willing to come and you can have him dismissed for it grows cold and I am not so well able to undergo hardships at some times and I want wood cut at the door and fires made and many things done that I am obliged to hire some done and some go undone." Although Lois gave birth soon thereafter, her worries about her family continued. "[O]ur dear son is sick. [I] am in hopes it [is] only a great cold and worms. Our daughter is well. Mother is sick with camp distemper but is better" (Volo and Volo 2003, 236) (Guthman 1980, 27, 45).

Perhaps the most telling remarks of hardship and suffering are those dealing with Nathan's absence. Two days after Christmas, Lois wrote, "I have looked for you 'til I am almost out of hope of your coming home at all. It would be a great comfort to me to have you come home and stay this winter. . . . I live a very sorrowful and lonesome life. Our dear son is well and says he wants Daddy." Later she wrote, "[I]f you lived as lonesome and felt as melancholy as I do you would be glad of a line from me. . . . If I could only have the enjoyment of my dear husband to live with me, I should think myself as happy as this world could make me." After more than a year's separation, Lois's agony deepened: "My only comfort is at present in the dear little pledges of our love. When I see them, I see my dear. Must I deny myself the pleasure of him? I was going to say, 'No!' I must refuse myself that pleasure when so glorious a cause calls him away from my arms. My country! Oh! My country! Excuse, my love, the anguish of a soul that has you always painted before her" (Volo and Volo 2003, 236–37) (Guthman 1980, 28, 34, 48).

Prolonged separation of husband and wife brought anxiety, longing, and pain. Mercy Warren wrote to her husband, "Oh! these painful absences. Ten thousand anxieties invade my bosom on your account and some times hold my lids waking many hours of the cold and lonely night." Mary Bartlett penned the following to her spouse: "Apples scarce, plumbs in the garden plenty. Pray do come home before cold weather, as you know my circumstances will be difficult in the winter, if I am alive." Abigail Adams became so desperate for news of her husband that her nine-year-old son, John Quincy, became post rider for her, traveling the 11 miles between Braintree and Boston with the latest reports of the war (Volo and Volo 2003, 237) (Holliday 1968, 101, 304) (Meltzer 1987, 78).

While the men went off to meet the war, too often the war came to meet the women who were left behind. Abigail Adams detailed the events of one night: "I went to bed about twelve, and rose again a little after one. I could no more sleep than if I had been in the engagement; the rattling of the windows, the jar of the house, the continual roar of the twenty-four pounders; and the bursting shells give us such ideas, and we realize a scene to us of which we could form scarcely any conception" (Volo and Volo 2003, 237) (Holliday 1968, 308).

The stress brought on by the bombardment of the Boston suburb of Charles Town by the Royal Navy took its toll on all family members. John Quincy Adams recalled:

> For the space of twelve months my mother with her infant children dwelt, liable every hour of the day and the night to be butchered in cold blood, or taken and carried into Boston as hostages. My mother lived in unintermitted danger of being consumed with them all in a conflagration kindled by a torch in the same hands which on the 17th of June [1775] lighted the fires of Charlestown. I saw with my own eyes those fires, and heard Britannia's thunders in the Battle of Bunker Hill, and witnessed the tears of my mother and mingled them with my own. (Volo and Volo 2003, 237) (Holliday 1968, 304)

Such fears were not unfounded. Eliza Wilkinson wrote to a friend of facing British foragers bent on robbing her home outside of Charleston, South Carolina.

> I heard the horses of the inhumane Britons coming—the raiders bellowing out the most horrid oaths and imprecations. I had no time for thought—they were up to the house—entered with drawn swords and pistols in their hands crying, "Where are those women rebels?" The moment they spied us, off went our caps, to get a paltry stone and wax pin, which kept them

on our heads; at the same time uttering abusive language, and making as if they would hew us to pieces with their swords.... They began to plunder the house of everything they thought worth taking; our trunks were split to pieces, and each mean wretch crammed his bosom with the contents. I represented to him the times were such we could not replace what they had taken from us, and we begged him to spare me only a suit or two; but so far was his callous heart from relenting, that casting his eyes toward my shoes, "I want them buckles," said he.... They took my sister's earrings from her ears, her and Mrs. Samuell's buckles, demanding her ring from her finger, and after bundling up all of their booty, mounted their horses; each wretche's bosom stuffed so full, they appeared to be afflicted with some dropoisal disorder. (Gilman 1969, 28–30)

Some years later Wilkinson described the accumulated emotional toll of incidents like this one on her family and herself.

The whole world appeared to me as a theatre, where nothing was acted but cruelty, bloodshed and oppression; where neither age nor sex escaped the horrors of injustice and violence; where lives and property of the innocent and inoffensive were in continual danger.... We could neither eat, drink nor sleep in peace; for as we lay in our clothes every night, we could not enjoy the little sleep we got. The least noise alarmed us; up we would jump, expecting every moment to hear them demand admittance. In short, our nights were wearisome and painful; our days spent in anxiety and melancholy. (Gilman 1969, 31, 43)

CAMP FOLLOWERS

As the war dragged on, many women joined their husbands in the patriot camps rather than face humiliation and starvation. Such a drastic move would be taken only in the most dire circumstances. The large body of civilians, collectively referred to as camp followers, traveled with the army, providing supplies, services, and emotional support. Camp followers usually included servants, slaves, sutlers (merchants who sold liquor and basic staples to soldiers), contractors, bureaucrats, and military employees, but as the war progressed, it was increasingly composed of the displaced families of soldiers. A British intelligence report regarding the Patriot army at White Plains in 1778 found that "Women and Waggoners [make] up near half of their army" (Volo and Volo 2003, 241) (Mayer 1996, 1).

Many women camp followers took on additional duties to alleviate the added stress their arrival placed on their husband's meager pay. The army had a need for laundresses, cleaning women, seamstresses, and nurses. Colonel Ebenezer Huntington wrote to his brother in 1780, "[M]y washing bill is beyond the limits of my wages. I am now endeavoring to hire some woman... to do the washing for myself and some of the officers." By providing services that were still within the gender-specific roles expected of them in the eighteenth century, women helped to legitimize their presence with the army. A body of enterprising women could fill some of the voids left by the inadequately run Quartermaster's and Commissary Departments. When a woman joined her husband in the field, she generally exposed herself to many of the same dangers he faced. General Washington asked Sarah Osborn if she was not afraid of the cannonballs, to which she replied, "It would not do for men to fight and to starve, too" (Volo and Volo 2003, 241) (Blumenthal 1992, 63) (Meltzer 1987, 145).

It is important to note that the rough jokes and snide remarks of a sexual nature often associated with women camp followers are more characteristic of the armies of the American Civil War than those of the Revolution. The role of women with the army, outside of any personal relations with their husbands, was to remain of a nonsexual nature. Married women were to be provided with certificates to that effect, which detailed the name of their husband and his regiment. Unmarried women were ordered to be "sent off," but no distinction was made for older girls, perhaps the daughters or siblings of the soldiers. Officially prostitution was banned in the camps, and those found practicing the trade were made to feel unwelcome. Confirmed prostitutes would have found the hard coin of the British paymaster far more attractive than the paper currency of the Patriots in any case. However, it proved impossible to police all the hundreds of legitimate sexual relationships among husbands, wives, and lovers in the camps to cull out the illicit ones (Volo and Volo 2003, 241) (Kerber 1980, 56).

LIFE WITH THE ARMY

Patriot women rarely sought refuge in the cities, as loyalist women did, because the urban centers were largely controlled by the British. In the absence of a sanctuary with family or friends, they were forced to follow the Patriot army to come under its protection. The lot of these women was one of hardship and sacrifice. The army was described in a letter written by a lady outside of Boston in 1777 as having "great numbers of women, who seemed to be the beasts of burden, having bushel baskets on their backs, by which they were bent double. The contents seemed to be pots and kettles, various sorts of furniture, children peeping through gridirons and other utensils—some very young infants, who were born on the road—the women barefoot, clothed in dirty rags." An officer described these women as "the ugliest in the world. . . . [T]he furies who inhabit the infernal region can never be painted half so hideous as these women." Most were reported to have one or more children with them, "few with none" (Volo and Volo 2003, 242) (Ellet 1859, 93) (Mayer 1996, 126).

The presence of wives and children with the army, although it could not be avoided without creating distress among the supporters of the American cause, was generally thought to be a great burden. In August 1777, Washington wrote, "In the present state of the army, every incumberence [*sic*] proves greatly prejudicial to the service; the multitude of the women in particular, especially those who are pregnant, or have children, are a clog upon every movement. The Commander-in-Chief therefore earnestly recommends it to the officers commanding brigades and corps, to use every reasonable method in their power to get rid of all such as are not absolutely necessary." Washington hoped to limit "the proportion of women which ought to be allowed to any number of men, and to whom rations shall be allowed." From time to time, quotas were discussed, but they were never really put into practice (Volo and Volo 2003, 242–43) (Fitzpatrick 1931–1939, vol. 9, 17, 203).

In this regard, the total of women's rations was established at a 15th of the issues for noncommissoned officers and privates. The wives could earn their rations by taking up work, and rates of pay were established for washing and other duties. However, in a cash-starved army, "the soldier, nay the officer, for whom they wash has naught to pay them." However, the general understood that ultimately he "was obliged to give provisions to the extra women in [the] regiments, or lose by desertion, perhaps to the enemy, some of the oldest and best soldiers in the service" (Kerber 1980, 56) (Fitzpatrick 1931–1939, vol. 9, 78–80).

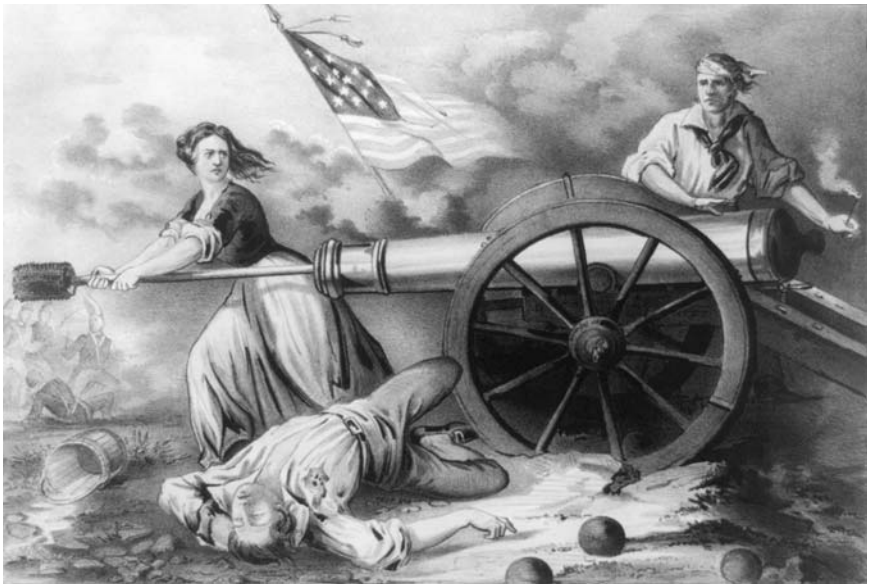
It was generally expected that the camp followers would refrain from marching among the ranks of men. When the army marched into Philadelphia in 1777, Washington gave detailed orders as to the appearance and decorum of the column. "If any soldier shall dare to quit his ranks, he shall receive thirty-nine lashes at the first halting place afterwards.... Not a Woman belonging to the army is to be seen with the troops on their march thro' the City." An eyewitness recounted, however, that the women were determined to be with their men, although they were "spirited off into the quaint, dirty little alleyways and side streets." Nonetheless, the army had barely passed through the main streets of the town before the women "poured after their soldiers again, their hair flying, their brows beady from the heat, their belongings slung over one shoulder, chattering and yelling in sluttish shrills as they went, and spitting in the gutters" (Volo and Volo 2003, 243) (Fitzpatrick 1931–1939, vol. 9, 126) (Preston 1933, 179).

Approximately 25 general orders were issued by Washington concerning women among the forces. The majority of them dealt with women riding in the wagons of the army: "Any woman found in a wagon contrary to this regulation is to be immediately turned out." The repeated requests for women to refrain from riding on the wagons suggests that they largely failed to comply with the general's expectations. Nonetheless, women who could ride on horseback were considered an asset if they would serve as drovers and thereby "diminish the number of drivers taken from the army" (Volo and Volo 2003, 243) (Fitzpatrick 1931–1939, vol. 9, 347) (Kerber 1980, 56).

ON THE BATTLEFIELD

There are several stories of heroic actions by women camp followers who took up their husbands' posts when they fell in battle. Over time it is likely that many of the details of their service have become mythologized or otherwise exaggerated. Mary Ludwig Hays, who has come to be known as "Molly Pitcher," may well be the best-known woman to have served in battle. Hays, like many other women known as "Molly Pitchers," carried water to relieve the thirst of soldiers in battle. The legend claims that at the battle of Monmouth, Mary Hays saw her husband, an artilleryman, hit by a British shell. She dragged him out of the way of further harm, and then returned to the battle, taking his place at the cannon. While Mary Hays is believed to have been present at the battle, there is evidence that her story may be an amalgamation of the deeds of many women. Private Joseph Plumb Martin recalled a scene he witnessed at the battle of Monmouth that day.

> A woman whose husband belonged to the artillery and who was then attached to a piece in the engagement, attended with her husband at the piece the whole time. While in the act of reaching a cartridge and having one of her feet as far before the other as she could step, a cannon shot from the enemy passed directly between her legs without doing any other damage than carrying away all the lower part of her petticoat. Looking at it with apparent unconcern, she observed that it was lucky it did not pass a little higher, for in that case it might have carried away something else, and continued her occupation. (Volo and Volo 2003, 244) (Scheer 1962, 132–33)



This idealized Currier and Ives print shows Molly Pitcher using a rammer on a cannon during the Battle of Monmouth. Her dead husband lies at her feet and a soldier prepares to light the fuse. In the background, the American flag. Courtesy of the Library of Congress.

Margaret Cochran Corbin served at her husband's side when he fell at his artillery piece at Fort Washington. It is said that she immediately took his place and continued there until she, herself, was wounded. Margaret Corbin was the first woman to receive a lifetime pension from the United States for her service-related disability received in action (Volo and Volo 2003, 245).

OFFICERS' WIVES

The wives of officers in the American army were not as likely to accompany their husbands on campaign as were those of the lower classes. Nor were they considered camp followers. Being from that part of colonial society that was generally better off financially allowed the wives and families of officers to find sanctuary among a wider range of friends and relatives capable of supporting them in the interim. The massive redistribution of populations during the war severely strained these resources, however, and individual households thought to be out of the way of the enemy swelled to accommodate fleeing friends and relatives. Jean Blair voiced her frustration when 20 "guests" sought refuge in her home in 1781. "I hardly ever knew the trouble of house keeping before, a large family and continual confusion and not any thing to eat but salt meat and hoecake and no conveniences to dress them" (Volo and Volo 2003, 245) (Norton 1980, 200).

Traveling with an army was both arduous and dangerous even for the wives of officers. The baggage train of the army, complete with women, children, and wounded, might be attacked by the enemy, and detachments were made from the army to deter such operations. Any man with the means to provide for his family away from the army would never willingly subject them to such experiences. Nonetheless, some officers' wives did meet their husbands in winter quarters when the army was not on the move. The practice was begun when Martha Washington and some other ladies joined their husbands outside Boston for the winter of 1775–1776. In 1778, Lafayette wrote to his wife in France from the encampment at Valley Forge, "Several staff officers are having their wives join them in camp. I am very envious—not of their wives, but of the happiness that this opportunity brings them. General Washington has also resolved to send for his wife" (Volo and Volo 2003, 245) (Mayer 1996, 15) (Blumenthal 1992, 86).

The official attitude toward these women was greatly different from that toward soldiers' wives. Officers' wives were considered ladies, and as such were accorded respect appropriate to their social station or the rank of their husbands. These women also made contributions to the war effort in their own way, by mending uniforms, sewing shirts, and knitting stockings for the soldiers. From time to time they visited the camps, dispensing food to the hungry and offering encouragement to the sick or emotionally distressed (Volo and Volo 2003, 245–46).

The gathering of the officers and their ladies during the winter created a kind of social season complete with dinners and dances, albeit considerably subdued from those of the prewar period. Dorothy Dudley wrote on January 30, 1777: "Madame Washington has enlivened the monotony of her winter among us by a reception, on the seventeenth anniversary of her wedding day. The fine old Vassall mansion was in gala dress, and the coming and going of guests brightened the sober aspect of the General's head-quarters." Several months later Dudley further elaborated on the event in a letter to a friend, "No display, no extravagance; but simple taste suited to this time of universal economy, characterized all the arrangements" (Volo and Volo 2003, 246) (Dudley 1971, 55, 69).

Major General Nathanael Greene wrote of the social regime he experienced during the winter of 1778–1779: "I spent a month the most agreeable and disagreeable I ever did a month in my life. We had the most splendid entertainment imaginable; large assemblies, evening balls, etc. It was hard service to go through the duties of the day. I was obliged to rise early and to go to bed late to complete them. In the morning a round of visiting came on. Then you had to prepare for dinner, after which the evening balls would engage your time until one or two in the morning" (Volo and Volo 2003, 246) (Tebbel 1954, 308).

WOMEN IN UNIFORM

Deborah Sampson (who is often known under her later married name of Gannett) took a bold step when giving her support to the cause of liberty. One night the young woman left home and journeyed 30 miles north to another community, where, dressed as a man, she enlisted in the Fourth Massachusetts Regiment as a youth, "Robert Shurtleff." Sampson was slightly wounded in battle several times. Fearing detection, she insisted each time upon treating her own wounds. Her fraud was uncovered when she contracted a fever and was hospitalized. "Private Shurtleff" was then honorably discharged from service in October 1783. Sampson's experience was not unique. Military records show that in August 1777, "Samuel Gay" of Massachusetts was "discharged, being a woman, dressed in men's cloths." Another woman, Sally St. Clair, is said to have kept her gender concealed until she was killed during the battle of Savannah. These are only a few women known to have served. There may have been others of whom no record exists, or those whose secret was never discovered. In every case where a woman was discovered passing as a man, she was discharged from the service (Volo and Volo 2003, 249) (Raphael 1991, 125).

It may seem strange that a woman living in such close quarters with men could conceal her gender for so long, but several eighteenth-century social presumptions made such a deception much easier than it would be today. Clothing did much in this period to establish the trade, wealth, and gender of the wearer. If you dressed as a merchant, it was assumed that you were a merchant. People did not generally dress out of their station, and women did not dress in male attire. Biases about the physical, emotional, and intellectual abilities of women, as well as limitations regarding acceptable female roles, forestalled the concept of a female soldier and minimized the likelihood of the men raising suspicions about another soldier's gender. It is likely that a young, thin woman in disguise would be seen as a male youth of frail physique who had not yet begun to shave. The disguise would be even more complete if the woman was physically strong and able to sustain the rough language and behavior of her fellow soldiers (Volo and Volo 2003, 249–50).

INDEPENDENCE AND A NEW BEGINNING

VICTORY

If one simply tallies the military strength and resources available, Americans entered the revolution with little prospect of military victory over Britain. Only the intervention of France, and support from Spain and Holland, allowed the war to end as it did. The many victories won by British arms on American soil prior to Yorktown should have proved decisive in ending the Revolution. The series of defeats suffered by Washington's army in New York alone should have ended the war in November 1776. The subsequent loss of Newport, Savannah, Charleston, and the nation's capital at Philadelphia should have ended the war by 1780. That they did not makes the War for Independence that much more remarkable.

The battles of the American Revolution were fought by relatively small armies, compared to the giant forces that swarmed across Europe during the eighteenth century. This is important to better understanding the nature of the conflict in North America. Decisive battles in Europe involved many more men, and the killed and wounded often numbered one-third of those on the field. In America not only were the armies smaller, but so was the number killed and wounded. Generally low casualty rates allowed both armies to survive repeated tactical defeats to fight again (Volo and Volo 2003, 339).

Small armies rely more on capable leadership and creative strategy than do larger ones. The Patriots seem to have been blessed with both. A limited number of troops also emphasizes the importance of terrain, of unit morale and cohesion, and of the concentration of fire upon the enemy. Small unit operations, the interdiction of supply lines, the use of surprise and other stratagems, and a reliance on the effects of partisan warfare were never more important than they were in the Revolution (Volo and Volo 2003, 339) (Black 1999, 105).

Washington quickly surmised that he could win the war only by keeping his army intact until Britain tired of fighting. Both he and his opponents considered the war one of outposts and ambuscades. The Patriots won few pitched battles, but their victories came when they were most needed. The continuance of the war hinged on the successes at Trenton and Princeton in the winter of 1776–1777. Without these victories the Patriot army might easily have dissolved into the footnotes of history. Likewise, an otherwise indecisive battle fought in the heat of late June 1778 at Monmouth, New Jersey, showed that the Patriots could face adversity in a European-style engagement. The training and discipline acquired by the Patriots during the Valley Forge winter were evident even to their opponents, making Monmouth the last major battle fought in the North. Thereafter, British strategy turned to the southern colonies (Volo and Volo 2003, 340).

INDECISIVE WARFARE

Much of America was never firmly controlled by either side through eight years of warfare. Whole armies were surrendered, and strategic positions were taken and retaken, without a decisive determination of victory or defeat. It may be that decisiveness simply eluded military strategists throughout the struggle. Even after their defeat at Yorktown, the British retained undisputed control of many of America's major urban centers, and they had more than 30,000 troops on station in America. The Revolution was a war waged "upon territories already fought over, sometimes more than once, by the contestants in conflicts over and done with." Nonetheless, many historians rank Saratoga and Yorktown among the dozen most decisive battles in military history (Volo and Volo 2003, 340) (Keegan 1997, 138).

COMMON CAUSE

It seems clear that the Patriots were unprepared to found an entirely new form of government when the war ended. The immediate reaction to victory was one of sometimes violent retribution directed at the loyalist population. At least 100,000 Loyalists fled to England or Canada during the course of the Revolution. Many waited until 1782 to take ship with the last of the Redcoats to leave New York City, hoping in vain for a positive turn in British fortunes. One historian has noted, "The formation of the Tory or Loyalist party in the American Revolution; its persecution by the Whigs during a long and fratricidal war, and the banishment or death . . . of these most conservative and respectable Americans is a tragedy but rarely paralleled in the history of the world" (Volo and Volo 2003, 340) (van Tyne 1999, 182).

In March 1783, two seditious papers were circulated among the patriot officers at the encampment at Newburgh, New York, suggesting that the army overthrow Congress and the state governments, and set up a monarchy or dictatorship. The papers were unsigned. Washington was apprised of the situation, and at a meeting in the Temple, a large building used for church services, he quietly defused the potential disaster by employing a simple piece of theatrics. As he rose to speak, he took out his eyeglasses to scan the offending papers. He then said:

> Gentlemen . . . I have not only grown gray, but almost blind in the service of my country. . . . Let me plead with you . . . that you express your utmost horror and detestation of the man who wishes to overturn the liberties of our country and who wickedly attempts to open the floodgates of civil discord and deluge our rising empire in blood. (Volo and Volo 2003, 341) (Wainger et al. 1956, 107)

Washington took formal leave of his officers at Fraunces Tavern, at the corner of Broad and Pearl Streets in New York City, some months later. It was a tear-filled scene as the former commander in chief shook the hand of every man in attendance. He said only a few words: "With a heart full of love and gratitude I now take leave of you. I most devoutly wish that your later days may be as prosperous as your former ones have been glorious and honorable" (Volo and Volo 2003, 341–42) (Wainger et al. 1956, 108).

In forming a new national administration, there were many Patriots with reservations about the exact limits of power to be given to the federal government and what authority should remain with the states and the individual citizen. A central government without proper limits to its power would result in trading a tyrannical monarch for a despotic congress. The founders, therefore, designed a government under the Articles of Confederation that would possess only those powers necessary to provide for the common needs of the 13 states. In this regard Congress may initially have gone too far. The obvious weakness of the Articles quickly threatened the existence of the nation. Thus, less than five years from the end of the war, the entire problem of governance had to be revisited again by the Constitutional Convention (Volo and Volo 2003, 342).

The Patriots were all volunteers—citizen soldiers—and they fought for independence under the specters of impoverishment, imprisonment, disability, or even death without resorting to European-style conscription. John Marshall, who served in the army and later became chief justice of the Supreme Court, wrote, "I found myself associated with brave men from different states who were risking life and everything valuable in a common cause" (Volo and Volo 2003, 342) (Purcell and Burg 1992, xi).

THE NEW NATION TAKES SHAPE, 1789–1820

Chronology, 1789–1820

1789 January: Georgetown University, the first Catholic college in the United States, is founded

February: Electors cast ballots in the first presidential election, selecting George Washington

March: Pennsylvania lifts its ban on stage plays

April 30: George Washington is inaugurated as the first president of the United States

May 7: U.S. Protestant Episcopal Church is established

May 12: Society of Saint Tammany is founded in New York City

September 29: Congress establishes an army of 1,000 men

October: George Washington tours New England

November 26: First national Thanksgiving Day

1790 First U.S. census tallies a population of 3,929,625

Prison reformers apply the idea of rehabilitation at Philadelphia's Walnut Street Prison

Duncan Phyfe begins making furniture in New York City

Revivals that foreshadow the Second Great Awakening begin in New England

Mercy Otis Warren's *Poems, Dramatic and Miscellaneous* is published

The *Universal Asylum, and Columbian Magazine* begins publication in Philadelphia

The *New-York Magazine, or Literary Repository* first appears

February: Quakers petition Congress to abolish slavery

March: In Philadelphia, John Martin gives the first major stage performance by an actor born in America

April 17: Benjamin Franklin dies at age 84

May: Adherents of Universalist religious doctrines meet in Philadelphia

Washington signs into law the nation's first copyright statute

The *Philadelphia Spelling Book* is the first book to receive a copyright under the new law

August: The merchant vessel *Columbia* arrives in Boston after circumnavigating the globe

John Carroll becomes America's first Roman Catholic bishop

October 18: General Josiah Harmar's expedition against northwestern Indians is defeated near Fort Wayne

December: Congress relocates the national capital from New York City to Philadelphia

In Pawtucket, Rhode Island, Samuel Slater opens America's first cotton mill, the start of U.S. industrialism

1791 John Adams's *Discourses of Davila* is published

William Bartram's *Travels* is published

Thomas Paine's *Rights of Man* is published

Benjamin Banneker begins publishing an almanac

Massachusetts Historical Society is founded

John Fitch receives a patent for a steamboat

February: Bank of the United States is chartered

April–June: Washington tours the South

November 4: Northwestern Indians defeat a U.S. force under General Arthur St. Clair

December: Virginia ratifies the Bill of Rights, providing the necessary approval by three-quarters of the states to make it part of the U.S. Constitution

1792 February: Thomas Paine's *Rights of Man,* part 2 is published

Jedidiah Morse's *The American Geography, or, a View of the Present Situation of the United States of America* is published

Noah Webster's *An American Selection of Lessons in Reading and Speaking* is published

The *Lady's Magazine and Repository of Entertaining Knowledge* appears in Philadelphia

Old Farmer's Almanac appears for the first time

The Boston Crown Glass Company begins producing window glass

April: Kentucky rejects measures that would exclude slavery and enters the Union as the 15th state in June

The National Coinage Act establishes a mint in Philadelphia, a decimal system for coins, and a 15:1 ratio of silver to gold in the U.S. dollar

May: Robert Gray sails his ship *Columbia* into the mouth of the great watercourse he will dub the Columbia River

The New York Stock Exchange is established

August–September: Opposition to the government's excise tax on whiskey grows in Pennsylvania and certain parts of the South

November: Second presidential election takes place

December: When electoral votes are counted George Washington wins a second term

1793 Hector St. Jean de Crevecoeur's *Letters from an American Farmer* is published

The periodical the *New Hampshire Magazine: Or, The Monthly Repository of Useful Information* begins publication

Published quarterly in New York, the *Free Universal Magazine* addresses religious topics

The first daily newspaper is Noah Webster's *American Minerva,* published in New York

Samuel Slater opens a Sunday school for children working in his Pawtucket factory to teach them basic educational skills

Eli Whitney invents the cotton gin

January: First hot air balloon flight in the United States takes place in Philadelphia

February 1: France declares war on Great Britain, Spain, and the Netherlands

February 12: Congress passes Fugitive Slave Act

April 22: Washington declares American neutrality concerning the European war

July 31: Thomas Jefferson resigns as secretary of state, to become effective on December 31

September 18: Washington lays the cornerstone for the U.S. Capitol in the new federal capital

November: Slave riots break out in Albany, New York

1794 *The Monthly Miscellany, or Vermont Magazine* begins publication

March: U.S. Navy is established

April: Pennsylvania abolishes capital punishment except for murder

May: Philadelphia shoemakers organize the first trade union in the United States

July: Whiskey Rebellion breaks out in Pennsylvania; it is quickly suppressed

August 20: U.S. Army defeats northwestern Indians at the Battle of Fallen Timbers

November: Jay's Treaty with Great Britain is concluded

1795 Several periodicals begin publication in Philadelphia, including the *American Monthly Review* and the *Philadelphia Minerva*

An inclined wooden railroad is built on Beacon Hill in Boston

January 31: Alexander Hamilton resigns as secretary of the treasury

June 24: Jay's Treaty is ratified despite its unpopularity

August: Treaty of Greenville signed with Ohio Indian tribes

October: Treaty of San Lorenzo (Pinckney's Treaty) is concluded with Spain

1796 Amelia Simmons's *American Cookery* is the first American cookbook

March: The U.S. Supreme Court rules on the constitutionality of a 1794 congressional statute, the first time that the Court renders such a decision

Pinckney's Treaty is ratified

May: Congress passes a land law to facilitate the sale of public lands in the Northwest Territory

June 1: Tennessee becomes a state

September 17: George Washington's Farewell Address appears in the Philadelphia *Daily American*

October: The *Otter* is the first American ship to explore the California coastline

November: France suspends diplomatic relations with the United States

December: John Adams is elected second president of the United States

1797 Jedidiah Morse's *The American Gazetteer* is published

January: New York moves its capital to Albany

March 4: John Adams is inaugurated as the second president

May: The frigate *United States*, the first vessel in the new U.S. Navy, is launched

June: Charles Newbold patents a cast-iron plow

September: The frigate *Constellation* is launched

October: The French rebuff an American peace commission unless it offers bribes, a continuing demand that will result in the XYZ Affair

The frigate *Constitution*, destined to become known as "Old Ironsides" during the War of 1812, is launched

1798 January–March: Negotiations in Paris break down completely

April: President Adams reports on the XYZ Affair to Congress

The Mississippi Territory, which embraces the eventual states of Alabama and Mississippi, is created

June: Congress abolishes debtor prisons

June–July: Congress passes the Alien and Sedition Acts

July: As potential war looms with France, George Washington is appointed commander in chief of the U.S. Army

Congress creates the U.S. Marine Corps and establishes the forerunner of the U.S. Public Health Service

September: Benjamin Bache, Benjamin Franklin's grandson, is arrested under the Sedition Act for allegedly libeling President John Adams

November: The Kentucky Resolutions protesting the Alien and Sedition Acts are adopted by the Kentucky legislature

December: The Virginia Resolutions protesting the Alien and Sedition Acts are adopted by the Virginia legislature

Eli Whitney begins an attempt to make guns with interchangeable parts

1799 Deerfield Academy is founded in Massachusetts

The shoemakers' trade union in Philadelphia (officially the Federal Society of Cordwainers) stages the first successful strike in American history

January: Congress passes the Logan Act, making it unlawful for American citizens to engage in private diplomacy with foreign governments

February: Congress passes the first law authorizing federal help to cities implementing health quarantines

A taxpayer revolt led by Pennsylvanian John Fries collapses after his arrest

March: New York enacts measures to facilitate the gradual emancipation of slaves within its borders

May: After months of undeclared war on the high seas, France offers to open peace talks

December 14: George Washington dies at age 67

1800 Second U.S. census counts about 5.3 million people, marking an increase of 35 percent in the population

The *Waverly Magazine* and the *Literary News, a Monthly Journal of Current Literature* begin publication

Pennsylvanian John Chapman begins his 50-year campaign to grow and tend apple trees in the Ohio River Valley, a vocation that will earn him the nickname "Johnny Appleseed"

George Washington's widow Martha is granted free mail service

Congress founds the Library of Congress

January: Philadelphia free blacks unsuccessfully petition Congress to end slavery and repeal all legislation supporting it

April: The first Federal Bankruptcy Act is enacted

May: The Land Act of 1800 revises policies for the sale of public lands

June: The federal government moves from Philadelphia to the new capital at Washington, D.C.

August: The Gabriel slave rebellion is prevented outside Richmond, Virginia, when it is prematurely discovered

September: France and the United States end their undeclared naval war with the Treaty of Montefontaine to take effect on December 21

October 7: Gabriel, leader of the slave rebellion, is hanged

November: Congress meets for the first time in Washington, and John Adams moves into the unfinished Executive Mansion

December: The quadrennial presidential election is held, but electoral ballots are not counted until the following February

1801 *The American Ladies' Pocket-Book* appears, describing itself as a "useful register of business and amusement, and a complete repository of fashion, literature, the drama, painting, and music"

The New York Academy, a public art museum, is founded but will cease to exist in 1805

January: John Marshall appointed chief justice of the U.S. Supreme Court

February 17: Thomas Jefferson becomes the third president-elect after a tie with Aaron Burr in the Electoral College throws the election into the House of Representatives

February: Judiciary Act revising the federal court system is passed

March 4: Thomas Jefferson is inaugurated as third president of the United States

August: A massive camp meeting revival at Cane Ridge, Kentucky, gives momentum to the Second Great Awakening in the West

December 8: Jefferson establishes the custom of sending annual messages (the equivalent of the State of the Union message) to Congress rather than delivering them in a speech, a tradition that continues until Woodrow Wilson departs from it in 1913

1802 *Catalogue of the Books, Maps, and Charts, Belonging to the Library of the Two Houses of Congress: Apr, 1802* is published

John James Beckley becomes first librarian of Congress

James Stevens designs a screw propeller

March: Congress repeals the Judiciary Act of 1801

Congress authorizes the establishment of the United States Military Academy at West Point, New York

The Peace of Amiens temporarily ends the European war

April: Rumors circulate that Spain has ceded Louisiana to Napoleon's France

July 4: The United States Military Academy formally opens

October: Spain unexpectedly closes New Orleans to American commerce, a violation of Pinckney's Treaty

November: In preparation for statehood, Ohio holds a state constitutional convention

1803 February: The Supreme Court ruling in *Marbury v. Madison* establishes the principle of judicial review

March 1: Ohio becomes the 17th state

April: Spain restores the right of deposit at New Orleans

May 2: The Louisiana Purchase Treaty is signed in Paris

August: The Corps of Discovery led by Meriwether Lewis and William Clark starts its westward journey beginning on the Ohio River

December 20: United States takes possession of the Louisiana Territory

1804 The first part of John Marshall's five-volume biography of George Washington appears, to continue through 1807

The New-York Historical Society is established

February: New Jersey institutes the gradual emancipation of its slaves

March: Congress revises land policy with the Land Act of 1804

May: The Lewis and Clark expedition embarks from St. Louis

Napoleon Bonaparte crowns himself emperor of France

July 11: Aaron Burr mortally wounds Alexander Hamilton in a duel at Weehawken, New Jersey

August 20: Charles Floyd succumbs to appendicitis, the only member of the Lewis and Clark expedition to die on the journey

December 5: Thomas Jefferson is reelected president

1805 Mercy Otis Warren's three-volume *The Rise, Progress, and Termination of the American Revolution* is published

Charles Willson Peale founds the Pennsylvania Academy of Fine Art, a public art museum

Ice is first exported from New England to the Caribbean

January: Part of the Indiana Territory is used to create the Michigan Territory

March 1: The Senate acquits impeached Supreme Court justice Samuel Chase

March 4: Thomas Jefferson is inaugurated for his second term as president

May: A strike for higher wages by the trade union of Philadelphia shoemakers fails when its leaders are arrested

The Lewis and Clark expedition sights the Rocky Mountains

July: Britain restricts U.S. trade with the French West Indies

August: Lieutenant Zebulon Pike leads an exploratory expedition into the Minnesota region

November: Lewis and Clark see the Pacific Ocean and establish a winter encampment at the mouth of the Columbia River

1806 Noah Webster's *Compendious Dictionary of the English Language* is published

Williams College students found the Brethren, the first American society to promote foreign missionary journeys

January 17: The first child born in the new Executive Mansion is Thomas Jefferson's grandson, James Madison Randolph

March: Congress authorizes the construction of the National Road from Cumberland, Maryland, to Wheeling, Virginia

April: Congress begins a long experiment using commercial restriction to persuade Britain and France to respect American commercial rights

May 30: Andrew Jackson kills Nashville attorney Charles Dickinson in a duel

July: Zebulon Pike leads another exploratory expedition, this time into the Southwest

September: The Lewis and Clark expedition arrives in St. Louis

November: Zebulon Pike's expedition sights the mountain that will later be named Pikes Peak

Napoleon issues the Berlin Decree

December: Jefferson requests that Congress prohibit slave importation as of January 1, 1808

1807 Essays by New Yorkers Washington Irving, William Irving, and James Kirk Paulding inaugurate a style that features American subjects and is gradually identified as the Knickerbocker School

Robert Fulton's *Clermont* is the first successful steamboat

January: Britain's Orders in Council restrict American shipping in response to Napoleon's Berlin Decree

February: Aaron Burr is arrested in the Mississippi Territory and will later be indicted for treason

March: Congress prohibits the foreign slave trade, to take effect on January 1, 1808

June: The British frigate *Leopard* fires on and boards the USS *Chesapeake* to remove alleged British deserters

September: Aaron Burr is acquitted of treason in Richmond, Virginia

December: Napoleon issues the Milan Decree, an additional insult to American neutrality

Congress enacts the Embargo Act, which bans all trade with foreign countries

1808 The *Missouri Gazette* of St. Louis becomes the first newspaper west of the Mississippi

The public art museum is revived in New York with the establishment of the New York Academy of Fine Arts

The opulent opera house Theatre d'Orleans opens in New Orleans

A temperance society is formed in New York City

January 1: The foreign slave trade is abolished

July: William Clark and others establish the Missouri Fur Company in St. Louis

December: James Madison is elected fourth president of the United States

1809 Washington Irving's *History of New York* is published under the pseudonym Diedrick Knickerbocker

James Stevens's steamboat cruises from Hoboken, New Jersey, to the Delaware River, the first ocean journey by a steamboat

January: Congress enacts legislation to enforce the increasingly unpopular embargo

February: Anger about, and resistance to, the embargo increases, especially in New England

March: Jefferson signs legislation that repeals the embargo and replaces it with less severe restrictive measures

The Illinois Territory, embracing present-day Illinois, Wisconsin, and eastern Minnesota, is created

March 4: James Madison is inaugurated as president

July: The Shawnee Tecumseh begins laying plans for an Indian confederation to resist American expansion in the Northwest

1810 The third census shows a 36.4 percent increase in the U.S. population to 7,239,881

The Boston Philharmonic Society establishes America's first symphony orchestra

One hundred cotton mills are operating in Rhode Island and Pennsylvania

Hot air balloonists A. R. Hawley and Augustus Post travel more than one thousand miles from St. Louis to Canada

May: Congress passes Macon's Bill No. 2, yet another variation of its increasingly ineffective effort to coerce British and French respect for American neutral rights

July: The New York trial of striking shoemakers in that city follows Philadelphia's 1806 lead in determining that such strikes are criminal conspiracies

September: Americans in the western part of West Florida rebel against Spanish authority and request annexation by the United States, a request to which the Madison administration consents in the following month

October: Country fairs have their origin in the Berkshire Cattle Show in Massachusetts

1811 Astoria, the first permanent American settlement in the Pacific Northwest, is established at the mouth of the Columbia River

The steamboat *New Orleans* completes a four-month passage from Pittsburgh to New Orleans and commences riverboat service between New Orleans and Natchez

January: Congress secretly authorizes the annexation of Spanish East Florida if residents agree or if another foreign power moves to occupy the province

March 4: Bank of the United States closes because Congress has refused to renew its charter

November: Construction of the National (Cumberland) Road commences

November 7: William Henry Harrison's force fights the Battle of Tippecanoe and destroys the principal village of Tecumseh's confederation

December 16: Centered at New Madrid, Missouri, one of the strongest earthquakes to occur in North America rocks the Mississippi River Valley

1812 David Rice's pamphlet *A Kentucky Protest against Slavery* is published

January 23: Another, stronger earthquake occurs at New Madrid, Missouri

February: Massachusetts governor Elbridge Gerry signs a bill that creates voting districts deliberately drawn for partisan advantage; their cartographic resemblance to a salamander gives rise to the term "gerrymander" to describe the practice of using redistricting to marginalize political opponents

February 7: Possibly the most powerful earthquake ever to occur in North America strikes New Madrid, Missouri, causing the Mississippi River to flow backward and resulting in thousands of aftershocks

April: As war looms with Britain, Congress enacts an embargo and authorizes President Madison to call up the militia

April 20: Vice President George Clinton's death leaves that office vacant for the remainder of Madison's first term; Elbridge Gerry will become vice president–elect in December upon Madison's reelection

April 30: Louisiana enters the Union with its capital of New Orleans the fifth largest city in the country

June 19: The United States declares war on Great Britain, thus beginning the War of 1812

July–August: Opposition in New England prompts Connecticut and Massachusetts to withhold their militias from the American war effort

August 16: Detroit is surrendered to British forces

August 19: USS *Constitution* defeats HMS *Guerrière* and is dubbed "Old Ironsides"

September: Russian tsar offers to mediate the Anglo-American war

October 25: USS *United States* defeats HMS *Macedonian*

December: James Madison wins reelection to the presidency

The British Royal Navy blockades the mid-Atlantic Coast

December 29: USS *Constitution* defeats HMS *Java*

1813 January 22: Following an American defeat at Frenchtown just west of Lake Erie, Indians massacre American prisoners on the River Raisin

March: United States accepts the Russian mediation offer, but Britain rejects it

March 4: James Madison is inaugurated for a second term

April: U.S. forces occupy Spanish Mobile

April 27: U.S. forces burn York (modern Toronto)

May: British extend their blockade southward into the Gulf of Mexico

June 1: HMS *Shannon* defeats USS *Chesapeake*

American captain James Lawrence is fatally wounded but shouts, "Don't give up the ship!"

September 10: Captain Oliver Hazard Perry's U.S. squadron defeats its British counterpart in the Battle of Lake Erie

October 5: William Henry Harrison defeats the British and their Indian allies at the Battle of Thames, where Tecumseh is reportedly killed

November: In the Creek War that overlaps the War of 1812, Tennessee militia forces under Andrew Jackson converge on the Creek Nation to fight a series of bloody but indecisive battles against Indians there

December: The Niagara frontier becomes the scene of retaliatory violence by American and British forces

1814 At Waltham, Massachusetts, Francis Lowell opens the first factory that integrates powered textile machinery for spinning and weaving, the forerunner of his factory complex at Lowell, Massachusetts

March 27: Andrew Jackson ends the Creek War by decisively defeating nativist Creeks at the Battle of Horseshoe Bend

April: Napoleon Bonaparte is defeated and removed from power, freeing British veterans for the American war

The Royal Navy extends its blockade to New England

July 25: A stalemate at Lundy's Lane near Niagara Falls is the bloodiest battle of the war

August 9: Treaty of Fort Jackson cedes 23 million acres of Creek land to the United States

August 24–25: British forces occupy Washington, D.C., and burn its public buildings, including the Executive Mansion

September 11: A British invasion of New York is repulsed at Plattsburgh

September 12–14: The British effort to take Baltimore fails after an extended bombardment of Fort McHenry

Francis Scott Key writes "The Star-Spangled Banner" to commemorate the American victory

November 23: Elbridge Gerry dies at age 70

December: The British begin their campaign against New Orleans

New England Federalists convene at Hartford, Connecticut, to protest the war

December 24: Peace commissioners meeting at Ghent sign a treaty ending the War of 1812

1815 The *North American Review* is published in Boston

Jedidiah Morse's pamphlet *Review of American Unitarianism* traces the growing controversy caused by the doctrine

John Stevens receives the first charter in the United States to build a railroad, but the project will languish for more than a decade

Baltimore's streets are illuminated by gaslights as the city's Gas Light Company becomes the first firm of its kind

January: The Hartford Convention adjourns after adopting resolutions that oppose the war and seek to redress New England's waning political influence

January 8: Andrew Jackson defeats the British at the Battle of New Orleans and becomes a national hero

February 17: The War of 1812 officially ends with the exchange of ratifications of the Treaty of Ghent

February–March: Congress reduces the size of both the army and navy

July–August: The U.S. Navy forces the North African sponsor states of the Barbary pirates to sign treaties

December: Madison proposes a public works program and the establishment of another national bank

1816 John Pickering's *Vocabulary* catalogs indigenous American words and phrases

March: Congress establishes the Second Bank of the United States

April: The African Methodist Episcopal Church is established in Philadelphia

June–August: Volcanic eruptions in Indonesia alter the world's climate, depriving New England of a growing season as almost a foot of snow falls in June and hard frosts occur throughout July and August

December: James Monroe is elected fifth president of the United States

The American Colonization Society is organized to colonize freed blacks in Africa

Indiana is admitted to the Union

Boston's Provident Institution is the first savings bank in the United States

1817 John Kenrick's *Horrors of Slavery* is published

Henry Shreve's steamboat *Washington* begins commercial service between Louisville, Kentucky, and New Orleans

January: Second Bank of the United States (known as the BUS) opens for business

March: Work begins on the Erie Canal to connect the Hudson River with Lake Erie, a project that will be completed in 1825

The Alabama Territory is created out of the eastern portion of the Mississippi Territory

March 4: James Monroe is inaugurated as president

December: Mississippi enters the Union

1818 The steamboat *Walk-in-the-Water* begins carrying passengers on Lake Erie from Buffalo to Detroit

March: Congress passes legislation granting lifetime pensions to all Revolutionary War veterans

March–May: Andrew Jackson leads an army into Spanish Florida to punish Seminole Indians, but in violation of his orders, he seizes Spanish forts and towns

June: Connecticut ends property ownership as a requirement for voting rights

December: Illinois enters the Union

1819 A serious financial panic ushers in a wide-ranging depression that sets off many bank failures and foreclosures throughout the year

The *Savannah* steams part of the way and sails the rest from Savannah, Georgia, to Liverpool, England, completing the first transatlantic voyage of a steamship

William Ellery Channing delivers a seminal sermon on Unitarianism

January: Congress refuses to condemn Andrew Jackson's behavior during the Florida invasion

February: A crisis over slavery in the prospective state of Missouri develops

Spain formally agrees to cede Florida to the United States for $5 million

March: Congress enacts measures to stop slave smuggling

June: An expedition under Major Stephen H. Long departs from Pittsburgh to explore the region south of the Missouri River, the Great Plains, and part of the Rocky Mountains

December: Alabama enters the Union

1820 January: Eighty-six free blacks embark from New York bound for the British colony of Sierra Leone

February–March: After a lengthy process of negotiation and adjustment, Congress enacts the Missouri Compromise, which temporarily quells arguments over the slavery question

The agreement to admit Missouri to the Union as a slave state is balanced by the admission of Maine as a free state

March: New England missionaries arrive in Hawaii

April: Congress revises the policy and procedures for the sale of public lands with the Public Land Act

December: James Monroe is reelected president of the United States

Overview

The Americans of the early Republic lived through some of the most exciting and perilous years of the nation's history. Having successfully gained independence from Great Britain, a feat whose sheer audacity astonished the world, Americans suddenly found themselves facing an even sterner challenge. They would have to shape diverse elements, different religions, and enormous geographical spaces into a new nation that could remain politically free and become economically prosperous. The great figures and events that shaped their country's destiny moved on a larger stage while they, American individuals, went about their daily routines (Heidler and Heidler 2004, 1).

Many Americans understood the momentous questions of their time with great clarity. Many, for instance, entirely grasped the arguments that caused the American Revolution, especially because years of closely followed debate had broken those arguments down to their barest essentials. The quarrel between Great Britain and its North American colonies is popularly depicted as centering on taxes levied by London, but taxes were a symptom of a more basic argument. Many colonists were disturbed by what they perceived as the steady erosion of their political rights under policies designed by distant and faceless authorities. In the years before the American Revolution, a series of measures by the British king and Parliament sought to strengthen and organize the British Empire, but many colonists in North America were increasingly alienated by this policy. Finally, the belief that their liberty was being systematically weakened caused Americans to take up arms and then, after considerable debate, to declare their independence (Heidler and Heidler 2004, 1–2).

In its simplest terms, the American War of Independence was fought to secure the right to regulate one's own affairs. To understand this is the key to understanding the political events that unfolded during and after the Revolution. The colonies that had transformed themselves into states during the conflict were not willing to relinquish local control to another distant and faceless authority merely because it was based in Philadelphia or New York. Committed to protecting themselves from intrusive regulations imposed by any remote authority, the states agreed only to a central government so weak that it turned out to be largely ineffective—or so argued the nationalists who feared decentralized power threatened the fate of the new republic. From 1781 to 1789, the United States government operated under a document called the Articles of Confederation, which denied the central government the power to tax, always the most irritating manifestation of regulation. Other attitudes etched by the revolutionary experience also appeared in the Articles. They did not create an executive (or president) because a president resembled a king. The government instead consisted of a unicameral legislature in which state delegations voted as blocs, each having one vote regardless of its size or population. Small states consequently felt protected from behemoths such as New York, Virginia, or Pennsylvania.

This system satisfied people who worried over losing what they had fought for—the right to regulate their own localities as they saw fit—but the system's weakness gradually became so apparent that it compelled reevaluation. Most ominous was the financial emergency that engulfed the government and disrupted the economy. The United States carried a staggering debt from the Revolution, and without the power to levy taxes, the Confederation government had no way to fund that debt. The government's sinking credit created uneasiness in the states, whose own debts were frequently just as much a problem. Commerce was crippled, and some states contemplated erecting separate economic systems, which to some Americans seemed a sure prelude to the states breaking away from the United States to establish separate political systems. The experiment in liberty, won with great patriotic sacrifice, seemed fated to fail in its first decade. European monarchies, especially Britain, looked on with unconcealed pleasure (Heidler and Heidler 2004, 2).

Scholars continue to argue over how close to collapse the American government actually was during the Confederation period. Although some claim that the economic and governmental problems were not really that dire, a sense of growing alarm nevertheless prompted Americans to amend the Articles of Confederation.

Ultimately, a major convention of all the states (but Rhode Island) elected to discard the Articles of Confederation and craft a new instrument of government. The result was the Constitution of the United States of America, drafted in 1787 and ratified by the states in the months that followed. Under the Constitution, three separate and distinct branches of the national government would each serve to regulate the behavior of the other two. The legislative branch, consisting of a bicameral congress, would make laws, regulate the currency, and levy taxes; the executive branch would administer and enforce domestic laws and, subject to the consent of Congress, direct foreign policy; and the judiciary branch would administer justice by hearing disputes arising from the law. In theory each branch would exercise vigilance to make sure that the Constitution, both in spirit and in letter, was protected from abridgment or change unless under clearly prescribed processes. The Constitution made the central government strong enough to fulfill its function, but its system of internal checks and balances promised to prevent the government from becoming so powerful as to threaten the liberty of the people (Heidler and Heidler 2004, 2–3).

Of course, people went about the everyday business of expanding the new nation as the Constitution established this new government. In 1790 the first official census counted the American population at nearly four million people, a figure that doubled in the 30 years that followed. About nine-tenths of America remained rural, but cities like Philadelphia (42,000 people), New York (33,000), Boston (18,000), Charleston (16,000), and Baltimore (13,000) were ripening into a rough urbanity. In 1790 few Americans lived beyond the Appalachian Mountains—95 percent of the population resided east of that rolling range—and those who had moved west were mostly in Kentucky, Tennessee, and Ohio, but their growing numbers made it possible for those regions to become states in only a few years rather than many generations. Foreigners observing the rough-and-ready life of American city dwellers and their wilderness cousins were more frequently carping than complimentary. Yet they grudgingly admitted that the strange people in this exotic new land were an enterprising and assured lot, blessed with abundant resources and possessed of the will to make the most of them (Heidler and Heidler 2004, 3).

It is worth remembering that the business of establishing another new government did not always proceed smoothly. Despite the promising opportunities provided by the land's sheer size and the citizens' intention to use it, the sheer size also posed a problem. Americans' traditional distrust of central authority was especially pronounced in the West, where hardy and self-sufficient pioneers cleared forests, slept lightly, and nursed deep suspicions about losing their independence to distant influences. The Mississippi River, more accessible and useful than rough trails through dark forests and over rugged mountains, was their lifeline to the outside world, including the eastern United States, but the Mississippi's southern currents passed through land owned by Spain. For years there would be the question of whether the U.S. government or the Spanish crown could offer these western dwellers the best future. For many years, the U.S. government was not favored in such a contest. Directing domestic affairs was also awkward. The American government's solvency remained uncertain as its revenues dried up while its debt, including a mounting wave of interest, swelled to a crest. The circulating currency was almost worthless, and many states still stumbled under their equally overwhelming indebtedness (Heidler and Heidler 2004, 3–4).

In short, the Constitution and the government it created did not magically solve the new nation's problems. The greater part of that task fell to ordinary Americans, a motley collection of folk who Europeans concluded were not much to look at. Most of the world's people existed in drudgery, many under fierce oppression, and the bosses who superintended that oppression or dictated that drudgery, whether from ornate thrones or rude lairs, were too often complacent in their power. They watched with attitudes ranging from bemused skepticism to outright hostility as ordinary Americans undertook to build a republic so geographically immense and so idealistically principled that there had never been anything like it in the world. The countless names of these Americans would not make it into any history book, nor would likely any of them ever regard their daily customs as particularly influential. But as individuals independently pursuing what turned out to be a collective dream, they were so different from anything before them that they not only conquered their lands but also changed the world beyond them. With callused hands and sweat-soaked clothes, occasionally bloodied by a fight, they proved that courage, tenacity, and endurance could secure liberty and court fortune. There had never been anything like it, or them, in the world.

Under the Constitution's provisions for selecting a president, the Electoral College in 1789 unanimously chose George Washington, greatly admired for his service as general of the Continental army during the Revolution and trusted as a man never to abuse power. Washington remains the only person placed in the presidency honored by such universal accord. Tall for his time at 6'2"—the average height was about 5'7"—Washington was physically imposing but retiring by nature and most reluctant to assume the burdens of the presidency. In his youth, he could be hotheaded and impetuous, but age and experience had steadied him, and though he never claimed great mental agility or pretended to wide learning, his character was as strong as it was stable. His countrymen revered him, and his journey from Mount Vernon to the new temporary capital in New York City showed it. Cannons thundered, bells tolled, and citizens cheered in celebrations that continued even after he took the oath of office on April 30, 1789. Sadly, as virtually all his successors would discover, there would come a time when the ovations became more subdued (Heidler and Heidler 2004, 4).

RIGHTS, REVENUES, AND REBELLION

Persisting in their revolutionary outlook, opponents of the Constitution had criticized it during the ratification debates for failing to pledge that the new government would respect freedom of speech, assembly, religion, and other individual rights. Indeed, the Constitution won ratification in part because of the unspoken promise that it would be amended to include such promises. Although theoretically the Constitution could be changed by a new convention at the request of two-thirds of the states, Federalist proponents such as Virginia congressman James Madison worried that another convention might thoroughly reverse the work of the first one. Consequently, Madison persuaded the necessary two-thirds majorities in both houses of Congress to authorize the simpler amending process of having changes proposed by Congress and put before the states for approval. Madison also drafted the amendments that he then efficiently steered through Congress (Heidler and Heidler 2004, 4–5).

The prescribed three-fourths of the states approved the first 10 amendments to the Constitution in 1791. Known as the Bill of Rights, these measures sought to preserve the most prized American principles of government and society, including freedom of religion, assembly, and speech. They guaranteed a press free from federal government control and a citizenry with the right to bear arms. Citizens are guaranteed trial by jury and can, without fear of reprisal, petition the government for redress of grievances. The Bill of Rights proscribed cruel and unusual punishment and forbid the federal government from seizing private property without due process.

To prevent such a specific list of guaranteed rights from creating the impression that they were the only ones protected, the 9th Amendment stated that identifying these particular rights "shall not be construed to deny or disparage others retained by the people." The 10th Amendment also reserved all rights not explicitly delegated or prohibited by the Constitution "to the States respectively, or to the people." Thus a robust central government spelled out protections for individual liberty and thereby helped to secure not just the grudging consent but the approbation of many of the Constitution's most vocal opponents.

The first Congress also passed the Judiciary Act of 1789, which organized the Supreme Court to be composed of a chief justice and five associates. New York's John Jay became the first chief justice. The Judiciary Act also established federal district and circuit courts and created the office of attorney general.

President Washington's official circle was small, consisting only of three department heads. Alexander Hamilton was secretary of the treasury, Thomas Jefferson was secretary of state, and Henry Knox secretary of war. Jefferson and Hamilton were arguably the most talented men ever to serve a U.S. administration. Because of the government's dire financial problems, the treasury was considered the most important of the executive departments, and its first secretary, Alexander Hamilton, assumed the most prominent role in conducting domestic affairs. Only 34 years old, Hamilton had been a boy wonder, but he had his detractors, who doubted his integrity and suspected his devotion to Republican government. Such qualms were intensified when Hamilton unveiled his plan to repair the country's financial situation (Heidler and Heidler 2004, 5).

Hamilton's first and foremost job was to restore confidence in the government's credit (known as the public credit), something he intended to do not only by funding the total national debt but by assuming all state debts as well. He insisted that ensuring the financial security of the nation at large would require that the credit of constituent parts of the Union, the states, be restored also. Under his plan, the federal government would retire its debt at face value in addition to about $13 million of accrued interest, a huge sum of more than $54 million. Because many supposed that such a massive debt would never be paid off, government bonds had decreased in value to as little as 10¢ to 15¢ on the dollar. The virtual worthlessness of these securities meant that mostly speculators had bought them, but now those speculators stood to reap incredible profits. Widows and war veterans who had sold their worthless government securities for a song felt cheated and betrayed.

The plan to assume state debts—tallied at about $21.5 million—was even more controversial. Hamilton believed that assumption, as the plan regarding state debts was called, would more thoroughly tie the states to the Union by making their wealthy creditors dependent on the federal government for their money. Although Hamilton also reasonably described the states' debts as part of the national obligation because they had been acquired during the Revolution, the plan appeared to states' rights advocates as a devious way of accomplishing centralization. Hamilton's plan elated states like Massachusetts that carried large debts, but states that had pinched pennies to stay solvent, like Virginia, believed they were being exploited to assist spendthrifts. Hamilton ultimately overcame these objections by agreeing to place the nation's capital on the Potomac River in exchange for Virginia's support of his economic plan. He was even able to persuade Thomas Jefferson to back the Hamiltonian system and thus secured the necessary majorities to pass it in 1790.

With the country's debt now ballooning to $75 million, Hamilton had to find sources of revenue to pay the continuing interest on it. He chose to rely heavily on tariff duties that would result from a dynamic import trade. Congress had already passed a tariff law in 1789, and the rate of roughly 8 percent on certain imports promised to fill the bill. At the same time, Hamilton hoped to use the tariff as a way of encouraging domestic industries to take root, but he was less successful in this endeavor. Farmers and merchants controlled Congress during the 1790s, and only two small tariff increases were approved in the following eight years (Heidler and Heidler 2004, 6).

Excise taxes on domestic products—especially a tax on whiskey—generated additional revenue, but they were by far the most unpopular taxes the government levied. Frontier farmers had been distilling their grains into whiskey for years, a process that made corn less unwieldy as well as more profitable for shipment. In regions where whiskey was used like money—even some preachers were paid with whiskey—the tax was detested, and by 1794, resistance in backwoods Pennsylvania was creating a serious domestic crisis. When "revenoors," as these moonshiners derisively labeled tax collectors, were intimidated into inaction, some by physical assault, President Washington perceived a grave challenge to federal authority. Hamilton agreed. The president mustered militias from surrounding states and personally led about 13,000 men part of the way into Pennsylvania, a gesture that was as significant as it was symbolic. Never much of an insurrection in the first place, the Whiskey Rebellion quickly collapsed before the show of federal force, and Washington pardoned the two offenders later found guilty. Yet the repercussions of the little Whiskey Rebellion were momentous, for the question of whether the central government would have the support of the states in times of crisis was decisively answered. Equally telling, on the other hand, were the rising voices of critics who denounced the large militia demonstration as an overreaction and again pointed to Hamilton as the serpent in Washington's garden (Heidler and Heidler 2004, 6–7).

THE BANK OF THE UNITED STATES

To Hamilton's thinking, the most important part of his financial system was a national bank, and his efforts to have Congress authorize the establishment of one sharply divided Washington's cabinet and spurred the formation of factions that evolved into political parties. Hamilton modeled his Bank of the United States on the Bank of England, and like the British institution, the American version would be a private establishment with the government acting as a significant stockholder and principal depositor. The bank would print currency to provide a fluid but stable medium of exchange while regulating credit to stimulate business.

Jefferson, who had grudgingly supported Hamilton's funding and assumption plan, balked at the idea of the bank. In fact, in a written opinion produced at Washington's request, Jefferson forcefully argued against it. His main objection, he claimed, was constitutional. The Constitution, he said, contained no explicit sanction for such a financial institution. Furthermore, since the 10th Amendment (which with the rest of the Bill of Rights was on the verge of being ratified) reserved to the states all powers not specifically granted to the central government, only states had the tacit constitutional authority to establish banks. By interpreting so narrowly the meaning of the Constitution, Jefferson voiced a theory of constitutional understanding called "strict construction" (Heidler and Heidler 2004, 7).

Washington asked Hamilton for a written opinion as well, in which the secretary of the treasury answered Jefferson's objections. In Hamilton's view, the Constitution granted the authority to exercise necessary powers, not impede them. He specifically cited the constitutional directive that Congress could pass "necessary and proper" laws to empower the government to carry out its duties. Because the government had the explicit power to collect taxes and control trade, the government had the implied power to erect such institutions as would assist those activities, such as a Bank of the United States. In direct contradiction to Jefferson's strict construction, Hamilton used the doctrine of implied powers to interpret the Constitution broadly, a reading of the document called "loose construction" (Heidler and Heidler 2004, 7–8).

Ultimately Washington cautiously sided with Hamilton on this issue to sign the bank into law. The Bank of the United States was licensed for 20 years, with its offices in Philadelphia. The institution was capitalized at $10 million, of which 20 percent was held by the federal government, and stock was sold publicly to an enthusiastic response. Yet the congressional debate over the bank had been jarringly venomous on both constitutional and financial grounds. Hamilton had won the day, but Jefferson and his followers, shocked by this defeat, were energized to challenge the secretary on any and all subsequent political fronts (Heidler and Heidler 2004, 8).

FACTIONS BECOME PARTIES

With relative swiftness, Hamilton's policies restored the government's credit, but they did so at a high political price. Funding the debt, assuming state debts, imposing the unpopular excise taxes that had spurred the Whiskey Rebellion, and establishing the Bank of the United States produced a wide array of enemies and gave them common purpose. Soon enough, systematic resistance grew out of the dispute between Hamilton and Jefferson, and acrimonious political debate became customary.

Americans resisted the idea of political parties, however, because many deemed parties to be pawns of special interests and havens for political corruption. During the colonial and revolutionary periods, factions formed over specific issues, flourished briefly during fierce debates, and then withered once the issues were resolved or fell from interest. In addition, the hardships of the Revolution had united all but the most incorrigible dissenters, and as the government drew legitimacy from the consent of the governed, those who opposed it seemed intent on thwarting the will of the people.

Jefferson and Madison's organized opposition to Hamilton was not only an innovation; it was close to being perceived as a dangerous one. Yet an energetic press campaign by the Jeffersonians, countered by Hamilton's supporters in newspapers of their own, both informed ordinary people of the debate and compelled them to take sides in it. From these shadowy factions, political parties took shape and gradually transformed into regular organizations that sponsored candidates and pushed programs. Hamilton's faction became the Federalists, and Jefferson's became the Democratic-Republicans, frequently abbreviated to Republicans (but not to be confused with the modern-day Republican Party, which came into being over the slavery controversy in the 1850s). Nobody at the time thought this was a helpful development—Jefferson and Madison themselves thought their faction would, like others before them, be a temporary arrangement to meet a passing need—but time would demonstrate otherwise. Despite the bickering and apparent stalemates they frequently engendered, political parties became a crucial element of democratic government. Debate from organized opponents kept in check the political behavior of those in power (Heidler and Heidler 2004, 8).

FOREIGN PROBLEMS: THE FRENCH REVOLUTION

Domestic policies encouraged the formation of factions that became parties, but arguments over the U.S. response to the French Revolution hardened the divisions and made party formation unavoidable. When the French Revolution began in 1789, most Americans applauded what they perceived as a striving for liberty and equality similar to their own recent revolutionary experience. Yet as Washington's first term drew to a close, revolutionary idealism in France increasingly gave way to paranoia and radicalism. Fearful that other European monarchs intended to restore Louis XVI to complete authority, French revolutionaries inaugurated what would become an almost uninterrupted quarter century of conflict. In late 1792, France proclaimed itself a republic, a move greeted with wild acclaim in the United States, but within months the new republic's most radical elements, styling themselves the Committee of Public Safety, initiated the Reign of Terror, the program of weeding out supposed counterrevolutionaries. In addition to sending thousands to the guillotine, the radical government abolished Christianity, among other sweeping reforms.

Such developments deeply divided American opinion. Federalists were already vaguely suspicious of the extremism early evidenced by some French revolutionaries, and the Terror confirmed their worst fears. Jeffersonians, however, insisted that the ends of liberty occasionally justified even the most excessive means. The debate over such diametrically opposite perceptions was disturbing enough, but when Great Britain joined a coalition—the first of four in the next 20 years—to fight France, the conflict threatened to involve the United States. Specifically, the possibility that France would invoke the Franco-American Alliance of 1778 cast a long shadow in American councils. The 1778 alliance had proved indispensable in helping the United States win independence from Great Britain, and Jefferson and his supporters argued in 1793 that the American debt to France for this assistance required honoring the treaty. President Washington, however, thought that impetuous participation in the European war could be catastrophic for the new nation, and he consequently proclaimed U.S. neutrality. Pro-French Jeffersonians seethed over what they saw as another example of Hamilton's deceit and unseemly manipulation of the aging Washington.

Neutrality became an even harder pill to swallow when Britain consistently provoked Americans by refusing to relinquish northwestern posts in U.S. territory, by stirring the Indians to violence on the frontier, and by assailing American shipping on the high seas. A diplomatic effort to adjust Anglo-American relations led to the unpopular Jay's Treaty, which only enraged the Jeffersonians further and even hurt Washington's personal popularity with the people at large. This agreement was informally named after John Jay, who had negotiated it. Despite its unpopularity, Jay's Treaty led to a felicitous arrangement with Spain. The mere fact of its existence so alarmed Madrid that Spain hurriedly granted the United States free navigation of the Mississippi and abandoned claims to a large stretch of territory in the U.S. southeast (Heidler and Heidler 2004, 9).

PRESIDENT WASHINGTON RETIRES

President Washington's growing dismay over partisan strife in the government was matched by his profound sadness at being the target of increasingly personal attacks in the press. Extremely dispirited, he chose to retire from office after his second term, a decision that surprised his foes as well as his friends. Both camps thought that Washington would remain president until his death, and the news of his departure alarmed them. The quarrels that had marred his second term would now be given free and perhaps disastrous rein in a contest for the presidency—the first truly competitive contest for that office. Given the political climate, some thought it might be the last (Heidler and Heidler 2004, 9–10).

Washington's decision established the tradition for American presidents of limiting their service to two terms, which lasted until 1940, when Franklin D. Roosevelt ran for and won an unprecedented third term. In 1951, the 22nd Amendment to the U.S. Constitution institutionalized the two-term limit for the presidency.

Although Alexander Hamilton was the most eminent member of his faction, his unpopularity precluded him as Washington's successor. Virtually by default, the budding Federalist Party chose Washington's vice president, John Adams. Emerging Republicans united behind Thomas Jefferson. The campaign took a nasty turn with searing personal attacks leveled by the opposing camps, and Jeffersonians reminded the country of the vigorous suppression of the freedom-loving Whiskey Boys and the alleged surrender of American honor in the negotiation of the British treaty. Despite such rancor, the election was held without violent incident, and John Adams narrowly claimed victory without his opponents threatening to void the results with revolution. In fact, under the rules of the day, Jefferson, as runner-up, became Adams's vice president. (In 1804, the 12th Amendment to the U.S. Constitution changed the process to prevent such a politically awkward situation from recurring.)

Hailing from Massachusetts, Adams had a distinguished record as one of the most constant champions of liberty before and during the Revolution, but he was never admired, and though he seemed indifferent to popularity, he nevertheless fretted over his role as Washington's successor. Hamilton intensely disliked him, adding to the uncertainties Adams confronted as the second man to become chief executive of the still-fragile republic. Hamilton had left the treasury in 1795, but he still exercised considerable control through his lieutenants in Adams's cabinet. For his part, Adams completely reciprocated Hamilton's feelings, which did not bode well for a tranquil time in office (Heidler and Heidler 2004, 10).

THE PROBLEM OF WAR AND DISSENT

Adams inherited a deteriorating international situation that soon embroiled the United States in an undeclared war with the French. Angry over Jay's Treaty, France began to waylay American shipping and snubbed Adams's diplomatic envoy. Although the country was incensed, President Adams again tried diplomacy by appointing a three-man commission to meet directly with Charles-Maurice de Talleyrand, the French foreign minister. Arriving in Paris in late 1797, the commission discovered that Talleyrand would not meet it unless the United States agreed to substantial bribes and concessions. When news of this behavior reached the United States in 1798, it seemed certain that American anger would lead to war. Overcoming Jeffersonian opposition in Congress, the government expanded the navy and created a sizable army, at least on paper. Meanwhile, shooting broke out on the high seas as U.S. warships clashed with their French counterparts in the West Indies (Heidler and Heidler 2004, 10).

At home, the excitement generated by the conflict resulted in instances of appalling legislative excess. Anti-French sentiment allowed Federalists to pass a series of laws designed to shrink their opponents' numbers and suppress their right to political dissent. A new naturalization law raised the residence requirement for citizenship eligibility from 5 to 14 years, and the Alien Act authorized the president to expel foreigners he deemed dangerous. The worst of the lot was the Sedition Act. Under its provisions, anyone who obstructed government policies or wrongly disparaged government officials, including the president, could be prosecuted and, if found guilty, fined and imprisoned. The Enemy Alien Act carried similar provisions in the event of formal hostilities but was never invoked because Congress never declared war. In any case, President Adams never used the Alien Act.

Despite its clear violation of the First Amendment's protection of free speech, the Sedition Act appeared to Federalists as the only way to contain the violent language that pro-French Jeffersonian newspapers heaped on the government's policies. Scores of editors were charged, and of the 10 who stood trial, all were found guilty by juries frequently badgered by Federalist judges.

Alarmed by these political persecutions, Jefferson secretly drafted a set of resolutions that the Kentucky legislature approved in 1798 and 1799, and James Madison drew up similar though more moderate resolutions that were adopted by the Virginia legislature in 1798. Both sets of resolutions were a skillful statement of the Union from a states' rights perspective, but because no other state would endorse them, they were ineffective in resisting the Alien and Sedition Acts. The Sedition Act expired in March 1801, but before its termination, the measure persuaded many to join the Jeffersonian camp, and the Virginia and Kentucky Resolutions helped to focus opposition to the Federalist Party and rally the Jeffersonians against Federalist tyranny in the presidential election of 1800.

In the meantime, full-scale war with France was averted by the happy coincidence that neither Adams, despite his clamoring country, nor Talleyrand, despite his imperious behavior, wanted it. France already had too many enemies to add the United States to the list. And true to his fundamental disdain for easy popularity, Adams resisted the swelling call for war against France because he, like Washington before him, believed that the country was still too weak to play at such a perilous game. His return to diplomacy enraged his own party and did little to endear him to suspicious Republicans, but it did lead to the Convention of 1800, a treaty signed in Paris with the new government of Napoleon Bonaparte (Heidler and Heidler 2004, 11).

EXPANSION AND DISCORD: 1800–1810

The presidential election of 1800 sharply defined the formation of the Federalist and Republican parties. Federalists promoted a robust central government that encouraged rather than regulated private enterprise, a stand popular with commercial interests, who generally supported the Federalists. Because this group saw trade with Great Britain as essential to maintaining the country's economic vitality, Federalist foreign policy favored Britain, especially after the outbreak of the French revolutionary wars, although it was hardly the fawning strategy that Jeffersonians depicted (Heidler and Heidler 2004, 11–12).

On the other side, followers of Thomas Jefferson who crystallized into the Republican Party embraced the notion that the government that governed least governed best. Desirous of a weak central government, Republicans harkened back to the Revolutionary generation's worries by proposing that local control of affairs was the surest safeguard against tyranny. They regarded the national debt as a burden on the backs of the people for the benefit of special interests, and they objected to special considerations given to manufacturing interests. In fact, Jefferson and his followers saw agriculture—and with it the implicit result that citizens would be independent landowners—as the bulwark of purity in the Republic. A man who owned his farm was, in Jefferson's view, beholden to no national politician, no British member of parliament, or even a French revolutionary. Nevertheless, Republicans favored the French in foreign policy because they sincerely supposed that the liberal ideals of the French Revolution advanced human freedom, while the British response suppressed it.

As might be deduced, Republicans tended to come from agricultural regions, such as the South and Southwest, while Federalist strength was in commercial New England and the mid-Atlantic coastal areas. Such regional differences coalescing into political parties was not seen as a healthy development, and at the end of the 1790s, the Republic's future seemed in ominous jeopardy. The presidential election of 1800 was to be another challenge for the political stability of the nation, and many were not certain the Union possessed the political maturity necessary to survive it (Heidler and Heidler 2004, 12).

The Election of 1800

As he had in 1796, Jefferson again challenged John Adams for the presidency in 1800, but this time the Federalists were encumbered by the perception that they had suppressed liberty with the Alien and Sedition Acts and by serious divisions in their own ranks. Hamilton's private attacks on Adams were made public and hopelessly split the party. Beset by harsh criticisms from all quarters, the Federalists responded by lashing out at Jefferson personally, accusing him of everything from adultery to atheism (Heidler and Heidler 2004, 12).

Despite such attacks, Jefferson bested Adams in the Electoral College by 73 to 65 votes, largely because of winning New York, but the vote also resulted in a startling stalemate. Ironically, Jefferson had won New York because of his running mate, New Yorker Aaron Burr, but at the same time Burr had received an overall equivalent number of votes as Jefferson in the Electoral College. Voting procedures that did not strictly designate votes for president or vice president caused the difficulty. Article II, Section 1 of the Constitution stipulated that the House of Representatives would resolve such a tie, but the lame-duck Federalist majority in the House was willing to elect Burr over the hated Jefferson. A deadlock ensued in which a frustrating series of ballots rendered no decision until a few Federalists, more fearful of Burr, abstained. Jefferson was finally elected (Heidler and Heidler 2004, 12–13).

Jefferson would refer to this presidential contest as "the Revolution of 1800," but his narrow victory hardly signaled an immense political change. More important and possibly revolutionary in the innovative sense was the orderly transfer of power through a hotly contested and controversial election. Doubts about the growing maturity of the American political system were, at least for the time being, laid to rest.

Less obviously, a great deal had changed, but nobody could have seen it clearly at the time. John Adams would be the last Federalist president, and the Federalist Party itself, once the supreme political statement of the age, would gradually wither and ultimately disappeared after the War of 1812. The party served a vital function in the formation and maintenance of the nation in its early days, but it gradually lost its relevance, especially when it retreated to parochial regionalism and preservation of the status quo. Tending toward elitism, the Federalists became the victims of their own arrogance and were unable to attract the loyalty of ordinary people. That inability, in the changing political and social fortunes of the early Republic, was the surest way to political extinction (Heidler and Heidler 2004, 13).

The Clash with the Judiciary

Thomas Jefferson took the presidential oath on March 4, 1801, the first president to do so in the new national capital of Washington, D.C. The setting was more a village than a town, and its pastoral situation seemed to match the thrift and plainness of the new administration. Indeed, such qualities were mirrored in the simplicity of the new chief executive, who exhibited his connection to ordinary people by strolling to his inauguration. In a famous phrase of his inaugural address—"We are all Republicans," Jefferson said, "we are all Federalists"—he tried to dispel concerns that he would completely overturn the government. Some things, however, were bound to change. Official etiquette was democratized to remove seating arrangements at formal state dinners, and Jefferson adopted surprisingly casual dress for official foreign visitors.

Although determined to preserve continuity in the government, Jefferson was also resolved to reverse intolerable Federalist measures. He pardoned those convicted under the Sedition Act and persuaded Congress to pass a revised Naturalization Act that returned residency requirements to five years. The only part of Hamilton's financial organization that Jefferson touched, however, was the excise taxes, which Congress repealed. Otherwise, he and his secretary of the treasury, Albert Gallatin, did not alter the funding and assumption arrangements or seek to dismantle the Bank of the United States (Heidler and Heidler 2004, 13).

Most of all, Jefferson and his party could not abide what they regarded as a dishonest ploy by the retiring Federalist majority in the final days of the Adams presidency. The Judiciary Act of 1801, passed by lame-duck Federalists, established 16 new federal judicial appointments, as well as additional posts, all of which Adams understandably assigned to Federalists. Although virtually all had been dispensed in the light of day, these appointments were scornfully referred to by Republicans as "midnight judges" to emphasize the alleged deceit behind the Federalist scheme to ensconce partisan obstructionists in lifetime posts (Heidler and Heidler 2004, 13–14).

The Republican Congress repealed the Judiciary Act of 1801 and thus legislatively removed 16 judges by abolishing their posts. Republicans, however, were unable to touch the new Federalist chief justice of the Supreme Court, John Marshall, who had also been appointed by Adams in the final months of his presidency. Marshall and the Supreme Court were soon embroiled in the struggle between president and courts in a pivotal incident that ended up establishing judicial independence. Adams had appointed William Marbury a justice of the peace for the District of Columbia, but Jefferson's secretary of state James Madison refused to award the commission. When Marbury requested that the Supreme Court compel Madison to make the appointment, Marshall faced a seemingly insoluble dilemma: The executive branch was empowered to enforce the Court's decisions, so how could one compel the executive branch to enforce a decision against itself?

Marshall's decision in the 1803 case of *Marbury v. Madison* was a tour de force, asserting the overarching preeminence of the Court in such a way that the president could not challenge it. Marshall prevented a political confrontation by dismissing Marbury's case, but he did so, he explained, because Marbury's direct application to the Court had been lodged under an unconstitutional federal law, specifically Section 13 of the Judiciary Act of 1789. By altering the original jurisdiction of the Supreme Court, Congress had legislatively modified the Constitution, something that could be accomplished only through the amending process. Therefore, by denying himself the power to challenge the Jefferson administration, Marshall established the Supreme Court as possessing an even higher authority, which was that of being the final arbiter of the Constitution through judicial review (Heidler and Heidler 2004, 14).

The implications of Marshall's decision were immediately apparent to the Jeffersonians. They resolved to tame the independent (or, in their view, obstructionist) Federalist courts by removing obnoxious judges through impeachment. Jefferson urged that Supreme Court justice Samuel Chase, who had been particularly fervent in enforcing the Sedition Act, be the first target. In early 1804, the House of Representatives impeached Chase for "high crimes and misdemeanors" as stipulated in Article I, Section 2 of the Constitution. The attack on Chase filled John Marshall with considerable apprehension because he believed that its success would set the precedent for removing judges on the flimsy grounds of unpopularity, a lethal blow to judicial independence. Yet when the case was heard in the Senate, it became clear that Chase, while unpleasant, had broken no laws. He was accordingly acquitted, and the precedent was set the other way. The impeachment process would not be an elaborate method of removing judges merely on a vote of no confidence. Judicial independence had survived this serious attack (Heidler and Heidler 2004, 14–15).

Pirates and Property: The Barbary War and the Louisiana Purchase

Americans traditionally distrusted large standing armies, and Jeffersonian Republicans accommodated those misgivings by reducing the military to a constabulary force of less than three thousand officers and men. Interested in retiring the national debt as quickly a possible, the Jefferson administration also reduced naval expenditures. Yet the world proved too dangerous to allow a sweeping dismantling of the navy. Barbary pirates, so named because they operated off the North African (Barbary) coast, practiced a crude form of ransom and blackmail by preying on merchant shipping in the Mediterranean to extract protection money for their rogue governments. For years, the United States had paid such tribute, but in 1801 the greedy pasha of Tripoli upped the stakes by capturing a U.S. warship and enslaving its crew. Jefferson sent the small American navy to punish these brigands, and over the next few years, U.S. frigates in conjunction with U.S. Marines intrepidly suppressed North African piracy. Aside from taming a barbarous lot in the Mediterranean, the exploits of the U.S. Navy fostered in foreign capitals a grudging admiration of American pluck.

More serious and closer to home, the United States faced a grave threat to its security when alarming reports told of a secret bargain in which Spain planned to cede to France vast holdings in the trans-Mississippi region called Louisiana. As if to verify such rumors, in 1802 Spanish authorities in New Orleans revoked the American right of deposit pledged by the 1795 treaty, enraging western farmers who depended on the Mississippi as a way to transport their produce. The domestic upheaval was worrisome, but the possibility of the region passing from weak Spain to the rapacious Napoleon Bonaparte was terrifying. In 1803 the United States mounted a major diplomatic effort to offer France $10 million for at least New Orleans. Indicating the gravity of the American predicament, Jefferson intended to negotiate a British alliance if France would not sell (Heidler and Heidler 2004, 15).

Fortunately for the United States, Napoleon's plans for Louisiana abruptly changed when an ongoing slave rebellion in the West Indian French colony of Saint Dominigue proved impossible to suppress. He was also cash strapped just as he was contemplating reviving the war with Britain. Consequently, he quickly offered not just New Orleans but the entire Louisiana region to the United States. On April 30, 1803, American envoys James Monroe and Robert R. Livingston signed a treaty with France that ceded Louisiana to the United States for about $15 million. Although Federalists objected that the Constitution did not authorize the president to make such arrangements, and Jefferson's strict constructionist philosophy troubled him about the matter as well, the dazzling prize of Louisiana was too tempting to resist. The Senate quickly ratified the treaty, and public opinion registered overwhelming approval for the arrangement (Heidler and Heidler 2004, 15–16).

The Louisiana Purchase was an astonishing transaction that would profoundly alter American lives for generations to come. It provided a measureless expanse for swelling American settlement while establishing the basis for American power in North America and eventually the world. An expedition led by Meriwether Lewis and William Clark explored the northern reaches of the Purchase all the way to the Pacific Coast, and one led by Zebulon Pike traced its contours in the Southwest. They were heralds of a rising tide of American pioneers who were already dreaming of populating Jefferson's "Empire of Liberty" (Heidler and Heidler 2004, 16).

The Embargo

Jefferson easily won reelection in 1804, but his second term was buffeted by the European war that started up again shortly after Napoleon's sale of Louisiana. The conflict, in fact, would outlive Jefferson's presidency, continuing without interruption for the next 11 years. In 1805 Britain and France began campaigns of economic warfare that gradually entangled U.S. neutral shipping, intimidating it with decrees and regulations designed either to prevent American merchantmen from aiding one side or the other or to prevent American merchantmen from showing any profits at all. Added to this injury was the insult of Britain waylaying American merchant vessels to conscript sailors from their crews, a practice called impressment. The Royal Navy claimed it was only retrieving deserters, but it was difficult to determine whether a seaman was an American citizen or a British runaway, and impressment officers did not usually take much trouble to find out. In 1807, the policy produced a serious crisis when HMS *Leopard* attacked the USS *Chesapeake* off the Virginia coast, killing and wounding several of her crew and forcibly removing four of her sailors. American outrage could have meant war, but Jefferson believed a thorough stoppage of all trade with the world would force France as well as Britain to respect American neutral rights. Accordingly, he persuaded Congress to pass the Embargo Act in December 1807, which stopped all exports from the United States whether in American or foreign ships (Heidler and Heidler 2004, 16).

Jefferson's grand experiment in economic coercion failed miserably. Rather than injuring France and Britain, the embargo devastated the American economy. As Americans increasingly violated the embargo with smuggling and other deceptions, the government employed increasingly draconian measures to maintain it. Eventually Americans were comparing Jefferson's extreme enforcement of the embargo to the excesses of British policy before the Revolution, and some in New England were discussing disunion. Congress finally abolished the embargo on March 1, 1809, by replacing it with the Non-Intercourse Act, a measure that banned trade with only England and France. Beginning with this modification of the embargo, both Congress and Jefferson's successor, James Madison, searched for an effective form of economic coercion for the next three years as they tried to protect American interests and rights with peaceful gestures rather than belligerent ones. Ultimately, they failed (Heidler and Heidler 2004, 16–17).

WAR AND RESURGENCE: 1810–1820

Coping with the European war dominated James Madison's presidency. Madison was more of a scholar than a politician, and he lacked the magnetism that Jefferson had used to lead the Republican Party. Even Jefferson's ability to beguile the nation had waned at the close of his administration. Madison did not fare any better at the start of his.

When James Madison took office on March 4, 1809, the Non-Intercourse Act was less than a week old and would never prove effective during the year of its existence. Congress replaced the act with Macon's Bill No. 2 in 1810, an even less effective measure that merely encouraged Napoleon Bonaparte to hoodwink Madison into believing that France alone was ending its depredations against U.S. shipping. Ignoring evidence that Napoleon was continuing his rapacious policies, Madison exclusively targeted Britain, a move that had momentous consequences. The administration's anti-British policy was not necessarily pro-French, but it essentially inclined America toward France and therefore made war with Britain more likely (Heidler and Heidler 2004, 17).

The War of 1812

The 12th Congress, which convened in late 1811, contained a number of firebrands, mostly from the West and the South, whose passionate calls for war against Britain would earn them the name "War Hawks." They were young men who not only chafed under the insults of British depredations against U.S. neutral rights but also were convinced that Britain was responsible for Indian uprisings on the western frontiers. With the cry of "Free Trade and Sailors' Rights," the War Hawk faction was instrumental in forcing the reluctant Madison to a moment of decision with Britain. Finally the president sent a war message to Congress in June 1812, and after a heated and divisive debate, the United States declared war on Great Britain at the end of the month.

From the outset, it was an unpopular war, especially in New England, where public displays of dissent gradually evolved into a serious antiadministration movement among New England Federalists. Although the war's main support was from agrarian sections, it was truly fought for seafaring rights, seen by farmers as imperative for protecting the honor and preserving the credibility of the flag. Yet the war disrupted the New England economy, and its origins struck many Federalists, who regarded Napoleon's France as the greater enemy of liberty, as shrouded in Republican duplicity. As a consequence, New England militias frequently refused to serve outside their state boundaries, hobbling the prosecution of the war (Heidler and Heidler 2004, 17).

Indeed, the War of 1812 was badly fought from the outset. The populace was never enthusiastic about it; therefore, the country was at best largely indifferent and was at worst divided by serious political disagreements. The country was also unprepared for the conflict. Its economy was weak, its regular army was meager, undisciplined, and commanded by aging fossils, and its militia was inadequately trained and occasionally spineless. Laboring under such disadvantages, the government in 1812 sought to mount aggressive campaigns on the Canadian border, but each effort proved predictably ineffective. British and Canadian forces, aided by Indian allies, met American invasions with vigorous defenses. Only scanty British numbers and London's preoccupation with the war against Napoleon prevented the affair from becoming an American disaster.

Meanwhile, heavy frigates in the small U.S. Navy bested British counterparts in several single-ship engagements that so disturbed the British Admiralty that it ordered captains to avoid individual actions against Americans. The boost to American morale was brief, though, for in 1813 the Royal Navy arrived off North America in such force as to blockade the American coast and bottle up the U.S. frigates. The British also carried out raids on Chesapeake Bay and by 1814 had extended their blockade from New England to Georgia while seizing parts of Maine.

Americans fared better on the Great Lakes. In 1813 Oliver Hazard Perry's Lake Erie squadron defeated a British flotilla off Put-in-Bay on September 10, 1813, and opened the way for American land forces to shatter the Anglo-Indian alliance in the region. Also in 1813, war erupted in the South between Creek Indian nativists (called Red Sticks) and U.S. forces, but in the following year, Andrew Jackson ended the Creek War by crushing the Red Sticks at the Battle of Horseshoe Bend on March 27. Such military successes were alloyed by the occurrence of atrocities and reprisals directed against civilians. In late 1813, retreating U.S. forces destroyed the village of Newark on the Niagara Peninsula, and the British response was a harsh campaign of devastation on the New York frontier. Likewise, the British cited the American destruction of York (present-day Toronto) in 1813 as justifying their capture of Washington on August 24, 1814, during which they burned several public buildings, including the Capitol and the Executive Mansion, which was not known as the White House until after its renovation, when it was whitewashed (Heidler and Heidler 2004, 18).

Napoleon's defeat in 1814 freed up British forces in Europe to prosecute the war in America with greater vigor. In addition to the assault on Washington, a veteran British army invaded upstate New York but was repulsed after the U.S. Navy defeated a British squadron on Plattsburgh Bay on September 11, 1814. In the same month, a combined British naval and army assault on Baltimore failed when American defenders withstood the naval bombardment of Fort McHenry and held off a land attack on the city's outskirts. An American lawyer named Francis Scott Key commemorated the U.S. victory in his poem "The Star-Spangled Banner." As British forces left Chesapeake Bay to mount an operation against New Orleans on the American Gulf Coast, New England Federalists, unable to contain their anger about the war any longer, gathered at Hartford, Connecticut, to consider ways of remedying their complaints. The Hartford Convention met from December 15, 1814, to January 5, 1815, approving a set of relatively modest resolutions. Yet the convention's actions prompted the rest of the country to suspect the Federalists' patriotism, suspicions that eventually doomed the party as a viable political force (Heidler and Heidler 2004, 18–19).

Although the British had refused Russian mediation offers immediately after the war broke out, their initial attempts to secure an armistice were telling. The overarching concern of the British government was always to defeat Napoleon, and London viewed the American conflict as a distraction from that primary task. After some protracted diplomatic maneuvering, peace talks between American and British envoys commenced at Ghent in August 1814, but the timing persuaded the British diplomats to stall the negotiations. Napoleon's defeat in the previous spring and the corresponding expansion of the British military in North America made decisive victories against the United States more likely. Yet news of British setbacks at Plattsburgh and Baltimore chilled those hopes. In addition, the nearly quarter century it had taken to defeat France had fatigued both the British public and its government. The longing for peace was reinforced when Britain's premier military hero, the Duke of Wellington, advised London to make arrangements quickly with the Americans on the best terms possible.

The talks in Ghent subsequently sped to a conclusion. Because the end of the war in Europe removed the practical necessity for impressment, Americans were able to discard their demand for its formal renunciation. In a similar gesture of practical conciliation, the British gave up their plans to alter the U.S.-Canadian border and set up a northwestern Indian barrier state between the United States and Canada. With the removal of these mutually unacceptable conditions, a treaty was signed on December 24, 1814, based simply on the *status quo antebellum*—the state of affairs before the war. Although hostilities closed with virtually all of the war's official causes unresolved, both time and circumstances had made those issues less relevant. Moreover, by the time the treaty arrived in the United States for Senate deliberation and ratification, a significant event persuaded many Americans that the United States had won the war. Unaware of the close of negotiations two weeks earlier, the British had assaulted New Orleans on January 8, 1815, and had been crushed by a makeshift force mainly composed of frontiersmen under Andrew Jackson. Raucous celebrations of this astonishing battlefield success accompanied unanimous Senate ratification of the Treaty of Ghent, convincing many that the two events were related and hence indications of U.S. victory (Heidler and Heidler 2004, 19).

The United States thus emerged from the War of 1812 surprisingly energized by the experience. The controversy and angry debate that had impeded the war effort, the political alienation of New England, and the generally miserable showing of U.S. forces in the field were quickly forgotten as swelling patriotism and pride inspired Americans to pursue expansive national aspirations. The removal of British power in the Northwest and the defeat of the region's Indians during the war accelerated settlement on that frontier. Similarly, Jackson's devastation of Red Stick Creeks in the South encouraged rapid settlement of that frontier as well. Americans thus looked westward, and pioneering again became a foremost part of the national philosophy (Heidler and Heidler 2004, 19–20).

The Indomitable American

Amplified American nationalism was the most obvious result of the war, and it worked a palpable change on American life. The unexpected triumphs at the end of the War of 1812 were a factor in the creation of this new nationalistic spirit, but there was more to it than simply a visceral pride over presumably besting Britain. For the first time since the Revolution, the United States could assert a real economic and political independence from European powers. Literature and art began to focus more exclusively on American settings, depicting admirable American characters and celebrating fabulous American landscapes.

Napoleon Bonaparte once said, "There is only one step from the sublime to the ridiculous." The observation was particularly, but differently, applicable both to him and to the United States in 1815. Refusing to accept defeat, Bonaparte had tried to recapture his imperial throne in France, escaping from exile on the cloistered little Mediterranean isle of Elba. But his fortunes collapsed at Waterloo in June, and he was permanently banished to the forlorn Saint Helena, a South Atlantic island half a world away from Europe. Meanwhile, across the Atlantic in the fall of 1814, the third session of the 13th Congress could not meet in the Capitol because the British had gutted it in August. Instead, representatives and senators crowded into the Patent

Office, one of the few public buildings the British had spared. Congress thought about moving the nation's capital from Washington but finally decided to keep the government there and restore its buildings on the Potomac. As a testament to this faith in the future, Congress also voted to reestablish its library. Thomas Jefferson's massive private collection of books, purchased from the former president, formed the basis for this new Library of Congress, a repository that eventually dwarfed those of ancient Alexandria and Athens. Bonaparte would likely have sneered at such a gesture. Yet those congressmen had actually reversed Napoleon's aphorism, just as the advent of the United States had reversed the era's ugly tendency to despotism manifested, for one, in people like Napoleon Bonaparte. Neither Napoleon nor the succession of autocrats in various lands who followed him down through the twentieth century ever understood why those Americans in the ridiculous setting of their smoldering capital could, with one small step, envision a sublime tomorrow framed by new buildings and informed by old books (Heidler and Heidler 2004, 20).

A New Economy

The government chartered another Bank of the United States in 1816. Anti-bank sentiment had allowed the first bank to lapse in 1811, but the clear requirements of financing the conflict with Britain turned the opposition of Jeffersonian Republicans, who had been harshly tutored by the war, into support for the new national bank.

Americans also had a growing manufacturing capability after the war, partly boosted by the U.S. policy of commercial restriction in the years before the conflict. When British merchants tried to muscle in on the American market after 1815, they cut their prices so drastically that American factories could not compete, and Congress responded by passing a protective tariff. Rather than having as its main purpose the raising of revenue, the Tariff of 1816 was designed to shield American manufacturers from foreign competition by placing as much as a 25 percent duty on imports. The move was extremely popular in manufacturing regions, for obvious reasons, but southerners also supported the tariff in the interest of promoting American economic independence. Parts of New England, however, opposed it because of qualms that it would hinder their shipping trade. Ironically, these regional attitudes would be reversed in a few years as the agrarian South caviled over having to purchase northern manufactured goods made more expensive by protectionism. New England would increasingly move toward manufacturing as the famous textile mills sprouted in the years after the war and would accordingly call for increasing levels of protection.

After the war, Kentuckian Henry Clay, the most prominent War Hawk in the 1812 Congress, hatched a plan of interlocking initiatives designed to accelerate and sustain American economic independence. Dubbed the American System, Clay's plan would protect American industry with high protective tariffs, whose revenues would be managed by the national bank to fund the construction of an elaborate transportation system of roads and canals. Debate over the viability, fairness, and constitutionality of Clay's tripartite system of tariffs, national bank, and internal improvements would frame the American economic conversation for a generation.

In the short term, Republican presidents James Madison and his successor James Monroe drew back from wholeheartedly endorsing the use of federal money for projects within a single state, occasionally wielding their veto to cancel undertakings that would do so (Heidler and Heidler 2004, 21).

Beneath the exhilaration and confidence of the Era of Good Feelings, then, were signs of brewing trouble. Arguments over Clay's American System unsettled political discourse, and the new Bank of the United States (BUS) was increasingly at the center of the quarrel. Ultimately an attack on the BUS by a state government came before the Supreme Court in the 1819 case of *McCullough v. Maryland.* The case involved the constitutionality of a tax that Maryland had imposed on the BUS and by extension the constitutionality of the bank itself. Chief Justice John Marshall, who had bolstered the central authority of the government in previous key decisions, spoke for a unanimous Supreme Court. He ruled that the BUS was constitutional on the basis of implied powers that sanctioned the central government's employing necessary and proper means to promote the public welfare. Furthermore, the Court ruled that Maryland (and by extension all the states) had no authority to tax federal institutions. Marshall observed in one of his most famous pronouncements that "the power to tax involves the power to destroy" and rejected the notion that the people of the United States would consent to grant individual states with such power (Heidler and Heidler 2004, 21–22) (Hall et al. 1991, 131).

Marshall's decision could make the BUS legitimate (at least for the time being), but it could not make it popular. In 1819, the same year as the McCullough case, a severe financial panic littered the economic landscape with failed banks, mushrooming unemployment, and ruined investors. Part of the cause for the disaster was an overexuberant speculation in western lands and other speculative projects, a bubble that was bound to burst sooner or later. Yet the early policies of the BUS, which encouraged rather than restrained reckless credit ventures, were also to blame, and the central bank's efforts to control irresponsible local banks in the wake of the crash worsened hardship by forcing foreclosures and bankruptcies. The years of heady boom had suddenly turned to catastrophic bust, and the many who blamed the BUS would not forget the hard times (Heidler and Heidler 2004, 22).

Expanding America

James Monroe, elected to the presidency in 1816, enjoyed a brief period of national unity and goodwill prompted by heightened patriotism and economic optimism. During his presidential tour of New England in 1817, a Boston newspaper giddily announced the dawning of a new age in American politics and auspiciously, if somewhat awkwardly, christened it the "Era of Good Feelings" (Heidler and Heidler 2004, 22) (Dangerfield 1965, 35).

During the years after the War of 1812, the United States also exhibited a more aggressive foreign policy. Monroe was fortunate to have John Quincy Adams as his secretary of state, for the erudite son of the second president was an extraordinary statesman and a match for any diplomatic adversary. Under Adams's stewardship, the United States finalized an important treaty with Britain in 1818 that settled the U.S.-Canadian border westward to the Rocky Mountains and arranged for mutual access to the Oregon country in the Pacific Northwest (Heidler and Heidler 2004, 22).

The status of Spanish Florida proved even more challenging for the Monroe administration, especially when Latin American revolutions threatened to collapse the Spanish Empire. As Madrid tried to summon the resources to suppress revolts in Argentina, Venezuela, and Chile, the Spanish drastically reduced garrisons in Florida, with the result that lawless anarchy became the prevailing condition on the Georgia border. When Florida's Seminole Indians took to raiding into Georgia, Monroe authorized Andrew Jackson to pursue them into Florida. Jackson was under orders to steer clear of any Spaniards, but his 1818 campaign completely disregarded the government's instructions for restraint. He executed two prominent Indians without a hearing and summarily put to death two British subjects after a quick court-martial. He marched on and seized two Spanish posts, including the Spanish capital of West Florida at Pensacola (Heidler and Heidler 2004, 22–23).

Several factors complicated framing a response to Jackson's flagrant violation of his orders. The most prominent was his great popularity—he was routinely referred to as the Hero of New Orleans—but another equally significant point was his obvious disregard for constitutional restrictions that made declaring war the exclusive prerogative of Congress. As Congress investigated the matter, the Monroe administration debated behind closed doors about the proper stand to take. Almost everyone wanted either to repudiate Jackson's behavior or to chastise him, but Adams persuaded the president to use Jackson's precipitous invasion as a way to pry Florida from Spain. Presented with the stark alternative of possibly losing Florida to the United States through military fiat or negotiating its cession through diplomatic procedure, Madrid chose the latter. The result was the 1819 Florida Purchase Treaty, somewhat misnamed because Spain also consented to draw a transcontinental line from Louisiana westward to the Rockies and then up to the 42nd parallel, extending to the Pacific Coast. By separating American and Spanish possessions in the whole of North America, the 1819 treaty not only presented the United States with Florida but also bolstered American claims to the vast Oregon country in the Pacific Northwest. Congress consented to this arrangement, and the essential illegality of Andrew Jackson's conduct was brushed away by his immense popularity and the success of the mission (Heidler and Heidler 2004, 23).

Slavery

Heated quarrels over slavery and its future soon troubled the Era of Good Feelings. The introduction of slavery early in the colonial period had been one of the most troubling developments of English colonization. The revolutionary generation struggled with the inconsistency of fighting for liberty while holding people in bondage, but southern economic dependence on slaves compelled the Founders to compromise on this most fundamental principle of human freedom. The result was an elemental inconsistency in the American social and political structure that could not be ignored forever. As slavery was ultimately confined to the agrarian South, the budding controversy became a sectional issue that would increasingly pit the South against the North, especially concerning the possible extension of slavery into the West (Heidler and Heidler 2004, 23).

In 1819, the Missouri Territory sought admission to the Union as a slave state and set off a furious debate. It had become clear that the South was falling behind the North in population, as the growing northern majority in the House of Representatives showed. With free and slave states each numbering 11, southern equality in the Senate would be jeopardized if Missouri became free, but such cold calculations of political power struck antislavery advocates as amoral at best. In 1820, the Missouri Compromise finally broke the congressional stalemate by admitting Maine as a free state to balance Missouri's admission as a slave state. In an effort to forestall future disagreements, the southern boundary of Missouri, the line of 36°30', was designated as the northern boundary of slavery for the rest of the Louisiana Purchase (Heidler and Heidler 2004, 23–24).

In this episode, the country had its first taste of the controversy that would eventually split the Union and plunge its people into the Civil War. Events leading to that cataclysm would unfold in the four decades following 1820, evolving so gradually that those living through them did not altogether grasp their ominous significance. It is not surprising, then, that most Americans in 1820 only vaguely comprehended the dreadful potential of the slavery debate. In fact, most were relieved that the difficult question of Missouri had been politically resolved with such an orderly solution. The moral inconsistency of slavery in a free republic, however, remained, and the debate that contemplated that moral question was a monster that in 1819 had stirred but not completely awakened. It would not slumber forever (Heidler and Heidler 2004, 24).

Domestic Life

The Republic's first three decades saw both remarkable change and admirable stability. The country experienced incredibly divisive political debates during the 1790s, but successfully managed a real transition of power without succumbing to violent passions that could undermine the government and weaken the constitutional framework. Instead, the United States was strong enough to withstand threats from abroad and tolerate dissent at home. Economic misfortunes, some quite serious, and even war with powerful Britain did not corrode the American spirit or daunt the American purpose. At the end of the War of 1812, a renewed sense of determination accompanied a surging patriotism to promote nationalism and unity. Pioneers trekked westward while back East, surveyors, engineers, and architects cut roads, dug canals, and raised cities along them. Thoughtful men penned stories and narratives celebrating the American spirit, and artists depicted the boundless optimism of a land without limits and a people eager to populate it (Heidler and Heidler 2004, 24).

By 1820, many of the problems of the so-called Era of Good Feelings seemed solvable, and it appeared that extraordinary accord would be the order of the new day dawning. Yet as the Federalist Party fell victim to charges of disloyalty and saw its program co-opted by the opposition, Republicans saw less need for unity and more reason to argue with each other. Southerners still grumbled over what they perceived as a shifty assault on slavery in the Missouri debates, while antislavery forces muttered that the resulting compromise revealed the nation's moral compass as badly askew. The economic crash in 1819 and subsequent depression replaced prosperity with poverty, substituted empty storefronts for bustling emporiums, and made eager workers into idle debtors (Heidler and Heidler 2004, 24–25).

The American experience of the day, contrasting periods of glowing confidence suddenly overshadowed by the appearance of hardships and uncertainties, is both sobering and inspiring. Despite the real bounty of the American land, it required great toil and considerable sacrifice to develop it. The native populations who inhabited the land posed an impediment to white settlement, and the resolution of that issue became a moral dilemma of considerable importance. Although the wide happiness of human liberty was truly extraordinary, the legions of slaves exposed the fact that liberty was imperfectly realized and incompletely enjoyed. The great promise of financial security could prove fleeting, an ephemeral dream knocked into reality by events far from one's home and unfathomable to one's imagination. And through it all, the ordinary man, woman, and child moved with a mixture of hope and hesitation into the future (Heidler and Heidler 2004, 25).

COURTSHIP AND MARRIAGE

Most marriages during the colonial period were arrangements whose primary goal was to benefit the families involved, a practice that emulated European traditions colonists had brought with them to British North America. For instance, it was not unheard of for a father to withhold the inheritance of a son who married against the family's wishes. By the end of the eighteenth century, however, courting couples themselves increasingly decided whom to marry and when. And just as the philosophy of marriage changed to deem the happiness of the couple as most important, so a couple's affection for each other became the crucial factor for starting a courtship and sustaining it to the altar. Parents, then as now, especially fathers, continued to express opinions about the suitability of suitors or prospective brides, but their children more and more made their own decisions of the heart. The new emphasis on affection as the basis for marriage also afforded young people more freedom during courtship rituals. Unchaperoned couples took strolls to steal kisses and attended parties where dancing allowed a degree of public intimacy. Not until later, in the mid- to late nineteenth century, did the Victorian era become so preoccupied with public appearance and private morality that middle- and upper-class couples had little time alone before marriage. The early Republic, on the contrary, was more broad-minded and less prudish. Without chaperones, for instance, premarital sex occurred on occasion, but young women during these years were not sexually reckless, and promiscuity was almost unheard of (Heidler and Heidler 2004, 27).

Given more say about whom they married, couples waited longer to wed. Part of the delay was born of caution, for given the freedom to choose a mate, they tended to be more deliberate and less impetuous. Also postponing marriage allowed for the male to acquire enough resources to start a family. Women married between their late teens to mid-twenties and men usually in their mid-twenties.

After a couple decided to marry, few family obstacles stood in their way. During the colonial period, fathers rarely allowed a daughter to marry before her older sisters because doing so could dissuade possible suitors from calling on them. In the new climate, older sisters still tended to marry first, but only because they reached marriageable age earlier. Their weddings were no longer required before the family's younger girls could be courted.

Marriage ceremonies in the early Republic were simple and unpretentious. They usually took place at the bride's home. Couples wore their best clothes, but only the wealthy bought special attire for the occasion. Neighbors treated weddings as a chance to socialize and made the events more celebratory than serious. Newlyweds made merry with the guests before retiring at the home of either the bride's or the groom's parents. During the night, wedding guests often serenaded them with both ribald and romantic songs (Heidler and Heidler 2004, 28).

Married Life

Because of the difficulty of travel and the need to earn a living, wedding trips were a thing of the future and even then generally only enjoyed by the wealthy. Instead, most couples quickly settled into a routine after the wedding. At most, newlyweds might briefly visit nearby friends before embarking on the hard work of setting up a household. Most people believed marriage should bring happiness and fulfillment to husband and wife alike, a relatively new idea that differed from prevailing attitudes during earlier times. Couples in the early Republic sought loving companionship and affectionate devotion, a sentiment reflected by literature, letters, and diaries that spoke of romantic love as the most important factor in a blissful and gratifying marriage. Changing expectations likewise brought changes in behavior. A marriage that emphasized affectionate friendship tended to be happier and thus reduced incidents of infidelity, especially by husbands, and married life exhibited new habits of demonstrative familiarity that would have been unthinkable in former years. Couples openly expressed their feelings, calling each other by first or even pet names, and frequently disclosed to each other in intimate letters their sexual yearnings, especially when apart (Heidler and Heidler 2004, 28).

The hope for happiness also meant that its absence was something to be corrected. Couples who found themselves mismatched were able to seek remedies that at best had been extremely rare for earlier unhappy marriages. Divorce was certainly not widespread, but neither was it unimaginable, especially when its emotional liberation was likened to the political liberation that resulted from the Revolution. Women no longer had to tolerate in silence their husbands' adultery, and men whose wives had deserted them no longer had to live like widowers to preserve the fiction of the union. New England and Pennsylvania made significant changes in their divorce laws to allow easier dissolution of marriages, and though several decades passed before laws were similarly liberalized in other parts of the country, attitudes about this difficult and previously forbidden subject were changing everywhere (Heidler and Heidler 2004, 28–29).

Despite the emphasis on companionship in marriage, sharply defined gender roles described differing responsibilities both to society and within the family. In both urban and rural settings, women took the primary part in nurturing the family's children. Unlike in earlier times, couples seldom toiled together to produce or acquire the family's basic material needs, especially in villages and towns, where men left the home to work at day jobs while their wives cared for the children. A mother's task included the cultivation of her children's talents and their preparation for adult responsibilities (Heidler and Heidler 2004, 29).

Sexual Relations and Childbirth

During the early Republic, most people got married and had children. Though families were usually smaller than during the colonial period, numbering about four children and two parents, they were still larger than the average western European family. Ignoring increase through immigration, a healthy American appetite for sexual activity is indicated by the considerable population growth between 1790 and 1820. A comparison of birth and marriage records also shows that in some parts of the country, a third of brides were already pregnant when they went to the altar. Premarital sex has always occurred, of course, but the greater freedom for courting couples everywhere and the persistence of bundling in rural areas likely contributed to this large number. In any case, bundling was an eccentric custom, especially for New England, where it had been most prevalent, and by the early nineteenth century, it was in disfavor, for obvious reasons. A suitor who stayed late was spared a long trip home in the dark by sharing his girl's bed, sometimes with a board between them or some other equally ineffective method, such as remaining clothed, to prohibit sexual intimacy.

Illegitimacy was quite rare, but it did occur. Growing cities meant an increase in the vices encouraged by the anonymity of large populations and the corresponding absence of social constraints. Prostitution consequently increased the number of illegitimate children in urban areas (Heidler and Heidler 2004, 29).

Childbirth everywhere was usually looked on as a hallowed and celebratory event, but it was also an occasion for great anxiety. Complications were common and could be deadly for both mother and infant, and the absence of routine antiseptic medical practices imperiled even the most robust newborns. A local midwife—in the South, she was often a female slave—usually presided over the delivery with other women from the community and family assisting. The protracted nature of labor, the shared purpose of the midwife and her assistants, and their expectations for a happy result often imparted the flavor of a party to the occasion. It was hardly a merry event for the prospective mother, however. Rather than reclining on a bed, she squatted on a midwife's stool to facilitate the birth and prayed that her trust in tradition was not misplaced. Midwives varied greatly in their skill levels. An older practitioner in the community usually trained apprentices, a form of mentoring that was not as detailed, of course, but otherwise resembled that for most physicians. Late in the period, some urban areas boasted deliveries performed by doctors, but their skill levels often varied as much as those of midwives. In addition, a male doctor not only deprived childbirth of the shared joviality of bustling women but in some ways increased the risks of the actual delivery. A male doctor was bound by canons of modesty that severely hindered any special proficiency he brought to the task. The woman was cloaked in such way that the doctor, unlike a midwife, could not watch the progress of delivery but could only feel it with his hands and instruments (Heidler and Heidler 2004, 29–30).

In farming communities, most births occurred in early spring, indicating that conception took place in early summer. Slaves, however, tended to conceive in the fall and had their babies in mid- to late summer. With the exception of women on the western frontier, women in the early Republic had fewer children during their most fertile years. In earlier times, married women usually were pregnant every other year, but between 1790 and 1820, the birthrate dropped steadily, particularly among the middle and upper classes, as many couples consciously used birth control to limit the size of their families. The decision was partly an economic one and was partly motivated by the belief that fewer children allowed the mother more time for individual nurturing. In established areas of settlement, even farmers ceased to view a large family as the blessing it had been before labor-saving implements reduced the need for many hands in the fields (Heidler and Heidler 2004, 30).

The decline in birthrate indicated a greater degree of cooperation between husbands and wives over the most intimate matters of their relationship. It certainly pointed to the wife's developing importance in making essential family decisions, even in the face of the traditional view that a woman's primary duty was bearing and raising children. Only a minority of the medical community sanctioned birth control, and most doctors actively discouraged it as unnatural. In any case, all methods of contraception were unpredictable at best. The primary method was male withdrawal before ejaculation, a technique called *coitus interruptus*. It was not a sure guard against pregnancy, however, and some doctors warned that the practice could be psychologically harmful and in some cases physically injurious by leaving the woman sexually unfulfilled. Condoms made from animal bladders were available but unpopular because they dulled penile sensation. Couples might attempt a pseudoscientific version of the rhythm method, but nobody really understood how a woman's menstrual cycle influenced fertility, the mechanics of conception not being discovered until 1827 (Heidler and Heidler 2004, 30–31).

Unintended pregnancy was consequently a likely possibility. Most women who became unexpectedly pregnant either greeted their condition as a happy accident or grimly reconciled themselves to the duties of expectant motherhood. Very few resorted to abortion, a practice that ironically increased dramatically during the later Victorian era. The early Republic had no specific laws against abortion, but most states recognized English common law, which made it illegal to kill a fetus after it quickened, meaning after its movements indicated life in the womb. The first state laws prohibiting abortion did not come until after 1820, so it is not clear why the early Republic essentially rejected abortion as a method of birth control. Perhaps the Second Great Awakening, a widespread revival of evangelical Christianity in which women played a major role, restrained the practice on moral grounds. In addition, surgical abortions were extremely dangerous procedures that could trigger hemorrhaging and frequently caused serious infections. Abortions induced by drugs were also risky and always painful. In this case, moral compunction and physical fear were far more powerful curbs than legislation (Heidler and Heidler 2004, 31).

Republican Mothers

Most wives became mothers within a year and a half of marriage and usually nursed their babies for about one year. In some cases, particularly in the plantation South, wet nurses, frequently slaves who had infants of their own, nursed the baby. During these years, however, the use of wet nurses was in decline. Most new mothers were allowed a period of rest or confinement for about one month. This period varied, depending on how much the new mother was needed for work around the home or business. Slave women were given much less time to recuperate from childbirth (Heidler and Heidler 2004, 31) (Kerber 1997, 58).

Before the Revolution, women led lives of relative isolation. Restricted by poor transportation and saddled with never-ending chores, most women cooked, cleaned, bore and raised children, and finally died without having set foot much beyond sight of their modest homes. Then dramatic changes loomed. In one respect, the American Revolution's exhilarating rhetoric of liberty was not limited to the political arena, as women made considerable contributions to the drive for independence. Many women enthusiastically sustained boycotts of British goods during the growing tensions before the war, and women provided significant moral and material support to patriot armies after the war began. Afterward few people seriously considered giving women any role, let alone an important one, in the running of the government, but perceptions nonetheless dramatically changed about women's responsibility to preserve what the Revolution had achieved. In sharp contrast to earlier views of women as morally fragile, spiritually delicate, intellectually anemic, and physically weak, women were now described as the morally superior sex and therefore uniquely competent to mold the next generation of Americans, the one that would either sustain the brittle experiment in liberty or lose the Republic to tyranny. The concept of republican motherhood that exhorted women to impart their superior virtues to their children was more than a plan to create good citizens; it was a way to fashion a great nation. While the men of the new republic supported their families, the nation's women would prepare their little boys to maintain democratic government and teach their little girls how to become republican mothers themselves. For years, tradition had dictated that women almost exclusively rear their children because men were busy doing more important things. Now, for many, there was the realization that "the formation of the moral and intellectual character of the young is committed mainly to the female hand." In the early Republic, raising a child to meet the nation's challenging and uncertain future became the most important job in the world, one far too vital to entrust to the workaday practicality of men (Heidler and Heidler 2004, 31–32) (Mintz and Kellogg 1988, 57).

At least that was the theory. In application, it lost some of the luster. In preparing for their key role in shaping society, young American women enjoyed more opportunities for education and relations outside the home than their European counterparts, but the education was of a sort and the relationships were of a type calculated to promote a specific purpose. Because men still viewed women as intellectually unqualified to absorb political theory, girls' curricula consisted of texts that celebrated the virtuous life and guided them to cultivate a pure heart. They were to pass on these virtues to their offspring. Such as they were, even these tedious educational experiences usually vanished after a woman married and had children. Republican mothers were too busy for much else besides motherhood. It would be wrong to suppose that all women felt trapped by their place in life or deprived because of the distinctive burdens that station placed on them. Contentment in family and a sense of making important contributions to society by raising good children seems to have fulfilled all but the most restless women of the early Republic (Heidler and Heidler 2004, 32).

Fatherhood

Fatherhood did not so much involve power and authority over wife and children as it did a duty to provide for them. Like mothers, fathers were expected to be more nurturing than authoritative in meeting their responsibilities. The father had an obligation to ensure the family's material comfort, support his wife's efforts to instill Republican values in the children, and serve as an example of upright behavior. Since work usually took him away from the household during the day, his family became a refuge from the routines of his job, and children, who in earlier times had represented a source of income or labor, now became a solace. Farmers taught their sons horticulture, and artisans in towns and villages trained their sons in trade (Heidler and Heidler 2004, 32).

FAMILY LIFE

By the early nineteenth century, the urban family no longer acted like an economic enterprise for which all members except the youngest children worked. Even on many farms, this significant change evolved as the family became less self-contained and began purchasing goods rather than making them. Parents bought cloth rather than weaving it and even shopped for ready-to-wear clothes. Items such as candles, soap, and shoes, previously produced by tedious labor, were becoming available at stores and freed family members to spend more time together in leisure and recreational pursuits. Almost all families read the Bible aloud, and particularly pious homes featured morning and evening prayers. More secular readings included newspapers, various instructional and religious tracts, periodicals, and even novels. Sunday morning church attendance was customary, with families always sitting together during services in most churches (Heidler and Heidler 2004, 33).

Dwellings

The family spent most of its time together at home. The average house was larger than most colonial homes, but still small by modern standards. An ordinary farmer or his urban counterpart, the artisan or laborer, seldom had more than two or three rooms in his house. The front or public room served as the cooking area, the sitting and eating area, and usually the sleeping area for younger children. Only parents had a private bedroom. Children slept several to a bed, segregated by gender, usually in the public room or a loft. If prosperous, the family might have separate bedrooms for girls and boys, but even the wealthiest households seldom boasted private bedrooms for children. Except for the cradle, beds were sized for adults and could accommodate several children.

Bedrooms were functional sleeping quarters rather than aesthetic retreats, containing only those items of furniture needed for a night's rest. Beds were valued as among the most precious furnishings in a house—people often specifically bequeathed them along with other household treasures—while other fine furniture was kept in the house's public areas. A straw-stuffed mattress was the usual bedding for the poor, while the affluent had feather beds. Only the wealthiest people used more than one room for entertaining visitors, and even middle-class homes generally lacked a separate dining area. Most people ate in the kitchen. In the South, wealthy planters placed kitchens in separate buildings to reduce heat and avoid fire dangers in the main house. As a result, the convention evolved of having a room set aside especially for dining (Heidler and Heidler 2004, 33).

Most houses were decorated quite simply, with few if any floor coverings and no artwork or decorations on the walls. Instead, walls served as a place to hang utensils, clothes, or guns. The public area had only enough chairs, stools, and benches to seat the family and a few guests. Clocks and mirrors were luxuries until late in the period, when better manufacturing methods made them affordable. Until then, only the affluent possessed a clock, usually placed on the mantel, and mirrors were quite rare (Heidler and Heidler 2004, 33–34).

Nearly all houses were constructed simply. They were framed with mortise-and-tenon joints and covered with whatever material was locally available and readily made, such as boards, clapboards, stone, or brick. Log houses were built only on the frontier. In rural areas, the community might pitch in to build a neighbor's house; otherwise, local carpenters fashioned and assembled most dwellings. Though each region of the country had its own distinctive style, some features were common to all. Except in the cities, for instance, houses rarely sat parallel to the closest road. Instead, they were situated to take advantage of the angle of the sun. In the North, most houses faced east so that the morning sun would warm them quickly.

For most Americans, houses were functional and reasonably comfortable dwellings that seldom featured fashionable architecture or pointless frills. Only the wealthy painted their houses or landscaped their grounds, and the area around ordinary houses was usually cluttered with debris and rubbish. Animals roamed the yard, their droppings remaining where they fell, and garbage was simply tossed out of windows and remained on the ground until a sizable accumulation signaled the time to bury it. Gardens were for vegetables rather than scenery, and no one but the affluent ever considered the wasteful practice of planting a lawn. Most wives worked at keeping the inside of their houses tidy and fairly clean, but even the most fastidious housekeeper lost the battle to dust, especially in the summer, when windows always remained open. By the end of the period, manufactured brooms were making housekeeping a bit easier, a sign that cleanliness in general was becoming more important.

The rich in both cities and countryside, however, set the standard to which many lower- and middle-class families aspired. Their affinity for Georgian architecture imported from Britain created the popular Federal style, a uniquely American version of the Georgian motif widely displayed in mansions that celebrated order and symmetry. Only a privileged few ever lived in such homes, but the middle class began to emulate the habits of the affluent in dining, leisure, and child rearing. By the end of the period, people saw the home as the place where the family should be most comfortable, the better to enjoy each other's company (Heidler and Heidler 2004, 34).

Relationships

During the early Republic, the family changed from an economic unit into a social refuge whose leisure time was increasingly separate from the outside world. Some historians have argued that this transformation was a result of the period's developing market economy, which made both work and economic transactions less personal than in previous times. Others have suggested that this type of family not only predated an industrial economy but also made the transition to it easier. For whatever reason, the family became less an economic entity whose main purpose was the material security of its members and more an emotional support system whose primary goal was preparing the next generation of citizens. The Enlightenment played a part in promoting the change, especially because of its emphasis on individual rights, an idea conveyed in popular novels, poems, and other texts that appeared throughout the period. Such works described parental love and obligations as more important than patriarchal authority while celebrating marriage as a union based on love and respect rather than an arrangement for economic benefit (Heidler and Heidler 2004, 34–35).

Modern conceptions of how families lived years ago frequently suppose that they were usually extended families, meaning that they included relatives beyond the so-called nuclear family of parents and children. The extended family of grandparents, aunts, uncles, and cousins certainly existed and in some instances resided in some form under one roof. In the rural South and on the frontier, the extended support network provided by such a wide number of relations remained important for survival and companionship. Yet the nuclear family became far more common during the early Republic.

As children became the center of the loving family, some observers noted that the family became preoccupied with child rearing. In middle- and upper-class homes, the parents no longer kept the cradle in the home's public area but instead placed it in the parents' bedroom or in a separate nursery. Particular home furnishings exclusively designed to meet the needs of small people also appeared during this period. For example, the forerunner of the modern high chair was introduced to help mothers feed toddlers, and craftsmen began making small chairs and tables specifically for children.

Possibly as a result of a rising middle class and its emphasis on democratic values, many saw the family's real purpose as properly molding children. Declining birthrates made children more emotionally precious as parents came to know them better as people rather than unformed family adjuncts. A child's death marked both the loss of a loved one for the family and an unfulfilled potential for the world at large.

Unquestionably, children became a much more important part of American society during these years, more so than they had at any previous time (Heidler and Heidler 2004, 35).

Childhood

Children grew up quickly during the colonial period. They were expected to make a real contribution to the household by no later than age seven. A physical manifestation of this abrupt and premature end to childhood was the practice of dressing children like miniature adults, usually beginning in their seventh year. After the Revolution, though, parents of middle- and upper-class children increasingly deferred both the trappings and obligations of adulthood. Children in poor families remained destined to take up labor quite early, particularly by hiring out to craftsmen or formally becoming apprenticed to them. The rising middle class, however, embraced childhood as essential for a person's proper development (Heidler and Heidler 2004, 35).

During the colonial period, parents, especially those grounded in Calvinist beliefs on the essential depravity of humankind, believed that they had to control the bad urges of inherently wicked children while compelling them to acquire basic skills such as walking and talking. Told that their children were potential vessels for Satan and that only strict supervision and constant useful activity would shield little souls from evil, mothers often proved demanding overseers, taking to heart the idea that idle hands were the devil's workshop. Conversely, late-eighteenth-century parents strove to develop their children's potential instead of merely fashioning them into obedient workers. Children learned to make decisions for themselves to enable them to live independently as adults. Children were also viewed as innocents whose boundless potential needed only correct guidance, not relentless correction, to reach its fulfillment. Poignant signs of this changing perception of children were their grave markers during the period. Whereas a common symbol on such headstones in earlier years was a death's head, these later gravestones often depicted angels or cherubs.

The new belief in childhood innocence prompted some experts to discourage strict forms of punishment, but not all parents agreed. A persistent view of human nature as intrinsically evil held that children were just as iniquitous as anyone else and to rear a child properly required the subjugation of his or her will. Despite the similarity of this attitude to that of earlier periods, the motive was nonetheless different. Rather than disciplining children as merely a higher form of domestication—in essence, why we housebreak dogs—people believed that strict discipline was crucial to make children better people by improving their character. Experts even counseled that guilt and embarrassment, rather than spankings, were more effective for altering unruly behavior. Many parents refused to abandon the maxim that sparing the rod spoiled the child, though, and corporal punishment continued as the most widely used penalty for misbehavior, especially for young children (Heidler and Heidler 2004, 36).

Authors of child-care books in the early Republic aimed their message at mothers rather than fathers and advocated a more natural approach to skill development. Mothers were encouraged to allow children to learn to walk and talk at their own pace. Enlightenment thought defined natural law as a set of patterns in which human behavior was a normal part of the universe's routine mechanics. As one intellectual of the period noted, "the first seven years of life are a period of greater importance, in the business of education, than is generally imagined." Childhood, with all its tempers and silliness, was merely one of the natural stages of life, an idea reinforced by the growing awareness that childhood experiences shaped the adult character. Raising a child should thus be done according to natural laws, expected developments, and steady progressions. In this philosophy, children were actual people with individual personalities and distinct temperaments. Rarely in their diaries and letters had parents of earlier times referred to the gender of newborn babies or even noted them by name, but early nineteenth-century parents did. Rather than depict children in portraits as diminutive adults complete with coiffures and mature attire, painters of the early Republic dressed them as children and set them among toys and other trappings of childhood. These children were seldom named after a dead older sibling, a practice that suggested parents were merely replacing one unformed person with another. Rather, children were deemed people in their own right whose unique qualities merited their own names (Heidler and Heidler 2004, 36–37) (Calvert 1992, 61).

Changes in how children were clothed also reflected the natural Enlightenment approach. Responding to warnings from physicians that swaddling infants could physically deform them, many parents abandoned the practice and dressed babies in loose smocks. (Immigrants, especially those from Germany, nevertheless tightly wrapped their babies well into the nineteenth century.) Careful mothers still placed a band of cloth around the baby's middle for back support and tended to overdress infants, even in the summertime. When child-care books criticized the custom, however, a reaction set in against layering children with heavy clothes, and the pendulum swung to the opposite pole. Experts believed that "a new-born infant cannot be too cool and loose in its dress" (Heidler and Heidler 2004, 37) (Calvert 1992, 64).

Mothers came to believe that constantly shielding babies from cold air made them susceptible to its ill effects as adults, an old idea that John Locke had endorsed a century before. At the end of the eighteenth century, parents gradually but avidly embraced it. The belief that cold temperatures made babies robust fostered the absurd notion that bathing children in cold water was good for them.

The way that older children were treated also began to change. Children's clothes, for example, became more practical for active little people. Upper- and middle-class boys of toddler age still wore a sort of gown, but it looked far less like a woman's dress than before. After a boy reached the age of four or five, he could wear long trousers and short coats over simple shirts, an outfit sometimes called a skeleton suit. At age 10, he began wearing a less formal version of his father's clothes. Prepubescent girls usually wore a loose-fitting frock, and after they reached the age of 12 or 13, they wore dresses more like their mother's. They were even fitted with stays to shape their developing figures according to the current fashion. Even after American women adopted, in the early nineteenth century, the looser Empire style of dress, stays remained an essential part of a woman's ensemble. Until puberty, children of both sexes wore their hair very simply. Upon reaching their teens, they sported the adult hairstyles appropriate to their sex (Heidler and Heidler 2004, 37).

The simplicity and practicality of dress and haircuts were partly to accommodate play. The colonial period regarded child's play as something to occupy those too young to work while parents and older children went about their labors. In contrast, the early Republic judged play as essential for a child's natural development. Again, children's portraits from the era tell a tale wherein the presence of toys for both genders exemplified this changed thinking about the importance of play. Because play was seen as key to physical and mental preparation for adulthood, children beyond the toddler stage were separated for play by gender. Girls played with toys and pretended at games that prepared them for marriage and motherhood. Their main toys accordingly were dolls. Boys, on the other hand, were expected to develop physical strength and mental agility. Their games were livelier, and their toys were balls, hoops, and marbles—the kind of playthings that were generally used out of doors (Heidler and Heidler 2004, 37–38).

The new emphasis on play did not affect the lives of poor children or the children of slaves. The poor often apprenticed their children to craftsmen, sometimes as early as their sixth birthday. The custom removed hungry mouths from meager larders or provided a way for a community to deal with orphans while preparing them for a trade. The arrangement was a formal one, delineated by a contract called an indenture, which spelled out the obligations of both parties. In exchange for room, board, and instruction in the arts and mysteries of a particular trade, the apprentice pledged to labor in his master's service for a specified number of years, usually at least four, or until reaching 21 years of age. Many masters treated their apprentices with kindness, but some simply exploited them for their labor while ignoring the obligation to teach them anything at all. The apprentice had a difficult life in either case. Many fled out of homesickness; many were returned to their masters. Masters were legally bound to provide adequate food, clothing, shelter, and training, but a child had little chance of successfully challenging violations of his indenture. If placed with a negligent, indifferent, or malevolent master, the apprentice donned his shabby clothing to work from sunup to sundown, ate unpalatable food, and finally bedded down in crowded, unheated quarters. Given enough of such treatment, many apprentices simply ran away. If they were clever enough to stay clear of their parents, they were hard to catch. Cities, especially in the Northeast, attracted relatively large numbers of such runaway boys. Those who became indigent usually joined roving gangs that staked out streets as their territory in the poorer sections of the city.

Slave children went to work at a very early age. By the time they were six, they were expected to perform light labor around the plantation or farm, such as feeding chickens or watching after younger children. A slave child's mother returned to regular tasks within a few weeks of childbirth, and the elderly women who cared for her child during the day usually left constant supervision to older children, usually under the age of 10. Slaves not much older than 10 were expected to help in the fields. On cotton plantations, they trailed behind adult slave gangs to pluck stray bits of cotton from stalks (Heidler and Heidler 2004, 38).

These unfortunate children, whether from impoverished families or as part of a slave community, suffered in varying degrees from inadequate diets and negligible childcare, deprivations that along with a regimen of grueling work made them much more susceptible to disease and accidents than their counterparts in the middle and upper classes. Yet moderately prosperous and even affluent children died in startling numbers. Part of the cause was an incongruous combination of avid attention and casual neglect at all levels of society. Wealthy mothers certainly supervised the rearing of their children, but servants or slaves often tended to their daily care. In middle- or lower-class homes, mothers were normally too busy to watch over young children all the time and left the chore to their older children, a circumstance fraught with potential calamity in any century. Childhood accidents that resulted in serious injury or death were numerous.

The relatively primitive state of the medical arts meant that any disease had the potential to be fatal for child and adult alike. Efforts to reduce infant mortality focused on prevention more than cures. During colonial days, infants were literally strapped into cradles constructed from solid pieces of wood to promote straight bone growth. Parents in the early Republic tried to preserve air circulation around sleeping infants by employing new cradle designs featuring slats or spindles on the sides. Nonetheless, children sickened and sometimes died from a variety of ailments. They were most susceptible in their first 10 years. About one in six babies died in the first year. Approximately 10 percent of children died before reaching adulthood. High infant mortality rates paradoxically made even doting parents wary of becoming too attached to newborns, and some did not name children until they were at least a few months old.

Children were especially vulnerable to intestinal diseases, but respiratory infections were the most lethal. Whooping cough, diphtheria, scarlet fever, and secondary infections from measles and chicken pox killed countless children during the period. Few effective treatments existed, and parents generally relied on traditional remedies such as potions laced with alcohol or opiates. Mothers regarded alcohol as preventive medicine and routinely dosed their children, including infants, with it at the earliest sign of illness. It was the rare child, in fact, who had not been introduced to some sort of alcohol from the time it was weaned. The growing influence of temperance movements after 1810 persuaded mothers to use a variety of syrups purportedly designed for children, but most still contained alcohol or other drugs. Children were thus treated for illnesses in the same manner as adults. As a result, the cure was almost as likely to kill them as the disease (Heidler and Heidler 2004, 39).

Intellectual Life

EDUCATION

The role of education in forming an intelligent citizenry became an important concern in the early Republic. During the colonial period, education beyond teaching the rudiments had been an academic exercise carried out by "Latin" schools, primarily in New England, whose principal purpose was to put boys on the path to college that would prepare them for the pulpit, the classroom, or the courtroom. Curricula were inflexibly limited to subjects inherited from the classical educational tradition in Europe, courses that focused on language, philosophy, and rhetoric rather than matters of practical utility. In part, this was a reflection of the old British idea that education was the special preserve of the upper classes (Heidler and Heidler 2004, 39–40).

In colonial New England, which was heavily influenced by Congregationalists, another purpose of primary education was to make people godly. The ferment of revolution, however, helped change these attitudes, and the years following American independence were to see marked transformations in beliefs about the purpose of education. "Speaking generally, it may be said that every New Englander receives the elements of education," a British visitor said several years after this period (Heidler and Heidler 2004, 40) (Hamilton 1833, 127).

In addition to leveling tendencies that dismantled British notions of aristocratic privilege, new ideas about the utility of education appeared. Book learning for some became a viable alternative to apprenticeship, providing a way to get ahead in a competitive world while simultaneously promoting solid principles of patriotism. Yet ordinary Americans were basically of two minds about education, and the early Republic was illustrative of that ambivalence. On the one hand, they were suspicious about education as simply an impractical pretension offering little of practical value for the great bulk of the population, those young men who would have to make their way behind plows and workbenches, or those young women who would spend their days at cradles and cookstoves. On the other hand, people intuitively believed that both the future welfare of the country and the prospects of enlarged opportunity for their children required an education. "Larning is of the gratest importance to the seport of a free government," conceded William Manning, a marginally literate Massachusetts farmer, who nevertheless noted that "costly collages, national acadimyes & grammar schools" were merely ways for the powerful "to make places for men to live without work" (Heidler and Heidler 2004, 40) (Morison 1956, 202–54).

Such mixed assessments about the worth of education resulted in mixed applications in the establishment of schools. Popular nostalgia imperfectly recalls that rural areas boasted the little one-room schoolhouse whose prim schoolmarm presided over students ranging in age from very young children to relatively mature young adults. The myth of avid learners and enthusiastic teachers frames this picture, but the reality was not as ideal. The building was typically makeshift and dark, the pupils often were unruly, and the teacher was usually a marginally skilled young man whose primary qualification for the job was an ability to maintain order, often with brute force. As to education, at most he could impart the rudiments of the three Rs—readin', writin', and 'rithmetic. The emphasis was on routine and drill, with a heavy reliance on recitation from the Bible and worn and tedious texts, a pedagogical method that rightfully earned these common schools the informal name "blab schools." The school day was also long, usually beginning at first light. Breakfast was at eight o'clock, followed by several hours of recitation until lunch. Several more hours of study and recitation followed lunch, and the day finally ended at five o'clock with prayers. These schools were privately and therefore inadequately supported, either through affiliation with the church or by modest tuition fees paid by parents, sometimes with something as simple as room and board for the teacher. Because older children were needed for chores on the farm during the growing season, their attendance tended to be spotty during those months. The customary pattern of school years broken by summer holidays is a holdover from the necessity of accommodating an agricultural economy, when children were especially needed for labor in the fields during the summer months (Heidler and Heidler 2004, 40–41).

Urban schools likewise relied on rote memorization and ceaseless drill, but they also attempted innovations necessitated by rapidly increasing populations of students. Desiring to impart moral virtue and mental discipline, some urban schools experimented with a teaching method invented by Englishman Joseph Lancaster, a Quaker convert troubled by the plight of the ignorant poor. Using teaching assistants called monitors, the Lancastrian system sought to increase class size to promote efficiency without diminishing the quality of instruction. A master teacher first taught the monitors, typically older students themselves, who then simultaneously ran pupils seated in groups through their drills. A total of nine different recitations could be conducted at the same time. In the morning, students gathered under the watchful eye of their monitor to recite their lessons in reading and spelling and progressed to advanced levels based on their rate of learning. Quakers established the first Lancastrian school as a charitable organization in New York City in 1801 and later opened a similar school in Philadelphia. In Virginia, Norfolk and Richmond also adopted the Lancastrian model in schools supported by a mixture of private donations and city taxes.

The apparent efficiency of such schools appealed to communities who resisted taxation for even the most basic city services. There was also the fascination of applying the concept of the factory to the education of children, especially for an age impressed with the wonders of mechanized routines. Yet the Lancastrian method was in the end more a fad than a lasting solution to the problems of mass education. In the first New York schools, for example, the classrooms were designed to accommodate as many as 500 students, certainly a tribute to economy of effort, but ultimately too great a sacrifice to the real business of instruction. In short, the Lancastrian system's methods were superficial, and its results increasingly unsatisfactory. It was eventually abandoned in all but a few places (Heidler and Heidler 2004, 41).

As a matter of tradition, all but elementary schooling was aimed at educating males. During the period, though, schools for girls were founded, and some exclusively male schools began admitting girls as well. Accordingly, literacy among women increased during the early Republic. Women were not encouraged to pursue significant intellectual endeavors, but the increasing number of educated women gradually opened the way for new careers. In New England, women began teaching younger children the rudiments of reading and writing, especially because such jobs were often seen as too unprofitable for men. The practice began in so-called summer schools while boys were working on farms. These schools admitted girls, who were instructed by the young women of the community. Gradually it became more acceptable for women to teach full-time, and educated single women thus had a respectable way of earning a living. It would have been unheard of, however, for a woman to remain employed in such a position after she married. Motherhood was considered her natural calling (Heidler and Heidler 2004, 41–42).

Throughout the period, primary schools supported by taxes—what became known as free public schools—were quite rare. Where they did exist, they were largely philanthropic enterprises established to educate impoverished children and were consequently considered inappropriate for middle- and upper-class children, who either attended private academies or, if sufficiently wealthy, were instructed by tutors. In this, as in many other aspects, the early Republic was a time of transition. The rise of common folk in the 1820s with the advent of Jacksonian Democracy persuaded the upper classes that educating the American masses was necessary in their eyes to preserve the country from mob rule. In the decades that followed, reformers and activists argued that society had an obligation to educate the people for the health of the country as well as their own well-being. Free public education was slow in coming and often sectional in nature, but the chance for its realization was born during the early Republic (Heidler and Heidler 2004, 42).

HEALTH AND MEDICINE

The constant threat of disease and the chances for contracting a serious illness cut across all ethnic groups and economic classes during these years. Most diseases were not fatal, but the scarcity of reliable medicine meant that they could be debilitating. Because sickness was omnipresent and its effects were possibly dire, Americans seemed almost obsessed with the topic of health, whether that of family or friends. Letter writers almost always opened with, and sometimes repeated in closing, news detailing the good or bad health of family members. Americans suffered pain, bowel ailments, and breathing problems with stoic resignation because they had little choice but to accept these events as normal and expected parts of life (Heidler and Heidler 2004, 42).

Diseases

Americans of the early Republic suffered from intestinal complaints with disconcerting frequency, and such illnesses could be dangerous, especially when they caused dysentery, a debilitating inflammation of the bowels that causes bloody diarrhea. Adults were better able than children to ward off the potentially fatal effects of intestinal ailments, and they more or less expected them to be part of life. Poor sanitation, bad water, and spoiled food caused most outbreaks, especially when these circumstances occurred in conjunction with lax personal hygiene. People on farms usually wore grimy clothes and grubby shoes that created an unhealthy mix of dirt, animal manure, and perspiration. The stench of privies, chamber pots, and soiled diapers pervaded towns and farms alike (Heidler and Heidler 2004, 42–43).

Americans also suffered from a wide range of respiratory complaints that ranged from common colds to serious influenza. Flu had not yet mutated to produce the deadly strains that would appear in the later nineteenth and the early twentieth century, but pneumonia and tuberculosis could kill and frequently did. Tuberculosis, often called consumption by the people of the time, was especially virulent in crowded cities and in homes where large families suffered from poor ventilation. In fact, incidence of tuberculosis mounted so rapidly in the United States that it was the leading cause of death by disease among adult Americans. Some studies estimate that 23 percent of New Yorkers who died in 1804 did so of tuberculosis or its related maladies. Boston and other large cities experienced similar ravages. Because tuberculosis is transmitted by saliva, eventual laws against public expectoration were prompted more by health concerns than by a prim sense of etiquette, but during much of the period, tuberculosis was viewed as a hereditary disease, and so even people who were infected were not isolated from the general population. Many times a person infected with tuberculosis did not immediately develop symptoms because the dormant bacterium waited until a different illness weakened its victim. Several years might pass before tuberculosis finally claimed the sufferer.

Epidemics were limited during the colonial period because most people were young immigrants whose exposure to the many diseases in Europe had improved their immunity. Succeeding generations, however, possessed diminishing levels of resistance to what in turn became increasingly uncontainable diseases. Meanwhile, the increasing population and its growing interaction allowed infectious diseases to spread more easily. The result was a greater incidence of epidemics in the later eighteenth century, when diseases like whooping cough and chicken pox were rampant. Why the incidence of some serious illnesses increased, however, remains a mystery. Scarlet fever had rarely been fatal during the colonial period, but it and other diseases might have mutated in the early nineteenth century to become successful killers (Heidler and Heidler 2004, 43).

Smallpox was always dangerous, disfiguring its victims, sometimes horribly, when it did not kill them. Colonial Americans lived in dread of it. Yet during the early

Republic, smallpox inoculations—the process of injecting a small amount of the disease into a healthy patient—made it much less common. Inoculation was controversial, though, and many people opposed it because it could make an otherwise healthy person seriously ill, and some of those inoculated actually died. The introduction in 1796 of a new type of vaccine using cowpox virus greatly improved inoculation's safety and effectiveness, although risks associated with smallpox inoculation remained, just as they do to this day (Heidler and Heidler 2004, 43–44).

Population growth and trade interaction made yellow fever even more terrifying than smallpox. Because Europeans had limited exposure to yellow fever, it had a higher mortality rate than smallpox, and no one knew how it spread. Not until a century later would scientists determine that people catch the disease from the *Aedes aegypti* mosquito. The unwitting partnership of infected people and carrier mosquitoes could allow the illness to cover astonishing distances with amazing speed. A person with yellow fever who traveled to an area inhabited by the *Aedes aegypti* mosquito or who traveled on a ship with such mosquitoes could trigger an epidemic. Adults of European ancestry were the worst yellow fever cases, while children of any race and those of African ancestry were the mildest. Symptoms included jaundice (hence the name), fever, and bloody vomit, often called the black vomit. "Some lost their reason and raged with all the fury madness could produce, and died in strong convulsions." About a quarter of those who contracted yellow fever died, but survivors were protected from its recurrence. Because mosquitoes need warm temperatures to survive, the disease occurred only in summer, and outbreaks did not necessarily take place in consecutive years, because carrier mosquitoes did not convey yellow fever in larvae. Instead, new outbreaks hinged on infected people being bitten by the *Aedes aegypti* (Heidler and Heidler 2004, 44) (Grob 2002, 75).

Philadelphia's yellow fever epidemic of 1793 was the most notorious incidence of the disease during the early Republic. The outbreak probably occurred as a result of the slave uprising on the Caribbean island of Saint Dominigue that drove thousands of refugees into Philadelphia during the hot summer of 1793. By August, the disease had reached epidemic proportions. Black men drove carts through deserted city streets dolefully ringing bells for households to bring out their dead for speedy burial. As one observer noted, "the wealthy soon fled; the fearless or indifferent remained from choice, the poor from necessity." More than 5,000 people died, about 10 percent of the population, most of them previously healthy adults. Over the next 30 years, outbreaks of yellow fever ravaged New York, Baltimore, and Boston, areas that were not native habitats of the *Aedes aegypti* mosquito and whose cold winters eventually wiped out mosquito populations that had been brought in by ship. The South, on the other hand, was not so blessed (Heidler and Heidler 2004, 44) (Hart 1897–1901, vol. 3, 40).

In the Deep South, the carrier mosquito is indigenous. Many southerners succumbed to yellow fever and malaria (also a mosquito-borne disease), but the wealthy escaped the worst outbreaks by relocating to higher, interior terrain during the summer, for although yellow fever's cause was unknown, experience had taught that low-lying regions were most at risk. During the first two decades of the nineteenth century, New Orleans alone experienced five yellow fever epidemics, each of them effectively shutting down the city. Shops closed, artisans ceased their trades, wharves fell silent, residents tightly shuttered their windows, and the grim population of mausoleums swelled (Heidler and Heidler 2004, 44–45).

The Medical Arts

Ailments were treated with a wide range of herbal medications and nostrums dispensed by folk healers, mothers, and wives. Meanwhile, an increasing number of trained physicians used both herbal and pharmaceutical medicines. Doctors of the period were usually educated in their profession in one of two ways. A few went to medical schools, but most went through a process similar to that of any artisan learning the arts and mysteries of any trade, apprenticeship to an older practitioner. No level of government required a license to practice medicine, and quacks could represent themselves as doctors after casually studying only a few books.

The medical arts were mainly a static set of skills and knowledge in any case, marked by few innovations and as little understanding about what caused disease and what promoted good health as the ancient world had possessed. The Greek Galen was still a primary authority, for example, and his theory about the four humors of the body was a guiding principle. Keeping the four humors of black bile, bile, phlegm, and blood in deft balance was believed to be imperative for good health. Illness was simply a sign that one of the humors was in excess and required purging. Methods for eradicating excessive humors varied, but they commonly included blistering the bottoms of the feet, the belly, the back, or head with heated goblets. Purgatives were administered to induce diarrhea or vomiting. By far, though, drawing blood was the most universally applied therapy for almost all ailments. Needless to say, these debilitating treatments further weakened an already fragile patient and were almost always the worst course of action.

Doctors employed a wide range of medicines, but many were more harmful than effective. The most commonly used medication was calomel, or mercurous chloride, a chemical compound that in its mildest form could seriously damage gums and teeth when taken with any regularity. Because anesthesia had not yet been invented and infection was almost certain, surgery was a last resort. Tooth extraction and amputations were fairly common, the former because of poor dental practices and the latter because of limb-crushing accidents or rampaging infections from wounds. Such procedures were extremely painful, and amputees often died of shock during the operation if not from the inevitable infection that usually set in days later. Tooth extractions could also lead to acute infections. During the period, advocates for better dental hygiene began with some success to encourage people to brush their teeth regularly, a regimen that could avert painful trips to barbers who frequently doubled as dentists (Heidler and Heidler 2004, 45).

Some American physicians studied in Europe, where advances were being made in the diagnosis and treatment of diseases, but these individuals were few in number and had relatively little influence when they returned to the United States. Some American doctors, particularly those affiliated with the few medical schools in the country, conducted medical research, but most of it was of little value. The majority of Americans remained skeptical about changing the way things had always been done. Even as avid a devotee of science as Thomas Jefferson said, "Some diseases not yet understood may in time be transferred to the table of those known. But were I a physician, *I would rather leave the transfer to . . . accident*, than hasten it by guilty experiments on those who put their lives into my hands" (Heidler and Heidler 2004, 46) (Shryock 1960, 73).

Hygiene

Overall hygiene generally improved during the early Republic, though baths in which the entire body was immersed in water remained rare. Daily cleaning consisted of splashing cold water from a basin usually situated in the household's kitchen area or, in warmer weather, outside near a well. Most people washed only their face and hands during this daily ritual. Soaps were normally too harsh for skin and were used exclusively for cleaning house and laundering clothes. The most affluent Americans used milder soaps imported from Europe and, by the end of the period, had begun acquiring tubs for soaking the entire body. Even primitive showers were installed in some homes. Convincing most people to bathe on a regular basis, however, proved difficult. One woman wrote after experiencing her first shower that she "bore it better than I expected, not having been wett all over at once, for 28 years past." Ordinary folk had to settle for ceramic basins and pitchers to wash up privately in their bedchambers (Heidler and Heidler 2004, 46) (Shryock 1960, 91).

Bathing might have become somewhat more customary, but other sanitation practices promoted rather than discouraged disease. Disposing of garbage and clearing away human and animal waste remained problems. Farm families piled up their garbage and periodically buried it, but urban areas had limited choices. Most towns had large numbers of feral pigs to roam streets and eat garbage tossed there by householders and business owners. Such pigs not only cleared refuse but also provided a food source of sorts for the most impoverished of the community, although the pigs carried more parasites than farm-raised pigs and passed them on to anyone who ate them. Human waste was also more of a problem in cities and towns than in the countryside, where it was buried or given to pigs to eat. Most households in both town and country featured privies placed away from the main residence, hence the "outhouse." Some rural poor simply answered the call of nature in the woods. No matter where privies were placed, they reeked in the summer and afforded ample opportunity for breeding diseases. Affluent city dwellers had their privies empty into a chamber that was periodically cleaned by itinerant laborers. Loading human waste into what was sardonically called a "honey wagon," the workers trundled this "night soil" out of town to sell to farmers for fertilizer. Most people generally used a chamber pot during the night, and only the poorest families did not have at least one chamber pot for use at night or by sick family members, giving rise to the expression "without a pot to piss in." The woman of the house or her servants emptied the home's chamber pots, so it is little wonder that homeowners increasingly sought new ways to make the disposal of human waste more convenient and agreeable (Heidler and Heidler 2004, 46–47).

Even with improvements in hygiene, life expectancy remained fairly stable during the period. Americans did generally live longer than people in other parts of the world, with people in the rural Northeast enjoying the longest life expectancy. Americans who survived childhood could expect to live into their 60s (Heidler and Heidler 2004, 47).

LIFE ON THE LAND

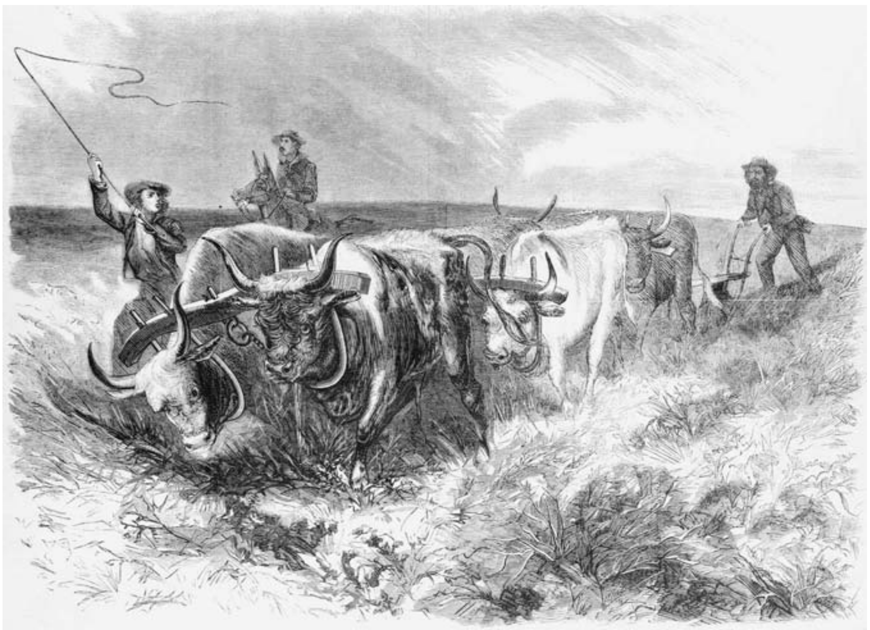
From the beginning, the most urgent human need has been to produce enough food to sustain life. Only in the modern period has abundance made for surpluses of food that permit other human endeavors, for without enough food there can be no cities, no arts, no culture, no progress. The reality of this fundamental human necessity and the relatively recent conquest of it is attested to by the fact that most Americans during the early Republic were farmers. In 1790, approximately 90 percent of the population cultivated the land. Yet the remarkable agricultural advances that would become so much a part of the American story—advances that in the early twenty-first century would have about three percent of the American population supplying most of the world's food—were already under way in the years following the American Revolution. In fact, the three decades after 1790 rank among the most extraordinary for agricultural advances. "Agriculture here assumes her most cheerful aspect," a traveler earnestly reported (Heidler and Heidler 2004, 51) (Wright 1963, 99).

By 1820, about 72 percent of Americans were farming, still a remarkably high figure by today's standards, but also marking a sharp decline during the preceding 30 years that would not be matched again until the next century. (During the next 20 years, for instance, progress slowed, so that in 1840, farmers still made up about 70 percent of the population.) The figures reveal that in the early Republic, Americans were employing significant mechanical advances in farming equipment and adopting innovative practices for the use of the land (Heidler and Heidler 2004, 51).

Plowing

Equipment and innovation aside, wherever and whenever growing things on the land has been practiced, it has always required four clearly defined steps: (1) soil preparation, (2) planting and tending, (3) harvesting, and (4) processing. In the beginning of all farming, there must be broken ground, and hardly anything is as physically demanding and tedious as preparing a field for planting. Changeless for centuries, the plow was the principal tool for turning the earth, and its design as well as the way it was pulled over the ground decided where farms would lie and how extensive they could be. Plows consisted of three basic parts: the blade that cut the earth was called the "plowshare"; the "moldboard" caught the broken soil and turned it away to create a furrow; and the "land side," the flat surface opposite the moldboard, provided the plowshare with a firm grip on the soil. Plowing appeared quite simple—it seemed that one need only direct the blade in a fairly straight line for the length of the field. Actually, though, plowing required considerable skill, and the cruder the plow, the more astute the successful plowman needed to be. Setting too fast a pace caked up the moldboard and spoiled the furrow. Going too slow prevented the share from properly cutting the ground. Old hands claimed—with good reason before the days of standardization—that each plow had a different temperament, requiring a different pace and a different way of handling to work the soil well. Oxen were frequently used as draft animals, but the preferred work animal for plowing was eventually the mule. Mules had long been in North America when, in a famously generous gesture, the Marquis de Lafayette sent George Washington a pack of asses from the Mediterranean island of Malta. Washington bred them to produce mules at Mount Vernon, joining a growing number of farmers who judged the mule superior to any other working animal. Given their tendency to kick, mules could be bad tempered, but they were generally steadier than horses and rarely ran away. They thrived on the simplest diet of corn husks and straw, while horses could be finicky and preferred a varied menu. Mules were healthy and hardy, did not require much attention, and withstood physical injury with remarkable stoicism (Heidler and Heidler 2004, 51).

Agricultural progress was closely tied to advances in plow designs and plowing methods, and important improvements occurred during the late eighteenth and early nineteenth centuries. As in many changes of the time, the Enlightenment played an important part in this process, because the Age of Reason did not concern itself only with political philosophy and intellectual inquiry. A strong practical bent emerged from Enlightenment thinkers whose contemplation of how to make the world more efficient encouraged them to apply systematic, mathematical principles to everything from rocking chairs to stovepipes. Thomas Jefferson of Virginia, a true child of the Enlightenment, always regarded himself as a farmer as much as the world marked him a statesman, and many credit him with creating the first improved plow design in America. Though Jefferson's plow was an advance—John Randolph, one of Jefferson's enemies, acidly remarked that his plow was the only worthwhile



Plowing on the prairie beyond the Mississippi. Sketched by Theodore R. Davis. Courtesy of the Library of Congress.

idea he had ever had—his dream of it being produced on a large scale was never realized (Heidler and Heidler 2004, 52–53) (Heidler 1994, 6).

Instead, plows were painstakingly hewn from wood on homesteads or, if the luxury of iron was available, pounded out, glowing red hot, under pinging hammers by leather-clad blacksmiths. Because iron was scarce and therefore costly, wood was used to fashion all but the working parts of plows until the eighteenth century. Plowshares and moldboards, the surfaces that cut and turned the soil, were frequently made of iron or at least had iron straps protecting a wooden base, but after the American Revolution, rising iron production meant the increasing appearance of entirely metal plows. The first U.S. patent for a cast-iron plow was granted in 1797 to Charles Newbold of New Jersey, whose design was a sturdy implement of one piece. Newbold's plow, however, had limited appeal because it was both expensive and difficult to repair. In fact, its one-piece design meant that damage to any part of the plow frequently rendered it useless. Sixteen years later, Baltimore inventor R. B. Chenaworth was selling a cast-iron plow with a removable plowshare, moldboard, and land side, a feature that facilitated replacement when parts were worn or damaged. In 1814 New Yorker Jethro Wood patented a similar plow with several additional improvements including superior and less expensive parts. Eventually Wood's plow set the standard for the implement, and when Edwin Stevens discovered a way to make the plowshare more durable in 1817, Wood integrated the process in his 1819 design.

Widespread use of the iron plow with interchangeable parts revolutionized farming during the early Republic. Like most machines, the plow was designed to allow more work to be accomplished by fewer people. In the South, the use of slave labor discouraged labor-saving innovations, so that hoeing and chopping persisted as the means to prepare soil for planting. Small southern farms tended to employ trowel-hoe plows and shovel plows. The trowel-hoe broke ground by slicing a single trench rather than a furrow. The shovel plow, on the other hand, was a simple device resembling a large spade with handles. It did not so much cut the soil as scratch it to about a three-inch depth, a result that restricted its use to certain types of soil unless it was supplemented with hoe and ax. The shovel plow was popular on poorer farms because it did not require as much animal power or skill as moldboard plows, and cotton planters preferred it because they could use it to cross-plow while not producing the large chunks of earth the moldboard plow did (Heidler and Heidler 2004, 53).

Even in the North, the American plow was lighter than its European counterpart. In part the difference stemmed from the American practice of regarding all innovations as temporary milestones on a path to something better. Utility was more important than sturdiness, and the lower cost of today's less durable product was appealing when gauged against the belief that clever improvements would make something superior available tomorrow. In addition, American farmers only rarely needed heavy plows in soils that gave fine yields with shallow cuts and small furrows. Labor saving was the main object of improved plows, which were able to accomplish half again as much work as their predecessors using half the number of animals. As the size of farms increased and the need for animal power and human labor lessened, the limitations on production ceased to be a problem during the planting phase and instead emerged during the harvest season. Not until the advent of mechanical reapers in the 1840s would the harvesting problem be mastered, but the road to an amazing increase in food production began in these years with these humble but important American innovations on one of the world's oldest farm implements (Heidler and Heidler 2004, 53–54).

Planting and Cultivation

Moldboards slowly drawn over fields tended to leave large lumps of soil unsuitable for planting, so plowing was only the first stage in preparing the ground for seeding. Horses or mules then pulled a harrow over the ground to produce the right soil consistency. The harrow was simply a wooden frame with attached spikes or metal disks that could break up large clods. Occasionally farmers hitched heavy round logs on axles behind a horse to squash down furrows and break up small earthen chunks.

How one planted or seeded depended on the type of crop. Many plants require space for proper growth and to ease cultivation once they take form, but some general procedures applied to all. Using a hoe or a similar implement, the farmer opened holes in plowed furrows and placed seeds in them. Grass, grain, and some vegetable seeds were usually broadcast, literally strewn by hand in sweeping motions over broken ground and then later thinned or transplanted. Tobacco was planted this way in seedbeds for transplanting, a tedious and backbreaking chore (Heidler and Heidler 2004, 54).

Corn planting went faster with two workers, one to work the hoe and the other to place a half-dozen seeds in the hole and close it with his heel to make a small hill. Hand corn-planting devices—tubes that dispensed a measured amount of seeds—were occasionally used, but they did not solve the problem of covering the seed, so they were mainly employed in gardens rather than large open fields. Nonetheless, the relatively large seeds in corn planting made them tempting candidates for mechanizing the seeding process, usually through the use of drills, which were in limited use after the Revolution. Jefferson, for example, experimented with seed drills in his fields at Monticello. Seed drills could be quirky tools, though, because they had to place a certain number of seeds in consistent patterns along set intervals. The slightest irregularity in the ground could disorder the machinery, and the occasional rock could damage it. The advantages of mechanical seeders were obvious in the diminished wastage and larger yields they produced, but during the early years of the Republic, farmers found them expensive and temperamental experiments rather than useful tools (Heidler and Heidler 2004, 54–55).

Cultivation commenced once plants sprouted. It took different forms depending on the crop. Wheat, for instance, required little attention, while almost all other crops needed some degree of thinning and weeding. Depending on the availability of labor and the method of planting, weeding was done with hoes or plows during the growing season. The era knew nothing of pesticides, so insects were removed by hand. Some larger farms employed irrigation if near a source of water, but for most, rainfall was the main irrigator, and droughts could devastate a crop; several years of drought could destroy a farm. By far the greatest enemy of the American farm during the period was soil exhaustion caused by repeated overplanting. Fields worn out by such a practice were frequently deserted and allowed to return to native grasses. Farmers would put in "Mays [corn] as long as it will grow, perhaps to two or three crops: the land is then left to nature, and fresh land resorted to and worn out in its turn" (Heidler and Heidler 2004, 55) (Strickland 1971, 126).

Conscientious farmers let fields lie fallow for one or two years and sometimes as long as four years. By the late eighteenth century, some were planting clover, a restorative plant, to replenish fallow fields while providing pasturage for livestock. Most livestock roamed free, however, and manure was not widely used for fertilizer. Near coastal regions, diligent farmers applied fish and seaweed. Indian lore prescribed one fish per maize mound; seaweed was spread at a ratio of 10 loads per acre, usually every third year. In the South, the repeated planting of tobacco and cotton so rapidly depleted the soil that when yields declined, people tended to move west to settle on relatively cheap, fertile land. These migrations resulted in tobacco culture spreading to the Piedmonts of Virginia and North Carolina and cotton into the Piedmont regions of South Carolina, Georgia, Alabama, and Mississippi. Writers like John Taylor of Caroline County, Virginia, encouraged soil conservation during this period, and some began early efforts at it, but the most important writings on the subject came after 1820. Meanwhile, a few farmers experimented with lime, marl, and gypsum, but the abundance of land to the west and the ease of migration away from depleted farmsteads discouraged systematic and widespread efforts to sustain and replenish the soil (Heidler and Heidler 2004, 55).

Harvesting

Climate, weather, and pests dictate farming techniques as much as soil conditions, and the natural rhythm of seasonal change made farming a strange mixture of the routine occasionally interrupted by the disagreeable and unexpected. The routines of spring planting, summer cultivation, and fall harvest were the constants, but sometimes things went awry. Wheat farmers in the mid-Atlantic states and New England were devastated by the invasion of the Hessian fly in 1797. In 1816 the weather turned bitterly cold and remained subnormal for several years afterward. People who lived through this peculiar chill referred to 1816 as the year without summer or, more colorfully, "eighteen hundred and froze to death." Rather than merely diminishing the growing season, the climatic change almost eliminated it in New England when even the summer months experienced killing frosts. Food shortages resulted, some farmers were ruined, and a westward exodus commenced to what migrants hoped would be more temperate climes. The cause for the abnormal cold was unknown to those afflicted by it, but we now know that a violent volcanic eruption in Indonesia in 1815 hurled so much debris into the air that the Earth cooled noticeably in the years following (Heidler and Heidler 2004, 55–56).

All this is to say that farmers have always been hostages of fate even as they have always been reassured by the regularity of seasonal change. Just as the farmer can be sure that the sun will rise each day, he knows that the approach of autumn will require him to harvest and handle his crops, and much of his labor all year long is directed to that final, key process (Heidler and Heidler 2004, 56).

Agricultural scene around 1860. Farm with early McCormick reaper. © Corbis.

Harvesting requires speed, and new tools for reaping grain that appeared after the Revolution helped. For years, farmers had used sickles or scythes to cut grain. The sickle, with its dramatic arc and sharp blade, could cut grain stalks close to their tops, but the scythe's tendency to smash grain usually restricted it to grass and hay cutting. Whatever the case, wielding these tools was difficult and exceedingly time-consuming work. Near the end of the Revolutionary War, American farmers began harvesting grain with a device called the cradle. An imported European invention, the cradle was a scythe fastened to a wooden frame from which extended curved metal fingers set just above and back from the blade. Competently swept, or "thrown," the implement sheared the wheat stalks into the fingers (hence "cradle"), from which the reaper could toss them to the ground for bundling into sheaves. Americans could "mow *four acres* of *oats, wheat, rye,* or *barley* in a day," marveled one observer, possibly with some exaggeration. Harvesting with a cradle was physically demanding but relatively fast, allowing a strong and experienced reaper to cut twice as much acreage in the same amount of time as someone wielding a sickle. Cradles, undergoing various improvements in design, would persist well into the nineteenth century as the preferred implement for reaping, until mechanical harvesters gradually began replacing them in the 1840s and 1850s (Heidler and Heidler 2004, 56) (Cobbett 1818, 190).

Cutting the grain was only the first step in harvesting. As the reaper threw the cradle, another worker followed with a hand rake to bind the stalks into sheaves that were in turn bundled together into shocks for drying in the field. The grain then had to be removed from the husks by threshing. As the name indicates, threshing was long accomplished by simply beating (thrashing) the husks, and New England farmers who grew grain for their own food stores usually threshed it by striking it with flails. Commercial growers in the mid-Atlantic region threshed their larger quantities by trampling it with livestock, a process called treading. Because the ground considerably dirtied treaded wheat, a better quality resulted from treading on platforms to produce cleaner and more expensive grain. The process used depended on the intended market, with southern farmers, whose wheat would be sold locally, using less costly ground treading. Large commercial operations aimed at international markets always used platforms (Heidler and Heidler 2004, 56–57).

The corn shock of stacked stalks with fat pumpkins resting in between has been emblematic of harvest season in America since the beginning of agriculture. Indians were planting pumpkins and corn to ripen together long before the first white settlers arrived. Corn's high yield in proportion to acreage had always made it a staple of human and animal diets in America, yet planting, harvesting, and processing corn required considerable effort because everything had to be done by hand. Expensive and unreliable seed drills obliged the farmer to put in seeds by hand; at harvest time, he had to remove the ears from their stalks, husk their thick shucks, and remove their kernels, all by hand.

Different techniques for harvesting corn either had harvesters shearing cornstalks or pulling the entire stalk from the ground, but whatever the method, the cornstalks had to be bunched into shocks in the open field for ripening and drying. When using corn for fodder, the farmer could pulverize the cob and the kernels together, but ideally corn was shelled from the cob. Some writers have suggested that the early use of seashells to scrape kernels from corncobs was the origin of "shelling" to describe the procedure. In the South, shucked corn was sometimes shelled by setting it on gapped shelving and flailing it with poles to beat the kernels from the cobs, but the method wasted a considerable amount of corn. Hand shellers used metal scrapers to rasp corn kernels from ears, a slow and tiresome chore that encouraged Americans to invent machinery for the job. The simplest mechanical sheller was also the most enduring basic design. It comprised a set of drums with spiral teeth through which the ear was cranked, stripping off the corn along the way. Mechanical shellers tended to miss a portion of the corn by leaving the tapered ends of the cob untouched, but improved designs gradually diminished the waste, and shellers were slowly introduced in all parts of the country (Heidler and Heidler 2004, 57).

Farmers in all regions made whiskey by distilling grains. Corn or rye in liquid form was frequently easier to transport across difficult terrain and fetched better prices. In remote western Pennsylvania, farmers even used whiskey as currency and thus were especially resentful when the new federal government levied a tax on it in the 1790s. The result was the notorious Whiskey Rebellion, which quickly dissolved when George Washington summoned militia to suppress the uprising. The Whiskey Rebellion indicated, however, how widespread and important personal whiskey making was in the early Republic. The availability of West Indies molasses in New England ports encouraged rum making, and farmers everywhere distilled whiskey, gin, and brandy. An avid taste for spirits led to the creation of factory distilleries that provided an important market for farm commodities as well, as commercial distillers needed countless wagonloads of grain, potatoes, and apples. Distilleries could also profit by selling grain residue for animal fodder. By the same token, brewers created a demand for barley and hops that led some farmers in various parts of the country to devote extensive tracts to these crops (Heidler and Heidler 2004, 57–58).

LIVESTOCK AND DAIRYING

For most of the colonial period, livestock on farms were a marginally domesticated lot of free-roaming animals that foraged for themselves. They were fenced out of crop-producing fields and were periodically rounded up from open woods for slaughter. Pigs, for instance, ran free and were largely feral, such as the razorbacks that came to be associated with western areas. A traveler in Kentucky noted that "of all domestic animals, hogs are the most numerous." Even large towns had marginally tame pig populations that roamed muddy streets and scavenged garbage-strewn back alleys, and it was true that the most omnipresent farm animals were pigs. Pork rather than beef was the much more prevalent dietary meat. Pigs ate anything, making them easy to sustain, but they were runty and stringy unless the farmer took care in feeding and finishing them. Successful pig growers supplemented garbage with beans, fruits, vegetables, and cornmeal. Beechnuts were said to improve the taste of pork noticeably (Heidler and Heidler 2004, 58) (Thwaites 1906, 245).

Everyone grew poultry of all sorts, both for home consumption and for market. The woman of the house generally tended the poultry, and the so-called egg money she earned at the local farmers' market helped meet household expenses. Chickens were most numerous, but geese and turkeys were plentiful also. Several times a year, women plucked goose feathers to stuff in bedding and mattresses and to sell for fashioning quill pens.

Improving roads saw the colonial oxcart gradually replaced by horse-drawn carriages and wagons. New England in the 1790s was the origin of a particular breed of horse whose short, muscular legs and fast gait made it especially desirable. Named after Justin Morgan, the owner of the breed's progenitor, a stallion named Figure, Morgan horses were sought out in New England and, with westward migrations, moved to newly settled regions as well. In due course, Kentucky, with its ample expanse of bluegrass, would establish itself as the premier horse-producing region in the country.

Many New England farmers began raising sheep when they found they could no longer compete with the longer growing seasons and more fertile soils of western settlements. Sheep supplied both wool for local textile mills and mutton for the table. At the turn of the century, the introduction from Spain of long-staple Merino sheep rapidly transformed New England sheepherding into a major enterprise that encouraged investment in textile factories and contributed to making the region the nerve center of American manufacturing (Heidler and Heidler 2004, 58).

Eighteenth-century agricultural advances in fodder crops and the better understanding of how animal manure replenishes the soil promoted more vigilant animal husbandry, especially for sheep and dairy cattle. When properly tended, sheep could yield two to three pounds of wool per animal. Farmers in all regions began to pasture their cattle during the summer. The South's warm climate allowed farmers to graze their animals in pastures throughout the winter as well, but by 1810, many southerners were emulating their northern neighbors in feeding their animals fodder in the colder months. Dairy farmers took care to shelter their animals in stables, where they fed them hay, corn, and oats. As western migration increased after the War of 1812, newer and more fertile wheat-growing areas in the West encouraged eastern farmers to emphasize animal husbandry and boost dairy farming. As a consequence, hay production to increase stores of winter fodder became important. Farmers planted large stands of hay and rapidly harvested it in autumn with scythes, clearing as much as two acres per day. After drying on the ground, hay was raked up for use in the winter. Better grades of fodder produced better milk, so care went into the feeding of livestock, a routine called "finishing." Farmers forked fodder into feedlots or brought it into barns on carts to toss into stalls. It was commonly pitched onto the ground in both barns and stockyards, a practice that both wasted fodder and undernourished animals, but the custom remained in force through the middle of the nineteenth century.

Virtually all dairy products were processed on farmsteads during the early Republic. Cows' milk, drawn by hand, was transferred into tubs and stored in a relatively cool place, such as a cellar or an outbuilding called a springhouse, so named because it was situated over or near a stream (or spring). The brick floor of the springhouse usually had several inches of water diverted onto it, where the milk tubs sat while the fatty, lighter portions of the milk (cream) rose to the top. If the farmer desired whole milk, he let the cream sit on the top long enough to sour a little before skimming it off with a ladle; skim milk resulted from ladling off the cream sooner. The springhouse did little more than slow the souring of milk and at best cooled it as a beverage to tepid temperatures (Heidler and Heidler 2004, 59).

Butter was produced by churning cream, a laborious and lengthy procedure that was never done to whole milk. Instead, farmers skimmed the cream and placed it into a churn, a tall, enclosed wooden vessel where the cream was agitated with a paddle to congeal it into butter. The farmer then placed the butter in a tub or a large cask called a firkin. Because subsequent churnings were added until the firkin was filled, farm butter varied greatly in quality; the oldest layer in the lowest part of the cask would be rancid, while the most recent on the top was relatively sweet. Nothing was wasted: rancid butter could be used to coat milk curds as they ripened into cheese. Because the cream had reached some degree of sourness before churning, even the topmost butter had a strong tang that probably would not appeal to today's palates. After 1810, commercial dairy farmers who produced butter for market had pioneered the use of sweet cream churned in large vessels that could hold many gallons at a time. These commercial churns were connected to treadmills or wheels powered by small animals, such as dogs. After the cream had turned to butter, it was set in large tubs or casks and covered, sometimes with cloth but usually with salt, and sealed to produce a consistently sweet butter. Nonetheless, butter did not travel well in the absence of refrigeration or pasteurization (the process of heating and rapidly chilling to kill bacteria), and such advances were still decades away in 1820. Consequently, butter was a local product, and only places near dairy regions could regularly enjoy it (Heidler and Heidler 2004, 59–60).

Cheese, on the other hand, profits from age and thus could travel far beyond the point of its creation without refrigeration. Cheese traveled so well that communities sometimes offered it in tribute to acclaimed events or people. In one celebrated episode, dairy farmers in the small Massachusetts town of Cheshire commemorated Thomas Jefferson's election to the presidency by combining a single day's milking of their thousand cows to make a giant cheese more than a yard across, almost two feet thick, and weighing about 1,200 pounds. A committee of Cheshire's citizens transported this enormous cheese by wagon and boat to the new capital of Washington, where it was presented to Jefferson on New Year's Day, 1802.

Cheese was sometimes made on farms by simply allowing milk to sour, a bacterial process that produces a thick precipitate (curd) and a watery residue (whey), which was removed. Cheese makers could speed curdling by heating the milk and adding rennet, the lining of a calf's stomach. The curd was then salted, for taste and curing, and ladled into a cheese press, a barrel with a perforated bottom lined with cheesecloth. After weight applied to the top pushed out additional whey, the curd remained for two or three days in the barrel. It was then taken out of the press, placed in molds, smeared over with something to seal it, such as lard or sour butter, and stored in a cool place for ripening. Ripening took anywhere from weeks to several months, during which the curing cheese was occasionally turned. All the cheese types during this period were of European origin; Dutch Edam is said to have been the first (Heidler and Heidler 2004, 60).

Life and Labor

Farmhouses were usually extremely simple frame or log cabins. More prosperous farmers might have clapboard houses, but they were rarely painted until later in the period, when the increasing manufacture of linseed oil made paint available as well as affordable. Farms obtained their water from wells with buckets or, if near a spring, from crude aqueducts fashioned by boring holes in logs (Heidler and Heidler 2004, 60).

All the tasks of farming were accomplished only by unremitting toil performed by many hands. In the North, if the farm was too large for the family to work, extra hands were hired. As in other trades, young boys could be apprenticed to farmers who would teach them how to farm while providing them with clothing and shelter. The apprentice was usually indentured to work under this arrangement until reaching 21 years of age, when he was released from his obligation, almost always leaving with gifts and money to help him make his start in the world. The apprenticeship system could be cruel and exploitative, depending on the temperament and character of the master, but it could also be instructive and familial. In any case, at most the system prescribed a term of limited service that helped young men get a start rather than ensuring, as southern slavery did, that they would never have a chance. In contrast, bondage in the South not only offset the high labor demands of growing and tending crops but tainted honest labor with the brush of slavery, discouraging whites from working anywhere but on their own land (Heidler and Heidler 2004, 60–61).

When hiring extra labor often proved too difficult or expensive for farmers who needed it only briefly, such as during a hectic season like the fall harvest or for specific chores like raising a barn, neighbors could band together for a "bee," an event that underpinned a festive social gathering with hard work. The men labored, and the women cooked; after the task was completed, jugs were raised and hearty appetites satisfied in a ritual that fostered neighborly cooperation and encouraged reciprocal generosity.

On the less settled, remote frontier and in poorer regions such as the marginal lands of the South, women might work alongside the men at all but the most physically demanding farming chores, although one observer in Kentucky noted that "women seldom assist in the labors of the field." Women in more established farming communities only took to the fields when an emergency required all hands to save the crop. Women toiled at equally demanding jobs, though, such as tending poultry and livestock, especially dairy cows, in addition to concentrating on their principal responsibility, the household. There a woman's days were filled from before dawn to well after dark with cooking, cleaning, spinning thread, weaving cloth, stitching clothes, making candles, molding soap, and raising children, a duty that frequently included their basic education as well as their moral improvement. She was the family's doctor of first and sometimes only resort, its moral arbiter, its chief confessor, and its primary comforter. The old homily about man working from sun to sun but a woman's work never being done persisted because it was so true (Heidler and Heidler 2004, 61) (Thwaites 1906, 250).

SOUTHERN AGRICULTURE

The South has a growing season with killing frosts in the winter, but unlike the North, the region enjoys much warmer temperatures for a longer period. In the upper South, across the region spanning from Maryland through Missouri, the growing season lasts about six months. The region from the Virginia coast south to northern Georgia and east to western Tennessee has a growing season of about seven months, the Piedmont regions of the Carolinas about eight months, and the Carolina Low Country and coastal regions of the Gulf of Mexico a luxurious nine months. The length of those various seasons determined the most prevalent crops in them. Generally speaking, tobacco flourished in the upper South, cotton would come to thrive in the middle regions, and rice, indigo, and sugarcane grew in areas with the longest summers (Heidler and Heidler 2004, 61–62).

Where rice was grown in abundance, such as the Low Country of South Carolina, it was the principal dietary cereal grain. Otherwise, corn held pride of place, specifically the variety called "Indian corn." In those early days, yellow corn was almost always used for animal fodder. Southerners prepared corn in a variety of ways, from roasting or boiling whole ears to shelling the kernels and boiling them to a mush, a concoction called hominy. Coarsely ground corn produced grits (always in the plural: there is no such thing as a "grit"), while a finer grind produced cornmeal for corn pone, which was corn bread usually made without eggs. Corn muffins and spoon bread, so named because it remained doughy after baking and required a spoon for eating, were also traditions. Southern corn bread was never sweetened with sugar, as it frequently was in the North. Because Irish potatoes did not store well in the South's hot climate, the southerner's substitute was the yam, which was called a "sweet potato." Sweet potatoes ripened slowly in autumn and were only bested by corn as the main staple of southern diets. Amid their stands of corn, southerners grew cowpeas, a legume that more resembled a lima bean than an English sweet pea, which required cooler weather to prosper. Apples grew in higher regions, and peaches flourished in the hot, humid weather of lower areas. Melons, especially watermelons, thrived throughout the region (Heidler and Heidler 2004, 62).

Common but inaccurate conceptions of the Old South have been formed by motion pictures in which opulent homes with white-columned terraces are surrounded by lush gardens and extensive fields of cotton. Actually, the South's large plantations constituted a very small fraction of the land and were lived on by an even smaller portion of the population. A visitor in 1825 to the Georgia frontier noted that the plantation he was visiting, "like all others, is made up of log houses. Through our quarters the wind blew to its heart's content; no light could keep burning, so that we had to see by the flames of the great fireplace. There was no ceiling, only the shingle roof directly above us through which the light penetrated" (Heidler and Heidler 2004, 62) (Handlin 1949, 161).

In any case, by 1800 the plantation system was not fully developed throughout the South, and cotton had not yet become the region's dominant staple. In 1820, cotton was gaining rapidly in importance, but its days of overarching importance in both the southern and national economies still lay ahead. That said, it should be noted that as the plantation system evolved in the South, small subsistence farms, inhabited by the poor whites of the region, tended to be less prosperous than northern farms. The result was a strangely oligarchic culture, extremely stratified, with a small proportion of wealthy planters at the top, a larger number of middling planters and farmers below, and the great majority of the white population in the lower class. That is not to say that the South did not have a middle class, but its members were more likely to be in commerce, banking, and the professions (Heidler and Heidler 2004, 62–63).

Slavery

Slave labor was used in the South, but its scale was more limited than commonly believed. During this period, only about a quarter of the white population of the South was even indirectly involved in slavery, and a much smaller percentage owned slaves. In addition, most slave owners were not plantation grandees but rather were farmers who owned a few slaves and usually worked with them in the fields.

Wealthy planters constituted a very small minority of the population, and even their homes were usually more practical than splendid. Very few planters had inherited their wealth during this period. Most were self-made men who ran large working farms rather than lavish agricultural showplaces. Generally, the largest houses consisted of two stories divided into 10 to 15 rooms, the lower level serving as a social area with a dining room, parlor, and perhaps a library, the second floor containing the bedrooms. Because of fire danger and to keep the heat of cooking fires away from the main house, the kitchen was a separate building, as was the smokehouse. Stables also sat some distance away. Larger plantations also featured a cotton gin and separate offices to oversee operations. Rather than exhibiting affluence, the planter was expected to behave as a gentleman with honor and to fill his proper place in society. A visitor to a crude log plantation in Georgia in the mid-1820s was pleased with the fine meal and "surprised to see the works of Shakespeare" on his host's bookshelves (Heidler and Heidler 2004, 63).

Yet the plantation culture, for all its intended graciousness, promoted and preserved the degrading institution of human slavery. Immediately after the American Revolution, slavery was actually in decline because the decrease in foreign markets depressed prices for plantation products such as rice, indigo, and tobacco.

Consequently, some planters began freeing their slaves, partly for idealistic reasons, but also because economic trends encouraged them to do so. Troubled by the incongruity of slavery in a free republic, several southern churches began to question the institution of slavery, and after 1817 some southerners joined the American Colonization Society, a group organized to promote the transport of freed slaves to the West African country optimistically named Liberia. Yet significant changes in southern agriculture undermined and ultimately destroyed these benevolent impulses. In the 1790s Georgia and South Carolina kept the slave trade open to repopulate these low country estates ravaged by the American Revolution. In 1803, with the admission of Louisiana to the Union, the need for laborers in the sugarcane fields increased the demand for slaves in that region. By then, more importantly, the cotton gin was revolutionizing cotton growing in the South, and the need for an abundant labor supply to grow and harvest cotton unfortunately solidified slavery as a southern institution. Significantly, southern slavery grew by natural increases rather than continual importation after Congress closed the United States to such practice, effective January 1, 1808. The vast majority of slaves in the American South were already American born so that an African American culture grew among the slave population (Heidler and Heidler 2004, 63–63) (Handlin 1949, 161).

Tobacco

Grains dominated the agricultural landscape of the North, and while corn and wheat were obviously grown in the South, they were rarely grown commercially. The exception was in northern Virginia, where a fading tobacco culture was gradually replaced late in the period by wheat farming on a scale comparable to that in the North. In the main, though, tobacco, cotton, rice, indigo, and sugarcane were the prevailing southern crops.

Tobacco was the principal crop during most of the colonial period because it enjoyed the best market, especially because cotton was difficult to process until the invention of the cotton gin in the 1790s. Tobacco, on the other hand, posed special difficulties in planting because its seeds are minuscule: about 10,000 will fill a teaspoon. Because sowing such small seeds in an open field was a pointless exercise, they were mixed with sand or ash and broadcast in seedbeds prepared by mixing in cinders, both to enrich the soil and hinder the growth of competing plants, weeds, and grasses. Planting was done near the end of winter to give the small plants the best chance of surviving relocation to open fields during spring rains. As the plants germinated in the seedbeds, growing fields were plowed and then fashioned into small mounds at three-foot intervals. At the first rain, slaves worked frantically to move the small plants from the seedbeds to the muddy fields, the best receptacle to prevent transplant shock. When the fields went dry, the transplanting ceased to await the next rain. A cycle of idleness and frenzied activity continued until the entire crop was transplanted. As the plant leafed out during the summer, considerable care had to be exercised in tending it. Those with experienced eyes knew just the right time to cut off the uppermost section of the stalk to promote sizable leaf growth. Shoots that sprouted between leaf and stalk—called suckers because they literally sucked out the plant's vitality and inhibited large leaf formation—were immediately pinched off throughout the growing season. Both the tops and undersides of leaves were regularly inspected for voracious hornworms, which could strip every plant in the field if left alone (Heidler and Heidler 2004, 64).

In early autumn, yellowing leaves signaled harvest time. Stalks were cut and laid in the fields for wilting before being strung on racks to dry. Prosperous planters could dry tobacco by hanging it from the rafters of tall barns. Outdoor curing was sometimes accelerated with low fires. Cured leaves became brittle and crumbled if handled too much, so the dried plants were left alone for the bulk of the winter. The return of humid weather in early spring made the leaves pliable and ready for final processing. Stalks were taken down and piled to preserve foliage texture as leaves were stripped and sorted into three grades of quality: the prime bright leaf, the less desirable darker leaves, and lugs from the lowest part of the plant. Bundling took place in wet weather for prizing, the packing of the bundles into casks called hogsheads. Weights and presses ensured that a hogshead was packed tightly to weigh about a thousand pounds when sealed off. The hogsheads' considerable weight meant that their transport was most easily accomplished by rolling them to river landings that served as shipping depots, a trip almost always undertaken in summer because roads were driest then. As this was taking place, the new crop had already been seeded, transplanted, and was under cultivation. It was all hard work with little idle time, since last year's crop was being processed while the current year's was being tended in the fields. Harvesting was backbreaking, curing required skill, and sorting and packing were arduous. "Nothing but a great crop, and the total abnegation of every comfort, to which the Negroes are condemned," wrote one traveler in 1788, "can compensate for the cost of raising this product and getting it to market" (Heidler and Heidler 2004, 64–65) (Handlin 1949, 86).

Rice

Rice was grown only where a large supply of water was readily available and fields could be designed to dam it and drain it away, a procedure that required elaborate levees and networks of ditches. Consequently, rice was grown in the coastal regions of South Carolina and Georgia. Brooks or swamps were the ideal location for this thirsty crop. Certain other necessities were required as well. Fields had to be situated in freshwater tidal floodplains to facilitate flooding and draining. Considerable ingenuity and vigilant maintenance were always necessary, and almost everything that could go wrong usually did. River creatures often damaged the dams, unexpectedly draining the crop and sometimes ruining it. Too much water was just as bad as none at all. Bad weather could bring freshets that scoured the fields, and coastal hurricanes could shove the ocean far up estuaries to turn freshwater tides brackish.

After the fields were broken, broad hills about a foot apart received broadcast rice seeds. If the hills were already muddy, they were covered; if dry, the field was flooded (or flowed) to promote sprouts. A set pattern of flowing and draining the rice fields could vary, but generally fields were flowed after the plant's first appearance, again in midseason, and finally when the mature stalks needed support to keep from breaking under the weight of the grain. Flows were interspersed with draining for cultivation to remove weeds and grass with hoes. Upon draining the final flow, harvesting commenced as the stalks were cut with a sickle and put aside for sheaving and drying. As with wheat, threshing was done by flailing or animal treading in preparation for milling. Unlike the grinding of wheat, which is meant to separate the chaff and break the kernel, rice milling seeks only to remove the husk. Rice mills thus resembled great mortars and pestles, with larger timbers mechanically raised and dropped to hammer the rice rather than smash it. After milling, the rice was winnowed, sifted, polished, and packed into barrels, the whole grain for market and broken kernels for the farmer's family. The chaff was either sold to brewers or fed to livestock (Heidler and Heidler 2004, 65).

Indigo

Although planted and cultivated in the same way as cereal grains are, indigo is actually a legume. Because it was a valuable source of dye and ink—its leaves yield a dark blue resin when fermented—the whole object of indigo growing was the reclamation of this dyestuff. After the plants bloomed, they were carefully harvested to preserve the leaves intact. The whole leaves were soaked in vats of water to produce a slurry that fermented in another vat while being violently agitated. At just the right moment, fermentation was halted with a stop agent, such as limewater. When the suspension settled, the water was drained off, leaving a solid, foul-smelling residue that was scooped, strained, pressed into cubes, and dried for market. Indigo was a demanding crop whose yields were relatively light—frequently less than a hundred pounds of dyestuff per acre. In its heyday, however, it offered a moderately good return for the investment of time and labor. In due course, West Indies indigo supplanted the American variety, especially because British bounties for growing it ended with the Revolution. By the late 1790s, some indigo growers were turning to long-staple cotton (Heidler and Heidler 2004, 66).

Sugarcane

Sugarcane grows only in regions with long summers. Cane fields did exist as far north as middle Georgia, but southern Louisiana had the best growing conditions. Despite its demanding cultivation requirements and difficult characteristics, sugarcane could be a lucrative crop. Some plantations by the late 1790s were producing a high grade of sugar that netted as much as $12,000 per season, the modern equivalent of almost $200,000.

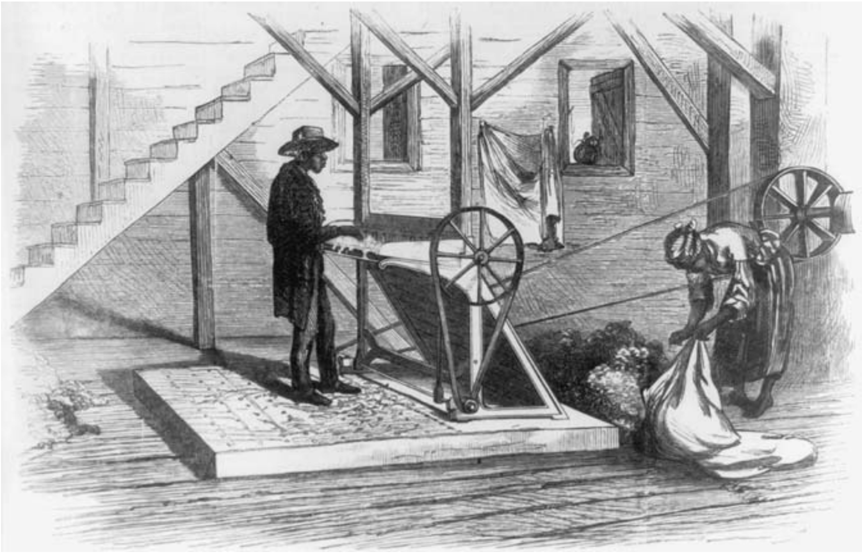
Cane growers planted their crop in deep, parallel furrows as early as possible in the year to take advantage of a long growing season. Even so, cultivation would not seriously commence until late summer. Because frost ruined the crop, cane was reaped anytime after reaching some level of maturity. Harvesting occurred in two stages. The first consisted of cutting a portion of the crop for seed cane that would remain in the field for reseeding in the following year. The second stage consisted of stripping and cutting the cane stalk by swinging a large machete in four rhythmic swipes: two to remove leaves, one to chop off the stalk at its base, and the final to remove its top. Gathered up on carts and taken to the plantation's mill, the cane was run between heavy rollers that mashed the stalks to squeeze out a clear liquid-sugar solution. Harvesting and milling could take place simultaneously, but a threat of frost focused all attention on clearing the fields. The necessity for speed at harvest made for a relentless schedule of virtually nonstop labor, especially at the mill (Heidler and Heidler 2004, 66).

Extraction was a wasteful business because the spongy stalks tended to reabsorb some of the liquid sugar as they exited the rollers. The smashed stalk also released impurities that had to be removed to permit the sugar to crystallize. Boiling the solution in a series of cauldrons brought up this residue as a scum that was repeatedly skimmed off to clarify the solution. The boiling also reduced the mixture to create concentrated slurry that, when cooled and drained, became a mass of crystals, tinted brown because of the high molasses content. During the first 20 years of the nineteenth century, improvements in beet processing, especially in France, were successfully used to process sugarcane. Pressure cookers and condensers allowed for higher temperatures that increased clarification and reduced molasses to produce a higher-quality, whiter sugar. Also, by 1817, new types of sugarcane, such as rapidly ripening variegated ribbon cane, shortened the growing season and increased yields. Despite such advances American sugarcane was never able to match West Indies varieties, which reseeded with little trouble and flourished in the much longer growing season. Sugarcane in the West Indies was so abundant, in fact, that much of it was only partly processed to extract a heavy molasses for making rum, one of the ingredients in the infamous triangular slave trade. Slave traders bartered West Africans for West Indies molasses, which they sold to New Englanders at significant profits. In contrast, the relative smallness of the Louisiana crop, the considerable domestic demand for refined sugar, and the competition of Kentucky and Ohio corn and rye whiskey meant that Louisiana cane was rarely used to make rum (Heidler and Heidler 2004, 66–67).

Cotton

There are many varieties of cotton, but only two grew in the American South. The most common was short-staple cotton, produced from green seeds with a velvet covering that clung tightly to the short fibers in the boll. Short-staple cotton thrived in the uplands, while the other variety, long-staple cotton, flourished only in the special climate and high moisture provided by coastal regions. It was frequently called Sea Island cotton because it was best grown on the islands off the South Carolina and Georgia coasts. Grown from shiny black seeds, long-staple cotton was relatively new to the continent in the 1790s. When indigo was waning as a lucrative crop, farmers in the coastal regions sought to replace it by importing seeds from the Bahamas, by most accounts beginning in 1786. Sea Island cotton was noted for its long, silky fiber that was ideal for lace or fine linens; short-staple cotton was more suited for coarser fabrics.

Carefully nurtured, long-staple cotton could yield as much as three-quarters of a million pounds in one season, valued at more than $300,000, the equivalent of



Scenes in cotton land: The cotton gin. Courtesy of the Library of Congress.

about $4 million today. Despite its great value, long-staple cotton posed special difficulties. It could flourish only in the special conditions along the coast, limiting the amount of acreage the crop could occupy. Planters preferred to prepare the ground for Sea Island cotton by hoeing rather than plowing because they claimed that even shovel plows clumped the soil. After harvest, seeds could be removed with relative ease by hand, and that practice continued even after the invention of the cotton gin. Ginning tended to break the long fibers and robbed the lint of its most desirable characteristic. Sea Island cotton required cleaning by hand (Heidler and Heidler 2004, 67).

Until Eli Whitney invented the cotton gin in 1793, cotton of the more abundant short-staple variety stood little chance of becoming a viable cash crop. Whitney's cotton gin had a profound impact on southern culture, but it also had a significant influence on national and international finances. Cotton became profitable as its more efficient processing coincided with the advent of textile mills in the North and in Great Britain. Over the next few decades, cotton production and export grew at a slow but steady pace, and the insatiable search for new places to plant cotton was one of the reasons for the rapid settlement of Mississippi and Alabama, which became states in 1817 and 1819 (Heidler and Heidler 2004, 68).

Although planting, tending, and harvesting cotton was extremely hard work, the greater problem had always been processing it. Short-staple cotton's green seed clung tenaciously to the fibers in the boll, and removing it by hand was so time-consuming that progress was measured in ounces rather than pounds. Whitney, a northerner who had been a mechanic in his youth, was visiting a Georgia plantation when he set out to conquer the age-old problem of removing seeds from short-staple cotton. The device he contrived was remarkably simple but remarkably effective. Two cylinders sat in a box, one bristling with fine wires, the other covered with brushes. The bristles protruded through a slotted side of the box against which the cotton was pressed. As the bristles rotated, they pulled cotton lint through the slots but left its thick seeds behind. The brush cylinder removed the clean cotton from the wires. His original design "required the labor of one man to turn it and with which one man will clean ten times as much cotton as he can in any other way before now, and also cleanse it much better than in the usual mode." Based on this prototype, large gins (short for "engine") could clean enormous amounts of cotton, making it profitable and hastening the transformation of what had been predominantly a tobacco-growing culture into the eventual Cotton Kingdom of the antebellum South (Heidler and Heidler 2004, 68) (*Annals of America,* vol. 3, 1968, 551–52).

Economics drove the change. In 1799, South Carolina planter Wade Hampton produced 600 bales that sold for about $90,000, a result that was at first tempting and then irresistible. As more planters and farmers planted increasing acres of cotton, the market fluctuated annually, occasionally falling precipitously when bad news from foreign markets suppressed demand. Such an event occurred in 1812, when the news of war with Britain saw the price plummet a whopping five cents per pound in one day. In addition, cotton made for other maladies. In spite of appeals for farmers to raise corn and other food grains, cotton continued to dominate southern agriculture for the rest of the nineteenth century (Heidler and Heidler 2004, 68).

The problems of processing solved, cotton nonetheless remained a demanding crop to plant and harvest, requiring prodigious labor from start to finish. The usual planting routine was to prepare fields with shallow-draft shovel plows that were driven over fields twice to break the ground more thoroughly. Then, moving single file over the tilled ground, one slave shaped a hill with a hoe and opened a hole in it, a second seeded, and a third scraped the soil to cover the seed. The process was carried out simultaneously by slave trios working in tandem across large acreages, moving side by side along lengthy rows from dawn to twilight. To keep down weeds, fields required backbreaking hoeing during the high heat of summer, and in the autumn, cotton was harvested by hand. Picking cotton was simply grueling because the low plants bent backs and the tough fibers of the cotton boll cut and cracked all but the most callused hands (Heidler and Heidler 2004, 68–69).

Cotton rapidly depletes the soil, but drives for replenishment through fertilization were slow in coming. Instead, there was a tendency for centers of high cotton production to move west, with new settlements established in the search for fruitful soil. By 1820, the richer earth of Alabama and Mississippi had already made the region, known as the Old Southwest, much more important for cotton growing than the eastern areas of the South. Southwestern planters could rely on the westward-spreading wheat boom in the North for food and could thus focus exclusively on cotton production. Slaves spent relatively little time producing food on these plantations, and planters worked these slaves intensely to swell production. Most crucial in cotton growing was assessing how much the labor force could harvest, for planting and tending a crop grown exclusively for commercial outlets was pointless if it could not be brought to market.

Small farmers took their cotton to gins throughout the South, and large planters frequently installed their own to clean their cotton and that of neighbors for a fee. During the 1790s, ginned cotton was stuffed by hand into hemp or burlap sacks and tamped down for baling, a slow process that could take a laborer a full day to fill one sack. Many planters used a lever press to pack their cotton, but gradually the more powerful screw press replaced it and by the early 1800s was the most prevalent method of sacking. Usually worked by two men and a mule team, the screw press could produce about 15 bales a day. Even so, planters rarely packed their cotton compactly enough to suit cotton brokers, whose shipping costs were determined by weight instead of volume. Consequently, southern ports featured large presses that further compressed the cotton before shipment, ideally to a standard weight of 500 pounds per bale. Brokers also erected fireproof cotton houses to store bales safely before they were shipped. Once the cotton was sold for shipment, slaves would roll the 500-pound bales to docks where stevedores, wielding hooks and tugging on block-and-tackle rigs, hoisted the bales into the ships' holds, their destination northern or British ports. Planters commanded prices for their cotton according to quality determined by the excellence and length of its fibers (Heidler and Heidler 2004, 69).

BUYING AND SELLING

Isolated farmers bought many goods from peddlers, the fabled traveling salesmen of so many ribald jokes featuring farmers' comely daughters. More established farming communities had access to the general store, which stocked everything from barreled pickles to shiny plowshares. Farmers were almost always cash poor, with prospects heavily reliant on a good crop, so transactions with rural merchants usually resorted to barter or credit with crops or the expected profit from them as collateral. Small farmers sold produce, eggs, butter, and cheese beyond what they did not need for their own larders at village farmers' markets not unlike those that can be found in small towns and cities today (Heidler and Heidler 2004, 69–70).

Brokers and Factors

Larger commercial farmers and southern planters placed their produce in larger markets, either in urban areas or for shipment abroad, a design that usually required middlemen, for even the most prosperous farmers lacked the contacts and expertise to exploit fluctuating profits and vague markets. Middlemen took the form of jobbers, brokers, or factors and could be expensive. Brokers acted as buyers' agents and could charge commissions as high as 20 percent; factors were sellers' agents who usually handled both the sale of the agricultural commodities and the financial affairs of their clients, such as securing loans and making purchases of goods in urban markets. Middlemen frequently owned warehouses in transportation hubs, such as cities along major roads, river towns, or coastal ports. Goods destined for shipment abroad would be purchased by middlemen from the farmer at wholesale and stored for sale to retailers or for oceanic delivery. The middleman could also serve as a central hub gathering diverse types of farm products to distribute to specialized sellers. Jobbers rarely owned storage facilities and most often focused on selling goods directly to the public, at auctions, for example. The exception to reliance on a broker-factor system was the case of small farmers. Wool growers also frequently sold directly to local textile plants in New England. In any case, because the undeveloped transportation network of the early Republic made markets regional for most farm products, the broker-factor system was in its infancy throughout the period.

Livestock marketing was a case in point. Farmers infrequently put their own livestock in retail markets because of the expense and complexity of doing so. Instead drovers bought livestock from farmers and herded the animals into towns or cities, a difficult chore fraught with risks because the journey usually killed some animals and wore down the rest. Before going on the auction block, animals had to recuperate from the journey with ample feed and water, an additional expense for the drover (Heidler and Heidler 2004, 70).

Crops such as grains, cotton, and tobacco enjoyed much wider markets. Grain farmers sold their product to middlemen who stored it in sacks in large warehouses. Corn was usually sacked, while wheat was occasionally kept in barrels. Grain middlemen were frequently mill owners who would sell flour locally. Wheat shipped abroad was always unmilled and was simply poured into the ship's hold. In any case, the considerable expense and labor necessary to turn wheat into flour made specialization a necessity. Wheat grains had to be lifted to a mill top, dropped into chutes, and funneled between the grinding stones, a labor-intensive job made potentially easier by a chained series of buckets invented by Oliver Evans in 1785. Yet even this first, crude grain elevator did not come into wide usage until the 1840s (Heidler and Heidler 2004, 70–71).

Southern planters who grew tobacco, rice, or cotton were completely at the mercy of the broker-factor system. Because most capital originated in Europe, for years the main brokerage houses were in London, but gradually Americans took over these transactions. American brokers and factors would station themselves in southern ports, but they usually had ties to banks in the North. Certain cities became the centers for the large cash crops associated with their regions. Richmond was the center for tobacco, for instance, Charleston and Savannah for cotton and rice, and New Orleans for cotton and sugar (Heidler and Heidler 2004, 71).

Perishables and Preservation

While the undeveloped transportation system of the early Republic meant that most farm products were marketed regionally, there were some notable exceptions. In 1787 South Carolina watermelons and sweet potatoes, carried by ship, were marketed in Boston. Nonetheless, perishable items such as produce and fruit were always unavailable out of season. Farmers tried to overcome the problems of perishables with a variety of ingenious solutions. Orchard tenders sun-dried apples, pickers pulled green corn from stalks and parched it, women of the house piled potatoes, carrots, and cabbages in cool root cellars and corn in cribs. Yet things simply did not keep for long, and such simple methods of preservation only slightly retarded spoliation. Meat was pickled, salted, or smoked (methods designed to remove excess moisture, the great accelerant of decay), but pickling altered the taste, and salting the texture. The art of curing meat in smokehouses is now regarded as a way of producing an appetizing delicacy; in the early Republic, it was a necessary process to prevent spoilage. Because city dwellers lacked an effective way to store food or dry meat, most perishable food remained on farms, even if destined for urban markets, until it was to be consumed (Heidler and Heidler 2004, 71).

Meanwhile, the period's inventive minds tackled the problem of food preservation. When Napoleon Bonaparte sponsored a contest for a method to preserve food for armies on the march, Nicolas Appert devised a process to vacuum-seal food in glass jars. Because the detection of bacteria, let alone their role in food spoilage, was decades away, nobody was sure why the simple application of high temperatures to containers that then sealed themselves upon cooling resulted in extending the life of fresh food. Yet by performing the relatively easy procedure of "canning" food, summer fruits and vegetables could be enjoyed in January. By 1819, transplanted Englishman William Underwood was canning seafood in a Boston factory, sealing his jars with tar, and another British immigrant, Thomas Kensett, was establishing a similar plant in New York, an establishment that in a few years would substitute tin cans for glass jars (Heidler and Heidler 2004, 71–72).

Self-Sufficiency

Self-reliance was the custom of farm life, and remote farmsteads were by necessity self-sufficient. Although the practice varied depending on the locality, even southern plantations preoccupied with tobacco or cotton growing set aside a certain portion of their fields to grow food. Meanwhile, the South Carolina Low Country, which primarily produced rice and sweet potatoes, became dependent on other areas for corn. Nothing went to waste, and everything had a use. Extra grain was distilled into whiskey or fruit into brandy by countless stills; at the hearthside, women pumped spinning wheels to spin thread from wool or cotton and weave it into cloth, creating aptly named homespun clothes. Tallow from animal fat was extracted during slaughtering to make candles and soap (Heidler and Heidler 2004, 72).

A Changing Economy

Part of America's revolutionary legacy included the fundamental belief that work was a noble enterprise. The Puritan work ethic, which extolled the busy life and warned against idleness, reinforced the repudiation of languid European aristocrats as part of America's revolutionary philosophy. Work was decent in itself. Americans of the early Republic embraced gainful employment as another mark of good citizenship, and political and social leaders endorsed work as essential for the free exercise and proper appreciation of political liberty. In that regard, the American Revolution was truly innovative, as it profoundly revised the customs of old Europe. Aristocrats might be better educated and more grounded in the theories of government, but they were so far removed from working people that they were not suitable to govern them. From Benjamin Franklin's homey advice about work building character to the realities of men like Washington and Jefferson being gentleman farmers, the Republic was steeped in the belief that work not only informed citizens but ennobled them. Historians have noted how Americans developed a uniquely heightened sense that labor carried its own worth, evidence of which was the belief that hard work justified private property much more than mere birthright did. The bitter arguments over Alexander Hamilton's plans to fund the national debt were rooted in these attitudes. Not only did it seem unfair that speculators would profit from Hamilton's plan, but the plan itself seemed to run counter to fundamental beliefs about fairness and equality in the American setting. The claims of original bearers of government securities were more legitimate because their motives for purchasing them were purer. Original bearers had supported the country, while speculators merely wanted to make money. Original bearers had worked for the money they had invested in the country; speculators preferred the leisure of cunning to accumulate their profits (Heidler and Heidler 2004, 75–76).

Those who worked with their hands—be they artisans, mechanics, or farmers—were not inclined to show much deference to anyone in any case, whether in matters of political leadership or social status. The attitude of an apprentice carpenter in rural Massachusetts is instructive. As part of a program of cultural improvement, he attended a literary club's debate on the question of who had more benefited society, lawyers or mechanics. He was pleased that mechanics won the day. The 1790s saw the formation of the country's first working-class associations, the forerunners of labor unions. Primarily aimed at promoting the interests of skilled artisans, these associations were also the symbol of the working class's new political and social independence from the landed gentry. More than coincidence had working-class associations appearing at the same time as Democratic Societies, the political action groups that protested political elitism in general and such measures as the whiskey tax specifically. The 1792 Association of Connecticut Artisans stretched across craft lines and was formed primarily to protest burdensome taxation. Mechanics with soiled hands, village artisans in leather aprons, and distilling farmers in the Pennsylvania backwoods foreshadowed Jacksonian Democracy, eventually to win voting rights for all adult white males during the 1820s. During the early Republic, the clanging hammer in small workshops throughout the country amounted to a death knell for the old ways of doing things socially as well as politically (Heidler and Heidler 2004, 76) (Bell 2003, 97–99).

Yet such gains did not occur overnight. Before the American Revolution, Pennsylvania abolished property qualifications for holding office, but other states not only sustained them; in some instances they increased them. The influence of the Revolution, however, was as telling in this regard as in others. Towns and cities saw growing working-class participation in political affairs, and legislative representatives from the working class gradually increased in number throughout the country. It marked a dramatic change from colonial times, when legislative assemblies were almost exclusively preserves of the landed elite.

More immediate was the disappearance of a class consciousness inherited from England that gauged artisans and mechanics as socially inferior. Instead, little distinction marked highly skilled laborers from people in the professions. Work meant economic independence, and economic independence meant status as well as freedom. It cannot be stressed enough how uniquely American this new reality was to the development of modern life. So universal was this understanding that by the end of the period, the federal census included a query about occupation (Heidler and Heidler 2004, 76).

Work not only had the appeal of functioning as a civic virtue; it provided practical benefits of material progress. America's promise was as apparent as it was abundant for the young man willing to learn a craft and work hard at it. Cities were growing at extraordinary rates, and the economy was expanding to include financial interactions that were more complex. Family enterprises of small scope became embryonic factories of ever-widening reach. And some changes foreshadowed modern problems. The old system of skilled craftsmen and their relations with apprentices rapidly unraveled. Instead of craftsmen acting as masters to apprentices, they became employers of wage earners, reflecting the new realities of a market economy in the dawning industrial age. The breakdown of the craft-guild system removed traditional controls on young men by hierarchical authority. The system that for ages had substituted for patriarchy simply disappeared as apprentices became employees. They enjoyed larger measures of economic freedom, but they also were not socially tethered, often too soon for their own good, and became denizens of the streets, creating unforeseen social problems (Heidler and Heidler 2004, 76–77).

ARTISANS

In the preindustrial economy of the early Republic, the artisan's special skills distinguished him from ordinary laborers and made him an important member of the community. He was an independent craftsman with liberty to work where and how he wished. He attained his station through a ritualized form of promotion in his craft, a system that was as old as the venerable guilds of the Middle Ages. The arrangement featured the process whereby one learned the "arts and mysteries" of a craft, a specific wording that denoted the importance of both expertise in workmanship and gratification in craftsmanship. The artisan did not merely produce material goods; he maintained an ethos of excellence imperative for his community to function properly.

The early Republic saw the last days of an arrangement that had dictated the relationship between, and responsibilities of, masters toward journeymen and apprentices. Derived from time-tested practices, the system was supposed to provide for the needs of pupils while they learned skills of a craft at the hands of an expert. The process was lengthy because acquiring proficiency with tools and materials took time, but it also sought to season young men by imparting an appreciation for the worth of good work. The good and conscientious master was not only charged with teaching his charges about how to make a living. He was also responsible for teaching them how to make a life (Heidler and Heidler 2004, 77).

Apprenticeship

The path to becoming a skilled craftsman followed one well marked by European tradition. Fathers taught their sons while accepting other promising young men to help in the shop in exchange for instruction. The understanding was framed by a legal agreement negotiated by the boy's parents, who paid the craftsman a small fee for his pledge to care for and teach his new apprentice. The contract establishing this relationship was, in fact, an indenture with clearly outlined responsibilities for both parties. The artisan would supply the apprentice with food, shelter, and instruction, including a basic education in reading and mathematics in addition to his craft work. In exchange, the boy would labor in his master's shop for a stipulated time, typically at least four years, sometimes seven. In any case, the indenture expired when the apprentice reached age 21. While in service, the apprentice was expected to preserve the mysteries of the master's trade, protect the privacy of his home, respect his property, and maintain a good moral character. What little courtship that might be allowed was closely supervised and could not in any case result in marriage until the expiration of the indenture. In fact, virtually all activities of the apprentice fell under the watchful eye of his master, who in theory had the authority to know where his charges were at all times of the day or night. The apprentice, for example, had to secure permission to leave the shop during the day and the premises during the evening. Many did not have the energy for mischief after workdays that could easily stretch into 14 hours (Heidler and Heidler 2004, 77–78).

Even under benign tutelage and benevolent regulation, apprentices were in for long, difficult, and tedious years, made especially unhappy by a system that denied them the open enjoyment of even the most harmless enthusiasms of youth. In addition, as earlier noted, some masters worsened this already despondent existence with inexcusable negligence or deliberate cruelty. Although the legal system tried to protect badly treated apprentices, haphazard and infrequent efforts at intervention were at best imperfect remedies. Apprentices frequently sought their own salvation by running away.

As the early Republic absorbed and implemented the lessons of the American Revolution, reformers increasingly criticized the apprentice system not just for these occasional barbarities but also as a vestige of medievalism out of place in the new nation. The absolute authority enjoyed by artisans under the terms of indenture was compared to a kind of quasi-slavery even as doubts arose about the artisan's exclusive ability to teach his craft, especially in a literate society whose youth could consult handbooks with greater ease and less trouble than toiling for years in a dark workshop. The indenture became less common, and the mutual obligations of master and apprentice transformed into the duties of employer and employee. The change carried advantages, but as with any change, it also was alloyed. Just as the apprentice no longer owed unconditional loyalty to his master, so the security afforded by careful masters who fed and clothed their apprentices was gone as well. Some prospered in the new, evolving system. Others fell through its cracks (Heidler and Heidler 2004, 78).

Journeymen

Nothing illustrated the troublesome aspects of this dying system better than the example of the journeyman. Under the old system, the apprentice's goal was to acquire skills sufficient to allow him to seek employment as a journeyman for wages. In that position, he could count pennies and through heroic frugality save enough money to set up his own shop and assume the role of master. Accordingly, the journeyman was better than an apprentice in both skill and situation, but he was not a self-sufficient craftsman. He was paid for his work, but he also usually lodged in quarters provided by his employer (Heidler and Heidler 2004, 78–79).

During the early Republic, a trend that had been developing during the colonial period continued. A noticeable disparity had become apparent that increasingly separated the master and the journeyman in social and economic standing.

The system of labor ensured that masters rose on the backs of journeymen as well as apprentices, accumulating personal property and economic security while the apprentices who toiled in their shops were exploited and journeymen were frozen in place. In part, this was a function of the age-old economic reality that scarceness enhances value: the few skilled craftsmen who owned shops could obviously claim the lion's share of profits, while the partially skilled and more numerous journeymen had to pay their dues while accepting modest wages. Yet the system promoted and then sustained this arrangement into an artificial stagnancy in which masters deliberately kept their numbers low to enhance their worth. The result was that journeymen found their situations increasingly immobile.

The lucky journeyman became a master. Most stayed put in their social and economic place, if not their jobs, as they became permanent itinerants (hence the name "journeyman") searching for work. They coped with competition from immigrants and apprentices who would often work for food and lodging in the North and watched talented slave artisans do the same thing for the same compensation in the South. During the early Republic, this unformed army of luckless laborers began to form associations that at first filled the role of benevolent clubs by aiding sick members and looking after the families of dead ones. Eventually, though, these groups encouraged journeymen to adopt tactics familiar to modern labor organizers, including public relations initiatives and strikes (what were then called "turnouts") against a specific trade. A host of difficulties, however, frustrated the formation of an influential labor movement during these years and for decades afterward. Workers found it difficult to cohere in large numbers across different skill levels, the pride of competent craftsmen a conceit that was impossible to shake. They stumbled over other differences as well, such as gender, race, and nationality. Hard economic times made immediate employment more important than farsighted ideals. Therefore their efforts were small, insignificant, and unsuccessful throughout the period. The day would come, though, when that changed as well (Heidler and Heidler 2004, 79).

Masters

The development of modern labor relations flew in the face of the traditional system in which masters defended their trades from overproduction by limiting apprenticeship and the dissemination of purportedly arcane expertise. In response to these changes, masters continued to establish their own trade organizations, a practice that for them dated from the early eighteenth century. In addition, they began to fulfill roles normally associated with entrepreneurs and middlemen. They haggled with suppliers, bargained with journeymen, and adjusted the way they sold their products, sometimes eliminating themselves from retail operations altogether to have their operations perform only production chores similar to those of a modern manufacturing plant. They became politically active as well, especially to prevent statutory regulations and to encourage the adoption of protective tariffs (Heidler and Heidler 2004, 79–80).

Yet their time as master artisans was waning, a circumstance over which they ultimately had little control. They inherently opposed factories as directly contrary to their ancient codes of craftsmanship. In thus opposing mass production, they were on the wrong side of economic history, for the dawning market economy of the nineteenth century would clamor for more things made more affordable for more people. Opposed to upward social mobility for their workshop employees, they were behind the changing times in social awareness as well, no matter their ongoing but threadbare attempts to disguise economic self-interest as compassionate paternalism. The years of this period were the beginning of this dramatic shift, and sometimes its advance was marked more in stalling fits than starts, but it was a shift inevitable in any case. Its acceleration in the latter part of the nineteenth century would make the master craftsman a nearly extinct species of worker. The artisan as artist, surrounded in his workshop by racks of tools passed down through the generations of his family, would be at best a quaint remnant of a time when the nation was new and its promise of explosive economic energy yet unrealized (Heidler and Heidler 2004, 80).

Preindustrial Work Ethics

Machines produced a few products during the early Republic, but craftsmen working in shops with uncomplicated tools made most things during most of the period. The pace of work was hardly constant. Visits from fellow craftsmen and customers frequently interrupted work, and pauses for conversation and refreshments were regular. In any case, a craftsman took his time, often varying his tasks, sometimes according to nothing more pressing than his mood. The craftsman measured his progress by the quality of the work rather than the time it took to complete it. Consequently, the particular days of the week held little importance for him. Mondays, for example, did not necessarily require steady labor, for he could always accelerate his pace during the balance of the week to finish a pending project (Heidler and Heidler 2004, 80).

A typical week of work for an artisan and his shop might pass as follows. Monday was frequently a day of preparation for the real work of the following days, and there were practical reasons for this. What were called "blue Mondays" saw the artisan and his charges tending their tools, collecting materials, and arranging for work to begin in earnest on Tuesday. The rest of the week would pass in labor at the pace already described. Journeymen were paid on Saturdays, and they frequently did not put in much effort that day, especially when kegs of beer might be brought into the shop to celebrate the end of the workweek. The journeymen's celebration continued on Saturday night, in the town and in saloons, with rollicking merriment that stretched into Sunday, making the shop on blue Monday a sluggish and listless place (Heidler and Heidler 2004, 80–81).

What appears to modern eyes as a languid work rhythm should not be confused with idleness, though. People generally accepted the Puritan work ethic that extolled labor as virtuous. They also accepted the idea that an industrious people were an imperative ingredient for the maintenance of Republican liberty. Moreover, artisans firmly embraced the notion that economic independence through discipline and self-sufficiency was the surest path to individual freedom.

In an ideal world, such noble sentiments would have been uniform, contributing to a high standard of behavior and an infallible quality of workmanship. But the early years of the American nation were no more ideal than those of any time. Shoddy craftsmen did exist then who produced inferior goods, and local governments tried to install regulations to ensure that such shady characters did not bilk unwary buyers with substandard materials and slapdash workmanship.

In an ideal world, too, the honest, hardworking craftsman would have made a success of his trade, but events and fate sometimes made that impossible. The challenge of operating a shop, laying aside capital to keep tools current, paying for the repair of those that broke, tutoring apprentices, managing journeyman, taking commissions, and fulfilling those commissions in a timely manner with excellent products was a tall order for the most talented and diligent of artisans. Many were not capable of meeting the varied demands of the shop while ensuring the happiness and safety of a household, and shop failures were more the routine than the exception, especially in risky economic times.

Moreover, the work ethic of the day was simply running out of time. A workweek that at best consisted of four days could not survive the scrutiny of the reform-minded nineteenth century, with its temperance movements and clanging factory bells. Teetotalers frowned on the Saturday beer and Sunday revels as sinful; manufacturing managers scowled at employees who showed up late to run machines that were never late, and at workers who rested to leave idle machines that were never weary. The transition that began in the early Republic from the artisan economy to the industrial one had a profound impact on the sense of how work was done as well as what work meant for Americans (Heidler and Heidler 2004, 81).

FACTORIES

The clanging hammer of the artisan's workshop sounded a knell for the old politics of class and privilege, but it was also the sound of a dying system gradually passing from the scene. The early Republic was mainly a preindustrial society of farms and workshops, but the seeds of a factory system were planted in the earliest years of the period. "It may be worth observing," said a visitor in 1819, "that there is something in the character of the American population, as well as in the diverse products of the soil, which seems favorable to the growth of manufactures" (Heidler and Heidler 2004, 81–82) (Wright 1963, 200).

In 1787, investors founded the Pennsylvania Society for the Encouragement of Manufactures and the Useful Arts, which established a textile factory in that city. When it burned down, the charitable Guardians of the Poor replaced it with another plant that operated until 1812 as a way to employ the impoverished. Both of these manufactories foretold the future of labor in an industrial setting: weavers gathered in one building where their labor was supervised and scrutinized in a way that would have been unimaginable to the average craftsman in the average workshop. In this new world, traditional permanent wage labor would virtually eliminate apprenticeship. Conversely, master craftsmen would become less definable as an economic and laboring class as they combined shop ownership with administrative functions associated with management rather than production (Heidler and Heidler 2004, 82).

All this was happening more rapidly than the misleadingly unhurried pace of the times might have suggested. The accomplished political economist Tench Coxe prepared a telling report that detailed the progress of manufacturing in the United States from 1787 to 1804, a snapshot of the remarkable variety already embraced in what was becoming a vigorous transformation of the American economy. Coxe noted that Americans had

> invented or acquired the machinery for freeing cotton wool from the seed, the spinning jenny, the spinning mule, the roving, twisting and carding machinery, the perpetual carding and spinning water mill, the flying shuttle with its appropriate loom, the machinery for coining or stamping metals, leather, &c., that for cutting card wire and nails, for reducing old woolen cloths or rags to the state of wool, for boring cannon which have been solidly cast, for pressing, packing and lading cotton, for spinning flax, hemp and combed wool, for various operations in the staining and printing of cotton and linen cloths, for rolling the finer metals, for plating the coarser metals with silver, for steam-engines, for grinding, in quantities, optical lenses, for fine turning in wood, metal, stone and other substances.

In 1810, U.S. Secretary of the Treasury Albert Gallatin issued another report that was even more enlightening about the rapid progress of American industrialism. Gallatin detailed the production of everything from soap and tallow candles to pottery and windowpanes (Heidler and Heidler 2004, 82) (Coxe 1804, 23–24).

Much manufacturing during this transitional time was the result of the "putting-out" system, an early form of factory labor that had been in use for decades. Merchants provided materials to workers, primarily women, who labored in their homes to make a variety of products for which the merchant paid them by the piece. The regions near American cities became busy scenes of household manufacturing, providing work for thousands of people who made everything from straw hats to tallow candles (Heidler and Heidler 2004, 82–83).

Just as in England, though, it was in the production of textiles that the emerging American factory system recorded its greatest gains. The first spinning mill in the United States was erected in Rhode Island in the year 1791, and others quickly followed. At the end of 1809 alone, 87 new mills were either put in operation or were being established, making the number of additional whirring spindles at the start of 1811 an astonishing 80,000 (Heidler and Heidler 2004, 83).

The Factory System

The unique concept of the factory consisted of placing machinery and workers into a building or collection of buildings to create constant production. Modern conceptions of factories always picture workers in orderly arrangements stationed at points along an assembly line. Early factories, however, were simply large workshops where artisans worked independently. As new machines increasingly mechanized textile processes such as spinning and weaving, artisanship became unnecessary. Unskilled machine operators with a minimum of training produced cloth quickly and cheaply on equipment too costly for any place but a heavily capitalized factory.

For the United States, the main impediment to establishing factories was Great Britain's prohibition on the export of both machines and the plans for them. The enterprising Englishman Samuel Slater solved the problem of acquiring machinery. Slater had been an apprentice to a partner of British inventor Sir Richard Arkwright and had carefully committed to memory Arkwright's designs for textile machinery. When the fledgling United States offered bounties to prospective inventors, Slater leaped at the opportunity, immigrating to America and, at the request of wealthy investors, opening a profitable spinning mill at Pawtucket, Rhode Island, in 1790. Soon merchant investors eagerly founded additional mills under New England's new laws of incorporation (Heidler and Heidler 2004, 83).

Finding ways to power machinery was a predicament, and its solution ironically made it difficult to find a ready supply of laborers. New England boasted an abundance of running streams and rivers that could supply power to textile mills, but these rural settings were relatively far from population centers. Booming job markets in cities made it difficult to entice laborers to countryside factories. Samuel Slater solved part of the problem by hiring entire families to work in his mills, but male laborers were increasingly difficult to come by, leading the large-scale mills of Francis Cabot Lowell's textile empire to employ farm girls from the surrounding countryside. Dexterity rather than strength was important to operate the increasingly complex machinery, and most women brought a basic knowledge of spinning and weaving to the task. In 1812, 87 cotton mills employed 3,500 women and children and only 500 men. With minimal training, women performed the tasks in Lowell's mills, working a six-day week, 12 to 13 hours a day. They were supervised by matrons, housed in dormitories, and forbidden to marry. For most of them, employment in a mill was a temporary state of affairs that ended when marriage removed them from the workforce. They were consequently a passive body of laborers with little interest in long-term labor improvements such as better wages or shorter hours, at least at first. Eventually, mill owners would face growing complaints about working conditions and poor pay that actually resulted in a few strikes by angry women workers, but those occurred in the 1830s and after (Heidler and Heidler 2004, 83–84).

The Spread of Factories

The embargo of 1807 and subsequent nonimportation measures passed by Congress quickened the pace of American industrial growth as domestic manufacturers tried to fill the gap left by absent British imports. That situation continued and the tempo of industrialization even accelerated after the War of 1812. Labor shortages forced American manufacturers to use machines for as many tasks as possible, but the unexpected industrial dynamic meant that the greater number of machines required a greater number of operators, increasing rather than diminishing the problem of the inadequate labor supply. Not until the widespread application of steam power would factory development become less dependent on natural sources of power, allowing for the placement of factories at the manufacturer's convenience.

Designing machines that could be repaired easily by relatively unskilled mechanics was necessary if factories were to branch out from the textile industry and move beyond the status of glorified workshops. The development of new machinery and techniques for building machines gradually made it possible for the factory system to extend to other industries. American inventor Eli Whitney, who invented the cotton gin in 1793, made an essential contribution to the factory system with his experiments in the use of interchangeable parts. Beginning in 1798, Whitney established an armory whose production of firearms attempted to use this novel concept, one that eventually eliminated custom work, later made possible the modern assembly line and prepared the way for mass production. Machine tools—machines that made other machines—became more precise, and as the jig (a guide that allowed precise replications of the same part) came to be used extensively, the use of interchangeable parts spread to other manufacturing processes. Jethro Wood's iron plows featured interchangeable parts. By 1820 the application of interchangeable parts to the manufacture of timepieces led to standardized production techniques that made clocks more affordable (Heidler and Heidler 2004, 84).

Roads and Rivers

A better transportation network was a crucial ingredient for the development of a healthy, diversified economy. In 1790, primitive methods of travel were the norm, with commerce on the coast or on rivers dependent on wind, weather, currents, and tides. Wagons lurched and bounced on rutted roads that when dry slowed an already slow pace and when muddy stopped it. "The road to Baltimore is frightful, built over clay soil, full of deep ruts, always in the midst of forests, and frequently obstructed by trees uprooted by the wind," a French traveler complained in 1788 (Heidler and Heidler 2004, 84–85) (Handlin 1949, 82).

Finding inexpensive and reliable ways to transport raw materials to factories and finished products to markets was essential. The cutting of better roads, often by private investors who charged tolls to cover expenses and make a profit, was a major development of the 1790s. These all-weather roads were called turnpikes because their tollgates bristled with pointed pikes that were opened, or turned aside, only after travelers paid a fee. Turnpikes were profitable investments, promoted brisk commerce wherever they appeared, and were a key venture for the next two decades, helping to speed western

settlement. In 1811 the federal government began constructing the National Road, which started in Cumberland, Maryland, and eventually stretched to Vandalia, Illinois, but the project spanned decades and was not completed until 1852. Instead, stretching into the 1820s canal building emerged as a popular trend, beginning with the fantastically successful Erie Canal that linked Albany to Buffalo.

Steamboats made their first appearance during the period. In 1787, inventor John Fitch's makeshift steam-powered vessel *Perseverance* had steamed slowly along on the Delaware River. Experiments and improvements by Fitch and others made steamboats less a novelty and, by the turn of the century, something of a fad. The real turning point came in 1807 when artist-turned-engineer Robert Fulton displayed the prowess of his *Clermont*. The *Clermont* huffed and puffed up the Hudson River from New York City to Albany, completing the 150-mile trip against the Hudson's current in less than two days, half the time it took a sailing vessel. Derisively dubbed "Fulton's Folly" by skeptics, the modest *Clermont* with her noisy boiler and ungainly paddlewheels had actually achieved a fabulous milestone. In fact, steamboats were nothing short of breathtaking in the difference they made in river travel. With the backing of wealthy investors and his own unwavering resolve, Fulton led the way in turning America's navigable inland waters into busy avenues of thriving commerce. Fulton died in 1815, but the transportation method he had helped develop and the steam technology that drove it continued unabated. By 1820 more than 50 steamboats churned the waters of the Mississippi River, besting swift currents at the then phenomenal speed of 10 miles per hour. There and on other rivers of the country, populations spread along their banks, farmers to ship out their produce and merchants to ship in the products of the growing eastern factory system (Heidler and Heidler 2004, 85).

Labor

An unfortunate consequence of the developing factory system was an increasingly serious problem with labor. The putting-out system had made manufacturing an extension of household rhythms, and the artisan's small shop had promoted face-to-face and even congenial relationships between masters, journeymen, and apprentices. Factories, however, were places with unapproachable owners whose expectations about diligent attendance and workplace discipline ran counter to the traditions of preindustrial America. Increasingly, as urban workers labored for long hours that left little time for relaxation and recreation of any sort, there was a sense of social dislocation and emotional dissatisfaction. Many workers could vividly recall when they had been artisans working for themselves at their own pace. Working for someone else was hard enough, but to accept an employer's belief that he owned your time was virtually impossible. In response, the workers labored at their own pace and took time off when they needed a rest. Unauthorized absenteeism in early American factories was common, and it is easy to understand why. Workers toiled long hours for low wages in poorly ventilated, badly lighted, and barely heated buildings. Laws kept them from forming associations that could collectively negotiate for better conditions and pay, the courts having judged such associations to be criminal conspiracies (Heidler and Heidler 2004, 85–86).

In Samuel Slater's Pawtucket mill, the first workers were seven boys and two girls, all under 12 years of age. Children had always worked, but the factory system exploited them shamelessly. Tending machines that never rested was mind-numbing, and for small children, it was always dangerous and occasionally lethal. Slater realized the potential for abuse and tried to alleviate it, establishing Sunday schools for his child laborers to teach them basic skills as well as provide them with moral instruction. Lowell never used young children in his mills. Other owners and managers, however, were neither that benevolent nor fastidious. In 1820, one-half of the nation's industrial labor force consisted of children younger than 10 years old, many of them fated to remain in dreadful ignorance, psychologically damaged and physically ruined. Some factories had whipping rooms that were the scenes of dreadful cruelties. Unfortunately, child labor conditions in America's factories would not materially improve until the elimination of child labor itself became a reformist cause in the early twentieth century (Heidler and Heidler 2004, 86).

The Industrial Work Ethic

The people who ran mills and factories expected laborers to show up every workday on time, prepared to devote their full energies to at least 12 hours of work, often 14. The length of the workday became a major point of contention, especially as workers accustomed to the more measured pace of the workshop struggled to adjust to the relentless march of machinery in factories. Accordingly, workplace discipline was another point of conflict, as laborers took unscheduled breaks, chatted with fellow workers, paused for refreshments, and generally asserted independence learned in the simpler workshops of America's preindustrial culture. The most successful practitioners of the old ways in the new factory setting were skilled artisans. The relative simplicity of certain machinery made them indispensable for performing necessary tasks. For others, managers tried to break old habits with punishments that ranged from fines to firings, but American workers have rarely submitted to such treatment. In later times, they would form unions. In the early Republic, they were apt to quit. In good economic times, quitting was easier, as it was in certain seasons, such as spring and fall, when the demands of planting, harvesting, and processing agricultural goods could absorb the unemployed. Americans were a restless bunch and a factory laborer might quit over nothing more tangible than the whimsical impulse to try his luck elsewhere (Heidler and Heidler 2004, 86–87).

BUILDERS

A factory could not build a house, and artisans in the construction trades were immune to the changes that industrialism portended. Construction techniques were less sophisticated than those used in today's buildings, but they were not so simple as to permit anyone to build his own house. Construction of a proper house required specialized skills and tools limited to a variety of craftsman who contributed to the creation of a correctly built structure. Focusing on a specific craft was partly a tradition, but the sizable investment in tools and the years of training necessary to acquire adequate expertise virtually dictated specialization. The proverbial jack-of-all-trades was at best a rarity and probably a myth because few men possessed the time, capital, and acumen to assume such a role. In populous areas, there were brick makers, brick masons, carpenters, joiners, painters, glaziers, plasterers, and stonemasons. In less established regions, some men might ply closely related trades, such as carpentry and joinery, but even that level of general skill had limits. A mason would not have made bricks, for example, nor would a carpenter have forged his nails.

Agreements between tradesmen and customers were usually quite simple and entirely straightforward. Typically consisting of a single page, a contract stipulated the dimensions of the house and contained the master builder's pledge that the work would meet expectations regarding workmanlike standards and practices and would be completed by a specified date. The prospective owner agreed to purchase materials and to ensure that the builder would be paid, even if the owner's death required his heirs and estate to meet the obligation (Heidler and Heidler 2004, 87).

In the absence of an architect, a talented carpenter acted as master builder. Beyond the predetermined dimensions of the structure, the master builder was largely responsible for the design of the house and was in charge of securing the services of other specialized artisans, such as painters. In that regard, the master builder performed the functions of today's contractor. To formulate estimates, he consulted price books that provided extremely detailed labor costs of artisans by trade. Artisans agreed to adhere to these as maximum charges to ensure their employability and to attest to their integrity. During hard economic times or in remote areas, the master builder might have employed some craftsmen at cheaper rates, but never for more than listed in the price books. Payment by the owner normally called for installments at the beginning, middle, and conclusion of the project. The contract also spelled out penalties for breaches (Heidler and Heidler 2004, 87–88).

Construction

Before construction began, the site was cleared and graded in preparation for digging a foundation. Unskilled day laborers toiled at these tasks with picks, shovels, and wheelbarrows. Following this initial excavation, a stonemason began the work of laying the foundation, the first and most crucial part of the construction process, for without a good foundation, everything that followed would be defective.

Carpenters then framed the house, a task that usually required the expertise of several different types of woodworkers. One might be employed to join large pieces into joists and studs, another made roof shingles, another carefully carved and finished tongues and grooves to join floor planking, and another finished interior walls or prepared them with laths for a plasterer. Affluent house builders might secure the services of a master carpenter called a joiner who fashioned items that had to fit precisely, such as door frames, windows, and stairs. The joiner was also responsible for aesthetically important details, such as crown molding.

Pegged joints, a remarkably sound construction method, were used to fasten the house's frame, but nails were available during the period. Before 1790, nails were made by hand in a laborious process that required the flattening out of their heads with a hammer and pounding them to taper on four sides. After 1790, cheaper nails were produced by machines and were tapered only on two sides. Forged wood screws before 1812 had irregular threads, but afterward machined screws came into use, the slots in their heads a bit off center from a hacksaw cut (Heidler and Heidler 2004, 88).

Brick Making and Masonry

Wooden houses required bricks for fireplaces and chimneys, and a wealthy owner might contract for a complete brick house, an expensive proposition because the bricks were made by hand. The process, in fact, required considerable ability to produce anything other than an inferior result. The practiced eye of the artisan brick maker could spot good clay, combine it with the proper amount of sand, add just the right quantity of water, and blend the whole for the correct length of time. He and his journeymen and apprentices then pressed the clay into wooden molds for drying in the sun. The final step involved stacking the bricks in a kiln, where they were fired at a temperature of nearly 2,000 degrees for several days. After they cooled, they were ready for laying. This work was usually done at the building site, where an expert brick maker with experienced help could turn out an astonishing number of bricks in a relatively short time. Though they proved remarkably durable, bricks were almost never uniform in appearance because of uncontrollable variations in clay, water, sand, and the heat of the kiln, something evident in the interestingly inconsistent character of brick buildings and houses erected during the period (Heidler and Heidler 2004, 88–89).

Combining sand, clay, and lime with some sort of bonding agent like cow hair made the mortar for bricklaying. The most difficult ingredient to come by was the lime, which had to be produced by firing limestone or burning shells to extract calcium oxide, or what is called quicklime. The quicklime was mixed with water in a sand pit to produce a chemical reaction so intense that the concoction boiled itself down to a powdery mass of calcium hydroxide, which, when mixed with water, became the bricklayer's mortar.

Bricklayers turned different sides of the bricks to set patterns for a pleasing visual configuration but mainly to create a strong structure, because a durable, solid bond required the alternation of bricks in some fashion. The most common patterns were English bond and Flemish bond. English bond placed the long side of bricks (the courses) in layers that alternated with layers of the end of bricks (the headers). All stretcher layers were aligned vertically, and header layers were placed to center on the stretchers above and below and the mortar joints between them. The Flemish bond alternated stretchers and headers in the same layer to produce what many considered a more elegant appearance, but with the disadvantage of being not quite as stable as English bond. The bricklayer used a trowel, a short-handled hand tool with a pointed blade, to spread, shape, and smooth the mortar. The trowel, a hammer, and a saw were used to cut the bricks to size, and a level and carpenter's square helped ensure that the work was plumb, straight, level, and to specifications (Heidler and Heidler 2004, 89).

Fine window glass from Europe was of the best quality, but American glassblowers could produce serviceable panes through a simple process that created "crown glass." The artisan superheated sand in a kiln, rolled it onto a hollow rod, and blew the molten material into a bubble that he then pressed into the form of a flat disk. The glassblower then tapped the disk off the rod and allowed it to cool before scoring it to crack into rectangular panels. Crown glass was relatively bulky and had swirling patterns that affected its transparency. It was called crown glass because one pane in each batch contained a noticeable blister from the blowpipe. Green glass (because of the mineral content of the sand), sometimes called German glass, was considered inferior for windows. Cylinder glass gradually replaced crown glass because it was both cheaper to make and of better quality. Molten sand was blown into a tube or cylinder. While the glass was still pliable, the cylinder was cut open and the contents pressed into a thin, clear pane absent of swirls and blisters. Panes were a standard size and put in window sashes by a glazier, a job so simple that an artisan painter often did glazing as well. The glazier mixed white lead and linseed oil to make supple putty that rigidly set to hold panes firmly in the sash. Painters had apprentices mix pigments with linseed oil and white lead to produce one of the period's popular colors for interior trim and plastered walls (Heidler and Heidler 2004, 89–90).

BANKING

Uniform currency, ready credit, and a sound central banking system that supported currency and credit were important components in the changing economy of the early Republic. Nothing had the potential to affect the daily life of Americans more directly than these fundamental issues relating to their pocketbooks. During the period, they went through several distinct stages, starting with the extremely unstable economy of the post-Revolutionary years that the first Bank of the United States helped to repair and put on a firmer footing. The uncertainties leading up to the War of 1812 were compounded by the high cost of that conflict. Finally, the mismanagement of the Second Bank of the United States in its early years contributed to the volatile economy that crashed precipitously in 1819, causing dire hardship across all sectors of society (Heidler and Heidler 2004, 90).

Money and Currency

Fundamental to an understanding of the problems confronting the country's young economy is the distinction between money and a circulating medium that represents money. Money has an intrinsic value. That value can derive from several factors, but traditionally it had resulted from the material from which money was made. Coins (or specie) were valuable because they were usually made of a precious metal such as gold, and they had value regardless of who minted them or what was engraved on them. They operated as money in its simplest definition, but even that simplicity was fraught with confusion. The profusion of various types of money in the early Republic gives us an idea of the problem. Coins from every nation were jumbled together in countless transactions throughout the cash-starved country. Even the nomenclature for money was muddled. Westerners called a Spanish reale a "bit," while New Yorkers called it a "shilling." The reale was worth about 12.5¢. Two bits totaled a quarter, four bits a half dollar, and eight bits a full dollar. According to some sources, the term "bit" originated with the curious practice of making change for transactions by physically breaking a dollar coin into eight wedges, or bits (Heidler and Heidler 2004, 90).

Because it circulated in the economy, however imperfectly, money was always currency. Yet currency was not always money, because items that merely represented money could circulate in the economy as well. That sort of currency had no intrinsic value but derived its worth from external sources. Currency in the form of paper notes could be valuable, for instance, because it represented money in the form of specie, either gold or silver coins. More intangibly, but no less effectively, currency could be valuable if people had confidence in it to function as a medium of exchange for goods and services. As long as someone accepted it to satisfy debt, it had value. The more people who accepted the currency, the higher the level of confidence in it, and the more functional it became as a substitute for money. The opposite was also unfortunately true. The paper currency issued by the Continental Congress during the Revolution offered a sorry example of how such specimens, not backed by gold, could turn worthless after losing public confidence. By the end of the war, what was colloquially called the "continental" was not worth the paper it was printed on, and the term actually entered the vernacular as a synonym for anything worthless. The experience colored an entire generation's perception of paper money and resulted in general and enduring suspicions about it (Heidler and Heidler 2004, 90–91).

Money had a great advantage in that it would always spend. As the wretched continental showed, under certain circumstances, currency would not spend at all, or it would not spend as effectively as money. Yet the advantage of currency was that its quantity could be artificially increased or decreased according to the needs and condition of the economy. Because an expanding (or inflated) currency was more abundant, its buying power was reduced, and prices rose to reflect the lower purchasing power. Inflationary cycles, however, usually promoted easier credit, because inflation typically stimulated buying and spending. A diminished amount of currency increased in value, but it also slowed economic activity and usually resulted in tighter credit. Achieving a balance between the two extremes of inflation and deflation was imperative, for that was how healthy economies expanded with reasonable credit while avoiding the hazards of spiraling prices. A key component was creating and sustaining public confidence, as Alexander Hamilton insisted in his plan to restore faith in the public credit. Confidence in currency for many years was founded on a reasonable ratio of currency to gold. A certain amount of currency represented a certain amount of gold and could be exchanged for it in that ratio (Heidler and Heidler 2004, 90).

Of course, this simple definition belies the considerable complexity of all but the most rudimentary economic systems, but the basic principles are sufficient to understand the largely undeveloped but nonetheless turbulent economy of the years following the Revolution. In the first place, many parts of the country had neither money nor currency and conducted transactions through barter. Observers in remote areas of America remarked that one never heard the words "buy" or "sell" but instead heard about "trades" (Heidler and Heidler 2004, 90) (Dick 1964, 117).

Where it existed, currency was uniform only in relatively small localities. Currency in the form of bank notes was only as valuable as the reputations of the issuing institution. States chartered banks during the 1780s primarily to issue bank notes to supplement the small amount of money in circulation, but also to accept deposits and make loans. These banks had no requirements to hold a percentage of deposits in reserve; therefore, there was virtually no curb on a bank's capacity to make loans. The soundness of a bank's notes, however, was controlled by its reliability in exchanging them for money, for the bank thus gave a rough indication of its money reserves (liquidity). Every bank would theoretically honor its own notes, and a trustworthy bank would have a sufficiently good reputation in a community and its environs to have the public honor those notes as well, accepting them for goods and services. Yet in distant locales, unfamiliar bank notes could make merchants wary. At the least, notes would be discounted at a rate commensurate with the cost of redeeming them. For example, someone with a note for $10 from a highly regarded bank in Boston would have no trouble using it to purchase $10 worth of goods and services in most of Massachusetts; the farther one took the note from Boston, though, the less valuable it became. Cashing a Boston bank note in Savannah, Georgia, might result in a discount rate of 10 to 20 percent, making the $10 note only worth $8. The balance of the discount rate was the levy for the trouble of cashing it at its distant, originating institution. Bank notes from an unfamiliar institution would likely merit an even larger discount, and some would be worthless (Heidler and Heidler 2004, 91–92).

Obviously, the local nature of currency was troublesome and expensive, and the establishment of a national currency that would be as valuable in Savannah as in Boston was most desirable. Regional efforts to set up central banking systems were an indication of this need, and a truly central bank was the answer. A central bank was essentially a bank used by, and exerting control over, other banks. For instance, small banks in rural areas usually had accounts at a large bank in a nearby city to smooth the progress of their transactions over a wider region. Yet a national central bank required government sanction to control the money supply, whether through specie or currency, and thereby promote economic stability (Heidler and Heidler 2004, 92).

The Bank of the United States

In 1791, the federal government chartered a central bank, the Bank of the United States. The bank, as a repository of government funds and a source of loans for individuals as well as federal and state governments, was the source of great controversy because many thought it nothing more than a servant of special interests. State banks were especially critical of its operations because notes on the Bank of the United States were redeemable at face value throughout much of the country, making it difficult for state banks to compete for customers (Heidler and Heidler 2004, 92).

The bank's most important public function was to regulate the amount of notes that state banks could issue by distributing money reserves to different parts of the country. Because it was the depository for the U.S. Treasury, it could exert enormous influence in this regard, and economic historians generally praise its operations as sound, profitable, and stabilizing. Several potential panics were averted when the Bank of the United States transferred funds to prop up endangered banks on the verge of failure, and it went quite far in establishing a uniform currency. In 1811, its approximately $5 million in notes amounted to 20 percent of the nation's circulating currency. Yet, its operations were extremely unpopular with state banks constrained by its control and disadvantaged by its issuance of reliable notes. Currency issued by the bank was never discounted, whereas notes from state banks could be subject to discounts ranging from 1 to 100 percent. Finally, political pressure from state banking interests and widespread misgivings among the public about a national bank caused the bank's demise in 1811, when Congress refused to charter it for another 20 years (Heidler and Heidler 2004, 92–93).

The Second Bank of the United States

For the five years that followed, the American economy operated without the stabilizing influence of a central fiscal institution. State banks in this vacuum greatly inflated the currency with extravagant issues of bank notes. Unfortunately, legislatures chartered additional state banks that worsened the inflationary situation even as the economy was being generally assailed by the war with England. As should have been expected, the extraordinary rate of inflation had a corresponding effect on prices, pushing them up more than 13 percent a year. In response to this mess, Congress chartered the Second Bank of the United States in 1816 as an exact duplicate of its predecessor. In its early years, though, a mediocre administration and occasional forays into fraud too often described the new national bank's activities, and it failed in its primary responsibilities to the average American citizen. The BUS did not maintain a stable currency ratio, nor did it exert much effort to control an explosive postwar economic boom. Finally, its attempts to restrict credit in

1819 contributed to a financial panic that turned into a major depression. Banks across the country failed, people lost their savings, foreclosures of farms rose, thousands of small business folded, and large firms cut payrolls, increasing unemployment. "Instability seems more common to Americans than to the youth of other countries," noted Giovanni Antonio Grassi, an Italian Jesuit who was president of Georgetown College from 1812 to 1817; his perceptive observation was made even before these events unfolded. "They frequently have the misfortune to see the finest hopes betrayed by tragic changes" (Heidler and Heidler 2004, 93) (Handlin 1949, 143).

The BUS would eventually rebound under responsible management and the resumption of steadying policies, but for farmers, small merchants, and artisans who had felt the hard consequences of the economic downturn, the damage to the bank's reputation was resonant and permanent. As the country moved into the 1820s, anger over the presumed role that the BUS had played in wrecking the economy coalesced into the new political movement of Jacksonian Democracy, a movement that would play an important role in shaping the lives of working people in the decades that followed (Heidler and Heidler 2004, 93).

Recreational Life

LEISURE

Leisure activities during the early Republic were similar to those of the colonial period, especially in that they usually took second place to work. The amount of work required to provide clothes, shelter, and sufficient food for a family meant that only the very young and the very rich could indulge in true relaxation. Older children and most adults sought to add pleasure to busy lives by contriving ways to make their labors entertaining and social.

There was also pressure from a culture that disapproved of pointless play. In the years immediately following the American Revolution, purists argued that amusement for amusement's sake was inappropriate for citizens in a virtuous republic. Americans, they insisted, should avoid the idle dissoluteness of European aristocrats. Ingrained notions of what constituted civic virtue dictated that even leisure should improve one's character, as well as society in general. In addition, the Puritan heritage of New England, the religious revival of the 1730s and 1740s known as the Great Awakening, and the Second Great Awakening of the early nineteenth century prompted many Americans to regard amusements as decadent self-indulgence. They believed that time on Earth should be devoted to its betterment and service to God. The attitude had adherents in all parts of the country, but New England's Puritan tradition of industry, frugality, and piety made it more prevalent in that region (Heidler and Heidler 2004, 95).

In cities, not only did limited space restrict leisure pursuits, but business owners and managers of workshops also discouraged activities that distracted laborers from their work. Consequently, pastimes that increasingly resembled later spectator sports arose more or less surreptitiously in cities. Back rooms in bars or saloons were the sites of cockfights, dogfights, and bare-knuckle prizefights. Rural Americans watched the same kind of sports, of course, and wagered on them as exuberantly as their urban counterparts, but Americans in cities and towns exhibited an especially avid enthusiasm for these forerunners of spectator sports (Heidler and Heidler 2004, 95–96).

Like all aspects of American culture, leisure activities were affected by differences in religion, region, social class, gender, age, and race. Even in the most serious and industrious of areas, however, people found the need to relax, socialize, and, on occasion, simply have fun (Heidler and Heidler 2004, 96).

HOLIDAYS

Americans did not engage in many leisure activities because they simply did not have the time. The majority of Americans worked six days a week, and most reserved Sunday for worship and sedate activities, and on farms there was always work that needed to be done, even on the Sabbath. While many European countries, particularly those with predominantly Catholic populations, celebrated an abundance of religious holidays that featured a variety of amusements, the United States observed few holidays throughout the nation. Reflecting their Protestantism, many Americans considered holiday festivities sinful and did not observe Christmas with revelry. New Englanders, with their Puritan heritage and the corresponding determination to avoid anything that resembled Catholicism, observed Christmas most somberly. Southerners, on the other hand, at least stopped work for a few days around Christmas, even allowing slaves a week of rest. Special food marked the occasion, but if gifts were exchanged at all, they were modest. Planters typically gave gifts of clothes and extra food to their slaves during the Christmas season.

Areas of the country settled by Germans saw the most enthusiastic celebrations of Christmas. Work came to a stop for a few days, and on Christmas Eve families put up

Christmas trees in their homes while drinking beer and singing songs. Areas in close proximity to large German American settlements gradually adopted similar customs, but not until later years did the manifestation of Christmas featuring a decorated tree and presents become characteristic (Heidler and Heidler 2004, 96).

Across the country, there were a few regional holidays. Many areas of New England marked the end of autumn with a harvest commemoration that resembled Thanksgiving of the later Victorian era. Most communities set aside days for men to gather for militia training, usually to coincide in rural areas with sessions of the county court. People from miles around traveled to the county seat, either to conduct business with the court or to participate in the militia drill. In the rural Northeast, the nearness of towns and good roads made the journey to these events relatively easy, but in the South and on the frontier, it could take days. Nonetheless, people regarded these occasions as important and found them enjoyable diversions. Lacking transportation did not stop poor citizens. They thought nothing of trekking long distances to relish even the briefest time with friends and relatives. They crowded those precious times with sporting contests and picnics and allowed their excited children to play past twilight (Heidler and Heidler 2004, 96–97).

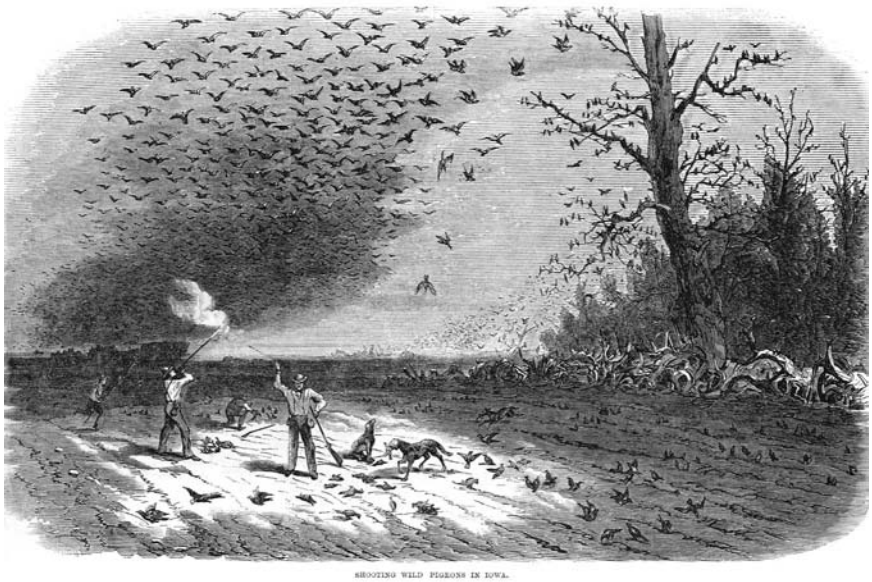
Unofficial holidays observed in towns with parades and speeches were the precursors of modern patriotic celebrations. After George Washington's death in 1799, his birthday became such an event. Laborers might be given a few hours to watch the festivities, but they seldom had the entire day off from work. Otherwise, the only holiday officially celebrated by the entire nation was the Fourth of July. On that day, workplaces in American towns and cities closed. People picnicked, played games, listened to speeches, and at nightfall marveled at fireworks (Heidler and Heidler 2004, 97).

THE SOUTH

The South possibly enjoyed a greater variety of amusements and leisure activities than any other section of the country. There were fewer religious proscriptions on such pursuits in the South, and because rural inhabitants could not rely on organized amusements like theater, lectures, and concerts—events at the mercy of calendars and clocks—southerners actually enjoyed more liberty in how they filled their leisure time.

The southern aristocracy likely felt the fewest moral or religious constraints on its leisure activities, particularly the males of this class. Although the elite southern male spent much of his time supervising the operations of a large business concern—such as a plantation or a commercial firm in coastal cities—he pursued leisure activities as well. In addition, societal expectations required wealthy country gentlemen to imitate the lifestyle of European aristocrats, especially the English gentry. A southern gentleman was expected to own fine horses, extend lavish hospitality to visitors, especially if they were relatives, enjoy excellent music and good literature, know the steps to fashionable dances, and charm ladies of all ages (Heidler and Heidler 2004, 97).

Hunting



"Shooting Wild Pigeons in Iowa." Wood Engraving. © Corbis.

Hunting was probably the most popular sport among southern men, whatever their economic class. Country gentlemen rode to their hounds for hours in pursuit of deer, wild boar, foxes, and other animals. Wealthy plantation owners had special horses for the chase, packs of well-bred dogs for the hunt, and specially tailored riding clothes, often made in Europe to imitate more accurately the British aristocracy's hunting garb. Hunts could be gala social occasions, especially the fox hunt, which culminated with dozens of smartly dressed men on first-rate horses, sometimes in the company of ladies clinging to sidesaddles, all pounding after hounds chasing a small, panicked fox. Southerners "loved the yelp of the pack and the excitement of the galloping group of horsemen, and the hard ride" (Heidler and Heidler 2004, 97) (Simkins and Roland 1972, 147).

When not on horseback, southern men scouted forests or stalked marshes for any number of bird species that were considered fair game. Hunters might return home at night with hundreds of birds or other small animals in their sacks. The hunter's reputation in his neighborhood depended on the sheer volume of the animals he killed, and, like much of what southerners did in their leisure time, hunting occasionally included wagers, the winner whoever killed the most animals. Among less affluent southerners, hunting birds or game animals such as deer combined leisure with necessity, because their quarry often fed their families (Heidler and Heidler 2004, 98).

Fishing

Fishing was an integral part of the economy for much of the eastern seaboard of the United States. In New England in particular, with waters that were rich with mackerel, cod, halibut, and other varieties of fish, many flocked to the sea to supplement their diet by catching fish. In the Chesapeake region, oysters were a highly prized delicacy. As the United States expanded, the many lakes, rivers, and streams that Americans came across supplied them with an abundant variety of fish and shellfish (Heidler and Heidler 2004, 98).

Contests

All classes and races enjoyed cockfighting, a sport that attracted audiences anywhere in the nation. A wealthy planter or a yeoman farmer might own the cock, or rooster, but everyone (though mostly males) from the community came to watch the two birds fight, sometimes to the death. While the owner of the victorious bird won a purse, everyone else, through numerous wagers, also had a stake in the outcome.

Most wagers involved animals of one sort or another, and no sport captured the imagination of gamblers more than horse racing. Horse races in the South, which had been regular occurrences since the seventeenth century, could be organized affairs between well-bred horses of the plantation elite or more spontaneous races between farmers simply proud of the speed of their riding horses. In the more organized events, each of the owners would put up money for the purse, or local promoters might supply the purse to bring spectators into town for the event. In any case, as in cockfighting, the purse was only a small percentage of the money eventually involved, for side wagers were usually significant. Every man from miles around would thus be involved in the outcome of the match. Most bettors attended the race, making the event a social gathering for people of all classes and from all backgrounds. Yet organized horse racing stood apart from other sports in the South because virtually all the contending horses belonged to the wealthy elite. Owning such animals and displaying a willingness to wager large sums on them was one way for a man to tell the world that he was an aristocrat. In fact, high-stakes gambling on all sports was a hallmark of those belonging to the plantation elite (Heidler and Heidler 2004, 98).

Major towns like Charleston, South Carolina, had at least one major public racetrack, and smaller communities usually maintained a racetrack as well, especially in plantation areas. Race week in Charleston was an important annual social event, and because tracks were owned and maintained by the community's respectable gentry, women could also attend the event. Plantation owners built their own racetracks to show off their racehorses, and buying an expensive racehorse to enter in local races was a convenient way for a newcomer to gain entry to the privileged circles in the neighborhood. Wealthy planters eager to have competitive racehorses might spend thousands of dollars and scour the country to acquire them. Many hours of training and preparation went into grooming a championship racehorse, for such animals, particularly when they won, added to their owner's prestige (Heidler and Heidler 2004, 98–99).

Horse racing was most prevalent in the South during the early Republic. The religious fervor of the Second Great Awakening caused many northern communities and even some northern states to outlaw the sport because it prompted gambling. In fact, for most southerners, wagering was what made the sport so appealing. Chronically cash poor, they risked such things as livestock, farm goods, wagons, implements, and sometimes even their slaves on the outcome of a race. Those who trained horses and the jockeys who rode them were often slaves who belonged to the horse's owner or whose services he acquired by lease. Jockeys who were especially talented in handling horses often became trainers after age and weight made them unsuitable for competitive riding. Slaves with such talents were extremely valuable, and they often received rewards when their horses won races. Some were so successful that they eventually bought their freedom and earned comfortable incomes riding or training racehorses. In any case, their value to their owners gave them a status enjoyed by few slaves during the period. Some jockeys became famous throughout the country while remaining slaves and were treated with a certain amount of deference, even by prominent whites. Perhaps the most famous of the period, Simon was such a talented rider that on more than one occasion he "alarmed the trainer of the other horse" when he appeared on the racetrack (Heidler and Heidler 2004, 99) (Hotaling 1999, 44).

As in the later history of horse racing, the most famous contests of the period were match races involving only two horses. Often match races were quarter races, called such because the track was only a quarter mile in distance, a course that tested speed rather than endurance. As breeding practices were refined to produce thoroughbreds, races over longer distances became common, a mile being the standard (Heidler and Heidler 2004, 99).

Southerners always enjoyed a good fight, but by the beginning of the period, the brawls that had been a common occurrence on the frontier were being consigned to lower social classes and were becoming less frequent and even illegal in many places. Still, the practice continued of organizing bouts between especially proficient fighters, usually poor whites or slaves whose owners wanted to capitalize on their fighting skills. Although these fights were sometimes referred to as boxing matches, they little resembled modern boxing. The men started in a standing position, but they quickly ended up on the ground, literally descending to a clawing, nasty display of brute strength and feral cunning. If a fight remained too tame for the crowd, it would begin to shout, "Bite, kick, and gouge" as encouragement for the fighters to draw blood. Antagonists rarely emerged without some degree of mutilation, and spectators laid bets not only on the outcome of the match but on the severity of injuries as well (Heidler and Heidler 2004, 99–100) (Dick 1964, 140).

Spectators of these contests and the fighters who gained their reputations by surviving them might have defined what they were doing as entertainment. Yet more than merely letting off a little steam or enjoying the thrill of wagering on proficient fighters, southern men, particularly in the backcountry, felt compelled to protect their reputations and the honor of their families, almost at any cost. Because a man's status within the community was determined by how his neighbors perceived him, any aspersion on his reputation, whether it questioned his prowess specifically or his integrity in general, required an immediate challenge, or honor was lost. Some scholars have attributed southerners' exaggerated preoccupation with honor to their living with the institution of slavery, especially because slavery tended to equalize the status of white males even as it made them acutely aware of the degraded condition of slaves. To be perceived as inferior to another white male was to emulate the lot of a slave, even if only symbolically. To defend one's honor was to establish as well as sustain one's equality.

As the frontier became more settled, an elite class developed there that aped the habits of its eastern counterpart, not only in dress and daily life but also in how matters of honor were settled. During the colonial period, refined men in the more established parts of the South had abandoned boxing or wrestling matches as ways to resolve disputes, instead resorting to the French custom of dueling with pistols. One would hardly describe the event as a pastime for the principals, but it was for the community. Its interest in such proceedings, particularly in the rituals leading up to a duel, was always keen.

Duels were not spectator events because protocol restricted attendance to the principals, their representatives, a referee, and often a physician. Yet the community at large was usually well aware of an impending contest weeks before it took place. Often insults exchanged in a local newspaper provoked a challenge, making all readers privy to the unfolding drama. After an official challenge had been issued and accepted, gossip—always a favorite leisure activity—quickly carried the news throughout the locale and, if the disputants were famous, beyond. After the duel, gossip broadcast its results, often with grand embellishments that underscored either the altruistic heroism or abject villainy exhibited at the event (Heidler and Heidler 2004, 100).

Taverns

American men enjoyed visiting their local taverns. Most southerners, though, lived in rural areas where the nearest tavern was hours away, an inconvenience that made southern men's visits less frequent than those of northerners. Southerners usually stopped at taverns or inns during their travels to pass the evening with the assembled locals in public rooms before retiring for the night (Heidler and Heidler 2004, 100).

Travelers brought news of the outside world and made taverns the best place to gather for both idle gossip about the neighborhood and solid information about major events of the day. When not swapping rumors or news, the men drank ale or spirits, smoked (usually pipes), and played games, most of which involved gambling. Card games such as whist, one of the most popular games, and dice games were almost always played for money. Others diversions like checkers, called "draughts" at the time, could be played simply to pass the time or, for serious competitors, to gain local renown (Heidler and Heidler 2004, 100–101).

Entertaining

A scarcity of taverns in the rural South obliged people there to conduct much of their socializing in private homes, a circumstance that gave birth to the renowned traditions of southern hospitality. Southern plantation owners recorded in journals and diaries how a night seldom passed without a guest in the house. Friends and family, traveling to towns or simply touring the area, often spent nights at private homes while making their way along their route. More than selfless generosity encouraged the welcome extended to these wayfarers. Aware that their own travels would be occasions for reciprocal hospitality, hosts took care to present their guests with meals and quarters. But such obligations had limits. Strangers had no claim to them, and the host might invariably accept payment for putting up an uninvited traveler.

The loneliness of rural isolation encouraged parties, barbecues, and dances among the plantation elite as well as middle-class farmers. Smaller dinner parties might begin with a lavish meal of numerous courses followed by a musical recital that featured both talented and marginally skilled musicians on pianoforte, violin, or flute.

Ladies might sing. Larger gatherings involved dancing that typically continued well into the night. Because many attendees came from miles away, they had a persuasive reason to stay and carry on the revelry for days. During the day, men busied themselves with games or sports, such as hunting, fishing, lawn bowling, and horseshoes. The women read, often aloud to each other, sewed, or simply chatted. In the afternoon, everybody reconvened for a barbecue or fish fry followed by more dancing and drinking.

People enjoyed these social gatherings whether the music was lively or sedate and the dancing vivacious or staid. Most people lived in the country, and barbecues and barn dances were more than ways to escape the drudgery of their daily routines. They served as chances to bind together communities and forge friendships with neighbors. They also provided the setting for a timeless dance of another sort, whether in the candlelit ballroom of a plantation house or on the straw-covered planking of a newly raised barn. Flirtation was a high art, and courtships quickly blossomed and just as quickly withered at these gatherings as older boys took their first bashful steps toward blushing girls. Whether powdered and perfumed or clad in simple homespun, the girls were made pretty by the attention of clumsy suitors and watchful fathers (Heidler and Heidler 2004, 101).

Travel

The ordeals of traveling in the rural South provide a dreary chronicle, whether one was lucky enough to journey by river or, as was more likely, doomed to the tribulations posed by consistently bad roads. Little wonder that people traveled only if they had to, generally because of business. Yet during the early Republic, some intrepid southerners began traveling for amusement. There were few tourist destinations, but their rarity made those that did exist more attractive. Virginia boasted two of the most popular early resorts, one at Hot Springs and the other at Bowyer's Sulphur Springs, which would eventually be renamed and achieve fame as White Sulphur Springs. Both were mountain communities built around warm mineral springs whose purported healing powers initially attracted the sick. By the early nineteenth century, however, tourists were traveling to the springs as well, where they could escape the summer heat of the lowlands. They lodged in crude, rustic cabins to enjoy the cool mountain air and take the waters of the springs (Heidler and Heidler 2004, 101–2).

In the early years, the journey to these resorts was too difficult for those living farther south. Rich plantation owners in the South Carolina Low Country and along the Georgia coast therefore sought out other ways to escape the summer heat and avoid the diseases it promoted. Some took sea voyages, primarily to the North, but occasionally to Europe. The wealthiest planters also kept homes in Savannah or Charleston, where their families and house slaves could reside during the summer months. Cooler sea breezes made life tolerable, and tropical diseases were usually less rampant. After relocating to their town homes, planters and their families enjoyed a social season full of balls, dinners, races, and parties. Whether set in a large private home or an elite social club, the party's center of the festivities was always a large ballroom. In other rooms, tables laden with a rich variety of food and colorful punches encouraged mingling by those resting from the dancing. Men who wished to smoke retired with brandy to a book-lined study, aptly referred to as the house's library.

The Louisiana Purchase in 1803 officially made New Orleans an American city, but socially it remained a cosmopolitan mélange of European customs as well as languages. It also remained an unendurable cauldron of soggy heat and brewing disease during the summer. New Orleans's Creoles—the people of Spanish or French descent—knew well the discomforts and perils of living there, and they did their best to flee the city during the hottest months. In the winter, though, wealthy Creoles made New Orleans a place so dazzling in its social pursuits that there was no place like it anywhere else in the country. Mostly Catholics, they enthusiastically celebrated every religious holiday on the church's calendar, and hardly a balmy winter night passed that did not include a luxurious ball or an elegant soiree. The season culminated on the eve of Ash Wednesday, the beginning of Lent, a day known as "Fat Tuesday" or Mardi Gras, a celebration so raucous that it made the city as notorious as it was fascinating (Heidler and Heidler 2004, 102).

Theater

Southerners enjoyed the theater regardless of gender or class. Classics, especially the plays of Shakespeare, ribald comedies, and slapstick farces found eager audiences in larger cities like Charleston and New Orleans as well as smaller towns. In rural villages, people flocked from the countryside to see anything onstage, awed by the make-believe magic and impressed by the exotica of traveling troupes of actors. Those brave souls might find themselves performing *Hamlet* in an opulent theater to appreciative and respectful audiences in Savannah one week, and to no less receptive but sometimes wildly participatory spectators in a small village's rough-hewn playhouse the next (Heidler and Heidler 2004, 102–3).

THE WEST

The West more resembled the South than the North in its leisure activities, yet the West did exhibit some unique characteristics. Pastimes there were usually more raucous and included both genders as well as broader cross sections of class. The biggest problem for frontier people was their lack of spare time for leisure, because unlike the eastern middle and upper classes, westerners' days were filled with work. Like southerners, people on the frontier typically lived in rural isolation, craved social contact, and consequently congregated whenever possible to worship, socialize, share information, and have fun. Visitors to the American frontier commented about how westerners would drop whatever they were doing to watch a fight or a race, or to pursue any other amusement, habits that drew scornful observations about the lack of work ethic among these rough-hewn backwoods people. Although it was true that most westerners were willing to miss an entire day of labor to watch horses gallop over a makeshift track, disapproving visitors did not understand the rigors of frontier life. Isolation was among the pioneer's heaviest burdens. When he had a chance to jostle and laugh with other people, he leaped at it.

Whether in small or large groups, western amusements almost always involved alcohol and gambling. Like southerners, westerners loved a good horse race, though their frontier horses were usually lumbering beasts of burden more accustomed to pulling a dray than running a course. Westerners too enjoyed blood sports such as cockfighting and hunting, but hunting was a practical undertaking to provide meat for the table as well as diversion (Heidler and Heidler 2004, 103).

Useful Socializing

Western gatherings were frequently fashioned to accomplish an important task like raising a barn or clearing a field. People found ways to make such events social as well as work occasions. While the men built the barn, the women visited around the kitchen fire, making food for the party that followed.

Logrolling was another social gathering that revolved around work. Whether it was a new arrival or a neighbor who needed to clear a new field, people would come from miles around to help cut down trees and prepare the huge logs for use as building materials or fuel. Frontier families made harvest festivals some of the most joyous events of the year. After chores such as husking corn, the group would eat a large meal that the women had prepared and then have a dance. Dancing was prevalent on the frontier, a pastime especially enjoyed by men and women because it was far less formal than dances held in the East. Frontier dances were often held after work, sometimes in the local tavern, boisterous affairs in which couples reeled and capered to loud, energetic music provided by local musicians. Again, the isolation of frontier life made these occasions both memorable as recreation and important as opportunities for older boys and girls to meet and begin courtships. Young couples made the most of such times. They sang, clapped their hands to lively melodies, danced well into the night, and occasionally slipped away for a stroll and a stolen kiss. Older folks watched these proceedings, perhaps sharing a dance or two, but mostly passing the time smoking their pipes, women included, telling familiar stories, and resting from the day's hard toil (Heidler and Heidler 2004, 103–4).

Storytelling

Whether in taverns or country stores (which on the frontier were frequently one and the same), or out camping during a hunt or on a front porch at twilight, people filled idle hours with storytelling. The adventurous life of the pioneer was exciting enough, but exploits regularly grew with each telling to produce much of the country's folklore, a series of mythic vignettes collectively referred to as uniquely American tall tales. Frontier folks never tired of hearing tall tales, especially when narrated by one of the period's great storytellers. Legendary feats of strength, fabulously fast horses, invincible fighters, and unerringly accurate marksmen populated the legends, sometimes including comical bungles by early pioneers. Like barn dances, the stories also carried more import than mere amusement. They provided barely literate rural people an oral tradition with which to pass down their heritage to succeeding generations (Heidler and Heidler 2004, 104).

Hunting on the Frontier

When men on the frontier were not clearing trees, plowing fields, harvesting crops, or mending fences, they were wandering the abundant woodlands hunting game or fishing on the creeks, rivers, and lakes. The profusion of animals on the frontier meant that a skilled marksman was never without meat, but it also meant that an important pastime for many American men was just beyond their front doors. Sometimes they went alone; other times they traveled in groups, driving their prey before them for more efficient killing in volume. Arranging themselves in a large circle, they forced everything within it toward the center. One Kentucky newspaper reported in 1796 that one group of hunters "produced seven thousand nine hundred and forty-one Squirrels killed by them in one day." Contemporary accounts of some group hunts during the period numbered the animals bagged in the hundreds, including bears and deer as well as smaller prey like squirrels and turkeys (Heidler and Heidler 2004, 104) (Dulles 1965, 71).

Frontier Contests

Like Americans elsewhere, western frontiersmen loved to gamble and would wager on almost anything. Betting on the number of animals killed in a hunt was a way of making the outing more interesting. To keep their shooting skills sharp, they staged shooting contests that earned the best marksmen prizes while offering an opportunity for everyone to gamble on the outcome. Such shooting matches were made into social occasions to which entire families came from miles away to watch competitors vie for a barrel of local whiskey or a cow. Marksmen took their turns at the targets, and male spectators placed bets on who would win and side bets on how well others would strike the target.

Shooting-match wagers were carefully organized in comparison to other betting occasions. Most sporting events that westerners wagered on were generally less formal than similar instances in the East. For example, horse racing was popular, but competitors generally rode their own horses, and tracks were not well maintained, if they existed at all. With more than a half-dozen horses running full tilt toward a makeshift finish line, frontier races were a thrilling combination of impromptu and perilous tactics. Riders intentionally interfered with opponents' mounts by thrusting hands in their faces. They cut off an adjacent rider to clip his horse's forelegs with their flying rear hooves. Western horse racing made more violent an already hazardous sport.

Showing off a fast horse and masterful riding ability was a way to demonstrate physical prowess on the frontier. There were others as well. Wrestling was the most popular contest on the western frontier and in the southern backcountry, but men also engaged in footraces and throwing competitions that had them hurling anything from tomahawks for accuracy to large logs for distance. They swung carefully honed axes in log-splitting challenges to test physical stamina and precision chopping.

Whatever the activity, numerous wagers were placed in anticipation of the matches, and money or materials changed hands after their conclusion (Heidler and Heidler 2004, 105).

Whether organized or not, frontier fights early on became the stuff of legend. A spontaneous fight in a tavern—drinking was always a sure catalyst for these affairs—fetched every man in sprinting distance to see its outcome. Particularly good fighters challenged others in organized contests for prizes as well as renown in a community, but such bouts were organized only in the loosest sense of the word, with no holds barred. Adversaries did anything to win, except use a weapon, in a style of fighting quaintly called Rough-and-Tumble. It was more like gnaw-and-claw, though, what with the gouging of eyes and the biting of ears, noses, and even testicles, gruesome tactics that encouraged the fainthearted to concede victory. Serious fighters grew their fingernails long and filed them to points to better gouge eyes. Frontier life was filled with dangers that carried the menace of accidental injury, but fighters inflicted and risked premeditated mutilation, physical marks of contests that were strange trophies because they were measured by what was missing—fingers, ears, eyes—rather than what was won. A traveler noted that once he entered Kentucky, he "saw more than one man, who wanted an eye," noting that he "was now in the region of 'gouging'" (Heidler and Heidler 2004, 105–6) (Dulles 1965, 74).

THE NORTH

The North was rural in character, much like the rest of the country, but its farmers, especially in New England, were more likely to live in villages and trudge daily to their fields. Northerners consequently saw one another more regularly than did people in the rural South and West. In addition, some places in the North were tending to urbanization, and city dwellers naturally lived in much greater proximity to their neighbors and saw them daily. Northerners had the chance to engage in more social forms of leisure than people in other parts of the country, but their leisure activities by circumstance were limited to the kind that could be pursued in more confined areas (Heidler and Heidler 2004, 106).

Industrialism and Leisure

Many employers believed that leisure bred vice and laziness. The attitude was a legacy of Puritan New England that viewed idleness as providing an opportunity for evil thoughts and sinfulness. During the beginnings of American industrialization, the old Puritan idea took on a new practical importance in the marketplace, for employers fretted about employees whose pursuit of leisure included strong drink that diminished their productivity.

Even Americans who did not work in factories found that urban life made the workplace inescapably separate from ordinary interactions with friends and family. Men in cities worked away from their homes more and more, and the time they spent with their families became their primary leisure activity. Families went to parks together, read quietly or aloud by the fire in the evenings, or sang songs around the piano to relax from the workday and renew their household ties (Heidler and Heidler 2004, 106).

The Second Great Awakening and Leisure

The Second Great Awakening was important in every region of the country, but New England and the area along the Erie Canal, known in western New York as the "burned-over district" for the intensity of religious revivals there, probably felt its impact on leisure activity the most. Ministers everywhere condemned spectator amusements such as horse racing, cockfighting, and card playing for the gambling they encouraged, denouncing dancing and drinking for good measure. Yet New England and areas of New York and the West settled by New England migrants believed the condemnations most avidly and embraced their prohibitions most eagerly. Powerful ministers and awakened congregations secured local laws to ban amusements such as horse racing and gambling and compel a strict observance of Sundays. Many feared that an activity that encouraged gambling was "the ruinous pursuit of the idle and the vicious" (Heidler and Heidler 2004, 106) (Chafetz 1960, 49).

Northern Taverns

Not all the preaching in the world could diminish for some the pull of the tavern or public house (pub, for short). Its lure remained as strong in the North as in other parts of the country, and many men still spent much of their spare time there. Drink was not the only attraction. After a long day's work, the camaraderie of talking with friends and playing games was appealing.

Taverns and pubs differed in the North, particularly the quaint rural pubs of farming villages as contrasted with the great variety of pubs and inns in larger cities like New York. In cities, pubs catered to a particular clientele rather than to the various tastes of an entire town or to the random traveler who happened in. For example, some pubs were described as "coffee houses" to distinguish them from working-class establishments. They served upper-class customers with better food and drink and generally featured more refined games and entertainments. They were also inns that offered lodging to more select travelers, typically men in the city on business. If women accompanied their husbands, the inn provided private bedrooms and dining rooms that could accommodate ladies. Otherwise, wealthy businessmen of the city could mingle with important travelers in the common room to discuss everything from the politics of the day to the prices of imports and exports. They lubricated their discussions with a variety of beverages. Beer, ale, cider, port, Madeira, sherry, and fine wines complemented an assortment of mixed drinks such as "flip" or "syllabub," a mixture of cider, sugar, nutmeg, milk, and cream. Refinement aside, such concoctions could be the ruin of many a wealthy patron whose dulled wits at the gambling tables shrunk his pocketbook.

Upper-class inns were primarily set apart by their food. They were cleaner and presented better appointments than working-class pubs, but it was the high quality of their board and the variety of beef, ham, oysters, and the like that determined whether wealthy customers would return. One delicacy served at finer taverns in the Northeast was turtle soup, a dish usually unavailable in private homes. Because the turtles that were imported from the Deep South and the West Indies weighed several hundred pounds, they were too large for private kitchens and in the days before refrigeration made too much soup for a single family to consume. Fashionable inns touted the availability of sea turtle soup in their dining rooms as an irresistible treat, and a kitchen's reputation for fine food could make an establishment a stylish place for private parties. Elite clubs attracted such social gatherings with special upstairs rooms designed for dancing and dining (Heidler and Heidler 2004, 107).

Pubs for middle-class males also supplied a practical service for the community by providing meeting rooms for clubs and a large room for parties or receptions. The trappings in such establishments were not as fine as those in the more expensive inns, but the food was hearty and the accommodations adequate for travelers who could not afford nicer taverns. Just as the affluent citizens did in their inns, clerks and small business owners gathered in their taverns at the end of the workday to discuss politics or business affairs (Heidler and Heidler 2004, 107–8).

Those who worked on the city's docks, in factories, or for artisans also had their pubs. More crudely furnished, they served plain food and simple beverages like beer, ale, and rum. The surroundings did not mean that the pastimes pursued there were any different, though. At these establishments, men still came together to gamble, tell stories, and complain about their lot in life. A man too busy to visit a pub could get a bottle at one of the city's many small grocery stores, which sold all types of beverages. For some, these "grog shops" were a regular stop on the way to or from work, a fact that made them prime targets for the emerging temperance movement. One British observer noted that while rarely did one see Americans in a falling-down-drunk state, "many are throughout the day under the influence of liquor" (Heidler and Heidler 2004, 108) (Batterberry and Batterberry 1973, 43).

Colonial times and the years of the early Republic were the heyday for the tavern and inn. By the 1820s, their time as places for wealthy businessmen and travelers to congregate was waning. Instead, hotels and restaurants were becoming popular as local gathering places for the economic elite. For other classes, the growth of the temperance movement was to make the sociable tavern into the iniquitous saloon, and the patronizing of it a cause for reproach rather than a source of relaxation (Heidler and Heidler 2004, 108).

Hotels and Restaurants

Cities like New York took the lead in establishing luxury hotels on the European model. These businesses served not only travelers but also the city's upper and middle classes as social gathering places. The first floor included a bar for gentlemen, a dining room, and a parlor where women could have tea. For posh social clubs to hold annual or semiannual balls, the second floor typically included a large hall that could accommodate an orchestra for dancing with smaller side rooms for serving refreshments. The third floor's smaller rooms were for club meetings or smaller receptions, and guest rooms were on the fourth floor and above, up to the sixth floor, which was the highest built before the advent of steel girder construction.

The popularity of hotel dining rooms encouraged some entrepreneurs to open establishments devoted to serving full meals in a relaxing atmosphere. Like hotels modeled on European establishments, these restaurants were more socially suitable for ladies than taverns and pubs. As cities such as New York developed a more refined nightlife featuring concerts and theater productions, it became both necessary and lucrative to provide establishments catering to women who attended these functions. Some restaurants even began serving elaborate late-night meals during the usually lengthy theater intermission, special repasts that were the forerunners of today's post-theater supper. On most evenings, though, restaurants were packed primarily with men, relaxing over a good meal and fine brandy (Heidler and Heidler 2004, 108).

Women's Leisure

Wives no doubt craved the same level of social activity as their husbands, but etiquette considered it inappropriate for respectable women to patronize pubs. The exceptions were community social occasions like wedding celebrations. Only on theater or concert nights did their husbands invite them to a restaurant. Otherwise, women socialized at home or church with other women. Those who did not work outside the home usually found opportunities to socialize casually with neighbors every day as well as during more organized activities. Middle- and upper-class women called on one another regularly. During such visits the hostess or her servants would serve tea or other light refreshments, and the ladies would discuss mutual friends, their charitable or church activities, or make plans for other social gatherings. Such visits were often unorganized and unannounced, while other women's social activities could be painstakingly planned. Formal tea parties included friends, wives of their husbands' business associates, or new women in the neighborhood. Women who accepted such an invitation were expected to reciprocate at some time in the future.

Women in the urban North also organized sewing circles to allow participants to congregate in one house to do their family's sewing while visiting. Such social events were sometimes charitable exercises in which ladies sewed garments for the poor. In the rural North, South, and West, women met in quilting bees to stitch blankets for themselves and the community. While centered on a useful activity, these events were cheerful chances for busy women to chat with neighbors (Heidler and Heidler 2004, 109).

Spectator Sports

As northern cities grew in population and area, the opportunity for shared pastimes like hunting, fishing, and other outdoor pursuits declined. As a result, northern urbanites turned to spectator sports and activities to fill their brief leisure time. Though increasingly frowned on by churches, gambling was often a central part of spectator activities. Northern cities held indoor cockfights and dogfights as well as human wrestling matches. Prizefighting did not become widely popular until the 1830s and

1840s, but such contests occurred, especially after formalized procedures for matches were imported from Great Britain (Heidler and Heidler 2004, 109).

Northerners enjoyed horse races, but the influence of the Second Great Awakening led to their being outlawed in some communities. Before that, horse racing had had a long tradition in the North. It was especially popular in New York from colonial times, and Long Island was the site for some of the country's most famous races, drawing people from great distances to watch renowned horses compete. The events were uniquely democratic, anticipating the egalitarian impulses of the Jacksonian Age, as people from all classes took ferries operating from Manhattan or New Jersey to Long Island, carrying picnics to spend the day watching races and enjoying the company of friends and family. The upper classes owned the thoroughbreds, but people from all strata of society enjoyed the races and were dismayed when laws banned the sport in many parts of the North (Heidler and Heidler 2004, 109–10).

Theater

In large northern cities, particularly New York and Philadelphia, the theater was a popular diversion. America's first professional actors were primarily from Great Britain and had performed in these theaters during the American Revolution. Avid theatergoers welcomed these actors back enthusiastically during the period of the early Republic. Like Americans elsewhere, northerners loved the variety of entertainment available in the theater. Offering musical reviews, instrumental recitals, and classical or fashionable plays, northern cities provided an assortment of amusements that most southerners and westerners could only dream about. In fact, larger cities in the North boasted an abundance of theaters, each of which offered several different kinds of entertainment nightly. Because of their popularity, theaters of the early Republic were quite large and offered a broad range of ticket prices from the most expensive private boxes to balcony seats that even working-class patrons could afford. European visitors found the quality of American theater amazingly good, partly, as one observer noted, because of "the enormous emigration, caused by the French Revolution," that supplied "theaters with excellent orchestras" and "a great mass of patrons," and were shocked to see in the audiences "men that, if in London could hardly buy a pint of porter" (Heidler and Heidler 2004, 110) (Hewitt 1959, 44–45) (McConachie 1998, 132).

The clergy argued that attending the theater did nothing to improve the average person, some even insisting that "to endulge a taste for playgoing means nothing more nor less than the loss of that most valuable treasure the immortal soul." Yet the quality of performances, as well as their content, particularly productions of the works of Shakespeare and other important playwrights, revealed a growing sophistication among American theatergoers in the latter part of the period (Heidler and Heidler 2004, 110) (Dulles 1965, 89).

Participatory Sports

Despite the growing number of spectator activities, city dwellers still tried to find ways to engage in physical activity during their leisure time. The proximity of rivers and lakes made it possible for many members of the upper and middle classes to take up boating, both sailing and rowing, as recreation. Again, the proclivity for gambling meant that both participants in, and spectators at, such events inevitably began to wager on their outcomes. The upper class dominated most of these boating activities, and certainly all the yacht clubs, but like many spectator activities, the races were watched and followed by people from all classes (Heidler and Heidler 2004, 110).

Aristocratic Leisure

Just as in the South, the upper classes of the North had the most leisure time and made the most of it. The affluent worked hard, but their wealth gave them time to enjoy reading, concerts and plays, and travel. Though general tourism did not become popular until transportation improvements made travel comfortable, the wealthy enjoyed pleasant carriages with shock-absorbing springs that softened the rattles of bumpy roads. Thus equipped, they made trips to places like Saratoga Springs to escape summer heat or to Newport, Rhode Island, to enjoy the sea breezes (Heidler and Heidler 2004, 110–11).

Those who wanted to make trips over greater distances found it increasingly easy to do so in the North. After 1790, several enterprising northerners opened stage lines for travelers. While most of their customers were men traveling on business, middle-class patrons increasingly began using stagecoaches to visit relatives in distant towns. When women also began buying tickets, owners made efforts to increase creature comforts. Yet a persistent problem that prevented travel from becoming a mainstream activity in the early Republic was the necessity for sleeping arrangements along the way. The country was dotted with taverns and pubs that provided lodgings for overnight travelers, but they were rarely clean enough to be considered suitable for ladies. A night spent in a wayside inn would often leave travelers itching from bedbugs and fleas that shared the filthy bedding. A British traveler put to bed in the communal dormitory of one roadside inn complained that after falling asleep, "I was soon awoke in torture from a general attack made on me by hosts of vermin. . . . I started from the bed, dressed myself, spread a coverlet on the floor, and lay down there to court a little more repose, but I was prevented by a constant noise in the house during the whole night" (Heidler and Heidler 2004, 111) (Jordan 1948, 63).

Improving roads in the latter part of the period meant that travel in the North for rest and relaxation not only increased in volume but varied in destinations as well. In addition to Saratoga Springs, other places began providing services as resorts, particularly scenic areas such as Niagara Falls and the New Jersey shore. The heyday of these resorts was still years in the future, but changing middle- and upper-class perceptions about leisure travel as a proper way to spend time gave them their start.

The wealthy could not only afford better accommodations when they traveled; they could also entertain at their homes in a much grander fashion than the other classes. People graced with invitations traveled miles to attend these affairs, some of which were destined for legendary status with their extravagant multicourse meals served by uniformed retainers. Well-dressed ladies and gentlemen sat at the dining table for hours while they were served the finest food available. Northern cities made it easier for the gathering of social, literary, or musical clubs, and they were accordingly more prevalent in that region than in other parts of the country. Upper- and middle-class men and women alike belonged to clubs purportedly founded to advance a common interest or promote a shared activity, but whose actual purpose was to provide a social outlet (Heidler and Heidler 2004, 111).

SELF-IMPROVEMENT

The idea that leisure time should be used for self-improvement, particularly of mind and character, gained wide currency during the early Republic. To become more virtuous citizens, the upper and middle classes spent much of their leisure time reading serious literature, developing musical skills or listening to others display theirs, and attending lectures to broaden their understanding of the world around them (Heidler and Heidler 2004, 111–12).

Literature

Books were quite expensive, but they were not particularly rare inasmuch as Americans loved to read. While most of the literature during the period came from Europe, many Americans had come to the conclusion that avoiding the corrupting influence of aristocratic Europe required developing a national literature. As part of the initiative to instill the values of a virtuous republic, many of the period's writers extolled the attributes of the Founders, often depicting them through gross exaggerations and sometime with sheer inventions. The most notorious example of this type of laudatory writing was the extremely flattering and largely fictional biography of George Washington written by Mason Weems. It was the source of myths such as young Washington's insistence that he could not tell a lie when admitting to cutting down a cherry tree.

Other historians who examined the relatively brief American past, however, did a better job of explaining why the Republic had been founded and of defining its essential philosophy. Notable historians of the American Revolution were Mercy Otis Warren (also one of the most important woman writers of the early Republic), David Ramsay, and biographer John Marshall (who was chief justice of the Supreme Court). Such authors were the best-selling celebrities of their day, and they were widely read not only because they inspired pride in the American past but also because they entertained audiences with a lively literary style.

In addition to history, Americans improved themselves intellectually by reading scientific treatises. Many were published in Philadelphia, the city with the largest scientific community during the early Republic. Works focusing on what that age called political philosophy (ours refers to it as political science) sought to make relevant in American terms the political theory of the Enlightenment.

American fiction had to wait a few more years to truly come into its own, but Americans loved to read foreign fiction, especially from Britain, from whence they imported it in large volumes. There were those who condemned the widespread reading of fiction as unproductive of republican virtue, but fiction that taught a moral lesson was considered acceptable (Heidler and Heidler 2004, 112).

Americans also enjoyed reading newspapers and magazines. Virtually every town of any size produced at least a weekly newspaper, and men interested in politics usually subscribed to other newspapers from large cities. Places like New York had many newspapers that appealed to various interests and different political affiliations. Politics increasingly was a spectator sport in the United States during the early Republic, and newspapers were a convenient way to keep up with both sides of the battle. They also became increasingly scurrilous in their attacks, thus adding to their entertainment value. For example, one paper during the presidential campaign of 1800 charged that if Thomas Jefferson were "elected to the Presidency, the seal of death is that moment set on our holy religion, our churches will be prostrated, and some famous prostitute, under the title of Goddess of Reason, will preside in the Sanctuaries." Such passages were sure to titillate even the most apolitical citizen (Heidler and Heidler 2004, 112–13) (Cullen 1996, 46).

Magazines, especially those for ladies, were also popular. Ladies' periodicals might have been dismissed as frivolous had they not always included practical tips about housekeeping and child rearing. Other magazines catered to people interested in the latest literature, art, and scientific pursuits. In keeping with the desire of many intellectual Americans to emphasize American contributions in those areas, many publications, in the words of the editor of the *Columbian Magazine,* hoped "to shew, that, the source of all improvement and science, a liberal encouragement was offered, at this early period of her independency" (Heidler and Heidler 2004, 113) (Kierner 2003, 330).

Music

Music was a part of most Americans' daily life. There were work songs, children's songs, and church songs that most people knew by heart. The period also saw a growing belief that knowledge of music and skill at playing a musical instrument were important parts of a proper middle- and upper-class education. Children took music lessons, and adults in urban areas spent time practicing the works of European composers such as Joseph Haydn and George Friedrich Handel. Even the most modest communities regularly staged concerts that featured local musicians and vocalists. In large cities, wealthy patrons of the arts established musical associations—the New York Philharmonic Society was an early example—to foster the development and performance of what became known as "classical music."

Hymns or other religious melodies were by far the most important music in most people's lives. Similarly, many fondly recalled and frequently sang or played the music of their fathers and mothers, the origins of a musical heritage later called "folk music." Families sang these songs around their fireplaces, and workers warbled them to pass the time of day, an age-old way of making the toil of daily chores lighter with a song. Taverns were always a popular place to hear old folk tunes or new, popular songs where soloists or groups performed. In fact, some of the most popular tunes were drinking songs deliberately fashioned to appeal to the partially inebriated, in both their ease of melody and their vivacity of verse (Heidler and Heidler 2004, 113).

Lectures

The prominence of the lecture circuit or lyceum movement did not occur until after 1820, but the custom of traveling experts expounding on everything from astronomy to zoology began during the period. Because Americans believed that education and self-improvement were imperative ingredients for economic success, public lectures attracted a surprising number of workingmen whose direct interest in some topics could only be surmised as marginal. Yet they trusted that increasing their knowledge in a general way could start them up the ladder of success. Beyond such a utilitarian goal was the doctrine that the expanding right to vote required that everyone be an informed citizen. It was a powerful incentive for individual self-improvement in all areas of knowledge (Heidler and Heidler 2004, 113–14).

Public Gardens and Parks

By the beginning of the nineteenth century, public gardens and parks became an innovative addition in many American cities. Sometimes for a small fee or free of charge, city dwellers could enjoy a taste of nature. Because French and British designers built some of these first public gardens, they often imitated those of Paris and London. The forerunner of the amusement park also appeared during these years. These parks were designed to provide a broad array of amusements, and competition caused proprietors to expand attractions by adding music, fireworks, outdoor plays, and refreshments, diversions that were especially popular in the summertime. Patrons whiled away hot evenings strolling through flowers, listening to music, and sipping lemonade. A popular treat at many of the gardens was frozen cream (or ice cream, as we know it), a novelty for Americans in the early nineteenth century (Heidler and Heidler 2004, 114).

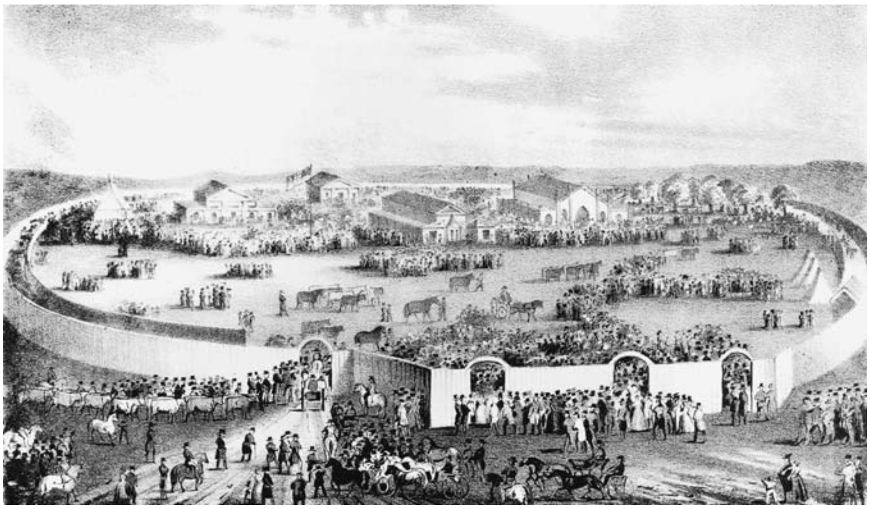
Politics

Political education was supposed to produce a more informed, educated citizenry, and many men brimming with such edification felt a keener interest in public affairs; some even exhibited a growing desire to participate in politics. Suffrage was fairly well spread among adult white males from the beginning of the Republic, but the elite nature of national politics had caused many to lose interest in voting. In many ways, local politics could be just as discouraging. Voters frequently had little say about who would stand for office because the patricians in a community typically merged into political cliques that chose candidates from their own ranks. Elections consequently were often boring, preordained affairs. Not only was it considered undignified for candidates to campaign, but they were expected to act like reluctant aspirants who stood for election only to fulfill their duty and oblige the will of the people.

Still, during the early part of the period, independent urban artisans and craftsmen took an interest in elections and showed their support for candidates with parades organized by trade. Celebrating a victory could produce grand spectacles as men turned out in the clothes of their occupation, some carrying the tools of their trade, others carrying banners, to march down the streets of American cities, their destination frequently a tavern (Heidler and Heidler 2004, 114).

The tradition of political parades persisted and reached its peak during the 1830s and 1840s. Indicative of a growing democratic spirit among the electorate, these later parades not only celebrated the election of a favorite candidate or a party victory but also served as rallies during campaigns to whip up support. In fact, by the end of the period, the expanding franchise that included a growing number of urban workingmen noticeably invigorated politics. Candidates found it necessary to court these new voters, and the best place to do that was where they congregated after work—the saloon. Consequently, ensuing decades saw the urban saloon become the gathering place for organizing urban politics, and it was the odd fellow who was not affiliated in some way with a political club that gathered in these drinking establishments (Heidler and Heidler 2004, 114–15).

The nation's rural areas, which characterized most of the country, saw politics changing there as well after the War of 1812 as more smaller landowners became involved in public affairs. Again, as the franchise expanded to include previously unaffiliated voters, they too had to be wooed. Rural folk needed little excuse to gather for eating, drinking, and generally having fun, and the tradition of the barbecue as political rally gained rapid and eager acceptance. Candidates pooled resources to pay for food and drink, and voters brought their families to hear speeches while feasting themselves full. Thus did politics become a leisure activity during the early Republic, resembling their manifestation today as a spectator sport, one the average voter found increasingly entertaining (Heidler and Heidler 2004, 115).



Agricultural fair at Auburn, New York. American lithograph, early nineteenth century. The Granger Collection, New York.

Agricultural Fairs

The European tradition of having periodic market fairs to sell goods and meet friends and family never took hold in America. In the South and on the frontier, distance discouraged the custom, and New England towns were close enough to farms to allow regular visits. Instead, the goals of self-improvement and scientific inquiry led agricultural societies to organize local fairs to promote the dissemination of useful knowledge. Beginning in the early nineteenth century, organizers in New England, the mid-Atlantic states, and the South began holding livestock shows to encourage more scientific methods of animal breeding and husbandry. These predecessors of today's county fairs at first gave prizes to farmers displaying the best animals, but they quickly evolved into more broadly conceived events. They became venues for exhibiting agricultural products and handicrafts and for educating farmers about new agricultural techniques. These early fairs also fostered national pride with displays vaunting American manufacturing. Moreover, such festivities, with their practical underpinnings, provided communities with recreational events that allowed people to mingle, hear an educational lecture, and listen to a local band without feeling guilty over being away from plows and churns (Heidler and Heidler 2004, 115).

CHILDREN

The new emphasis on the importance of childhood meant that people placed a greater importance on play and toys than in earlier times. A main reason for the change in children's clothes, for example, was to make play easier. From the time they could walk, small children of every class and race spent most of their time playing, and middle- and upper-class children had toys. Boy and girl toddlers generally played together, but when most children reached the age of three or four, their play was usually segregated by gender, though there were exceptions. Typically, though, the types of play activities, games, and toys became gender specific. Many believed that adult recreation should be useful, and likewise many thought that children's play should center on self-improvement by preparing them for adulthood. Considerable thought was given about how best to accomplish this goal. Pamphlets outlined what was appropriate and what was inappropriate for children's play activities. One urged that "amusements of our youth shall consist of such exercises as will be most subservient to their future employments in life" (Heidler and Heidler 2004, 115–16) (Steiner 1970, 4).

When not in school, boys in rural areas spent much of their time in outdoor pursuits. Older boys learned the leisure activities of their fathers, especially how to ride horses, shoot guns, and catch fish. Outdoor games were designed to produce strong bodies able to plow fields, build barns, and shoe horses. Boys played with balls and sticks and had organized outdoor games like "shiny" or "bandy," the early equivalents of field hockey. In these games, boys were organized into teams and used sticks to knock something through a goal. Often they had to make do with whatever round object they could find or fashion, because real balls were rare. The opposing team tried to prevent the score and to steal the ball. In colder climates, boys played an early form of curling. On frozen ponds, teams of four players pushed around as many as eight large, heavy stones at the same time. The object was to move your own stones while obstructing those of the other team. In addition to such organized sports, boys made up games or played make-believe as children have in all times. They pretended to be soldiers fighting the British during the Revolution or the War of 1812; they pretended to be pioneering scouts seeking a new trail to the frontier; they pretended to be great hunters. The games they played and activities they participated in were little different from those of their fathers and would remain largely unchanged when taken up by their sons (Heidler and Heidler 2004, 116).

Little girls were not only more regulated in their outdoor activities; they were encouraged to do much of their playing indoors, a formula designed to prepare them for their roles as homemakers. Yet girls did have outdoor games, and on occasion they were even able to persuade boys to play with them. Boys and girls, for instance, were allowed to play battledore and shuttlecock, an ancestor to badminton. A game called "the needle's eye" was much like the modern game of Red Rover: children arranged in two parallel rows stood holding hands as a child from one row ran toward the other with the object of breaking the chain, all to the cadence of chanted verses. All these activities were literally considered child's play, for adults rarely participated in anything akin to modern team sports. Rarely did female children, for that matter. Since girls were considered more delicate than boys and in little need of physical strength, they spent most of their time indoors with their dolls or playing parlor games. During inclement weather, boys might join girls' parlor games, but they would never play with dolls (Heidler and Heidler 2004, 116–17).

Many children's parlor games of the early Republic were similar to those of today. For instance, blind man's wand was similar to the modern game of blindman's bluff. In the earlier game, a blindfolded child tried to find playmates by touching them with a stick (hence the wand) and asking them questions to determine their identities. The unlucky child who was first found and then found out became the next "blind man."

The growing emphasis on the importance of play meant the appearance of more elaborate toys. Children had always had toys, but they were generally homemade and hence quite simple. For poor children, this remained the case, but for others of even modest means, increasing numbers of manufactured toys or playthings crafted by artisans were brought into American homes. Girls played with realistic dolls that ranged from those of superb craftsmanship for the affluent to simple cloth figures that nonetheless became prized possessions of girls in humbler homes.

The birth of the American factory system all but eliminated leisure time for poor children. They always had to work harder than their middle- and upper-class counterparts, and during these years their use as factory laborers meant even less time than before for play. Such children worked 10 to 12 hours a day, six days a week, leaving them with little energy to play even if they found the time. Yet except for the impoverished and those unfortunates who were born into slavery, children's lives showed a marked improvement during the early Republic. Their importance as future citizens made adults look at childhood in a different way than had previous generations. Play became an important part of a child's development, helping to mold the boy into the reliable husband and upright father, the girl into the virtuous wife and tender mother, and both into citizens able to sustain the Republic and advance its ideal of liberty (Heidler and Heidler 2004, 117).

Religious Life

FAITH AND CHARITY

A remarkable continuity marks the American experience with religion, despite the fact that Americans prided themselves on the diversity of faiths in their country. From the earliest years of the colonial period through the early Republic, a central theme of American religious faith was the belief not only that divine providence guided the destiny of peoples and places but that the American setting was the site for a new chosen people. As one clergyman put it: "In the discovery and settlement of this country God had some great end in view." In addition, Americans believed that their civic system was God's gift of liberty and opportunity not only for Americans but also eventually for the entire world. In all events and dangers, God would protect the nation and its people, preserving them for some future service in a broader plan of good works. It was a perception handed down from the first Puritan congregations of New England. By the early nineteenth century, it had become thoroughly interwoven in the complex American religious fabric. The American Revolution—an undertaking that succeeded against the longest odds—and the eventual formation of the new government under the Constitution were regarded as self-evident proofs of greater accomplishments to come (Heidler and Heidler 2004, 119) (Bodo 1954, 7).

The importance of religion in the function of American society was therefore immense. The Puritan mind was possibly more influential than the dazzling intellectual innovations of the Enlightenment. Although some intellectuals gravitated to Deism, the idea that God was more an objective observer of his perfect mechanical machine than a prime mover in the affairs of men, the great bulk of the population believed God was not only supreme but also actively involved in charting human affairs. A good example of this belief can be seen in the diary of the dying Quaker Samuel Cole Davis, who confided to himself and future generations to "remember it was the Lord that sent this affliction on thee." Such a notion made for an energetic religious faith that occasionally achieved levels of phenomenal vigor, such as during times of fervent religious revivals. It also bolstered a patriotism that extended far beyond a devotion to one's country simply because it was one's home: Americans believed that God's divine will was directing the destiny of the Republic, and in its early years, patriotic loyalty to that Republic was a form of what sociologists and historians would eventually characterize as "civil religion." Moreover, religion convinced many "that it is possible to produce such a change in the moral character of man as shall raise him to a resemblance of angels" (Heidler and Heidler 2004, 119–20) (Kagle 1986, 11) (Nye 1960, 30).

The religious diversity that flourished in the American setting has always been a perplexing riddle for scholars. What made the infant United States a place where so many different and occasionally antagonistic faiths could coexist? The circumstance certainly ran counter to history. The rise of Roman Catholicism from the ruins of the ancient world set the pattern for religious conformity that was considered the ideal, both by the Catholic community and later by the various sects of the Protestants. The concept of religious conformity, in fact, was virtually unbroken in the history of the Western world from the fifth-century fall of Rome through the establishment of colonies in North America. One church all-encompassing and dominant was the quest, and attempts to establish such a church labeled all outside it as dissenters at best, heretics at worst. Much mischief and some malevolence resulted under the banner of religious conformity, from the imposition of annoying social disabilities to appalling physical persecution. Yet the United States refused to establish such a dominant church, and by deliberately contriving ways to separate any church from government sponsorship, the new nation sought to prevent such domination from occurring by accident. As one American Presbyterian wrote, "there is not a single instance in history in which civil liberty was lost, and religious liberty preserved entire." Political and religious liberty were inseparable. For instance, during the early Republic, President James Madison refused to sign a bill chartering an Episcopal Church in Alexandria, District of Columbia, arguing that "the bill exceeds the rightful authority to which governments are limited by the essential distinction between civil and religious functions." In another case, evangelical groups decried the breaking of the Christian Sabbath, especially by the U.S. Post Office, which under an 1810 statute was directed to deliver mail seven days a week. Nonetheless, their intense lobbying proved to no avail. Congress upheld Sunday mail delivery as a central bulwark of the separation of church and state (Heidler and Heidler 2004, 120) (Nye 1960, 196) (Richardson 1896–1899, 489).

In short, no particular religious group was allowed to decree governmental policy, and the result was an incredible religious diversity. The First Amendment to the Constitution not only prohibited the establishment of a state church; it also set the circumstances in which the new nation could become a haven for virtually every species of faith (and nonfaith) that the human mind could contrive. Most Americans subscribed to some sort of faith, or as one observer noted, "those that have it [religion], shows it, and those that have it not wish to be considered religious for the credit it gives in the society." The civil religion of the American experience—that amalgamation of spiritual faith and civic obligation—encouraged tolerance through a sense of community that crossed denominational lines. And the conspicuous absence of the government promoting a particular faith made all the others feel less threatened. The United States was unique in its approach to a problem that had troubled cultures since the time of the Romans (Heidler and Heidler 2004, 120–21) (Mayfield 1986, 13).

We should not, however, leap to the conclusion that religious differences and disputes did not exist in the early Republic. Even the predominance of Protestants did not mean that most Americans were bound as one in a common religious belief. The early Republic continued the tradition of religious debate and doctrinal argument that had begun during the earliest colonial times. Congregations continued to split hairs and divide into new groups, new sects formed, and some groups embraced emotional revivalism while others rejected it with sniffing disapproval. That great intellectual ornament of the eighteenth century, rationalism, seemed sensible to some, troubling to others, and atheistic to the anxious. In fact, about the only thing that all these disparate and various groups, sects, and denominations could agree about was the prudence of religious freedom. And even given that point of agreement as an ideal, there were boundaries to it in reality. The First Amendment could not stop Protestants from being suspicious of, and sometimes attacking and persecuting, Catholics. States were not constrained by the Constitution from promoting or excluding religion. Virginia was unique in its adoption of statutory religious freedom, for many other states collected taxes to support religion or imposed special restrictions on others. However, because of the Constitution's legal guarantees, Protestants proselytized from each other's denominations without violent reprisal, and new sects could usually be regarded with wariness and misgivings without their being snuffed out by vicious attacks. Religious rivalry was neither nationally dire nor dangerously violent in a sustained, systematic sense. Even in 1819, during the storm over Unitarianism in New England, one of the bitterest arguments in American denominational history, a visitor from England declared, "All is harmony." He concluded that "here are no disputes about religion; or, if they be, they make no noise." While this testimonial was something of an exaggeration, it was a tribute to the American tradition of religious freedom that it contained more truth than overstatement (Heidler and Heidler 2004, 121) (Hutchison 2003, 14).

DENOMINATIONAL DIVERSITY AS AN ARTICLE OF FAITH

The concept of denominations—separate religious entities that offer different belief systems within a broad framework of agreement—was essentially a creation of the nineteenth century and in many ways was a reflection of religious pluralism in the early Republic. It is not the purpose here to recount the theological history of the nation and its various faiths, but before examining the effects of religion on daily life during the period, it is useful to describe briefly the major and minor varieties of belief that made up the incredible range of religion in those early years of the nation. The following capsule descriptions are arranged alphabetically (Heidler and Heidler 2004, 121–22).

African Methodist Episcopal Church

Those unfortunate Africans traded into slavery in British North America and their descendants during the colonial period experienced a varying and an intricate mixture of compulsory acculturation and voluntary integration into Protestant Christian traditions. The sweeping evangelism of the late 1790s and early 1800s increased the number of black Christians just as it did white ones, though efforts to convert slaves had less proportionate success. The great movement of enslaved blacks into Protestant churches did not occur until the 1830s and after, but already native-born slaves were adapting Christianity as suited their spiritual and social needs. In the South, where slavery not only persisted but was fixed in place by the rise of the plantation system, some slave owners tried to use religion as a way to promote obedience to masters as a condition for salvation. Slaves, however, just as frequently connected their plight to that of the ancient Hebrews in Egyptian captivity, and their hymns ("spirituals," in their parlance) remain a testament to the longing for freedom in this world and, barring that, salvation in the next.

In the North, freedom in this world did not always mean equality, even at the church altar. In 1787, black members of Saint George's Methodist Episcopal Church in Philadelphia left the parish to protest prejudicial treatment and thereafter met in a rented stockroom to hear sermons by their leader, former slave Richard Allen. This initial group formed the nucleus of additional black congregations that formed throughout the city and in 1816 joined to establish the African Methodist Episcopal Church (AME). Allen became the denomination's first bishop upon being ordained by the aging Methodist leader Francis Asbury in one of his last official acts, a tie to the Methodists that saw the AME church emulating Methodists in doctrine, church polity, the General Conference system, and eventually wide-ranging missionary work.

In 1796 a similar break by black parishioners occurred in New York when their displeasure over being marginalized in the John Street Methodist Episcopal Church prompted them to establish a separate congregation. With the blessings of Francis Asbury, they built their own church and named it Zion in 1800. The new denomination soon spread to Connecticut, New Jersey, and Pennsylvania, although it did not formally withdraw from the Methodist Church until 1820. Almost 30 years after that, the denomination honored the original New York congregation by adopting the name American Methodist Episcopal Zion Church (Heidler and Heidler 2004, 122).

Baptists

Many Protestants in the United States were Baptists, a denomination that began in early seventeenth-century England that embraced five cardinal principles. Baptists believed in separation of church and state, thorough congregational independence, faith based exclusively on the scriptures, conversion and membership in the church as a result of a personal religious experience, and baptism by complete immersion. Although Roger Williams is sometimes described as the founder of American Baptists and his church in Providence, Rhode Island, established in 1638, as the original Baptist congregation in America, some scholars argue that Williams and his followers did not practice complete immersion. Nonetheless, during the colonial era, Rhode Island was the hub for the dissemination of Baptist theology and in 1764 became the site of the first Baptist college in America. Elsewhere in New England, Baptists were subjected to harsh harassment until the end of the seventeenth century, and their numbers were mostly confined to the mid-Atlantic colonies, where English and Welsh immigrants brought the faith with them in increasing numbers, especially to New York, Pennsylvania, Maryland, and Virginia (Heidler and Heidler 2004, 122–23).

As with other denominations, the Great Awakening had a profound impact on the Baptists, leading to a faction committed to religious revivals. Following untrained and unpaid farmers who took on the mantle of preachers, this faction grew swiftly in Virginia and North Carolina, especially among the poor, and by the late eighteenth century, southern Baptists had become plentiful and powerful. Because they devoutly believed in the separation of church and state, they strenuously urged the new American government to embrace the idea, a mainstay in sustaining religious liberty in the early Republic. Meanwhile, their reliance on farmer-preachers meant the Baptists would rival even the Methodists during the Second Great Awakening in establishing new churches on the American frontier (Heidler and Heidler 2004, 123).

Catholics

Roman Catholics had been among the first English colonists with the establishment of Maryland in 1634 as a refuge for those fleeing persecution in England. Yet they were never numerous in the colonial establishment and even in Maryland suffered maltreatment under punitive laws throughout the colonial period, a reflection of the anti-Catholic animus dating from the English Reformation. Yet there were Catholic signers of the Declaration of Independence, Catholic soldiers in the officer corps and ranks of the Continental army, and Catholic delegates to the Constitutional Convention. They remained a minority, however, and were slow to secure civil rights in various states (Heidler and Heidler 2004, 123–24).

Colonial Catholics had relied on the Jesuit order for spiritual guidance, but in the decade after the Revolution, the suppression of the order and the break with Britain saw a greater reliance on American prelates. Marylander and cousin of a Declaration of Independence signer, former Jesuit John Carroll became the first bishop of Baltimore. At that time, Catholics numbered about 35,000 in the mid-Atlantic states and scattered French settlements on the frontier. Meanwhile, the Catholic Church's presence in the United States grew solely because of disruptive European events, especially the French Revolution, which sent many French priests into exile in the United States. The presence of these French churchmen created a problem in itself when Americans divided over the Anglo-French war in the early 1800s. Yet the long history of Catholic educational and charitable work that had begun in 1737 with Ursuline nuns in French New Orleans continued unabated. Georgetown Academy served all faiths, and St. Mary's, the first Catholic seminary in the United States, opened in Baltimore. Maryland's Elizabeth Ann Bayley Seton, destined to become the first American-born saint (canonized in 1975), founded the Sisters of Charity of St. Joseph and in 1809 a school for girls in Emmitsburg. The Sisters of Charity opened America's first Catholic orphanage in Philadelphia, and in South Carolina plans to publish a Catholic weekly bore fruit in 1822 when Bishop John England brought out the first issue of the *United States Catholic Miscellany*.

Even after the absorption of French Louisiana in 1803, Catholic numbers remained slight throughout these years, and Catholics were abided because they were unobtrusive. When political and agricultural problems in Ireland during the 1820s brought a flood of Catholic refugees to American shores, their growing presence meant growing resentment from Protestants in competition for jobs and social status. The result was a new round of informal persecutions, some resulting in violent incidents, fueled by occasionally scurrilous charges of corruption in the church and scandalous misconduct in the convents (Heidler and Heidler 2004, 124).

Church of the Brethren

Because, like Baptists, members of the Church of the Brethren believed in total immersion for baptism, they were known as "Dunkers," often modified as Dunkards. Their baptismal observance required that they be plunged three times, once for each entity of the Holy Trinity. Originally appearing in the German states in the late 1600s, Dunkards came to America in the early eighteenth century to settle in Pennsylvania, Maryland, and Virginia. Eventually they spread westward, establishing simple farming communities that adhered to an unadorned faith in the Bible, the Trinity, and baptism as the basic requirements for deliverance. Dunkards refused to swear oaths, rejected tobacco and alcohol, and passionately opposed slavery. They just as avidly embraced pacifism.

The rites of the Dunkard faith were a daily event centering on emulating Christ's washing of feet, ceremonies of fellowship, the breaking of bread, and finally the observance of the Eucharist. Congregations enjoyed autonomy to elect their own ministers (Heidler and Heidler 2004, 123).

Congregationalists

Congregationalists were theologically descended directly from the Puritans of England and consequently enjoyed pride of place as one of the oldest, most numerous, and most significant religious groups in the colonies. For later generations, they would come to define the persevering and innovative American spirit. The first of their number, Separatist Puritans, had in 1620 established a colony at Plymouth against all odds after agreeing to the celebrated Mayflower Compact, the first statement in the New World of the ideals of popular government. In religious terms, they were also seminal in establishing Congregationalism as the desirable standard for church organization in several New England colonies. Although detractors in England mounted attacks on Congregationalism, the denomination continued to develop its own identity throughout the colonial period, especially as Puritan immigrants swelled the population. Harvard and Yale Colleges were established to supply educated ministers during these years, and broad-minded Congregationalists adopted the Halfway Covenant to moderate the necessity of having a religious experience to qualify for church membership, a measure that angered traditionalists and caused some to gravitate to Presbyterianism. While the Great Awakening in the 1730s and early 1740s swelled Congregationalist numbers, it also led to serious doctrinal arguments that ultimately fractured Congregationalism into conflicting camps, a prominent one eventually becoming Unitarians. Politically, however, Congregationalism supported the American Revolution, and its clergymen readied their flocks for the sweeping cultural and governmental changes that the break with Britain portended (Heidler and Heidler 2004, 124–25).

The Congregationalists undertook noteworthy missionary and educational initiatives during the early Republic. America's first missionaries to foreign lands hailed from the organization the Congregationalists created in 1810, work that continued in the 1820s and 1830s in remote frontier areas of the United States itself and beyond its borders. Congregationalists also sustained important colleges they had established at Williams, Amherst, Oberlin, and Carleton.

Yet in the years of the early Republic, Congregationalism remained a regional presence in New England that failed to accompany the large migrations of New Englanders westward, mainly because of the Congregationalist insistence on an educated clergy. The Plan of Union of 1801, which the Congregationalists eventually rejected, proposed to merge their scattered adherents on the frontier with more numerous and better-established Presbyterian congregations, and the results were predictable. Most such worshippers did not merely join Presbyterians in church attendance; they became Presbyterians in fact, and Congregationalism remained both regional in character and small in size. The Congregationalists eventually formed the American Congregational Union in 1832 (Heidler and Heidler 2004, 125).

Deists

Deism was more a philosophy than a theology. Deists believed in a supreme being but rejected revelation and denied mystical canons of Christianity, such as the occurrence of miracles that violated natural laws. Coinciding with the rationalism of the Enlightenment, Deism came to America in the late eighteenth century when some notable American intellectuals and influential figures embraced the philosophy during the revolutionary era. Higher education was affected by Deism—some would have said "infected" by it—and traditional denominations reacted to it with growing dismay, especially in New England, where it gave impetus to the Second Great Awakening. Yet Founders such as Benjamin Franklin and George Washington were attracted to Deism's tenets of rationalism and toleration. Thomas Jefferson openly espoused Deism, leading to the eventual charge by his political enemies that he was an atheist (which he was not), as did Thomas Paine, who undoubtedly was an atheist, thus muddying the waters regarding the philosophy's potential consequences in attracting a large number of believers. The romanticism of the early Republic, however, would greatly erode the attractions of Deism as a philosophy-faith, while some basic facets of it were incorporated into the rationalism of Unitarianism and Universalism (Heidler and Heidler 2004, 125–26).

Disciples of Christ

The Great Revival on the American frontier had a direct impact on the formation of this denomination, especially because its principal leaders were the dynamic Thomas Campbell and his son Alexander. Originally Presbyterian ministers, the Campbells established in 1811 a congregation in Pennsylvania based on Thomas Campbell's Christian Association, which he had founded two years earlier. Frequently referred to as Campbellites, the denomination officially called itself Disciples of Christ and advocated not just the revival of the Christian faith but also the restoration of Christian principles based exclusively on a fundamental interpretation of the Bible, especially the New Testament. The denomination was attractive to frontier settlers and spread rapidly westward. By the 1830s, various other revival movements were also embracing the Disciples of Christ, the Kentuckian Barton Stone and his flock prominent among them (Heidler and Heidler 2004, 126).

Episcopalians

During the colonial era, the Church of England (known informally as the Anglican Church) was the established state religion, but the Revolution's break with England and the subsequent acceptance of the principle of separation of church and state required the restructuring of their church by American Anglicans. They adopted the formal title of Protestant Episcopal Church and informally became known as Episcopalians. In a rapid sequence of reorganization, Episcopalians developed a national organization and obtained consecration of American bishops. By then, the entire church had been brought under central governance (Heidler and Heidler 2004, 126).

During the early Republic, the Episcopal Church concentrated on healing the damage to it caused by the Revolution. Many of the faithful who saw allegiance to the British crown as a bulwark of their church had been alienated. By 1811, the vigorous spirit of revival that had swept through other denominations a decade earlier also began to take hold in more staid Episcopalian circles as so-called Low Church advocates embraced the evangelical imperative and gained control from High Church traditionalists. Important achievements and growing numbers reflected the denomination's rejuvenation. An Episcopal seminary was established in 1817, and general missionary work began three years later. Starting in 1810 and for the next 20 years, Sunday schools became a fixture in almost all parishes. Doctrinal disputes again emerged in the 1830s when the Oxford Tractarian Movement in England—an endeavor to revive Catholic principles in the church—appealed to the defeated High Church faction and encouraged them to mount a determined effort to regain their control of policy. The quarrel that ensued continued for decades (Heidler and Heidler 2004, 126–27).

German Denominations in Pennsylvania

The Protestant Reformation began in the German states in the early sixteenth century when Martin Luther systematically began challenging Roman Catholic doctrines. Lutherans were thus the first protesters to Catholic policies and practices. They came to America early with seventeenth-century Dutch, German, and Scandinavian colonists, and in 1742, the first Lutheran synod was established. Ethnic and linguistic diversity characterized the faith, and the growing immigration of Lutherans after the American Revolution further diversified congregations during the early Republic on the basis of language alone (Heidler and Heidler 2004, 127).

The Reformed Church was also a part of the Reformation that swept the German states. The denomination first appeared in Pennsylvania and had around

150 churches by 1763; by 1793, it had assumed the official name of German Reformed Church. During the migrations into the West, the church expanded into areas such as Ohio and Indiana. The Reformed churches were strictly Calvinist and believed in purging their worship of all traces of Catholicism (Heidler and Heidler 2004, 127) (Middleton 1996, 287).

Moravians were the American manifestation of a denomination founded in Saxony in 1727. Settling in Savannah in 1734, Moravians soon relocated to Pennsylvania and were quickly joined by other Moravian immigrants from Europe. Additional settlements were established in North Carolina near what is now Winston-Salem. Moravians were devoted to the notion of religious consistency and consequently closed their communities to outsiders until the middle of the nineteenth century. They were nonetheless enthusiastic missionaries to Indians and others seen as needing spiritual revelation, carrying their faith in the Bible as the exclusive guide to behavior. Moravians believed in infant baptism but accepted members upon a declaration of faith.

Mennonites derived from a splintering of Reformation denominations that had separated from more traditional elements over the issue of infant baptism. Their spiritual founder was the Dutch cleric Menno Simons, hence the name Mennonite. Rejecting baptism except upon voluntary declarations of faith, Mennonites were Anabaptists (or rebaptizers) whose primary spiritual guidance was based on the tenets from the Sermon on the Mount. They submitted to civil laws but would not breach their inherent belief in pacifism, their resistance to swearing oaths, or their aversion to participating in civic affairs. The most conservative elements of the faith eschewed modern conveniences and fashionable forms of dress. Their first American presence was in 1683 at Germantown, Pennsylvania, where they established a farming community. Swiss and Dutch immigrants swelled their numbers in the following years and included subsects of the faith, such as those following the Swiss Mennonite Jakob Amman, who were thus known as the Amish (Heidler and Heidler 2004, 127).

The Amish followed the teachings of their founder that stated that control of the church required strict penalties for deviations from traditional doctrine and customs. The Amish consequently practiced social restraint by shunning the excommunicated. Shunning forbade all routine contacts with the wrongdoer, even sexual intimacy with a spouse who was under reprimand by the community. In keeping with their Mennonite heritage, the Amish embraced pacifism, kept neat farms isolated from outsiders, adhered to plain dress, and renounced modernism. Their concentrated numbers in Pennsylvania apparently originated the term "Pennsylvania Dutch," a misnomer because it was an American distortion of "Deutsch," meaning German (Heidler and Heidler 2004, 127–28).

The Church of United Brethren in Christ was an amalgam of Mennonite and earlier evangelical Protestant denominations. In 1800 a conference officially established the church in Frederick, Maryland, and 15 years later a General Conference amplified and refined its doctrines. Members embraced a form of Methodist Arminianism and performed baptisms only upon voluntary conversions (Heidler and Heidler 2004, 128).

Judaism

Jewish religious community life was established in North America when two dozen Sephardic Jews fled Brazil for the Dutch colonial city of New Amsterdam in 1654. When New Amsterdam became New York City in 1659 with the transfer of the colony to British colonial administration, the small Jewish community there enjoyed minor privileges that enhanced their religious identity and practices, such as the establishment of a separate Jewish cemetery. During the colonial period, Jewish numbers grew with the arrival of eastern or central European immigrants seeking to escape religious persecution and political maltreatment. These immigrants, known as Ashkenazim for their German and east European ancestry, settled in coastal towns such as New York, Philadelphia, Charleston, and Savannah, where they formed the bulk of the Jewish communities. The minority was the older, more established Sephardic Jews, sometimes called Portuguese Jews because of their Iberian roots. In addition to differing in social rank, these two congregations also differed over rituals of worship, a circumstance that continued beyond the colonial period into the early Republic. The result was a significant departure from some aspects of Jewish doctrine, such as the strict observance of the Sabbath, especially because the nature of exilic Judaism tended to congregational autonomy. In fact, under Jewish law, 10 adult males could form a congregation and appoint a rabbi whose only qualification might be a detailed knowledge of Jewish texts (Heidler and Heidler 2004, 128).

Jewish life in the early Republic resembled that of the colonial years. Working at traditional trades such as shopkeeping, merchant trade and shipping, wig making, and gemstone cutting, they prospered as a small but industrious minority. Their numbers remained quite small—fewer than 3,000 Jews lived in the United States at the close of the American Revolution—and not until the 1820s did that situation begin to change. After the Napoleonic Wars, immigration from eastern Europe greatly increased the number of Ashkenazim in both coastal regions and the interior, so that by the 1840s, Jews were a noticeable presence as far west as the Mississippi River (Heidler and Heidler 2004, 128–29).

American Judaism did not remain a static theology during the early Republic. Time-honored and conventional practices such as obedience and loyalty to the Jewish community became less important in the politically free and economically dynamic American setting. Autonomous congregations became more responsive to the social wishes of their members and less likely to adhere strictly to traditional Jewish religious laws and customs. That is not to say that Jews were secularized by the American experience of the early Republic, but they did respond in predictably secular ways to the energetic social, political, and economic forces that described life in the United States during the first part of the nineteenth century (Heidler and Heidler 2004, 129).

Methodists

Originating in England in the 1730s as an Anglican religious club at Oxford that "methodically" studied the scriptures, Methodists were in sufficient number in America to be noticed about 30 years later. Methodists accepted the doctrine of

Dutch Calvinist Jacobus Arminius, which celebrated human free will as compatible with God's omnipotence. In essence, by accepting Arminianism, Methodists rejected the strict Calvinist notion of predestination, the belief that God has already determined the fate of every soul on earth.

Beginning in 1769 and for the next few years, the celebrated Methodist preacher John Wesley dispatched a total of eight missionaries from England to spread the word, but their small numbers belied the influence they wielded. For one thing, the charismatic Francis Asbury, who would become the primary leader of Methodism in the United States until he died in 1816, was among them. Secondly, a homegrown group of ministers arose in Maryland and Virginia. Lacking ordination, they did not administer the sacraments, but some ordained Anglicans with evangelical inclinations admitted Methodist converts to their folds or administered the sacraments to them separately (Heidler and Heidler 2004, 129).

Of Wesley's British missionaries, Asbury alone remained during the Revolution, and, after victory over Britain, Wesley's influence waned because he had supported the king. In the face of such American opposition, Wesley set aside petty issues of church governance to grant American congregations ecclesiastical autonomy, if not complete independence. Because no American Methodist preachers had been ordained and so they could not administer the sacraments, Wesley ordained two English preachers and sent them to America with plans to establish a superintendence of American Methodists that would have included the popular Asbury. Subtly attuned to the new American political climate, though, Asbury was disinclined to accept any role in church governance without the blessing of his preachers. The remarkable result of his reluctance was a conference in Baltimore during the Christmas season in 1784 in which the Methodist Episcopal Church was formally established, complete with ordained preachers and protocols for service. The assemblage even adopted a hymnal. A publishing house, the Methodist Book Concern, was established in 1789 to produce religious pamphlets, books, and official tracts of the church (Heidler and Heidler 2004, 129–30).

During their work before the Revolution, Wesley's missionaries, including Asbury, had used the circuit system that had proved so effective in England, and its continuance during the 1790s was greatly responsible for the increase in Methodist numbers. By following a migrating population with the Methodist message of unencumbered grace and individual accountability, preachers won a phenomenal number

American Methodists proceeding to their camp meeting. J. Milbert del.; M. Dubourg sculp. c. 1819. Courtesy of the Library of Congress.

of converts on the frontier during the Great Revival. By 1820, Methodist membership in America was more than 200,000, a rate of increase that continued for the next 30 years to nearly a million souls (Heidler and Heidler 2004, 130).

Presbyterians

American Presbyterians represented a mix of Scots-Irish immigrants and New England Puritans. The first Presbyterian congregation was at Snow Hill on Maryland's eastern shore in 1684, and by the eighteenth century, the Philadelphia Presbytery had assumed leadership of the denomination, which was growing because of continuing Scots-Irish immigration. Disaffected Congregationalists also swelled Presbyterian numbers, as they were attracted to inherent traditionalism, and, like the Congregationalists, Presbyterians almost universally supported the American Revolution, further adding to their luster. In 1788 a central assembly took on the task of governing the faithful, and its organizing potential meant that Presbyterians would be poised to take advantage of the great religious surge of the revival movement at the beginning of the 1800s. The Plan of Union of 1801 formalized cooperation on the frontier between Presbyterians and Congregationalists, and many Congregationalists became Presbyterians, but as the years passed, the church was increasingly racked by dissension brought on in part by such converts resisting Presbyterian traditionalism.

Although they were to become a significant influence in shaping the culture of an expanding America, Presbyterians would not be as omnipresent on the frontier during the Great Revival as Baptists and Methodists. In part, their comparatively high educational standards meant that their ministers were in shorter supply. At first, ministers hailed mainly from New England (Aaron Burr's grandfather Jonathan Edwards and his father were examples), but the College of New Jersey (later Princeton) eventually supplied the bulk of the denomination's leaders, and Presbyterians would be tireless in establishing colleges to match the westward march of American migration (Heidler and Heidler 2004, 130).

Quakers

Officially called the Society of Friends, they were colloquially known as Quakers because they were said to have spasms as they underwent religious experiences. The Society of Friends originated in England during the mid-seventeenth century in response to the preaching of George Fox, whose message focused on the notion of an "inner light" in every person and the doctrine of Christ residing in all people. The Anglican establishment in England regarded Quakers as heretical, and they suffered severe persecution. They came to American shores early in the colonial period, but Puritan New England reflected Anglican suspicion about them and tried to persecute them out of existence with fines and floggings. When those measures failed, the Quakers were banished, but the persistence of the faith saw it taking hold nonetheless, and they were actually welcomed in some places such as Rhode Island and New Jersey. William Penn founded his colony of Pennsylvania as a refuge for persecuted Friends from all over Europe, and by the time of the early Republic, they were quite numerous and ethnically diverse. When Quakers ceased active proselytizing in the eighteenth century, systematic persecutions ended, but other denominations continued to regard them with suspicion, especially for their rigid pacifism, which prohibited them from serving in the military, and for their clannish discipline that enforced marriage exclusively within the faith. They were early advocates of humane and fair treatment for Indians and early proponents of antislavery. During the early Republic, Quakers participated in the great westward migrations that motivated the rest of the population, though they mainly moved into the Northwest Territory because of its ban on slavery (Heidler and Heidler 2004, 130–31).

Because they believed that God exists in everyone, Quakers stressed human decency and always strove to eliminate evil with sincerity, simplicity, honesty, and pacifism. Quaker shopkeepers and their customers did not haggle over prices, and they were noted for their use of "plain speech" that substituted "thee" and "thou" for what they regarded as the formal pronoun "you." They observed equality between the sexes in worship, and although Quakers had largely relaxed evangelizing among the unconverted, they accepted anyone into their faith who indicated willingness to acknowledge its tenets and fulfill its obligations. Quakers worshipped in unstructured and unprogrammed meetings that assembled the faithful at least once and sometimes twice a week in plainly constructed and unadorned meetinghouses. They sat quietly unless members were moved to speak, offering themselves as witnesses by sharing religious thoughts and experiences for the group to discuss freely (Heidler and Heidler 2004, 131).

A splinter group from the Society of Friends was the United Society of Believers in Christ's Second Coming, which had formed in the mid-eighteenth century in England. They were known at first as Shaking Quakers and later simply as Shakers. The first Shaker community in the United States was established in New York at Watervliet in 1776. Because Shakers were celibate even in marriage, they did not naturally increase their number, and the sect grew only by attracting converts and adopting orphans. During the early Republic, it eventually numbered almost 20 communities of about 6,000 members. Shakers owned property in common and were noted for their exquisite but simple craftsmanship, which produced a distinctive style of furniture. Shaker hymns were equally simple, but they were also lyrical celebrations of uncomplicated pleasures, such as "Simple Gifts," which the twentieth-century American composer Aaron Copland wove into several of his most famous compositions (Heidler and Heidler 2004, 131–32).

Another Protestant sect similar to the Quakers formed in Germany under the leadership of religious reformer George Rapp. In 1803 persecution by Lutherans forced the sect to move to Pennsylvania, where they founded the town of Harmony. They were called Harmonists and have usually been identified as the Harmony Society. Like Shakers, they practiced strict simplicity, owned all property in common, and strove for celibate marriages. In 1815 most Harmonists moved to Indiana and founded the town of New Harmony, but their new location proved a harsh and uninviting spot for many members, who either left the faith or trudged back to Pennsylvania after selling their property to Robert Owen, who had plans to establish his own utopian community there (Heidler and Heidler 2004, 132).

Unitarians

Unitarianism grew out of theological challenges during the Reformation that questioned Roman Catholic doctrines, especially that of the Holy Trinity, the belief that God exists as one being in three entities: the Father, the Son, and the Holy Spirit. Unitarians, however, regarded the Trinity as negating the fundamental Judeo-Christian belief in monotheism and insisted instead that God existed in only one entity. In old Europe, even other Protestants regarded Unitarians as highly heretical because they essentially denied the divinity of Christ. For a time, they were able to exist only in Poland and Transylvania, but eventually Unitarian émigrés carried their beliefs westward, sometimes suffering martyrdom as they did so. Not until 1813 did they gain any kind of recognition as a viable faith in Britain (Heidler and Heidler 2004, 132).

The origin of American Unitarianism defies a simple explanation. In essence, the Puritan congregations of old New England underwent a profound transformation in the first two decades of the nineteenth century. A moderate body of Liberal Christians became Unitarian Congregationalists, as contrasted with traditionalists who remained Trinitarians. The split basically resulted from the dissent of certain Congregationalist clergymen in New England who rejected Calvinist doctrines that had formed the core of the Great Awakening. Those doctrines included absolute predestination and original sin (the concept that man is naturally depraved). Instead, Unitarians insisted that God was compassionate rather than angry and that man had a free will to choose righteousness over iniquity. A formal break occurred in 1796 when Boston's King's Chapel seceded from the Protestant Episcopal Church and officially embraced Unitarianism, and during the years that followed, additional New England congregations became essentially Unitarian in belief and practice, if not formally in name. Finally, in 1819, the influential Congregational minister William Ellery Channing delivered a sermon entitled "Unitarian Christianity" that gave formal voice to the fundamental philosophy of Unitarianism, and that date is usually taken as the birth of organized Unitarianism. Rather than adhering to a specific doctrine or dogma, Unitarians believed in rational thought and individual ethics as the basis for their conviction and also believed that revelation was not an event but a continuing process that made religious learning a lifelong process (Heidler and Heidler 2004, 132–33).

Another religious belief that ran a parallel course to Unitarianism was Universalism, also a movement born of opposition to the notions of inherent human wickedness and predestination. In 1790 three disparate groups representing these thoughts met in Philadelphia and formed the Universalist Church. The congregation remained small, however, and was mainly extant in New York and eventually some portions of the Midwest (Heidler and Heidler 2004, 133).

REVIVALISM

One of the most profound episodes in the early Republic centered on a series of religious revivals called the Second Great Awakening. Its impact on daily routines for a considerable number of Americans was as immeasurable as it was intense. In some respects, it revealed the heightened religiosity in an increasingly secular social, political, and economic environment. The expanding religious sentiment that began swelling in the 1790s and resulted in a sustained burst of revivalism at the turn of the nineteenth century formed a vital part of the story of those Americans (Heidler and Heidler 2004, 133).

Origins

Even during the colonial period, the broad geographic expanse and irregular establishment of American colonies brought about a growing variety in religious faiths. A level of tolerance was necessary merely to keep the civil peace even in the face of the established Church of England, but such forbearance might actually have been a reflection of religious indifference. By the beginning of the eighteenth century, time and distance had lessened the Old World's religious hold on distant flocks, no matter what their faith. An effort to renew flagging religious fervor was in part responsible for a revival movement in the 1730s and 1740s that is popularly called the Great Awakening. Revivals not only sought to reanimate the faithful but also endeavored to win new converts. Glimmerings of this development were seen in New Jersey's Dutch Reformed Church as early as the 1720s, but the movement took flight in New England in the 1730s when Jonathan Edwards delivered a series of fervent, vivid sermons that convinced listeners that they were indeed "sinners in the hands of an angry God." Spurred by the equally moving addresses of George Whitefield, who took his message on the road, the Great Awakening continued into the 1740s, gaining converts and finally kindling dissent, the latter among those who objected to the absolute statement of Calvinist doctrines such as predestination and original sin. Nonetheless, the Great Awakening soon broke regional boundaries to spread southward and breathe life into Presbyterians, Baptists, and, by the American Revolution, Methodists as well (Heidler and Heidler 2004, 133) (Edwards 1844, 313–21).

The Great Awakening did more than enlarge church congregations of the various Protestant denominations. It also served to counter the rationalism of Enlightenment philosophy, which was essentially unreceptive to notions of revealed religion. Nonetheless, the appeal of rationalism, evidenced by the lure of Deism among American intellectuals, did work to dampen religious fervor in the latter part of the eighteenth century. The constitutional prohibitions on a state church also seem to have diminished the influence of the organized churches. Finally, the westward migration of the American population following the Revolution put into play the same geographic factors of distance that had earlier loosened the ties between colonial populations and Old World churches. Organized religion in the eastern United States saw its influence waning among pioneers (Heidler and Heidler 2004, 134).

The Second Great Awakening

Church leaders responded to this development by renewing the revivalism that had proved so successful in the Great Awakening. Beginning in New England, the Second Great Awakening got under way in the 1790s as devotees of Jonathan Edwards sought to overcome the appeal of Deism, what some called the "'French infidelity' that was threatening to sweep away every vestige of Christianity." Occurring within customary church ceremonies, the eastern revival effectively invigorated church attendance and encouraged missionaries to travel abroad as well as to scattered pioneer communities on the American frontier. Nobody, however, was prepared for what happened in sparsely populated frontier regions. The Second Great Awakening in the western American wilderness was to become the Great Revival (Heidler and Heidler 2004, 134) (Nye 1960, 213).

The western manifestation of revivalism was intensely emotional, broadly interdenominational, and exceptionally infectious. By 1799, Presbyterian, Baptist, and Methodist ministers were riding circuits throughout the frontier to inspire the faithful and convert the unchurched. The western wilderness did not appear a promising vineyard for the Lord's work, and its tough, profane, hard-drinking denizens might reasonably have been judged as beyond salvation. Yet initial sermons—passionate orations delivered in crude log buildings serving as unembellished churches—began drawing folks from all over, especially after word spread about the extraordinary physical reactions among attendees. Some observers then and now have attributed the attraction of these services to the irresistible desire of lonely pioneers to seek out social occasions, whatever their purpose. Leaving aside speculations about their motivation, the number of people attending the sermons grew so steadily that they finally resorted to congregating at large camp meetings, an old idea that found new life as remarkable things began to happen. Organized as multidenominational events in Kentucky by ministers such as Presbyterians James McGreevy and Barton W. Stone, camp meetings rapidly spread as a method of religious revivalism. They took place in woods and clearings, usually near streams that provided water, and attracted settlers from both near and far, some traveling for days to the event and remaining for days to hear preachers exhort the faithful, extol the blessed, condemn the profligate, and save the willing. Services occurred virtually nonstop, several preachers bellowing at the same time just out of earshot of each other. Darkness did not stop them, and only the flicker of bonfires and pine resin torches broke the otherwise impenetrable night of the deep woods. Some of the men drank liquor, of course, and the doings of some young men and women in distant shadows were decidedly more physical than spiritual. Yet even cynics who came to scoff at these events were often swept up in the contagion of them. The swaying crowds, the fatigue caused by long travel and little sleep, the eerie shadows thrown by the fires and guttering torches made for an evocative scene. Pioneers were not used to crowds, and they were certainly not accustomed to late nights. Sooner or later, for reasons that are not at all clear, something would snap, and the tension of the meeting would erupt into frightening, bizarre displays of emotionalism. Burly men sobbed uncontrollably, women barked like dogs, children rolled violently on the ground; people broke into frenzied dances, spasmodically jerked their arms and legs, and spoke in unintelligible tongues. Some even injured themselves in free falling exercises or banged their bloodied heads against trees (Heidler and Heidler 2004, 134–35).

In 1801, Barton Stone was the moving force behind the most stunning camp meeting revival of the period. It took place in the second week of August in

Bourbon County, Kentucky, at a place called Cane Ridge, some seven miles from the community of Paris. The event attracted a phenomenal number of people. By some estimates, as many as 20,000 souls came to Cane Ridge, and there were possibly more who drifted in and out over the course of the meeting, making it briefly one the most populated places in the United States. "From Friday until the following Thursday, night and day without intermission," there were people "engaged in some religious act of worship." Generating a sound like Niagara Falls, the crowd shouted, barked, and jerked for six days while listening to continuous sermons, sometimes as many as seven occurring at once. On occasion, hundreds of people were simultaneously struck by the falling exercise, dropping to the ground as though felled by artillery, "like men slain in a mighty battle." They rose up, though, and, after it was over, continued to feel the intense glow of the experience, enlarging Methodist, Baptist, and Presbyterian congregations or forming new sects such as the Christian Church or the Disciples of Christ. Some joined the Shakers (Heidler and Heidler 2004, 135–36) (Nye 1960, 218) (Cartwright 1856, 38) (McNemar 1808, 25).

The growth of evangelical denominations such as the Baptists and Methodists, actually to outstrip older groups like the Congregationalists and Episcopalians, was instrumental in the growing democratization of society and politics at the close of the early Republic and the start of the Jacksonian period. The years after 1820 saw emotional revivals spread eastward, and upstate New York experienced such an extended period of religious commotion that it was dubbed the "burned-over district" and became the seedbed for new faiths such as the Church of Jesus Christ of the Latter-Day Saints, popularly known as Mormons, and Adventists, who believed in the looming end of the world to coincide with the return of Christ. By then, the revival was firmly embedded in the practices and rituals of American evangelism, a fact forged by the astonishing and unexpected events that had swept across the frontier in the first years of the century (Heidler and Heidler 2004, 135–36).

WORSHIP

Urban churches during the colonial period essentially copied the architectural designs prevailing in England, and those structures naturally remained in place after the Revolution. New construction in the years that followed, however, consciously sought to break with British influences and establish a unique American style. The period's general architecture is often called Federalist, to match the dominant political culture of the day, and though it bore distinctive American characteristics, it was actually derivative of Georgian architecture then dominant in England. Church architecture thus mirrored this trend, and not until the later decades of the nineteenth century did it become a distinctive American style with the appearance of neo-Gothic designs.

In new settlements on the frontier and in established but remote rural areas, church construction tended to be quite simple and often produced nothing more than a log meetinghouse with crude benches and a plain raised platform for the preacher. Sometimes, the church was simply a clearing where wagons could be drawn so that their occupants could listen to a sermon delivered from a tree stump (Heidler and Heidler 2004, 136).

Sermons and Services

In established eastern churches, the patterns of worship were staid and traditional. Christian church services took place on Sundays, and the congregation was expected to dress formally for the event. Even the lower classes reserved special clothes, nicer than ordinary attire, to wear while attending worship services. In the early years of the period, indigent or unsupervised children might be rounded up in certain cities to attend Sunday schools, a facet of church life that went through distinct phases (Heidler and Heidler 2004, 136).

The eastern Protestant denominations had always been intellectual centers and continued to be during the early Republic. In 1800 Congregationalists and Presbyterians still held considerable sway with about half the congregations in the entire country and with a long tradition of establishing colleges to educate their clergy. College-educated ministers sermonized weekly on both spiritual and temporal matters and did not hesitate to illuminate current events with the light of religious thought. In Congregational and Presbyterian churches, that thought centered on the belief that Adam in the garden had damned all men and women with his original sin, the Passion of Christ had atoned for mankind's sins, and only the elect who had been born again would see heaven, regardless of their good works or adherence to the sacraments (Heidler and Heidler 2004, 136–37).

Frontier Methodism

On the frontier, traditional and established denominations encountered a different environment of worldly concerns. Toughened pioneers rejected church hierarchies just as ardently as they scorned political ones. Formal modes of worship in fancy clothes were unlikely, and the intellectualism of refined eastern pulpits was regarded as both irrelevant and pretentious. Instead, most pioneers relied on the circuit rider, frequently a Methodist minister instantly recognizable by his clothing: a broad-brimmed hat, prominent collar, and dusty, long coat. He rode a circuit that covered a hundred miles to visit remote cabins and preach the Bible through John Wesley's explanations. His scattered flock accepted him precisely because he had not been to college. Instead, he was an alumnus of the school of hard knocks, steeped in useful, relevant knowledge about life rather than esoteric theories from books, and as familiar with the physical territories of his journey as he was with the people who eagerly awaited his arrival. In spite of its simple trappings and the unpredictability imposed by a wilderness setting, circuit riding was neither disorganized nor haphazard. The preacher rode his circuit for four years, during which he held services every single day, two on Saturdays and Sundays, and was expected to be on time for them with clocklike reliability. His sermons were not the sober, contemplative discourses of eastern churches but were stirring declamations in ordinary language that vividly portrayed the horrors of damnation and the splendors of deliverance (Heidler and Heidler 2004, 137) (Burns 1982, 494–501).

Frontier Baptists

More informal than even the Methodists, the Baptist frontier preacher was frequently a local resident whose qualification for the pulpit was simply "the call" from the Lord. That condition made him competent in the eyes of his church to spread the Gospel after the Council of Brethren had duly assessed him and had conferred ordination through prayer. These farmer-preachers continued to till, sow, and harvest their fields because they received no salary from the church. They could move with congregations or, wanting one, seek it out in unchurched regions. They posed no financial burden on the church, and their guidance from regional associations was minimal (Heidler and Heidler 2004, 137).

Baptists primarily differed with Methodists about total immersion in baptism, but the frontier also saw lively theological debates over issues such as predestination, free will, and original sin. Methodist circuit riders occasionally conducted services for Baptist congregations, but Baptists remained vigilant against the chance that such intermittent contact with believers in "infant sprinkling" might contaminate their congregations (Heidler and Heidler 2004, 137) (Ahlstrom 1972, 444).

Living and Dying

The goal of salvation was central to the cycle of birth, life, and death in the Judeo-Christian culture of the early Republic. Adhering to the early Roman Catholic belief that only the baptized were in the community of Christendom and that even innocent souls dying unbaptized could not enter heaven, infant baptism was the custom of Roman Catholics and most Protestant churches. For Protestants, however, it was more a ceremony establishing the covenant between the individual and God than a ritual relating to sin and salvation. In the Protestant church, Baptists were unique in rejecting infant baptism, holding to the belief that it derived from no biblical authority. Further, Baptists insisted that only adults could be guilty of sin and only adults could understand the significance of the baptismal experience. Baptists also refused to baptize by affusion (sprinkling water) but insisted on total immersion to emulate the experience of Jesus at the hands of John the Baptist (Heidler and Heidler 2004, 137–38).

Explaining death and instilling confidence that it impinges only on the body, not the soul, is a key function of all theologies. Funeral practices are intimately tied to religious beliefs about the meaning of life and the reality of an afterlife and as rituals serve a vital psychological purpose for the bereaved. Dressing and preparing the corpse, offering the opportunity for family and friends to view the remains, holding a wake, participating in processions, crafting eulogies, joining in prayer, and tolling church bells were ways to celebrate life as much as mourn death. For Americans in the early Republic, death from accident and especially from disease was a pervasive likelihood, and the commemoration of life with assurance of salvation was a central part of their daily lives (Heidler and Heidler 2004, 138).

Charity

The birth of new denominations and the strengthening of others was not the only feature of the Second Great Awakening, for within this increased variation of faith there was also a reaffirmed commonality of basic theology that eroded differences in the Protestant community. Unlike the original Great Awakening, which had focused on fixing belief in predestination and human corruption, the Second Great Awakening preached a message of universal deliverance and in many cases even the essential goodness of people as demonstrated in their good works. The buoyant idea encouraged missionary work, educational endeavors, and reform movements that campaigned for temperance and against vices such as gambling (Heidler and Heidler 2004, 138).

Although working outside the home was socially unacceptable for married mothers, charity work offered women an outlet because such activity was seen to complement their role as nurturers. Just as women tended to be more prone to conversion experiences during the Second Great Awakening and tended to outnumber men at camp meetings and church services, so they took the lead in organizing church projects to aid the poor, such as collecting and distributing food and clothing. They were also responsible in the early nineteenth century for establishing the first Sunday schools, institutions designed to teach poor children how to read and write through religious instruction. In charity work, women performed as "republican mothers" for those women who were too poor or ignorant to take on that role themselves (Heidler and Heidler 2004, 138–39).

The American Board of Commissioners for Foreign Missions was founded by the Congregationalists in 1810 and attracted the backing of Presbyterians as well. Nondenominational groups included the American Education Society, founded in 1815 and the American Sunday School Union, founded in 1817, which formed the basis for a network of generous charitable institutions that crossed religious lines by including a variety of religious leaders. Beginning in 1816, the American Bible Society undertook the task of providing translations of the Bible to all peoples of the world, frequently at no cost and always unadorned by commentary (Heidler and Heidler 2004, 139).

Temperance

The pervasive problem of inebriation was an early target of reform. As a result of custom and to take the edge off daily routines that were both demanding and tedious, American men and women drank spirits as a matter of course. Festive events such as weddings and somber ones like funerals saw excessive drinking and sometimes devolved into fracases. The aftereffects of strong drink kept workers at home on Fridays and Mondays, and drunken fathers were apt to mistreat their children and abuse their wives. In what would amount to a long campaign against hard liquor, temperance societies sprang up in New York in 1808, Massachusetts in 1813, and

Connecticut in 1813, leading to the formation in 1826 of the American Society for the Promotion of Temperance in Boston, which a decade later had a million members on its rolls. Frequently led by women, these moral reform movements helped to elevate their status as social and moral arbiters (Heidler and Heidler 2004, 139).

Sunday Schools

First established in the United States in the 1790s, Sunday schools emulated British efforts to expose impoverished child workers to a basic education, using the only day free of labor those children enjoyed. In America, such schools began appearing in larger eastern cities and emergent factory towns, especially in New England, where children received Bible-based instruction in the three Rs of reading, writing, and 'rithmetic. At its outset, the enterprise was unique in that it broke with a tradition of spiritual instruction for children that emphasized religion over attaining even rudimentary skills, a practice that dated from colonial times. Instead, early Sunday schools focused on literacy as much as spiritual teaching, convinced that good citizenship depended on turning children into responsible educated adults. Before the appearance of these Sunday schools, unsupervised children tended to gather on Sundays to engage in raucous play that frequently led to mischief. Sensing a developing social problem, education-minded reformers established Sunday schools both to take these rowdy children off the streets and to impart to them at least some proficiency in reading and writing. In this form, the Sunday school enjoyed a mixed success at best, and had it not been transformed by the advent of revivalism, the institution might not have survived its early structure and purpose. In addition, in urban areas the beginning of public schools that functioned as regular weekday educational institutions reduced and ultimately eliminated the need for Sunday schools in that role (Heidler and Heidler 2004, 139–40).

Under the influence of the Second Great Awakening and the sustained evangelical zeal it inspired, the concept of Sunday schools gradually changed in the first years of the nineteenth century to make them primarily a tool of religious instruction. Correspondingly, the rapid expansion of these schools led the evangelical movement to formalize them as an integral part of Protestant religious custom, adapting the content of lessons as well as pedagogy to the renewed importance of spiritual development. In this fashion, the Sunday school became an extension of church activity rather than a philanthropic gesture to promote primary education. In that regard, the Sunday school became a melding of charitable impulse and evangelical purpose, a design both to uplift the children of the church and to sustain them as Christian citizens of a virtuous republic (Heidler and Heidler 2004, 140).

Colleges

Continuing the colonial tradition, higher education was intimately tied to religion during the period, and the Second Great Awakening encouraged in ensuing years the establishment of denominationally sponsored liberal arts colleges throughout the South and West. Their primary function was to educate young men for the ministry, and their curricula replicated the traditional course of study for that purpose.

Latin, Greek, mathematics, and moral philosophy not only formed the curricular core; those studies frequently formed the whole of the educational experience at these new, rough outposts of learning (Heidler and Heidler 2004, 140).

In the East, however, many of the colleges that had been founded during the colonial period as training grounds for clergy from various denominations moved away from church sponsorship and instead became schools where wealthy young men could acquire some finish. These developments shocked and dismayed the clergy, who worried that young college men no longer "made any pretensions to piety," and that in these universities "the name of God is blasphemed, the Bible denounced, the Sabbath profaned, the public worship of God is neglected." Still, American belief that knowledge and virtue were tied together kept colleges and universities at the top of many people's list for charitable giving (Heidler and Heidler 2004, 140) (Nye 1960, 205).

Beyond the Mainstream

Many people during the early Republic lived differently from ordinary Americans. In most cases, as when cultural differences dictated a different lifestyle, they did so by choice. Indians, immigrants from other countries, and pioneers who chose to leave established settlements for the frontiers are examples of those who deliberately took paths that diverged from the conventional. In other instances, however, people fell out of the mainstream involuntarily. African American slaves especially exhibit that unfortunate circumstance. Criminals obviously chose the way of misfit, but society leveled compulsory punishments that ranged from incarceration to death. In short, a significant number of Americans lived differently from their fellow countrymen, attesting to the fact that long before it was fashionable to admonish it to be, America was a place of diversity (Heidler and Heidler 2004, 143).

DEATH

Dying was as social as it was somber in the early Republic. Embracing the belief that a person should never be alone during the last stages of a terminal illness, family and neighbors took turns sitting at the deathbed, especially at night. In rural areas, neighbors traditionally came to "watch the night" with a dying person, and consequently most deaths occurred at home with the failing person surrounded by loved ones (Heidler and Heidler 2004, 47).

Wakes and Funerals

A tolling church or courthouse bell announced a person's death if near a town. Nine peals signaled the passing of an adult male, six an adult female, and three a child, followed by one toll for each year of the person's age. By the time the bell was ringing, family members would be preparing the body for burial by bathing the corpse, dressing the hair, and finally covering the body in a burial shroud. Women usually prepared bodies for burial, even those of deceased men. In cities, certain women performed burial preparations for pay, making them the forerunners of modern funeral directors. Embalming was not practiced during the early Republic, and therefore the funeral had to be conducted fairly quickly after death, especially during the summer months. During the colonial period, some people were hastily buried by simply wrapping them in cloth and placing them in the ground. Americans of the early Republic, however, were typically buried in wooden coffins that were usually custom made (Heidler and Heidler 2004, 47).

A wake was customary, the open coffin sitting in the parlor or front room of the house to allow family and neighbors to pay their respects. Before the growing influence of the temperance movement, alcohol was served to the men during the wake. The house itself was considerably altered for the occasion. Mirrors were covered with a white cloth, and furniture was moved into the public areas to accommodate guests. The funeral service was conducted in the house, and afterward the coffin was sealed and shouldered by pallbearers to a wagon for conveying it to the graveyard; everyone else walked behind. In frontier areas far removed from church graveyards and on plantations with family burial plots, the person would be buried on the property. Slaves, too, were buried on the grounds of the home in a separate slave burial ground. They usually conducted their own services, though the owner and his family might attend. These ceremonies usually occurred just before nightfall (Heidler and Heidler 2004, 47–48).

Most people who attended funerals did not wear black, as became the custom in the later Victorian era. If they could afford a special mourning outfit, close family members wore black, and widows were expected to wear black for at least six months after their husband's funeral. Many women widowed in old age wore black for the rest of their lives. Male mourners wore a black armband.

If the deceased owned a home and property, community leaders or the local court appointed three reputable men to list the household's effects and other property for probate. Probate records are still valuable sources to enhance our understanding of the material culture of the early Republic because these appointed agents recorded everything from each teaspoon in the house to the smallest tool in the barn. The list was then presented to the court, which distributed possessions and property in accordance with the deceased's last will and testament or, if no will existed, according to state law (Heidler and Heidler 2004, 48).

Social Life

INDIANS

Most Indians east of the Mississippi River during the early Republic lived in permanent towns and villages where daily routines stemmed from a primarily sedentary, agricultural existence. Considerable intermarriage between Indian women and white traders did not change the fact that most Indians still lived apart from European American communities. Yet frequent contact with white society, especially through trade, changed Indian culture in the years following the early colonial period. White trade goods such as cloth, metal pots, hatchets, hoe blades, and guns lessened the effort necessary to produce food and sustain shelter, but they also created a creeping dependency. Each generation suffered a gradual erosion of basic knowledge about how to make the items essential to sustain their traditional culture. White society eventually possessed the means through dependence to force ever larger land cessions from Indian tribes. Daily life became easier in some ways, but the heritage of Indian existence as marked in their birthright of land steadily diminished. To many Indians, the land was their "life and breath" (Heidler and Heidler 2004, 143–44) (Braund 1993, 175).

Farming and Hunting

Despite their use of labor-saving devices and manufactured goods, those Indian cultures persistently clung to their customs. While they produced most of their food by farming, their agricultural techniques remained the same as before contact with Europeans. For instance, women did most Indian farming, with the exception of clearing fields. In Iroquois, Creek, and Cherokee cultures, women owned their fields and passed them down to their daughters, reflecting the matrilineal structure of those Indian cultures. (Lodgings also belonged to women.) In the spring, the women of a town spent most of their time preparing the fields and planting the season's crops with seeds saved from the previous year's harvest. Although some crops were exclusive to different regions, corn was the mainstay of virtually all Indian nutrition. Various beans, squash, and pumpkins supplemented their diets. Women spent much of the growing season tending their plants while minding children, keeping house, making clothes, and preparing food. In the fall, they worked together to bring in the harvest and preserve food for the winter. Corn was parched to be eaten later or to be pounded into meal for bread or mush. Beans were dried (Heidler and Heidler 2004, 144).

Men spent much of their time in activities that largely centered on providing food as well. Indians acquired most meat by hunting, and animal hides and furs served as the primary goods to barter with whites for manufactured items. To supply their towns with meat as well as an adequate number of hides to trade with whites, Indian men often had to range great distances from home. The most important long-distance hunts occurred in the fall and winter for southern Indians and in the late summer or early fall for northern tribes. By the period of the early Republic, untrammeled hunting had depleted many traditional Indian hunting grounds of game, particularly of deer, whose skins were a prized trading article with whites. Federal Creek agent Benjamin Hawkins reported in 1799 that some hunters "have returned from hunting without any skins and I have heard from one town who have not killed fifty." Declining resources and far-ranging hunting parties made for conflict with other Indian tribes who were vying for the same food supplies, and sometimes the result could mean war. Moreover, dwindling resources meant that by the early nineteenth century, Indians were finding it increasingly difficult to support their families. Southern Indians, particularly the Creeks and Seminoles, sought to ease the problem of decreasing game by adopting white cattle-herding practices with European breeds. The temperate climate and large expanses of open land favored such husbandry, and these Indians became particularly adept at raising cattle. Tending herds became one of the primary responsibilities of a town's men and boys (Heidler and Heidler 2004, 144–45) (Braund 1993, 178).

Games

In addition to hunting and husbandry, men might help wives and daughters prepare fields for planting, especially if clearing were necessary. Otherwise, they built the town's buildings, carried out heavy repairs, sat in governing councils, and served as warriors in times of conflict. Among the Creeks, a particularly numerous linguistic group, warriors often outnumbered the standing army of the United States. To hone war-making skills, Indian boys and men spent much time playing violent ball games. In existence long before Europeans arrived in America, these extremely rigorous games served as important rituals as well as practical exercises. In the North the Iroquois played the game that was the predecessor of modern lacrosse. It was played primarily during the harvest season. A team of approximately 15 to 20 members, each wielding a staff with a small basket at the end, tried to deposit a deerskin ball in a goal guarded by the opponent. The contest featured a good deal of physical contact, including the use of the sticks as cudgels.

In the South, Creeks and Cherokees played a similar game. A match between two towns included large wagers that could make or break a town's economy for the coming year. Perhaps more important than material considerations, a town's honor and prestige often rested on the outcome of a match. The night before the game was filled with religious ceremonies and dancing that resembled rites preceding a war. In the Creek and Cherokee ball game—"stickball," as it was called by whites—two posts made of stripped trees sat about 10 feet apart at each end of a three- to four-acre field. Teams tried to knock a small deerskin ball through these goals. Players carried two sticks similar to those used by Iroquois but shorter, with small leather baskets on the ends to catch the ball. As in the Iroquois game, the sticks were also used as clubs. The ball carrier ran it down the field to toss through the goalposts while opposing players could use any tactic to stop him and his teammates. Injuries abounded during a typical contest, which ended only when a team scored 12 goals. For evenly matched teams, a game could take all day. Most Indian groups staged these ritual ball games between towns of the same tribe or confederation, though there were instances of Creek towns challenging Cherokee towns. Within a particular confederation, such as the Creeks', contests determined status for individual warriors and their towns (Heidler and Heidler 2004, 145).

Matrilineal Clans

The importance of a town's clans and its place within the governing structure of the confederation primarily established its status. Within the town, the clan determined a person's place in everything from social status to marital opportunities. Matrilineal societies sustained clans through their females. Property such as houses or fields descended to daughters from the mother, and though rank for males and females was a function of her standing, the actual practices attendant to matrilineal descent could be quite complicated. For example, a male's inherited titles or positions came from his mother's side of the family. That meant that his standing came from his maternal uncles rather than from his father. Correspondingly, important positions held by his father came to him through his father's mother and were passed on to his father's sisters' sons. Once a boy came of age and began his training for hunting and as a warrior, maternal uncles conducted much of his education. Girls, whether in a matrilineal or patriarchal structure, learned at the hands of their mothers (Heidler and Heidler 2004, 145–46).

Towns

When not tending crops, most girls and their mothers spent their time in the town. Indian towns east of the Mississippi River were situated near flowing bodies of water on defensible ground. Many had been in the same location for decades or even centuries by the time of the early Republic. Beyond this generality, all similarities from region to region ended. The architecture and layout of Indian towns varied not only for different locales but for different tribes as well. In the North, the six nations of the Iroquois (the Oneida, Cayuga, Seneca, Onondaga, Mohawk, and Tuscarora) typically constructed fortified towns surrounded by log palisades. Iroquois men built platforms behind the palisades for defenders to stand on while shooting attackers. By the early Republic, Iroquois numbers within the United States were greatly diminished, a result of many Iroquois siding with the British during the Revolutionary War. Those who had not fled to Canada still clung to traditional ways, however, including the plans of their towns and the style of buildings in them. Some Iroquois who had married whites or lived near them began to build houses much like those of their white neighbors, but those of the old towns continued to construct the traditional building called the longhouse. These structures, sometimes as much as 100 feet long, consisted of a long central hall from which numerous rooms extended that served as living quarters for individual families. Each town also had storage buildings for food and other essentials and a large meeting hall for important gatherings and celebrations.

In the South, extended families of the Creeks, Cherokees, Seminoles, Chickasaws, and Choctaws—groups that whites had dubbed the Five Civilized Tribes—lived in individual wattle-and-daub houses. These structures were framed with small trees and limbs and covered with mud or clay mixed with straw (daub). By the early Republic, many southern Indians had begun building log cabins and framed houses with mud or stone chimneys. The changing architecture did not, however, alter their traditional ceremonies and festivities, including the placing of a ceremonial structure in the center of town (Heidler and Heidler 2004, 146).

Similar to all cultures, Native American society revolved around rituals and ceremonies. Because the town's survival depended on a good yield of crops, the most important festival coincided with the earliest harvest. For Creeks, this was the Green Corn Ceremony, aptly named because it occurred when the earliest corn was ready for collecting. In honor of this significant event, the town was thoroughly cleaned, and a new fire was started in its ceremonial center. The town then enjoyed a week of celebrations and games. In anticipation of a celebratory banquet, people not only fasted but also purified their bodies by taking a powerful emetic known as the Black Drink. Thus cleansed, the people of the town shared a grand feast (Heidler and Heidler 2004, 146–47).

Like people of all cultures, Indians conducted particular rituals attendant to the death of any of their members. Some groups, like the Creeks, buried their dead, though generally in a sitting rather than prone position, and usually put items with the body that the person had owned in life. Perhaps the Choctaws had some of the most elaborate death rituals. The deceased was placed on a platform in the open for a number of days until the flesh was "putrid, so as easily to part from the bones." A group of specially trained Choctaws then stripped the flesh from the bones, which were then "deposited in the bone-house." When the bone-house was full, relatives of the dead took its contents out of the village and in a solemn ceremony covered the bones over with dirt, creating an earthen mound (Heidler and Heidler 2004, 147) (Rae 1996, 531).

Troubled People

During the early Republic, Indians east of the Mississippi witnessed profound and troubling changes that would have a direct impact on their daily lives. The end of the American Revolution removed British-imposed restrictions on western migrations of whites, and settlers poured into the regions that would become the new states of Kentucky, Tennessee, and Ohio. As these pioneers encroached on Indian lands, trespassed on Indian cornfields, and killed game in Indian hunting grounds, Indians retaliated. The years between the American Revolution and the War of 1812 saw wars on the frontier between settlers and Indians that gradually changed everything for the land's original inhabitants. Some Native Americans in both the North and South deemed that Indian unity might stem the seemingly endless and irresistible tide of white settlement, and they sought to strengthen existing confederations or organize new and more broadly conceived ones. Creeks in the South and the great Shawnee warrior Tecumseh in the North were the most determined, but ultimately both were defeated. Tecumseh fell in the War of 1812, and the Creeks suffered a crushing loss to Major General Andrew Jackson, who forced them to sign the Treaty of Fort Jackson, a coercive arrangement that ceded 23 million acres of their land to the United States. The wholesale defeat of Indians during the War of 1812, in fact, opened the floodgates to white settlement in the West while providing the government with the way to separate Native Americans from their lands. The result was the removal policy that relocated most eastern Indians to areas west of the Mississippi during the 1830s (Heidler and Heidler 2004, 147).

AFRICAN AMERICAN SLAVES

Spreading migrations that expanded tobacco and cotton increased the demand for slavery while changing its demographics. Under provisions agreed to at the Constitutional Convention of 1787, Congress could not prohibit the foreign slave trade any earlier than January 1, 1808, if it chose to do so. Thereafter, an increasing need for slaves was met mostly through natural increase, but also through illegal trade. Between 1808 and 1820, probably more than 15,000 slaves were smuggled into the South. Meanwhile, a domestic slave trade transferred slaves from plantations in declining agricultural areas of the East to sell them to the newly settled, burgeoning plantations of the Old Southwest (Heidler and Heidler 2004, 147–48).

Under the demand of these labor-hungry regions, the price of slaves rose steadily during the period, particularly for young and healthy men. In 1800, a young black man's average price was about $500; 20 years later that price had doubled. Almost everyone regarded the slave trader with contempt, but his activity was abided nonetheless. It was a disagreeable necessity, went the reasoning among those in the East who had more slaves than their limited or depleted lands needed. In law and custom the slaveholder had complete power and authority to do with his "chattel property"—slaves—as he saw fit. No laws prevented him from separating husbands and wives, or selling children if need be. While many planters faced with bankruptcy ultimately put aside their normal revulsion against the family heartbreaks that slave trading caused, many others would not tolerate it and were careful to direct in their wills that their slave families be kept together. Once in the hands of traders, however, slave families were at the mercy of the market.

American prohibitions against the international slave trade took effect in 1808, but before that, between 1790 and 1808, the international slave trade flourished, and the lives of some of those eventually bound for slavery in the United States included its horrors (Heidler and Heidler 2004, 148).

The Slave Trade

Most Africans brought to the United States came from the agricultural areas of West Africa, meaning that they had spent most of their lives planting, cultivating, and harvesting crops. How they fell into slavery varied, but by the 1790s almost all either were prisoners of African tribal wars or had been captured by fellow Africans specifically to be sold into slavery. These captives' journey to the coast for sale to white traders was only the first stage of a prolonged, ghastly ordeal. Their hands bound and their feet hobbled, they were formed into lines and tied together to walk for days to the coast, receiving little food and water as they did so. After they reached the ocean, a slave-trading ship captain selected them, branded them with his mark, and loaded them aboard his ship. Thus began the infamous Middle Passage of the transatlantic slave trade. Chained together, slaves lay prone in rows in the cargo hold, "frequently stowed so close, as to admit no other posture than lying on their sides." Only allowed above decks for short periods, they spent the bulk of the voyage wallowing in urine, feces, and vomit, breathing fetid air, and subsisting on a mean diet. It is, in fact, only surprising that more did not die. Some were driven to suicide by the horrors of the voyage. An appalling 15 to 20 percent perished in the Middle Passage. Most of these desolate people were imported to the Caribbean sugar islands and Latin America rather than the United States. Over four centuries of the Middle Passage only about five percent of the slaves exported from Africa came to the British North American colonies or the United States (Heidler and Heidler 2004, 148–49) (Rae 1996, 35).

American Slavery

Slaves born in America were the products of over a century of acculturation and adaptation between Americans of African, European, and Native American descent. As a result, the cultural context of their daily lives bore influences from all these traditions. By far, however, the overriding feature of their existence was the fact that they were slaves by force of law. It bears remembering that while their lives, like those of most Americans, revolved around work, they worked completely for the benefit of someone else.

Most slaves worked on small farms or middling plantations. On small farms they lived with the farmer or in a separate shelter on larger concerns. They lived near the main house in slave quarters, log or clapboard cabins that could be marginally comfortable or barely livable, depending on the plantation. The "quarter" was usually arranged along a dirt lane, sometimes colloquially called "the street." On large plantations, an overseer, the planter's factotum, supervised daily activities with the help of assistants or drivers, specially chosen slaves who supervised the gangs in their specific tasks each day. Slaves working on a small farm were less specific in their labor and performed many different tasks on a daily basis. Work commenced at first light, stopped for a long midday lunch of corn bread and occasionally salt pork to avoid labor in the hottest part of the day, and then continued until dusk. In addition to the proficiency necessary to plant, cultivate, and harvest crops, slaves could acquire special skills to become talented brick masons, blacksmiths, carpenters, or seamstresses and enhance the self-sufficiency of the farm or plantation and be hired out to farmers and others needing such skills. During the growing season, most slaves worked hoeing grass and weeds away from crops. Women were often employed at spinning thread or yarn and weaving cloth, especially during rainy periods when they could not work in the fields. In any case, slaves who did not labor in the fields worked long days as well. House servants rose long before their masters to light kitchen fires, cook breakfast for the household, iron clothes, help the master and mistress dress for the day, or begin another round of endless housecleaning. Most plantations did not have hundreds of slaves, and one or two people performed most of these duties (Heidler and Heidler 2004, 149).

Slave families consisted of about the same number of children on average as white families, but slave women probably gave birth to more children in their lifetimes than the average white woman did. Roughly one in three slave children died before the age of two, an appalling infant mortality rate even for a time when all children were vulnerable to disease. Slaves, however, suffered under especially taxing conditions that featured poor prenatal care and nutrition and work schedules that kept mothers in the fields and away from breast-feeding responsibilities. Even erratic feedings could do harm as slave infants suffered from their mother's poor diet, and small children who were too young to work often served at best as marginally neglectful babysitters (Heidler and Heidler 2004, 149–50).

Leisure and Lore

When slaves finished their daily work, they returned to simple lodgings for an evening meal and a few hours with friends and family. With time to prepare rations provided by their owner and vegetables grown in their gardens, slaves could enjoy a more restful and agreeable meal than during the day. The planter supplied the basics for their diet, most often an allotment of salted or cured pork, dried corn or cornmeal, molasses, and salt. Slaves planted gardens with foods that would have been familiar to tables in Africa. Peanuts, yams (called sweet potatoes), and various vegetables grew well in the South and were important sources of nutrition for whites as well as slaves. Slave men supplemented their families' diets by fishing in nearby rivers, streams, and lakes. Southern states had laws prohibiting slaves from owning guns, but owners would sometimes lend shotguns to slaves for hunting.

After the evening meal, slaves visited neighbors in the quarters, watched their children play, listened to stories, and sang and danced. Storytelling was important for slaves, not only as a diversion but also as an oral tradition that preserved their history. In a ritual as old as the fables of Aesop, adults used folktales to teach children important lessons about ethical behavior, some of these stories originating in Africa from the seventeenth century and passing from generation to generation. Considered among the wisest people in the quarters, storytellers wove parables that often followed the exploits of anthropomorphized animals learning life's lessons the hard way.

They told their tales in English, but like everything about slave culture, there were vestiges of African influences. This was especially true on larger plantations, where slaves had less contact with whites and in Low Country and sea island areas of the Carolinas and Georgia where blacks vastly outnumbered whites, lived and worked with little direct contact with whites for much of the year, and had enough new African blood, by way of illegal imports, to inform the African American cultures there and even contribute to the persistence of Gullah and Geechee speech. Yet specific African languages existed only as relics because even those who recalled the old ways of talking found themselves awash in a sea of alien tongues. The wide array of West African languages simply frustrated the emergence of a common, native vernacular. Instead, learning English and integrating it with pidgin variations of their own vocabularies and syntax was the only way for them to communicate within the slave community as well as with the white one (Heidler and Heidler 2004, 150).

Their music also had strong African roots and was an extremely important part of their lives, in both the quarters and the fields. In Africa, people at work passed the time singing verses in the form of chanted declarations and responses. Slaves sang the same type of songs at their work with different words rendered in English but cadenced in the rhythms of Africa. The lyrics of these songs, however, had a distinct

American flavor and often told of "the usage they have received from their Masters and Mistresses in a very satirical stile and manner." African influences also framed dancing done by the slaves during evenings and holidays. Musical instruments such as the banjo, bones, and various drums featured in their compositions also had African origins (Heidler and Heidler 2004, 150–51) (Blassingame 1979, 115).

Faith

Slave funerals were another example of how succeeding generations sustained African customs even after the passing years had clouded their origin. Although it was not a convention in Africa to hold funerals at night—slaves did so partly from necessity because they were often deprived of the necessary time during the workday—they emulated West African practice by dancing and singing in celebration of the deceased's return to a true home. Interment in the slave cemetery included placing belongings on the grave to make the journey home easier (Heidler and Heidler 2004, 151).

By the early Republic, many slaves practiced a Christianity marked by vestigial African influences. For years, slaves on large plantations gathered on Sunday to conduct their own services and to hear sermons by their own preachers. Following revelations about possible slave insurrections, however, the custom of allowing such unsupervised worship fell into disfavor because of white fears that slave gatherings encouraged conspiracies and risked rebellions. Increasingly, planters insisted that white ministers preside over slaves' services or that their slaves attend white churches. During these services in white churches, the ministers often took the time to instruct slaves to "obey your masters and mistresses" so that "your back won't be whipped." Farmers and planters who owned only a small number of slaves especially adopted the practice of taking their slaves to their churches. Whether openly or secretly, however, most slaves continued to hear sermons by black preachers, who often even awed white observers with the "wonderful sympathy between the speaker and the audience." Wherever they worshipped, or if they worshipped at all, afterward most slaves had the balance of Sunday off from work. The exceptions were house servants, whose work of preparing meals and tending to household chores and childcare knew no holiday (Heidler and Heidler 2004, 151) (Blassingame 1979, 131–32).

Other Tasks

In the late fall after the harvest came hog-killing time. Slaughtering was almost as important a time as reaping for the well-being of the farm or plantation. Most of the meat that the master's family and slaves had during the winter would be prepared during hog killing. The largest hogs were chosen for slaughter and killed either with a bullet to the brain or by having their throats slit. They were strung up by their hindquarters and cut open to remove their internal organs, which would be boiled to make them edible for various dishes. After skinning the carcass, slaves cut up the hog to smoke and salt cure, necessary techniques for preserving the meat during the coming year. Plantation slaves were the primary laborers for this lengthy and unpleasant chore, and because nothing went to waste, they received the parts of the hog that whites did not want, such as the intestines. These were cleaned, boiled, and fried to produce what became known as chitterlings or chitlins (Heidler and Heidler 2004, 151).

In addition to hog killing, numerous other tasks needed completing before the planting season. Fences had to be mended, roofs patched, hay baled for livestock fodder during the winter and spring, and tools and plows repaired. These jobs were purposely postponed during the busy growing season for when there would be time during the off months. Thus the only real break from the grind of daily labor came at Christmas. Most slaves received about a week off at Christmas, days filled with extra food and perhaps a bit of spirits to celebrate the season. During this week at the end of the year, they enjoyed music, dancing, and visiting, even with slaves from other plantations. Yet the simplicity of their life was structured around want and deprivation, and nothing illustrated that fact more than the marginal clothing they received as part of their gifts at Christmas. Men were usually given trousers and work shirts, and women either simple dresses or the cloth to make them. Children wore only simple shifts or shirts until they reached working age, and their mothers were given cloth to make these simple garments (Heidler and Heidler 2004, 151–52).

Punishments

Slave misconduct was usually punished by whipping, a bad enough experience, but atrocious cruelties also occurred, such as branding or other forms of mutilation. Even planters who considered themselves humane often resorted to these practices, which to field slaves were almost always meted out by the overseer. Aside from the indignity and deprivation inherent in the system, deliberate mistreatment of slaves was rare. Even the most uncompassionate owner realized that starving slaves or depriving them of clothing and shelter risked causing sickness and death and was economically imprudent. Yet any system that gives individuals absolute power over others will have the potential to promote instances of extreme cruelty. One South Carolina slave owner and his wife beat one of their slaves until his back resembled raw meat and then "applied a pickle of *pepper and salt* to his wounds." "The miserable wretch died a few hours after in the most excruciating tortures" (Heidler and Heidler 2004, 151–52) (Mesick 1922, 135).

Most slaves endured their lot, showing defiance in covert ways, such as working at a slow pace or feigning illness, but others ran away, some in a bid for freedom, some in attempts to return to former owners after being sold in protest of some outrage or loss of privilege. In the wake of the 1790s slave insurrection in Saint Dominique (Haiti) and the barely thwarted 1800 Gabriel Revolt in Richmond, Virginia, whites installed harsh slave codes to stem defiance, snare fugitives, and prevent insurrection. Yet the rules were only marginally effective. Their enforcement in rural areas would have required the constant vigilance of whites. As it happened, regulations that theoretically prohibited slaves from unsupervised or unauthorized travel were honored more in the breach, as slaves moved around quite a bit, especially when owners used them as couriers for long errands or hired them out to work for neighbors.

Some few planters even permitted their slaves to learn to read and write, a direct violation of laws that were designed to prevent the circulation of seditious ideas. The overwhelming majority of slaves, however, remained illiterate. In contrast to other Americans, even the lowly convict, the slave's lot was forlorn and bleak. One hard day was much like the hard days that preceded and followed it. While some had better masters than others in terms of treatment, food, and punishments, their lives were not their own, and their children were condemned to the same wretched state, and as far as they knew, their children's children as well, generation unto generation, forever (Heidler and Heidler 2004, 152–53).

FREE BLACKS

Whether they lived in the North or the South, free African Americans during the early Republic had a status at best marked by ambiguity. As runaway slaves, freed slaves, or descendants of freed slaves, African Americans in the North were typically placed in economically and socially inferior positions. In the South, free African Americans were generally descendants of former slaves who had won freedom either through extraordinary service to their masters or because of an owner's moral qualms about the institution of slavery. In some cases, free African Americans in both the North and the South were descendants of indentured servants from the colonial period who had actually never been slaves. At best, the free black was regarded as a second-class citizen, and more frequently he was viewed not as a citizen at all. The section of the country determined how well he lived (Heidler and Heidler 2004, 153).

The South

The upheaval of the Revolutionary War led to many slaves running away successfully and taking on new identities as free blacks. The tide of antislavery feeling that gripped many southern slave owners following the American Revolution also increased the number of free blacks in the South as altruistic owners manumitted their human property for reasons of conscience or to unload seemingly unprofitable wards. By the early years of the nineteenth century, free blacks made up almost 10 percent of the black population in the South. Yet the surge in manumissions quickly subsided when whites began to fear the influence of free blacks on slaves. Legislatures actually began to make it more difficult for owners to free their slaves. Yet freed slaves and other free blacks were uncomfortable reminders both to their brothers still in bondage and to whites that African Americans could succeed in a region that made most of them slaves (Heidler and Heidler 2004, 153).

It was a strangely replicated world. Free blacks lived apart from whites while nevertheless making their livings in much the same way that whites did. White society, however, made it clear that "be their industry ever so great and their conduct ever so correct, whatever property they may acquire or whatever respect we may feel for their character, we could never consent, and they could never hope to see . . . their descendants visit our houses, form part of our circle of acquaintances, marry into our families, or participate in public honours or employment." The attitude persisted and took greater hold in the 1820s and 1830s, the period ironically lauded as that of Jacksonian Democracy, when white men enjoyed an expansion of political rights while disenfranchising free black men in states like North Carolina and Tennessee where they earlier had the vote (Heidler and Heidler 2004, 153–54) (Berlin 1974, 187–88).

Some whites would have preferred that no free blacks live in the slave South, but in some instances, their presence was economically indispensable. They performed tasks that even the poorest whites considered beneath them, and they provided an extra source of workers that was more cost-effective than slave labor for seasonal jobs. Small landowners could hire free blacks to harvest crops without having to pay their living expenses for the rest of the year. Oystermen, fishermen, and crabbers could hire free blacks to help during their busiest season and afterward send them on their way. In cities, black men recently freed from slavery labored as dockworkers, teamsters, and day laborers while their wives worked as domestic servants for middle-class tradesmen. Descendants of slaves or servants from the colonial period were often artisans or craftsmen, their skills passed down through generations of skilled laborers. In rural areas, particularly in the upper South, many free blacks were small farmers who were descended from slaves or servants who had acquired land during the colonial period. They went about their daily lives in much the same way as other small farmers.

Whether they were urban workers, craftsmen, or small rural farmers, the daily lives of free blacks in the South might have appeared little different from those of their white neighbors, at least at first glance. Yet differences made subtle by casual observation were quite profound. Free blacks in rural settings had a very limited social circle. In areas where schools for white children were scarce, educating black children was nearly impossible. Only parents who were literate could teach their children to read and write, and such rudiments were the only education their children would receive.

In cities their situation was somewhat better. There, free blacks living in closer proximity to other free blacks and urban slaves had people with whom they could socialize and attend church. Urban free blacks were more successful in establishing churches for their communities as well as schools for their children. Against white opposition that feared any assembly of blacks, whether they were free or slaves, independent black churches were established in southern towns at the beginning of the early Republic. In addition to the African Methodist Episcopal Church, numerous other black denominational churches sprang up in the urban South (Heidler and Heidler 2004, 154).

Some early abolitionists, especially Quakers, established schools for free black children and sometimes set up night schools for free black adults to teach them the rudiments of reading and writing. By the early nineteenth century, free blacks operated most of these urban schools, many times in association with black churches. White fears meant that many of these schools were short-lived. Responding to their limited opportunities for economic upward mobility and the increasing inability to educate their children, many free blacks migrated to northern cities during the first half of the nineteenth century. There were also more compelling reasons to do so. The increasing value of slaves saw unscrupulous whites abducting free blacks and taking them out of state to sell into slavery. The rise of this deplorable practice gave added urgency to northern migrations (Heidler and Heidler 2004, 154–55).

The free blacks who remained were largely those who either practiced a craft or plied a trade that made them familiar in a community and hence difficult to kidnap or those who were simply too poor to relocate. The former continued to live in close-knit black communities of the urban South, while the latter simply scraped by, usually as urban day laborers.

Important exceptions to this pattern were free blacks in Louisiana. Slavery had existed in Louisiana for most of its history, but under French and Spanish rule, attitudes toward race were considerably different from those that would prevail after the United States took possession of the territory in 1803. French and Spanish colonists had frequently come to the region without families and had settled down with black women. These arrangements resulted in a sizable population of mixed-race children whose social and legal status was distinctly different from that of their counterparts in the United States. There, liaisons with slave women were seldom admitted, and their offspring almost never recognized. In French and Spanish Louisiana, however, it was not unusual for white fathers to recognize such children and free them and their mothers. When the United States took possession of Louisiana, there were a large number of free black households descended from these unions.

Most of Louisiana's free blacks of mixed heritage lived in New Orleans, where they formed a separate class of largely middle-class tradesmen and artisans. During French and Spanish rule, some free black families had amassed considerable wealth and property, sometimes including slaves. At the beginning of American administration of Louisiana, about a quarter of the population of New Orleans were the so-called *gens de couleur libre*. Their numbers significantly increased over the next decade as a result of large free black migrations from the Caribbean. With their Catholic and generally French-speaking cultures, the *gens de couleur libre* were a separate caste in the tripartite racial world of the lower Louisiana region. Their culture and status would also separate them from the Protestant-oriented "American" slaves who came into the region after the U.S. annexation (Heidler and Heidler 2004, 155).

French and Spaniards in Louisiana had never treated free blacks as social equals, but they had not imposed serious legal restrictions on them either. American officials and settlers found the fact shocking that free blacks in Louisiana were also a part of the territory's armed militia. Despite such reflexive fears, enlightened territorial officials like Governor William C. C. Claiborne realized the value of having additional men to repel foreign invasions or to put down slave rebellions. The free black militia thus remained in existence throughout the early Republic, with happy results for the United States in its greatest hour of need, when the famous "free men of color" rallied to Andrew Jackson's standard to defend New Orleans from the British at the end of the War of 1812.

Yet Louisiana's territorial legislature could not repress fears that a successful, prosperous free black community provided a dangerous example to the slave population.

The free blacks of New Orleans could educate their children and attend religious services with far fewer restrictions than free blacks of any other southern state, but the legislature enacted laws explicitly defining the status of free blacks as inferior to that of white citizens. Less formal but no less insulting was the expectation that free blacks show extreme deference to whites (Heidler and Heidler 2004, 155–56).

Although the custom was most prevalent in Louisiana, some free blacks throughout the South owned slaves. Most lived in towns and cities, where their slaves toiled in workshops or merchant enterprises. Successful black business owners occasionally made enough money to buy land and in some instances, especially in Louisiana, owned plantations that used slave labor no less industriously than neighboring operations owned and operated by whites. In many instances, black slave owners "owned" members of their own families, whom they had bought to protect them from whites (Heidler and Heidler 2004, 156).

The North

Slavery had existed throughout the North during the colonial period, but it never became as integral to the northern economy as it did to the southern one. Because slaves were far less numerous in the North, social pressure to maintain the system was not as intense, and attitudes that emerged from the American Revolution had more leverage in bringing about slavery's abolition. In fact, reconciling the principles of the Revolution with actual practice led northern legislatures to enact gradual emancipation laws during the 1780s and 1790s (Heidler and Heidler 2004, 156).

The relatively sudden occurrence of northern emancipation created two groups of free blacks. There were those people who had been born free, descendants either of freed slaves or of indentured servants from the colonial period, and there were former slaves who had run away to freedom, especially during the Revolutionary War, and those recently freed by northern statutes. People born into freedom tended to be more comfortable economically than the recently manumitted, and though they typically resided in segregated communities, those communities were usually stable. Fugitives and recently freed slaves, on the other hand, had to scramble for work and settle for makeshift lodgings in a world that reflexively relegated them to the lowest economic and social level. Many fugitives and recently freed slaves were illiterate and could find only the most menial jobs. A sense of black community emerged, though, even in the face of these glaring differences of place and circumstance. The total number of blacks in most northern communities was small, and empathy for the poor among them encouraged the development of solidarity that knew no caste and counted no income (Heidler and Heidler 2004, 156) (Horton 1993, 26).

In the absence of white fears about a combination of free blacks and slaves organizing rebellions, northern cities and towns displayed greater tolerance toward the establishment of black churches and schools. The founding of black churches provided important social as well as religious centers for African Americans. In addition, some regions at first did not have racially segregated education. At the beginning of the early Republic, their relatively unobtrusive numbers meant that some free black children attended school with white children, especially in New England.

Yet as northern manumission increased the number of free blacks, white prejudice also grew. White parents objected to the presence of black children in schoolhouses, and white children predictably responded to the negative attitudes exhibited by their parents by mistreating their black schoolmates. Black parents addressed the growing problem by creating their own schools, a practice that had become standard in most northern communities by the end of the period. Given the relative poverty of blacks, the black schools were almost always inferior to white schools in both instruction and facilities, and free black children often left school no better prepared for the demands of a competitive world than when they had entered. By the 1830s, leaders in northern black communities were calling for an end to school segregation in public schools, but more than a century would pass before the situation changed (Heidler and Heidler 2004, 156–57).

Most black families relied on the work of both parents, and other children, to survive. Men worked in various trades but often found work as day laborers while women worked as domestic servants or remained at home to take in laundry from the white part of town. Most families barely scraped by on their meager earnings, except in the few cases where free blacks found lucrative work as skilled craftsmen (Heidler and Heidler 2004, 157).

The white community rarely treated the most accomplished blacks as equals. The supremely talented mathematician and astronomer Benjamin Banneker, for example, was never accorded the celebrity or acclaim he deserved. By the time he died in 1806, Banneker had shown himself to be one of the country's most accomplished scientists. Like many free blacks of his generation, he was a descendent of an English indentured servant and a freed slave in Maryland, but his accomplishments were anything but typical. A farmer by profession, he was only self-taught in mathematics and mechanical design but nevertheless devised and built an exceptionally reliable clock. He also became proficient in astronomy, primarily by using his extraordinary powers of observation, and began publishing an almanac in the 1790s that featured the movements of planets and the position of stars from his own calculations as well as wide-ranging literary excerpts for the amusement and enlightenment of readers. His mathematical skills made him a valuable member of the surveying commission that laid out the District of Columbia. Banneker was by no means an activist, but neither was he falsely modest. In a celebrated exchange, he challenged Thomas Jefferson's supposition that blacks were mentally inferior. Yet when sending a white friend calculations for astronomical events, he nevertheless felt the need to preface his predictions by asking his reader "to view with an eye of pity. . . . the first attempt of the kind that ever was made in America by a person of my complexion" (Heidler and Heidler 2004, 157–58) (Woodson 1969, xxiii).

Free African Americans during the early Republic might have started the period with a sense of hope born of expectations that the revolutionary rhetoric of freedom and opportunity would extend to them. Especially in the North, where some even fought in the Revolution for the same ideals that white citizens had embraced, the promise seemed realizable. Yet the promise was only partly fulfilled, and the dream was often tragically denied. The Revolution did result in freedom for many slaves in both the North and the South, but this change in legal status did little to improve either their economic or social circumstances. In the lower South, the situation for free blacks so deteriorated during the early Republic that many migrated to the North. There they found their liberty less tenuous, but they still enjoyed few opportunities for advancement and remained firmly lodged at the bottom of the social and economic ladder (Heidler and Heidler 2004, 158).

PIONEERS

Life on the frontier was naturally more difficult than in the more settled parts of the country. The journey itself could be the most arduous part of the experience, as explained by one pioneer when he wrote in his journal that the party "then sailed for Kaintucky. Arove at Limestone the 18th, after 10 days of the fertigueinest time I ever saw." Pioneers found densely forested lands in need of clearing to make them into farms. The frontier had no lumber mills and brickyards, so homes had to be built from materials at hand and by the people who would live in them. All of these demanding chores had to be accomplished before settlers could begin planting crops and establishing stable routines (Heidler and Heidler 2004, 158) (Dick 1964, 21).

Forests to Farms

The most common method of clearing fields involved a protracted process of girdling trees by cutting a ring through the outer layer of bark to produce a wound that gradually killed the tree and made removing its stump easier after it was cut down. Very old trees left enormous logs that had to be moved away before a field could be plowed and planted. Abandoned Indian cornfields were obviously more attractive farmsteads because they allowed one to avoid this tiresome job. Draft animals such as mules, oxen, or horses helped to pull felled trees out of the way. If other settlers lived nearby, the chore became a social occasion called logrolling. Neighbors brought their draft animals to make the work go quicker while women prepared a feast for the party to follow (Heidler and Heidler 2004, 158).

The varying condition of frontier land dictated the type of farming practiced there. It might take years to clear enough land to yield a surplus of crops for sale rather than subsistence. Most frontier farmers had small vegetable patches and exerted most of their effort raising corn. Corn could be used for fodder, mainly for pigs, and ground into meal for the family's bread. When farmers finally cleared enough land to produce a surplus of corn, it could be distilled into whiskey for easy transport to local or distant markets.

Generally, women worked with their husbands to plant and harvest the crops. Children who could walk often pitched in as well. Though frontier farms rarely divided labor between the sexes, certain jobs were the special province of females. Women tended vegetable gardens, fed the animals, cooked, cleaned, and raised the children, chores familiar to farmwives in every section of the country. Men cleared additional fields, repaired tools, for blacksmiths were scarce on the frontier, and hunted. Most men enjoyed hunting, but what was often a sport in eastern rural areas was a necessity on the frontier. Game frequently provided the family's only meat, and a good hunter could not only set his family's table but also have enough additional game meat to trade for other necessities.

Frontier families went to bed earlier than eastern ones. Backbreaking labor encouraged the habit, of course, but the expense of candles and lamp oil did so as well. Twilight sent many families to bed. Before dawn, the wife and older daughters rose to stir the banked fire to life and warm the usually single room of their home. They prepared breakfast, and the long day's labors began anew (Heidler and Heidler 2004, 158–59).

Elbow Room

As more land was cleared and put under cultivation, the western frontier increasingly resembled the rural East. Houses and barns were newer and made from cruder materials; streets of scattered villages were muddy and fewer in number, and they were lined with fewer businesses and contained fewer professionals like doctors and lawyers as their residents. Yet these people aspired to the stability of civilization and the comforts of established, thriving settlements. This desire for stability and even civilization led at least one observer to describe many of these pioneers as a group "possessing remarkable traits of character and manners which are a compound of civilization and barbarism." Other pioneers, however, particularly men, moved to the frontier to escape eastern society. Some of them brought their families, and when another wave of wanderlust overtook them, they simply uprooted and moved them again. When the economy thrived and farm prices rose, they could pocket nice profits for farms with cleared fields and structures, certainly more valuable than uncleared woodland. Some even found the presence of family too constricting and preferred to move out to the frontier or beyond alone. If they settled in one place at all, they cleared only enough land for subsistence. They usually preferred more mobility, hunting for their food and trading with Indians for furs and animal skins (Heidler and Heidler 2004, 158–59) (Dick 1964, 24).

Mountain Men

Immediately preceding the War of 1812, entrepreneurs realized that riches were to be made by cutting into the British monopoly on the Canadian fur trade. The most famous of these men was John Jacob Astor, whose American Fur Company was a short-lived attempt to eliminate the British domination of the fur trade in the Pacific Northwest. Manuel Lisa's Missouri Fur Company cultivated trade with the Indians of the upper Missouri River, depending on a rough breed of frontiersmen to bring in the furs and skins from the Rocky Mountains and the upper plains. These characters were the fabled mountain men whose activities became the stuff of legend on the American frontier.

The mountain man actually spent most of his life well beyond the frontier. He lived in a shadowy, often unmapped region of plains and mountains far from white settlements. Much of the year he was either alone or paired with a temporary partner trading with Indians of the far West, people removed from eastern awareness. The mountain man mainly trapped animals for fur companies, the type of animal depending on the company. Companies that specialized in the upper Missouri trade generally dealt in buffalo robes or skins. Traders hunted buffalo (the American bison), which were still abundant on the upper plains, and traded for their skins with Indian tribes in the region. Mountain men in the Rocky Mountains typically trapped beaver for pelts, which were valuable in the East and in Europe for making men's hats.

Though a mountain man made his living from trapping, he had to be proficient with a gun as well. Defending himself from animals, particularly the aggressive grizzly bear, and the occasionally hostile Indian was an everyday possibility. Indians of the plains and the Rockies traded with these trappers but also naturally saw their presence as a threat and their activities as impinging on vital resources. Sometimes Indians tried to force these intrepid trappers out of a region, and mountain men could be either stubborn or compliant as the case required.

Life for mountain men revolved around the seasons. They usually spent winter in makeshift cabins or among the Indians to be near hunting and trapping regions at the start of spring and then traveled to a company fur trading post. These summer journeys were lengthy in time and distance, but worthwhile because they allowed for the purchase of supplies and whiskey, with perhaps a bit of money left over. In the fall, mountain men took advantage of the hunting season before the harsh winter again forced them into a sort of human hibernation, hoping that they had bagged enough game to sustain them through the long white months. Some were not so lucky and starved to death during particularly severe winters when no game moved through their isolated camps (Heidler and Heidler 2004, 160).

"Hunter and Indian" by Darley, Felix Octavius Carr, 1822–1888, artist. Courtesy of the Library of Congress.

It was a lonesome life, yet mountain men thrived on solitude and wide open spaces. But its days were numbered from the start. During the 1820s, the practice of holding rendezvous in the mountains began so that trappers and company men could exchange goods. The rendezvous was no doubt a welcome break from utter isolation, but that it even became possible was a sign that the wilderness was not as distant and as empty as before. By the end of the early Republic, the romance of the solitary mountain man was all but finished. Some still clung to the lifestyle, but competing with the trapping systems employed by organized companies proved impossible. Most mountain men by the 1820s traveled in large groups, sometimes numbering 50 trappers, and divided their labors for efficiency. Some looked for food, others hunted or trapped, and others maintained the camp and did the cooking. Not only were they more productive in their labors, but these groups could better defend themselves against Indians and rival companies. In addition, the number of traps necessary to procure large numbers of beaver pelts required a sizable investment, and lone trappers could not compete with these company operations. Only those outfitted by the big companies could make a living from trapping and hunting by the 1820s, and by the 1830s and 1840s, this prototypical frontiersman, while not extinct, was finding that changes in the market and the unrestrained trapping of beaver had altered his world. Other pursuits allowed him to remain on the frontier, but that too was steadily changing. He led exploring parties through the Rockies and across western deserts or guided wagon trains to the Pacific Northwest and to California, earning him a living, but one tinged with the irony that his new activities placed him among the very people he had labored so hard to escape (Heidler and Heidler 2004, 161).

IMMIGRANTS

The number of immigrants who came to the United States between 1790 and 1820 was small compared to the tremendous numbers to come in the mid- to late nineteenth century. Yet they became a significant part of the population and had a considerable impact on the country's course and development. Most were hardly indigent, but they shared the same motives for coming to America as later immigrants—to make a better life for themselves and their families and to escape political turmoil or religious persecution in their native lands.

Most immigrants during the early Republic came from northern and western Europe. Though the greatest waves from Ireland and Germany would not come until the 1840s, immigrants traveled from there during these years, as well as from England, France, and other European countries. They sought out the economic opportunities and political freedoms that the United States offered, but they were also running away from hardships in their native countries. Farmers who had divided their lands beyond the point of further division to provide sons with a way to make a living believed that the abundant land in America was the best chance for them to continue the agricultural traditions of their ancestors (Heidler and Heidler 2004, 161).

Many of these people thus came to the United States expecting to maintain as well as improve their way of life. They were to find, though, that while land was plentiful, getting to it and buying it, as well as the tools and livestock needed to work it, was an expensive undertaking. The result was often a dream deferred as a pattern developed that would persist over the next century for immigrants who landed in America's cities and remained there. They took what work was available and struggled to save enough money, their constant hope that one day they could buy a farm (Heidler and Heidler 2004, 161–62).

Germans

The immigration of indentured servants is an important part of the American story in the colonial period, but the practice of selling one's services to pay for one's passage to America continued during the early Republic as well. It was especially prevalent among impoverished Germans, sometimes called redemptioners because someone would have to redeem their services to free them from years of servitude. Their status was legally little better than that of a slave during their indenture, and they were sometimes subjected to unspeakable brutality while being deprived of the necessities of life (Heidler and Heidler 2004, 161–62).

The misfortunes of redemptioners began aboard the ship that brought them to America. During the voyage, they were obligated to the captain of the vessel for their passage, and upon arrival in the United States, he sold them to the highest bidder. Frequently deprived of all but the most negligible food and drink, redemptioners often arrived in the United States quite ill from malnutrition and the close confines of the ship. Children suffered the most on such voyages. One reformer wrote that "the cry of the children for bread was, as I am informed, so great that it would be impossible for man to describe it." Some passengers actually starved to death on the voyage. Others did not complete it for other reasons. In 1805 a captain stopped his ship in Great Britain and sold some male passengers against their will to British army recruiting agents, despite the fact that they were leaving wives and families aboard. An observer who came aboard one of these ships when it arrived in the United States described conditions on board as a "revolting scene of want and misery. The eye involuntarily turned for some relief from the horrible picture of human suffering." German Americans already in the United States, many of them descendants of Germans who had come during the colonial period, formed relief societies to mitigate the suffering of these new German immigrants, but many continued to suffer under abusive masters long after arriving in the United States. Their dreams of quickly saving enough money to buy a farm faded as redemptioners were sold to work as house servants or manual laborers, often under terms that took years to fulfill. Even after years of backbreaking toil and after they had obtained their freedom, they had little more than what they had brought to the United States in the first place, which was often only the clothes on their backs. Many more years would pass before they had the money to buy the tools necessary to work for themselves and begin saving for land (Heidler and Heidler 2004, 161–62) (Moquin 1971, 6) (Mesick 1922, 45).

Irish

Impoverished immigrants from Ireland also suffered terrible hardships. Many Irish came to America during the colonial period, and their letters home to friends and relatives encouraged an almost continuous immigration to America well into the early years of the nineteenth century. A much larger number of Irish immigrants came to the United States in the late 1840s fleeing the great Potato Famine, but they would be inspired to do so by these earlier pilgrims.

More than half of the Irish immigrants of the eighteenth century were the so-called Scots-Irish from the northern part of Ireland in Ulster. Although they were called Scots-Irish, they did not recognize the distinction and simply referred to themselves as Irish. The label, however, derived from the fact that they were descendants of Scot migrants to Ireland. These colonial immigrants were mostly Presbyterian Protestants who had been unable to support families on the poor soil of northern Ireland and unwilling to abide oppressive British land policies. Some reports have as much as half the population of Ulster immigrating to the American colonies during the eighteenth century. Some migration from the Catholic parts of Ireland occurred during the colonial period and would continue after 1790, but Catholics migrated in far smaller numbers and generally not in family groups. Most Irish Catholics who came over before the Potato Famine were single men looking for economic opportunities.

Instead, many Ulster migrants came as families and found few economic opportunities in America's small colonial cities. They consequently traveled as extended families or clans to the colonial backcountry, where they soon became the largest European ethnic group on the American frontier. In fact, by the beginning of the early Republic, people of Irish or Scots-Irish descent made up about 15 percent of the American population. Most lived in the Pennsylvania and southern backcountry in the way most pioneers did, occupying crude log homes, planting corn, and raising pigs. Eastern elites disparaged their primitive lifestyle, but these hardworking people produced some of the country's most important leaders. American presidents Andrew Jackson, James K. Polk, James Buchanan, William McKinley, and Woodrow Wilson were descended from these robust Ulster Irish folk (Heidler and Heidler 2004, 162).

The establishment of an independent United States did not stop Irish immigration. Yet these later arrivals found a changed situation. The chance to find jobs in growing American cities had increased, and the greater distances involved in getting to land on the frontier made it less available. Many of these Irish immigrants had been farmers, but they also possessed other skills that made them valuable in a country short of experienced laborers. Unlike German redemptioners, most Irish immigrants before the Potato Famine paid their own way to the United States and frequently brought savings as well as tools with them. They fled political oppression, particularly after the failed uprising against the British in 1798, and a declining economy that had assailed traditional crafts such as linen making that had earlier sustained a large part of the population. They were skilled artisans whose customers no longer had the money to buy their handiwork, schoolteachers whose pupils could no longer take the time from work to attend schools, physicians who no longer had solvent patients, and business clerks whose businesses had locked their doors and let them go. They saved their money or sold their businesses and came to the United States (Heidler and Heidler 2004, 163–64).

This relatively well-educated group of immigrants, largely from middle-class origins and fleeing what they regarded as British economic and political oppression, was eager to embrace the American experiment in republicanism. Irish males threw themselves into American politics with a will as newspaper editors, pamphlet writers, and political operatives. They often embraced the most radical of republican ideas, were strong supporters of the Jeffersonian view of republican government, and were at least partially responsible for the increasing democratization of American politics at the end of the period.

The Ulster Irish spoke English, though in a very distinct dialect, followed a form of Protestantism already familiar to most Americans, and often plied trades that were much in demand in the United States. Thus, their everyday lives were little different from those of other European Americans. Children attended the same schools as other children, wives performed the same domestic chores as other wives, and husbands engaged in the same types of work as other men, both in rural and urban settings (Heidler and Heidler 2004, 164).

French

French immigrants also came to the United States in large numbers during the 1790s and in the years following the Napoleonic Wars. Immigrants of the 1790s came for a variety of reasons ranging from their admiration for the American experiment to flight from the excesses of the French Revolution. Still another group came as a result of the slave uprising in what would become Haiti (Heidler and Heidler 2004, 164).

French immigrants who fled the French Revolution fell into several groups. In the early days of the Revolution, many were monarchists who feared the empowerment of the French lower classes. People with such fears were unlikely to come to the United States with its philosophy of greater liberties for its citizens, and in fact few of these so-called Royalists did head for America, preferring instead the refuge of European monarchies. Royalists who did come to American did not remain long. Splits among French revolutionaries regarding the best course for France spawned dissent and power struggles that caused another wave of departures from France. As the revolution turned violent, many revolutionaries ran to America rather than risk the Reign of Terror. Generally well educated, these refugees took up the professions they had practiced in France, including journalism, medicine, and the law, and consequently they quickly fit into American society. They also introduced a great deal of French culture to the United States, particularly in food, art, and literature, and entered into the numerous political debates that consumed so much of the American middle and upper classes' time (Heidler and Heidler 2004, 164–65).

Other French immigrants to the United States during the 1790s were refugees from the slave revolt on the island of Saint Dominique. As many as 20,000 French merchants, plantation owners, and families fled to the United States when slaves working the sugarcane fields successfully revolted. Many of these refugees spent only a brief time in the United States before taking passage to France or other French colonies. Most of these émigrés ultimately departed for France or Spanish Louisiana, where they could speak French, acquire cheap land, and resume plantation agriculture under a more congenial government. Yet one group's arrival in 1793 was probably responsible for the transmission of yellow fever to Philadelphia, one of the worst epidemics of that disease in U.S. history.

Another wave of French immigration followed the fall of Napoleon in 1815. When Napoleon was sent into his final exile on the island of St. Helena, many of his followers feared reprisals from the restored Bourbon monarchy. Several hundred of these refugees persuaded Congress to sell them a parcel of 100,000 acres of Alabama land on the Tomblike River for two dollars an acre. The ostensible purpose was to relocate to Alabama on land recently taken from the Creek Indians, transplanting a grape and olive culture in the process, hence the name of the settlement—the Vine and Olive Colony. The settlers who established the town of Demopolis consisted of upper-middle-class supporters of Napoleon, military officers, and their families. Hardly experienced in commercial agriculture, they soon failed at it, and most of them moved back to France after receiving promises of pardons. Those who remained in the United States moved to Louisiana or to Mobile because of their large French Creole populations. In their less than a decade of residence at Demopolis, however, they exerted considerable influence on the culture of the region's newly established planter class. Their dress, food, drink, dances, music, and general joie de vivre (joy of living) made Demopolis one of the most festive places in Alabama as well as the country (Heidler and Heidler 2004, 165).

Wherever they settled, in fact, French immigrants influenced American culture far out of proportion to their actual numbers. The American middle and upper classes associated the French with sophistication and attempted to emulate them whenever possible. New restaurants appearing in American cities consciously copied French recipes and advertised their dishes as the latest in French cuisine. American hairstyles for both men and women changed dramatically with the influx of French refugees in the 1790s. Only older men continued to wear wigs, while the rest tied their hair behind at their necks in simple queues. When men in Napoleonic France stopped wearing the queue and cut their hair short, such became the fashion in the United States. Men's fashions that had adhered to British styles began to incline toward the French in the 1790s. By the early nineteenth century, long pants had replaced knee britches, and men wore beaver hats and high-collared coats. Women also followed the French in matters of dress and hairstyles. In the 1790s, fashionable American women adopted the loose, narrow, high-waisted dresses that presaged what became the Empire (after Napoleon's empire) style of the early nineteenth century. The elaborate coiffures of the eighteenth century gave way to simpler styles worn around the face and cascading down women's shoulders (Heidler and Heidler 2004, 165–66).

Jews

Though a few did immigrate during this period, most Jews in the United States during the early Republic were not recent arrivals, and the largest immigration of Jews into the United States was still a number of decades away. Jews had come to the American colonies as early as the seventeenth century, the first group from the Portuguese colony of Brazil to the Dutch colony of New Netherlands in 1654. These Sephardim (Jews from the Iberian Peninsula) were the first of thousands who found in the New World a refuge from the extreme persecution of the old. Other groups of primarily Sephardic Jews came to other colonies as well. The religious toleration practiced by Rhode Island made Newport the primary haven for Jews in the English colonies. The southern colonies of South Carolina and Georgia also proved very tolerant of these persecuted people, and Jews migrated to those colonies in the eighteenth century as well.

During the colonial period, the English colonies placed restrictions on the open, free exercise of the Jewish faith, but such proscriptions were mild compared to those imposed in Europe and in Latin America. Therefore, by the time of the early Republic, most American cities—especially New York, Philadelphia, Newport, Charleston, and Savannah—had thriving Jewish communities (Heidler and Heidler 2004, 166).

The new nation's constitutional protections in most states meant that Jewish congregations could practice their faith without fear of legal reprisals, but by then, most American Jews were so thoroughly acculturated into their communities that they had not experienced serious impositions in years. In addition to following their faith in peace, they participated in the social and political life of the community the same as their Gentile neighbors, leading one British visitor to comment that he was "surprised that all who profess the Hebrew faith do not emigrate to the United States, as they would there not only be free from civil incapacities . . . but would even find themselves eligible to the highest offices in the Republic." The descendants of those first Jewish immigrants worked in the professions of medicine and the law, engaged in politics despite strictures in some cases that only believers in the Holy Trinity might hold office, established business activities, worked in various trades and crafts, and in general were indistinguishable in their daily lives, except for the day they celebrated the Sabbath, from any other European Americans (Heidler and Heidler 2004, 166) (Mesick 1922, 266).

Beginning in the early nineteenth century, however, a new wave of immigration established another group of Jews in the United States. Spurred by discriminatory laws in most of the German states, German Jews, or Ashkenazim, began coming to the United States in small numbers. Most of these immigrants were young, single men who planned to save enough money to send for family members. Some were successful; some were not. For the most part they initially settled in northeastern cities, where they worked as day laborers. The few who were skilled workers might work for established craftsmen and, if they were fortunate, might save enough money to open their own business (Heidler and Heidler 2004, 166–67).

Those never joined by families often blended into the Gentile community, married outside their faith, and lost much if not all of their Jewish heritage. Language and cultural differences deprived them of ready acceptance by the older American Jewish communities, which primarily spoke English and were generally part of the upper economic echelons of American society. Only after larger numbers of Jews in family groups started arriving in the 1830s did American Jewish working-class communities begin to take root in urban areas (Heidler and Heidler 2004, 167).

English

Most immigrants to the United States came from England, where the shortage of good farmland and the restrictive nature of skilled trades drove many working-class people to emigrate. Colonial America had been a destination for such people since the early seventeenth century, and its change to a sovereign republic did not stem the tide. Because they not only spoke English but did so with pronunciations indistinct from the American accent of that day, these immigrants quickly blended into American society.

The most employable English immigrants were those who had worked in the growing number of English factories, particularly in the textile industry. The British government placed restrictions on the emigration of such people and made it illegal to export machinery plans, but many Britons seized the economic opportunity and found a way to America, some with important machinery blueprints, even if only in their memories. Men such as Samuel Slater brought valuable information to America to transform the country's economic life by giving birth to the American factory, the basis for the American version of the Industrial Revolution (Heidler and Heidler 2004, 167).

A Nation of Immigrants

Rather than moving to rural areas and taking up life on farms, most immigrants during the early Republic stayed in the cities where they first arrived. Seeking familiar language, culture, and religion led some groups, especially Germans, to form urban neighborhoods that became small enclaves of particular European nationalities. During the day, mothers in working-class neighborhoods congregated to watch their small children play and talked over problems. In the evenings after work, a sense of community developed as the men and older children returned from labors to visit with neighbors, attend parties, and socialize in neighborhood pubs. On Sunday (Saturday in Jewish communities), these neighbors attended church together and socialized afterward. In short, the pattern of their daily lives differed little from that of other Americans. Although languages may have been alien or accents distinct, and though they resided a few streets away from other groups, acculturation was relatively easy in these years when people walked to work and public events and crowded into the limited circumferences of cities, and the time it took was relatively short. Not until the tremendous tide of immigration in the 1830s and 1840s did Americans begin questioning the value and wisdom of having millions of immigrants arriving in the United States.

Many people came to the United States during the early Republic because they wanted to be part of the great American experiment in liberty and equality. Yet the large numbers of people who initially did not seem to fit in gave rise to worries that ideas incompatible with American institutions were coming with them. In the 1790s, for example, French immigrants brought with them ideas that some Americans believed to be excessively democratic. Congress had as early as 1790 passed naturalization laws that required a two-year residency in the United States before applying for citizenship, but such regulations were not particularly restrictive. By 1795, however, the residency requirement had been increased to five years. Three years later, when many French immigrants were seen as favoring the Democratic-Republicans, the party in opposition to the Federalist majority in Congress and the John Adams administration, the Federalist-controlled Congress acted again. Prompted by an undeclared naval war with France, a new Alien Act extended the residency requirement for citizenship to 14 years. Coupled with the Sedition Act, which made it illegal to criticize the sitting government, this distressing legislation was in part an attempt to stifle political opposition, an effort that miscarried by contributing to the backlash that handed victory to the Democratic-Republicans and Thomas Jefferson in the 1800 elections. In such indirect but no less tangible ways, immigrants could profoundly affect mainstream American politics (Heidler and Heidler 2004, 167–68).

CONVICTS

As in all times, some people who chose to live outside society's conventions did so maliciously. The early Republic had its criminals who justified their actions with the same rationalizations that have always informed the illicit deed: necessity drove this one to theft, or unfairness drove that one to felony. Crime has always been part of the human story, but the years of the early Republic were a transitional time in which new explanations for criminal behavior and new techniques for dealing with it made their first appearance. Punishments, for instance, contrasted markedly with those meted out during the colonial period, when criminals were more likely to be whipped or branded. Public humiliations had been routine, with offenders placed in stocks confining hands and feet between two notched wooden boards or in pillories with an additional hole for the head. Habitual crooks were banished, and in extreme cases, some were executed. Jails were used for temporary incarceration before trial or sentence, not for punishment (Heidler and Heidler 2004, 168).

During the early Republic, though, convictions for criminal offenses increasingly meant a sentence to spend a specified amount of time in a state prison. In fact, the establishment of the earliest prisons coincided with the elimination of the death penalty in most states for many crimes. By the nineteenth century, most states executed only those found guilty of treason or murder. Although these same states preserved the right to impose death sentences for robbery, arson, assault, and counterfeiting, they usually did so only after multiple convictions. In any case, a person under sentence of death was never sent to a prison. Prisons were not used as places for executions until the 1830s. Instead, the condemned was kept in a local jail until the appointed time for the execution. Those executed in the United States during the early Republic were typically hanged in public ceremonies, a practice that continued into the 1830s. By then, humanitarian objections finally overcame the public's fascination with such exhibitions, at least in the older eastern towns and cities.

Following British tradition, public executions had been conducted in America since colonial times. Such spectacles were thought to deter potential criminals while meting out just deserts to the convicted. Some victims doubtless took pleasure in seeing their assailants punished, but most of the people who traveled miles to see executions came out of morbid curiosity. The days before an execution were garish and grotesque. Salesmen hawked their wares, and traveling entertainers performed for crowds who gathered to see the hanging. Executions became social occasions for rural communities and cheap entertainment in cities. The actual event was a short affair, lasting only a few minutes. The condemned mounted the gallows, a minister prayed with him for a few minutes, a hood was placed over his head, his legs and hands were bound, and a noose was placed around his neck. A competent executioner could ensure a broken neck, and a quick death followed the drop through the scaffold's trapdoor (Heidler and Heidler 2004, 169).

Rehabilitation

These gruesome events, however, declined sharply during the early Republic because of the Enlightenment belief that every man was perfectible and religious convictions that all people were redeemable. Such beliefs inspired Massachusetts to establish the first state prison in 1785, and other states soon followed suit. New theories developed in Britain proposed that the controlled environment of a properly arranged prison could alter behavior, thus rehabilitate criminals, weaning them from wickedness and preparing them for productive lives in society. Enlightenment thinkers posited that sentences in penitentiaries (the term was another British modernism) could be spent learning the value of hard work while contemplating the consequences of bad behavior. Such theories rested on the belief that criminals actually were good people who had gone bad because they had not been raised correctly (Heidler and Heidler 2004, 169).

Undoing childhood misdirection became a serious undertaking, and the daily regimen of prisoners resembled extreme military discipline. They awoke early to a simple breakfast such as corn mush. Prisoners were then placed at various tasks where they learned basic skills in trades, a remedy for idleness and the boredom it encouraged, the theory being that monotony perpetuated criminality. The most popular skills were in carpentry, weaving, and nail making. Prisoners in urban areas could be taken out during the day to work on various public works projects such as street repairs, a practice condemned by free laborers who rightly claimed that convict labor drove wages down at best and put honest workers out of a job at worst (Heidler and Heidler 2004, 169–70).

During work periods, male inmates could not idly chat with fellow prisoners, even those sitting next to them. Guards allowed only work-related conversations. Women prisoners, given jobs considered appropriate for their gender such as sewing or spinning, were allowed to talk. An incentive for good work included a modest wage from which the cost of room and board was deducted, leaving a small amount of money to help parolees make their way after serving their time. Although working in prison was considered a privilege, the work itself could be arduous and uncomfortable. A British observer who witnessed the work in a Connecticut prison's blacksmith shop noted that when the shackled prisoners entered "the smith, some went to the sides of the forges, where collars, dependent by iron chains from the roof, were fastened round their necks." Prisoners who misbehaved or disobeyed rules were not allowed to work and could not earn money, one of the most persuasive punishments that could be used against a prisoner (Heidler and Heidler 2004, 170) (Hart 1897–1901, 45).

Prisoners whose crimes were heinous or who were considered too dangerous for the regular prison population were not allowed to work at the outset of their sentences. Instead, they were placed in individual cells and only saw guards when their single daily meal was brought to them. Such prisoners were only rarely even allowed books. A record of unblemished behavior might earn such prisoners the right to join the main prison population and begin a work regimen. Some prisons actually had several gradations of punishment, including "solitary confinement in a dark cell . . . as the severest usage; next, solitary confinement in a cell with the admission of light; next, confinement in a cell where the prisoner is allowed to do some sort of work; lastly, labor in a company with others" (Heidler and Heidler 2004, 170) (Mesick 1922, 116).

At the end of their 10- to 12-hour workday, prisoners returned to dormitories. Early in the penitentiary experiment, they slept, socialized, and ate in large rooms. The evening was the only time when they were not completely regimented in their activities. After the evening meal, they could visit as long as the sound of conversations did not reach to their guards' ears. If prison officials thought the noise too loud, conversations were stopped (Heidler and Heidler 2004, 170).

Because the purpose of these early prisons was reform, the conditions in them were intended to be carefully presented and maintained. They were somewhat Spartan, but initially they were clean and relatively warm in the wintertime. Food was nutritious if not plentiful, and medical care was available to everyone. Alarming problems, however, began marring the noble experiment in rehabilitation. Reducing the number of capital offenses meant that by the end of the eighteenth century, relatively new state prisons were terribly overcrowded. Overworked and undermanned, these institutions frequently became places to keep criminals rather than reform them. Extremely crowded prisons abandoned solitary confinement even for hardened criminals, integrating them with the general prison population, where they became master criminal tutors for hosts of criminal apprentices. The only training many prisoners received during their incarceration was how to become better criminals (Heidler and Heidler 2004, 170–71).

As these problems became so obvious that officials could not ignore them, a new round of reforms was put into place in the early nineteenth century, including a return to single-cell prisons, not just for violent offenders but for all inmates. Prisoners were let out of their cells during the day for work and to eat meals, but they were ordered to remain silent. Officials believed that quiet, contemplation, and hard work would restore criminals to the right path. Work was redesigned not only to teach prisoners good habits but also to produce necessary items like shoes and nails that would offset some of the cost of inmates' upkeep. It is hard to say if these reforms, the precursors to more than two centuries of like-minded efforts in penology, resulted in the rehabilitation of significant numbers of good people who reformers reasoned had gone bad through bad circumstances and environment. No solid statistics relate levels of recidivism for late eighteenth- and early nineteenth-century prisoners, but we do know that prisons of the period continued to be very crowded (Heidler and Heidler 2004, 171).

Military Life

A FRONTIER ARMY

The U.S. Army in 1790 was quite small and mostly concerned with duty on the frontier. Excluding officers, the authorized strength of the army was 1,216 men, although that figure was seldom reached. Soldiers were all enlistees and were mainly posted in the wilderness of the Ohio River Valley, where they were supposed to overawe potentially hostile Indians. It was a job that took them far away from friends and family, and it could be both dangerous and frustrating. Scattered garrisons were neither large enough to intimidate angry Indians nor able to prevent settlers from riling those Indians by moving onto their lands and stealing their possessions. The army was also powerless to prevent Indian retaliation that such misdeeds spurred. Instead, soldiers were huddled in isolated posts, eating bad food and sleeping in austere barracks while waiting for the government to send enough men and supplies to maintain the peace (Heidler and Heidler 2004, 173).

When the growing violence on the Ohio River frontier finally captured the government's attention, the little army was forced into combat. Under mounting political pressure, the War Department ordered the army's commander, Josiah Harmar, to attack the Indians. The army's consequent introduction to Indian warfare proved enlightening, at least for the men who survived it. Poorly trained militia supplemented the paltry number of regulars, and the resulting force proved shockingly ineffective. In fact, it was chased back to its headquarters at Fort Washington (near Cincinnati) in the fall of 1790. More soldiers, also exhibiting the awkwardness of too little training, were sent to the Ohio River in the summer of 1791 and placed under the command of territorial governor Arthur St. Clair. That November, northwestern Indians walloped them as well. Such defeats were stern tutors, and the government grimly learned its lesson to increase the frontier army to 5,000 and install a rigorous training system that became a major part of these soldiers' daily lives. Led by General Anthony Wayne in 1794, this capable and disciplined force finally dealt Indians in the Ohio country a decisive defeat at the Battle of Fallen Timbers (Heidler and Heidler 2004, 173–74).

Most of the military history of the 1780s and 1790s has focused on these few battles, perhaps to give the impression that military life after the Revolution was marked by incessant Indian war. In reality, the average soldier on the western frontier saw little combat, and daily schedules were more described by the routine of drill and the tedium of garrison duty than the perilous excitement of battle. After the victory at Fallen Timbers, the government again sharply reduced the army's numbers, sacrificing preparedness to frugality but also calming widespread fear that a standing army posed a threat to the civilian government. Nonetheless, the inconsistent nature of frontier affairs for the next decade caused the army to swell in times of crisis and ebb in periods of calm. The soldier's lot was at best hard and unpredictable, and when no threat loomed, he was usually unappreciated and sometimes disdained by a suspicious and skeptical citizenry. Little wonder that during good economic times, both officers and enlisted men left the army in droves. During peacetime, most soldiers and officers remaining in the early Republic's army were there because they had no other prospects of employment (Heidler and Heidler 2004, 174).

Officers

During these years, a man became an officer more frequently as a result of his influence than his worth, for having powerful political friends was indispensable in obtaining promotion, even for the experienced and meritorious. This unwritten but persistent policy of giving preferment to men with proper political connections resulted in an officer corps that was both highly politicized and essentially incompetent or, as one officer characterized them, "Beasts & Blockheades." As with most political patronage, the practice endured only as long as its consequences were trivial. Appallingly poor officer performance in the War of 1812 imperiled the country, however, and brought rapid and meaningful changes to the way commissions were granted and promotions earned (Heidler and Heidler 2004, 174) (Coffman 1986, 7).

Officers during the period suffered from a surprising lack of job security. Periodic military increases to meet Indian threats at home or international ones abroad were usually followed by reductions. Officers were never certain that their jobs would last for more than a year or two. In fact, many were released during cutbacks with the idea that they could always be recalled when needed, an idea that the government embraced in theory but found wanting in both application and results. Not only was the army's stability of command seriously impaired, but many competent officers found civilian positions that were at least more secure and frequently better remunerated than their military careers. Understandably, they had no desire to reenter the service, whether the country needed them or not (Heidler and Heidler 2004, 174–75).

Training

The average private received a considerable amount of training over the course of his enlistment from officers and noncommissioned officers, but officers who did not attend the United States Military Academy—the great majority during the early Republic—received virtually no formal training. Usually, newly commissioned officers were taken under the wing of a more senior officer or noncommissioned officer and informally taught the job. In the absence of such a mentor, the new officer learned his profession through observation. Exceptions were officers assigned to artillery or engineering units. President George Washington established an artillery and engineering training school at West Point, New York, in 1794, an institution that eight years later became the United States Military Academy. After the War of 1812, junior officers increasingly came from West Point, but though better trained than non–West Point graduates, these young men had a lot to learn about life in the army.

Indeed, one of the greatest impediments to developing a strong, professional officer corps was the lack of training provided for young officers. Nowhere was this more evident than during the few occasions when officers led their men into combat. Because battles were rare occasions until the War of 1812, Congress, at least, did not see the dearth of officer training as a valid worry. The executive branch, on the other hand, was another matter, for presidents were well aware that the army had tasks other than fighting battles. Not just Washington, with his military background, but thoroughgoing civilians John Adams and Thomas Jefferson also decried the lack of technical expertise of American engineers and the reliance on foreigners to carry out those functions in the U.S. Army (Heidler and Heidler 2004, 175).

Duties

Newly commissioned officers were usually young men whose first task was the thankless and frustrating chore of recruiting those they would command. The new officer was usually expected to sign up a company, a unit that usually numbered from 75 to 100 men. He could undertake this assignment in a variety of ways, but the most promising approach was to travel to a city where the pickings would at least be more plentiful. Printed handbills and posters, paid for out of his own pocket, advertised his purpose and with any luck would generate some interest and produce a few takers. Even while continuing to accept recruits for his quota, the new officer commenced rudimentary training for his new charges, a job that could include instilling simple concepts such as distinguishing left from right but also teaching, "by gentle methods, regularity of conduct." Sometimes he had to hunt down those whose second thoughts about joining the army prompted them to desert. Meanwhile, everything had to be documented in regular reports to his commanding officer or the War Department. As soon as the officer had filled his ranks, he joined his regiment, where the serious training of the men commenced under the more practiced eyes of toughened, experienced sergeants (Heidler and Heidler 2004, 175–76).

Recruiting chores did not end there. When soldiers did not reenlist, recruiting was necessary to reinforce existing units. It was one of the most undesirable jobs in the army, one usually given to junior officers, who spent a large part of their early careers at it. Yet there were also compensations. Recruiting assignments allowed young officers to leave the frontier for more populous areas and more interesting social circles, sometimes even landing them in the eastern cities of friends and family (Heidler and Heidler 2004, 176) (Coffman 1986, 18).

For the most part, though, recruiting duty was difficult and unrewarding, especially during good economic times, when ample civilian jobs made military service much less appealing. In times of military expansion, recruiting officers faced different but no less challenging problems. As officers from different units moved into an area to compete for the same people, they resorted to innovative stratagems. For example, they could interpret rules regarding minimum physical requirements in imaginative ways to accept recruits whose health barely allowed them to fog a mirror. Though forbidden to enlist men "whilst in a state of intoxication," many recruiters did resort to collecting potential soldiers "from the streets and prisons of the cities" (Heidler and Heidler 2004, 176) (Coffman 1986, 14, 15).

One prominent historian has mused that given the new government's hostility toward a peacetime army, it was the potential threat posed by Native Americans that resulted in a permanent American army. It was certainly true that the primary duty of officers at isolated frontier posts was to treat with local Indians and prevent conflicts between them and settlers. Many officers came from the East, where more established communities had not seen an Indian for years, so they tended to regard Indians as exotic rather than threatening—sometimes to be rudely awakened. Yet at the outset, most officers were more curious than antagonistic about native populations, which was good, for the government expected them to serve as preliminary diplomats and preserve the peace. To that end, officers were also instructed to remove settlers from Indian lands, an assignment that made them unpopular with the growing numbers of squatters flocking to the frontier. Traders, some unscrupulously intending to sell enlisted men and Indians whiskey, also came under the purview of the commanding officers of frontier forts (Heidler and Heidler 2004, 176).

Most officers had time to explore the countryside, read, write letters to family, and socialize with fellow officers. Their mealtime assemblies, called the officers' mess, were convivial gatherings full of stories and lengthy reminiscences. If posted near a town or settlement, they could attend dances, go to dinner parties, receive regular mail, and court local girls. In isolated garrisons, though, officers struggled to create wholesome and varied amusements. Some failed and took to strong drink to break the monotony of their days, with regrettable results (Heidler and Heidler 2004, 176–77) (Prucha 1969, 1–5).

Itinerant assignments usually promised a level of discomfort, but permanent stations, whether frontier forts or urban garrisons, usually offered officers better quarters, food, clothes, and pay. While they were exempted from the kind of discipline meted out to enlisted men, officers were neither idle nor indulgent. They functioned in a chain of command that had them, in stipulated degrees of authority and responsibility, not only making decisions for everybody in their charge but also regularly explaining those decisions to superiors. In fact, the chores of routine reporting made them as busy as the soldiers under them as officers generated oceans of paper that were dispatched according to closely defined procedures to places where the reports were carefully filed away, usually unread and likely forgotten.

Especially in peacetime, officers shared with their soldiers the reality that army life was extraordinarily tedious. They trained men, filed reports, watched drills, filed more reports, meted out punishments for breaches of discipline, filed additional reports, supervised work parties, filed reports about that, and sat on courts-martial, which required extensive reports. The occasional parley with Indians introduced variety to duties, but such episodes, of course, also entailed filing reports. And even as dense smoke hung over a battlefield and the moans of his wounded men carried across recently contested ground, an officer began to frame the actions of the day in his mind. He would have to recount them in a report (Heidler and Heidler 2004, 177).

Pay

Even if better than the lot of a lowly private, an officer's life was not very appealing when compared to the opportunities for advancement and the better pay available in civilian employment. If they had the chance, enlisted men tended to leave the army during good economic times, and many officers followed suit by resigning their commissions. Given the pay scales for the period, it is not difficult to see why (the following figures are based on 2004 currency values). In 1792 a lieutenant made $26 a month (less than $500 in current value), a captain $40 (a little more than $700 in current value), and a major of infantry $50 (less than $1,000 in current value). This meant that in terms of today's purchasing power, the lieutenant made less than $6,000 a year, the captain about $8,000 a year, and the major less than $12,000 a year. The pay for senior officers was better, of course, but hardly bountiful. At $104 a month, a brigadier general earned the equivalent of $24,000 a year in current value, and a major general's $166 a month could only go as far as about $36,000 of today's money.

In comparison with a comparable civilian job, a junior officer drew about half the pay of an entry-level clerk in a large business or government job. And though the young officer did receive his food and housing and could earn extra-duty pay, if he had plans to marry and have a family, his compensation was simply inadequate (Heidler and Heidler 2004, 177).

Officers contrived ways to supplement their paltry salaries. If they were lucky enough to have an extended stay in one place, they could moonlight by taking part-time jobs in the community. Those posted on the frontier might take advantage of the opportunity to snatch up cheap land before settlers moved into the area. After settlers came and the land increased in value, some officers made a nice profit that they then invested in other enterprises. It was the wise officer who did, for there was no fixed retirement system, and officers who had not shown such foresight were compelled to stay in the service until they died, essentially with their "boots on" (Heidler and Heidler 2004, 178).

Sometimes the ingenuity behind supplementing one's income crossed the line into shadowy areas that were at best dubious and at worst constituted outright misconduct. The senior officer in the army during part of this period serves as an example of both. Major General James Wilkinson was perhaps the most resourceful officer in the history of the service at finding ways to increase his income. In addition to engaging in the usual business activities, he also worked as a secret agent for the Spanish government, accepting regular payments to supply details about American activities on Spain's border in the Southwest, deeds that made him, according to one historian, "the most consummate artist in treason that the nation ever possessed" (Heidler and Heidler 2004, 178) (Muir 1997, 555).

Pensions

Congress usually granted pensions both to enlisted personnel and to officers who served in conflicts, especially those who were disabled or, in case of their death, to their widows and orphans. The process of granting these annuities was sometimes cumbersome and tardy, though. The congressional Committee on Claims began receiving petitions for the Revolutionary War in 1794 and was supplanted by the Committee on Pensions and Revolutionary War Claims in 1813, a structure that was again revised in 1825. As late as 1875, pension rolls from the Revolutionary War still had 379 widows on them. Yet no fixed national retirement system existed for the military during the period, and those who had not been on the rolls in a war could expect no income beyond their terms of active service (Heidler and Heidler 2004, 179–80).

UNITED STATES MILITARY ACADEMY

Origins

The United States Military Academy was established at West Point, New York, in 1802. Even before it received that official designation, President Thomas Jefferson charged its commanding army engineer, Lieutenant Colonel Louis de Tousard, to instruct officer candidates. The cadets' daily routine was accordingly established before the small facility that George Washington had created to teach engineers and artillerists that became the military academy. Initially, that routine was haphazardly organized around mathematics classes in the morning and physical and military training in the afternoons. With no age or educational requirements in place, the cadet corps presented a strange cross section of American manhood. Some cadets were 10 or 11 years old, while others were grown men with families. Some had only had the equivalent of an elementary education, while others had already graduated from a civilian college. The primary qualification for admission seems to have been family political connections.

Jefferson wanted to bring order at West Point and to create a curriculum that would benefit the nation. Envisioning an academy that would embrace as well as teach the scientific erudition of the Enlightenment, he appointed celebrated scientist Jonathan Williams, superintendent of cadets in 1801. Early in the following year, Congress made everything official by designating West Point as the United States Military Academy and creating the Corps of Engineers, in part to maintain it (Heidler and Heidler 2004, 180).

Early Curricula and Practices

The academy physically began its existence when classes commenced in April 1802. Yet the shortage of money and the lack of qualified instructors meant little change in the daily routine of the place and its people. Slowly, though, the curriculum broadened. In addition to mathematics, cadets began to study physics, fortifications, and artillery. Passing examinations that queried their knowledge of these subjects and familiarity with certain basic textbooks qualified cadets for graduation, and if an officer billet was vacant, a cadet received his commission. It was an improvement over the old, narrow system, but as an education, it was not even closely comparable to that for a degree in a civilian college. Gradually, the addition of subjects like French (the language of many military texts) gave cadets a better-rounded education, but the emphasis nevertheless remained on the rote memorization of generally superficial texts (Heidler and Heidler 2004, 180).

The wide range of cadet capabilities drove that emphasis, a circumstance that was eventually recognized as a problem. Those who had been to college usually completed their studies at the academy in about a year; others were there for as many as seven years. This mixture of student proficiency made teaching a challenge and encouraged reliance on a daily schedule that primarily focused on slogging through specified texts. It finally became apparent that through no fault of their own, the cadets themselves were thwarting efforts to create a meaningful educational curriculum as well as an effective training regimen. In 1810 new regulations stipulated that an entering cadet had to be between 15 and 20 years old and possess minimal skills in reading, writing, and arithmetic (Heidler and Heidler 2004, 180–81).

Cadet Life

Daily life for the average cadet was not made routine until the security threat posed by the War of 1812 forced Congress to reform the academy. Cadets during the war spent their days studying engineering, mathematics, French, drawing, and physics. The penury of Congress meant, however, that the academy was at best supplied with outdated equipment and obsolete textbooks. Furthermore, the demands of the war for an increasing number of officers translated into pressure on instructors to hasten their cadets to graduation. The conflict ended before the reforms could see West Point officers making noticeable contributions to the war effort, but many in Washington mulled over additional reforms. Further changes created a curriculum and training program that placed West Point cadets under the most regimented daily schedule in the United States.

Virtually every waking moment of a cadet's life was planned for him. His day began at 6:00 A.M. roll call, followed by room cleaning and inspection, breakfast, three hours of mathematics, two hours of French, and dinner, the main meal of the day throughout the nation in those days, which took place a bit later than the modern lunch. He then studied two hours of drawing and engineering before his daily drill, a scheduled study time, an evening parade, and supper. A failure to perform according to rigorous standards, not being where he was supposed to be at any given time, or violating any rule drew penalties that ranged from verbal reprimands to walking tours to confinement to quarters. Really serious offenses meant dismissal.

Meals under the new regulations were equally regimented. Cadets marched in and out of meals, sat ramrod straight, and kept silent at the table. The food was bland but nutritious. Breakfast consisted of coffee, bread and butter, and a meat. At dinner cadets ate meat, bread, potatoes, and two vegetables. Supper, the lightest meal of the day, was tea and bread and butter. Once a week cadets received dessert at dinner and supper (Heidler and Heidler 2004, 181).

Stricter regimentation did not necessarily mean absolute order, however. For example, prospective cadets received appointments throughout the year and traveled to West Point immediately to begin their studies. Class schedules and orderly lectures were almost impossible, as new cadets arrived who had no background in the subject. On the other hand, cadets left the academy just as irregularly, sometimes through dismissal for disciplinary reasons, but more often because they were judged competent enough to become officers. Under those circumstances, even the stricter program did little to impart a sense of day-to-day continuity in the cadet ranks (Heidler and Heidler 2004, 181–82).

That situation began to change in 1816 when the War Department mandated that all cadets must remain for four years and could enter the academy only in September. In addition, a significant curriculum reform sorted out the course of study according to a cadet's matriculation. Cadets took classes that grew more involved and sophisticated in each of their years until graduation, a system that fostered a sense of class unity important in creating esprit de corps. In their day-to-day experience, cadets took classes with the same cadets through four years of school (Heidler and Heidler 2004, 182).

During the next three years, new superintendent Sylvanus Thayer introduced further changes. Daily life became even more regimented to include military training in a summer encampment, a change that made West Point the cadet's exclusive home during his entire four years of attendance. In fact, he was allowed summer leave only once. Superintendent Thayer's goal was to establish a system whereby "the standing of an individual is dependent wholly upon his own merits." Cadets cooperated with this new system not only to escape punishment but also to enhance their daily performance and conduct ratings that ranked them within their classes. Upon graduation, a cadet's ranking determined his assignment, ranging from the elite engineers for the top graduates to the common infantry for the least stellar performances. By 1820, the United States Military Academy had become a prestigious educational institution that was well on its way to providing the U.S. Army with a majority of its commissioned officers (Heidler and Heidler 2004, 182) (Ambrose 1966, 75).

ENLISTED MEN

A variety of motives impelled men to enlist in the U.S. Army during the early Republic. The enlistee usually received some sort of bounty ranging from $2 to $16, a value set by how badly the country needed his services. Bounties could be persuasive inducements, especially for those who were otherwise unemployable. New soldiers also received a uniform and a daily ration of food. The average ration during the early Republic was about a pound of beef or pork, give or take a few ounces, bread or flour, one gill of liquor (four ounces), salt, vinegar, and part of a candle. Soldiers were supposed to be paid anywhere from $3 to $7 a month, but pay was seldom regular. Soldiers received extra pay for additional work beyond combat or garrison duty. Many frontier forts were built far from the usual supply of laborers, and soldiers collected extra pay for constructing their own forts, a practice that probably kept some men in the army by matching the pay received by laborers in a city. The extra financial opportunities and the free clothes and shelter made soldiering an appealing way to make a living for some. As war with Britain loomed, other incentives came into play. In January 1812, for instance, soldiers were exempted from prosecution for debt, an immunity that lured countless debtors into the ranks. Additionally, the British army paid its soldiers considerably less than the American army and treated them far more harshly. Many British soldiers, already knowing the profession, deserted to the United States and joined the American army (Heidler and Heidler 2004, 182–83).

The army promised men a roof over their heads, regular food, and warm clothes, and for some unskilled and illiterate laborers, those were sufficient inducements to sign up. Others joined for adventure, leaping at the chance to see the frontier and perhaps make their fortunes there. Army life, however, could disappoint with open-air encampments, wretched rations, and ragged uniforms. The frontier was often monotonous rather than exhilarating, and fortunes proved as hard to make there as anywhere else. Desertion was always an option for the disillusioned, especially if they had not squandered their bounty money. It and their new clothes might carry them far enough to someplace else in the country where they could avoid capture and make a new start (Heidler and Heidler 2004, 183).

Duties

New recruits received about four hours of drill instruction each day while they waited to depart for their assignment. After the recruiting officer reached his quota, he usually marched his company to its permanent station, which was typically on the frontier. If he were lucky, he would have a couple of noncommissioned officers with him to maintain discipline, because it was during this journey that most men tried to desert. Many who remained in the ranks required constant vigilance to keep them from preying on civilians with crimes that ranged from petty theft to physical assault.

After soldiers reached their destination, most of their time might be consumed by building the fort they would garrison. The expanding frontier made fort construction one of the army's primary activities, and a special incentive like an extra whiskey ration could help speed the work. Soldiers first cleared the site both to improve observation from the bastion and to provide the materials for its construction. If a structure already existed, soldiers would either refurbish it or add outbuildings such as stables. There was always the need for general maintenance. The strictness of discipline and the importance placed on drill could vary from fort to fort, depending on the taste of the commanding officer. Some insisted on regular drill and practice at the manual of arms at least every other day; others were so easygoing that their garrison's martial skills atrophied while the men spent their days gardening and hunting (Heidler and Heidler 2004, 183).

During the early 1800s, the government found important activities to keep its outland army busier in the service of the country. The developing frontier made road building an important function for soldiers, in part to facilitate pioneer travel, but mainly to tie together the growing number of scattered forts. Road building became a particular preoccupation after the War of 1812, when that conflict brought into government hands millions of acres acquired from Indians. In addition, the war's logistical complications had revealed serious difficulties in moving troops and supplies, a consequence of a lack of roads and the abysmal state of extant ones. In the wake of the war, soldiers spent much of their time remedying this problem with picks and shovels (Heidler and Heidler 2004, 183–84).

Also in those years, the frontier soldier was frequently involved in exploratory expeditions. In major expeditions such as the celebrated one conducted by army officers Meriwether Lewis and William Clark into the Pacific Northwest and Zebulon Pike into the Southwest, frontier soldiers trekked into uncharted lands to search out the sources of rivers, locate the best places to build bridges, and determine the best places for forts. In the process, the uncharted lands of the American wilderness became mapped regions with their physical features revealed and their vast distances measured by army engineers, surveyors, and cartographers (Heidler and Heidler 2004, 184).

Hardships

The typical fort or post was a small concern with only a couple dozen men. When not performing caretaking chores, soldiers cultivated gardens, hunted game, and fished nearby streams to supplement their dreary diet. Civilian contractors hired to supply rations were notoriously haphazard in their vaguely scheduled visits to frontier outposts, and soldiers periodically had to travel long distances to retrieve provender and other supplies. The arrival of a civilian supplier was hardly a cause for celebration, in any case. The rations they brought were usually meager, sometimes spoiled, and always only just edible. In fact, having posted most of its soldiers on the frontier, the government in some ways acted as if they did not exist. Pay was routinely late, supplies sometimes went missing, and uniforms unraveled into rags. Officers tried to remedy these problems, but often all they could do was send detachments to scattered settlements in the hope they might purchase enough supplies to stave off starvation. Irregular pay was a different but no less difficult problem. With depressing frequency, desperate officers, gauging plummeting morale and rising desertions, had to send parties of officers and men hundreds of miles to fetch payrolls that were months in arrears (Heidler and Heidler 2004, 185).

Contemplating these problems, soldiers found it easy to feel that the government had abandoned them. Collapsing morale saw some desert, but others remained in place to crawl into whiskey bottles. Susceptible officers and enlisted men alike became notorious drunkards. Itinerant traders, their wagons filled with whiskey, followed payrolls to frontier forts to make paydays into spree days that ended with many of the men stumbling drunk. Some officers joined a few civilian authorities to call attention to the problem of soldiers' drinking, but the culture of the times was not inclined to see anything alarming. American men drank a profuse amount of alcohol anyway, and most observers did not regard the presence or absence of a uniform to be pertinent. There were officers, however, who were appalled by the breach of military discipline that drunkenness posed and worried about the overall health and effectiveness of their commands. They might ban from their posts traders with alcohol and build their forts as far as possible from nearby towns with their tempting saloons, but soldiers always found a way around these well-intentioned gestures. With relative ease, they supplemented their whiskey ration (Heidler and Heidler 2004, 184–85).

Officers were more often forced to restore discipline after the fact by leveling severe punishments for drunkenness. Consequences for soldiers guilty of violating regulations or laws were harsh by anyone's standards. During the early Republic, corporal punishment was common for numerous infractions including theft, assault, and insubordination. Under regulations, the maximum number of lashes a soldier could receive was 100, but other physical ordeals could be substituted for or added to a sentence of flogging. On the eve of the War of 1812, the army ceased flogging malefactors, but the practice of branding continued, usually to a visible part of the body like the face or hand, to make readily and permanently apparent that its owner had committed a military breach. Trivial offenses could mean reduced rations of food or whiskey, the latter deprivation being regarded by most soldiers as the worse punishment. A violator might have to perform duties while dragging around a log or cannonball chained to his leg. The most serious offenses could mean a death sentence, either by hanging or firing squad, depending on the crime (Heidler and Heidler 2004, 185).

Health

Army life was unhealthy. It carried the risk of combat, but there were other perils as well. Poor food, indifferent health care, insufficient shelter, incipient or outright alcoholism, and the likelihood of being posted to unhealthy locations made soldiering highly dangerous aside from the chance that one might be shot in battle. Those who had the misfortune to be stationed in the South during summer probably suffered most. The heat made physical labor doubly difficult, spoiled food quickly, and carried the constant threat of tropical disease. Yellow fever was prevalent, and physicians were in short supply because most competent doctors would not serve under such conditions. The army made do with poorly trained surgeons (Heidler and Heidler 2004, 185).

It was all a prescription for trouble, and in 1809 it produced a first-class health disaster at Terre aux Boeufs, Louisiana. The commander was General James Wilkinson, later infamous for his wide-ranging corruption, who in this instance displayed a scandalous disregard for the 2,000 men in his charge by refusing to move them to healthier ground. The scandal went beyond dereliction. Wilkinson wanted to remain near New Orleans to cultivate dishonest relationships with civilian contractors in the city. As Wilkinson padded his pocketbook, his men remained on low ground whose main features were bad water, swarming mosquitoes, poor sanitation, and rotten food. The encampment became a nightmare. Delirious with fever, the dying filled the camp with screams while the living endured the stench of feces and unburied, rotting corpses. At last, even Wilkinson could not ignore the calamity unfolding at Terre aux Boeufs. He belatedly acted to move survivors to higher ground. By then, almost half of his command was dead (Heidler and Heidler 2004, 185–86).

Actually, Wilkinson's debacle was only an amplification of a condition that was a chronic blight, though in less spectacular ways, throughout the period. The health and welfare of soldiers at posts throughout the country was of minor importance to the government. After the War of 1812, however, new attitudes appeared in the War

Department. The increasing reliance on the regular army to build roads, maintain frontier forts, and treat with Indians required healthy recruits kept fit by positive changes in procedure. The contracting system was improved, and the men's rations were placed on a sounder nutritional basis with the introduction of fruits and vegetables. Even with these changes, soldiers were hardly pictures of health, but they were better off than their fellows of only a few years earlier (Heidler and Heidler 2004, 186).

WOMEN AND FAMILIES

Women helped to alleviate the drudgery and monotony of life at frontier posts. The army provided for up to four laundresses per company of soldiers, not only to clean the men's clothes, bed linens, and quarters, but also to furnish a feminine presence. Many were either already married to, or would marry, enlisted men. Such authorized women workers, who received rations and pay from the army, were considered a civilizing influence, but "loose females" were another matter. It was one of the realities of soldiering that wherever men in uniform gathered, prostitutes would follow. Most officers discouraged the presence of prostitutes because they caused quarrels and transmitted diseases, but at forts located near settlements, they were almost impossible to exclude. It did not help that many officers kept mistresses, possibly emulating European practice, and lost some measure of moral authority to preach sexual abstinence in the process (Heidler and Heidler 2004, 186) (Coffman 1986, 25).

On the other hand, the presence of fewer women meant frictions of another sort, such as officers frolicking with subordinates' wives. Some officers discouraged their men from marrying, but because they had no authority to forbid such unions, they were more often than not foolish to oppose them (Heidler and Heidler 2004, 186).

Soldiers and officers tried to maintain a measure of normal family life while serving on the frontier. The outbreak of war endangered women and children who lived in garrisons, yet when presented with peril, women could prove helpful. Caught in the crossfire as Indians attacked Arthur St. Clair's expedition against the Ohio River tribes, the women lent assistance and even engaged in combat (Heidler and Heidler 2004, 186).

In the early nineteenth century, officers more regularly had their wives with them, at least for part of the year. Their companionship not only helped to chase away the blues on the humdrum frontier; the wives themselves also provided medical care of sorts to men frequently without physicians. Theirs was a lonely life, though, because officers' wives likely had few female companions of their social class at the frontier forts. Properly educating their children in such remote sites was a doubtful undertaking at best and at least one of the reasons many wives spent most of the year living with relatives, usually their parents. Those who remained with their husbands did their best to teach their children. In some cases, an educated enlisted man taught them.

Many officers with growing families found they could not support a wife and children on their limited salaries. If not lucky or clever enough to find other sources of income, they were compelled to contemplate leaving the service for a civilian job. Officers also left the army to spare their families the strain of being regularly uprooted as well as the isolation and danger of frontier life. Finally, a military husband and father who died in circumstances other than combat potentially placed his family in an economic crisis. Because there were no official provisions for their upkeep, they were left to fend for themselves (Heidler and Heidler 2004, 187).

MILITIA

According to the Militia Act of 1792, states were to maintain a militia force of fit men between the ages of 18 and 45 for national defense in emergencies. Beyond that requirement, how states were to train, equip, and supply these men was entirely up to them. Taking advantage of such lax oversight, states usually neglected the militia, especially during hard economic times, leading one militiaman to comment at the beginning of the War of 1812 that "most of our officers as well as the men are as yet destitute of the qualifications requisite in military life." Communities held militia musters to train and practice firearms drills, but these events gradually transformed into social occasions in which picnicking, drinking, and dancing supplanted most training. Firearms were anything but standardized and not always in good repair. Ammunition and powder were in short supply. Consequently, the militia muster typically consisted of marching and firing practice in the morning, with social activities filling the afternoon (Heidler and Heidler 2004, 187) (Merrill 1964, 79).

On the rare occasion when a local militia company was called for duty, its lack of training was instantly apparent. On the march, militiamen straggled behind regular soldiers. Their wretched camp hygiene made them sick. Their poor discipline and inadequate training meant that they often ran from battles. Although the War of 1812 saw militia behaving admirably in some actions, the usual capriciousness of citizen forces compelled the government to rely far less on them in the years after that conflict (Heidler and Heidler 2004, 187–88).

COMBAT

The most extended period of combat for American soldiers during the early Republic was the War of 1812 (1812–1815). Of several Indian conflicts, the most important was the First Seminole War of 1818. While life in frontier forts included the constant threat of conflict with Native Americans and the occasional border skirmish with a European neighbor, American soldiers actually saw little or no combat during the period.

War is always a possibility for soldiers, of course, whether on the frontier or in less remote garrisons, and it is a testimony to the early Republic's complacency that its soldiers were seldom effectively trained to meet the exigencies of combat. Until the

War of 1812 forced a reevaluation of the military structure, deficiently trained officers inevitably produced ineffective combat soldiers (Heidler and Heidler 2004, 188).

The U.S. Army and militia practiced offensive and defensive warfare in every conflict during the period. Daily marching over long, often roadless, terrain to attack the enemy generally preceded offensive battles, particularly in the War of 1812. In short, campaigns involved relatively little fighting, most battles generally lasting a few hours at most, and considerable marching. Offensive combat consisted of open-field charges or assaults on fortifications. In both cases, an artillery barrage directed at enemy troops or their fortifications preceded the infantry's advance, usually answered by an artillery bombardment from the enemy. Depending on the skill of gunners, bombardments could be noisy but ineffective or terribly destructive. If the latter, infantry hunkered down to weather the storm of shells interspersed with piercing shrieks from the wounded and the visual horrors, as one witness described, of a ball flying through the air taking "off one man's head." Infantry advanced in straight, parallel lines. If fighting on an open field, the opposing army mirrored these movements. The two forces marched to within firing range of their smoothbore muskets, usually 100 yards or less, and discharged a volley. The casualties from gunshots were typically light because the muskets were notoriously inaccurate at anything but virtually point-blank range. Instead, the volleys threw up dense clouds of smoke from the black gunpowder, an acrid screen that intensified as the sides reloaded and fired additional rounds. One American soldier who fought at the battle of New Orleans on January 8, 1815, said that "the morning had dawned to be sure, but the smoke was so thick that every thing seemed to be covered up in it." At some point, the issue would be pressed by a melee in which the infantry staged a bayonet charge for hand-to-hand combat. Those contests usually decided the fate of battle (Heidler and Heidler 2004, 188) (Merrill 1964, 95) (Cox 1996, 128).

Attacking fortifications required an infantry charge under the cover of continued artillery support lest the fort's guns have free rein to cut down advancing soldiers. The front ranks carried scaling ladders to overrun the fortification's outer works as a prelude to assailing the main fort.

American forces during the War of 1812 more commonly defended a fortified position. During attacks, duties in the fort varied. Some soldiers manned the fort's artillery while others were positioned at gun ports and on the ramparts. Officers either supervised artillery fire or paced behind the men on the walls to give encouragement and to direct their musket volleys. Attacks on fortifications often became formal sieges in which the enemy surrounded the fort and threatened an attack for days extending into weeks. A siege reduced the daily routine of soldiers to the essentials of survival: they took cover during artillery bombardments, kept watch for surprise attacks, and stretched diminishing supplies of rations. Living under siege was considered the most unpleasant of military duties (Heidler and Heidler 2004, 189).

Despite the perils, noise, and chaos of battle, many preferred some sort of action to the monotony of garrison life. A well-trained army could function like a machine in battle, fostering a great deal of satisfaction and pride among those who were part of such an organization. Unfortunately for American soldiers, during the War of 1812, their armies often operated like broken machines. Large numbers of volunteers and militia with virtually no military experience or training were hurled into offensive and defensive battles against better-trained opponents who were often allied with Indian warriors, leading one discouraged American to lament, "we are doomed to experience nothing but disaster and disgrace where ever our arms are turned." Understandably, if not laudably, Americans simply ran. While there were some notable exceptions, such as the battle of Lundy's Lane in July 1814, when American soldiers charging a British battery engaged in one of the most "gallant acts ever known," and the battle of New Orleans in January 1815, these few instances did little to persuade against serious reforms in the U.S. Army. After the war, the government made a determined decision to rely almost entirely on a regular army. The daily life of the average soldier would thereafter involve far more training, conducted by increasingly competent officers (Heidler and Heidler 2004, 189) (Knopf 1957, 166) (Cox 1996, 114).

THE NAVY

The peacetime lives of sailors, whether in the merchant fleet or in the U.S. Navy, were typically a good deal busier than those of average soldiers. Sailors received on average at least twice as much pay as enlisted soldiers, about $10 to $12 per month during the period. A sailor's pay was higher in part because he was consigned to lengthy tours at sea. Yet sailors on merchant vessels received even higher wages (as much as $15 to $20 a month), making it difficult for the navy to recruit able-bodied, knowledgeable seamen. In wartime, an extra incentive was that navy seamen had the opportunity to win prize money, a portion of a captured ship's value, but it was common knowledge that strict discipline framed shipboard life with punishments that were not only harsh but also violent. The army discontinued flogging in 1812, but sailors were subject to it until 1850. Rank water, spoiled food, and cramped living conditions were the sailor's lot, confirming Samuel Johnson's observation that serving aboard ship was like being in prison, with "the chance of being drowned" (Heidler and Heidler 2004, 189–90) (Boswell 1934, 266).

Personnel

Similar to army practice, the captain and his officers had to man their ships by personally recruiting their crews. The British Royal Navy filled out its crews by using impressment—often little more than the forcible abduction of inebriated tavern patrons—but law prohibited American naval officers from forcing men to serve. Accordingly, conditions were usually better in American ships than in British ones, if for no other reason than to induce volunteers to sign on. In peacetime, however, the most liberal enticements could not compete with the far more palatable situation and more generous pay of merchant service, and only the chance for prize money in wartime could offset the advantages of the merchant marine.

Life aboard ship was an unpleasant combination of unthinking obedience and demanding labor. The one discouraged the irritable, and the other disqualified the very young, the very old, and the infirm. Most men who joined the navy were in their late teens or twenties, and they typically signed on as a last resort after failing to find employment at anything else. The unskilled were likely recruits, then, but those whom discrimination and prejudice had made outsiders also found a home in the navy. For example, a large number of African Americans became sailors. Some captains hesitated to recruit black seamen, but manpower shortages usually prevailed over bigotry, and some figures calculate that African Americans made up between 15 and 25 percent of the American navy (Heidler and Heidler 2004, 190).

Duties

Ships were incredibly complex and self-contained communities in which each man had a particular place and duty. As in any organization, some duties gave sailors added status and authority. The navy's equivalent of noncommissioned officers had particular responsibilities and held the men under them accountable for their implementation. The boatswain (pronounced bosun) supervised a boatswain's mate to keep the ship's heavy canvas sails and intricate rigging in working order. The master-at-arms commanded a complement of seamen to maintain order aboard ship and report infractions of the regulations to officers. The ship's carpenter and his assistants could be the busiest people aboard, especially after combat, when extensive damage required repairs. Weather could also inflict dire damage on wooden sailing vessels, and the carpenter and his mates were seldom idle. The purser kept all the ship's money, squared its ledgers with expenses paid during a voyage, and disbursed the men's monthly wages (Heidler and Heidler 2004, 190).

Ships functioned best when they were under strictly regulated routines, and their crews best abided the tedium of endless days under sail and in confined quarters when they were busy. Every crewman consequently had a set of jobs that required his attention every day, usually in the same order, if not during the same hours. Because ships at sea required some portion of the crew always to be on duty, the men were organized into several work gangs called watches. The duties of watches could range from two to five hours, depending on the time of day. Watches rotated so that nobody always had to work at night. Part of the watch spent its entire time trimming sails according to instructions from officers on the quarterdeck (the part of the vessel nearest the helm) to adapt to changing wind and weather. This could be dangerous work, whether one was heaving lines on deck or scampering aloft in the rigging, and sailors who were able to set and haul in sails during a blow (high winds) were more than valuable to a ship; they were essential to its survival. Less perilous work also occupied watches: normal wear and tear required housekeeping chores such as scrubbing the deck with pumice stones, washing away detritus, and painting and polishing woodwork to a high sheen, hence its nautical name of brightwork. Day watches also honed gunnery skills to meet the American navy's goal of firing "three broadsides to the enemy's two" (Heidler and Heidler 2004, 191) (Beach 1986, 75).

Food

The crew was also divided into groups called messes for three daily meals. There was neither enough time nor room for the entire crew to eat at the same time. Depending on the size of the ship and the weather, men usually ate on deck with one or more of the members of the mess dispatched to the galley to retrieve the food. Breakfast, the lightest meal of the day, typically consisted of bread or hardtack and hot tea. Dinner, the largest meal, was eaten at midday and included beef or pork, bread, peas or potatoes, and occasionally cheese. Supper, served in the late afternoon, consisted of leftovers from dinner. After each meal, the men were issued a part of their daily rum ration.

Officers and noncommissioned officers were also divided into messes that were scheduled to avoid conflicts with the watch they commanded. Their meals consisted of freshly cooked food served to them at tables in the wardroom or other quarters below decks. Yet neither officers nor crew would have described the food as anything other than fuel. The best that could be said was that only the foulest weather prevented galley fires from making food hot. Otherwise, meat was in varying stages of decay, cheeses always bore evidence of gnawing rats, and weevils squirmed in moldy bread. Long voyages with few stops for provisions meant that both officers and men ate increasingly unpalatable food that was fairly well spoiled by the time it was prepared. A corresponding increase in intestinal complaints toward the end of a voyage was a standard condition for officers and crew (Heidler and Heidler 2004, 191).

Officers

The popular perception of life at sea as a dashing adventure attracted middle- and upper-class men to a naval officer's career, and the fact that officers received the lion's share of prize money in wartime was an encouragement as well. A wartime navy saw some commissions given to adult men with more regard for their political influence than their naval experience. Most officers, however, received their appointments to the lowly rank of midshipman as teenagers. Influence worked here as well inasmuch as these appointments were usually meted out to the sons or relations of influential men, but at least they were in the form of officer apprenticeships that allowed youngsters literally to learn the ropes before exercising significant command. A midshipman hardly found himself in an exalted position, but he outranked common seamen and could expect from his captain a comprehensive education on seamanship, navigation, and leadership. Most of a midshipman's day was occupied by running errands and performing chores for the captain and other officers. After a midshipman completed his training, he was recommended for a lieutenant's commission, but there was usually a waiting list, especially in peacetime, when few vessels were at sea. Some midshipmen had to wait several years before a lieutenant's commission became available.

A new lieutenant took on part of the crew as his immediate subordinates and commenced to supervise certain functions of the ship. The number of lieutenants aboard ship varied according to its size. The largest American vessels, the so-called super frigates, usually had a complement of six. The senior lieutenant acted as the captain's second-in-command. At sea, the captain ruled over all aboard as an absolute dictator, his authority backed by centuries of naval tradition and an elaborate set of codes and punishments that preemptively presumed his judgments sound and his disciplinary actions just (Heidler and Heidler 2004, 192).

Discipline

The captain wielded unqualified authority out of necessity. Common seamen and officers alike endured the difficulties imposed by living in extremely close quarters, and discipline was essential to maintaining order. Consequently, regulations were strictly enforced, though the typical sailor was prone to violate rules. The tedium of long cruises led to fights, drunkenness, and insubordination. Most offenses were punished with flogging, the number of lashes depending on the seriousness of the transgression. When the captain or a formal court-martial imposed a sentence of flogging, all hands were required to witness the punishment to deter them from straying as well. Yet stray they did, and such punishment scenes regularly occurred aboard American naval vessels (Heidler and Heidler 2004, 192).

Harsh punishments, bad food, boring routines, and the potential for horrible death in battle could not deter sailors from a life at sea. The prospect of adventure doubtless appealed to many, and hard times threw unskilled workers into the martial life, as it did on land as well as at sea, but they took pride in their ships and never embarrassed their country. The American navy during the early Republic carried the flag to far-flung ports in peacetime. In times of trouble, it comported itself with keen efficiency and admirable skill. It began to build a widespread reputation for having the best officers and the most able seamen in the world (Heidler and Heidler 2004, 192–93).

Battle

Discipline was crucial to ensure proficient conduct during a naval battle, an event so violent and chaotic that it could paralyze an inexperienced crew. Everyone had to be trained to perform his duty during battle not only without hesitation but also with reflexive speed (Heidler and Heidler 2004, 193).

At first sight of an enemy vessel, drumbeats sounded the command to clear the decks for action and post to battle stations. Limited space below decks typically meant that gun decks were used for sleeping and eating, and an impending engagement required the clearing of hammocks and tables so that gun crews could load and run out their pieces. The upper deck and gun deck quickly became scenes of apparent confusion that were actually highly organized drills practiced hundreds of times. Sailors meanwhile darted through the rigging to set sails best to maneuver the ship into range of the enemy. As the ship closed on the enemy, captain, helmsman, and sailing master worked together to keep the ship's profile from being fully exposed to enemy fire as gun crews began testing their ranges. Ships could maneuver for hours, firing only sporadically, trying to secure the "weather gauge," the upwind position that provided significant advantages over an opponent. The object was to bring all the ship's guns to bear (a broadside) while minimizing the risk posed by enemy fire. Everything depended on the wind and the crew's skill in handling sails, an especially unpredictable chore when enemy shot damaged masts and rigging, making it difficult to maneuver the ship. While the captain shouted instructions to maneuver the ship, he and his officers also barked orders regarding the ordnance: starting with "cast loose your guns" to ensure that the guns were no longer lashed to the bulwarks, followed with orders to load, "run" (put the muzzle out of the gun port), "aim," "prime" (put powder in the touchhole), and finally "fire!" (Heidler and Heidler 2004, 193) (Robotti and Vescovi 1999, 83–86).

If the ships closed, they increased their rates of fire, and engagements often became slugfests of endurance. Shouting officers paced among seamen loading and firing heavy cannons whose concussions shivered every timber in the ship and whose recoil snapped taut, straining ropes that barely kept the weapons in place. Salvos from the enemy hurtled with earsplitting shrieks and found their target with horrifying results, ripping wide holes in planking and throwing up large splinters of wood that could be deadlier than shot and shell. Gun deck crews continued firing in intense heat and choking smoke as explosions and debris maimed those they did not kill. Sand spread on decks prevented them from becoming slick with blood, but dismembered bodies impeded work and were either shoved to the side or sent to the surgeon's table. The frenzy panicked many, especially those new to battle, but if they tried to flee, the ship offered few avenues of retreat. Officers and their noncommissioned mates had the duty of forcing the frightened back to their posts. An officer confronting unreasoning terror might even resort to killing an escaping sailor with his sword or pistol as an example to everyone else that it was safer to fight the enemy (Heidler and Heidler 2004, 193–94).

Men aloft handled the sails, or what was left of them, and those on deck prepared to repel boarders if the enemy grappled his ship to theirs. Every warship had a complement of marines whose primary job was to take positions in the rigging to shoot enemy officers and to fend off and fight boarders. Marines took charge of prisoners if a ship surrendered without being boarded.

Depending on advantages in size, guns, and wind, naval battles could be over in minutes or lengthen into hours, especially ones with relatively equal opponents. Prolonged fights inflicted staggering damage to both ship and crew, and officers suffered especially high mortality rates.

The ship's surgeon and his mates tended to the wounded. They did their best to remove casualties while the engagement raged around them, and those with a chance for survival were rushed to the sickbay, where the surgeon amputated mangled limbs and stitched up wounds. Many who survived this initial trauma died either of shock or from infections that were a common consequence of unsanitary medical practices (Heidler and Heidler 2004, 194).

Health

The surgeon's most frantic periods were during and immediately following battles, but he was constantly busy at other times as well. Close quarters, spoiled food, foul water, and fetid air below decks meant that there were always plenty of sick sailors. Some surgeons were trained physicians, while others learned their craft through apprenticeship like many civilian doctors. They employed at sea the same medicines and techniques as their civilian counterparts on land: bleeding and purgatives were the most common remedies, treatments that never cured and sometimes killed. If the ship had one, a chaplain conducted the funerals that were sadly regular events; the captain did so otherwise. With the entire ship's company assembled, appropriate readings from the scriptures preceded the tipping of the corpse, wrapped in a canvas shroud, into its watery grave (Heidler and Heidler 2004, 194).

Epilogue

The only unconditional laws of human existence are those of change and imperfection. Numerous ancient fables and modern tales revolve around the simple wisdom of the indisputable constant in all human affairs: "This too shall pass." Equally numerous stories point to the reality that all things are alloyed. The years of the early Republic were no exception. By the early 1800s, almost 200 years of European settlement had steadily made its mark on the land of America, first on the eastern seaboard, then on its interior. The remarkable progress of settlement, however, was often at the expense of lands left barren and exhausted by overplanting, and its advance frequently deprived Indian populations of birthrights and dignity (Heidler and Heidler 2004, 197).

As colonies became states and the Confederation became the constitutional republic, agriculture remained the chief occupation throughout the nation, but as the first two decades of the nineteenth century ended, a remarkable revolution in farming was already taking place. Farmers used more and better implements to increase yields. Experiments in novel farming techniques revealed a continuing American fascination with innovation and improvement. Meanwhile, other Americans strode westward, clearing fields and notching logs for windowless cabins, attracted to that hard life by the expectation that hard work would make them prosperous and keep them free. After the War of 1812, Americans exhibited a renewed dedication to their experiment in liberty and even more confidence in the apparently boundless possibilities for their country. Crops filled the fields, factories prospered as their numbers increased, canals and turnpikes lured investment and hurried commerce, and nothing seemed beyond the reach of a new nation whose unofficial motto might have been "We can do anything" (Heidler and Heidler 2004, 197–98).

Yet the people of the early Republic could not do some things at all, at least for the time being. They could not ease the plight of native peoples for whom expanding white settlements posed an increasing threat. Unable to fashion a satisfactory solution to this cultural as well as physical collision of Indians and whites, Americans would resort to the shameful program of taking Indian lands and removing their inhabitants to regions beyond the Mississippi River. In a similar way, the immorality of slavery in their free republic left them more stymied about resolving this inconsistency with each passing year. Slavery by 1820 was peculiar to the South, but the question of whether it could expand into territories already loomed in the angry debates over Missouri's admission to the Union. To the enslaved, the troubling contradiction of slavery and freedom was more than a disruptive social, economic, and political question. For them, it regulated every aspect of their existence. For those blacks who had shaken the bonds of slavery, or even for those who had never known it, its taint still cast a huge pall over their lives. Farmers guiding their plows across dawn-lit fields in Ohio, planters watching the gangs trudge to the cotton rows, and the slaves themselves with callused hands could not have known the terrible cost this moral dilemma would exact. In 1820 freedom was more than a generation away for these people, a freedom that would be bought with more than 600,000 American lives.

Nor did these Americans realize that the Industrial Revolution was dawning, its effects and consequences destined to change forever the lives of everyone. With its impressive technological advances, the coming industrialism would make goods previously reserved for the wealthy staples of everyday households. It would also create a new type of laborer, the factory worker. These men and women did not farm or learn arcane skills or ply special trades. They instead adjusted their lives to clocks, clanging bells, shrill steam whistles, and the unremitting din of well-oiled, tireless machinery. Their workplaces were at first in rural settings because running streams provided the first sources of power, but cities often grew around these early factories, eventually transforming the surrounding countryside into bustling junctions of trade, culture, and people. There would be new theaters, museums, and art galleries; but there would also be squalid slums with hollow-eyed children, broken men, and women old before their time (Heidler and Heidler 2004, 198).

Yet the revolution in what later generations called consumerism—people of the early Republic would have called it material progress—crushed eighteenth-century social and economic theories about the rigidity of class systems. What happened in these pivotal years in America should also discourage the modern tendency to dismiss the buying and selling of things as coarse consumerism and exploitative commercialism. European intellectuals asserted that only necessity made poor people work, but the American experience revealed that theory to be nothing more than condescending hogwash, to use an Americanism grating to European ears. In America, aspirations to a better life encouraged and emboldened all classes, a circumstance that was a true break from old European ideas of society and the proper place for people in it. By acquiring the material comforts of more elevated social classes, one could reach a state of gentility. The result might be seen as a paradox for the earnest republicans who rejected kings and disdained aristocrats, but it was not really. By making gentility the normal course of progress for ordinary people, Americans turned the trappings of aristocracy into a hallmark of democracy. In America, where anybody could achieve the status of "gentleman" or "lady" through hard work, anything was possible, even the emancipation of slaves, eventually. European observers might have assumed that the reward for hard work—the accumulation of material comfort—was merely another example of America's lack of refinement, but that snobbish attitude missed the point. In America, the accumulation of material comfort was an evolutionary step to the creation of a society far different from that imagined in the doomsday predictions of a Malthus and more egalitarian than any envisioned by the violent prescriptions of a Marx (Heidler and Heidler 2004, 198–99).

The changes that marked America during these years were not entirely about the getting of things. Americans were a literate people, a result of religious convictions, economic necessities, and political obligations. Foremost they believed that only educated citizens could preserve free government. Inherited as part of the Puritan legacy of learning, America's thirst for knowledge either matched or surpassed any other place in the world. Furthermore, the concerns prompted by religious revivalism meant a growing compassionate impulse that found expression in charitable institutions, embryonic abolitionism, and reform movements fighting alcoholism, rampant gambling, prostitution, and a host of social ills. Rather than the product of persistent, grim Puritanism, these efforts were a demonstration of buoyant faith in the betterment of mankind, a logical melding of Enlightenment rationalism with romantic optimism. In any case, Americans were not always toiling to better themselves or improve others. They took time to court, to marry, to make love, to raise children, to laugh, to stroll country lanes or city parks (Heidler and Heidler 2004, 199).

The ordinary American in 1820 might well have described his or her life by distilling it to such essentials. Americans' philosophical embrace of the principles that had driven the Revolution a generation earlier did not mean that they were necessarily a philosophical people. They inclined toward action rather than introspection, and the liberties they enjoyed were tangible evidence of sacrifices, not abstract rhetorical flourishes for a political speech (Heidler and Heidler 2004, 199–200).

CHANGES AND CONFLICT, 1821–1861

Chronology, 1821–1861

1821 March 5: James Monroe is inaugurated for a second term as president of the United States

1822 May: Denmark Vesey is executed for plotting a slave uprising

President Monroe vetoes the Cumberland Road Bill, which authorized improvements to the Cumberland Road or National Turnpike

1823 December: President Monroe includes the declaration later known as the Monroe Doctrine in his annual message to Congress. The doctrine stated that the United States would look upon European intervention in the Americas as an unfriendly act

1824 March: Henry Clay of Kentucky first outlines his American System, a program of protective tariffs and internal improvements

December 1: No candidate for president receives a majority, throwing the presidential election into the House of Representatives

1825 February 9: House of Representatives elects John Quincy Adams as the sixth president of the United States, giving him the votes of 13 states, with seven voting for Andrew Jackson and four voting for William Crawford

March 4: Inauguration of John Quincy Adams

Charges of a corrupt bargain are raised by Jackson supporters against Henry Clay, who supported Adams in the House vote and who was then appointed secretary of state by Adams

1826 July 4: Thomas Jefferson and John Adams both die on July 4, the 50th anniversary of the Declaration of Independence

1827 April: Baltimore and Ohio Railroad incorporated, and becomes the first railroad to be organized in the United States

1828 May 19: Passage by Congress of the Tariff of 1828, the so-called Tariff of Abominations

December: First nullification crisis

South Carolina nullifies the Tariff of 1828

Andrew Jackson is elected the seventh president of the United States, defeating John Quincy Adams's bid for a second term

1829 March 4: Andrew Jackson is inaugurated as the country's first western president

1830 January: Daniel Webster debates Robert Y. Hayne over states' rights and the nature of the Union

May: President Andrew Jackson signs the Indian Removal Act into law

1831 January: Abolitionist William Lloyd Garrison begins publishing *The Liberator*

Spring: Political breach develops between President Jackson and Vice President John C. Calhoun

August 22: Nat Turner, a radical slave preacher, is killed as he leads a bloody slave revolt in Virginia

1832 November: South Carolina nullifies the Tariff of 1832

December 5: Andrew Jackson is reelected president, defeating Henry Clay

1833 March 2: President Andrew Jackson utilizes the Force Bill against South Carolina, but Henry Clay provides a compromise

March 4: Inauguration of Andrew Jackson for a second term as president

September: President Jackson removes public funds from the Bank of the United States, the recharter of which he opposes

December: American Anti-Slavery Society is organized

1834 January: Whig Party is formed as opposition to the Jacksonian Democrats

June 21: Cyrus McCormick's mechanical reaper is patented

1835 December: President Jackson recommends passage of a bill to prohibit the circulation of antislavery literature through the U.S. mail; the bill was defeated in 1836

1836 February 25: Samuel Colt's revolver is patented

March 6: Mexican General Antonio Santa Anna captures the Alamo at San Antonio, killing all the Texans defending the fort

Upon the expiration of its charter, the Bank of the United States ceases to exist as a national institution

April 21: General Sam Houston defeats Santa Anna's army at the Battle of San Jacinto

May: House of Representatives adopts the Gag Rule preventing consideration of petitions calling for the abolition of slavery; the right to present such petitions is strongly defended by former president John Quincy Adams, now a representative from Massachusetts

December 7: Vice President Martin Van Buren, a Democrat, is elected the eighth president of the United States

1837 March 4: Inauguration of Martin Van Buren as president

May: Panic of 1837 gains strength, leading to many bank failures and widespread economic hardship

1838 June: Forced removal of Cherokee from Georgia by the U.S. Army begins the "Trail of Tears"

1839 August: Cuban slave ship *Amistad* is brought into New Haven, Connecticut, by a U.S. naval vessel

November: Antislavery Liberty Party is founded in New York State; James G. Birney is nominated as the Liberty candidate for president

1840 December 2: William Henry Harrison, a Whig, is elected as the ninth president of the United States, defeating incumbent Democratic president Van Buren

1841 March: Africans from the *Amistad* are freed by the Supreme Court to return to Africa

April 4: President William Henry Harrison dies of pneumonia after serving only 40 days in office

Vice President John Tyler succeeds to the presidency

1842 August 9: Webster-Ashburton Treaty is concluded between the United States and Great Britain

1844 May 24: Samuel F. B. Morse sends first telegraph message: "What God hath Wrought?"

December 4: James K. Polk of Tennessee, a Democrat, is elected as the 11th president of the United States, defeating the Whig candidate, Henry Clay

1845 July: Republic of Texas formally agrees to annexation to the United States

The term Manifest Destiny is first employed, appearing in a newspaper article by John L. O'Sullivan

1846 May 13: United States declares war on Mexico as a result of tensions arising from the U.S. annexation of Texas

May–September: First battles of war fought at Palo Alto, Resaca de la Palma, and Monterey

June 15: Settlement of the Oregon Dispute between the United States and Great Britain

June–July: Bear Flag Revolt brings Mexican California under U.S. control

August 8: David Wilmot of Pennsylvania introduces the Wilmot Proviso into Congress calling for a ban on slavery in any territories won from Mexico

1847 February 22–23: American forces under General Zachary Taylor win a victory at the Battle of Buena Vista

March 9: American forces under General Winfield Scott land at Vera Cruz in eastern Mexico

April–August: General Scott's army marches toward Mexico City, winning victories at Cerro Gordo and Churubusco

September: U.S. forces enter Mexico City

1848 January 24: Gold is discovered in northern California

February 2: Treaty of Guadalupe Hidalgo ends the Mexican War by giving a half million square miles of the West to the United States

July: Seneca Falls (New York) convention adopts a series of women's rights resolutions

November 7: Zachary Taylor, a Whig, is elected as the 12th president of the United States

1849 March: Department of the Interior is created

1850	July 9: President Zachary Taylor dies and his succeeded by Vice President Millard Fillmore
	September: Compromise of 1850 extends the bounds of legal slavery and strengthens the Fugitive Slave Act
1852	March–June: Harriet Beecher Stowe's *Uncle Tom's Cabin* appears first as a serial and finally as a complete novel
	November 2: Franklin Pierce, a Democrat, is elected as the 14th president of the United States, defeating the Whig nominee Winfield Scott
1853	December: United States completes the Gadsden Purchase, buying the southern portions of the present-day states of Arizona and New Mexico from Mexico
1854	January: Kansas-Nebraska Act, which would repeal the Missouri Compromise and substitute the concept of popular sovereignty, is endorsed by northern Democrats
	February: Antislavery proponents form the Republican Party in reaction to the Kansas-Nebraska Act
	May 30: Kansas-Nebraska Act is passed by Congress and signed by President Pierce
1855	December: A virtual civil war over slavery exists along the border between Kansas and Missouri
1856	May 22: Senator Charles Sumner is beaten with a cane by Rep. Preston Brooks of South Carolina in the Senate Chamber of the Capitol
	Fiery abolitionist John Brown kills five proslavery men at Pottawatomie Creek in Kansas
	November 4: James Buchanan, a Democrat, is elected as the 15th president of the United States
1857	March 6: Supreme Court hands down its decision against Dred Scott and declares the Missouri Compromise of 1820 unconstitutional
1858	June: In Illinois, the Republican Party chooses Abraham Lincoln to run for the Senate against Stephen Douglas
	Lincoln gives his famous "House Divided" speech
	August–October: Lincoln and Douglas engage in a famous series of debates
	Douglas wins the Senate seat
1859	October 18: John Brown is seized by federal troops led by Lieutenant Colonel Robert E. Lee at Harper's Ferry
	December: John Brown is tried, convicted of treason, and hanged
1860	May: Republican Party nominates Abraham Lincoln for president
	June: Democrats nominate Stephen A. Douglas for president, though southern delegates withdraw from convention, refusing to support Douglas
	November 6: Lincoln wins election in a four-way race, becoming the first Republican president
	December: South Carolina votes to secede from the Union
1861	January–February: Six other southern states (Mississippi, Florida, Alabama, Georgia, Louisiana, and Texas) secede and form the Confederacy

April 15: With the bombardment of Fort Sumter, President Lincoln calls for 75,000 volunteers to defend the Union

Virginia joins the Confederate States, followed by Arkansas, North Carolina, and Tennessee

American Civil War begins

RELIGIOUS LIFE
SLAVERY

The United States entered into the dawn of a new era in 1821. America's growth potential during the next 40 years seemed unlimited. The expansion westward offered new opportunities for those who were looking for the independence and adventure that the new territories had to offer. This was particularly true for the waves of immigrants that began to enter the United States beginning in 1840 and extending through the outbreak of the Civil War in April 1861. Cities began to grow larger and more crowded as immigrants looked for opportunities in industries that were expanding during this period. Coupled with this were advances in technology that facilitated the growth of the American economy, as well as enabling people to travel greater distances.

The development of canals in the 1820s and 1830s would help transport goods over greater distances and allow those goods to get to markets faster. The canals would soon be superseded by the development of steam locomotives and the growth of the American system of railroads that would soon begin to crisscross the nation. The change from the birth of the United States to its birth as an industrial nation couldn't have been better symbolized than when a signer of the Declaration of Independence also signed the charter that established the Baltimore and Ohio Railroad in 1827. The period would also see the invention of the telegraph, which allowed for communication over great distances. The railroad and the telegraph also created new towns as the nation expanded westward, for towns began to develop along the rail lines and the telegraph helped these towns stay in contact with the cities in the East.

The economy of the United States began to grow as it became more diverse. The agricultural society that had been envisioned by Thomas Jefferson at the opening of the nineteenth century was now giving way to an industry-based economy. Small factories began to spring up, and as demand increased for goods and raw materials such as iron, these small factories began to grow, and with them came the need for more workers. More people, particularly immigrants, many from Ireland and Germany, began to seek work in the industries that were arising during the 1850s. As cities grew, so too did the problems of overcrowding, crime, and disease.

The future for the American Republic seemed bright in 1821, but the optimism of the 1820s would soon be overshadowed by growing sectional tensions over slavery. The Missouri Compromise of 1820 seemingly settled sectional differences over the institution of slavery in the new territories, but as America began to expand farther westward, and as the northern population and industry grew, there were many in the North who felt that slavery should not be allowed to expand westward. Northerners came to see slavery as an anachronism that was holding the country back in its development as an industrial nation and a free-labor society. There were also voices in the North who believed that slavery was a moral abomination and they called for its complete abolition. As America moved through the 1840s, the voices calling for the abolition of slavery became louder, and with the victory in the war with Mexico (1846–1848), the split that had begun to develop between North and South became wider.

Southerners began to see slavery less as a moral question and more as a matter of their rights within the Union and a cornerstone of their understanding of the republic. The debates that had developed during the votes for the approval of the Declaration of Independence and the Constitution demonstrated the ferocity with which the southern states would fight to maintain what they saw as their way of life. The idea that states had a right to ignore those federal laws that were outside the scope of the Constitution had been promulgated by Thomas Jefferson and James Madison in the Virginia and Kentucky Resolutions of 1798. The idea of states' rights took on a greater meaning in the working out of the Missouri Compromise, as it became clear to southerners that the North's growing population and its economic prosperity were a threat to its way of life, which for many meant the maintenance of the slavery in the South. Over the next four decades, both sides would become more hardened in their stance over slavery, and the result would lead to the most destructive war in American history.

CHANGE IN AMERICAN POLITICAL CULTURE, 1820–1828

The idea of popular government in America began to become a reality during the 1820s. Property qualifications that had denied many adult white males the right to vote were slowly abolished during the first 30 years of the Republic, so that by 1825, all adult white male citizens could vote in every state except Virginia, Rhode Island, and Louisiana. By 1840, the number of white adult male citizens who could vote in their local, state, and national elections would reach 90 percent. There arose a feeling that every man had a say in government and that political office was now open to those who did not belong to the elite class that had governed the country up to this point. This idea was particularly popular in the developing western territories, where many who had left the poverty of the East felt that they now had a voice in shaping the development of their new land.

The development of political parties, which had begun in the 1790s with the Federalists and Democratic-Republicans, took shape as the 1820s progressed. Despite the idea that democracy would allow the common man to shape political ideas, in many cases it was the interests of businessmen, bankers, and speculators, who used their economic wherewithal to shape legislation at every level of government. They used their influence to gather ordinary people into political groups that would come to dominate the government in America.

Although it was true that 90 percent of adult white male citizens could vote in America by 1840, there was a large segment of the population that still could not, and this included unnaturalized immigrants, women, free blacks, slaves, and Indians. Although women would become influential throughout the century through their participation in volunteer organizations that allowed them to exercise public influence, electoral politics remained largely the province of men. For many, the term "manhood suffrage" meant exactly that; women were to remain at home and raise the children and take care of the household, and men were to attend to political matters. The influence of women in the political sphere would become more pronounced as the Civil War approached, as it was women who were in the vanguard of many reform movements in the North.

Free blacks, North and South, generally had no right to vote as it was thought they were not fit to exercise the franchise. There was no possibility of blacks gaining the right to vote in the South, but before the outbreak of the Civil War, free blacks did gain the right to vote in a few New England states.

GROWTH OF POPULAR PARTICIPATION

The participation of more people in the political process during this period could be seen in the increase of public meetings to discuss issues that directly affected them. It also gave the elites a forum that enabled them to maintain their political power. These gatherings also helped gauge public opinion on various issues and allowed a free exchange of ideas that led to compromise on many issues.

Another development that marked the change in the American political landscape was the growing number of newspapers that were now available to the public. The growing literacy rate, coupled with a desire to garner information from distant sources, spurred the expansion of the newspaper industry in America. Now the paper was more than just a venue for merchants to advertise their goods, but a source of information that people found to be necessary in their lives. There were also the many public forums that were used to address the various issues that confronted them. Public entertainments, such as traveling shows, lectures, and demonstrations of technological or medical breakthroughs, also contributed to the growing political culture in America as politicians saw these gatherings as an opportunity to promote their political views.

THE PRESIDENTIAL ELECTIONS OF 1824 AND 1828

The new political culture in the United States came to the fore during the presidential election of 1824. At the beginning of the decade, state leaders began shaping party politics as it was seen that political parties could provide an arena that allowed for the contentious issues to be debated and compromises reached to solve problems, thereby strengthening the nation. The Democratic-Republicans, who had started under Thomas Jefferson's and James Madison's direction, began to split apart after the War of 1812. New leaders such as Henry Clay of Kentucky and John C. Calhoun of South Carolina began to sponsor federal programs to improve America's infrastructure, policies that had been advocated by the defunct Federalist Party on the national level. On the local level, leaders such as Martin Van Buren in New York formed the opposition to the power of old, elite families who had dominated local government for years. It was this growing split within the Democratic-Republicans that led to the contentious election of 1824.

Five candidates, representing five factions of the party, ran for president in 1824. John Quincy Adams of Massachusetts and Henry Clay of Kentucky represented the nationalist wing of the party; John C. Calhoun of South Carolina represented those who supported states' rights from the Lower South; Andrew Jackson of Tennessee represented the values of Jefferson, with belief in limited government and an agricultural economy; and finally William Crawford also supported traditional Jeffersonian ideals of government. As a result of so many candidates running for office, none was able to obtain a majority in the Electoral College, which caused the election to be sent to the House of Representatives. Calhoun had dropped out of the race to receive a vice presidential nomination, with the result that Adams received 84 electoral votes, Clay 37, Crawford 41, and Jackson 99.

Adams was elected by the House and became president, which caused a great deal of consternation not only with Jackson, but across the nation as well. Having gained the support of Henry Clay, who mobilized votes from New England and the Ohio Valley, Adams won despite having fewer popular votes than Jackson. The fact that Clay was then made secretary of state, considered a stepping-stone to the presidency, led many to cry foul over what was seen as a corrupt bargain made to steal the presidency from the people's candidate. Calhoun feared that the alliance formed between the northern and western interests might align against the South. This was partially correct, as Clay's American System, which called for the government to spend funds for internal improvements such as roads, tariffs, and a national bank to boost the developing economy, was supported by Adams.

Southerners feared that the growing power of northern and western interests would weaken their political power and lead to their subjugation and the loss of their rights. Opposition of small farmers was added to the growing objections to Clay's plan, which was only partly enacted. Sectional differences also arose over Adams's support of an import tariff in 1828, characterized as the "Tariff of Abominations" by southerners, who believed that the money would be funneled into northern industry and that the South would receive nothing, something that was not true. Adams's attempts at establishing better relations with South American nations were blocked by southerners who feared that such relations would create unrest among the slave community. Although Adams had worked to try to heal the rifts caused by the election of 1824, they were only exacerbated, and the result was that the election of 1828 led to a major political realignment.

The feeling that the election result of 1824 had been the result of a corrupt bargain led to the belief that special interest and privilege had stolen the election from the people. Some political leaders argued that for the people to be heard, a more effective system of party organization was needed. This process had already started in New York under the leadership of Martin Van Buren, who created a system of party loyalty that would become integral to the American political system. Seeking to break the power of Governor DeWitt Clinton, Van Buren established party loyalty through the assiduous use of patronage to reward those who supported the party. This system spread to other states, like South Carolina, where Senator John C. Calhoun used it as a base to oppose the Tariff of Abominations and to promote the idea of nullification, which would become important in the 1830s and again in the decade leading up to the Civil War in 1861. The symbol of the change that was occurring in American politics can be seen in the death of two of the men most responsible for the establishment of America's independence, Thomas Jefferson and John Adams. Both men died on July 4, 1826, 50 years to the day that the Declaration of Independence was signed, and with their passing, the generation that had established the nation and warned about the proper place of political parties in a republic passed into a new generation that moved America into a new age of growth and the creation of the "Second American Party System" on the idea that political parties were essential to democratic order.

The new party organization that brought Andrew Jackson victory in 1828 was built on the increased involvement of the average citizen in the political process. Many of the property qualifications that had been instituted to limit the involvement of the common people in politics were being eliminated in favor of adult white male suffrage. Coupled with this, the emergence of the penny press, which focused its reporting on political issues on the local and national level, made the average citizens aware of the issues that affected them. As a result, people took a more active role in selecting candidates for political office, whether for their local town council or president of the United States.

THE AGE OF JACKSON

The election of Andrew Jackson as president in 1828 would have a long-lasting effect on the United States up to the outbreak of the Civil War in 1861. Jackson's use of presidential power led to the establishment of the Whig Party, questions as to the role of the federal government in the economy, the role of Supreme Court, and most importantly the issue of states' rights.

Limited Government

Jackson came to office determined to sweep away the old order that he felt had stolen the election of 1824. As a result, the Democrats rewarded their supporters with appointments to federal jobs, which ensured their loyalty to the party. The idea that "to the victor go the spoils" became firmly established in American politics. Jackson viewed his presidency as an opportunity to change the role of government in the life of the average citizen. The first objective on Jackson's agenda was to limit the presence of the federal government in the economy, in particular the use of federal funds for the interests of individual states, which Jackson and the Democrats believed would not serve the nation's interests. Following this limited view of government, Jackson used his veto powers to stop the funding for projects such as the building of roads and the establishment of protective tariffs and a national bank, believing that this would reduce the national debt and limit the presence of the national government in the lives of its citizens.

The Nullification Crisis

As Jackson looked to decrease the power of the federal government, he had to deal with a crisis that threatened the federal union and later informed secession in 1861, the nullification crisis. The Tariff of 1828 had enraged southern planters and had led to fears that northern and western business interests would overwhelm their plantation economy. It also signaled the South's declining political power in the nation, which along with the use of antislavery criticism of southern life, fostered a "minority self-consciousness" among white southerners. They became increasingly suspicious of anything that threatened their interests, especially slavery, and came to see antislavery threats in any word or action directed against them. In 1830 John C. Calhoun, who was Jackson's vice president, anonymously published a pamphlet titled *The South Carolina Exposition and Protest* that not only condemned the tariff, but also promulgated the Doctrine of Nullification. It declared that the Constitution was a compact of equal parties and that the violation of that compact, or contract, nullified its terms. Thus, an individual state could nullify a national law if it went against the interests of that state. This was an idea that had been loosely suggested by Thomas Jefferson and James Madison in their opposition to the Alien and Sedition Acts in 1798, though they balked at secession as the ultimate remedy for an aggrieved state. Calhoun's doctrine posited that secession was right.

Nullification struck directly at the authority of the federal government, and debates in Congress further exacerbated the feelings on both sides of the issue. Senator Robert Hayne of South Carolina argued for the right to oppose what he saw as an attempt by northern business interests to crush the South. Senator Daniel Webster of Massachusetts countered that the interests of the nation far outweighed the interests of individual states. Jackson, who believed that the protective tariffs were unfair, nevertheless believed that nullification was unconstitutional and was not in the interests of the nation. When a further tariff was passed in 1832, the crisis reached its head when the South Carolina legislature that November declared the tariffs null and void. Jackson acted swiftly, and in January 1833 asked Congress to enact a Force Act that would use the army and navy to enforce federal authority. He also called for a compromise measure that would allow South Carolina to save face and rescind the nullification order. Having little support from other states, and faced with the use of military force, Calhoun resigned as vice president and was elected to the Senate, where he worked with Henry Clay on a compromise tariff measure. The crisis had been averted this time, but as the controversy over slavery increased in the late 1840s, Calhoun would again emerge as the leader of the states' rights movement.

The Bank of the United States

As the nullification crisis wound down to its conclusion, Jackson faced off against what he saw as the symbol of elite interests in the country, the Bank of the United States (BUS). The bank had been chartered by Congress in 1816 in part to control the flow of money, particularly the issue of paper money by state banks, which would devalue its value. It had been successful in doing this, and it was seen as a bulwark against a depression, although many believed, particularly in the West, that it was merely holding back economic development by limiting the amount of credit that local banks could issue. There were also eastern businessmen who looked to establish banks of their own in the West, and thus wished to see the BUS disbanded.

Since its charter was only for 20 years, the bank needed Congress to renew it in 1836 to continue, but supporters of the BUS brought the issue of the bank's charter up for a vote in 1832. Jackson used the opportunity to reject the charter on the grounds that the bank only served the interests of the elite and not the farmers, mechanics, and laborers of America, as well as undermining the rights of the states to regulate their economies. Jackson vetoed the measure, and it withstood the efforts by supporters of the bank to override it. Jackson would use the issue of limited government in the election of 1832.

The Indian Question

As Americans began to expand westward, one of the most pressing questions that faced the federal government was what to do with Indians living on lands with great economic potential. Government policy that had been adopted after the American Revolution had been to sign treaties with the various Indian nations that exchanged land for territorial rights. This treatment of the Indian tribes as sovereign nations changed during the Jackson administration. Having carried out expeditions against the Indians during the period of the War of 1812 that forced the Creek Indians off lands that they occupied in Tennessee, Alabama, and Georgia, Jackson continued this policy into his two administrations. He supported the passage of the Indian Removal Act, which called for the forced removal of the Indians in the states east of the Mississippi River to territories west of it. The Cherokee Indians in Georgia adopted a constitution and appealed to the Supreme Court to define their status as an independent nation, and therefore not subject to the laws of Georgia. In *Cherokee Nation v. Georgia* of 1831, the Supreme Court ruled that the Cherokee were subject to the federal government, and were not separate governments. In the appeal case of 1832, *Worcester v. Georgia,* the Court ruled that because they were protected by the laws of the federal government, the state of Georgia could not violate the rights guaranteed in treaties, which would have protected the Cherokees from being forced off their land by the state. Jackson refused to accept this, and sent federal troops to forcibly remove the Blackhawk Indians from western Illinois, and then sent troops into Florida and Georgia to remove the remaining Creek and Seminole Indians there, and send them to Indian Territory, as part of an Indian removal policy that began with removing the Choctaw from the Mississippi territory. The resulting campaign to remove the Cherokee in 1838 led to a forced march of 1,200 miles for over 14,000 Indians by General Winfield Scott that resulted in the death of over 3,000 elderly and very young Indians in what came to be known as the "Trail of Tears" by the Indians.

The Election of 1832 and the Establishment of the Whig Party

Opposing the view of limited government were the National Republicans who believed that the only way for America's economy to move forward was through the use of federal funds for the improvement and building of roads across the nation, for the regulation of capital through a central bank, and with protective tariffs to encourage industry. A federal banking system would be used to invest in the projects, and to maintain the money collected from federal tariffs that would be used to build the economy. This was part of the American System that had started in 1815 under the leadership of Henry Clay, and was supported by members of the party, which still looked to gain support from the elites of society. The National Republicans hoped that Clay would return them to the White House in 1832, but the superior organization and party loyalty of the Democrats led to another Jackson victory.

Using his election as a mandate to eliminate the Second Bank of the United States, Jackson removed the government's gold and silver reserves into state banks to destroy the bank before its charter ended in 1836, and he succeeded. Despite the efforts of supporters to maintain the bank, Jackson and the Democrats were victorious, and his opponents were convinced that they needed to organize like the Democrats. The result was that in 1834 a cross section of varying interests across the country came together to form the Whig Party. Under the leadership of men like Henry Clay and Daniel Webster, the Whigs looked to limit the power that Jackson had come to wield as president, and to limit the influence of the common people in the governing process. Whigs believed that most people were incapable of understanding the nuances of the governing process, and that the elite class should handle important decisions that affected the nation, an idea that is present in Plato's *Republic*.

The members of the Whig Party, like the Democratic Party, came from all parts of the country. In the East they were made up of primarily businessmen and traditional elites who were supporters of Clay's American System. Westerners found government involvement in supporting the building of roads, bridges, and canals in the burgeoning cities of the western territories appealing. In the South, there was a new elite, who although still tied to a slavery-based economy, backed government-supported projects to break away from the old plantation aristocracy that they believed was holding back economic growth in the South. There was also a moral reform movement within the party that appealed to many voters. The idea that the upper and middle classes should lead the way in solving the problems of the lower classes, such as poverty, alcoholism, slavery, and indolence, fed into the idea of the superiority of the elites in American society. They feared a government by the lower classes—consisting of immigrants, common workers, and Catholics—and united to prevent government from being controlled by the common mob. It was a message that allowed the Whigs to make serious inroads into the hold the Democrats had on government at all levels by the elections of 1836. Although they were unable to prevent a Democrat, Martin Van Buren, from capturing the White House, they would muster enough power to capture it in 1840 with the election of William Henry Harrison.

AMERICA AND A CHANGING ECONOMY

The conflicting platforms of the Democratic and Whig Parties were a reflection of the competing visions that Americans had for the future of the country. The country was predominantly an agricultural nation, which was the vision that Thomas Jefferson had for the future of the United States when he was president, but as the nation moved through the first half of the nineteenth century, new ideas of commerce and technology began to slowly transform the nation into an urban and commercialized economy. It was a process that created new opportunities for the ambitious to gain wealth and stature; it was also an unsettling sign to those of the old order, who saw the traditional values that they held dear being swept aside in the quest for wealth and status.

The one region that felt particularly threatened by the change in America's economy were the planters of the South, particularly as it related to the institution of slavery. The cotton economy, which had found a growing market in Europe, had become very profitable with the invention of the cotton gin in 1793. The use of slaves to work the cotton fields, rather than using hired hands, had greatly increased the profits that were taken in by southern planters. Between 1830 and 1860, half the totals of America's exports were due to cotton. Southern planters moved their operations westward with the nation, and slavery grew in the states of Kentucky, Louisiana, Tennessee, Mississippi, Alabama, Arkansas, and Texas. Southerners believed that slavery should be allowed to continue to expand westward with the nation. Unless slavery could expand, it would die—or so southerners believed. They thus feared that without open access to western territories, the southern economy would be dominated by northern and western business interests that would reduce the South into a vassal of northern and western business interests. Southerners viewed any limitation on slavery as a direct assault on their liberty, which contributed mightily to increasing sectional tensions through the 1840s and 1850s, and led to secession and war.

The movement of southern planters was accompanied by westward migration from the northern states as well. Many of these settlers looked to find better land than the rocky soil of New England and had heard of the availability of fertile and expansive land tracts in the West. The continuing proliferation of state banks made it possible for farmers to get the credit they needed to buy large tracts that they couldn't get in the East. Federal laws that favored preemption—the right of those who were squatters to have the first right of purchase and also reduced prices on land that had not sold—were enacted into law by Congress in the years between 1820 and 1850 and helped to create a rush of settlers into the West that would continue for the remainder of the century.

THE INFRASTRUCTURE OF GROWTH AND THE GROWTH OF INDUSTRY

Henry Clay's American System had called for the government to fund the projects that would enable the nation's economy to grow. During the last decade of the eighteenth century, Americans had cut trails through forests to facilitate the movement west and had built roads or turnpikes in many of the northeastern states that allowed for the transportation of goods to and from the cities. These roads slowly made their way west, and by 1850 they reached to Illinois. As more people moved westward, the road network began to grow. But there were other ways that people could move as the century progressed, and these played an increasingly important role in the development of America's economy.

The use of rivers to transport materials and commercial goods was faster than overland transport in the early part of the century. The building of canals also became important in developing the nation's economy. Early in the century most river traffic consisted of boats that were moved by sail, or, in the case of canals, through the use of mules that pulled the boats from shore. What made this method of transport more efficient was the development of the steam-powered vessel. First in the East in 1807, by the mid-1830s in the West, and by midcentury on the Mississippi River and its tributaries, the steamboat provided effective transport on waterways. Combined with the canals of the East, like the Erie Canal in New York, the steamboat tied together the growing commercial centers of the West with the industrial cities of the North. The steamboat also made possible the expansion of cotton westward, furthering not only the expansion of slavery but also the growing specialization in cotton production. The South thus became more tied to the national economy but also more dependent on it, a condition that would lead to its growing suspicion of northern and western economic and political motives.

The introduction of steam power was not relegated to riverboats and ships. The use of steam to power locomotives began to take shape in England in 1825 with the first railway operation, then came to the United States with the chartering of the first American railroad, the Baltimore and Ohio, which was chartered on February 28, 1827, and construction of which began on July 4, 1828. In 1833, Andrew Jackson became the first president to ride on a railroad when he rode in a B&O train. Other railroads soon began to pop up along the East Coast and moved west over the next 30 years. The crude nature of early steam locomotives, and the problems with track construction and safety, made railroad travel very dangerous, but the potential for travel and commerce was enormous. By the beginning of the Civil War, over 30,000 miles of track had been laid. The railroad drove America's economic and industrial growth from midcentury into the first half of the twentieth century.

The origins of America's factory system can be traced to the textile mills of New England. The modern industry that would turn the United States into an economic giant by the end of the nineteenth century began in Lowell, Massachusetts, in 1822. By developing a water-powered plant that brought the processes of spinning and weaving together in one location, and by using large investment capital and unified management, and specializing in the manufacture of one type of cloth that didn't require any particular skill, the factories of Lowell had paved the way for future industries in the United States. Also, in the machine shops of the textile factories, mechanics developed machine tools and skills that contributed much to America's industrial takeoff by midcentury.

THE NEW IMMIGRANTS

The influx of immigrants, particularly in the 1840s and 1850s, increased the labor supply, pushed settlements westward, and contributed to the rapid growth of cities, but also led to increased tensions between the ideas, interests, and identities of native-born citizens, and the vision that the new arrivals had of the American dream. These would play a key role in the development of the country, and the political and social conflicts of the 1840s and 1850s.

Immigration from Europe had been curtailed by the War of 1812, and had remained low during the 1820s. During the 1830s the numbers began to rise, increasingly with people coming from Ireland, but with significant numbers of English and others in the flow. The numbers of Irish coming to the United States exploded during the 1840s—a result of the potato famine that struck Ireland in 1845. Over the next 10 years, more than 200,000 Irish came to America per year, settling mostly in northern port cities such as Boston, New York, Philadelphia, and Baltimore. Unable to afford the cost of traveling west and buying land, most remained in the city, living in tenements or other cheap housing. Most males took up work at low pay as unskilled laborers, and women took up jobs as domestic servants or seamstresses. The influx of immigrants resulted in terrible overcrowding in the cities, and the tenements and boardinghouses that these immigrants came to live in were bastions of filth, disease, and crime. The majority of these Irish immigrants were Catholic, and therefore were looked upon with suspicion by native Protestant white Americans who feared the Catholic Church as an authoritative institution loyal to a foreign power. Most Irish were actively recruited by the Democratic Party and helped to enhance the power of the political bosses in many cities like Boston, New York, and Philadelphia.

Germans were the other large immigrant group that came into the United States during the 1830s and 1840s. Many of these immigrants sought to escape from declining economic conditions in their homeland, and others were fleeing the failed revolutions of 1848. They differed from the Irish in that many Germans had connections with German communities that had established themselves in places like Pennsylvania and Ohio. They also had more money available to them when they left their homeland, which allowed many to establish farms in their new home, and many had skills that made it possible for them to obtain higher-paying jobs. Once they arrived in the United States, they moved into western cities like St. Louis, Milwaukee, Cincinnati, and Chicago, some to New Orleans, and some even into the state of Texas. Still, large numbers of Germans settled in eastern cities, especially New York, Philadelphia, and Baltimore.

THE RISE OF NATIVIST SENTIMENT

The influx of large numbers of immigrants during the 1830s and 1840s, coupled with the overcrowding that was occurring in the cities, and the declining birthrate among middle-class urban Protestant white Americans at this time, led to calls for limits on the numbers of immigrants coming into the country. Because the Irish and Germans were being actively recruited by the Democratic Party, there were many who saw this as a threat to the American political system. As a result, the first secret society that looked to limit the number of immigrants allowed into the country emerged with the creation of the Native American Association, which in 1845 would become the Native American Party. By 1850 it formed alliances with other nativist organizations that became the Supreme Order of the Star Spangled Banner, which called for more restrictive naturalization laws, stringent literacy tests for voting, and the banning of Catholics and other aliens from holding public office. The policy of secrecy that was enjoined upon its members called for them to answer "I know nothing" when asked about their political views, and resulted in people calling them the "Know Nothings." The party maintained its greatest strength in states in the Northeast like New York and Pennsylvania, and it even gained brief control of the government of Massachusetts by 1854 under the banner of the "American Party." As the sectional controversy raged during the 1850s, the strength of the Know Nothings waned, and they disappeared as a party, although a new surge of immigration in the 1870s and 1880s would see the reemergence of the nativist movement in the United States.

THE ELECTIONS OF 1840, 1844, AND THE MANIFEST DESTINY

Looking to capitalize on a depression that hit the country in 1837, the Whigs decided to follow the example of the Democrats and ran an old soldier and Indian fighter, William Henry Harrison, for president against Jackson's successor and friend Martin Van Buren in 1840. In what became known as the "Log Cabin Campaign," Harrison was elected president with 53 percent of the popular vote and 234 electoral votes to Van Buren's 60. The Whigs expected to begin to implement their policies of economic expansion through government subsidies, to raise tariffs to protect American industries, and to recharter the Bank of the United States. All these plans came to an end with the sudden death of Harrison in April 1841 after a brief battle with pneumonia, supposedly brought on by his two-hour inaugural speech on one of the coldest days in Washington, D.C., without the benefit of an overcoat. His successor, Vice President John Tyler, was a former Democrat who blocked many of the programs that the Whigs, led by Henry Clay, had looked to initiate. Tyler was thrown out of the Whig Party, but the damage had been done, and when the election of 1844 approached, it became clear that the Whigs were vulnerable.

The issue that led to the Democrats regaining control of the White House was the annexation of Texas. Texas had fought for its independence from Mexico in 1836, which the Texans won with Sam Houston at their head at the Battle of San Jacinto on April 21. Texas sought to join the Union in 1836, but because the admission of such a large slave state into the Union would create sectional tensions, Jackson had delayed any action and Texas became an independent republic. As the United States entered the 1840s, the idea of "Manifest Destiny" gripped the country. Spread across the country by the "penny press," it called for a "vast empire of liberty" that would spread across not only America, but Canada, the Caribbean, Mexico, and into the islands of the Pacific. There were many, particularly Henry Clay, who warned that expansion would reopen the slavery controversy in the United States, but the rush to the West drowned out these warnings. Americans pushed westward.

Southern Democrats, pressing for the annexation of Texas, looked for a way to gain the support of their northern brethren, and found it in the Oregon territory, where a boundary controversy with the British had created much heated debate and the talk of war. As more and more Americans began to move west of the Mississippi in the 1840s, the call for the annexation of Texas and a solution to the Oregon boundary led to the Democrats nominating James K. Polk, a former Speaker of the House, for president in 1844. Polk won the election over Clay, and with the admission of Texas as a state in February 1845, tensions between the United States and Mexico began to increase. Realizing that he needed to concentrate his resources against Mexico, Polk settled the boundary question over Oregon with the British in June 1846 by setting it at the 49th parallel. Wanting to acquire the Mexican territory of California and New Mexico, Polk looked to enter into negotiations with Mexico, while at the same time sending an army under Brigadier General Zachary Taylor to the Nueces River in Texas to await developments. When Mexico rejected Polk's offer to purchase California and New Mexico, he sent Taylor's army to the Rio Grande River, which the Americans claimed was the boundary of Texas, while the Mexicans claimed it was the Nueces. The stage had been set for a conflict that would forever change the United States. The Mexicans attacked a part of Taylor's force, and Polk used the incident as a pretext to declare war in 1846.

THE WAR WITH MEXICO, 1846–1848

Although it had been anticipated that the war with Mexico would be concluded quickly, it went on for two years. The Whigs claimed that the war had been set up by the Polk administration, and as the war dragged on, many Americans in the Northeast and Midwest especially believed that the war had been started under dubious circumstances. Zachary Taylor had been ordered into northern Mexico and was to capture Monterey and to push on to Mexico City. Taylor captured Monterey in September 1846, but his advance toward Mexico City was slow, and hampered by a lack of men and supplies. Meanwhile, Polk had orchestrated the capture of New Mexico and then California through the use of the army, navy, and American residents who taken up arms against the Mexicans.

With the northern advance into Mexico City bogged down, Polk turned to the commanding general of the army, Major General Winfield Scott, to lead an invasion of Mexico from Vera Cruz on its east coast. Polk feared that Taylor would become a political rival if he succeeded in taking Mexico City, so he looked to Scott to diminish Taylor's popularity. Scott led 14,000 men on a campaign that saw few American casualties, and led to the capture of the capital. The government of Antonio Lopez de Santa Anna fell, and a new government was forced to settle with the United States to end the war.

In the Treaty of Guadalupe-Hidalgo, Mexico agreed to cede California and New Mexico to the United States and acknowledge the Rio Grande as the boundary between Mexico and Texas. The United States agreed to pay Mexico $15 million and assume any claims its new citizens had against Mexico. The agreement didn't achieve Polk's dreams of annexing much of northern Mexico into the United States, but as events would prove, the war had reopened the sectional controversy over the issue of slavery.

THE ELECTION OF 1848 AND THE SECTIONAL CRISIS

The victory of the United States over Mexico had opened up vast new territories in the West, and led many to question whether slavery should be allowed in the new territories. In 1846, before the start of the war, Polk had asked Congress for $2 million to negotiate with Mexico to gain California and New Mexico. Congressman David Wilmot of Pennsylvania attached a proviso to the bill that prohibited slavery from any territory gained from Mexico; the bill passed the House, but was defeated in the Senate. Southerners decried the bill as an attempt by northerners and westerners to deprive them of their right to own slaves and the freedom to move them into the new territories, while northerners and westerners saw slavery as an evil that should not be extended any farther in the United States. Polk tried to have the Missouri Compromise line extended to California where slavery would be banned north of the line and allowed south of it. Others supported a plan that would eventually become known as "popular sovereignty" whereby the residents of the individual territories would vote on whether to allow slavery into their midst. Both parties attempted to bury the issue during the presidential election of 1848, but the issue would not go away.

When Polk announced that he would not run for reelection in 1848 due to ill health, the Democrats nominated Lewis Cass, a party regular, while the Whigs nominated Zachary Taylor, the hero of the Mexican War. The fact that both candidates skirted the issue of the expansion of slavery was evident by the emergence of the Free Soil Party with former president Martin Van Buren as its candidate. The Free Soil Party opposed the extension of slavery into the territories and called for a platform that allowed for free labor in the territories. Taylor went on to win the election, but the Free Soil Party polled over 290,000 votes, and sent 10 members to Congress, a clear indication that the issue of slavery could not be glossed over any longer.

Further exacerbating the issue was the discovery of gold in California in January 1848, news of which spread throughout the country and then the world. Hundreds of thousands of gold seekers flocked to California. Many were to be disappointed and would drift into poverty or move to other gold and silver strikes in the West, while others would look to establish themselves in California as merchants and farmers and would lead successful lives. There were also many Chinese who managed to make their way to California in hopes of finding gold and returning to their homeland rich. Most would meet with failure, and would begin working on the growing railroads that began to spread through the West at that time, and would become the backbone of the workforce that would build the transcontinental railroads after the Civil War. With more people heading west, it now became imperative that some solution to the sectional crisis be found.

Taylor believed that statehood would solve the problem of slavery in the territories, so he pushed for California to be admitted as a state in December 1849. Because it was clear that California would enter as a free state, southerners feared that the balance between slave and free states would be upset, and that the admission of Utah, Oregon, and New Mexico would further the power of the North and West to move against slavery. Many southern leaders began to talk openly of secession, and it looked as though civil war was about to break out.

THE COMPROMISE OF 1850

To avoid the outbreak of war, in January 1849 Henry Clay moved to introduce a compromise bill that would avert sectional strife and, he hoped, bring an end to the slavery question. His bill called for the admission of California as a free state, the formation of territorial governments from the lands gained from Mexico without restrictions on slavery, the abolition of the slave trade but not slavery in Washington, D.C., and a more stringent fugitive slave law. The bill created a political firestorm, and after six months of haggling, nothing had been accomplished. Taylor threatened to veto the bill, and this led to an attempt by younger members of Congress to look for a way to get the bill passed. One obstacle was removed when Taylor died suddenly after eating too many cherries and consuming too much iced milk at a July 4 celebration in Washington. His successor, Vice President Millard Fillmore, desired compromise, so the path to compromise was clear. Senator Stephen A. Douglas of Illinois broke the bill into individual parts so that those who objected to certain portions of the bill could maintain their integrity by not having to vote for any obnoxious provisions. This, coupled with backroom deals that Douglas made, allowed the bill to clear Congress in September 1850. Fillmore signed the bill and declared that the sectional problem had been solved, but this was not the case.

THE ELECTION OF 1852 AND THE KANSAS-NEBRASKA ACT

As a result of the passage and signing of the Compromise of 1850, many northern Whigs left the party and joined the Free Soil Party and its candidate John P. Hale. Thus began the rapid unraveling of the Whigs over the slavery question. The Whig candidate for president in 1852 was another hero of the war with Mexico, Winfield Scott, while the Democrats nominated New Hampshire congressman Franklin Pierce for president. Pierce won the election, but on his way to Washington for his inauguration, his train derailed, and his young son was killed in front of his and his wife's eyes, an ominous sign that marked the tenure of Pierce's presidency. He tried to avoid the divisive issue of slavery, but as northern opposition to the Fugitive Slave Act increased, northerners increasingly ignored it or subverted it by aiding fugitive slaves. Southerners grew more angry over a key piece of the Compromise, and believed northerners had betrayed the "compromise" and could no longer be trusted to keep their word.

With more Americans moving into the western territories, there was an increased call for the building of a transcontinental railroad, but the problem arose as to where it should be built. This led to further sectional tensions. Northerners favored Chicago as the eastern terminus, while southerners favored St. Louis, New Orleans, or Memphis, and the battle lines were now drawn. The southern route had originally been rejected because it would pass through Mexican territory, but this was solved when the secretary of war, Jefferson Davis, sent James Gadsden to negotiate a settlement with Mexico over the strip of land that lay in what would be modern-day New Mexico and Arizona, which was accomplished at a price of $10 million. But then events took a turn that would lead the country on the road to civil war.

Stephen A. Douglas, whose work on the Compromise of 1850 had thrust him into the national spotlight, now looked for a way to get the transcontinental railroad to pass through Chicago, thereby cementing his hold on political power and promoting westward expansion. To do this, he introduced a bill that called for opening up the territory of Nebraska to white settlement. Southerners opposed the bill because the territory was north of the Missouri Compromise line and would be closed to slavery, so he proposed that the territorial legislature would vote on whether to permit slavery in the territory, thereby leaving it up to the people. Southerners were not happy with this and demanded further concessions, so Douglas attached a measure to the bill that would repeal the Missouri Compromise, and create two territories, Kansas and Nebraska, organized under the principle of "popular sovereignty," with Kansas being the more likely to accept slavery. The bill, which was known as the Kansas-Nebraska Act, tore apart what was left of the Whig Party and also led to many defections by northern Democrats who opposed the repeal of the Missouri Compromise. The members of both of these groups joined a new political party that was opposed to the Kansas-Nebraska Act and the extension of slavery into the territories—the Republican Party. In the midterm elections that year the Republicans won enough seats in Congress so that when they joined up with the Know-Nothings they were able to control the House.

BLEEDING KANSAS AND THE ELECTION OF 1856

The movement of settlers into Kansas began almost as soon as the bill had been signed into law, and in 1855 elections were held to choose a state legislature. Helped by the incursion of armed proslavery forces from Missouri, a proslavery legislature was elected. The legal inhabitants of the territory, who were opposed to slavery, then held separate elections in Topeka and adopted an antislavery constitution and immediately applied for statehood after electing a legislature and choosing a governor. Their petition was rejected by Pierce, who denounced them as traitors, then recognized the proslavery government as the legal government. As a result, proslavery forces descended on the town of Lawrence and burned the Free Soil governor's house and sacked the town. In retribution for this action, antislavery forces led by the fiery abolitionist John Brown murdered five proslavery settlers by hacking them to death with a machete. This, the "Pottawatomie Massacre," was only a preview of the violence that would continue right through the Civil War.

Another incident that symbolized the increasing violence over the issue of slavery took place in the Senate of the United States. After Senator Charles Sumner of Massachusetts gave a stinging speech denouncing the violence in Kansas and the institution of slavery and verbally attacking Senator Andrew Butler of South Carolina, Congressman Preston Brooks, a relative of Butler, attacked Sumner with a cane, beating him so severely that Sumner was unable to return to the Senate for four years. Sumner became a martyr in the North for his stance against slavery, and even though he was censured by Congress for his actions, Brooks was elected by the people of his South Carolina district to resume his seat in Congress and to continue caning enemies of slavery.

With the nation beginning to come apart, the election of 1856 further confirmed that the parties were still avoiding the issue of slavery. The Democrats nominated James Buchanan, a solid party man from the key state of Pennsylvania; also because he was serving as minister to Great Britain during much of the crisis, he was not directly tied to the slavery troubles threatening the party. The Republicans, making their first appearance on the national level, nominated a safe candidate in John C. Fremont, an army officer and explorer, with a platform that focused on internal improvement programs and no further extension of slavery into the territories. The Know-Nothings and Whigs, both of whom were breaking up, nominated Millard Fillmore. Buchanan narrowly won the election, but the choice could not have been worse as events during his presidency would mark him as an indecisive and weak leader.

THE DRED SCOTT CASE AND FURTHER TRAGEDY IN KANSAS

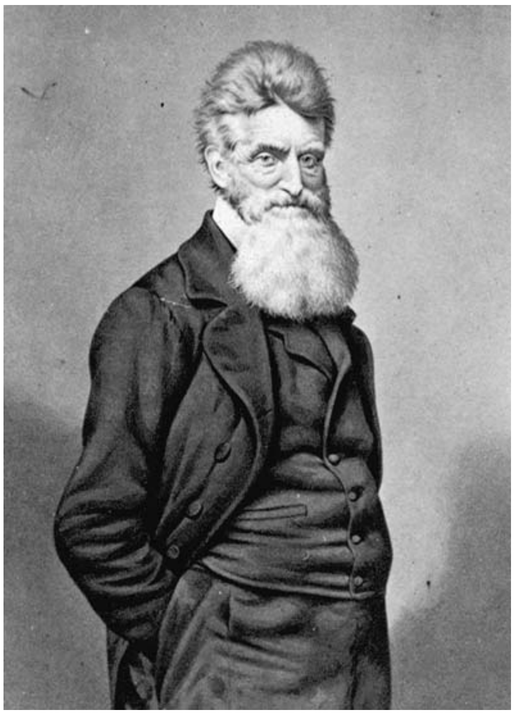
The first crisis that confronted Buchanan was the Supreme Court's decision in the case of *Dred Scott v. Sandford* on March 6, 1857, which would further galvanize both sides in the slavery issue. Dred Scott had been a Missouri slave owned by an army surgeon who had taken him into Illinois and Wisconsin as a result of his assignments. After his master had died, Scott sued the surgeon's widow for his freedom stating that his residence in free territory liberated him, and his claim was upheld by a circuit court in Missouri in 1850. The surgeon's widow, Irene Sandford Emerson (the Court had her name in the legal document as "John F. A. Sandford"), appealed the ruling to Missouri's State Supreme Court, which overturned the circuit court's ruling. Scott then appealed to the federal courts, and Sandford's attorneys argued that he had no right to do so as he was not a citizen. The case went before the Supreme Court, and, writing the majority opinion, Chief Justice Roger Taney stated that because Scott was a slave, he was property, and because the Fifth Amendment prohibited Congress from taking property without "due process of law," Scott had no basis to appeal to the courts. In effect, the decision declared the Missouri Compromise unconstitutional and undermined popular sovereignty, for if Congress could not bar slavery from entering a territory, no territorial legislature, a creation of Congress, could do so.

The opinion led to great celebrations in the South, where it was seen as a vindication of their argument that the federal government had no right to interfere with slavery and the extension of it. Northerners saw it as another example of how the power of southern slave interests had subverted the government. Buchanan supported the decision, and then tried to resolve the Kansas controversy, but only made the situation worse.

Buchanan proposed that Kansas be organized as a state, which led to the call by proslavery forces for a constitutional convention to be held in Lecompton. The constitution would legalize slavery, and there would be no opportunity given for the voters to reject it. When an election for a new legislature was called for, free soil and antislavery forces won a majority and submitted the Lecompton Constitution for a vote, and it was rejected by a 10,000-vote margin. There had been fraud and violence on both sides during this process, but it was clear that the majority of the people of Kansas did not want slavery in their midst. Buchanan bowed to congressional pressure and pushed for the admission of Kansas as a slave state; with that the idea of popular sovereignty, espoused by Stephen Douglas, would essentially be dead. With the support of western Democrats, Douglas managed to have the bill die in Congress. In 1858 a compromise was reached that called for the question of slavery in Kansas to be submitted again, and if the residents voted for it, Kansas would be admitted as a slave state, if they rejected it, their admission would be delayed; the latter is what happened. It wouldn't be until the end of Buchanan's tenure that Kansas would be admitted as a free state in 1861.

THE LINCOLN-DOUGLAS DEBATES AND JOHN BROWN'S RAID

The midterm elections of 1858 for Congress and the Senate gained great importance as a result of the events over the last two years, and it would be the debates for the Senate in Illinois that brought Abraham Lincoln to the national stage and led him to the White House two years later. Douglas had been at the center of the slavery controversy since 1850, and his position on slavery was ambiguous at best, according to Lincoln, who as a Whig had served in the Illinois legislature and one term in Congress in the 1840s, and had become a prominent lawyer in Springfield. The Republicans in Illinois tapped Lincoln to unseat Douglas from his Senate seat on the basis of his inability to deal with the slavery issue that was tearing the nation apart. Lincoln was not an abolitionist and did not believe that blacks were socially equal to whites, but he did believe that slavery was an evil that must be prevented from spreading and that the principles of the Declaration of Independence must be respected. He, and members of his party, did not believe they had the legal authority to abolish it where it already existed. The debates led to a great deal of interest as a result of the increasingly ominous tone of the sectional controversy and Douglas's likely bid for the presidential nomination in 1860. Douglas managed to return enough Democratic legislators to the Illinois legislature to be sent back to the Senate (during this time it was the legislature, not the voters, who voted for U.S. Senators). But although Douglas won the election, Lincoln's ability to frame the slavery question as a moral issue and argue for basic rights to one's labor and self-respect won him support across the Republican Party.



Half-length photograph of abolitionist John Brown. Courtesy of the Library of Congress.

On October 16, 1859, the abolitionist John Brown and 16 followers, including his four sons, seized the United States Army Arsenal at Harper's Ferry, Virginia. Brown hoped that this would be the signal for an uprising of slaves in the area, who would flock to Brown, who would arm them, and encourage an armed uprising of slaves that would end human bondage in the South. No slaves came, for U.S. Marines under the command of Lieutenant Colonel Robert E. Lee stormed the arsenal, killing 10 of Brown's followers, and captured Brown. He was then put on trial in Virginia for treason, was convicted, and hung. Before his death, Brown declared that the sin of slavery that existed in the country would only be purged through the shedding of blood; his words would prove to be profoundly prophetic. More important, Brown's courage and dignity as he awaited his death inspired northern intellectuals such as Ralph Waldo Emerson and Henry David Thoreau to celebrate him as a Christian martyr. Southerners were more shocked by the response of northerners to Brown's words than Brown's actions and were convinced the North generally had gone mad with abolitionist fanaticism.

THE ELECTION OF 1860

The death of John Brown had further galvanized the North and the South over the issue of slavery, with southerners believing that Brown's "invasion" was part of a secret northern plot to destroy them, and northerners becoming more determined to end the extension of slavery and check the "slave power." The Democratic Party entered the election divided between southerners who wanted slavery protected and expanded, and westerners who believed in popular sovereignty, and northerners who wanted to protect slavery without conceding it too much power. During the Democratic convention in Charleston, South Carolina, delegates from eight southern states walked out rather than nominate Douglas, and a candidate was not picked until the northern Democrats met in Baltimore and chose Douglas for their candidate and southerners met later in Richmond and nominated John C. Breckinridge as their standard-bearer. The Democratic Party was split in two. The Constitutional Union Party, made up of border states, chose John C. Bell as a compromise candidate. The Republicans, sensing that they had a clear shot at gaining the White House, passed over more prominent candidates like William Henry Seward of New York and Salmon P. Chase of Ohio to choose Lincoln as their candidate for president. The reason for this was because Lincoln's eloquence, his moderate stance on slavery, and his obscurity would appeal to moderate Democrats and former Whigs. The results of the election bore out the party's choice as Lincoln garnered 180 electoral votes, far outdistancing his opponents, even though he won only 39 percent of the popular vote and no votes from the South. The Republicans failed to win a majority in Congress, but they did well overall. The South now believed their only choice was to secede from the Union.

SECESSION AND THE BEGINNING OF THE CIVIL WAR

Equating Republicans with abolitionism and race war, and believing that their position was untenable with the Republican president in the White House, southerners from the Deep South urged secession. South Carolina was first to leave on December 20, 1860. It was followed by Mississippi (January 9, 1861), Florida a day later, then Alabama on the 11th, Georgia on the 19th, Louisiana on the 26th, and Texas on February 1st. That same month, representatives from the seceded states met in Montgomery, Alabama, and formed the Confederate States of America and began to occupy federal forts within their boundaries. Buchanan had told the states in December that they had no right to secede, but also said that the federal government had no right to stop it—a perfect position for a man whose indecision had marked his presidency. Most of the federal forts in the South were quickly occupied by Confederate forces except for Fort Pickens in Pensacola, Florida, and Fort Sumter, under the command of Major Robert Anderson in the harbor of Charleston, South Carolina. Fort Pickens would remain in federal hands throughout the war. It would be the standoff over Sumter that would lead to war.

Buchanan had tried to send supplies to Sumter in January 1861, but Confederate guns in the harbor had turned the ships back. When Lincoln was inaugurated on March 4, the stalemate continued. Lincoln made it clear that the fort was federal property and would remain so. He informed the South Carolina authorities that a ship that only had food and water would attempt to resupply the fort and that if they were fired upon, the government would resist. On April 12, after driving away the relief ships, the Confederate government ordered the commander of the forces in Charleston, Brigadier General Pierre Gustave Toutant Beauregard, a former student of artillery of Anderson's at West Point, to open fire on the fort. After a two-day bombardment, in which only one soldier in the fort lost his life, due to one of its guns malfunctioning, Anderson surrendered the fort. Lincoln then called for 75,000 volunteers to put down the rebellion, and, as a result, four more border slave states, Virginia (April 17), Arkansas (May 6), Tennessee (May 7), and North Carolina (May 20) seceded. And the war came.

Domestic Life

The antebellum period, particularly in the American South, conjures images of oversized verandas, lazy rivers churned by the paddle wheels of luxurious steamboats, exaggerated hoop skirts, and trees hung with Spanish moss. At first glance, the slower pace of the Civil War antebellum period, 1820–1860, seems to have rendered it an era untouched by time. The South seemed to cling to an idyllic, if mechanically inefficient, simplicity while remaining suspended in the past like a character in a romance novel. Meanwhile, the North was developing its industrial strength and a modern sophistication concerning business, ethics, and morality. To meet the needs of an expanding nation, canals, railroads, fabric mills, and cities filled with immigrants all seemed to spring from the very soil of the North. This simple dichotomy between North and South is the stuff of history textbooks and grammar school recitations, but the antebellum period was actually exceedingly complex and replete with contradictions.

American society and culture was at once chivalrous and crude; hospitable and harsh; and bold and backward. It is difficult today to conceive of a society that could elevate civility, personal behavior, and honor to such high standards, and yet perpetuate an institution that denied basic human status to a large portion of its population. Individual southern plantations were virtually self-sufficient "city-states" lacking little in the way of food or the means to provide for their daily needs; yet the region was almost totally dependent upon remote markets, manipulative agents, and manufactures located in the North or England. The plantation aristocracy ruled the South like feudal lords, but they were critically starved for cash, virtually steeped in perpetual debt, and constantly fearful lest their slaves should kill them in their beds.

Moreover, the entire cultural life of the nation seemed to radiate from the great cities and universities above the Mason-Dixon Line. Notwithstanding its cultural accomplishments during the period, the North with its urban centers was no American Zion. Northern reformers, while reveling in their vast catalog of reform movements regarding abolition, public education, temperance, prison reform, and women's rights, seemed incapable of separating the unfortunate victims in society from a personal responsibility for their plight. Reformers and idealists emphasized cultural integrity, social rehabilitation, and personal reformation among the poor of the teeming and increasingly industrialized cities of the North, but the northern elite remained intolerant of immigrants, Catholics, the poor, or free African Americans living in their midst. Consequently, the poor stayed in their crime-ridden environment; women and children were continually abused by derelict husbands and fathers; alcohol flowed freely until the twentieth century; and the freed slaves remained on the bottom rung of social and economic life.

It is commonly taught in history class that a handful of states, formed into a weak republic after the American Revolution, were welded into a nation in the crucible of civil war. Yet the antebellum period was a time when America gained much of the morality, ethical strength, and integrity that characterized the nation during that conflict. The antebellum period was a bridge from the innocence of the early years of isolation on the Atlantic Coast of North America to that of a mature nation willing to take its place in the wider world and stand astride the continent like a colossus. The period saw the establishment of free public schools and esteemed institutions of higher learning, advances in art and artistry, and unforeseen developments in technology and productivity (Volo and Volo 2004, ix).

MODERNIZATION

As the antebellum period began, America was approaching its golden anniversary as an independent political state, but it was not yet a nation. There was considerable disagreement among the residents of its many geographical sections concerning the exact limits of the relationship between the federal government, the older states, and the individual citizen. In this regard, many factions invoked concepts of state sovereignty, centralized banking, nullification, popular sovereignty, secession, all-Americanism, or Manifest Destiny. However, the majority deemed republicanism, social pluralism, and constitutionalism the primary characteristics of antebellum America. Slavery, abolition, and the possibility of future disunion were considered secondary issues, at least until the 1840s (Volo and Volo 2004, 3–4).

Cultural and social changes were sweeping the cities of America during the period. Industry and urbanization had moved the North toward a more modern society with an unprecedented set of novel cultural values, while the South had essentially lagged behind in the traditions of the eighteenth century. The mixing of traditional folkways with a more modern vision of America had caused social influence, political authority, and traditional concepts of family to become uncertain, unstable, and somewhat ambiguous. Historians have noted that the differences between the "folk culture" of the South and the "modern culture" of the North fueled the broad-based reform movements of midcentury and may have ignited the turmoil over state sovereignty and slavery in a form of "culture war." The debate surrounding these questions, driven by an intensely partisan press, "not only aroused feelings of jealousy, honor, and regional pride, but raised fundamental questions about the future direction of the American society" (Volo and Volo 2004, 3–4) (Sewell 1988, xi).

The most obvious modern element in northern society was the rapid growth of its urban centers as more and more people flocked to the cities to find work in the factories. Although the class structure was still dominated by the old social elite, a new middle class was striving to become socially acceptable; and it was becoming increasingly difficult for the community to distinguish between the two. Unfortunately, the distinctions between these and the urban lower classes continued to be characterized by sharp contrasts in wealth, ethnic origin, and religion. The lower classes of the North were exceedingly poor and composed, in large part, of immigrants. Between 1820 and 1860, the top three major countries of origin, respectively, were Ireland, Germany, and Great Britain. These three supplied 85 percent of all immigrants to the United States in the antebellum period (Fehrenbacher 1969, 100).

In 1800, the entire United States had been an essentially rural country. Fewer than 6 percent of its population of five million lived in towns with populations larger than 2,500. Only Philadelphia and New York had populations greater than 25,000. The settlement of the Mississippi Valley and the Northwest Territories during the first half of the nineteenth century had contributed to a vast internal migration. Ironically, as the number of family farms increased, so did the population of the major cities. By 1850, the population of the country had risen to 23 million, and more than 30 percent had settled in towns larger than 2,500 persons. Although three-quarters of the population were still involved in agriculture, the expansion of commerce and industry had drawn almost two million factory workers into towns that were both old and new. The urban population thereby became the fastest-growing segment of the population (Volo and Volo 2004, 4).

The number of towns having more than 10,000 persons increased from 6 to more than 60 in less than half a century. Cities as distinct as Providence and Chicago were experiencing similar rates of growth. A number of small coastal towns became booming cities by midcentury in response to America's rise to maritime greatness in the clipper ship era. Boston, Salem, Portland, and New Haven, for example, were all active coastal trading cities in 1850. Salem was among the top five seaports in the nation with respect to the value of the trade that passed through it annually. Other towns grew due to their proximity to railroads. Boston alone was the terminus for no fewer than seven railroads. Westward expansion along the growing system of canals and the successful navigation of the western rivers by steamboats made a number of inland ports equally important. These included Buffalo, Syracuse, Cleveland, Pittsburgh, Cincinnati, Louisville, Memphis, Natchez, and St. Louis (Volo and Volo 2004, 4–5).

The cities that had been the largest at the turn of the century remained so and experienced the greatest rates of population growth. By 1850, New York City boasted a population of more than 500,000 people. Philadelphia, Boston, Newport, Baltimore, New Orleans, and Charleston had grown to hold hundreds of thousands of persons. Nonetheless, southern cities had attracted less than 10 percent of the population of the region. The physical size of American cities also increased from less than a one-mile radius to that of four or five miles. Northern cities were characterized by a well-defined and established business district and the beginnings of the suburbs. Unfortunately, there was also an enormous growth in slums, tenements, and ethnically segregated residential areas filled with the poor and uneducated.

Many of the poorest immigrants were Irish Catholics. The Irish were the first truly urban group in America, living in crowded slums rife with crime and disease and experiencing severe religious prejudice at the hands of the Protestant majority. "Help Wanted" advertisements were often followed by signs stating, "Irish Need Not Apply." One of the ironic characteristics of the new modernism in northern society was the simultaneous existence of antislavery sentiment and severe ethnic prejudice among upper-class Protestants. This is especially surprising in view of the prominence of social reform movements in the North (Volo and Volo 2004, 5).

The South was a structured hierarchical society tied to tradition and continuity rather than progress and change. Southerners strove to maintain a romanticized version of the old aristocratic order as it was before the American Revolution. They were remarkably intolerant of social reform and disdainful of activism; yet they thought of themselves as well mannered, chivalrous to women and children, religious, and protective of all that was still fundamentally good in America. They lionized the stratified, but benevolent, social order portrayed in the nineteenth-century romance novel and often acted the parts of popular fictional characters in their response to real-life situations in a way that seems preposterous to us. The "miserable artisan and his daughter," too much honored by the slightest notice of the son of the plantation master, retained the "insolence" to tell him that his notice was unwelcome (Volo and Volo 2004, 5) (Scott 1831, 9).

FAMILY

The vast majority of southern citizens were small farmers and planned their lives around rural activities and seasonal chores such as barn raising, quilting bees, planting, haying, and harvesting. Family members usually cooperated in completing chores. This togetherness was thought to foster feelings of kinship and traditional family values. Their concept of time was based on general divisions of the day (e.g., sunrise and noon) and the year (e.g., spring and summer), and they set their appointments or ended the workday by this standard. Free white laborers and artisans were paid by the completion of a task, and rarely by the clock or calendar. The system provided continuity in the work relationship between employer and employee, and it was not unusual for one family to be employed by another in the same capacity for several generations (Volo and Volo 2004, 5–6).

While most northerners were still farmers or engaged in processing agricultural products, a growing segment of the population was becoming tied to the cities and factories. Middle-class men who had grown up in the first half of the century could remember a childhood spent living in a family working environment, either on the farm, in a cottage at the mill, or in a room behind the family shop. But as the century progressed, men's work increasingly took place in the special atmosphere of business premises like the factory or office. Fathers commonly left the home to work for 10 to 14 hours, and their children rarely saw them during daylight hours. A father's work and workplace became foreign to his children. This tendency to go to work, rather than to work at home, led to the virtual removal of men from the home environment, leaving it the sole province of the female. With the general availability of the pocket watch, these men increasingly lived their lives by the clock. Factory workers were expected to work in shifts dictated by the public clocks that came to be prominently displayed on towers, in the streets, and on the factory walls. The idea of being on time represented a significant change in the lifestyle of most city dwellers; and since the North was the most urbanized section of the country, being on time became characteristic of northern life (Tosh 1996, 9–15).

Conversely, southerners, who had no need to work by the clock, were often viewed as shiftless and lazy. Southern laborers feared the development of the unprecedented "work for wage" economy of the cities, and they saw northern wage earners as degraded and enslaved persons. The city worker sold himself into economic bondage for a wage, and southerners dreaded the expansion of a similar work for wage system almost as much as abolitionists dreaded the expansion of slavery. Southern whites were clearly anxious to maintain their status as freemen, even if this required that they be very poor freemen. Many in the laboring class believed that the North was determined to enslave them to the factory system or counting house. The modern egalitarian society of the North was viewed with disdain and seen as degenerate and immoral. Rising crime rates in the cities, flagrant and open prostitution, and the squalid conditions of the urban lower classes were proffered as proof of northern inferiority (Volo and Volo 2004, 6).

The South was led by a privileged planter class whose elite lifestyle was maintained at the expense of the rest of society. This planter aristocracy relied on its kinship network and social status as a means to personal success. Outsiders saw southern culture and institutions as backward, inefficient, and harmful to the American nation as a whole. Nonetheless, the southern elite voluntarily assumed the role of benefactor and knight errant to all other levels of their society. This obligation was extended to their slaves in an ambiguous, but serious, way. Many southerners were genuinely concerned for the physical and moral welfare of their slaves but only in terms of continued racial separation and subjugation. Failing to acknowledge the good in southern society because it was tied to slavery caused increasingly acrimonious, alienating, and violent rhetoric to become the norm of political and social debate as the war approached (Volo and Volo 2004, 6–8).

PLANTER ARISTOCRACY

Wealthy antebellum planters saw themselves and their class as the natural leaders of their communities and as a social elite whose wants were rightly supplied by the labor of the rest of society. Historically, the South had been neither democratic nor purely aristocratic. Instead, southern politics had reached a balance much closer to the classical Roman concept of the republic, a public order in which the power rested with an elite group of people who ruled for the good of all. The planters saw an outward display of benevolence toward black slaves, always tempered by the limits of the institution, as a tool that elevated the character of their class—making them independent, generous, affectionate, brave, and eloquent. Slaves and servants not only made their master's wealth evident, but they also helped to sustain it with their labor and their obedience.

Few in the Southern planter class actually had aristocratic roots. This greatly intensified the need of the social structure and the hierarchy to define itself in historically acceptable terms. The planters invented a social mythology in which the blood of their class was deemed noble or at least tinted blue. Many upper-class southerners incorrectly traced their ancestry to the royalty of Europe—a royalty that still ruled due to its blood ties to past kings. Planters with an English heritage might claim their descent from the Cavaliers of the English civil wars of the 1640s. No mere followers of the Stuart kings, planter ancestry might be derived from dukes, earls, knights, and loyal squires who had ridden at Nasby. Those with Scots-Irish blood, who could not trace their ancestors back to the Bruce or Brian Boru, easily found ancestors among the Celtic chieftains of their clan. There were enough southern families who had legitimate family trees of this sort—the Lees, the Fairfaxes, and the Randolphs, for instance—to maintain the truth of the fiction (Volo and Volo 2004, 8).

Although half of the white population of the South had come to the colonies as indentured servants, generations of close and sometimes carefully planned intermarriage spread the supposed royal connections so thin that all families of position and power in the South could claim rule by some form of "divine right." Marriage into an influential family was also a distinct advantage in politics. Thomas Jefferson's father had substantially improved his social standing by marrying a daughter of the well-placed Randolph family, and John Marshall's marriage into the powerful Ambler family brought him influential connections that ultimately led him to a prominent place in the federal government. Whether through birth, marriage, or myth, support of the southern gentry was indispensable for the man who would rise in politics (Volo and Volo 2004, 8–9).

The upshot of all this ancestral mythology was that the planters themselves came to believe it. They behaved in a haughty manner reminiscent of the old nobility of Europe; taught their sons an aristocratic code of social behavior; married their daughters as if sealing treaties between feudal estates; and demanded positions of authority and command in their communities. "Civilization would cease but for the universal desire of white men to become aristocrats," wrote George Fitzhugh in *Cannibals All, or Slaves without Masters* (1857) (Volo and Volo 2004, 9) (Fitzhugh 1857).

As the early decades of the antebellum period wore on, the northern opposition to slavery came to criticize the aristocratic pretensions of the South, and southerners found some necessity to explain themselves. Fitzhugh recorded a defense of the southern way of life that would be used over and over during the antebellum years. "Pride of pedigree . . . ancestral position . . . [and] respectable connexion [*sic*] . . . will, ere long, cease to be under the ban of public opinion. Every man in America desires to be an aristocrat, for every man desires wealth, and wealth confers power and distinction, and makes its owner an unmistakable aristocrat. What vile hypocrisy, what malicious envy and jealousy, to censure and vilify in others, that which every man of us is trying with might and main to attain . . . [the] desire to found a family and make aristocrats of their posterity" (Volo and Volo 2004, 9) (Fitzhugh 1857).

The planter aristocracy successfully dominated southern society for almost two centuries by applying their wealth and political influence to the wheels of government. Their numbers were so small that no more than 50,000 persons—men, women, and children—in a population of several million qualified as part of this class. As long as the planters could support themselves with the products of their own plantations, they were relatively insulated from economic depression and spiraling consumer prices. This economic security, once the hallmark of the great plantations, gradually became less certain as the war approached (Volo and Volo 2004, 9).

KINSHIP

Family was the most conservative and inviolable of upper-class institutions. Many of the best American families had resided in the same section of the country for generations. By the time of the Civil War, there was hardly a family of note that did not occupy at least the same social position that it had of the founding of the republic. Periodically, the family would gather, and cousins, aunts, and grandparents would trace the family tree from long before the Revolution. To maintain their high social position and authority, it was important for socially elite families to have a strong sense of obligation to their blood relatives (Volo and Volo 2004, 10).

In this regard, maternal uncles and aunts played an essential role of great trust. "A mother's trust that her brothers and sisters would take care of the children in case of her death gave special significance to the role of the uncle and aunt." While uncles and aunts could be relied upon for monetary assistance, guidance, or support, nieces and nephews need not be orphaned to call upon them. Extenuating circumstances of many kinds could and did bring the influence of these relatives into play in terms of a tightly knit kinship network. A number of words and expressions have endured expressing this obligation, including "kinfolk," "blood kin," "blood ties," and "kissing cousins" (Clinton 1982, 52–53).

Intermarriage between second and third cousins was common in the South because it perpetuated the family name, fortune, and bloodline. However, it was almost unheard of in northern families. A historical study of southern and northern families numbering 100 each found that 12 percent of southern marriages were between cousins whereas not a single case was found in the northern sample. Although such findings could be laid at the door of southern clannishness, it should be remembered that northern young people living in cities and towns had many more opportunities to meet prospective mates, unrelated to them by blood, than southerners who were largely isolated on farms and plantations (Clinton 1982, 57–58, 233).

With kinship came advantage and obligation. Birth into one of America's leading families was essential to making a political career almost everywhere. Social prominence, business and political influence, and the presumption of ability—whether it was present or not in an individual—were inherited from one's father or uncle in much the same way that businesses, land, or slaves were inherited. Fathers expected their first-born male heirs to follow in their footsteps; they also were protective of their daughters, providing their sons-in-law with influence if not money. Daughters who remained unmarried into their adult years were often given the position of companion to their fathers. Granddaughters in similar circumstances were treated in much the same way, especially in the absence of a living father. Men were similarly solicitous of their nieces, daughters-in-law, and all their children. So pervasive was the assumption that kinship ruled that men were given positions as sheriffs, justices of the peace, militia captains, or county lieutenants by influential relatives without the slightest charge of favoritism being made by anyone in the system (Volo and Volo 2004, 10–11).

Siblings were treated in a hierarchical manner with all the male offspring being given a superior position over their sisters. The inferior position of females, often supported by state law, implied an obligation that was placed upon men to defend the honor of their female relations. A brother could intervene in the affairs of his sisters and their circle of friends with or without their permission. At times these brothers could take on a very combative stance when dealing with a sister's reputation. Female cousins came under the same type of protection. As women were not permitted to correspond with men who were not relations, many young women had no knowledge of men who were not their blood relatives until after their marriage. Even then their social relationships with males were limited to the friends and acquaintances of their husbands (Volo and Volo 2004, 11).

COURTSHIP AND MARRIAGE

The continuation of the family name and fortune through marriage was the most conservative of social institutions, and the rules, customs, and traditions that surrounded courtship and marriage were well established. There were multiple purposes for marriage in this period. The obvious ones were to provide for child rearing and to assure the continuity of the family fortune through the instrument of inheritance. The unspoken purpose was to provide a socially acceptable outlet for sexual relations.

While young men were free to remain single, all young, respectable women were expected to begin seeking out a marriage partner appropriate to their social position as soon as they left adolescence. Nonetheless, a widower with young children was expected to remarry for the sake of his motherless offspring if no appropriate female relation, such as an unmarried sister or aunt, were available to care for them. Before a man could hope to prosecute a courtship successfully, he had to establish himself in a profession or come into his inheritance. Courtships could be protracted if the suitor's financial expectations took some period to come to fruition. This fact tended to drive up the age of eligible suitors or increase the disparity in years between a well-established husband and a young wife still in her childbearing years. In the North, the difference in age between husband and wife during the antebellum period averaged a mere two years, while southern couples were separated by an average of six years (Volo and Volo 2004, 11).

Women who remained unmarried often lived with other relatives and looked to them during financial emergencies. Many young women looked to their maternal aunts and uncles in this regard for support, guidance, and companionship. In the absence of a father or uncle, a young woman might depend on her own brother for a roof over her head. Few men could shirk their responsibilities to a female relative without a loss of reputation and community standing. This was especially true in the South where the role of benefactor was an essential characteristic of plantation life. Nonetheless, an unmarried adult woman was often awkwardly placed in the kinship scheme. Many of these women made their contribution by helping with routine household tasks and could make a few dollars by spinning flax and wool for others. It is from this practice that the term "spinster" has come to refer to an older unmarried woman (Volo and Volo 2004, 11–12).

As the nineteenth century proceeded, a major cultural change took place as women gradually gained a modicum of control over themselves and the property that they brought to a marriage. This generally paralleled a similar movement in Victorian Britain. In many northern homes, the focus increasingly came to rest on the wife and children. In response, there evolved a growing formalism and rigid authoritarianism that antebellum husbands demanded of their families and households when they were present. On southern plantations, an older, more traditional male-dominated formalism—highly characteristic of the eighteenth century—continued to hold sway. Although these factors were most strongly entrenched among the southern planters, they established a trend in marital custom throughout the South. For daughters of the planter class, a man's wealth and reputation were the primary factors in arranging a marriage or choosing a husband. Furthermore, to maintain their social position, intermarriage between cousins far enough removed to dispel charges of consanguinity was common among the planter aristocracy. Finally, women in the South married at a younger age—almost four years younger on average—than their northern counterparts.

A particularly attractive or well-heeled woman might have groups of suitors vying for her attentions. Typically, parents encouraged such groups to call together upon their daughter at home because they believed the practice discouraged gossip. Under such circumstances, young men had little opportunity of measuring the woman's attitude toward their individual suit. Most gentlemen resorted, therefore, to a go-between in the early stages of any serious courting to gauge whether or not their more formal attentions would be rebuffed. The woman's brothers or male cousins often served in this capacity. All but the most eligible men met with a series of mild rebuffs as young women were discouraged by their parents from taking too many prospective fiancés into their social circle before selecting one from a small group of two or three as a husband (Volo and Volo 2004, 12).

Unmarried couples—even those who were formally engaged—might easily offend the community if their behavior was perceived to be sexual in any context. As women were not permitted to correspond with men who were not relations, many young women had no knowledge of men who were not their blood kin or friends of the family. For this reason, they favored cousin marriages, wherein they were at least familiar with their prospective partner. Nonetheless, anxious parents frequently married off their daughters at 15 or 16, fearing that they might become involved in some sexual impropriety that would cause them to be shunned by prospective suitors. Overt sexuality at any stage in a woman's life before marriage would certainly meet with social ostracism and might actually result in criminal indictment for fornication in some jurisdictions (Volo and Volo 2004, 12–13).

Upon their marriage, young women passed from the domination of their fathers to the equally powerful authority of their husbands. Women had little or no legal standing in the courts, could not sign enforceable contracts, and held no tangible assets in their own names in most states. A husband and wife were considered one person in law, and the very existence of the wife was often incorporated and consolidated into that of the husband. Until late in the period, the property brought to a marriage by the wife legally became that of her husband. Many widows disdained remarriage, having in their bereavement finally found relief from the overbearing power of even the best of husbands and fathers. Nonetheless, in some states a widow might lose her property rights to her adult sons, if not otherwise provided for by the will of the spouse. Only for a brief period—usually between puberty and marriage—did women have any real control over their fate. Yet this control was very limited, residing solely in their ability to choose a husband from among a set of suitors acceptable to her family (Volo and Volo 2004, 13).

HOSPITALITY

The North had developed towns and villages as it expanded, spawning numerous public houses and inns every few miles that could provide needed quarters to the traveler. The South, however, grew as counties, with travel accommodations appearing with great infrequency and mainly along only the major commercial routes. One diarist noted that during a six-month journey through the South he came upon public houses less than once a week. Born of necessity, in a region where sweeping plantations produced few travelers and left the countryside bereft of small villages, southern hospitality developed as a general custom wherein a traveler might ask for lodging at any private home happened upon as nightfall approached (Volo and Volo 2004, 13).

There was a considerable gap in expectations, however, between some northern travelers and the hospitable southern homeowner. Period writings of northern travelers document that they confronted a grudging hospitality in the South characterized by rude behavior, wretched fare, and poor accommodations. Southern readers deeply resented these stories, and some vowed to show any Yankee seeking hospitality just how paltry such situations could be. Part of this problem may have arisen from the fact that many northerners were viewing the relationship with a dictionary definition of hospitality in mind. To them, hospitality meant receiving and entertaining visitors without remuneration. Some southerners saw hospitality as the kindness of permitting a complete stranger to take shelter with them, and they had no problem declaring the exact price expected in return upon being approached by an unknown traveler. In 1860, a traveler in Mississippi recorded that he was usually received free of charge, if the house belonged to people of means, or paid the customary charge of one dollar for which he was furnished with supper, lodging, breakfast, and food for his horse. Southerner travelers, especially those of quality, may have been treated differently in homes below the Mason-Dixon Line, for they commonly describe warm receptions that always found "room for one more" in even the humblest abodes and gracious hostesses who seemed able to repeat the miracle of the loaves and fishes (Volo and Volo 2004, 13–14).

Certainly, what elevated the phrase "Southern hospitality" to its current connotation would be the lavish presentations and courtesies extended to invited guests or to visitors who presented themselves with letters of introduction to prominent plantation owners. Guests could anticipate the assistance of servants in preparing their dress, luxuriant presentations of abundant food and drink, and free use of the plantation's amenities such as horseback riding, libraries, and gardens. Period letters and journals often describe parties of multicourse meals, which one senses are taking place with uncommon regularity and are probably reserved for holidays or special occasions. One breakfast description included corn bread, buckwheat cakes, boiled chicken, bacon, eggs, hominy, fish, and beefsteak all served at a single sitting. A "hunt" breakfast provided as a brunch after a morning of riding with the hounds might also include a variety of beverages including light wines and sweet liquors. Dinner offerings were likely to be equally impressive. An 1833 letter detailed a dinner that began with very rich soup and continued with a saddle of mutton, ham, beef, turkey, duck, eggs with greens, potatoes, beets, and hominy. After the circulation of champagne came dessert, which offered plum pudding and tarts followed by ice cream and preserves and peaches preserved in brandy. Lastly came figs, raisins, almonds, and wines that included port, Madeira, and a sweet wine for the ladies (Volo and Volo 2004, 14).

DUTY AND HONOR

Although the two were not mutually exclusive, there is some truth in viewing the South as a society with a profound sense of honor; while the North as a whole seemed driven more by duty, a communal conscience analogous to a compact made with God. Americans of the early nineteenth century were strongly influenced by such sentiments. The consciousness of duty resonated particularly well with the parallel development of social reform in the North. To shirk duty was to violate the collective conscience and offend morality by omission. Devotion to one's duty was viewed as a personal responsibility rather than as a collective obligation. "We all of us have a duty to perform in this life," wrote one journalist. It was not enough to support the norms of society from a distance. Duty required that a man place his life on the line. Many southerners also cited obligations to duty in their writings and speeches, but they were much more likely to speak of honor.

Honor was primarily a masculine concept that dealt with one's public image and reputation. There is ample evidence of a link between the romantic themes of adventure, glory, and honor, which appeared in the popular literature of the period, and the letters and diaries of the southerners. Nonetheless, southerners also viewed honor in a contemporary light, and the continued popularity of dueling attests to the vitality of the sentiment in the southern psyche. They often wrote of being dishonored in the eyes of their "revolutionary ancestors" should they fail to defend their families or the southern cause and lifestyle. Nonetheless, the appeals to duty and honor were most often found among the letters and journals of the more literate upper classes (Volo and Volo 2004, 14–15) (McPherson 1997, 24).

DUELING (DUELISTS)

The golden age of dueling lasted from 1830 to 1860. However, affairs of honor, where men resorted to the use of arms to settle personal grievances, were part of

American culture dating from colonial times. The dancing masters of the eighteenth century, who had taught the finer points of swordsmanship to the gentry along with the latest dance steps from Europe, largely abandoned the teaching of dance in the antebellum period to open fencing schools and academies of dueling dedicated to teaching the requisite skills of both sword and pistol. Well-known duelists occupied much the same position in antebellum society as sports figures do in modern times. They were followed through the streets, fawned upon by waiters in restaurants, and had their mannerisms and dueling styles copied by the young men. Although formal in its procedures and socially acceptable at the highest levels of society, dueling quickly lost favor in the North and came to be seen as characteristically southern. This view has been reinforced in modern times by numerous films and romantic novels (Volo and Volo 2004, 15).

Quarrels among citizens of the upper class never ended in simple fisticuffs, and it was social suicide to strike a blow in anger. The possibility of being involved in a duel was a social reality for all those who considered themselves gentlemen or who dealt in politics. At all levels of society, individual liberty, manliness, and respect for social position were held in such high esteem that one put his life and personal honor on the line to protect them. Even in the midst of polite conversation, gentlemen were always on guard to protect their integrity. Nowhere in America, and possibly in the Western world, was dueling so universally practiced as in the antebellum South, and it was in New Orleans that the practice of dueling reached its zenith. As southern society also favored a relaxed cordiality among social equals, the two notions of rigid honor and social familiarity often required a delicate touch. Defending one's honor reached such heights of absurdity that a moment of awkwardness might result in a challenge that could not, with honor, be ignored (Volo and Volo 2004, 15–16).

A word and a challenge were the purest form of the dueling code. The purpose of a duel was to resolve a point of honor, not simply to kill an enemy. Opponents who lost sight of this might be looked upon as murderers by purists, who saw the entire process as an exercise in character (Truman 1884).

Initially, only swords were used in dueling and, consequently, there were few fatalities. However, with the advent of the more lethal percussion cap pistol and its reliable ignition system, fatalities increased. No attempt has been made to determine the absolute number of duels that were fought in the South, as the task is both daunting and the records of duels were somewhat concealed by the need to evade the laws that tried unsuccessfully to prevent them. The number of duels fought in this period likely figures in the thousands and the fatalities in the hundreds. Many of these affairs grew out of political party wrangling that was often lacking in restraint and sophistication in this period. Duels sometimes ran through a political party or social grouping in a series involving one individual after another, one encounter producing the next. Dueling began losing favor in the South mostly because it degenerated either into contests with shotguns, axes, and clubs or brawls between groups of lower-class men using fighting knives and repeating pistols. Only the violence of the Civil

War was able to overshadow this apparent lust for individual combat (Volo and Volo 2004, 16–17).

PROSTITUTION

The openness of prostitution in the nineteenth century scandalized the social and religious elite everywhere. Proper ladies universally frowned upon any man who was too open in his lustfulness, but in a male-dominated society they could do little to enforce their displeasure on the male population at large. Upper-class unmarried men involved in a relationship with prostitutes, black or white, seem to have received a special dispensation from society, especially in the South and West (Volo and Volo 2004, 17).

The nightly trade in amorous economics was available in most large towns and cities in America. Most prostitutes were poor white women who worked their clientele in cheap saloons, hotels, or dance houses. These women were of the lowest class, commonly having taken up prostitution in their teens. They moved in and out of the dance houses and bordellos and could be brought in from the street for as little as a dollar. They were described as "degraded beings [and] habitual drunkards" who were "remarkable for bestial habits and ferocious manners" (Volo and Volo 2004, 13) (Asbury 1938).

The manifestation in which prostitution appeared in southern cities was somewhat dictated by the class and means of the clientele. White prostitutes of varying quality were available almost everywhere, but some southern men of wealth seemingly relied on the common practice of supplying themselves with a quadroon (mixed race) mistress for short-term affairs. Others, too far displaced from cities to conveniently satisfy their lustful desires with a professional harlot, simply considered every slave cabin a bordello. Comely slave girls brought exaggerated prices on the auction block with mixed race, light-skinned girls bringing a premium (Volo and Volo 2004, 17).

Although ordinances were passed that prohibited the renting of rooms to prostitutes in most cities, local politicians or the police often protected bordello owners. A madam might run a bordello by openly obtaining an annual license at a small cost. These licenses prohibited soliciting on the streets or from the doors and windows of the bordello. Indictments for prostitution, charging the keeping of a disorderly house, usually targeted madams who engaged in interracial social activity. The so-called high-class bordellos were housed in brick or brownstone buildings filled with mahogany woodwork, brass fixtures, and marble fireplaces—and furnished with fine carpets, pianos, furniture, art, and statuary—making them some of the most pretentious and luxurious residences in the country. Only the finest wines and champagnes were served; the ladies wore evening gowns while being entertained by musicians, dancers, and singers in the public rooms; and the ladies changed to the finest lingerie in their boudoirs. As many as 30 women might work in a single house, each paying a fee to the madam, and receiving between $5 and $20 for an amorous experience (Volo and Volo 2004, 17–18).

MISCEGENATION

One of the unique features of slavery in this period was the pervasiveness of miscegenation, or interracial sexual activity. Some free black women turned to prostitution in the absence of any hope of economic security. The desire of white men to have sexual contact with black females was not unheard of in the North and West, but it was seemingly so common in the South that there was almost no social stigma attached to it. An antebellum abolitionist confidently reported that half the slave population of the South was mixed with white blood. However, statistical analysis suggests that fewer than 10 percent of the slaves in the South were of mixed ancestry; and only a small percentage of the children born to slaves in a given year were fathered by white men (Blassingame 1973, 77–78).

The extent of miscegenation is somewhat obscured by the superfluous methods used by nineteenth-century investigators to quantify the mixed-race population of the South as mulattos (half black), quadroons (one-quarter black), and octoroons (one-eighth black) by the criteria of the outward appearance of the skin and the absence or presence of certain defining racial features. A large population of mixed-race persons passing for white may also have obscured any meaningful estimates at the time (Volo and Volo 2004, 18).

Evidence suggests that female slaves were often bribed, cajoled, or simply seduced by their masters, but any romantic notions involving the practices of miscegenation are best avoided by historians. Notwithstanding this reservation, some white southerners demonstrated a long commitment to their black mistresses, recognized their mixed-race offspring, and attempted to provide for their upkeep and well-being. Often this took the form of a public admission after death, and many interracial alliances were recognized in a planter's will. The white children of such men often went to great lengths to undo those parts of their father's will favorable to their biracial siblings. The courts rarely upheld a will favorable to mixed-race children in the face of a concerted effort by their white relations, especially if the whites were the elder sons (Volo and Volo 2004, 18–19).

The question of how common sexual affairs between slaves and masters actually were, as opposed to how often they appear as titillating tidbits of gossip in journals and letters, is undecided. Southerners went to great lengths to structure laws and cultural norms that would prohibit such interaction. Many slaveholding states passed antimiscegenation measures providing severe social penalties for white men who openly bedded black women and massive physical retaliation for any sexual activity upon any black men who had relations with white women.

The concept of white women willingly sleeping with black men was a proposition too explosive for the delicate egos of white males. White women were expected to respond to blacks as they would to any animate property, like pets, ignoring the indelicacy of even naked adult males. Young southern women were expected to steel themselves into viewing the naked slave as a dehumanized object, no more indelicate than livestock in the barnyard. Documented cases of the daughters of wealthy plantation owners bearing mixed-race children are rare, and, when found, they are accompanied by tales of social rebuff, revulsion, or personal disaster (Volo and Volo 2004, 19).

MOLDING YOUNG MINDS

When not working, children were made responsible for pursuing their education. The home, of course, was the first place where the foundations of education were laid. Mothers were responsible for the very early education of their children. This included a shaping of their moral character. *The Mother's Book* (1831), by Mrs. Lydia Maria Child, advocated the deliberate and early cultivation of a child's intellect. After describing some simple amusements for very young children, Mrs. Child advised, "But something ought to be mixed with these plays to give the child the habits of thought" that might convert basic daily activities into stimulating intellectual endeavors. She urged that older children be reminded that the more knowledge they gained the more useful they would be as adults. Additionally, it was essential that children be fortified with solid moral foundations. Mrs. Child cautioned against selecting readings for children that merely culminated in a moral. "The morality should be in the book, not tacked upon the end of it." With such home training, children entered school at ages four or five with certain basic moral and cultural understandings upon which would be built a formal education. A lesson concerning the value of education printed in a school reader of the period stated, "The highest objects of a good education are, to reverence and obey God, and to love and serve mankind. Every thing that helps in attaining these objects, is of great value, and every thing that hinders us, is comparatively worthless" (Child 1831, 11, 90) (Sanders 1860, 185–86).

Most young children spent their formative years at home among their siblings. Given the relative isolation of the family farmstead or widely dispersed plantations, children spent almost all of this time surrounded by brothers and sisters. In some families, children of the same gender might pair off according to their approximate age. Although sisters often cultivated enduring and affectionate relationships, brotherly closeness in childhood often evolved into internecine rivalries in adulthood for inherited property or family position. This was especially true in the hierarchical world of the South, but it was not uncommon elsewhere due to the dominant role men were expected to take in the antebellum social order (Volo and Volo 2004, 63–64).

Decisions as to who would farm, who would be apprenticed to a trade, and who would be sent for advanced schooling were generally made to benefit the family as a whole. These determinations were not always equitable from the individual's point of view, but this was a secondary consideration to a greater good—the welfare of the family. Those young men who had few family connections or little wealth were subject to serving out their lives as farmers or laborers. The constant partitioning and subdividing of land among children and grandchildren often made the size of individual holdings impractical. Young men were often forced to move to the territories to find sufficient land to set up a farmstead of their own and marry. Beyond marriage, young women did not have even the limited choices provided to men. The few occupations open to females produced little income, and they either married or relied on relatives for the remainder of their lives (Volo and Volo 2004, 64).

Because of the closeness of antebellum families, it was not unusual in large households to farm out an extra child, even an older teenager, to a blood relative. This child was usually a daughter as they were considered a drain on family resources because they posed "little or no hope of return." On the other hand, because boys could work in the fields and strike out on their own when grown, "a son was thought too valuable to part with under any circumstances." Kinship ties were strengthened between families who took in an extra child. The system worked fairly well. Younger children could depend on their relations for financial assistance, a proper upbringing, and a modicum of individual attention; and older children received support and guidance by forming close relationships with members of an extended family (Clinton 1982, 54).

Fathers were always the final authority in the household, but they clearly understood the demanding nature of childcare with half a dozen children bustling around, each trying to engage a parent's attention at every moment. In a male-dominated society, many men were plagued by the incessant demands of their little ones, and therefore chose to enjoy them from a distance. Although women were equally bothered by the noise of children and their demands for attention, they were more likely to accept the role of parent and domestic supervisor than men. Historian Catherine Clinton has noted, "Because the role of motherhood was elevated and enhanced during the early republican era, women perhaps suffered more keenly [than men] from the duties imposed on them as parents." Besides providing a basic education, a mother also "carried out the unpleasanter task of daily discipline, policing her children's behavior, interceding in quarrels among siblings, and doling out demerits, lectures, and whippings" (Clinton 1982, 47).

The eighteenth-century practice among financially well-to-do families was to provide a wet nurse or servant to care for the immediate needs of the children. This method of childcare had largely gone out of favor in nineteenth-century America, and having older children entrusted to slaves or servants ran counter to the advice available in the literature for parents that sprang forth from the publishers of the cheap press. Moreover, it was feared that older children might be negatively influenced by the behavior of slaves and servants, and white children were warned by their parents to be cautious of Negroes and hired help. A contemporary mother wrote to her children in this regard, "[O]n no account familiarize with them—be kind and civil and never converse with them about family affairs of any kind" (Clinton 1982, 49).

Infants suckled for about a year, and the choice to nurse was a very personal one. Many women preferred to have a wet nurse, but they were made fearful of the results of using a surrogate on their child's upbringing by the largely anecdotal musings of supposed child experts. Although regular nursing was a physical strain, wet nurses were usually employed only when a mother's own milk failed or her recovery from childbirth was in question. Upper-class women tended to turn the task over to a hired white woman, and newspapers were filled with advertisements seeking available wet nurses. Southern folklore notwithstanding, the practice of employing black slaves to suckle white infants was generally avoided in the antebellum period (Volo and Volo 2004, 65).

Prominent among southern traditions was the stereotypical character of "Mammy." Plantation records acknowledge the presence of female slaves who held a position equivalent to that of a head housekeeper or caregiver to the master's children. Yet their appearance in the antebellum record is incidental and outnumbered to a great degree by the employment of white governesses. Not until after the war were there a significant number of black women in such circumstances. The secure place of the Mammy in the mythology of the plantation has been created by a combination of historic revisionism and romantic imagination that seems at first to have been a projection of the slave owners' own delusions about how their household slaves were devoted to them on a personal level—a repeated allusion found in contemporary southern diaries, especially those of young women. Moreover, the image of the black wet nurse reduced the slave to "an animal-like state of exploitation . . . to be milked, warm bodies to serve white needs." Certainly, female slaves were maintained to help with the supervision of children, but they were generally mistrusted and prohibited from any close contact with white children for fear that it would weaken the slave-master relationship (Volo and Volo 2000, 179–80) (Clinton 1982, 202).

About 50 percent of children outside the American South attended school with some regularity. Some areas of the Midwest and New England had enrollments as high as 90 percent. Attendance in rural areas suffered from the fact that many parents "task[ed] their children heavily with farm labor, and [not] until such tasks are finished are they allowed to start school." School might be in session in some communities for only three or four winter months in an entire year. The modern cycle of the school year, with its two-month summer vacation, still mirrors the nineteenth-century need for the labor of children in agricultural regions during the busy growing season (Burrowes 1861, 27).

In the Northeast and Midwest, where formal schooling existed, common schools were typically open to all the children in the community and paid for by the community either by subscription or taxation. The largely rural nature of the South generally hampered the creation of an effective public school system except in more densely populated areas. With no textbooks being published in the South before the Civil War, southern teachers depended upon northern or European sources for their materials. Moreover, financially able southerners preferred to send their children to private institutions rather than public schools. Private academies, which flourished in this period, offered reasonably good instruction primarily in the classics. Large domestic complexes on southern plantations sometimes contained separate buildings designed to serve as schoolrooms for the children of well-to-do families who hired tutors (Volo and Volo 2004, 66).

Conditions in common schools varied tremendously from community to community. Most provided no more than crude benches without backs, slates for writing, and a limited number of shared books. There were few, if any, educational standards at this time. The length of the school day and school year varied as the individual community saw fit. The schools were supervised by a group of designated citizens who oversaw operations. Their duties included "the levying of tax, the location of school houses, the purchase and sale of school property, the appointment and dismissal of teachers, and the selection of studies and textbooks." The dedication and expertise of these directors was, however, often called into question (Burrowes 1861, 14).

COMMON SCHOOLS

Today, a comprehensive education is seen as a pathway to a stable income and a successful career, but this was not always obvious. Antebellum education reformers noted that the centuries-old system of apprenticeship was quickly fading away in the wake of increased industrialization and mass production, and a more practical educational system was needed. The system they devised for all children, based largely on German and Swiss theories of education, emphasized accurate arithmetical and bookkeeping skills that could be applied to the factory or business and precise penmanship, grammar, and spelling for use in the business office. Ironically, the natural characteristic of children to run and play was also recognized by the inclusion of a specific and formal period of recess that would have undoubtedly been seen as sheer idleness a generation earlier.

The proposed curriculum was well meaning and forward-looking because it was designed to prepare children for life in a changing modern society, but it was unforgiving of various learning styles and abilities and marked by a strict adherence to propriety. Timeliness, regimentation, absolute silence, and a strict work discipline (similar to that imposed in a workhouse or prison) were highly valued. Any breach of classroom decorum was punished, often with physical force that ranged from a cuff on the ear to a whipping with a hickory rod. A generally inadequate, poorly trained, and underpaid teaching staff often relied on the threat of corporal punishment for motivation rather than on fostering intellectual curiosity among the students. Sadly, the educational atmosphere, especially at the schools frequented by immigrant children, was generally repressive. One of the first groups formed to help provide schooling for the poor was the Free School Society of New York City, founded in 1805 (renamed the Public School Society of New York in 1826). Its first president was DeWitt Clinton, then mayor of New York. The members of the society were determined to offer an education to poor children by making private donations, soliciting subscriptions from the public, and requesting funds from the state. These schools were taken over by the New York City Public School Department, which was formed in 1842 (Volo and Volo 2004, 70).

There were more than 200 public schools in New York City in 1851, and the number of pupils was more than 107,000. The whole annual expense of almost $275,000—$2.57 per scholar—was derived partly from the Common School Fund of the state and partly from a property assessment placed on the city residents. A similar public education society was founded for the poor of Philadelphia. By 1818, a citywide system was in place serving almost 50,000 scholars at a cost of almost $200,000, or $4.00 per scholar. Boston had a free school as early as 1635 and deserves an honorable place as the initiator of free public education in America. By 1851, Boston reportedly kept one-quarter of its population (approximately 35,000 children) in school all year at a cost of $183,000, or $5.23 per student. Differences in cost among these cities can generally be attributed to the length of the school year, the quality of the facilities, the availability of teachers, and the local cost of living (Volo and Volo 2004, 70–71).

Meanwhile, in 1837, a group of influential men led by Horace Mann pushed legislation through the Massachusetts Legislature creating a state system of education. Mann's efforts, based largely on the theories of Swiss educator Johann Heinrich Pestalozzi, generally resulted in a more centralized school system. Mann also introduced the concept of high schools and state teachers' schools into the Massachusetts system. At about the same time, Henry Barnard and John Pierce were making similar efforts in Connecticut and Michigan, respectively. These pioneer educators made great strides in the development of free public education.

Yet not everyone was convinced that universal public education was beneficial for America, and the concept was the topic of widespread disagreement, public controversy, and political debate. The ongoing development of a system of free public schools was paralleled by the institution of a Catholic school system in the immigrant-filled cities of New York and Boston, which tended to exacerbate the controversy and underpin the opposition. Whereas many Protestant groups in the Midwest gave strong support for the idea of public education, the owners of private academies, foreign-language schools (mostly German), and those institutions administered by minority religious communities generally opposed it. Questions of private versus state control of parochial and private schools were as prominent then as they are now. Such notions were seen by some as a threat to fundamental values and a clear danger to the social status quo that had to be avoided at all costs (Volo and Volo 2004, 71).

Social conservatives, North and South, particularly deplored the development of free public schools that admitted children from many classes, ethnic groups, and family backgrounds. They feared that they would be exposed to a set of novel values that stressed social equality rather than republican principles. The French observer of American democracy, Alexis de Tocqueville, no opponent of the value of education in general, wrote in 1831 that he saw in the nascent system of American public education disturbing signs of a trend toward mass conformity that might suppress individual expression and personal talent. He envisioned a new kind of "social despotism" emerging, suppressing personal liberty by the power of intellect and by the force of emotion (Fehrenbacher 1969, 98).

The majority of school reformers were northerners, and, because most southerners felt that the public schools were at least partially responsible for the distasteful attitudes displayed by residents of that section of the country with regard to slavery and states' rights, they hesitated to embrace any institution that could produce such thinking. Largely because of these attitudes, basic public education in the South languished. As late as the 1830s, nearly one-third of white southern adults were illiterate, and by 1860, only four southern states and a few isolated communities had effective public school systems (Volo and Volo 2004, 71–72).

It was, nonetheless, thought essential by many that children should be prepared for the intellectual and technological challenges that nineteenth-century society would present to them. Senator Daniel Webster noted the connection: "The future life and character of a nation is to be seen in its system of schools." Those living during the antebellum period witnessed major changes in the American system of education, many of the characteristics of which are still with us today, and public sentiment gradually became more favorable to a more egalitarian system of public schools. Thomas H. Burrowes, a contemporary educator, noted, "People are beginning to see that their children can get a sound practical . . . education in our common schools" (Barnard 1969, 867) (Burrowes 1861, 51).

CHILDREN OF AFFLUENCE

During the second quarter of the nineteenth century, the movement toward community or common schools gained momentum, but many wealthy families avoided public education in favor of private institutions generally known as academies. These had flourished since colonial times. Based largely on similar institutions in France, Holland, and Scotland, the academies had been founded initially by those persons deemed dissenters from the established Church of England. Dutch Reformed, Baptists, Presbyterians, and Methodists all founded academies in America. Many of the Presbyterian academies founded by Scots-Irish communities in the southern backcountry maintained strong ties with universities in Edinburgh, Glasgow, and Ulster. In New Jersey, Pennsylvania, and Delaware, where there was little enforcement of the laws governing the established religion in colonial times, academies expanded in number, in the scope of their courses, and in the power they maintained (Volo and Volo 2004, 72).

The All Saints Summer Academy was typical of these religious academies. In 1832, the rice planters and their wives of Georgetown, South Carolina, joined forces to form a private school with the help of the Reverend Alexander Glennie of the Episcopalian faith. It was six years later, under the direction of David D. Rosa, that it opened to both male and female students who could afford the tuition. Students over 12 years of age paid $20 per term, while those under 12 paid $10. Board and washing fees totaled an addition $13.50 per month, and the school expected students to provide their own furniture and bedding. The school provided a complete English-style education as well as religious instruction. Classes in Latin, Greek, French, music, and drawing required additional fees. Although initially styled a summer school, the term started in January and ended with the onset of the malaria season in late summer or early fall (Volo and Volo 2004, 72–73).

Many academies in the antebellum period served as preparatory institutions for university studies. The nonconformists who ran these academies were receptive to the influences of intellectual and educational innovations, which taught classical literature, science, and politics in English rather than in Latin. "The academies were in their very nature alternatives to the established practice of higher education." The Albany Academy of New York was so highly rated that it was called "a college in disguise" by the president of Union College, Dr. Eliphalet Nott. A few academies evolved into independent degree-granting institutions. The academy movement had evolved and diversified in format and emphasis, but the institutions retained their status as educational alternatives for parents who could afford them (Blow 1963, 28) (Cremin 1970, 324).

The Richland School for Classical, Scientific and Practical Education near Rice Creek Springs, South Carolina, was typical of the boarding academies frequented by the sons of southern planters in the antebellum period. A surviving school catalog from 1830 claims that the institution was organized along the lines of the most improved pedagogical principles to be found in Europe or America. The younger students, beginning as young as seven or eight, were taught spelling, arithmetic, grammar, and geography. Older students were offered three curricula: one for the business minded, one that led to a life as an engineer, and one for future planters. The courses of study included an appropriate mixture of mathematics, penmanship, bookkeeping, surveying, navigation, civil engineering, geology, chemistry, botany, mineralogy, and the principles of agriculture, depending on the curriculum the student chose to follow. All students studied Greek, Latin, rhetoric, and classical literature, and an appropriate regard for moral precepts and the general principles of the Protestant religion were impressed upon the students.

A few academies were open to both boys and girls, but generally the sexes were educated at separate institutions. A female academy movement swept the country, both North and South, in the early years of the century. Younger girls were offered courses in music, singing, drawing, painting, French, and the social graces. Older girls, generally too poorly prepared to undertake more advanced studies, concentrated mainly on refining their knowledge of etiquette and manners and their ability to manage a household. A few schools went beyond domestic subjects to offer academic studies. Emma Willard's Female Seminary founded in 1821 in Troy, New York; Catharine Beecher's School for Young Ladies founded in 1824 in Hartford, Connecticut; and Mary Lyon's Mount Holyoke Seminary founded in 1837 in South Hadley, Massachusetts, all attempted to teach academic subjects to young women; but they always did so in the guise of their application to domestic economy so that they would not be seen to threaten the male-dominated world of business and trade (Volo and Volo 2004, 74).

Parents viewed attendance at an academy differently, depending largely on the section of the country from which they came. The growing sectionalism that affected the rest of society was also affecting the educational choices made by parents. For northern parents, the academy for young women was seen as an important step on the pathway to a college education or to a position in the emerging fields for women of school teaching, social service, or authorship. Well-disposed young women might have their educations augmented by lessons in mathematics, Latin, science, and the classics. The parents of young southern women tended to view attendance at the academy as an end unto itself, preparing their daughters for their preordained role in the plantation culture as the mistress of the manor house and fitting them as well-read and socially acceptable wives and mothers for the southern aristocracy. Historian Catherine Clinton has noted that "although mothers and daughters warmly greeted improvements in their education, these women of the planter class realized that their intellectual development would most likely wane with marriage, decline with housekeeping, dwindle with motherhood, and at no time result in any measure of social recognition" (Clinton 1982, 138).

As the century approached its midpoint, it became increasingly obvious that many of the women educated in the academies were the mainstays of the hated reform movements, particularly abolition and women's suffrage. Socially conservative parents viewed these institutions as contagious sources of social liberalism and began to turn their daughters away from them as an educational option. The female academy movement, already suffering from lagging enrollments due to repeated economic panics, went into decline in the 1850s. Oddly, during economic hard times it was more likely for northern parents than their southern counterparts to dispense with their daughter's education away from home. For upper-class southern parents, time spent at the female academy had become an absolute necessity if they wished their daughter to secure a proper marriage. The northern schools, therefore, suffered the greater declines when southern students were removed from their rolls, yet the schools did not disappear. Rather, the emphasis of the surviving institutions shifted from intellectual pursuits to the development of social graces and ladylike decorum to attract continued patronage from the South. For their part, the academies located in the South carefully resisted any impulse to modernize their approach to education that might be seen as filtering down from the North. Because the doctrine of male dominance and female dependence remained pervasive throughout the country, an advanced education for women was not generally seen as crucial to a life devoted to caring for a husband and raising babies. Consequently, by midcentury, the curricula of many female academics came to be characterized as frivolous and superficial (Volo and Volo 2004, 75).

Tuition at male academies like Richland was almost $300 a year. This was no mean sum, but it included room, board, bedding, washing, mending, firewood, lighting, and health care. The cost of tuition was rather more for girls than boys because of the additional fees accumulated in taking courses in dance, music, drawing, and embroidery, as well as a preference for occupying private rooms rather than living in dormitories. Northern academies solicited southern students because their parents could pay regularly and were generally ill disposed to public education, especially when the establishment of community schools required the use of their tax dollars. Most southerners feared that free public education would create "ragged schools" like those filled with pauper children in England, and there was a belief that "poor whites" would swarm the free institutions of public education. Nonetheless, good academies, especially for boys, were difficult to find; many institutions were notorious for ignoring the education of the child as long as he or she refrained from causing an annoyance to the teachers. As sectionalism grew, certain southern parents with children in northern academies found discomfort with their selection and withdrew their children from attendance. They even began to regret the fact that so many northerners had been employed as teachers and tutors in the South (Volo and Volo 2004, 75–76).

CHILDREN OF POVERTY

Conditions for children in the urban areas of America were quite different from those found in the American heartland. By the 1840s, northern cities were filled with the poor, uneducated children of immigrants who were packed into shanties, tenements, and ramshackle boardinghouses. The streets of the cities were scenes of prostitution, gambling, drunkenness, and other forms of wrongdoing. Street gangs, often led by deceitfully clever adults and composed of grimy-faced and coarse adolescents, ruled whole areas of certain cities and worked in concert with corrupt politicians, neighborhood wardens, and political machines. In a country supposedly blessed with economic abundance, it was difficult to understand the causes and conditions that led to such poverty, illiteracy, and crime among such a large segment of the population. Yet these were the obvious disturbing realities in antebellum America for anyone who chose to see them (Volo and Volo 2004, 66–67).

Poverty, ignorance, crime, and intemperance drew forward a number of well-meaning social reformers from among the upper and middle classes. They generally viewed the poor immigrant population as human raw material "to be acted upon, to be improved, manipulated, elevated and reformed." An implicit faith in the perfection of America left many among the socially conscious Protestant upper classes with the notion that these social ills were capable of eradication if the systematic roadblocks and characteristic reluctance to change among the old order were removed. Believing that the root cause of ignorance, drunkenness, and crime was poverty, some of the earliest organizations to gain popular support were societies for the prevention of pauperism (Rothman 1972, 41).

Reform advocates, focusing on the urban environment, railed against towns that licensed grog shops, saloons, and houses of prostitution. They defamed politicians who allowed gambling halls and dens of iniquity to flourish, or who refused to take the temperance pledge. However, compassion quickly changed to disapproval, criticism, and castigation of the poor themselves. In 1827, an investigatory committee of the New York Society for the Prevention of Pauperism unhesitatingly reported that the vice found in large eastern cities was attributable in large part to the actions of the poverty-stricken residents themselves. The report found most of the poor of New York City "depraved and vicious." Of course, few of the reformers on the committee thought to ask the poor what they felt were the primary causes of their condition. The poor may have listed unfair labor practices, ethnic or religious bias, and unscrupulous landlords as causes of their plight; but their views on the subject were generally neglected (Volo and Volo 2004, 67).

As the extent of poverty among the urban immigrant population of the North reached epidemic proportions, complacency and pity quickly gave way to a heightened suspicion of the poor themselves. "Surely the poor were partly to blame for their own misery, having succumbed to the vice of idleness or intemperance . . . victims of the numerous temptations set before them by society." Some northerners and many in the South, unconvinced of the menace to their communities that was posed by poverty and disease among the lowest level of the social order, were distressed by the radical way social activists approached their task. While there remained a strong belief in individualism, personal strength of character, and the ability of Americans to overcome the handicaps of their environment, by the 1850s such concepts were becoming identified more and more with conservative resistance to social reform. Opposition forces found many of the reform proposals unrealistic, grandiose, sanctimonious, and antagonistic to traditional American concepts of personal rights and freedoms (Rothman 1972, 38–42, 100–105).

The reform movement of the nineteenth century was, in fact, characterized as one of activism of the "haves" for the "have-nots" rather than a demand for reform from those who were oppressed. This form of personal protest would not become popular until late in the century. Activists formed a sort of reform elite, which not only had the conceit to decide upon the areas of society that needed reformation but also attempted to differentiate between the worthy poor, whose lot was due to misfortune, and the corrupted and unworthy idlers (Volo and Volo 2004, 68–69).

Wives abandoned by their husbands and widows with small children were almost universally viewed as among those worthy of public assistance. Women were commonly prohibited from many trades. When they were permitted employment, they were routinely given the lowliest work, and if it was a job also given to men, women were paid less for the same work. Many women, alone and destitute, ended up as prostitutes. A contemporary observer described their plight:

> Of all the human race, these poor creatures are the most pitiable; the ill-usage and the degradation they are driven to submit to are indescribable; but from habit they become callous, indifferent as to delicacy of speech and behavior, and so totally lost to all sense of shame that they seem to retain no quality which properly belongs to women but the shape and the name. (Robinson 1973, 92)

Charitable organizations existed to serve these people, but their main strategy was to send these poor wretches back to their homes or parents. This was not always possible for immigrants whose homes were thousands of miles away. The reformers concluded that eliminating the stain of poverty from the fabric of American society would require the isolation of the poor, by force if necessary, from their sources of temptation and the instruction of the destitute in the habits of industry and labor. The poor, regardless of the individuality of their plight, would receive aid only while confined within a series of public almshouses and workhouses. Once inside, they would be taught order, discipline, and responsibility. A group of New England philanthropists was assured in 1843 that the almshouse was "a place where the tempted are removed from the means of their sin, and where the indolent, while he is usefully and industriously employed . . . is prepared for a better career." This grandiose plan resulted in institutions that were little more than places of unrelenting work and severe discipline, even for those of 8 or 10 years of age (Volo and Volo 2004, 69) (Rothman 1972, 42).

The almshouses generally failed to relieve the problem of prolonged poverty or its symptoms. The profit from the labor of the residents generally went to the institution, preventing the inmates from accumulating travel money or a nest egg for an attempt at a renewed life. The truly depraved and corrupted among the poor avoided such institutions, as did any children old enough to fend for themselves on the streets by working odd jobs, begging, or stealing. Gangs composed of young men and women flourished while the almshouses filled to overcrowding with the helpless, the decrepit, the abandoned, and the very young. The emphasis on rehabilitation and personal reformation, initially a primary goal of the antipoverty reformers, quickly became irrelevant as the most heartrending members of the poor community were hidden behind brick walls. Gone were any semblance of a comprehensive educational program and any time for childhood play or frolic. A committee in New York reported in 1857 that the general conditions found in such institutions, after more than 30 years of operation, had degenerated into a cruel and punitive system of custodial care (Volo and Volo 2004, 69–70).

THE SCHOOLHOUSE

Youngsters fortunate enough to attend school spent a good deal of time in the schoolhouse. The little red clapboard schoolhouse of one room common to the folklore and anecdotal history of many communities may not have been as common in antebellum America as most people think. School buildings were constructed in a number of ways including in brick, wood frame, logs, and stone. According to period documents, 58 percent of school superintendents in Pennsylvania described their schools in negative terms. It was not unusual to see claims that the schools were "less fit for the purpose of schooling, than would be many modern out houses for sheltering cattle." One schoolhouse was described as "a crumbling, dilapidated, damp, unwholesome stone building with a ceiling eight feet high, room about twenty-six by thirty feet into which one and hundred seventeen are crowded, and placed at long, old fashioned desks, with permanent seats, without backs." One superintendent reported finding "the teacher and pupils huddled together, shivering with cold, and striving to warm themselves by the little heat generated from a quantity of green wood in the stove." Additional complaints included a lack of "outhouses and other appliances necessary for comfort and convenience." Concern was expressed over the fact that schoolhouses were "placed far off the road and buried in the wildest forest" (Burrowes 1861, 20–97).

In many schools sufficient blackboards were also wanting. Many blackboards in poorer regions were just smooth wooden boards, painted black, and covered with chalk dust. "Chalking in" the wood provided a reasonably erasable surface.

Well-supported schools had not only blackboards of real slate but also outline maps, spelling and reading cards, charts, and globes. The average school had only one or two of these instructional materials. Writing paper was scarce in rural schools and considered too valuable for scratch work and student lessons. Students commonly wrote on wood-framed slates. Although these were initially "confined to such as had made advancement in arithmetic . . . now we find the smallest scholars engaged with their slates" (Burrowes 1861, 80).

Furniture was, at best, sparse in most classrooms. "It is useless to complain of school furniture," lamented one superintendent. "It seems that people would sooner see their children have spinal or pulmonary affliction, than furnish the school room with proper desks and seats." A York County, Pennsylvania, superintendent noted, "I witnessed a great deal of uneasiness, amounting in many instances to intense suffering, among the small children, from . . . being seated too high. In some instances, the desks are still attached to the wall, the scholars with their backs to the teacher" (Burrowes 1861, 81, 97).

Nonetheless, documentation exists of a number of new school buildings that were described in more favorable terms. One school superintendent described a "tasteful brick building 30 × 45 . . . furnished with first class iron frame furniture for 62 pupils." Other new buildings were built of wood, and one was "24 × 36 with four tiers of seats for two pupils each accommodating 64 pupils." Another superintendent boasted, "All the rooms are warmed by coal stoves, most of them have ceilings of proper height, windows adapted to ventilation; plenty of black-board surface; and they are tolerably well seated." A new schoolhouse was proudly described as having an "anti-room, closets and platform and in every respect is superior to most of the other [school]houses" (Burrowes 1861, 20–97).

School revenue was directly tied to the success or failure of local commerce. In an 1861 report, the county superintendents in Pennsylvania noted that the frosts of June and early July, resulting in the loss of much of the wheat crop, caused a "pecuniary embarrassment" that forced a shortening of teaching time and a reduction of the wages of some teachers to the point that some of the best educators left the county or became engaged in "other pursuits." Nonetheless, the remaining teachers were applauded for their self-denial and the manner in which they bore up during a difficult time. In the same year that some agricultural districts chose to suspend school for the entire year due to poor crop yields, lumbering districts were favored by high water that made the movement of lumber more efficient. These were favored by increased prosperity, and the schools were unaffected (Burrowes 1861, 24, 20).

TEACHERS

Most teachers received their pedagogical training at a normal school, an institution dedicated to the profession of education roughly equivalent to a junior college program today. In the antebellum period, graduates from normal schools were more common among public schoolteachers than college or university graduates, and many teachers trained in normal schools continued to serve into the middle of the twentieth century. Rural districts were often unsuccessful in obtaining normal school graduates and had to settle for whatever reasonably well-educated persons they could find (Volo and Volo 2004, 80).

Although both men and women taught, male teachers were preferred. As the Civil War approached, many young men left the schoolroom, thereby opening the door for more women to enter the field of education. Of the teachers in Philadelphia, four-fifths were female. A county superintendent of schools noted the employment of female teachers with some dissatisfaction because they were believed to be "inadequate to the task of controlling a winter school." However, he also noted that the "superior cleanliness and arrangement of their rooms, the effect of their natural gentleness and goodness on the scholars . . . amply compensated for their want of physical force." These qualities were appreciated even more when it was found that the young women could be paid lower salaries than the generally older male teachers. The average salary reported in Pennsylvania in 1861 for a male teacher was $24.20 per month. Women were paid $18.11 (Burrowes 1861, 4, 32).

School districts sometimes had to go far afield to find teachers. The Board of National Popular Education, a teacher preparation institution in New England, advertised the availability of its female graduates for rural teaching positions in the Midwest in the following aggressive manner in 1849:

> The Board collects its teachers in classes semi-annually at Hartford, Connecticut, and carries them through a short course of preparatory training. . . . It is desired that the applicants . . . for teachers . . . be made by letter. . . . The application should state the name of the town and county, where the teacher is wanted; the branches in which instruction is desired; the probable number of scholars; the rate of compensation, specifying whether with or without board; and the family to which the teacher may resort on her arrival. It is desireable [*sic*] that information should accompany the application in regard to the place—its population, healthfulness, and social and religious priviledges [*sic*]. If a special preference is felt as to the religious denomination of the teacher, let it be expressed in the application, and it shall, if practicable, be complied with. . . . As applications to the Board are becoming so numerous, teachers may not be expected to be sent unless a compensation of at least $100 per annum, besides board is offered. Instruction in the higher branches or in the case of very large schools, it is expected will command a higher compensation. (Volo and Volo 2004, 81) (*Janesville Gazette* 1849, 1)

Teaching in the common schools was a young person's profession largely because it was generally a part-time job with nominal annual rates of pay translating into one-half or less over the typically shortened school year. The teachers spent a good part of the remaining months attending academies and normal schools or taking on other work, including manual labor and housekeeping (*Boston Directory* 1859, 487).

The majority of teachers were between 18 and 25 years of age, but some were little more than children themselves. A school superintendent complained that it was "to be regretted . . . that parents will urge their sons and daughters to seek to become teachers at so early an age; and it is a great error in directors, as a general rule, to employ such young persons. Men engage persons of mature age and experience on the farm, in the shop or store, in the kitchen or dairy room; but they hire girls or boys of 15 or 16 to train up and educate their offspring." Teaching offered moderately educated young persons, especially women who had no other professional prospects, the respectability of a professional calling without the expense and effort of lengthy studies at law or preparation for the ministry. Nonetheless, some parents preferred "to have there children work in the mines or learn a trade [than to] become qualified to teach school" (Burrowes 1861, 27, 43, 83).

Some school districts established examinations to ensure that teachers were competent to assume their duties. Most exams were a combination of written and oral questions. "They were held publicly, and attended by numbers of citizens, who had a desire to see and hear [the process] for themselves." Emma Sargent Barbour's sister, Maria, wrote about the examinations given in Washington, D.C., suggesting little need for advanced preparation among aspiring educators. "[Hattie was] accompanying me as far as City Hall where I was to be examined, when she remarked that she had a good mind to try just for fun. She went in and passed an excellent examination and next Monday will take a position at my school." Not all examinations were quite as simple as Maria seemingly implies. Many applicants failed the examination process and were turned away, and others, considering that many rural districts were lucky to find teachers at all, ultimately found employment without certification (Burrowes 1861, 40) (Moskow 1990, 193).

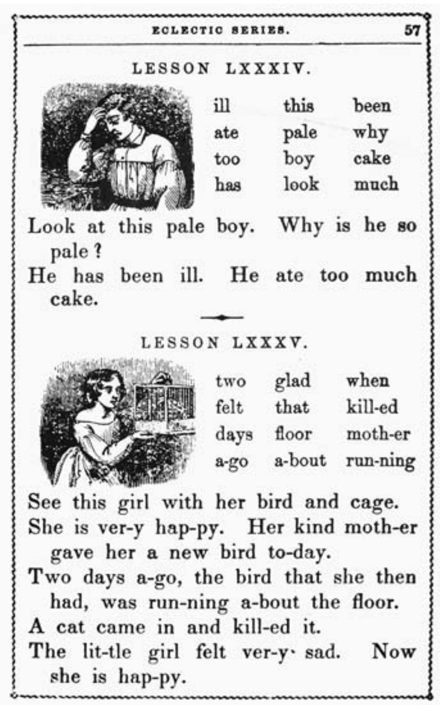
Institutes were held periodically to help teachers to improve their skills. Some occurred only once a year whereas others were held semimonthly on alternate Saturdays. The idea of professional development for schoolteachers had not yet taken hold. It was expected that any person who had successfully passed through his or her own formal schooling as a student could also teach effectively. Naturally, not all teachers performed to the satisfaction of the districts. A Wayne County, Pennsylvania, superintendent wrote of his teachers: "Two last winter had the reputation of being of intemperate habits, and some few are rough and rowdyish in their manner" (Burrowes 1861, 91).

INSTRUCTIONAL METHODS

Reading was always the main lesson of any school day. Traditional reading materials included the *King James Bible* (1611), regarded by many as the central textbook for all education; the *Westminster Catechism* (1647), the most popular of more than 500 catechisms available to be used with young students; and the *New England Primer* (1688–1690), used widely in the early decades of the republic. However, texts like these, which were generally grounded in a Calvinistic form of the Protestant religion, were falling into increasing disfavor among educators by the beginning of the antebellum period. Nonetheless, they continued to be used but were supplemented with works rooted in a more general morality. Popular nonsectarian materials from the period included *McGuffey's Eclectic Readers* (1838–present), the *Peerless*

Pioneer Readers (1826) by the same author, Webster's "Blue-Backed" *Speller* (1783), and *Ray's Arithmetic*. Spelling was just becoming standardized, and *Leach's Complete Spelling Book* of 1859 contained a "Collection of Words of Various Orthography" that included words of "common use, which are spelled differently by the three most eminent Lexicographers . . . Webster, Worcester, and Smart." Books like these represented a significant force in framing the mores and tastes of the nation and were outweighed only by the continuing influence of the Bible (Volo and Volo 2004, 82) (Leach 1859, 140).

William Holmes McGuffey, though a religious man and an ordained minister, began writing the *Peerless Pioneer Readers* in 1826 because he was dedicated to the cause of secular education. He published the first volume a decade later, and received $1,000. In 1838, he released *McGuffey's Eclectic Reader*, the best-known title among his works. McGuffey was the first to attempt to arrange his materials for students of different ages and to select topics that generated their interest and enthusiasm. In 1845, McGuffey was appointed professor of moral philosophy at the University of Virginia; until his death in 1873, he continued there, periodically revising his readers to suit the interests, abilities, and comprehension of the children who would use them. His books quickly became some of the most popular and effective teaching tools available in the United States at the time. Eventually, he evolved a series of six graded texts, a spelling book, and a high school reader. For most students, the level of the reader from which they could read determined their grade level in school. These readers passed through many editions and were adopted as standard texts by 37 states in McGuffey's lifetime. It is estimated that more than 120 million copies were sold (Volo and Volo 2004, 83).



ECLECTIC SERIES. 57

LESSON LXXXIV.

ill	this	been
ate	pale	why
too	boy	cake
has	look	much

Look at this pale boy. Why is he so pale?
He has been ill. He ate too much cake.

LESSON LXXXV.

two	glad	when
felt	that	kill-ed
days	floor	moth-er
a-go	a-bout	run-ning

See this girl with her bird and cage.
She is ver-y hap-py. Her kind moth-er gave her a new bird to-day.
Two days a-go, the bird that she then had, was run-ning a-bout the floor.
A cat came in and kill-ed it.
The lit-tle girl felt ver-y sad. Now she is hap-py.

McGuffey's Primer, c. 1840. Lesson page from an edition of William Holmes McGuffey's "Eclectic Primer," c. 1840. The Granger Collection, New York.

Emma Sargent Barbour's letter from her young cousin Mary gives additional insight into the nature and varieties of period textbooks: "I am getting along first rate, at school. I don't always get 10—tough by any means. I always get 9 in writing. I study *Robinson's Arithmetic*, it is a very hard one. *Frost's United States History*, *Towen's Speller*, *Weld's Grammar*, the same almost exactly like the one I studied [in the] east, but the *Grammar* is not at all like it. I read out of *Sargent's Reader*." Many schools suffered from a lack of uniform class sets of texts, although the adoption of this practice was frequently a goal. One forward-looking educator wrote, "In time, however, as the old books, (some of which, carefully preserved, have descended from grand-fathers) are worn out, uniform class-books will be used, much to the advantage of teachers and pupils" (Moskow 1990, 99) (Burrowes 1861, 36).

Most lessons were done via rote memorization and recitation. In a time when paper was at a premium, teachers generally heard the lessons of their students. Poems, speeches, readings, arithmetic facts, and times tables were presented orally by the student before the class. Arithmetic and grammar exercises, for the youngest students, were done on a small lap slate or on the classroom blackboard. Older students were sometimes given "foolscap" (writing paper of poor quality) on which to do their mathematics and essays. To stimulate student motivation, less interesting material such as geographic facts were sung to popular tunes and multiplication tables were often taught in verse, such as, “Twice 11 are 22. Mister can you mend my shoe?” or “9 times 12 are 108. See what I’ve drawn upon my slate.” Mental arithmetic was still an innovation in learning, and more than one district supervisor reveled in the fact that it was taught in his schools. “Mental arithmetic has been extensively introduced during the past two years and will soon be considered an indispensable item even in our primary schools.” Rural schools were often ungraded and had no standard final examinations or report cards. Scholastic success was given a showcase via exhibitions, bees, and quizzes held for parents during which students demonstrated their expertise in spelling, arithmetic, geography, and history. In addition to adulation, winners were given certificates and prizes such as books or prints (Anonymous 1971, 13, 65) (Burrowes 1861, 42).

There were few educational standards at this time. There were no state or national norms, and all standards that did exist were local. The length of the school day and year varied as the individual community saw fit. The average length of the school term in 1860 was five months and five and a half days, almost exactly matching those months between harvest and planting when there was little for children to do on the farm. A typical school day ran from nine to four with an hour for recess and dinner at noon. The day often commenced with a scripture reading followed by a patriotic song. Emma Sargent Barbour received a letter from her sister, Maria, addressing her teaching duties: “I am a regular schoolmarm. School commences every day at nine o’clock when they write a half hour and the lessons follow.” A subsequent letter provides more details of a teacher’s day. “School! School!—is the cry, my daily life may almost be embraced in the following programme; rise at seven, breakfast at half past, practice my little singing lesson and ready to start for school at half past eight. Direct the youths how to behave and hear lessons until twelve, then from twenty minutes to a half an hour, hear missed lessons and eat lunch, chat with the boys until one o’clock, then proceed as before until three; prepare for dinner and sometimes attend receptions or receive company in the evening” (Volo and Volo 2004, 84) (Moskow 1990, 122, 139).

The subjects that were taught at any level of education depended on the competency of the teachers and varied greatly from place to place. In the annual report of Armstrong County, Pennsylvania, the superintendent boasted, “The number of schools in which geography and grammar are not taught is steadily diminishing. There is a considerable increase in the number in which mental arithmetic is taught. Algebra was taught in 11 schools; history in 4; natural philosophy in 2; Latin in 1; composition in 5 and in several there were exercises in declamation and vocal music.” In Connecticut, one of the more progressive places where state standards were dictated by the legislature, incorporated towns with 80 families were required to have at least one school for young children that taught English grammar, reading, writing, geography, and arithmetic. Towns with 500 families were to establish an additional school for older students that offered algebra, American history, geometry, and surveying. Those places with larger populations might institute programs that included natural philosophy (physical science), Greek, and Latin as they saw fit (Burrowes 1861, 21).

In addition to the three Rs, schools were expected to infuse a strong moral sense, foster polite behavior, and inspire good character. Another instructional objective, presented in a reading text, was "a desire to improve the literary taste to the learner, to impress correct moral principles, and augment his fund of knowledge." There was no sense of separation of religion or morality from secular education. The report of the Beaver County, Pennsylvania, superintendent of schools noted, "The Bible is read in 140 schools; not read in 17. I trust that all our teachers may become so deeply impressed with a sense of their duty, in the moral education of their pupils, that we may soon report the Bible read in every school." An introductory geography book contained the following extraordinary attestation in its preface: "The introduction of moral and religious sentiments into books designed for the instruction of young persons, is calculated to improve the heart, and elevate and expand the youthful mind; accordingly, whenever the subject has admitted of it, such observations have been made as tend to illustrate the excellence of Christian religion, the advantages of correct moral principles, and the superiority of enlightened institutions" (Town 1849, 22) (Mitchell 1852, 5).

Readers contained lessons emphasizing honesty, morality, and good manners such as "The First Falsehood," the "Effects of Evil Company," a "Contrast between Industry and Idleness," and a "Dialogue between Mr. Punctual and Mr. Tardy." Stories, poems, and essays used in instruction drilled the messages that good triumphed over evil, frugality surpassed extravagance, obedience superseded willfulness, and family always came first. This can be seen even in brief multiplication rhymes: "5 times 10 are 50. My Rose is very thrifty" or "4 times 10 are 40. Those boys are very naughty." The last was inscribed beneath a picture of two boys fighting. Some texts published in the North contained distinctly antisouthern sentiments, whereas many from the South carried pro–states' rights and militant themes. Caroline Cowles Richards wrote in her diary just prior to the outbreak of war, "I recited 'Scott and the Veteran' today at school, and Mary Field recited, 'To Drum Beat and Heart Beat a Soldier Marches By.' Anna recited 'The Virginia Mother.' Everyone learns war poems now-a-days" (Anonymous 1971, 33, 41) (Richards 1997, 132).

Gifted students could pass through the entire local system of schools by age 14 or 15, but only the most well-heeled could move on to college or university. Although college enrollments grew throughout the antebellum period, the slow development of high schools in the northern cities provided for a less expensive educational opportunity than college or the academy for boys who wished to become merchants or mechanics. Most people felt that this form of higher education should not be part of the legal public school system. A high school education was seen as terminal at the time. Boston, a leader in educational matters, did not open a high school for girls until 1855. By 1860, there were only 300 high schools in the United States, 100 of which were in Massachusetts. High schools remained a uniquely urban institution until after the Civil War. Nonetheless, in the decade after the war, only 2 percent of the 17-year-old population had graduated from high school. A foreign visitor to New England found that most middle-class American men had a basic education that stressed reading and writing, but that few exhibited the fine formal education available in Europe (Calkins 1975, 127).

HIGHER EDUCATION

Colleges and universities in America have long been viewed as repositories of knowledge established to train the best minds to deal with advanced philosophical concepts, if not in technical and professional subjects. There were 11 major colleges established during the colonial period. There were 12 more colleges established from the end of the Revolution to 1800; 33 from 1800 to 1830; and 180 from 1830 to 1865. The oldest colleges in the East were established by private groups and chartered by their respective legislatures, but they were otherwise independent of government control. Those in the West and South were generally supported and controlled by their state government. From the early part of the nineteenth century there was some effort to offer higher education to women. Mount Holyoke Seminary in Massachusetts (1837) and Elmira College in New York (1855) were nearly equivalent to those schools reserved for men. Vassar in Poughkeepsie, New York, which styled the prototype of modern women's colleges, was not founded until 1865 (Volo and Volo 2004, 86–87).

Although most institutions had a religious purpose and oversight, most had broader interests too. The establishment of new institutions in America that lacked the ancient customs and traditions of European schools inevitably led to the development of a university system rooted in a more general form of Protestantism. Unassociated, as most were, with the older universities of Europe, American colleges tended to humanize religious life, moderate intolerance, and bring the academic community closer to a less sectarian form free of most of the controversies over doctrine that plagued the older institutions. American institutions of higher learning came to be characterized by their relatively heterogeneous student bodies, their acceptance of a common worldview rooted in Christianity, and their openness to new ideas (Volo and Volo 2004, 87) (Cremin 1970, 330n).

The Catholic institutions remained, unapologetically authoritarian, resolute and unalterable in their structure. As the oldest and best-organized religion in the Western world, Catholics demanded the unquestioning obedience of their members to the will of the church, and expected the same from the teachers and students at their colleges. Nonetheless, Alexis de Tocqueville said of the Catholic institutions in Maryland: "These colleges are full of Protestants. There is perhaps no young man in Maryland who has received a good education who has not been brought up by Catholics." The Catholic church in America began its educational system on a diocese-by-diocese basis in response to anti-Catholic legislation in New York that required the daily reading of the King James (Church of England) version of the Bible. The Catholic system included a number of colleges and seminaries, as well as high schools and grammar schools, but these were limited to regions with large Catholic populations wealthy enough to support them. In 1839, more than 5,000 students attended eight institutions in New York alone (Mayer 1960, 78).

Southern colleges and universities offered opportunities comparable to their northern counterparts. The College of William and Mary in Virginia was well thought of even in the European academic community. The University of North Carolina–Chapel Hill, first chartered in 1795, remained a single building near the

Stephen Girard founded the Girard College, in Philadelphia, Pennsylvania, for the education of orphans. The building was constructed from July 4, 1833, to 1847 and went into operation in 1848. Courtesy of the Library of Congress.

New Hope Chapel until 1860. Student enrollment at Chapel Hill increased steadily, with only Yale boasting of a larger student body before the war. The University of Virginia, founded in 1825, was unequivocally cosmopolitan and academically ranked second in the nation in 1860, preceded only by Harvard. Although largely under state control, most of the South's colleges were supported by religious denominations.

Colleges also sprang up in the rural southern countryside from the rootstock of older academies that were clearly offering college-level instruction. Clio's Nursery in North Carolina and the Newark Academy in Delaware were two examples. No fewer than 25 institutions like these were granted state charters before the end of the antebellum period, and several received considerable state aid that helped them to remain solvent despite declining enrollments. Nonetheless, the outbreak of the Civil War had a profound effect on most southern colleges. Roanoke College in Virginia (1842) was one of the few southern institutions to remain in operation throughout the conflict. Many closed for the duration of the war as young men streamed into the military units of the Confederacy. Federal or Confederate forces occupied some college buildings to use as hospitals, barracks, and headquarters during the war (Volo and Volo 2004, 88).

College studies everywhere were heavily laden with classical course content, which seems to have taken on the role of a puberty rite granting access to proper society through the pain and punishment of reading Livy, Cicero, Homer, Plato, Euclid, and other ancient writers in the original Greek and Latin. Instruction was based on the same fundamentals as those of the seventeenth century, and, as with primary education, oral recitation was the most common form of instruction. In much the same way that physical activity was preparation for the life of a laborer, the function of higher education was thought to be the training of the mind through mental discipline rather than instruction in specific course content. In the 1850s, an observer noted the system used at Yale: "The professor or tutor sat in a box, with his students before and beneath him, and the so-called education consisted of questions upon a textbook. Not questions to elicit thought, but simply questions to find out how nearly the students could repeat the words of the book, or, if it were a classic, to find out how little they knew of Latin or Greek grammar." Many students found it impossible to satisfy their instructors by thinking in Greek and Latin, and they were generally indifferent to the classical course content, hoping instead to learn more about the application of science, mathematics, and engineering, which, if treated at all, were given the same superficial attention that they are in grade school today. As late as 1854, many of the professors at Princeton expressed their satisfaction with the traditional curriculum, noting that no "experiments in education" had been given the slightest countenance (Volo and Volo 2004, 88) (Bishop 1969, 59).

In the 1820s, George Ticknor, a professor of European languages at Harvard, proposed a program of college studies based on the departmental subdivisions and elective courses, but the institutions of higher learning in America were slow to adopt this structure. Nonetheless, by the 1840s medicine and law were being taught as separate curricula. Work in the sciences, which covered physics and astronomy with some topics in chemistry and geology, consisted mostly of lectures with occasional laboratory demonstrations. Many important technological advances were initially considered philosophical toys created for the entertainment of those in the lecture hall. Mathematics explored algebra, geometry, trigonometry, and calculus and encompassed the strict memorization of rules with only a limited effort to apply them to practical problems. Rhetoric students studied composition as well as speaking. Other studies included natural and biblical philosophy and logic (Volo and Volo 2004, 89).

College professors were offered small salaries, and often found that at the end of the year they were reduced to dividing the assets of the college treasury because enrollment had not met expectations. There were no research facilities or grants, and there was no tenure, pension, or retirement plan. Instructors served at the will of the college president or committee. There was no special training for college instructors beyond what they knew, which was usually based on their own classical educations. Most institutions provided a number of tutors to assist the professors, but these were almost always young men in the early stages of training for the ministry.

Professorship at the university level evolved from a mere organizational model to one of a larger intellectual and pedagogical specialization, and the college lecture, like its civilian counterpart, soon came to be a device whereby the instructor could present and contrast his own ideas with those of others in a systematic and efficient form. Chester Dewey, a professor at Williams College and later at Rochester, was typical of the breed in the early days of the period. Well versed in the Bible—he was an ordained minister—Dewey was a tireless lecturer, giving more than 4,000 lectures in chemistry, mineralogy, and botany from 1810 to 1827. Each was peppered with biblical quotations and allusions like a well-rehearsed sermon. Nonetheless, Dewey was a serious scientist who enthralled his audience with demonstrations and pranks such as lighting alcohol with an electric spark, passing a current through his students, and making things glow in the dark by coating them with phosphorous (Volo and Volo 2004, 90).

Notwithstanding teachers like Dewey, as early as the first quarter of the century, educators had begun expressing concern over the direction of higher education. In 1820, Alden Partridge, an educator and later superintendent of the United States Military Academy at West Point, gave a lecture on his views concerning the deficiencies to be found in public colleges and seminaries of higher learning. His speech was subsequently printed and circulated widely throughout the pedagogical community. His main point was that the college years were an opportunity to prepare young students to correctly discharge the duties of any station in life in which they might be placed. The key weakness he found in the American system of liberal education was that it prepared students only "to become members of the college or university," calling for the study of Latin and Greek while giving "very slight attention" to English language and literature, the elements of arithmetic, and other practical matters. "Here they spend four years for the purpose of acquiring a knowledge of the higher branches of learning; after which they receive their diplomas, and are supposed to be prepared to enter on the duties of active life. But, I would ask, is this actually the case?...Has their attention been sufficiently directed to those great and important branches of national industry and sources of wealth—agriculture, commerce, and manufactures?" (Volo and Volo 2004, 90–91) (Barnard 1969, 840).

Partridge also found the system of higher education wanting in the areas of physical education, then popular among German educators and proponents of the gymnasium for producing "a firm and vigorous constitution." Beyond the superficial niceties of clean clothing and bedding, hygiene at most colleges was little regarded with few or no facilities for bathing and restrooms no more advanced than those of the outhouse found on most rural farms. Athletics were barely tolerated, and at some institutions running, jumping, climbing, and many other forms of physical exertion were considered below the dignity and deportment of the scholar. The lack of exercise produced a student body that was sickly and desk-bound. In midcentury, Oliver Wendell Holmes described them as "a set of black-coated, stiff-jointed, soft-muscled, paste complexioned youth[s]," and Nathaniel Parker Willis described them as "hollow-chested, narrow-shouldered, [and] ill-developed looking" (Volo and Volo 2004, 91) (Bishop 1969, 58).

Partridge denounced the large amounts of idle time afforded students away from their studies and the quantities of disposable money available to those students from wealthy families, "thereby inducing habits of dissipation and extravagance, highly injurious to themselves, and also to the seminaries of which they are members." Finally, he decried the requirement that all students follow the same course of study in a prescribed length of time. "All youth have not the same inclinations and capacities...for the study of the classics...the mathematics and other branches of science." By following a predetermined length of time for the course of education, "the good scholar is placed nearly on a level with the sluggard, for whatever may be his exertions, he can gain nothing in respect to time, and the latter has, in consequence of this, less stimulus for exertion" (Volo and Volo 2004, 91) (Barnard 1969, 840).

College students during the antebellum period seem to have been no better in terms of their decorum than modern scholars. Moreover, some of their activities went beyond pranks, drunkenness, and adolescent licentiousness to a level that was remarkably unrestrained and even violent. In general, student manners were good with boys doffing their caps to faculty and attending early morning religious services. Yet although there were long periods of peaceful coexistence on antebellum college campuses, faculty-student relations were often strained at the very best institutions and many disagreements resulted in the smashing of furniture, the use of explosives, and the effusion of blood. One institution in New York found it necessary to codify its regulations forbidding students to "blaspheme, rob, fornicate, steal, forge, duel; or assault, wound, or strike the president [of the college] or the members of the faculty" (Volo and Volo 2004, 91–92) (Bishop 1969, 29).

Rioting among the students was somewhat of a tradition at many schools. In 1807, Harvard students protested the quality of the food; in 1823, 43 of 70 seniors were expelled; and, in 1834, the entire sophomore class was dismissed for the remainder of the year. At Yale in 1830, Benjamin Silliman attended his laboratory with two loaded pistols during a period of student unrest that ended with the banishment of half the sophomore class, and in 1843, a tutor was fatally stabbed when he tried to subdue a window-breaking rioter. Four years later, protesting students shot and killed a New Haven fireman. Princeton experienced six major student rebellions between 1800 and 1830, many of which were related to drunkenness. In 1817, of an entire student body of 200 scholars, 125 were expelled after a pistol was fired through a tutor's door and a bomb was exploded in Nassua Hall, breaking the windows and cracking the walls (Volo and Volo 2004, 92).

Southern schools mirrored their social and cultural environment with frequent duels with pistols between students and outbreaks of physical violence toward the administration. In 1840, six seniors attacked the president of the University of Georgia, and in the same year, a student stabbed and killed the president of Oakland College in Mississippi. The faculty chairman at the University of Virginia was seized and whipped by a throng of rioting students before the state militia could restore order. The man later died of his wounds. A modern historian has noted of these incidents, "Granted they were exceptional and hence memorable; nevertheless they reveal a habit of mutiny that lay dormant from the mid-century to our own times. In the early days of the Republic violence was part of American life, on the frontiers and in the turbulent cities. The collegians did no more than follow the example set by their elders. They were subjected to a galling regime of restriction and repression, to a routine of hardship, to a curriculum of studies that was generally unwelcome. The explosions were likely to be thunderous" (Volo and Volo 2004, 92) (Bishop 1969, 30).

MILITARY EDUCATION

Near the end of the eighteenth century, the young United States felt an immediate want for men trained in the best possible habits and principles of military science. As early as the Revolution, George Washington had recognized the inherent weakness of a country that had to rely on foreigners to shape his army and to plan his fortifications. For quite some time there was a struggle among competing ideas of just what balance of moral, intellectual, and physical disciplines was needed to provide for a corps of properly trained officers for the army of the United States. The English author John Milton penned a pedagogical outline for military education that was very close to the one instituted in American schools. Milton's ideas were based on "virtuous and noble" principles designed to prepare the student "to perform justly, skillfully, and magnanimously all the offices, both public and private, of peace and war." His program of education included studies in a number of areas such as mathematics, surveying, engineering, navigation, and the art of fortification. He also suggested a dedication to physical education, a knowledge of geography, and any academic activity that helped the student contemplate "the serene countenance of truth in the still air of delightful study" (Barnard 1969, 865–66).

In 1802, Congress established the idea of a national military academy at West Point, but the idea of making a separate institution for the scientific study of warfare had not yet fully matured. As a school, West Point for many years survived "an inchoate existence, without regular teachers, or limited studies, or proper discipline. . . . No professor of engineering or any other department was appointed before 1812 [and] in fact, there were no graduates prior to 1815" (Barnard 1969, 865).

The curriculum chosen for West Point cadets in 1825 included, in their order of importance, mathematics, natural philosophy, mechanics, astronomy, engineering, chemistry, French, tactics, principles of artillery, mineralogy, ethics, and history. Some attempt was made to adapt the school to the tone of higher education in civil institutions, but the object of West Point was not civil, but martial life. Yet as late as 1840, a period newspaper, *Citizen Soldier,* found the U.S. Military Academy at West Point "monopolizing, aristocratic, unconstitutional, and worse than useless." In 1862, Henry Barnard, editor of the *American Journal of Education,* noted of West Point, "It was not to be expected that schools of refined, scientific art should be found by small colonies in the wilderness of a new world. When even their clergymen must resort to Europe for education, and their lawyers for license, it was in vain to expect their soldiers to be accomplished engineers" (Volo and Volo 2000, 187) (Barnard 1969, 721).

As part of his formula for the revision of all higher education, Alden Partridge had also dedicated a good deal of his thinking to the inclusion of military studies and discipline for all students. Although the course of academic studies that he proposed was as extensive as that of any academy or college in New England at the time, not everyone favored the inclusion of military topics and discipline. In 1820, Partridge opened an institution for almost 500 students organized under his own ideas at Norwich, Vermont, and in 1824, he removed the academy to Middletown, Connecticut, at the invitation of the citizens of the region. Here the school grew to house more than 1,200 pupils from every state and territory in the United States, many from Canada, Mexico, and the West Indies, and several from South American nations. In 1834, he reopened his institute in Vermont as the Norwich University, and in 1839, he established a similar school at Portsmouth, Virginia, which came to be known as the Virginia Literary, Scientific, and Military Institute. In 1853, he opened at Brandywine Springs, near Wilmington, Delaware, another institution "in which he fondly hoped his ideal of a National school of education would be realized." His plan, as it developed, emphasized "physical training in connection with military exercises and movements [accompanied by] the acquisition of practical knowledge of the great principles of science that underlie all the arts of peace and war." The success of Partridge's schools in Vermont, Connecticut, Delaware, and particularly in Virginia led to the establishment of similar schools of military training throughout the nation and particularly in the South (Volo and Volo 2004, 94).

As early as the first decade of the nineteenth century, an unequaled interest in military education had been clearly manifest in the South, and by the final antebellum decade, the movement toward military education and the establishment of schools dedicated specifically to the martial arts had gained marked momentum. A military career became increasingly acceptable for the sons of the plantation aristocracy who reveled in a military mythology that traced their descent from the Cavaliers of the English civil wars. The success of southern warriors during the Revolution and during the Mexican War of 1846 also greatly enhanced the prestige of a military education and career. In 1854, a Charlestonian noted that the South cherished a military spirit and wished to diffuse the precepts of military science among its young men so that they might defy the North should it take up arms against the South (Volo and Volo 2004, 94–95).

Notwithstanding the negative attitudes toward a northern education, the aristocratic characteristic of military education at West Point certainly appealed to southerners. So highly prized was the quality of this military and academic preparation that more than one-third of the student body at West Point had southern roots. In 1861, 306 graduates of West Point had joined the Confederate army as officers. U.S. Secretary of War Simon Cameron remarked on the situation in July 1861:

> The large disaffection at the present crisis of United States Army officers has excited the most profound astonishment and naturally provokes inquiry as to its cause. . . . The question may be asked in view of this extraordinary treachery displayed whether its promoting cause may not be traced to a radical defect in the system of education itself. (Patterson 2002, 8)

Notwithstanding Cameron's remarks, public sentiment in the South had increasingly frowned upon a military education at northern schools. North Carolina was among the earliest of the southern states to initiate the study of the martial arts as a regular part of the course of study. Schools in South Carolina, Mississippi, and Alabama also showed interest in military education by the second quarter of the century. By the 1840s, a generation of young men had been trained in light infantry tactics, broadsword exercises, and cavalry evolutions on "the plan of the West Point Seminary" in schools based in the South.

Most initiatives at established academic schools simply added to the ordinary branches of studies the science of camps and tactics—a modification that was found agreeable to the youth of the country. Nowhere did southerners better understand this problem than in Virginia and South Carolina. In 1836, Virginians decided to substitute a military school for the company of state guards by diverting the financial resources of the state from the Lexington Arsenal to the Virginia Military Institute (VMI) in its stead. Virginians pointed to the development of VMI as "thoroughly and exclusively Virginian" and pointed with pride to the state patriotism engendered therein. South Carolinians attempted to combine the "enterprise and decision of a military character" with the acquisition of a scholastic education by converting the Arsenal at Columbia and the Citadel and Magazine at Charleston into military schools. Another major southern school, the Georgia Military Institute, was opened in 1851 (Volo and Volo 2000, 187–88).

An important factor in the growth of southern military schools was the zeal of those who graduated. The graduates of these schools, especially those of VMI, devotedly promoted military education throughout the South. Many VMI graduates went on before the breaking of the crisis to serve as instructors in newer institutions. When the war came, it was not surprising that two-thirds of the highest-ranking officers in the Confederate army were from Virginia (Volo and Volo 2004, 95–96).

Nowhere else in the South were there any developments remotely approaching the success of schools like VMI. As the war approached, town after town in the South boasted a new "military academy." However, students attending these institutions generally saw only minor modifications in instruction and the addition of various military activities—riding, military drills, and tactics—incorporated into the routine academic curriculum. Companies of uniformed cadets were established in many places. Most prospered only briefly, to be abandoned when the novelty wore off. State support was generally limited to providing the school with tax exemptions and as many antiquated muskets, artillery pieces, and other arms as needed for training purposes. Some military institutions received increasing public support as the sectional disputes tearing at the nation proceeded toward war.

Yet military education required more than mere financial support. Military schools enjoyed excellent public relations in the South, engaging in activities designed to excite the interest of the populace. Cadets made frequent off-campus visits to communities to display their skills at drill and their attractive, if rather gaudy, uniforms by parading in the town square or on the county fairgrounds. An unbridled martial spirit was abroad by the 1850s, and most southerners regarded their military schools as among their most valuable regional assets. Moreover, a wider usefulness was recognized in having a cadre of military personnel that could quickly respond to possible slave uprisings (Volo and Volo 2004, 96).

SCHOOLS OF SCIENCE

Not until 1827 would the term technology be coined to represent the application of the study of science to real-world situations. Jacob Bigelow first used the term during a lecture at Harvard. At most colleges and universities, only a few scientific lectures were given each year in addition to the classical curriculum. Williams College boasted of an astronomical observatory, but major schools like Dartmouth and Bowdoin adhered to a strictly classical curriculum. As late as 1845, at Yale the first two years of college were limited to Latin, Greek, and mathematics, and during the next two years students were exposed to periodic lectures on natural philosophy, chemistry, mineralogy, geology, and astronomy. There were two professors of science and three teaching assistants. Harvard offered essentially the same subjects, although some chemistry and natural history were studied in the first two years. Oddly, one of the weakest fields affecting science education was mathematics, which was so mired in the work of Newton and Euclid that it could not easily expand into new dimensions of theoretical thought (Volo and Volo 2004, 96–97).

At the beginning of the antebellum period, no formal laboratory instruction existed at any school even though Amos Eaton had demonstrated its usefulness at Rensselaer College in New York as early as 1817. At Yale, Benjamin Silliman Sr. had a single basement room for experimentation that was enlarged only after the Medical School was established, and John W. Webster, author of the *Manual for Chemistry* (1826), founded a chemistry lab at the Harvard Medical School in that year. Nonetheless, Silliman and his son Benjamin Jr., who was also a teacher, had attracted a number of young men interested in chemistry and geology to Yale. In 1842, the younger Silliman was able to secure a workshop at the school in which to instruct a few students interested in the practical application of scientific or engineering principles.

The early teaching of biological science at Williams College ultimately affected not only the curriculum at Yale and Harvard but also that of Amherst College and the Rensselaer Institute. In New England, private medical schools were opened at Pittsfield, Massachusetts, at Woodstock and Rutland in Vermont, and at Fairfield near Utica, New York. Although their clinical facilities were primitive by today's standards, these rural schools were advanced for their day, successfully competing for students with Yale and Harvard. Yet by the beginning of the Civil War, most of the rural medical schools had disappeared, and their students had been absorbed into the major urban universities. The inspiration for these schools came from abroad where many American physicians had received their own training. It is interesting to note that the scientific school at Yale was founded largely by men trained in agriculture, whereas at Harvard it was founded by those rooted in industry. John Pitkin Norton started the School of Applied Chemistry at Yale in 1847 (Volo and Volo 2004, 97).

Another of the weaknesses in American higher education was in the area of scientific agriculture. Southerners were much more expert in this regard than New Englanders. Many southerners had formed or joined private agricultural societies in the eighteenth century and early nineteenth century in an attempt to better underpin the plantation system. The colonials had used seaweed, clam and oyster shells, fish, ashes, and bone meal to improve their soil, but they did not spend a great deal of time using animal fertilizers. This may have been because virgin land was plentiful, but also because direct and purposeful fertilization was a new idea. It was not until several decades had passed that the earliest settlers noticed a change in the soil that they were farming. At first it had been dark, almost black, but with time its color became lighter, and crop yields fell. Scientific agriculturalists in England, like Jethro Tull, believed that active cultivation of the soil was the secret of its fertility. Deep plowing was his answer to diminished crop yields as this helped to dry out wet land and allowed the soil to better utilize rainfall. Jared Elliot, a minister and doctor from Connecticut at the turn of the century, correctly believed that the fertility of the soil was associated with the organic matter that it contained. He showed that the addition of swamp mud to the soil increased the yield and improved the crops, and he was one of the first to note that certain crops rebuilt the soil. Ultimately, he was able to show that animal manures, cover crops of red clover and timothy, and a year's rest between plantings could significantly improve agricultural production. Later experiments showed that root crops such as turnips and carrots helped the soil.

Moreover, turnips, in particular, could be used as winter feed for livestock (Volo and Volo 2004, 97–98).

In the 1840s, many southern planters abandoned their worn-out coastal land for new fields in Mississippi and Alabama, which promised to be more fertile. The rich black soil of these areas promised an abundance of cotton. Yet, in just a decade, these new lands were also showing the effects of erosion and soil worn by extensive single-crop agriculture. This circumstance found the next generation of planters moving on again to Texas and Arkansas. Virginia Senator John Randolph, seeing fields gullied and rivers full of mud, called the farming techniques commonly used in his state "improvident." He warned his fellow planters, "We must either attend to . . . our lands or abandon them and run away to Alabama." Randolph, with a few concerned planters, sponsored programs that trained farmers and their slaves to use modern plowing methods. They introduced technological improvements to farming and encouraged soil experiments. Another planter, Edmund Ruffin, advocated replenishing soils as both healthy economically and as a way to ensure southern "independence." He served for many years as the head of the Virginia Agricultural Society. This group also fostered more modern farming methods, and from 1833 to 1842, Ruffin was the editor of the *Farmer's Register*, a publication dedicated to the improvement of agricultural practices (Volo and Volo 2004, 98).

MECHANICAL AND TECHNICAL INSTITUTES

As Americans became increasingly aware of the role of science and technology in the dramatic economic changes they observed all around them, informal education in various forms grew in popularity. This increasing role played by science and technology in the minds of the American public was reflected in the "tremendous popularity of public lectures on chemistry, steam engines, geology, and astronomy." The number of lyceums that hosted such lectures grew to 3,000 by 1835 (Timmons 2005, 178) (Weiner 1966, 167).

As American colleges and universities increased in enrollment and prestige, a backlash formed from a large segment of the population who believed the universities were of little help to the common artisan or mechanic. In many instances, concerned citizens formed mechanic's institutes to train and educate the technical workforce in the sciences they believed were crucial to successful and enlightened manufacturing. These institutes provided public lectures and various modes of formal education for the sons of local middle-class workers. The most famous and most successful of these mechanic's institutes was the Franklin Institute in Philadelphia (Timmons 2005, 178).

In 1824, the founders of the Franklin Institute intended to provide educational opportunities for working artisans and mechanics, and their children. At various times in its history, the institute provided evening lectures and formal schools for training in the sciences, technology, architecture, drawing, and many other subjects. No matter the subject or the mode of delivery, the target audience was always the working class rather than the children of the wealthy, who were already served by the colleges and universities. The citizens of Philadelphia and surrounding areas embraced this sort of outreach; by 1839, membership in the institute had climbed to 2,500 (Sinclair 1974, 240).

An episode occurring in the first years of the institute's life serves as an example of the original intentions of the founders. In 1830, the Franklin Institute conducted a series of experiments to determine the efficiency of water power, at the time the most important source of power for mills and other manufacturing concerns throughout the nation. Volunteers from the institute, using money raised from donors such as engineers, mill owners, and other interested parties, performed carefully planned experiments with various types of waterwheels and other equipment. The results of the experiments were hailed as an example of the advances that could be achieved when *practical* men of *science* cooperated with private *industry* to find solutions to *technical* problems (Timmons 2005, 178–79).

The italicized words summarize the hopes of many leaders of American science and American industry in the nineteenth century. It was strongly held that science could, and should, be practical. This practicality would manifest itself in finding solutions to technical problems in American industry. Part of the Franklin Institute's mission, and the mission of other technical institutes, was to prepare mechanics for the coming revolution in technology by educating them in the methods and theories of science (Timmons 2005, 179).

Perhaps the most important endeavor undertaken by the Franklin Institute was one that, if successful, might prove the most beneficial to everyday life in America. The study, undertaken in 1830, was intended to determine the causes of boiler explosions on steamboats and to make recommendations as to methods to prevent such explosions. The steamboat, hailed widely as evidence of America's technological abilities and a sign of progress for everyone, was actually a dangerous place in its early days of operation. By 1830, there had been almost 60 explosions taking more than 300 lives in the United States. Although there had been several investigations into the causes of these explosions, including one sponsored by Congress, few conclusions were reached. A special committee of the Franklin Institute, chaired by Alexander Dallas Bache, was appointed to investigate these explosions. In 1835, after years of experiments on boilers, Bache and his committee completed their report (Sinclair 1974, 171).

This study was important for many reasons, not the least of which was calling attention to the continuing tragedies occurring on steamboats across the nation. Besides the obvious benefits, there were other outcomes of the study that established precedents for cooperation among private institutions, business and industry, and the government. Bache's experiments were partially supported by government funding, a novelty in antebellum America. Although funded by government sources, the report was published in the institute's *Journal,* marking the publication as an important repository for practical scientific information (Sinclair 1974, 191).

Although Bache submitted his report to Congress, with recommendations that legislative action be taken to regulate unsafe practices on steamboats, little was done for years. Even a bill passed by Congress in 1838 proved ineffectual for controlling the steamboat industry. By 1848, the lives lost in boiler explosions had risen to more than 2,500. Finally, in 1852 Congress passed a bill that did prove effective in reducing deaths caused by boiler explosions. There can be no question that in this matter, as well as many other practical matters, the Franklin Institute had a positive impact on everyday life in America—a realization not lost on the many Americans who appreciated the institute's work (Sinclair 1974, 190).

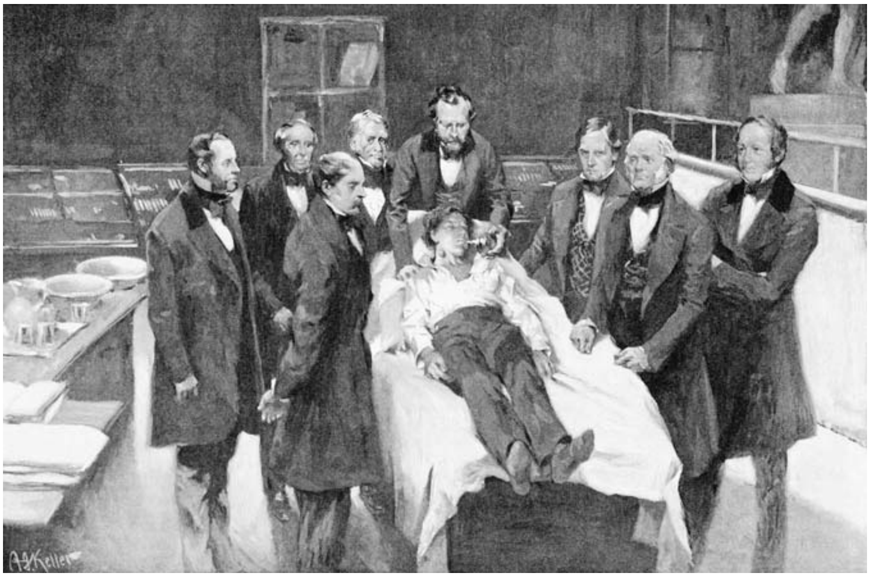
Other modes of formal and informal education, directed at the common man who might not have the time or the resources to attend college, were prominent in American life. The lyceum movement sprouted throughout the country as lecturers traveled far and wide providing entertaining educational opportunities. Often these lectures addressed scientific topics using laboratory equipment as much for special effect as for education. Many Americans achieved a degree of fame through this informal brand of higher education. Amos Eaton, cofounder of the Rensselaer School in New York, became a noted and wildly popular lecturer on "agriculture, domestic economy, the arts and manufactures," among other topics (Marcus and Segal 1989, 83).

Bringing science directly to the people, in theory, was a good idea. In practice, the preponderance of popular lectures and publications often resulted in misinformation and sensationalism. At the close of the nineteenth century, Robert Simpson Woodward, a physicist at Columbia University, lamented the damage done by unqualified lecturers:

> An almost inevitable result of the rapid developments of the last three decades especially is that much that goes by the name of science is quite unscientific. The elementary teaching and the popular exposition of science have fallen, unluckily, into the keeping largely of those who cannot rise above the level of a purely literary view of phenomena. Many of the bare facts of science are so far stranger than fiction that the general public has become somewhat overcredulous, and untrained minds fall an easy prey to the tricks of the magazine romancer or to the schemes of the perpetual motion promoter. Along with the growth of real science there has gone on also a growth of pseudo-science. It is so much easier to accept sensational than to interpret sound scientific literature, so much easier to acquire the form that it is to possess the substance of thought that the deluded enthusiast and the designing charlatan are not infrequently mistake [*sic*] by the expectant public for true men of science. There is, therefore, plenty of work before us; and while our principal business is the direct advancement of science, an important, though less agreeable duty, at times is the elimination of error and the exposure of fraud. (Timmons 2005, 180) (Weiner 1966, 181–82)

HEALTH AND MEDICINE

The nineteenth century witnessed the birth of a medical revolution in the United States (and throughout the world) that would lead to better health, increased life expectancy, and an overall elevated quality of life for most Americans. Although this revolution was still a work in progress by century's end, a new interest in the application of scientific methods to such things as surgical techniques, disease prevention and treatment, and physician training laid the groundwork for modern medicine.



First public demonstration of surgical anesthesia (1846), Massachusetts General Hospital, Boston. Hand-colored halftone.

After centuries of medical practices that had changed very little from medieval times, numerous medical milestones occurred in nineteenth-century America. Inoculations helped reduce the threat of some horrible diseases, the use of anesthesia made surgery safer and less painful, and the growing acceptance of the germ theory of disease led to the eventual adoption of antiseptic practices in surgery. Many of the institutions critical to improved health care for the common man formed in the nineteenth century. Modern medical schools emerged, some from the ineffective schools already in existence, whereas others appeared as new experiments in modern medical training; the first woman, Elizabeth Blackwell, received a medical degree from an American college in 1849; the American Medical Association formed in 1847; and the individual states, beginning with Massachusetts in 1869, formed boards of health to monitor medical care. In addition, other institutions related to the overall health of Americans appeared: The first colleges of pharmacology opened; the American Dental Association formed in 1859; and the first dental schools opened after the Civil War (Timmons 2005, 133).

Each of these institutions resulted in both immediate and long-term health benefits for Americans. Science, and to a lesser extent technology, played an increasingly important role in improving medical care. Ironically, advances in both the theory of medicine and the everyday practice of health care arrived at about the same time that many Americans were becoming increasingly aware of some of the dangers to their health caused by the oncoming Industrial Revolution. The juxtaposition of the new wonders achieved by science and technology against the societal ills, including issues of health, brought about by some of these same technical advances, continues to be a point of concern for America today (Timmons 2005, 134).

Antebellum Medical Practices

Health care in the United States in 1800 was minimal, as it was throughout the world. In a time before the germ theory of disease, before standardized and thorough training for physicians, and before science played a significant role in medicine, the health and welfare of Americans was often more a matter of luck than of medical care. The late nineteenth century witnessed a growing awareness from physicians and the general public alike as to the increasing importance of scientific methods applied to medicine (Timmons 2005, 134).

The overall health of Americans around the turn of the nineteenth century was much the same as it had been for previous centuries. Simple infections, treated by antibiotics today, often resulted in death. Infectious diseases were not understood and certainly not curable in 1800. Diphtheria, whooping cough, scarlet fever, measles, mumps, typhus, influenza, chicken pox, and smallpox ravaged the population as physicians stood helplessly by. Autopsies performed on victims of an 1820 yellow fever epidemic in Philadelphia represent an unusual instance in which antebellum physicians attempted to use scientific principles to investigate the cause of disease. Several diseases in particular caused devastation in the early nineteenth century: yellow fever, malaria, primarily in the South, and cholera and tuberculosis, which struck primarily in the crowded cities of the North. In the country, it was difficult for infectious diseases to establish a foothold, whereas in the crowded cities, epidemics were more common. Boston, although relatively healthy as cities go, provided its residents with a life expectancy five or six years lower than rural Massachusetts. New Orleans, with its swampy, semitropical climate, poor sanitation, and plethora of diseases entering from its port, was "very likely the most dangerous place in the United States" (Shryock 1972, 128) (Larkin 1988, 81).

New Orleans was not the only southern locale in which health problems plagued the citizens. Due to factors such as warm weather and low-lying wetlands, malaria and other diseases were more prevalent than in the North. The difference in life expectancies was so pronounced that life insurance companies habitually charged more for southern policyholders. Southerners' health improved with the introduction of vaccinations, new drugs to treat malaria and related fevers, and new and improved techniques for draining wetlands. Unfortunately, the Civil War resulted in a southern medical infrastructure in disarray (Shryock 1966, 49, 52, 70).

American physicians argued that health and medicine presented unique problems and demands for both the doctor and the citizen. Many of these unique demands were specifically placed on the nervous system: "constant choice and opportunity in business and religion, a lack of standards in personal and social life—all created tension and excitement." From school age through adulthood, competition and the hectic pace of life strained the physical and psychological well-being of Americans. The typical American "lived his life at a pace too frenetic for relaxation or rest." Especially when compared to Europeans, American religion, politics, and business caused stress. A nineteenth-century commentator on the subject concluded, "The result of this extreme activity, is exhaustion and weakness. Physical bankruptcy is the result of drawing incessantly upon the reserve capital of nerve force" (Rosenberg 1966, 149).

In spite of these sentiments about life in the United States, American physicians were unwilling "to exchange its liberties for the placid tyranny of the Russian or Turkish empires" where politics and religion were seen as comfortable and leading to complacency among their citizens. For most Americans in the nineteenth century,

> progress and liberty were unquestionably desirable, and the ailments which they induced in American minds were in a sense additional bits of evidence for the superiority of American ways of life. Technological change might be the cause of mental unease, but almost

all Americans were relatively sanguine in their attitude toward the future of such material change. Many Americans believed that the very processes of technological change that appeared to threaten mental health would ultimately provide remedies. Such ills that might develop in the interval were those of a transitional period in history and a small price paid for social progress. (Rosenberg 1966, 141)

The type of medicine practiced by the typical nineteenth-century American physician is often referred to as "heroic" medicine, a term implying an aggressive intervention—very often to the disadvantage of the patient—involving bloodletting, the use of purgatives, and other potentially dangerous methods. In a time before medicine was established as a scientific discipline, alternatives to the heroic practice of medicine offered a skeptical, and sometimes desperate, public other opportunities for seeking relief from medical conditions (Timmons 2005, 135).

American physicians in the nineteenth century often combined "themes of nature, providence, and nationalism to legitimize their efforts." Popular medical books of the day included herbal remedies, moral aphorisms, and even traditional cures adopted from Native Americans. One of the most popular of these medical books, John Gunn's *Domestic Medicine* (1830), was so widespread that the "typical small library on the southern Indiana frontier, for instance, boasted a Bible and a hymnbook; if there were a third title, it was often Gunn's health manual." Many other herbalist medical manuals gained widespread popularity, such as Samuel Thomson's *New Guide to Health: or, Botanic Family Physician* (1822). The resulting Thomsonian movement affected the healing practices of Americans across the country. Many frontier families looked to these manuals for their health care in lieu of the availability of a local physician. Even trained physicians found use for such "herbals" (Murphy 1991, 75, 76).

Botany and herbal studies seemed a natural fit for the physician, especially the traditional country doctor. Many of America's leading physicians were students of natural history, whether as a subject studied at the university or as a hobby. The latter was especially prevalent, as physicians "concerned with broadening their educational horizons . . . acquired practical hobbies in natural history" including the study of such diverse topics as "botany, zoology, geology, mineralogy, chemistry, anthropology, agriculture, and even gardening." Country doctors, with the task of traveling many miles between patients, were especially encouraged to fill their time "with quiet contemplation of flowers, trees, and rocks." In combination with the popular self-help herbal manuals, nineteenth-century Americans—especially rural Americans—often perceived of medicine as a process of employing nature to help fight sickness and disease (Haller 1981, 204).

Medical movements outside the medical establishment gained popularity with the common people of the United States who were dissatisfied with the medical treatment offered by conventional practitioners. The list of popular movements is as lengthy as the reasons the American people embraced nontraditional medicine:

The tendency for brinkmanship therapeutics resulted in the spawning of countless system-builders [in medicine], each seeking to replace traditional medicine with a newer mode of

> treatment. Mesmerism, Thomsonianism, mind-cure, faithcure, baunscheidtism, Christian Science, electropathy, hydropathy, vitopathy, and chemopathy had all but abandoned the older specifics for promises of quick and harmless cures. These medical heresies rivaled the religious sects, political parties, movements, and fads that emerged, along with the common man, in the early decades of the nineteenth century. Unfortunately, few of the systems did more than compound the errors of the past. (Haller 1981, 100)

Several of these medical heresies had a tremendous impact on the common man in America. One such sect was Mesmerism, a hypnotic technique developed by Austrian physician Friedrich Anton Mesmer. Based on the theory that man possessed an animal magnetism, Mesmerism gained the support of many well-known Americans, from respected physicians and professors to college presidents. Another, phrenology, the belief that the intellect and characteristics of a man could be divined by studying the shape of the head, also attracted a loyal following in the United States (Haller 1981, 104).

Homeopathic medicine became very popular by midcentury. This medical sect, founded in Germany and brought to the United States, depended on a philosophy of "likes cure like," with the applications of highly diluted drugs that caused symptoms similar to those experienced by the patient. Because of the diluted state in which the drugs were administered, homeopathic physicians tended to cause less harm than their conventional counterparts. By the later part of the century, homeopathy reached such a level of acceptance that its adherents formed their own medical schools and medical journals (Shryock 1972, 144).

In some ways, improved technologies actually contributed to the declining health of the country. The mail-order business, made possible by faster transportation—especially railroads—and advertised in the new penny papers, "also brought turn-of-the-century Americans, always distrustful of doctors (and carrying a definite streak of hypochondria), access to a new range of quack practitioners and patent medicines." William G. Rothstein calls the patent-medicine industry "the single most important long-run alternative to regular medicine." With the traveling "medicine man" a not-so-happy tradition in isolated settlements, these same predators were now able to advertise and deliver their elixirs from a distance. Gullible Americans with a little cash could order Swamp Root for "weak kidneys caused by overwork, by lifting, or strain," pepsin gum to "cure indigestion and sea sickness," an electric belt "to cure pain and nervous diseases, and "Swift's Specific," which claimed to be "the only hope for cancer." One could also order cures for syphilis, rupture, "lost manhood," stomach disorders, and almost any other disease, real or imagined. Faster communications and transportation fostered a growing market for these miracle cures, just as the Internet today seems to be accelerating the level of awareness of similar supposedly miracle drugs (Kent 2000, 23, 24) (Rothstein 1972, 158).

Medical historian Richard Harrison Shryock notes several contributing factors to the slow improvement of American medicine. The vast size of the country, its regional differences, its heterogeneous population, and even its complex system of government all contributed to the problem. In addition, an underlying utilitarian view of scientific research resulted in a nation "to whom technology naturally seemed more significant than 'pure' science." This view of science, coupled with a lack of aristocratic patrons—such as those found in many European countries—interested in funding research, resulted in nineteenth-century America trailing in the types of basic scientific research needed to make great breakthroughs in medicine (Shryock 1966, 33).

The first nineteenth-century breakthrough attributed to scientific medicine occurred in 1800, when Benjamin Waterhouse began vaccinating family and friends with Edward Jenner's newly discovered smallpox vaccine. Smallpox had a long history of decimating populations, with a mortality rate of close to 30 percent of those who came down with the dreaded disease. In fact, smallpox nearly accomplished what many white invaders tried—the eradication of the Native American population. At the turn of the eighteenth century, smallpox was a disease dreaded by people all over the world, and the citizens of the United States were no different (Timmons 2005, 138).

Enter Benjamin Waterhouse. Waterhouse was an American-born, European-trained physician who was appointed to one of the first professorships at the Harvard Medical School. In 1800, after reading about Jenner's recent discovery that cowpox could be used to inoculate humans against smallpox, Waterhouse wrote to Jenner asking for samples of his vaccine. To demonstrate his confidence in the safety and effectiveness of the smallpox vaccine, Waterhouse's first subjects were his own children, other family members, and household servants. When several of these newly inoculated children were purposely exposed to the smallpox virus with no ill effects, Waterhouse proceeded to persuade others (Timmons 2005, 138–39).

In spite of his initial success, it was not smooth sailing for Waterhouse and the smallpox vaccine. Several factors conspired to undermine the public's confidence in the vaccination. Through contamination or spoilage, some of the vaccinations proved ineffective, or worse, actually led to the vaccinated subjects contracting the disease. Waterhouse initially planned to profit from the inoculations by demanding a portion of the profits made by other physicians administering the vaccines. This soured some to Waterhouse and his cause. Yet, properly administered, the results were undeniable. With the support of many powerful people, including President Thomas Jefferson, Waterhouse and others were able to instigate large-scale inoculations that led to significant reduction of smallpox outbreaks in the United States (Timmons 2005, 139).

Other advances in antebellum medicine helped promote good health and provide relief from, and sometimes even a cure for, disease. Breakthroughs in pharmacology included the isolation of morphine from opium, and quinine from cinchona bark, and the introduction of the first hypodermic needles to inject such medicines. Morphine became an important—and unfortunately often overused—painkiller, while quinine provided for better control of malaria (Shryock 1972, 131).

Overall, the health enjoyed by the typical American did not improve to a great degree in the first half of the nineteenth century. Especially in the larger cities, Americans' health may have actually deteriorated. In spite of the continuing health problems, there were indications that things were improving slightly. Life expectancy in Massachusetts, for example, climbed throughout the century and from 1850 to 1900, the nationwide life expectancy climbed from about 50 years of age to more than 68 years of age. It was the medical advances of the second half of the century—especially the years after the Civil War—that led to a marked improvement in the nation's health. One of the most important developments was an improved system of physician education (Shryock 1960, 26) (Shryock 1966, 166).

Educating America's Physicians

At the beginning of the nineteenth century, the apprentice system continued to play a primary role in American medical training. Physicians were infrequently educated in the sciences, and medical schools were often disorganized and ineffective. In the first decades of the century, the physician's "training varied enormously—there were men with formal medical education, many who had learned through apprenticeship to another physician, and practitioners who were self-instructed and self-certified." Much medical treatment was based, as it had been for many centuries in Europe, on the "humor" theory of sickness. This theory held that sickness was caused by an imbalance of humors, or fluids, in the body. Thus, "bleeding," or the opening of a vein to draw off blood; "purging," or administering laxatives; and "puking," or administering emetics to induce vomiting, were typical treatments given by physicians. These treatments usually did more harm than good, and attendance by a physician was really of no more use than being sick without the benefit of a doctor (Larkin 1988, 87–88).

Around 1800, only four medical schools existed in the United States. By the mid-1820s, this number had grown to 17. It was not until 1825 that Robley Dunglison became the first full-time professor of medicine in the United States at the University of Virginia. Yet, medical training leading to medical degrees did not necessarily ensure qualified physicians. In fact, the public's perception of physicians in antebellum America was much different than today. A practicing physician described the problem:

> It is very well understood among college boys that after a man has failed in scholarship, failed in writing, after he has dropped down from class to class; after he has been kicked out of college, there is *one* unfailing city of refuge—the profession of medicine. (Shryock 1972, 138)

Even the president of Harvard, Charles Eliot, lamented the quality of person often found in physicians:

> An American physician may be, and often is, a coarse and uncultivated person, devoid of intellectual interests outside of his calling, and quite unable to either speak or write his mother tongue with accuracy. (Murphy 1991, 104)

The reason for such a remarkable disdain for physicians was simple: It was extremely easy to become a doctor in the United States. Even in the middle of the century, "almost any man with an elementary education could take a course of lectures for one or two winters, pass an examination, and thereby automatically achieve the right to practice medicine by state law." The education received at American medical schools was sparse, to say the least. How much training, after all, could be obtained in two short terms—the second term being a repeat of the first term, so that students essentially passed through the same training twice? What training that was obtained was usually of low quality. A typical American medical school of the early nineteenth century looked like this:

> First, the lecture was the sole pedagogical method used in all courses, except practical anatomy. Clinical, tutorial, or laboratory instruction was rare, even in subjects like chemistry. Second, the quality of instruction, even at the best schools, could be no better than the state of medical knowledge, and was consequently deficient in all aspects. Third, formal medical education complemented rather than replaced the apprenticeship system. Clinical subjects were supposed to be taught by the preceptor, and scientific subjects by the medical school faculty. (Rothstein 1972, 88–89)

With such inadequate training, it is little wonder that an American physician advised, "A boy who proved to be unfit for anything else must become a Doctor" (Shryock 1966, 152) (Murphy 1991, 104).

SURVEYING

Surveying was essential for many of the activities preceding and following settlement. Americans armed with scientific techniques provided surveys for building roads, railroads, and bridges; for boundaries between states and counties, as well as between private lands held by farmers, settlers, or land corporations; and for the layout of the new towns appearing all over the landscape. Surveying an unknown wilderness as vast and unyielding as North America proved to be a prodigious task. Some American surveyors were well qualified and accomplished incredible feats of accurate measurement; others were not as talented and made grievous errors in their surveying. Nearly all were hampered by poor quality equipment and instruments, low pay, little financial support for the surveys, and extremely difficult conditions caused by the size of the land, geographic obstacles, and unfriendly natives (Timmons 2005, 159).

Railroad building would lead to improvements in surveying techniques out of necessity as tracks were laid into places where roads had never gone. Measuring elevation changes became more important to surveyors. The grade at which a locomotive could climb, or safely descend, was vital, and the knowledge of a particular surveyor could mean the difference between a safe railroad and one fraught with dangers (Timmons 2005, 160).

For the first half of the nineteenth century, surveying and engineering in America usually fell to the Army Corps of Engineers, established at West Point in 1802. The Topographical Engineers, initially a bureau with the Corps of Engineers but later an independent corps, were especially influential in bringing a scientific eye to western exploration. In antebellum America, the Topographical Engineers, "Armed with more accurate techniques and equipment, consumed by an enthusiasm for inquiry, and fired by the spirit of Manifest Destiny . . . provided scientific mapping for half a continent." As early as 1819, the Topographical Engineers participated in explorations involving a great variety of scientists and scientific purposes, as described by an observer to an expedition to explore the headwaters of the Platte and Red rivers:

> Botanists, mineralogists, chemists, artisans, cultivators, scholars, soldiers; the love of peace, the capacity for war; philosophical [scientific] apparatus and military supplies; telescopes and cannon, garden seeds and gunpowder; the arts of civil life and the force to defend them—all are seen aboard. (Lasby 1966, 253)

Whether the job fell to army engineers or civilian scientists, surveying the western lands played a critical role in the development of a uniquely American settlement pattern, and scientific surveying became the cornerstone of land distribution in the West. Land surveyed and sold in square grids, towns, and farms revealed an organization unknown in Europe and other parts of the world. Surveying and mapping were only the first steps in a process that continued with the purchase of land (or, in many cases, land given away by federal and state government) and subsequent settlement. In the words of Andro Linklater, "The desire to possess land drew people westward, but it was the survey that made possession legal." Thus, the planners "transformed land into a commodity that could be precisely delimited, purchased, and registered in a land office, even if no one had ever seen it" (Timmons 2005, 160–61) (Linklater 2003, 166) (Nye 2003, 27).

SCIENTIFIC AND TECHNICAL INSTITUTIONS

In the nineteenth century, a growing number of Americans came to realize the profound impact science and technology had, and would continue to have, on everyday life. Americans from all walks of life embraced science in ways that are foreign to our modern experience. In today's world, where entertainment can be had with the touch of a finger to a remote control; where electronic games are a chief (and cheap) source of diversion for millions of children and adults; and where every newspaper offers a plethora of social and cultural activities for any age, it is difficult to conceive of science as entertainment. But in a nineteenth-century world where diversions were not as easily obtained, such activities as traveling lectures and scientific demonstrations offered the general public the opportunity to experience new and wonderful things (Timmons 2005, 169).

Scientific and technological developments in nineteenth-century America were more eagerly anticipated and embraced by the general public than they are today. Courses and lectures offered to the public at such places as the Albany Institute in New York or the Franklin Institute in Philadelphia were well attended by artisans, mechanics (an emerging class of skilled laborers who worked with the new machines of the industrial age), and others of diverse social and economic backgrounds. Exhibits at museums such as Charles Willson Peale's museum in Philadelphia and the Smithsonian Natural History Museum in Washington, D.C., attracted interest from people in all walks of American life. Later in the century, cities began building museums as vessels of public education. The motto of New York's American Museum of Natural History, for instance, was "for the people, for education, for science." Special exhibits such as those found at the 1876 Centennial in Philadelphia drew visitors from all over the country to marvel at scientific and technological wonders from the United States and the rest of the world (Timmons 2005, 169–70).

Americans embraced science in the nineteenth century, hoping to attain a higher intellectual plane:

> Though abstract science and the institutions which foster it did not flourish in antebellum America, a social climate favorable to its ultimate growth was created.... Americans could view science as an admirable, even socially prestigious, avocation—if not as a practical vocation. Science clubs and botanical and mineralogical trips sponsored by academies and secondary schools all helped to provide young men and even young women with a sedate interest in science and left in the minds of a few an inspiration sufficient to encourage the devotion of later years to its pursuit. (Timmons 2005, 170) (Rosenberg 1966, 159)

SCIENCE AND TECHNICAL SOCIETIES

"Nothing, in my view, more deserves attention than the intellectual and moral associations in America." This line, from the most famous foreign commentator on American democracy, expressed the view that to understand nineteenth-century Americans, one must attempt to understand their desire to come together to form clubs, societies, and associations. During his extended tour of America, Tocqueville was struck by the fact that

> Americans of all ages, all stations in life, and all types of disposition are forever forming associations. There are not only commercial and industrial associations in which all take part, but others of a thousand different types—religious, moral, serious, futile, very general and very limited, immensely large and very minute.... In every case, at the head of any new undertaking, where in France you would find the government or in England some territorial magnate, in the United States you are sure to find an association. (Tocqueville 1969, 513, 517)

Tocqueville realized the power behind these associations. He knew that, in a democracy, such associations spurred action:

> As soon as several Americans have conceived a sentiment or an idea that they want to produce before the world, they seek each other out, and when found, they unite. Thenceforth they are no longer isolated individuals, but a power conspicuous from the distance whose actions serve as an example; when it speaks, men listen. (Tocqueville 1969, 516)

These sentiments applied to all sorts of associations, including the many scientific and technological associations formed in the nineteenth century. An understanding of the workings of these associations leads to a better understanding of American attitudes toward the sciences (Timmons 2005, 176).

The first scientific societies founded in the United States were, for the most part, gathering places for educated Americans to discuss science, as well as other intellectual subjects. They were not scientific societies in terms of the modern definition—organizations of professionals specializing in particular branches of science. Moreover, before the mid-nineteenth-century scientific societies were regional, rather than national, in nature. For these reasons, the first societies played a smaller role in the advancement of American science than did organizations established after midcentury.

The American Philosophical Society (APS) was the first learned society of any importance founded in the British colonies of North America. Its incorporation represents America's first sustained attempt to emulate the learned societies of Europe, even before achieving independence. The society, patterned after the Royal Society of London, published the first volume of its *Transactions* in 1771. The stated purpose of the APS was to extend man's knowledge of science. The knowledge that the society claimed to target, at least at its inception, was not the esoteric and theoretical knowledge of pure science, but rather useful knowledge that might be utilized for the good of the American people.

Although the founders of the APS initially claimed an almost exclusive interest in practical science, in reality pure science played a small but important role in the pages of the *Transactions* of the society. For instance, although the subjects of applied mathematics such as surveying, navigation, mechanics, and astronomy dominated the early volumes, a few contributors did write papers on pure mathematics (Timmons 2005, 176).

Although conceived of as national societies, the American Philosophical Society and others like it remained largely local in scope. The lack of a truly national scientific organization hindered the advancement of science in the United States. This all changed in 1848 when members of the Association of American Geologists and Naturalists formally changed their name to the American Association for the Advancement of Science (AAAS), and in the process changed the scope of the organization to include the promotion of all the sciences in America (Timmons 2005, 176–77).

Benjamin Silliman Sr., the first president of the AAAS, was one of the most influential American men of science in the nineteenth century. Silliman, already established as a professor of chemistry and natural history at Yale, was the founder and publisher of the *American Journal of Science* (1818–present). Under Silliman's guidance, and the guidance of future leaders, the AAAS made many significant contributions to life in America in the nineteenth century, including pioneering support of conservation of natural resources. The original founders of the AAAS conceived of the association as "a vehicle for influencing national scientific policies and eliminating amateurism in American science." The AAAS's role as promoter of American science, however, resulted in a large membership that included the leading American scientists of the day, as well as a large number of nonscientists from academia, politics, and various walks of life. Although such a membership was rooted in the democratic foundations of the nation, it also led to a dilution of the quality of science presented at the annual meetings and published in the association's journal, *Science*. Several American scientists, convinced of the importance of including only the scientific elite in shaping the role of science in America, began plans for a new scientific organization sanctioned by the federal government and open to only the best scientists in the nation (Timmons 2005, 177) (Sinclair 1974, 250).

In addition to the societies formed by so-called pure scientists, the nineteenth century was extremely important to the development of the engineering profession in the United States, as witnessed by the formation of various engineering societies. The first such society, formed in 1852, was called the American Society of Engineers and Architects (later becoming the American Society of Civil Engineers). This was closely followed by the appearance of the American Institute of Mining and Metallurgical Engineers and other societies for engineering specialties. A rough progression of the application of new science and technology can be seen from these various societies: The need for civil engineers and architects for roads and building construction preceded an increased need for technical expertise in mining and refining the minerals needed for continued progress (Timmons 2005, 177–78).

Physicians in America also understood the importance of organization. Building on a foundation of local and state organizations, the American Medical Association (AMA) was founded in 1847. Among its other responsibilities, the AMA helped regulate physician licensing, set standards for medical schools, oversaw a code of conduct for practicing physicians, and established journals for the publication of medical advances (Timmons 2005, 17).

LITERATURE

Taken against the devastated backdrop of the Civil War, American tastes in literature during the antebellum period seem frivolous. Students studying the period, blessed with the knowledge of the coming civil crisis, often expect that its literature, journalism, poetry, and plays might exhibit an overwhelming dread, a foreboding, or a sense of impending tragedy. Yet contemporary American readers and writers were generally unaware of the coming cataclysm. Even if they sensed that a major civil disturbance was on the way, they had no way of foretelling the extent of the disaster. America had not yet passed through the crucible that would change a group of states united by a common political system and revolutionary history into the United States. Generally, America's attention was drawn to other things: the opening of the West, the war with Mexico, the development of the railroads and the system of canals, the politics of nullification and self-determination, or the reform of urban society (Volo and Volo 2004, 204).

It is difficult to find a looming American tragedy in antebellum literature. Certainly, it cannot be found in the entertaining stories of Washington Irving or the adventure novels of James Fenimore Cooper, two of the most popular American authors of the period. Nor can it be found in the introspection of Walt Whitman, Ralph Waldo Emerson, or Henry David Thoreau, or in the melancholy, gloom, and horror mongering of Nathaniel Hawthorne, Herman Melville, or Edgar Allan Poe respectively. Most Americans simply did not choose to read literature that proclaimed the imminent dissolution of the union. Only in the South did a secessionist press flourish, and it found only a small audience. In fact, most readers outside the halls of academia preferred the wildly popular romances, escapist adventures, and Gothic tales written by lesser-known American authors and published in the penny press. No doubt the momentum for a new realism concerning the fate of the nation was beginning to well up here and there, especially in the antislavery movement, but no clear and unmistakable portent of disaster appeared in print (Volo and Volo 2004, 204–5).

Literacy

One measure of literacy in a society is the extent to which writing and reading replace oral communications. "Literacy . . . makes practical the maintenance of a communication network wider than one's locality." If only the ability to write one's name is used as the standard for literacy, documentary evidence suggests that most Americans were probably literate. If the ability to read for comprehension is added, drawing a valid conclusion as to the general literacy of the antebellum population becomes more difficult. The difference between signing one's name and a true literacy, where theoretical concepts and political strategies are being shared or modified in written or printed form, has enormous implications. It is almost certain that most native-born Americans, as opposed to recent immigrants, possessed a basic reading literacy. However, simple comprehension is a great deal different from the sophisticated skills required to read difficult prose, political and philosophical treatises, theoretical works in languages other than English, or the Greek and Roman classics.

Literacy was first measured as a separate category in the census of 1850, but informal surveys and anecdotal evidence suggest that the ability to write, and particularly to read, was quite high. An analysis of legal documents, letters, and journals of the period suggests that as much as 90 percent of free white men in New England were literate. This proportion shrinks to 70 percent among those on the frontier where there were few books available beyond the Bible. The planters of the aristocratic South seem to have mirrored the high literacy rates found among their social and economic peers in England. In the South, at least 70 percent of the white male population could read, and the planter aristocracy probably owned the most extensive personal libraries in the nation. This does not mean that southern males read constantly. Although southern planters were well educated, Aristotle, Caesar, and Cicero were more likely to be the names of slaves laboring in their fields than those of books on their nightstand. These authors were the stuff of schoolrooms, and adult reading preferences resided in more practical works (Volo and Volo 2004, 205).

In 1800, Americans across the nation read more for purposes other than a mere schoolroom recitation of Greek and Roman classics. Although it was common to see period house plans showing libraries, only the wealthy classes could afford to devote an entire room to books. The classical titles on the householder's bookshelf were more often for display than for everyday reading, just like the specimen cases filled with fossils and insects or the magnifying glasses, stereoscopes, and other optical curiosities that resided there. Four types of reading material have been identified as popular with readers of the antebellum period. In order of their volume of production these can be grouped as: religious tracts; purposeful or instructive texts; newspapers and magazines; and novels written for a variety of purposes, including entertainment. These categories, while somewhat arbitrary, can serve to describe the majority of the printed materials sought by nineteenth-century readers (Volo and Volo 2004, 206) (Kaser 1984, 14).

The Cheap Press

Much of what Americans read was considered literature of the lowest class at the time and has come to be most closely associated with the paperbound volumes of Irwin P. Beadle's dime novels—advertised as "a dollar book for a dime." These, however, were not being published before 1860. Technological improvements in publishing and printing were initially made in the 1830s, but they were largely limited to inexpensive newspapers, magazines, and pamphlets. Nonetheless, in the 1840s, they were applied to the fantastically popular hardcover novels, causing the price of the genre to fall from several dollars per bound volume to as little as 50¢ or a quarter dollar. Unbound and paperback editions were available for as little as 6.5¢, although the better works generally brought an average price of a quarter dollar. Thereafter, the emergence of a new popularity in reading and writing among the American middle class underpinned a growing national interest in publishing and professional authorship (Lupiano and Sayers 1994, 119).

Conspicuous among the publishers of this inexpensive form of reading material were Rufus Griswold and Park Benjamin, who started a weekly magazine called *Brother Jonathan* in 1839. This publication concentrated on reprinting popular British novels without paying royalties to the authors. Another weekly called *The New World* concentrated mainly on reproducing the works of American authors. The remarkable steam-powered rotary press, invented in 1847, made paperbound publishing, in particular, remarkably inexpensive, and there was an enormous demand for cheap imprints among political parties, states' rights proponents, antislavery organizations, temperance and reform movements, and advertisers. Victor Hugo's *The Hunchback of Notre Dame* (1834) and Edward Bulwer-Lytton's *Last Days of Pompeii* (1834) were among the hundreds of British novels pirated by the American cheap press. Although both sold for $10 in deluxe leather-bound editions, they sold for a mere 10¢ in paperback, making them available to a whole new segment of the reading population (Smith 1981, 907).

At these prices, the work of Charles Dickens, Walter Scott, Washington Irving, or James Fenimore Cooper reached a wide audience. The power of this literature to influence the minds of nineteenth-century readers should not be underestimated. The young were warned at the time that in the choice of books there was a "great need of caution," and the potency of literature to govern the minds of readers proved inestimable. Fictional characters possessed a remarkable ability to influence society. Uncle Tom, Topsy, Ivanhoe, Hawkeye, Hester Prynne, Ichabod Crane, and Ebenezer

Scrooge were incredibly familiar characters to those that read as much as antebellum Americans did (Hawes 1835, 144–58) (Faust 1996, 154).

Romanticism

Most American intellectuals of the prewar period were widely read in the literature of European romanticism, and they used romantic allusions freely in their writing. A romantic movement that emphasized feeling, imagination, and nature swept the nation in the decades before 1860. It embraced the past, drawing strongly on the styles and ways of ancient civilizations and medieval times. Romanticism could be found in architecture, painting and decoration, and even in the institutions of government. The South, in particular, felt that its pastoral society with its ruling elite and slavery-bound servants more closely matched the ideal of ancient Rome than the industrialized society of the North with its venial politicians attempting to rule the urban centers by manipulating the teeming immigrant masses.

Lacking, for the most part, true aristocratic roots, southern planters invented a social mythology for their entire class, and they came to believe in it. The foundation for much of what they did was based directly upon what they read. Largely isolated from the reality of European aristocracy, they lionized the stratified but benevolent social order portrayed in the romantic novels of authors like Walter Scott and strove to maintain a romanticized version of the old aristocratic order as they believed it to be before the American Revolution. They behaved in a haughty manner reminiscent of the old nobility of Europe; taught their sons an aristocratic code of social behavior; and married off their daughters as if they were sealing dynastic treaties between feudal estates. Individual liberty, manliness, and respect for authority and position were held in such high esteem that a man might put his life on the line like a medieval champion in shining armor from *Ivanhoe* (1819) or *The Talisman* (1825) (Volo and Volo 2004, 207).

Northern intellectuals held many beliefs that were unknown to the old aristocratic families of Europe. Democracy in America had destroyed many old social and political relationships and replaced them with new ones. Many aspects of American life had been altered in forging the United States. Besides politics and social structure, family relationships, education, the role of women, speech, literature, science, entertainment, and many other areas of life changed. Although most Americans avoided the study of social philosophy in the traditional sense, they were, nonetheless, possessed of a number of assumptions with regard to the new nation, its population, and its society. Foremost among these was a restless ambition born of a faith in the concept of universal equality among all free white men (Volo and Volo 2004, 208).

The number of those that tried to cultivate a sense of letters, the sciences, and the arts in the egalitarian North was immense. However, a foreign visitor to America in the 1830s, Alexis de Tocqueville, feared that "the absence of great patrons, of schools for instruction, of time to develop and refine talent" might inhibit Americans from achieving the highest quality of work in these areas. Tocqueville correctly predicted that American democracy would produce "mediocre writers by the thousands" and an "ever increasing crowd of readers . . . continual[ly] craving for something new."

Tocqueville was convinced that this would ensure "the sale of books that nobody much esteems." However, he failed to predict the greatness that other writers might achieve. Indeed, James Fenimore Cooper and Washington Irving were already captivating many European intellectuals at the time of Tocqueville's visit (Volo and Volo 2004, 208) (Smith 1981, 158).

Writing as a Profession

Literary pursuits were deemed a gentleman's avocation prior to the first quarter of the nineteenth century. American gentlemen "loved their books and often acquired a polished literary style, but they seldom ventured into print." To write a treatise on surveying, mining, or husbandry and share it among one's social equals was one thing, but to publish them for the common people to read often offended their sense of propriety. The language of antebellum writing was therefore filled with socially acceptable catchwords such as "Nature," "Reason," "Wit," "Honor," "Virtue," "Prudence," and "Sense." Its style was utilitarian and conversational, and it seemingly excluded the stiffly artificial, indirect, and abstract forms of earlier years for a style that more closely resembled modern prose (Volo and Volo 2004, 208) (Middleton 1952, 7).

Washington Irving was one of the first Americans to find dignity in the role of a professional author. He is best known for the short stories that introduced the Headless Horseman, Ichabod Crane, Rip Van Winkle, and Dietrich Knickerbocker (his own pseudonym) to American readers. Although he has been called the father of the American short story, Irving ventured into essays, poems, travel books, and biographies. One of his greatest works, written in the later years of his career, was *The Life of George Washington* (1855–1859). Irving was the first American author to achieve international fame (Volo and Volo 2004, 208–9).

Washington Irving at first studied law in private schools and was admitted to the New York bar in 1806. He started his writing career in 1802 by making contributions to the *Morning Chronicle*, a newspaper edited by his brother, Peter. He later joined with his other brother William in writing a magazine-like publication known as *Salmagundi* (1807–1808). From 1812 to 1814, he was the editor of a similar magazine, *Analetic*, which circulated in both New York and Philadelphia. The first of his works to achieve lasting fame was his comic history of old Dutch New York called *A History of New York* by Dietrich Knickerbocker (1809). Although the stories in this book quickly became part of New York's folklore, it was the success of Irving's *Sketchbook of Geoffrey Crayon* (1819) that allowed him to become a full-time writer (Volo and Volo 2004, 209).

The *History* and *Sketchbook* were the first American works to gain widespread attention in Europe. Irving noted, "Before the appearance of my work the popular traditions of our city [New York] were unrecorded.... Now they form a convivial currency and... link our whole community together in good-humor and good fellowship." Moreover, the stories contained in these works of literature helped to forge a link between writing and art. John Quidor and Albertus Browere, both native artists from New York, gloried in producing illustrations of Irving's Dietrich Knickerbocker characters; and Asher B. Durand, Thomas Cole, and William Sidney Mount, all noted landscape painters, produced works based on themes found in *Sketchbook*. Literary and artistic journals like the *New York Mirror* (1823–1842) and *The Knickerbocker* (1833–1865) provided the public with engravings of the artists' paintings. "At no other time in the history of American art was the writer so closely allied to the artist" (Hoopes and Moure 1972, 15).

Ironically, much of the work for which he is best known, filled as it is with Americana, was actually written by him in Europe, where Irving lived from 1815 to 1832. He lived in London, Paris, Dresden, and Madrid. While in Spain, he worked for the U.S. Embassy, served as a secretary for the American Legation under Martin Van Buren, and had a brief romantic liaison with the writer Mary Shelley. From 1828 to 1832, when he returned to New York, he wrote several works with Hispanic themes. These included a number of books that concerned the history and legends of Moorish Spain, including *Columbus* (1828), *Conquest of Granada* (1829), *The Champions of Columbus* (1831), and *Alhambra* (1832). Upon his return to America, he toured the West and South, producing travel books titled *The Canyon Miscellany* (1835) and *A Tour of the Prairies* (1835). From 1842 to 1845, Irving was the U.S. ambassador to Spain (Volo and Volo 2004, 209).

Irving's home in Tarrytown-on-Hudson in Westchester County, New York, is called Sunnyside. It is a small unimposing Gothic Revival–style cottage open to the public as a historic landmark home. Although it is nestled in the heart of the Hudson Valley that Dietrich Knickerbocker so loved, Irving lived there only briefly from 1836 to 1842 and again from 1848 to 1859, when he died. During the last decade of his life, Irving served as the president of John Jacob Astor's Library, which later became the New York Public Library. He published a 15-volume set of his own major works (1848–1851). Besides the five-volume life of George Washington that he finished during this period, he wrote a careful presentation of the life, beliefs, and teachings of the prophet Mohammed called *Mohomet and His Successors* (1850). After his death, his major works were collected and published in 21 volumes that were made available to the public in 1860 and 1861 (Volo and Volo 2004, 210).

The Romance Novel

Beginning in the second decade of the century, the novel—the most popular form of antebellum escapism—gained a growing acceptance and appeal among the general reading public. Middle- and upper-class women have long been recognized as the chief consumers of this literary form. They read a flood of paperbacks filled with melodramatic situations, thrilling crises, and unspeakably evil villains. So great was the popularity of the novel that it drew criticism. As late as 1856, the Code of Public Instruction for the state of New York recognized the necessity of excluding from all libraries "novels, romances and other fictitious creations of the imagination, including a large proportion of the lighter literature of the day." The propriety of such "a peremptory and uncompromising exclusion of those catch-penny, but revolting publications which cultivate the taste for the marvelous, the tragic, the horrible and the supernatural [is without] the slightest argument." The code also expressed an obvious disgust for works dealing with "pirates, banditti and desperadoes of every description." A published guide to propriety for mothers, written by Mrs. Lydia Child in 1831, decried "the profligate and strongly exciting works" found among the novels in the public libraries. "The necessity of fierce excitement in reading is a sort of intellectual intemperance," producing in the estimation of the guide's author "weakness and delirium" in women and young girls. The works of Lord Byron, Camden Pelham, Edward Maturin, Matthew G. Lewis, and Ann Radcliffe were all identified as having "an unhealthy influence upon the soul" that should be avoided (Rice 1856, 325) (Child 1831, 93–94).

For modern audiences, the only recognizable name in Mrs. Child's list of forbidden authors is that of Lord Byron (George Gordon). Mrs. Child does not identify her reasons for including Byron in her list of authors to be avoided, but his collected works along with his letters and journals were available at the time to most American readers in a multivolume edition. Byron, Scott, Shakespeare, and Dickens were probably the most famous British authors known to those outside of Britain in the antebellum period. Byron was certainly the most notorious of the romantic poets and satirists. His influence on European poetry, music, novels, opera, and painting was immense. His 1814 work, *The Corsair,* sold 10,000 copies on the first day of its publication (Volo and Volo 2004, 210–11).

The Adventure Novel

Second only to Sir Walter Scott's works in popularity were the American adventure novels of authors like James Fenimore Cooper. Inspired by Scott's historical novels, Cooper drew many mutually exclusive stereotypes, characterizing Indians as good and evil, male characters as wise or foolish, and female characters as fair or dark both physically and temperamentally. His first novel, *Precaution* (1820), was poorly accepted by American readers, largely because it imitated the British form of Jane Austen's *Pride and Prejudice.* Cooper's second work, *The Spy* (1822), was an outstanding success. Cooper is said to have started writing because he needed money, and the success of *The Spy,* which sold 8,000 copies in the first month after its release, seemed a satisfactory means to that end. Still, many male readers considered novels to be "trivial, feminine, and vaguely dishonorable" because they appealed to the emotions and aroused the imagination. Nonetheless, Cooper found that there was a great demand for adventure tales derived from the Revolution; and his writing was sufficiently manly and moral to find acceptance by a wide audience. His work successfully emphasized American incidents and scenes as interesting and important, but they were popular among men mainly because of their masculine adventure themes. He also wrote a series of American sea tales, starting with *The Pilot* (1824), which featured the person of Captain John Paul Jones (Volo and Volo 1998, 208).

Like Scott, Cooper promoted a social vision of a stable and genteel society governed by its natural aristocracy, "perpetuating property, order, and liberty" as represented by a reunited American gentry. That this view resonated with the southern image of itself would have upset Cooper with his very northern attitudes. *The Pioneers* (1823), Cooper's third book, was dedicated to the proposition that the American republic, poised on the verge of "demagoguery, deceit, hypocrisy, and turmoil," could be transformed into a stable, prosperous, and just society. It sold 3,500 copies on the first day of its release (Taylor 1996, 21–27).

"Few storytellers in all history have enjoyed so wide a popularity as [James] Fenimore Cooper." Cooper's novels were often read aloud to eager audiences. He hammered out one adventure after another, acting out exciting plots against the lush and unforgiving scenery of the American wilderness. He introduced the first classic American fictional hero in the person of Natty Bumpo, the character known as Hawkeye in the five adventure novels that make up his Leatherstocking Saga. The history of Bumpo, who may have been based on an old hunter that Cooper knew in his boyhood at Cooperstown in western New York, was not at first planned, and the series was not written in chronological order. Bumpo is introduced in *The Pioneers* (1823) as an angular, irritable 70-year-old who deplores the advance of civilization upon the wilderness. He then appears in his best-known incarnation in his thirties in *The Last of the Mohicans* (1826); in his eighties in *The Prairie* (1827); again in his thirties in *The Pathfinder* (1840); and finally in his twenties in *The Deerslayer* (1841) (Volo and Volo 2004, 214–15) (Nevins 1966, 2).

Cooper seems to have grasped the process by which the old frontier came to be dominated by a civilization with European roots, and he communicated it clearly to his readers. "He had a realistic understanding of many facets of pioneer life: the romance, the heroism, the lawlessness, the crudity, the simplicity, the provincialism, the honesty, the corruption." His portrayal of the settlement of the old New York frontier as a spiritual adventure resonated well with a public interested in westward expansion and religious revival. Cooper's depiction of the frontier can be criticized in that he filled his plots with "improbabilities." His pages are filled with random encounters, idle young women wandering in the wilderness to serve as the objects of rescue, and eligible young men to furnish suitors for the women. However, Cooper never claimed to be a realist, only a "romancer." It was the succession of adventurous episodes, not the overall plot that riveted his readers. The same "cliffhanger" formula can be found in the cinema available to early twentieth-century moviegoers or the more recent television miniseries format. Once Cooper had hit upon a money-making formula, he maintained it, writing over 30 novels. He considered *The Pathfinder* and *The Deerslayer* his best works (Nevins 1996, 7, 24).

In 1826, Cooper took his wife and went to live in Europe, and he did not return until 1833. He had written four best sellers among his first six novels. He then set about making it eminently clear that he was uneasy with what he considered American vulgarity and lack of manners by taking his countrymen to account in a series of books in 1838—*The American Democrat, Homeward Bound,* and *Home as Found.* Like a parent correcting a child, Cooper lectured Americans on their lack of decorum, condemned the tone of their politics, and criticized their press. He made it clear that he was offended by the seeming pushiness and familiarity of the lower classes, and expressed a belief in limiting suffrage to men of good breeding who might direct the fortunes and culture of the rest of America. The newspapers were quick to denounce him, and he became the target of unrestrained personal criticism even though his work remained popular. He launched a legal and literary counterassault on those editors and politicians that disagreed with him; yet when he died in 1851, many literary greats attended or spoke at his memorial including Daniel Webster, Washington Irving, and William Cullen Bryant (Volo and Volo 2004, 215).

The fact that he grew up in a region of New York from which most Native Americans had been removed colored Cooper's depiction of Indians. His knowledge of native life was almost completely acquired from his own reading of personal narratives and histories of Indian peoples written in the previous century. Cooper neglected to derive certain elements of Native American life from these sources. Except for a few chapters at the end of *The Last of the Mohicans*, Indians appear as individuals with personal traits rather than as communities or tribes with a social organization. His Mohican allies and friends, Chingachgook and Uncas, are clearly idealized portraits possessed of every virtue and no vices; almost all other Indians are depicted as evil, villainous, and untrustworthy. However, "to wish that Cooper had been more realistic and scientific in his portrayal of the forest, and frontiersmen, and the savage, is to wish that he had been a different kind of writer, and to miss his true achievement." Although many of his novels are not highly regarded today, the best of them can still enthrall both young and old readers. Three of his Leatherstocking tales have been made into major motion pictures, and one of these, *The Last of the Mohicans*, has been remade several times and has come to characterize an entire period of American history (Nevins 1966, 34).

Juvenile Literature

Youngsters were expected to read the Bible, their lessons from their schoolbooks, and little else in the way of entertaining literature. Like Lydia Maria Child, who advised young women to avoid novels, the Reverend Doctor Joel Hawes warned young men that in the choice of books there was a "great need of caution." He believed that a person's character could be "ruined by reading a single [ill-advised] volume." Yet he confessed that one book, "wisely selected and properly studied" could "do more to improve the mind, and enrich the understanding, than skimming over the surface of an entire library" (Hawes 1835, 144–58).

Several publications surfaced during the antebellum period to attempt to fill the gap between dry religious tracts and scandalous romance novels. In 1827, a weekly literary magazine was founded in Boston with the purpose of providing appropriate reading material for youngsters. Known as *The Youth's Companion*, the magazine remained in publication for more than a century and received contributions from many famous authors including Alfred Lord Tennyson, Thomas Hardy, Rudyard Kipling, Louisa May Alcott, John Greenleaf Whittier, Robert Louis Stevenson, and Jules Verne. In 1830, Sarah Josepha Hale published another work, *Poems for Our Children*, that included classics such as "Mary Had a Little Lamb." In 1853 and 1854, Nathaniel Hawthorne published his tales for children: *A Wonder Book* and *The Tanglewood Tales* (Volo and Volo 2004, 216).

School readers made their first appearance in the schoolroom during this period. The *Peerless Pioneer Readers*, containing stories of interest to children, were first introduced in 1826 by William Holmes McGuffey, and the first of a long list of

McGuffey's Eclectic Readers, was published in 1836. Six readers in this series appeared between 1836 and 1857 with their sales reaching a peak during the Civil War. Literally millions of copies found their way into schoolrooms and children's nurseries during the antebellum period. In 1846, Epes Sargent's *School Reader* was published. Elijah Kellogg's blank verse *Spartacus to His Gladiators* appeared in Sargent's first edition and became a standard exercise in classroom declamation of young students for decades (Volo and Volo 2004, 216–17).

Escapist Literature

Americans were quick to record in their letters and journals the completion of *Nicholas Nickleby* (1839), *The Pickwick Papers* (1837), *The Deerslayer* (1841), *Ivanhoe* (1819), or other works of obvious quality, but they also read a great deal of low-quality material, much of which they did not mention. Nonetheless, many of these works have been identified. They include such masculine titles as *Con Cregan* (1860), *Son of Eric, Gold Friend, The Quadroon of Louisiana* (1856), *Son of the Wilderness, Scar Chief of the Halfbreeds, Wild West Scenes,* and *Our Own Heroes.* Other popular works were *Lady Audley's Secret* (1862), *The Mystery, Macaria,* and *Louisa Elton.* Captain Mayne Reid, a friend of Edgar Allan Poe, published *The Rifle Rangers: Adventures of an Officer in Southern Mexico* in 1850, and Ann Stephens, the first author published in Irwin Beadle's dime-novel format, wrote *Malaeska: The Indian Wife of the White Hunter* in 1860 (Volo and Volo 2004, 218).

Each of these publications was unquestionably escapist literature of the lowest sort. Yet books of this type sold well. An American author like Reid was able to follow his first success with other successful titles such as *The Scalp Hunters, The War Trail,* and *Forest Exiles.* In 1853, Reid wrote a novel inspired by his 15-year-old spouse, appropriately titled *The Child Wife,* and in 1856 he wrote a popular play called *The Quadroon* that combined a theme of tragic love between a white man and a free mulatto woman with a knife duel, a steamboat explosion, a slave auction, and two murders. The success of *The Quadroon,* which was transformed into a popular stage play in the North, reflected the extent of the involvement of the reading public in the slavery controversy. Another young American author, distinguished before the outbreak of hostilities, was John W. DeForest. From 1851 through 1859, DeForest wrote several books including the *History of the Indians of Connecticut,* and the novels *Witching Times, Oriental Acquaintance, European Acquaintance,* and *Seacliff.* DeForest went to war as a captain with the 12th Connecticut Volunteers, and many of his battlefield reports were printed by *Harper's Monthly.* In these, DeForest shared the simple truth of life in the army and on the battlefield (Croushore 1949, vii, 130–31) (Kaser 1984, 4, 5) (Morgan 1992, 32).

Social Commentary

The works of the English novelist and social commentator Charles Dickens were widely read in America. In Dickens's very popular works, readers found some character, situation, or condition that seemed to bolster the many different views of modern society held by Americans. Social reformers in this period generally championed the cause of the poor, but Dickens was generally unconcerned with the economic aspects of social reform, choosing rather to deal with an increased appreciation of the value of the human being. Ignorance, for him, was the great cause of human misery (Volo and Volo 2004, 219).

Dickens's stories emphasized the need to enlighten traditional ways of thinking. However, many in the American South misread Dickens's message and saw the misfortune, destitution, and disease that filled his works as characteristic of all urban life. Modernization and urbanization were the great evils haunting the romantic domains of the southern imagination. For these, Dickens's novels mirrored the inevitable bleak future of America if northern concepts of social progress continued to be implemented as English ones had for decades without noticeably improving society. Southerners despised such ambiguous social remedies as the poorhouses and the workhouses that filled Dickens's pages. The debtor's prison of *Little Dorrit* (1855) and the orphanage of *Oliver Twist* (1838) were obviously not sufficient to solve the social ills characteristic of an urban society. Southerners were left with a portrait of cities, like those of the North, veritably teeming with the exploited masses from which they chose to be separated.

Although thoroughly English in its settings and personalities, the interactions of Scrooge with characters from *A Christmas Carol,* first published in 1843, seemed to embody the very limitations of modern society in midcentury. Stripped of its sentimentality, the story portrays a secular, rather than a traditionally religious, attitude toward the holidays. The spirits and ghosts of Christmas are remarkably worldly in their appearance and temporal in their outlook. The awakening of a social conscience in Scrooge is uppermost in their endeavors. Ultimately, it is the specter of an unlamented death, a topic of great concern to persons of the nineteenth century, that brings Scrooge around. Yet even a morally awakened Scrooge refuses to devote his life to social work. Instead, he acts out his reformation on a very personal level. Apologists for the southern way of life proclaimed that Scrooge's treatment of Bob Cratchit emphasized the abuses possible in an age governed by the "work for wage" system that so lacked a sense of personal involvement and family dedication. The personal responsibility that many southerners felt toward their neighbors, their workers, and even their slaves seemed noble in contrast to the socially anonymous caretaking for the unfortunates found in Dickens's works (Halliman 1984, 111).

Nonetheless, Americans North and South loved Dickens's works, and all his writings were instantly read and eagerly put into print. Because much of his work was published in England in serial form, it was sometimes reprinted without the permission or knowledge of the author by the American press. Within hours of their arrival in the United States, many of his works were reprinted and available for sale. His *American Notes* (1842), generally critical of the republic and much of New York society, sold 5,000 copies in New York City in two days at the price of 12.5¢ a copy. In Philadelphia, 3,000 copies sold in just 35 minutes. It was estimated at the time that 400,000 sets of Dickens's works were sold in the United States before the war. Many of these were published by the paperback press and brought no money to the author (Smith 1981, 255, 907).

In 1842, Dickens and his wife toured America, and thousands of citizens turned out to welcome them in New York City. Thousands more greeted them in Boston, Philadelphia, Cleveland, St. Louis, and Richmond. Dickens, described as a small but intelligent looking man with a fashion of dress approaching that of a dandy, was a stark contrast to his quiet and unassuming spouse. He came to America believing that the United States was the hope and promise of the world, but he found New York filthy, crowded, and unsophisticated. In his *American Notes,* written upon his return to England, he left a generally stark verbal description of many American cities as they appeared in the middle of the antebellum period (Volo and Volo 2004, 220).

Dickens described those Americans he saw in New York as crude, violent, and lacking in the manners expected of middle-class Englishmen. He was particularly taken aback by the widespread acceptance of the offensive habit of chewing tobacco and spitting the results into any convenient curbside. He was also aghast at the conditions he found in American tenements, prisons, and places of recreation. He considered the tenements hideous, the prisons loathsome, and the taverns low and squalid. He also expressed a strong aversion for the American press, calling it a "foul growth" upon America's utilitarian society. He found the American form of Republican government polluted by political trickery and underhanded tampering during elections, and fettered by shameless greed and veniality among its highest officials (Volo and Volo 2004, 257).

Dickens liked the city of Richmond, but he was much dismayed and distressed by the ever-present reminder of slavery everywhere in the South. The city was the third largest in the South and had proven an elegant state capital with fine buildings and traditional architecture. Dickens proclaimed the city the most picturesque in America. Despite his personal hostility toward race-based bondage, which he made obvious at every opportunity, Dickens and his wife thrilled the residents of Virginia with their visit. Ironically, he was also impressed by the excellent morale exhibited by the slaves in the factories and warehouses he visited, and he expressed that he greatly enjoyed their spirituals and tunes (Wish 1950, 500, 507).

He was struck by the absence of a festive air in the Quaker-dominated city of Philadelphia. He wrote of it in comparison to his native London:

> How quiet the streets are. Are there no itinerant bands, no wind or stringed instruments? No, not one. By day there are no Punches, Fantoccini, dancing dogs, jugglers, conjurers, orchestrinas, or even barrel-organs? No, not one. Yes, I remember one. One barrel-organ and a dancing monkey. Beyond that nothing lively, no, not so much as a white mouse in a twirling cage. Are there no amusements? Yes, there is the lecture room and evening service for the ladies thrice a week, and for the young men the countinghouse, the store, the barroom and the filthy newspaper urchins are brawling down the street. These are the amusements of the Americans. (Smith 1981, 769–70)

The author also toured toward the West. He found Cleveland, Ohio, unacceptably dirty and unsophisticated. He reported that the Indians, who were so highly esteemed by the authors of romantic literature, were actually "wretched creatures . . . squatting and spitting" (Smith 1981, 945).

Dickens felt better about the French quarter of St. Louis, Missouri:

> In the old French portion of the town, the thoroughfares are narrow and crooked, and some of the houses are very quaint and picturesque; being built of wood, with tumble-down galleries before the windows, approachable by stairs or rather ladders from the street. There are queer little barbers' shops and drinking houses, too, in this quarter; and abundance of crazy old tenements with blinking casements; such as may be seen in Flanders. Some of these ancient habitations, with high garret gable-windows peeking into the roofs, have a kind of French shrug about them; and being lopsided with age, appear to hold their heads askew, besides, as if they were grimacing in astonishment at the American Improvements. (Wish 1950, 368–69)

At the end of his *American Notes*, Dickens tried to soothe the disappointment and the anger that he anticipated his comments would engender among his American readers by declaring at least the upper classes of society "frank, brave, cordial, hospitable, and affectionate." Indeed, many among the social and literary elite viewed Dickens's comments with sympathy and found them rooted in a reality that they themselves saw every day in many urban centers. Most attributed the starkness of Dickens's criticism to the author's own exaggerated expectations for the "noble course" that had begun in the United States. Hoping to see an American Zion inhabited by the stately scions of the founders of the American republic, Dickens was devastated by the realities of the American lifestyle, the frailties of its population, and the political bickering that had no meaningful bearing on the operation of the world's great republican experiment. This was a factor in the formation of his judgment of America to which Dickens himself admitted in later years. Nonetheless, when *Martin Chuzzlewit* (1843–1844), Dickens's American novel, appeared shortly after his return to England, it proved especially offensive to some of the residents of New York City, and many citizens were loath to forgive him for his characterizations. One man wrote that Dickens had written "an exceedingly foolish libel upon us, from which he will not obtain credit as an author, nor as a man of wit, any more than as a man of good taste, good nature, or good manners. . . . Shame, Mr. Dickens!" (Smith 1981, 257, 258).

Poets

A contemporary observer of the antebellum scene noted that "we have no national school of poetry. . . . We've neither a legendary past nor a poetic present." This observation may help to explain America's fascination with stories of the Revolution like Cooper's, with tales of medieval times like Scott's, or even with whimsical anecdotes of the New York Dutch like Irving's. But George Templeton Strong, who wrote the comment, was clearly mistaken. The antebellum period began the golden age of American poets, which, although interrupted by war, continued throughout the nineteenth century. An anthology of American poems published in 1842 sold over 300,000 copies at $3 a copy. It has been pointed out that William Cullen Bryant was the period's newspaper editor-poet, John Greenleaf Whittier its abolitionist-poet, Oliver Wendell Holmes its doctor-poet, James Russell Lowell its gentleman-poet, and Henry Wadsworth Longfellow its professor-poet. Each was a poet and something else, but it was Longfellow who became the great popular poet of the century (Smith 1981, 972, 976–77).

William Cullen Bryant began life as a lawyer, but in 1814 he published "The Yellow Violet," which combined a praise of nature with a moral principle, thereby setting the mode of American poetry for the century. One year later he wrote "Thanatopis" and "To a Waterfowl." He started his life as an aggressive Federalist, became the editor of the *New York Evening Post,* turned Democrat, and ended as an antislavery Republican. Much of Bryant's work exhibited strains of the traditional Puritan ethic: propriety in one's private life, devotion to the task at hand, a deep interest in public affairs, and a faith in the American citizen. Many of his poems engaged the concept of unmourned death, a nineteenth-century preoccupation. Both the devoted Christian and the transcendentalist could read his work with pleasure (Beard and Beard 1927, 785).

Of all the literary figures of the time, John Greenleaf Whittier, the son of Quaker parents, was the one most closely identified with antislavery. Even William Lloyd Garrison, premiere antislavery activist and newspaper editor, took note of him in *The Liberator.* In the late 1820s, Whittier worked feverishly for several abolitionist newspapers, finally becoming editor of the prestigious *New England Weekly Review.* His early works—*New England Legends in Prose and Verse* and *Justice and Expedience*—urged immediate emancipation for all blacks. In 1846, Whittier published *Voices of Freedom,* a book of antislavery poems. He served as a speaker and lecturer for the cause and supported the rising Republican Party in the 1850s. His work praised nature and looked to the pleasure of common things. A contemporary described him as "a breath of air from a world of purity and beneficence." Although many of his verses have become mere historic curiosities with the passing of slavery, his rhymes caught the manners and morals of the common people. His famous poem "Barbara Frietchie" was written during the war (Volo and Volo 2004, 232) (Smith 1981, 977).

The works of Oliver Wendell Holmes and James Russell Lowell were almost indistinguishable to the casual reader. Both were Harvard graduates, but it was Lowell who became the leader of their literary circle called the Fireside or Schoolroom Poets. This group included Whittier, Holmes, Longfellow, and sometimes Emerson. Lowell's work was blatantly moralistic, making him seem conservative by modern standards, but, being an ardent abolitionist and temperance advocate, he was hardly considered so in his own time. His poem, "The Present Crisis," was written in 1844, and it made a deep impression on northern audiences. It was four years later that Lowell published four volumes: *Poems, Fable for Critics, The Biglow Papers,* and the *Vision of Sir Launfal.* Of these, only *The Biglow Papers* was political. The *Vision of Sir Launfal,* with its emphasis on the value of heartfelt charity, was America's contribution to the Arthurian Holy Grail legend. In 1857, Lowell became editor of the *Atlantic Monthly* magazine, and during the war he helped edit the *North American Review* (Volo and Volo 2004, 233).

Holmes left Boston after Harvard to study medicine in Paris, and he returned to find that the aging frigate *Constitution* was rotting in its mooring. Energized by a report that the heroic ship from the War of 1812 was to be demolished, he penned the immortal poem "Old Ironsides" that appeared in the *Boston Daily Advertiser* in 1830. The poem helped to save the vessel from destruction and prompted its preservation. It quickly became the subject of classroom recitation everywhere. One of Holmes's most famous poems was "The Chambered Nautilus," which drew an analogy between the ever-expanding shell of the creature and the need for constant spiritual growth. His work in the decades after the Civil War made his reputation as a poet extraordinary (Smith 1981, 982).

Henry Wadsworth Longfellow was a born storyteller, producing romantic tales of the far away and long ago much like the other successful authors of the period. He was perfectly democratic in his poetry, and his work needed little scrutiny to make its point. Longfellow held the chair of literature at Harvard. His most popular poems among those available during the period were "The Village Blacksmith," "The Song of Hiawatha," "The Wreck of the Hesperus," and "The Courtship of Miles Standish." When published in 1855, "The Song of Hiawatha" sold 50,000 copies in five months at $1 a copy. "The Midnight Ride of Paul Revere" appeared in Longfellow's *Tales of the Wayside Inn*. Written in 1860, this largely inaccurate and romanticized version of Revolutionary history became popular during the Civil War, but it ignored many of the facts of the encounter at Lexington in 1775, including the capture of Revere and the contributions of other alarm riders. The poem became the subject of classroom recitations and American history lessons into the twentieth century. For generations of Americans, Longfellow was their poet, and he lived for three-quarters of a century, thereby fixing his place above all the others in the minds of most Americans (Volo and Volo 2004, 233) (Smith 1981, 977).

Ironically, though little poetry of value was produced below the Mason-Dixon Line at this time, southern life served as the inspiration for some of the most original and endearing of American lyrics. Francis Scott Key's "The Star-Spangled Banner" is undoubtedly the most famous. The earliest southern poet considered to be of any merit is William Crafts (1787–1826), who celebrated the sporting passion of his native Charleston in "The Raciad" and later penned "Sullivan's Island." William Grayson (1788–1863) authored several volumes, but only "The Hireling and the Slave" (1856) gained any notice because it purported to show the superior condition of the unpaid slave to the paid hireling (Volo and Volo 2004, 234).

Historians

During the antebellum period, there appeared an incredible dedication among amateur historians and antiquarians to gathering the papers, folklore, and objects of colonial and revolutionary life that seemed to be slipping away in a newly industrialized America. In colleges, libraries, state archives, and private collections, there was preserved the work of a thousand hands. Among these was George Tucker of Virginia who produced a southern gentleman's history of the Old Dominion; Timothy Smith, who did the same for Mississippi; and Timothy Dwight, who produced four massive volumes of historical observations concerning New York and New England. Between 1818 and 1865, more than 400 titles were published on the history of Illinois alone.

The growing interest in former times among amateurs was usurped by a cadre of professional writers of history dedicated to the laborious and scientific style of historical writing then popular in Germany. A remarkable number of the historians who achieved lasting reputations in the field were connected with Harvard University. The massive *Life of George Washington* and the Spanish histories assembled by Washington Irving, who was not a Harvard man, have already been mentioned. However, Irving's biography of Washington came late in the antebellum period (1855), and other historians of note had already been at work on similar projects.

However, it is clear that many of the Harvard historians harbored moralistic, anti-Catholic, anti–Native American, and pro-Protestant prejudices in their writings that have gone largely uncorrected in many twentieth-century textbooks. All were well-to-do men of letters who were largely unable to deal with American history without including the backdrop of Spain, Britain, or France. Beyond the struggle for independence, America, in isolation from European history, seemingly had too few significant experiences in its short existence around which these men might pull their histories together as literature. The coming cataclysm of the Civil War would resolve this problem and lead to the publication of thousands of historical works concerning the details of the conflict. The separate opinions of the antebellum historians, given form by a common regard for recording the colonial history of America as they thought it should be, were also reflective of the popular literature and poetry of the day. Nonetheless, the group's reporting of factual events was detailed and their labor exhaustive. Their works, taken collectively, remain a foundation for all future study in this area (Volo and Volo 2004, 236).

Harvard graduate William Hickling Prescott was one of the first to achieve literary success by writing history. Taking his style from European historians like Edward Gibbon (*The Decline and Fall of the Roman Empire*, 1776), Prescott amassed a monumental pile of printed material and documents from which he fashioned the three volumes known as the *History of Ferdinand and Isabella* (1838). This was an immediate success on both sides of the Atlantic, and it was followed by *Conquest of Mexico* (1843) and *Conquest of Peru* (1847). However, Prescott considered the production of histories a form of literary entertainment for the reader, not the stuff of serious scientific research (Volo and Volo 2004, 236–37).

George Bancroft followed his graduation from Harvard with a stay at the University of Göttingen, where he learned to write history in the German style by including an intensive and systematic analysis of all the available data. He began to distribute his 10-volume *History of the United States* in annual installments in 1834. From the founding of the colonies to the adoption of the Constitution, Bancroft wove his way through long and arduous researches somewhat prejudiced by his own New England origins and Democratic politics. His work portrays early America as an unblemished utopia to which the nation needed to return.

At approximately the same time, Richard Hildreth, the Massachusetts jurist and antislavery novelist, produced a six-volume work detailing American history from the Federalist point of view. His first volume appeared in 1849, but with the final volume of the work, completed in 1852, it spanned the period from the age of discovery to the Missouri Compromise of 1820. Hildreth was an abolitionist and temperance crusader, and his desire for reform bled through in his historical writing, costing him some readership. He had first come to attention as an author by writing antislavery tracts. His later work, *Despotism in America* (1854), described the sociological and psychological effects of slavery on American history. Both of his American histories contained some inaccuracies based in their author's politics, but they represented a great treasure of data concerning the social evolution of America.

Foremost in the field of precise historical scholarship were Jared Sparks and Peter Force. Sparks, president of Harvard and editor of the *North American Review,* produced a 12-volume compilation of the *Diplomatic Correspondence of the American Revolution* in 1830. He followed this with 12 volumes of the *Writings of George Washington* (1837), and 10 volumes of the *Works of Benjamin Franklin* (1840). In 1853, he produced a four-volume compilation of important letters between prominent Americans and George Washington known as *The Correspondence of the American Revolution.* These massive collections are still used for historical research today. In his editing, Sparks corrected the eighteenth-century grammar and spelling of the documents he researched to reflect the new American standards being developed by men like Noah Webster. Unlike Force, Sparks was more than a mere collector. The documents and letters he compiled were always accompanied by his commentary on their value and meaning (Volo and Volo 2004, 237).

Peter Force was a publisher, politician, and editor of *The National Journal.* Together with Matthew St. Clair Clarke, the secretary of Congress in 1833, Force undertook the task of compiling an extensive library of American documents with the financial support of the federal government and succeeded in publishing 20 volumes before losing his grant of $22,500 per 800-page text. The first volume of his monumental work, *Documentary History of the American Revolution,* appeared in 1837. By this time, Clarke had retired from the project after calculating that the research cost to himself and Force was $11,000 per volume. Having lost his financing, Force nonetheless continued the work for three decades. His research was conducted in the best traditions of scientific historical scholarship. Unlike Sparks, who was working on similar projects at the time, Force offered no interpretation of his collection and was thereby able to collect an incredible mass of paperwork. His collection remained unhampered by the inclusion of any political editorials or romantic intrigues to tempt the palates of contemporary audiences (Volo and Volo 2004, 237–38).

In 1867, the entire Peter Force Library (more than 22,000 unbound volumes, 40,000 pamphlets, and 129 bound works) was purchased by the Library of Congress for $100,000. The collection began chronologically with Spanish documents written in the late fifteenth century (1490), but the majority of the documents date from 1750 to the end of the Revolution. Represented herein were eighteenth-century American newspapers, imprints, pamphlets, manuscripts, maps, atlases, official reports, private papers, and colonial correspondence. Taken together, they are today known as the *American Archives.* So massive was Force's work that some parts of it have yet to be indexed.

Few people at the time would have chosen Benson J. Lossing from among a list of eminent American historians, yet his dedication to capturing the words and memories of the last survivors of the American Revolution before they faded away led him to the publication of a large two-volume work known as the *Pictorial Field-Book of the American Revolution* (1851). Beginning in 1847, Lossing traveled more than 8,000 miles through the original 13 colonies making sketches of historic places and relics from the Revolution and jotted down the reminiscences of the war taken from those whom he stumbled upon during his visits. Interspersed in his own narrative of the Revolution were the accounts of these eyewitnesses to history and tales of his own travels. Although his interviews were based on hearsay and anecdote and done in a random rather than a systematic manner, Lossing made a record of unmatched scope and variety that most contemporary readers found interesting (Volo and Volo 2004, 238).

Although he was personally excited by American history, Lossing's career as a woodblock engraver, and the New York engraving company that he founded, took up most of his time. He did much of his research in his spare time, but Lossing was no neophyte historian. He had experienced modest success as both a writer and an illustrator before undertaking his monumental task. In 1840, he had published and illustrated the *Outline History of the Fine Arts* and had earned some literary distinction with a series of short illustrated paperbacks called *Seventeen Hundred and Seventy-Six.* Moreover, Lossing was one of the first historians to grasp the benefits to the reader of matching fresh and authentic illustrations with his text, and he included 1,100 woodcut engravings, original pen and pencil drawings, and watercolors with his 700,000-word text (Volo and Volo 2004, 238–39).

Lossing's *Field-Book* began appearing in monthly paperback installments in July 1850. A total of 30 were printed while the enormous two-volume edition of almost 1,200 pages was being prepared. This was released in two parts in 1851 and 1852, respectively. These works sold well among history buffs, but academic historians were critical of Lossing's journalistic approach to history, which they thought had "sacrificed academic standards on the altar of popularity." Nonetheless, Lossing had measured the pulse of the public correctly. Most readers found the stiff academic style of the period frustrating and boring, whereas Lossing's histories were interesting and stimulating. Possibly for this reason Lossing found that his work was in great demand. His subsequent illustrated articles were published by *Harper's Magazine*, almost one every month throughout the 1850s, and the publication of his *Pictorial Field-Book of the War of 1812* (1868) was only delayed in its release by the outbreak of the Civil War. He later published a three-volume *Field-Book of the Civil War* (1868) based on his studies of both Confederate and Federal war records. All of Lossing's work was done with a fervor that matched his love of history. By 1890, he had written and published more than 40 books and hundreds of magazine articles. His purpose throughout was "to lure readers into history" (Volo and Volo 2004, 239) (Cunningham 1968, 78–79).

Much like Lossing, Francis Parkman actively sought out the scenes of his histories by camping, hiking, and exploring America's rivers and mountains in an attempt to bring the ethic of nature into his writing. After graduating Harvard with a degree in law, Parkman set out in 1846 to gather firsthand information about the American Indian. The results of his travels can be seen in the vivid and authentic-sounding descriptions of Native Americans included in *France in the New World, The California* *and Oregon Trail,* or *The History of the Conspiracy of Pontiac.* All of these were published between 1849 and 1851. His post–Civil War works, including seven volumes written between 1865 and 1892, left an indelible stamp on all subsequent writing about the period of the wars for control of North America between France and England. Parkman's research was prodigious, and very few errors or omissions have been detected by subsequent researchers. Moreover, his easy narrative style, popular with antebellum readers, failed to attract negative criticism from the academic historians (Volo and Volo 2004, 239).

Parkman visited French-speaking Canada and the Adirondack region of New York to do much of his research, and he actually traveled the Oregon Trail in 1845. However, for his own *Conspiracy of Pontiac,* Parkman drew heavily on the earlier work of Alexander Henry, a New Jersey adventurer and author of *Travels and Adventures in Canada.* Henry's work was a classic tale of the Canadian fur trade that recalled the days of the French and Indian War. Because he had traveled the northern forests and toiled up the rivers in his own canoe, Henry understood the life of the French coureurs de bois and native trappers. Henry David Thoreau called Henry's book a "classic among books of American travel . . . that read like the argument to a great poem, on the primitive state of the country and its inhabitants" (Volo and Volo 2004, 239–40) (Brooks 1944, 167–68n).

Newspapers

There were millions of newspaper subscribers in the country before the Civil War. European visitors to Brooklyn, New York, were amazed that the English-speaking population of the town of about 300,000 supported a newspaper circulation of 70,000—about one paper for each family. Newspapers gained influence steadily during the first half of the nineteenth century as education spread the power of reading across the population. Alexis de Tocqueville noted in 1831 that Americans had settled the continent with the Bible, the axe, and the newspaper. Many news sheets had their foundation in the colonial press, but new papers were constantly being founded. The weekly *Philadelphia Register and National Recorder* appeared as early as 1819, and the *Springfield Republican* was founded in Massachusetts in 1824. In 1825, the *Boston Traveler* was founded as a daily, and in 1833 *The Sun* was founded as a penny daily in New York. In 1834, the *New Yorker Staats Zeitung* was founded as a German-language weekly. James Gordon Bennett launched *The New York Herald* in 1835, and the *Philadelphia Public Ledger,* the *Blade* of Toledo, Ohio, and the German-language *Volksblatt,* all daily newspapers, began publication in 1836. In 1837, the *Connecticut Courant,* the country's oldest weekly (begun in 1764), became *The Hartford Daily Courant.* In the 1840s and 1850s, the *Boston Herald,* the *Chicago Tribune,* the *Chicago Times,* the *New York Times,* and the *Sacramento California Union* were all founded as daily news sheets (Volo and Volo 2004, 240) (Cremin 1970, 409).

Although the *Baltimore Sun* and the *New Orleans Picayune* were prestigious dailies, southern papers were slower to develop than those in other parts of the country. They were almost completely dependent on northern sources for type, presses, and newsprint—a weakness that was sorely felt during the Civil War. Nonetheless, an incredibly large number of local publications appeared as citizens came to favor the newspaper as an individualized form of communication (Volo and Volo 2004, 240).

Newspapers printed speeches in their entirety within a few days of their being given. Political arguments, essays, letters to the editor, and discussions among dedicated readers—both genuine and planted for effect—flowed in the wake of every issue. Persons read alone, or in small groups, with the leisure to reread and analyze what was printed. Many extraordinary pieces of literature first appeared in the press. Many of Dickens's works and Stowe's *Uncle Tom's Cabin* first appeared in newsprint as serials. In 1823, the *Troy Sentinel* of New York printed an anonymous Christmas poem by a learned biblical author, Clement Clarke Moore, titled "A Visit from St. Nicholas," which later became better known as a book called *'Twas the Night Before Christmas*. However, in the estimation of the publishers, the most important articles to be printed were the official proceedings taking place in Washington, D.C., often with biting editorial preambles. Even routine congressional debates were reported in painstaking detail (Volo and Volo 2004, 240–42).

The power of the press to influence a wider audience than that which could be assembled at any one place and time was not to be underestimated. Some papers tried to remain neutral, but others sought out political alliances either because of the agenda of the editors or, more commonly, to attract a lucrative trade in political advertising and public printing. Neutrality on any topic of public interest often doomed a newspaper to failure. At times, the papers were so full of scandal and untruth that their publishers were prosecuted for libel; and more than one duel was fought over the comments made in the press.

The papers that sprang to the side of Andrew Jackson in his 1828 presidential campaign—and they were too numerous to be counted—bitterly assailed the administration of John Quincy Adams. In this way, they became an organ of the political party; and, in an era of slow-moving news and uncorroborated sources, they became an effective tool for convincing the party voter of the universal appeal of its candidate or position.

One of the earliest influential newspapers in the South was the *Courier*. Begun in Charleston, South Carolina, in 1803, it quickly became one of the most influential and popular of southern papers. Its editors refused to give in to public pressure during the tariff, nullification, and secession crises, reporting only the activities of the conventions without adding any editorial support for their positions. As early as 1828, Robert B. Rhett used his Charleston-based newspaper, the *Mercury*, to urge resistance to the unrestrained rule of the federal government. Rhett pleaded with his readers for the southern states to secede en masse in defense of states' rights and southern culture. The *Mercury* continued to plead the case of disunion right up to the eve of the Civil War.

The *Richmond Whig* was a leader when it came to strong opposition to disunion. The *New Orleans Crescent* opposed any form of violence. The *Memphis Eagle* portrayed peaceful secession as an absurd pipe dream. Many papers, including the *Natchez Courier*, the *Nashville Banner* and the *New Orleans Bulletin*, reminded the South of its intense reliance upon the North and warned that before any drastic measures be taken, the South had best make itself independent first (Volo and Volo 2004, 242).

Other papers foresaw and accepted the inevitable conflict. *DeBow's Review,* a monthly commercial publication located in New Orleans, urged the South to diversify its economy and build railroads, factories, and canals and thereby free itself from any dependence on the North. By midcentury, *DeBow's* was increasingly seen as a vehicle for secessionist propaganda. The *Hornet's Nest* of Charlotte, North Carolina, published a list of northern businesses that did not support the South's position and urged other editors to print the list in their publications, a counsel that the *Southern Confederacy,* one of the most vehement of secessionist papers, applauded (Volo and Volo 2004, 242–43).

The secession press was most intense in South Carolina and Mississippi. Besides the Charleston *Mercury,* several other newspapers actively stressed southern independence. Some, like the *Natchez Free Trader,* plainly recommended secession as the only recourse for southern grievances. Southern nationalism was hawked by the respected *Southern Literary Messenger,* once edited by Edgar Allan Poe; and even the *Southern Quarterly Review* was pleading the cause of disunion. Virginian papers tended to be less unanimous in these opinions. Yet the *Richmond South,* edited by Roger A. Pryor, and its sister paper, the *Enquirer,* edited by Henry A. Wise, both sported prominent secessionist themes. The Richmond *Examiner* and the *Dispatch*—once neutral and conservative—threw all their powers, and their large circulation, into the cause of secession by 1860 (Volo and Volo 2004, 243).

Although there were many local news sheets, most people looked to illustrated newspapers such as *Leslie's* or *Harper's.* A number of American engravers made a living during the early antebellum period by circulating prints of early artworks. These sold well, and many antebellum inns and parlors were decorated with the likenesses of Washington, Hamilton, Jefferson, or Jackson. Alexander Anderson was an American woodblock and copper engraver who produced his earliest work for mass publication near the end of the eighteenth century. Anderson was forced to improvise his own tools and methods, even hiring a blacksmith to make thin sheets from copper pennies for his first engravings. His first financially successful copperplate engraving was of American naval hero John Paul Jones (Brooks 1944, 159).

New York publisher Frank Leslie produced woodcut illustrations for his *Illustrated Newspaper.* The combination of stark black-on-white graphics and terse prose to interpret ongoing news events was a new concept in the American newspaper business that was quickly adopted by other news agencies. Leslie, whose true name was Henry Carter, had emigrated from Britain in 1848. There he had worked as an engraver for the *Illustrated London News,* which was the first newspaper to employ graphics. In London, Leslie learned the processes for turning pencil sketches into woodcut engravings that could be transferred to newsprint economically. In 1852, P. T. Barnum, the famed American showman, developed a process by which the sketch was divided into several pieces to be engraved on as many blocks by individual engravers and carefully assembled into a single printing surface. Barnum hired Leslie as a supervising engraver for the short-lived *Illustrated News* (Volo and Volo 2004, 243).

Leaving Barnum, by 1854, Leslie had set up his own organization and published the first issue of *Frank Leslie's Ladies' Gazette of Paris, London, and New York,* one of the first illustrated fashion magazines in America. The *Illustrated Newspaper* quickly followed in 1855. Leslie employed more than 130 engraving and print artists as well as a substantial number of roving sketch artists. He introduced a number of different papers to American readers: the *Illustrated Zeitung*, a German-language edition aimed at the Germanic immigrant population of the North; the *Budget of Fun*, a whimsical publication featuring cheap fiction; the *Ten Cent Monthly;* the *Lady's Illustrated Almanac;* and the *Lady's Magazine and Gazette of Fashion*. All of these bore his name, beginning their titles with "*Frank Leslie's*" (Volo and Volo 2004, 243–44).

In a day when a partisan press was the rule, *Leslie's* stood apart. Except for tolerating an anti-Irish sentiment and portraying Negroes in a stereotypical and condescending manner, *Leslie's* condoned little that was political. Within four years of Leslie's first publication, two independent graphic news weeklies were launched in competition with his newspaper empire: *Harper's Weekly* and the *New York Illustrated News*. Fletcher Harper, the well-financed publisher from Harper and Brothers, actively tried to recruit Leslie's artists and engravers and aggressively tried to exceed Leslie's circulation. Leslie provided poor and erratic pay for his artists, many of whom he lost to competitors. By the opening of the Civil War, the two newspapers were within 10,000 copies of one another, with the *New York Illustrated News* a distant third (Volo and Volo 2004, 244).

Two of the best sketch artists of the period were the brothers William and Alfred Waud. Ironically, each served with a different paper: William working for *Leslie's* and Alfred for *Harper's*. William proved particularly adept at ingratiating himself with the social elite of South Carolina during the secession crisis. Because of the paper's uncommitted stance, wherever Waud traveled, he found individuals to be cooperative and helpful. Leslie instructed him to use the utmost care in making his sketches and to avoid giving any indication of political sympathies toward one side or the other. Nonetheless, Waud left *Leslie's* in 1863 to work at *Harper's* with his brother Alfred and another fine artist Theodore Davis. William Waud's genius and discretion were matched by an army of artists who continued with *Leslie's*, including Eugene Benson, Arthur Lumley, Henry Lovie, C. S. Hall, F. H. Schell, and Edwin Forbes. Forbes, a mere 22 years old, drew so well that readers "scanned the drawings in *Leslie's* for familiar faces" (Volo and Volo 2004, 244) (Forbes 1994, preface) (Stanchak 1992, v–xii).

The quality of the sketches drawn by these artists was not always reproduced faithfully by the engravers, and, in viewing these graphic scenes, great care must be taken. What the artist drew was not so much reproduced as copied. The field artists were often in a hurry to get their work back to the engravers. Unfinished sketches of prominent figures in the scene with backgrounds and lines of soldiers "roughed in" and labeled as "trees here" or "Capitol building here" were often sent off to the engravers to be filled by hands whose eyes had never witnessed the scene. In many cases, this made the illustration more one created by imagination than reality. The results were sometimes unfortunate. Engravings of historic episodes from the American Revolution, popular in the press at the time, were often wildly inaccurate as to the cut and design of uniforms and equipment from the eighteenth century as engravers dressed Washington's soldiers in Federalist-era uniforms (Volo and Volo 2004, 244–45).

The South was generally dependent on northern publishers to print its books and newspapers. In the entire South, there was only one type factory, no facilities for printing maps, and an entire inability to make inexpensive wood-pulp paper. A well-illustrated magazine, such as *Harper's* or *Leslie's*, could not be published in the South. The *Southern Illustrated News* and other papers were often limited to a single sheet of newsprint. These made an attempt to mimic *Harper's* and *Leslie's* with crude engravings but were obviously not comparable to the northern news outlets. Nonetheless, patriotic southerners bombarded their newspapers with so much unsolicited poetry on nationalistic themes that some publications began charging to print it. Newspapers like the *Montgomery Daily Advertiser* were particularly successful in creating a wide public identification with the stirring events of the winter of 1860 and the spring of 1861 (Volo and Volo 2004, 245) (Faust 1988, 8, 17).

ANTEBELLUM HOMES

There was no single characteristic house style during the antebellum period, but the elegant plantation homes built in the American South, with their central entrances, balconies, columns, and formal ballrooms, came closest to representing a discrete architectural style for the period. The focus on southern architectural characteristics somewhat distorts the character of home building in the period. Actually, the majority of homes built from 1820 to 1860 were Greek Revival, Classical Revival, and Federalist style structures or some adaptation thereof. Moreover, surviving examples of stately northern mansions and palatial southern plantation houses reflect the power, idealism, and tastes of only the wealthiest Americans. Unlike the homes of the wealthy, most of the functional and sturdy structures belonging to average Americans no longer exist in an unmodified form, having undergone numerous renovations in the twentieth century. Their original contours and characteristics were seldom recorded except by accident in a photograph, painting, or sketch (Volo and Volo 2004, 115).

Although home ownership served as an ideal during the period, many families, especially in the cities, had to settle for apartments, boardinghouses, and tenements. Even among individual homeowners, there was a wide diversity of residences including mansions, villas, multistory houses, cottages, cabins, and soddies. The Irish immigrants were noted by observers at the time for building shanties—structures that were virtual shacks. Yet the majority of homes built during the antebellum period were simple frame farmhouses. In the largely rural areas of a young America, a husband and wife might sit down, pencil and paper in hand, with thoughts focused on cornfields or pumpkin patches rather than on cornices or pilasters. These amateur architects tended to design plans for a practical house, a functional barn, a predator-proof chicken coop, or a well-drained pigpen. Fenced farm fields and properly planted orchards were far more important to the common farm family than symmetrical facades or grand staircases. Many of these plans were piecemeal and disordered, and few such drawings survived (Volo and Volo 2004, 115–16).

Yet in an odd custom among rural societies in nineteenth-century America, some of the best plans were rescued from obscurity. Prizes were sometimes offered for successful farmhouse designs by a number of agricultural improvement societies. Many of the most functional plans were submitted and displayed at county fairs or published in farm journals. Ordinary periodicals often carried house plans, and few illustrated magazines failed to carry a floor or building plan of the month. Evidence gleaned from sources like these has allowed historians to construct an accurate picture of the average farm home (Volo and Volo 2004, 116–17).

A number of architectural pattern books were published during the period that contained a variety of house plans of different sizes and prices. Among these was *Rural Residences*, published in 1837 by Alexander Jackson Davis. This particular architectural pattern book was thought to have introduced the Gothic Revival style to North America. In a similar manner, *Victorian Cottage Residences* and *The Architecture of Country Homes* were published by Andrew Jackson Downing in 1842 and 1850, respectively. Both emphasized the Carpenter Gothic style (Volo and Volo 2004, 117).

THE MIDDLE-CLASS HOME

The typical middle-class home could be divided into three classifications of rooms: public rooms, private rooms, and workrooms. The common public rooms included the hall, parlor, dining room, and library, and the private rooms were the bedchambers and nursery, which were almost exclusively located on the second floor. The placement of a bedroom on the first floor of a two-story home, except in the event of sickness or infirmity among the occupants, was considered risqué in many circles. The final category of rooms included workrooms such as the kitchen, pantry, laundry, scullery, or cellar. These were often the haunts of servants, if the family could afford them, or places where the homeowners did not want to be seen doing the work of servants. Of course, every middle-class family hoped to support the fiction that they were wealthy enough to avoid doing their own hand labor (Volo and Volo 2004, 117).

The Front Hall

In addition to the practical purposes of providing a barrier against the cold or containing the mud and dirt from outside, the front hall of an antebellum home had a very important social function. Business dealings in these times were much more likely to be done face-to-face, and guests needed a place in which to be greeted when calling. The front hall provided a reception area where these dealings could take place without exposing the family's private quarters to the view of strangers. In the absence of a servants' entrance, shopping purchases were often delivered here, and in urban areas, mail might be delivered at any time during the day (Volo and Volo 2004, 117).

The front hall was the public face of the home, and it was important that it be decorated in a fashion that was appropriate to the social standing of the family. It was likely for the hall to be furnished with a pair of chairs for visitors, a mirror for checking one's appearance, and a table to receive calling cards. Upscale homes often had massive pieces of furniture that combined several of these features. Floors could be tiled for the practical purpose of accommodating the dirt of a high-traffic area, but more often they were covered with carpet or oilcloth. Elizabeth Blair Lee wrote, "I have enquired [*sic*] about carpets & oil cloth—the latter is much the cheapest for the Hall—the best quality costs $1.25 to $1.50 for a square yard—a poor carpet costs that & dust makes the oil cloth best in other respects." Oilcloth was often made of canvas coated with a thick layer of oil-based paint and decorated with a geometric design. The effect of these designs was often remarkably similar to that of real tile, marble, or carpet (Volo and Volo 2004, 117–18) (Laas 1991, 313).

The procedure known as "calling" was a social function that was required by proper society and governed by convention. On the topic of calling, *Martine's Hand-Book of Etiquette* stated, "Such visits are necessary, to maintain good feeling between the members of society; they are required by the custom of the age in which we live, and must be carefully attended to." Martine counseled that ceremonial calls be kept brief. "Half an hour amply suffices for a visit of ceremony. If the visitor be a lady, she may remove her victorine [a type of veil], but on no account either the shawl or bonnet, even if politely requested to do so by the mistress of the house. Some trouble is necessarily required in replacing them, and this ought to be avoided." Upon exiting the home, callers would leave a card identifying themselves, which would be placed in a cardholder in the front hall. Elaborate cardholders were made from silver or china. Ladies magazines contained patterns for handcrafted ones. "In leaving cards you must thus distribute them: one for the lady of the house and her daughters . . . one for the master of the house, and if there be a grown up son or a near male relation staying in the house, one for him" (Martine 1866, 112–13, 116).

This photo of Professor George Agassiz by James Black is an example of a carte de visite that would be kept in photo albums, or used when visiting a home or office as a means of introduction. Courtesy of the Library of Congress.

Socially conscious women kept a list of family members and business acquaintances who formed a basic calling circle. It would be expected that persons on this list would be visited at least twice a year. Failure to reciprocate in calling could be considered a grievous slight. Naturally, close friends and family would see each other more frequently. Martine warned, "Keep a strict account of your ceremonial visits. This is needful, because time passes rapidly; and take note of how soon your calls are returned. You will thus be able, in most cases, to form an opinion whether or not your frequent visits are desired." Brides were kept particularly busy making rounds as they introduced themselves in their new social position. Women were reminded that "it is the custom for a wife to take her husband's cards with her, and to leave one or two with her own" (Volo and Volo 2004, 118) (Martine 1866, 116).

The Parlor

The parlor was the most public room in the antebellum house. Parlors were common to both the North and the South and across the social classes. Some more affluent homes had a front parlor solely dedicated to formal visitations and a back parlor for family use, but a single parlor was most common. The parlor was the place where important visitors and relations would be received. Where the front hall was the public face of the home, the parlor was where the first impressions of the family were formed. Decorating decisions were made in a very calculated manner so as to project the image a family wished to portray. Parlors contained a family's best in every way. It would have the highest ceilings, the largest fireplace, and most elaborate furnishings. The center feature of most parlors was a large circular table with a kerosene or oil lamp. Here the family would gather to write, read, converse, play games, or engage in needlework and crafts. The need to gather around the central light, which may have been the only one in the room, helped to foster a communal atmosphere. The parlor table allowed family members to be together, yet various members of the family could be engaged in a variety of pastimes. They were able to function as individuals, yet remain a part of the family community as a whole.

The second focal point of the parlor was the fireplace. The mantel was often heavily decorated with pictures, collections of natural objects, or mementos. What could not fit on the mantel might be contained on shelves or étagères around the room. An intense appreciation of nature prevailed during this time, leading to the collection of seashells, fossils, minerals, pinecones and dried flowers, all of which might be displayed in the parlor. It was felt that objects like these reflected a harmony between the natural world and the civilized one. Homes decorated with objects of nature were thought to demonstrate nature's beauty in family life. Additionally, using natural objects as decorative accents showed a wife's sense of economy, an attribute much extolled in women (Volo and Volo 2004, 118–19).

Other parlor furnishings might include an upholstered sofa, armchairs, and a pair of easy chairs, all covered in matching fabrics. Rocking chairs were very much in fashion during the period, and parlors were just one room in which they might be found. Common upholstering materials included brocades, silk damask, and tapestry, all adorned with tassels, cords, and fringe. It was not unusual for sofa ensembles to contain a large gentleman's armchair and a smaller chair with half arms for the lady, which accommodated her wide skirts and kept her posture properly erect. The placement of chairs around the room allowed social groupings to change as activities varied. A person might move from the solitary activity of reading quietly to join a game with other family members at the table. Sofas were designed with slight curves to encourage conversation. Ownership of a piano or parlor organ bespoke solid middle-class status. Parlor organs, as opposed to pianos, tended to be an outgrowth of domestic religious worship during which the family celebrated the Sabbath by singing hymns and playing ecclesiastic music. These were particularly important to homes that actively fostered the Christian development of family worship. The reed organ, which was perfectly suited to use in the parlor, was being produced in the United States by the 1840s. Pianos were more a status symbol rather than the organ in heralding the financial stability, educational accomplishment, and cultural propriety of the owner and his family. More than 20,000 pianos were being produced annually in America by the time of the Civil War. Advertisements for pianos and organs filled period newspapers and magazines. Retailers offered payment terms even for their least expensive models that sold for about $300 (Volo and Volo 2004, 119–20) (Crawford 1977, v).

Families enjoyed singing and listening to pieces played on the piano. As with many of the activities undertaken by antebellum society, people followed their inclinations with little restraint. Consistent with this view was the growing popularity of piano concerts given in both public halls and private parlors. An 1853 editorial in the *Pittsburgh Evening Chronicle* gives a generally negative perspective on this phenomenon: "A hobby of society at this present day is to be music-mad, and the adulation and toddyism lavished upon every Piano Forte player of any talent is enough to disgust all sensible people with the instrument forever.... [O]ne would suppose that there was nothing else worth living for in this life but music and the Piano Forte player especially." The editors further noted that "Signor Pound-the-keys... fills his pockets for one night's work with as many dollars as three-fourths of the community earn in a year" (Volo and Volo 2004, 120) (Howard 1965, 199–200).

The piano was generally considered a feminine instrument, and women actively cultivated their musical talents on it. "Young ladies are the principal interpreters of domestic music," stated *Macmillan's Magazine* in 1860. This association with the feminine led to the selection of many accessories that were generally thought to interest women to adorn the piano top. Yet the pursuit of musical excellence may not always have been motivated by a love of harmonious tones. The piano provided a reason for courting couples to be in relatively close physical proximity during a time when proper behavior generally forbade such intimacy. By the piano, the couple could exchange glances as the young woman played, and the young man could bend closely, as he courteously turned music pages for the seated player (Anderson 1997, 22).

The sheet music industry, aided by advances in printing and engraving, was already well established and flourishing at the beginning of the period. The sheet music itself was often beautifully lithographed, providing the additional bonus of an inexpensive piece of artwork for the parlor. Some families acquired so much piano sheet music that a separate piece of furniture, sometimes known as a Canterbury, was acquired by the family to hold it. Possession of such a piece of furniture was an additional status symbol (Volo and Volo 2004, 120).

Assorted small tables around the parlor contained additional bric-a-brac, a stereoscope with its 3-D photographs, or perhaps a gilded album that was used to collect *cartes de visite*. Filling albums with *cartes de visite* was quite a family hobby, popular with families across the middle and upper classes. Edwin Weller wrote to his fiancée, "I should be pleased to aid you in filling up your Album with nice Pictures, and will do so if I have an opportunity." Some albums were elaborate and decorated with silver or brass clasps and covered with velvet, wood, or mother-of-pearl. Inside, the album contained 20 or more pages of precut frames ready to receive the *cartes*. With time, the *cartes* became relatively inexpensive, and at least one photographer advertised on the back of his work, "CARTES DE VISITE, 6 for $1.00." Filling an album was an accomplishment likely to be made only by middle- or upper-class families with incomes that allowed for a good deal of discretionary spending. People generally stood for photographs at landmark times in their life, such as just after marriage or betrothal, following the birth of a child, or before leaving for war. *Cartes* could also be purchased, and collectors acquired pictures of famous people or *cartes* that contained a religious or poetic sentiment (Walton 1980, 25, 65).

The walls of a home were often covered in wallpapers that boasted large floral bouquets tied with ribbons, verdant foliage, or oversized fruit—a style that had started late in the decade of the 1840s and persisted into the 1860s. The walls were usually further ornamented with paintings and, for the less affluent, black-and-white prints or color lithographs. Attractive prints of good quality and color were readily available in the second half of the period, and many families took advantage of this new technology. Subjects included farmyard scenes, prints of famous racehorses, European riverscapes or landscapes, hunting vignettes, still lifes, and biblical tableaus. The popularity of farmyard pictures in homes decorated in brocade and tassels can be attributed to the passion for establishing a sense of harmony with nature and an underlying yearning, in an increasingly industrialized environment, for simpler times.

European subjects might be used as wall hangings to remind the family members of travels they may have made, a fact the family would have been desirous to publicize to visitors. Another popular subject was that of famous people, both historical and contemporary. These were chosen from among musical, literary, political, and military venues especially from the Revolution, the War of 1812, or the Mexican War of 1846. Representations of these people might take the form of a painting, a print, an engraving, or a bust. The public figures with which a family chose to decorate their home made a powerful statement about the owners of the parlor (Volo and Volo 2004, 121).

Not only did the selection of these works of art show good taste and education, but also they served as silent but concrete reminders of revered values. George Washington, for example, was admired as a selfless leader who put the public interest above his private preferences. The presence of his picture in the parlor showed that the family valued this attribute. A picture of Thomas Jefferson showed a respect for the law, and that of Andrew Jackson a certain egalitarianism. These pictures served as constant reminders to children of what was expected of them in adulthood. Many of the women depicted in this form were wives of famous men such as Martha Washington or entertainers like the singer Jenny Lind. The message for young girls was an expectation that they would be quiet movers, gently working behind the scenes (Volo and Volo 2004, 121–22).

Floors were carpeted with patterns that tended to be floral or of natural colors. However, carpets were sold by the linear yard and came in strips a little more than two feet wide. They had to be pieced and sewn together much like wallpaper patterns. Susan Evans wrote to her sister, Emma Sargent Barbour, about the installation of new carpet. About a dozen women came to assist her in the installation. "I had to help cut the breadth, but we were not very experienced hands and consequently the carpet was cut wrong, or rather one breadth fell short. We measured it before hand, but could not seem to make the figures match any other way." Nonetheless, extant examples show that carpets were often sewn with remarkable skill by professional installers who hid the seams and flawlessly matched the patterns. Mats often covered carpets in high-traffic areas or where fireplace sparks were likely. It was not unusual to take up the carpet in summer and replace it with sewn reed mats to make the home seem cooler and to save wear and tear on the generally expensive carpet. Elizabeth Blair Lee compared prices for a carpet from two merchants in Washington and Philadelphia, respectively, and stated that they ranged from $150 to $262 for a room.

Many Americans revered intellectual pursuits, and books were, therefore, a must in the parlor. Diary entries refer to reading more than any other pastime in middle-class homes. Large, heavy Bibles were most often displayed on the central table as a symbol of the family's dedication to religion. Other books were frequently displayed on tables or on built-in bookshelves. Books brought learning and the world outside into the home. A parlor containing books showed that the owners valued knowledge and wished to better themselves. The information contained therein provided greater understanding of the natural world and the Lord's works. Antebellum middle-class Americans were fond of creating literary allusions in their lives, and they did not limit themselves to pictures of famous authors or samples of their works. Statues and ceramics containing scenes from literature were used to decorate the parlor, as were religious symbols (Moskow 1990, 68) (Volo and Volo 2004, 122).

Windows were almost buried beneath a shroud of fabrics. Closest to the window would be a thin curtain, most likely made of lace, which served as both a barrier to flies and a window treatment. These would be covered with a second layer made of heavy fabric that could be closely drawn to block out the light entirely and prevent the fading of upholstery and rugs. The ensemble would be topped off with a valance fashionably trimmed with cords, tassels, and braid. Overall, the antebellum parlor was a place of abundant accumulation. It also gives insight into the spirit and the structure of the society of which it was a part (Volo and Volo 2004, 123).

The Library

Although it was common to see period house plans showing libraries—and many trade catalogs displayed library furniture—libraries were only affordable to the upper classes and the wealthiest among the upper middle classes. Although the antebellum home, in comparison to the home of an earlier century, was becoming increasingly dominated by feminine interests and decorations, the library remained largely a male domain. It was a place to which a man could retreat and engage in the kind of activities that did not coincide with the outward picture of the female-dominated home and hearth. Here a man could smoke, drink, and discuss money, politics, and war without exposing the rest of the family to such vulgarities. Libraries were usually on the ground floor and off to one side. Decorations were more subdued than in the parlor. Walls were paneled or covered in dark-colored paper. Heavy bookshelves filled with leather-bound volumes were a necessity, and other furniture would include a desk or writing table, large gentlemen's chairs, and various occasional tables. If a man had hobbies or interests, it would be here that he would pursue them. Gun cases and other weapons collections might be featured, and specimen cases containing fossils or insects might be displayed among accompanying magnifying glasses and other optical aids (Volo and Volo 2004, 123).

The Dining Room

The luxury of a room dedicated solely to the purpose of dining was another badge of middle-class status. Families of lesser means ate in kitchens or in areas adjacent to the parlor, set aside for dining. Dining room furniture tended to be massive, often of mahogany or other dark wood. Elizabeth Blair Lee wrote to her husband, "I have look[ed] at some furniture & find that dining room furniture alone will cost four hundred dollars of oil walnut which is as cheap as oak." The standard number of chairs was eight. A sideboard was a common complement, providing an excellent place to display oversized serving pieces and candelabras. Walls tended to be dark to show up well under candlelight, the standard lighting for this room. Even during luncheons, it would not be unusual to draw the draperies and eat by candlelight. The formal dining experience was one of tremendous ritual and ostentation. Books of etiquette contained page upon page of rules guiding proper behavior while dining. Certain foods required highly specialized serving or eating utensils, and attention to proper form while dining was extremely important. Of the 30 pages that Martine dedicates to dining in his etiquette book, 10 of these pertain solely to carving meats at the table. Beginning in the mid-nineteenth century, the upper classes developed a passion for complicating the dining process by introducing such superfluous table items as spoon warmers, cheese servers, and other odd serving pieces in an attempt to further ritualize the dining process and to distinguish those "in the know" from the common folk (Volo and Volo 2004, 123) (Laas 1991, 212).

The Kitchen

The main utilitarian room in the mid-nineteenth-century house was the kitchen. It was here that the most mundane, labor-intensive household duties took place. The kitchen was always located on the ground floor with a door to the outside, to facilitate deliveries. It was not necessary for it to be adjacent to the dining room, and in certain circles, distance was considered an asset, keeping odors contained. Very large homes might have a separate building that served as a summer kitchen. Kitchen furnishings were functional and simple. There was usually a large central worktable, a cupboard for storing dishes, and a "safe" for storing cheeses, breads, cooked meats, pies, or puddings. The safes were a kind of screened cupboard that protected kitchen items from insects, pets, and vermin, but they did nothing to regulate their temperature (Volo and Volo 2004, 124).

Miss Beecher's Domestic Receipt-Book advises, "The kitchen floor should be covered with an oil cloth.... Nothing is cleansed so easily as an oil cloth, and it is much better than a painted floor, because it can be moved to be painted." In many homes, the kitchen was also the scullery and the laundry. In those cases, there would also be a deep sink with a drying rack for washing vegetables and pots. Indoor sinks generally had hand pumps but drains to the outside were a rarity. Dirty water often had to be bailed out and emptied outside. Dishes were washed in a large wooden bowl as a measure to keep down breakage. Pots were stored by hanging them from racks (Volo and Volo 2004, 124) (Beecher 1850, 253).

In this period, unlike in the previous century with its massive stone hearths, many homes had a single dominating feature in the kitchen—a wood-burning iron stove. Cast-iron stoves had become fairly standard in middle-class homes in the North by 1860. Many styles had been patented with special functions or unique characteristics. They ranged from simple cylinders for heating a small room to large, ornate contrivances for larger spaces. Iron stovetop and oven combinations for the kitchen were just becoming fashionable, and many were installed into existing kitchen fireplaces. Some had several levels for cooking, baking, and heating water. Metal chimney pipes were often routed through the walls or ceilings to several other rooms to provide indirect heating from a single stove. Even elaborate systems of stovepipes were seemingly ignored in terms of the overall household aesthetics and were viewed as the price for efficient and modern heating. In rural areas and in much of the South, particularly among the lower classes, cooking was still done on an open hearth. There were those who resisted the kitchen stove solely because they felt that the hearth was the traditional heart of the home (Volo and Volo 2004, 124–25).

Kitchen furnishings might include an ice chest, which was a large double-sided wooden box with charcoal or sand sandwiched between the inner and outer layer of sideboards for thermal insulation. These became more sophisticated with time, but there was no attempt at true refrigeration. A block of ice was simply placed in the box to keep dairy products cool. The melt water was captured in a pan below. Ice was cut from ponds and lakes in winter and stored for future use in an icehouse. Commercial icehouses could be found in urban areas. Dry goods such as flour, sugar, and cornmeal were stored in crockery or in tinned iron or wooden containers. Rural kitchens, and those of families of lesser means, were also likely to be more family oriented than those found in the more wealthy homes, which had servants or slaves. These kitchens may well have been used for sewing or helping children with studies. Responsively, they would contain additional furnishings to suit their multipurpose functions (Volo and Volo 2004, 125).

The Bedrooms

The bedrooms of the late antebellum period were very different from those of the previous century. They were no longer the semipublic multiple-use spaces of the eighteenth century in which a person might receive close acquaintances. Bedrooms were now very private places and would not even be referred to in polite conversation. Beds retained the use of rope springs and feather mattresses, but the wooden frames had lost some of the mass of earlier times. The heavy bed curtains of former years had all but disappeared. Built-in closets were just beginning to come into vogue in 1860, and clothing or linens were stored in trunks, chests of drawers, and wardrobes (Volo and Volo 2004, 125).

After her husband sent her some cloth samples for bed linens, Elizabeth Blair Lee wrote, "The linen is wonderfully cheap—Cotton that width costs in the city $1.25 cts & not of the best quality—that linen here would sell for $1.50 to 60 cts.... You could not do better to buy than buy two pairs—they will take about 11 yards—I have 12 prs of double linen sheets & two prs single... & two pairs of Blankets—for we cannot get any blankets here for less than six dollars. I would like one pair" (Laas 1991, 313).

Beside the bed might be found a small table upon which to rest the chamber stick used to guide one to the bedroom upon retiring. Oil lamps were usually not found in bedrooms, and carrying an oil lamp with its liquid fuel from room to room was considered a major fire hazard. An overturned or dropped candle presented less danger of a quickly spreading conflagration. Therefore, store-bought candles continued as an important commodity through the end of the century. Many communities required that homeowners have leather fire buckets at hand, filled with sand, to stop the spread of accidental fire. Some of these were imprinted with the commercial logos of fire insurance companies. People generally did not sit in bed and read before sleeping nor did they lounge about in their lingerie. Bedrooms were likely to be drafty places most of the year and cold in winter (Volo and Volo 2004, 125–26).

The Nursery

Cribs and cradles were frequently found close to the parents' bed to facilitate breast-feeding and as a precaution should the child take ill during the night. Older children in lower economic situations might also sleep in the same room. Families who could afford it had a nursery for the children, and children of particularly wealthy families might share the nursery with a nanny. Nurseries also often doubled as schoolrooms and might also contain globes, maps, and perhaps a blackboard as needed for instruction (Volo and Volo 2004, 126).

The Necessary

Whereas wealthy families might have had inside plumbing and the accompanying bathroom facilities, most people had to make to with ceramic washbasins and pitchers on a washstand, and a chamber pot under the bed. Full-fledged baths were labor-intensive events that involved bringing up heated water from the kitchen to the bedchamber so that a compact metal tub could be filled. Only the lower classes bathed on the ground floor, if at all. This relegated total immersion baths even for the middle-class homeowner to special occasions. Sponge baths were the more common occurrence. Freestanding outhouses were the rule almost everywhere, but outhouses were not convenient at night. Most bedrooms contained a covered chamber pot. Some chamber pots were hidden in various pieces of furniture like chairs and stools, but some were merely stored beneath the bed until their contents were emptied into the slop jar in the morning and disposed of down the outhouse hole (Volo and Volo 2004, 126–27).

THE SOUTHERN PLANTATION HOUSE

The mention of the antebellum South invariably brings to mind images of stately mansions with porticoes, balconies, and ballrooms. The grand, white-columned plantation house has become so symbolic of the antebellum South that many people think it was developed there. On the contrary, the South developed no distinctive style of architecture of its own, but it was very successful in adapting existing modes from Europe, and even from the North, to its own needs and inclinations. From colonial times, upland southern homes continued an Anglo-Saxon building tradition. Southern structures can be found that show Tudor, Stuart, and Jacobean influences. It was, however, the Georgian style that really took hold during colonial times and reigned until the Greek Revival style came into favor during the 1830s. Later plantation houses still bear traces of a lingering Georgian influence. In the Deep South, with its historic ties to France and to Spain, a blend of European influences was adapted to the subtropical climate of the Gulf Coast and Mississippi Delta. This is particularly true of the existing plantation houses in Louisiana that survived the ravages of destruction during the Civil War due to the early capture of the region by federal troops. Houses were constructed high off the ground, away from dampness and potential flooding. Walls were built thick to keep out the heat, and long, sloping roofs extending over two-storied porches provided a perpetual shade and comfortable space for outdoor living (Volo and Volo 2004, 127–28).

Regardless of their European antecedents, most southern plantation houses exhibited a number of common architectural features. The facade was symmetrical with evenly spaced windows and central doorways both in front and in the rear. Rounded colonnades extended upward from the ground to support an elaborate band, called a "frieze," running above the doorways and windows but below the cornice. This provided a classical dignity to the home and was sometimes decorated with designs and carvings. The roof either was hipped, sloping down to the eaves on all four sides, or it was gabled, the slope of the roof forming a large triangle. The area supported by the columns was called the "entablature." Beneath this were the balconies and covered porches. Sometimes external staircases divided and curved gracefully from the upper balconies to the center of the house.

As the indisputably common feature of the typical southern plantation house, columns deserve special mention. A column is an upright pillar or post that may be purely decorative or may serve as a structural support for the roof. With details reminiscent of the Parthenon, pillared homes reflected a passion for antiquity and classic style. They were introduced into the American South by Anglo-Americans who moved into the region about the time of the Louisiana Purchase (1803) (Volo and Volo 2004, 128).

Inside the southern plantation home, there was frequently a large center hall and a grand staircase with large rooms to either side, allowing for good air circulation and ventilation. High-ceilinged rooms with full-length windows allowed for the circulation of the cooled porch air and gave the rooms a sense of dignity and scale unlike that seen in any other region of the country. When open, the windows sometimes served as walkways onto the porch. Sleeping chambers were generally kept on the second floor. Dormer windows, which added light to the attic, were also common (Volo and Volo 2004, 128–29).

Regularity of design was carried from the main house to the outbuildings that made up the entire plantation, creating a sense of symmetry and a pleasant arrangement of structures. Two pavilions frequently flanked the central building. A typical domestic complex included a detached kitchen about the size of a single-room house, a springhouse or root cellar for the cool storage of milk products, a smokehouse to preserve meats, a laundry, and sometimes an icehouse, a schoolroom, or a storehouse. Slaves and servants were often quartered in these work buildings, or they were provided with separate housing out of sight of the main building. Northern travelers often compared the scene posed by a plantation to that of a small village (Volo and Volo 2004, 129).

GREEK REVIVAL HOUSES

Stately, pillared Greek Revival homes reflected a passion among their owners for antiquity. Popular from about 1825, these homes commonly featured pedimented gables, a boxy symmetrical shape, a heavy cornice, a wide unornamented frieze, and bold but simple moldings. Many of these structures had entry porches with columns and decorative pilasters. Long, narrow windows often flanked the front door. Actually, the earliest example of note of Greek Revival styling was not a domicile but an office building—Latrobe's Bank of Pennsylvania, built in Philadelphia, in 1798.

Many architects, trained in Europe, worked in the Grecian style, and the fashion spread via carpenter's guides and pattern books. The style spread across the country, ironically, taking hold in the South more slowly, at first, than in the North, and penetrating the Deep South only in the very last decade before the Civil War. With its classic clapboard exterior and bold, simple lines, Greek Revival architecture was the most prominent housing style in the United States for seven decades, receiving a designation at one point as the "National Style."

The Greek Revival also came to be viewed as the embodiment of the paternalistic, chivalric, and aristocratic ideals of the South. It remained an integral part of the conservative southern culture in a time when the industrialized North was moving forward. The southern planter aristocracy considered the style a physical manifestation of the ideal of Greek democracy and of the independence of individual states. The new state capitol building in South Carolina, completed in 1860, was constructed in Greek Revival style, as were many of the federal buildings planned for Washington, D.C. (Volo and Volo 2004, 129).

Arlington House, residence of Robert E. Lee before the Civil War, is a good example of Greek Revival architecture. Hand-colored woodcut.

The federal capital at Washington was highly valued as a symbol by nineteenth-century Americans. Carefully laid out in a district allocated from within the boundaries of Maryland to salve the pride of the South, the nation's capital city had been under construction since the turn of the century. Americans pointed proudly to the imposing structure of the U.S. Capitol Building, as well as the General Post Office, the Bureau of the Treasury, the Smithsonian Institution, and the Executive Mansion, as representative of a vigorous young nation preparing to take its place among the leading countries of the world (Volo and Volo 2004, 130).

Unfortunately, Washington was also symbolic of other things. The plans for the city, like the basic founding concepts of the nation itself, were as pretentious as they were visionary, and in 1860 both lay unfulfilled and disordered. Sprawling along the banks of the Potomac with the "Old City" of Alexandria, Virginia, across the water, the great buildings of the new capital remained incomplete even after the expenditure of vast sums of money and six decades of effort. The U.S. Capitol Building, an imposing architectural edifice, lay unfinished with its original dome removed—scaffolding and a towering crane representative of restructuring and rethinking. The wings of the building were "stretched bare and unfinished, devoid even of steps." The imposing obelisk of the Washington Monument, at that time, lay as a mere foundation. Blocks of marble, lumber, cast-iron plates, and the tools of workmen strewn about the district gave quiet testimony to the fact that the plan for the nation's first city, like the social and political plan for the American nation itself, was incomplete and open to revision. As the gap between northern and southern political beliefs widened during the antebellum period, the Greek temple form of architecture came more and more to symbolize stability and authority in the South at a time when its lifestyle, institutions, and political rights were under increasing attack (Volo and Volo 2004, 130) (Leech 1941, 5–6).

CABINS

Few residents of the South lived in plantation manors. The vernacular architecture of the Upland South was characterized by the log cabin, constructed of horizontal courses notched together at the corners. This technology was brought to the area with the migration of the Scots-Irish and Germans who came from central Pennsylvania in the early nineteenth century. Many of the cabins of white yeoman farmers varied little in construction from those of slaves. What set them aside were the unique additions and porches, which personalized these homes in a way that the uniformity of slave housing rarely permitted. Porches, an architectural concept imported from Africa, were used as extended workrooms for the house and to that end were generally furnished with tables and some kind of seating. One popular style of cabin was the dogtrot, which could be described as two, two-room cabins joined together by a central breezeway onto which each section opened and that could be used for outdoor activity (Volo and Volo 2004, 130–31).

Wood was the characteristic building material in the Lowland South due to the abundance of timber, particularly yellow pine. Post and beam buildings assembled with basic mortise and tenon joints or notch joints were versatile enough to be used for outbuildings and farmhouses alike. Exterior walls were usually shingled or sided with planks. Interior walls might be finished in lathe and plaster. Wood framing, requiring the use of pit saws or water-powered sawmills, was generally reserved for larger homes. These building techniques changed little before the Civil War (Volo and Volo 2004, 131).

GOTHIC REVIVAL HOUSES

It is said that Sir Horace Walpole began the Gothic Revival in architecture when he decided to renovate his English country home in the mid-eighteenth century. In an attempt to get away from the boxlike symmetry of the more classical Georgian style, Walpole included arched windows, pseudo-medieval battlements and parapets, and other Gothic details to the design. The new look was inspiringly romantic, bringing to mind the style of storybook castles. Fanciful, romantic features that appealed to the emotion ultimately replaced the orderly classical ideals that appealed to the intellect. The Gothic style was also strongly suggestive of ecclesiastical structures like churches and convents. Some of the common features of Gothic Revival architecture were steeply pitched roofs, pointed leaded glass or clover-shaped windows, asymmetrical floor plans, grouped chimneys, pinnacles, crenulated battlements, and wide verandahs. Gothic Revival design became extremely popular in America in the 1840s.

Alexander Jackson Davis was one of the first architects to formalize the Gothic Revival style in his 1837 book *Rural Residences*. His design for Lyndhurst, a quarried stone country estate in Tarrytown, New York, was an archetype of the style. Wealthy homeowners from all over the North attempted to reproduce at least some of the features of this romantic and imposing structure, although they did not follow the Gothic pattern blindly. An excellent example is the Lockwood-Matthews mansion in Norwalk, Connecticut, begun in 1860 and finished during the Civil War (Volo and Volo 2004, 131).

Little by little, houses throughout the country began to show the influence of a frivolous and romantic Gothic design. Andrew Jackson Downing helped to spread this trend by applying it to wood-frame buildings. In both his pattern books, *Victorian Cottage Residences* (1842) and *The Architecture of Country Houses* (1850), Downing suggested the scrolled ornaments, lacey trim, and vertical board and batten siding made of wood that best characterized what is known as the "Carpenter Gothic" style. Many older homes of wood, brick, and stone had Gothic appointments layered on as an afterthought either in wood or in cast iron. The "Wedding Cake House" designed by G. Bourne in Kennebunkport, Maine, is an excellent example of such a home. Basically a Federalist-style brick structure built in 1822, the Wedding Cake House had lavishly carved buttresses, spires, and lacey spandrels applied to its facade, and a Palladian window was set in above its main entrance by 1855. In the post–Civil War years, the fanciful and overly elaborate details of the Gothic style lost popularity among homeowners. Nonetheless, Samuel Sloan's pattern book, *Sloan's Homestead Architecture* (1867), remained a popular source of architectural details inspired by the Gothic Revival (Volo and Volo 2004, 131–32).

This photo is an example of Gothic architecture of the mid-nineteenth century. This is Lyndhurst in Tarrytown, New York, the home of Mrs. Helen Gould. Courtesy of the Library of Congress.

The Gothic Revival may have experienced its best and most lasting expression during the late antebellum period in ecclesiastical structures. Arched windows made from leaded stained glass, pseudo-medieval appointments, towers with gargoyles, and buttressed sidewalls adorned these buildings. Trinity Church of Boston, designed by George Brimmer and begun in 1829, is one of the earliest examples. Other examples of ecclesiastical structures in the Gothic style include: the First Unitarian (North) Church of Salem, Massachusetts (anonymous architect, 1836), Trinity Church, New York (Richard Upjohn, 1839), and St. Patrick's Cathedral, New York (James Renwick, 1858). Although the Gothic style went out of fashion, these churches were built over many decades, thereby keeping the style in the public eye well after the Civil War (Volo and Volo 2004, 132–33).

CLOTHING AND FASHION

A contributor to the *National Recorder* in 1829 made the following observation on women's fashion:

The history of woman is the history of the improvements in the world. Some twenty or thirty years ago, when manual labour performed all the drudgery, some five or six or seven yards of silk or muslin or gingham would suffice for the flitting flirting of the most gay and volatile of the sex. But as soon as the powers of steam are applied, and labour is changed from physical to intellectual, the ladies, in their charitable regard for the operative class of the community, begin to devise means for their continued employment, and as the material is produced with half the labour, the equilibrium must be sustained by consuming a double quantity. (McClellan 1937, 406)

Although the observer's remarks were made tongue-in-cheek, there is some basis here in fact. Industrialization had redefined the role of women in the home. Men were caught up in an economy where they worked outside the home and away from the household for an extensive part of the day. The same industry and commerce also brought increased wealth to a growing middle class, and a larger share of the family's dispensable income came to reside in the hands of the women of the household. New laborsaving inventions also freed women from much of the drudgery of household labor and increased the amount of free time they had. With both the time and the money to follow fashion, they anxiously awaited the arrival of the latest fashion magazines, which contained illustrations of the latest Paris fashions (Volo and Volo 2004, 136–37).

One of the greatest influences on American women's fashion during the period was *Godey's Lady's Book*. Louis B. Godey founded the magazine in July 1830. In addition to serials, essays, poems, and craft projects, it featured engraved fashion plates. Each month, the magazine depicted morning dresses, promenade dresses, seaside costumes, riding habits, dinner dresses, and ball gowns. Such wardrobe depth was seldom needed for the vast majority of the magazine's readers, whose clothes could generally be categorized as public or social and domestic or work, with a few seasonal additions for summer and winter. As time progressed, *Godey's* began to show fashions better suited to the lifestyle and interest of the middle-class American woman. By the 1860s, *Godey's* had become a fashion institution, setting the standard for fashion savvy. Other magazines such as *Peterson's*, *Arthur's*, *Graham's*, *Leslie's*, and *Harper's* began to follow suit or grew in popularity (Volo and Volo 2004, 138–39).

Fashions in the opening years of the nineteenth century, like the architecture and furniture, echoed the past. Napoleon's campaigns in Italy focused the attention of architects and designers on the ruins of Rome, and an almost universal interest in politics further stimulated the revival of the republican ideals of ancient Greece and Rome. Artists drew inspiration from ancient history, and classic style became popular in every kind of decoration. This strong classical influence in fashion lasted only briefly in the opening years of the antebellum period. After 1820, there was a reaction against the high-waisted Empire style and the togalike draping of fabric related to Greco-Roman influences (Volo and Volo 2004, 139).

WOMEN'S DRESS

The period 1820–1830 marked the transition from the Empire style to a new romantic look. Fashions reinforced the image of the affluent woman of increased leisure. Skirts became increasingly fuller. Sleeves were set low on the shoulder restricting movement and making them very impractical for household labor. Working-class and rural women wore garments that were less hampering but that followed the basic style and silhouette of the period.

The waistline moved gradually downward from just below the bust to just above the anatomical waistline. The bodice during the 1820s and 1830s generally had wide, V-shaped crossover folds draped from the shoulder to the waist. This was often covered with an extremely wide capelike collar called a "pelerine." Made in either white or matching fabric, the extremely popular pelerine extended over the shoulders and across the bodice. The fichu-pelerine was a variant that extended into two long strips that crossed at the waist and passed under a belt. When the neckline was open, a chemisette, or tucker, was commonly worn beneath to fill in the opening. These fillers created the impression of an underblouse but were actually sleeveless and sideless articles that were secured around the waist. This construction created less bulk and could be easily laundered. They could be varied to create a different look with the same basic garment. The neckline during this early part of the period was usually high and crowned with a small collar or ruff. The pelisse-robe was another style of day dress. Adapted from the outer garment of the same name, it was a kind of coatdress that was secured down the front with buttons, ribbons, or hooks and eyes (Volo and Volo 2004, 139).

From 1825 to 1832 the exaggerated fullness of the sleeve was the most striking feature of women's dress. Almost as much material was required to make a pair of fashionable sleeves as for the skirt of a gown. The leg-of-mutton sleeve, or gigot, was greatly puffed at the shoulder and graduated into a long sleeve that fitted tightly at the wrist. The demi-gigot sleeve was full from the shoulder to the elbow then fitted from the elbow to the wrist frequently with an extension over the wrist. Some sleeves were a small puff covered by a sheer oversleeve. Another sleeve was full to the wrist but tied at intervals with ribbons or fabric bands. Yet another was extremely full from shoulder to wrist where it gathered into a fitted cuff. Sometimes the cuff was accessorized by a *santon,* which was a silk cravat that was worn around the neck (Volo and Volo 2004, 139–40).

Skirts ended at the instep until about 1828 when they became shortened to ankle length or just above. In 1836, they once again returned to the top of the foot. From the beginning of the period until 1828, the skirt was fitted through the hips with gores gradually flaring out to create fullness at the hem. Thereafter, skirts began to get fuller at the hips as the fabric was gathered or pleated into the waist. Popular fabrics included muslin, printed cotton, challis, merino, and batiste.

Evening dresses followed the same basic silhouette with a few alterations. Necklines were lower, and sleeves and skirts were shorter. During the 1820s, the neckline could be square, round, or elliptical. In the 1830s, they were usually off the shoulder. Evening dresses were usually made in silks, satins, gauze, or organdy.

Around 1836, the silhouette began to undergo a transformation, which moved fullness and extravagance from the top of the garment toward the bottom. Bodices usually ended at the waist but increasingly came to a point at the front. The "Y" bodice was most common. It had a fanlike appearance and remained in vogue through the remainder of the antebellum period.

Sleeves in this period were set low and off the shoulder, and the puffiness of the sleeve began to migrate down the arm. Bishop sleeves were loose sleeves that grew wide at the elbow, causing the sleeve to hang in a curve and creating the appearance of a slightly bent arm. They extended from a row of vertical pleats at the shoulder and fell into a full, relaxed sleeve that gathered at the wrist. A newer style also emerged that was fitted at the shoulder but widened about halfway between the elbow and the wrist into a bell shape. Because of this looseness, undersleeves, which would conceal the forearm from view, were worn for modesty's sake. Undersleeves were separate, straight sleeves that fitted closely at the wrist and extended to the upper arm where they were secured by a drawstring. Most commonly they were of white cotton or linen (Volo and Volo 2004, 140).

Skirts became increasingly fuller with excess fabric gathered into the waist. Many hems were edged with braid or other trim to reduce wear. Additional horizontal trim was added for balance, but overall the effect created a certain heaviness at the bottom of the garment. Trims included ruching, cording, scallops, and flounces. Most skirts had one or two flounces at the bottom, but some had row upon row down the entire length of the skirt. Others had a horizontal panel at the front of the skirt. An innovation at the time was the inclusion of sewn-in pockets. In the past, pockets were a part of a woman's underdress. They were separate articles that were suspended from a band tied at the waist and could be reached through slits in the outer skirt (Volo and Volo 2004, 140–41).

Evening dress continued to follow the same silhouette as in the day. Necklines were off the shoulder and either straight or with a dip at the center. Many had berthas, a wide neckline covering, which provided additional modesty for older or more conservative women. Fabrics included silk, moiré, velvet, and organdy. The use of trims increased greatly. Popular choices included lace, ribbon, and flowers.

The study of fashion during the last decade of the antebellum era is particularly exciting because this period represented the first time that there was widespread photographic documentation of what people actually wore. No longer is the study merely subject to interpretations of the hand-drawn or engraved fashion plates to which period women may have aspired. Whether or not a woman could afford the extravagances touted by the fashion plates of the day, it can be seen that the look that she was hoping to attain was the same. Women of this period wanted to create the appearance of a narrow waist. Virtually all lines of garments emphasized the smallness of the waist by creating the illusion of width at the shoulders and hips. This was further accentuated by foundation garments, which altered the body's physical appearance.

The dress bodices during the period can be classified by three basic styles. There was the "O" bodice, distinguished by the fullness of the fabric as it cascaded over the bust and gathered in around the waist. "O" bodices were especially popular prior to the Civil War. The bodice that was becoming fashionable at this time was the "V" bodice. This very fitted style was characterized by double or triple vertical darts extending from the waist. The darts, as well as the side and back seams, were usually boned. Stays could be made from whalebone, metal, or even wood. The third style of bodice was the "Y" style from the prior decade. Like the "O" bodice, "Y" bodices were relatively loose fitting.

Regardless of style, bodices ended at the natural waistline. The bodice portion of the dress fastened at the center front by hooks and eyes whereas the skirt portion had a side-front closure. This created an awkward opening that extended vertically from the neck, then horizontally along the waist and then vertically again down a few inches along the left front skirt seam. The *armscye*, or armhole, was almost always diagonal or horizontal to give the shoulders a sloping and wider appearance (Volo and Volo 2004, 141).

Sleeves by this time were very full, particularly at the elbow, again imparting the illusion of the slender waist. Sleeves, too, came in three fundamental styles. Straight sleeves were simple, loose-fitting sleeves that gathered together into a cuff at the wrist. Bishop sleeves continued in popularity. Pagoda sleeves tended to be found on more elaborate dresses. This was a loose sleeve, which was widest at its hem and usually of bracelet length and worn with an undersleeve (Volo and Volo 2004, 141–42).

Often sleeves had sleeve caps. These were ornamental pieces of fabric that covered the top few inches of the sleeve supporting the image of the wide, sloping shoulder. Sometimes the impression of a sleeve cap would be created through the use of trim. Short cap sleeves, which revealed a woman's arm, could only be found on ball gowns.

The necklines of day dresses usually came to the base of the neck. Many were trimmed by small, white collars, which were sewn flat and met in the front. Some had very short stand-up collars. Collars were basted inside to protect the garment from wear and soiling. They could easily be removed for frequent launderings from which the entire garment could be saved. The collars would be constructed of sturdy white or very light-colored fabric that could stand up to the repeat washings this portion of the garment required. Sometimes these collars had matching sets of cuffs, which were similarly attached and served the same purpose. Collars were frequently decorated with a broach at the center of the neck. If a bow were used, the tails of the bow would extend diagonally away from the center, continuing to proffer the illusion of the broad upper torso. Ball gowns often had wide, bateau necklines (Volo and Volo 2004, 142).

Many of the fabrics and dyes used at this time did not hold up to frequent laundering. Garments were often taken apart and resewn when cleaned. The *Household Encyclopedia* provided nine pages of instructions for washing various fabrics, such as "Take rice-water, and wash them quickly, without soap." Other methods employed included the use of bran, ox-gall, salt, elixir of vitriol, and egg yolk. Most women's dresses were never totally laundered but rather spot cleaned as needed (Volo and Volo 2004, 142) (Haskell 1992, 15–23).

Skirt lengths were long but seldom touched the ground where they would have become exceedingly hard to keep clean. Hem tapes were common to many skirts. The tapes or trims were wrapped around the finished hem and could be removed for cleaning or replacement. Skirts were very full and were either fully gathered or pleated at the waistline. No effort was made to make the stomach area appear flatter because, once again, the fuller an area away from the waist seemed, the narrower the waist appeared (Volo and Volo 2004, 142).

Fabrics used for dresses and skirts included silk, linen, wool, and cotton. These were available in an almost infinite variety of weights and weaves, some of which are no longer available today. By far, cotton and linen were the most common choices for everyday wear. Silk was expensive. If the average woman owned a silk dress, it would be saved for very special occasions. Linen, because of its extreme durability and ability to be produced at home, was considered frontier or laborer clothing. This was particularly true in the South where it was in common use among the slave population. Wool continued to have its place because of its warmth and especially because of its fire-retardant qualities. Cotton, a status symbol earlier in the century, had become readily available and affordable for even modest households by the 1830s due to an extremely well-developed textile industry and the invention of the cotton gin. From time to time, there were movements in the North among abolitionist women to avoid the use of cotton due to their belief that cotton was produced largely as a result of slave activity, but this tended to be confined to relatively small groups (Volo and Volo 2004, 142–43).

The color palette available at this time was basically that which could be achieved by natural dyes. While southern women tended to wear lighter hues, popular colors included browns, soft blues, greens, lavenders, and grays. Yellows and deep berry-toned reds were also in use. Black was a common color for trim and detailing. Even though chemical dyes had been introduced by the end of the 1850s, these colors were mostly found in decorative fabrics for the home. Although some showy young women in the North did wear them, proper ladies did not. *Peterson's* counseled against the use of bright colors saying, "though they may gratify the savage, will not please the educated eye." Readers were warned about wearing yellow and yellow-greens: "It is scarcely necessary to observe that, of all complexions, those which turn upon the yellow are the most unpleasant in their effect—and probably for this reason, that in this climate it is always a sign of bad health" (Shep 1987, 127–29) (Merrifield 1861).

Popular patterns included geometrics such as dots, checks, and stripes. Sometimes these were combined with small floral motifs or grouped into small clusters. Large florals were not in style nor were the very small floral calicos, which were not popular until later in the century. Patterns were also created by variations in the weave or with the use of shiny and dull threads.

Trim to dresses was generally placed in horizontal or diagonal lines, continuing the illusion of the narrow waist. Day dresses had little trim except on the sleeves or bodice. Skirts, if trimmed, were done so near the hemline. The trims used included braid, piping, binding, or ribbon. Ribbons were commonly gathered, pleated, or ruched. Some skirts appear to be trimmed at the hem but had actually been fitted with a hem protector. This tape wrapped around the hem of the garment to protect it from wear. It was much less expensive to replace a worn hem tape than to replace the garment, and the process was less labor intensive than turning the skirt. Some ball gowns had flounces or even a series of ruffles along the skirt. Trims on gowns tended to be more expensive and elaborate than those on everyday dresses (Volo and Volo 2004, 143).

Accessories

Dresses were updated or embellished by the use of accessories. A dress might be given a different look by the addition of a "fichu." There were several styles of fichus, but, basically, they covered the upper back much like a shawl collar and extended over the front in long tails that either met at the waist or crossed over each other. Some extended down the skirt a foot or so. Fichus were often made of sheer, gauzelike fabrics. They were decorated with ruffles, ribbons, lace, and bows. These were particularly popular in warmer climates at a time when propriety dictated that a lady's shoulders be fully covered until evening. A cooler dress with a scooped neckline could be worn and covered by the lightweight fischu. They were also worn over ball gowns by older women. Once again, practicality dictated that the fischu be a separate piece that could be cleaned more easily than the entire dress. This also allowed dresses to be easily changed to reflect new trends in fashion. Berthas served a similar purpose to fichus but were like oversized collars rather than wraparounds (Volo and Volo 2004, 133–34).

Sashes and waistbands were made of rich fabrics often embroidered or trimmed. They extended well down the length of the dress. Belts of many different styles were worn and some were quite elaborate. The Medici belt stands out as perhaps the most notable style. It was several inches wide at the sides and back but the front flared out into two exaggerated points that extended up to the area between the breasts and down to midstomach. The Bretelle corset was similarly shaped with shoulder straps almost like braces.

Ball gowns, naturally, would not have been found in the majority of women's wardrobes, but their splendor and overstated nature demands some comment over and above the few aforementioned remarks. Ball gowns had scooped necklines, short sleeves, and extremely full skirts. Silk was the fabric of choice. Ball gowns were elaborately decorated with long sashes, tiers of laced ruffles, flower garlands, or whatever extravagance might have struck the wearer.

Skirts worn with shirts and jackets or with vests and jackets were popular among young women in their teens and twenties. It was not until the mid-1860s that the skirt and blouse unaccompanied by the jacket was seen. The jackets were similar to what is called the bolero today. Jackets frequently matched the skirt fabric. As the fashion grew more popular, the jackets became decorated with more and more black braid, which was often done in increasingly ornate patterns. Vests were generally of a solid fabric. Blouses were white and generally closed by buttons rather than the hooks and eyes that fastened dress bodices. The end of the blouse was sewn into a waistband as opposed to hanging loose (Volo and Volo 2004, 144).

Riding habits consisted of a skirt, jacket, blouse, and occasionally a vest. Hats were small and frequently had a veil. The fabric was closely woven to withstand snags on branches, and dark colors were preferred for practicality. Of course, not all women rode for exercise. Some rode in parks to be seen, and these ladies often preferred more elaborately decorated outfits. *Godey's Lady's Book* offers this description of an illustration: "Riding habit of black cloth with fluted worsted braid and large gilt buttons; white cashmere vest; scarlet cravat; black felt hat with black feather and scarlet bow" (Volo and Volo 2004, 144–45).

White wedding dresses came into fashion toward the end of the period; however, many women still followed past traditions and were married in their best dress. Those fortunate enough to be able to afford such a specialized garment tended to wear dresses that might be considered plain by ballroom standards. Expense was more likely to be put into the fabric rather than trim. Generally, weddings were held during the day. Wedding dresses were, therefore, day dresses with jewel necklines and long sleeves. In keeping with the look of the day, headdresses and veils tended to lie flat on the head to avoid adding height. Coronets of real or artificial flowers were arranged so that they framed the face and added width (Volo and Volo 2004, 145).

Undergarments

Quite possibly, undergarments reached the highest level of complexity and sophistication in fashion history during this period. Undergarments served to protect the outer garment from body soiling, molded the body to create the ideal look, and served to distribute the weight of the full skirts over the hips. Like the previously discussed collars and cuffs, undergarments were constructed of serviceable fabrics that could be laundered repeatedly. They were usually white.

The garment worn closest to the skin was the chemise—a knee-length, loose-fitting shift. The body was almost triangular in shape due to the gussets on the sides. This basic garment had changed little in the previous 600 years. During this period, the neck was so wide that it was almost off the shoulder and the sleeves were short, "infant sleeves." Trim, if any, would be found at the neck or sleeve cuff. Sometimes the yoke would be decorated with small tucks. Its prime purpose was to help absorb perspiration and protect outer garments. It was sometimes affectionately called a "shimmy."

Drawers by this period had come to be worn by women of all classes. Commonly known as "pantalettes," they were constructed of two independent legs attached to a waistband and extended to just below the knee. Sometimes these were decorated with tucks, fancy stitching, or eyelet (Volo and Volo 2004, 145).

The corset was worn on top of the chemise. The purpose of this garment was to make the waist look small compared to other parts of the body and to shape the upper portion of the body upward and outward from the waist to the bust. Corsets were lightly boned and usually had steel clasps at the front while lacing up the back to allow for adjustment. Some had laces in the front with a "busk" inserted for rigidity. Busks were often made of whalebone. Light corsets were introduced to girls around age 12 and certainly by the age of puberty. Over the corset was worn a corset cover, or camisole. These were sleeveless and extended to the waist (Volo and Volo 2004, 145–46).

Early in the period women wore a small cotton- or down-filled pad known as a bustle. It was not as dramatic or highly structured as the bustle that was to reappear at the end of the century. The bustle was tied around the waist and located at the back. Worn in addition to multiple layers of petticoats, it served to create extra volume and further support the full skirt (Volo and Volo 2004, 146).

The crinoline, or hoop, was the major fashion innovation for women during the 1850s and is perhaps the single garment most associated with women's clothing during the antebellum period. The circumference of skirts increased steadily throughout the decade with some reaching 12 to 15 feet. This proliferation of fabric required the use of more and more petticoats to sustain the volume. *Peterson's Magazine* touted the crinoline as a solution to the problem:

> There can be no doubt, that, so long as wide and expanded skirts are to be worn, it is altogether healthier to puff them out with a single light hoop than with half-a-dozen starched cambric petticoats as has been the practice until lately. Physicians are now agreed that a fertile source of bad health with females is the enormous weight of skirts previously worn. The hoop avoids that evil entirely. It also, if properly adjusted, gives a lighter and more graceful appearance to the skirt. (Volo and Volo 2004, 146) (*Peterson's Magazine* 1856, 204)

Crinolines could be covered or caged. Caged crinolines were a series of hoops of varying sizes suspended from strips of tape, which descended from the waist. Covered crinolines were fabric petticoats that contained casings to hold the hoops. Generally, day dresses had crinolines that were somewhat smaller than those worn for the evening. Atop the crinolines were placed one or more petticoats for added fullness and to soften the ridges that could be created by the hoops. Skirts tended to be so much greater in circumference than the crinolines that they tended to drape over this support in folds.

Even a small sampling of period photographs would indicate that few women actually wore hoops in the extreme proportions depicted in fashion plates of the day. The normal proportion for the diameter of the hoop was approximately 50 percent to 70 percent of the wearer's height. Women engaged in vigorous work would decline wearing them. The structural material that made the hoop was often of long thin strips of whalebone, called "baleen," turned back on itself in a circle (Volo and Volo 2004, 146).

The nightdress was ankle-length white cotton and approximately two and a half to three yards wide at the hem. The collar, cuffs, and yoke were often decorated with embroidery, lace, ruching, and tucks. Nightcaps, often decorated with lace and bows, were still worn. Prior to dressing, a woman might wear a morning robe over her nightdress (Volo and Volo 2004, 148).

Outerwear

Until the mid-1830s, the pelisse was the common outer garment. The pelisse followed the general silhouette of the dress and sleeve style of the day and was similar to the modern coat. After that time, when it came to outerwear, women had a wide variety of options, including capes, cloaks, shawls, jackets, and coats. Capes varied in length from just below the hip to just above the ankle, and they fit closely to the top portion of the torso. Some capes had arm slits for ease of movement. Cloaks were extremely full to accommodate the full sleeves and skirts.

Jackets and coats naturally followed dress lines, making them many times wider at the hem than at the shoulder. Jackets, or "paletots" as they were called, may have been more popular than coats because they were more lightweight. Even coats tended to be 6 to 10 inches shorter than the hem of the skirt.

Shawls were very popular, and retailers advertised the arrival of new shipments of them. They were oversized and extended well down the back of the skirt. Commonly, two-yard squares were folded into triangles. Double-square shawls could be 64 inches by 128 inches or more. Some shawls were knitted or crocheted; others were made from wool or lace. Many were decorated with fringe, ruffles, or lace, and paisley shawls were particularly popular (Volo and Volo 2004, 148).

"Mantel" was the general term used for other outer garments not previously mentioned. Mantels tended to be basically triangular in shape although the back could easily have a rounded point. They extended over the shoulders and were slightly shaped at the arms. The long ends in front assumed a variety of shapes. For summer wear, the fabrics tended to be light and unlined. Winter mantels were made of heavier, lined fabrics. Evening mantels were made of luxurious fabrics such as velvet or satin and decorated with braid and other rich trims (Volo and Volo 2004, 148–49).

Headgear

Hats in the 1820s and early 1830s were either large brimmed with high, round crowns or bonnet style. They were commonly decorated with feathers or lace and tied beneath the chin with a large ribbon. The "capote" was a style of bonnet that had a soft fabric crown and a stiff brim.

The "coal scuttle" bonnet was popular during the 1840s. These bonnets fit the head closely on the sides and extended straight out on all three sides, creating an almost tunnel effect for the wearer. Over the next decade the bonnet brim shortened and widened somewhat, making it more attractive for wearers and improving their visibility. Bonnets were popular throughout of the period. They were one apparel item that women could constantly update by reworking the trim or decorations to meet the current vogue. Favored decorative features included ribbon, lace, and clusters of silk flowers or berries. These were used on the outside of the bonnet as well as inside of the brim to frame the face. Huge ribbons several inches wide were tied in large bows beneath the chin. The outsides of bonnets were covered in silk or more commonly polished cotton, which was then pleated, ruched, piped, or quilted. A gathered flounce or skirt was often found attached to the base of the bonnet at the nape of the neck. For summer wear, bonnets were often made of straw.

When serious protection from the sun was needed, it was the slatted bonnet that came to the rescue. These work garments were made of cotton or linen and bore no decorations or trim. They had long back pieces that extended over the shoulders, and the front could be folded back or fully extended to shade the entire face. Women were seldom photographed in sunbonnets due to their unflattering appearance.

During the day women wore dainty caps made of muslin, lace tulle, and ribbon. These would never be worn outdoors. Crocheted nets were also worn, but they were generally not considered suitable for dress occasions. Some older, conservative women wore more substantial caps, often with lappets, which fully covered the head and were reminiscent of the caps more commonly worn during the previous century (Volo and Volo 2004, 149).

Ancillary Clothing

Aprons were an important item in a nineteenth-century wardrobe. The difficulty involved in cleaning garments made clothing protection an important step in household management. Early in the period, aprons covered almost the entire dress. The aprons fit closely at the top of the chest and tied at the back. They hung down loosely from shoulder straps to just above the hem (Volo and Volo 2004, 149–50).

As skirts widened, household aprons grew to accommodate them. Aprons became extremely large, enveloping almost the entire skirt from front to back and extending down to within a few inches of the hem. Often they had rectangular tops, which were known as "pinners" because they were held in place by pins rather than the neck strap common in the twentieth century. Smaller aprons would be worn for mealtimes unless servants served the meals.

Aprons would often be made from fabrics with small plaids or checks that would help to hide stains. Although they could be solid, they were seldom white. Aprons were made from linen, flannel, wool, or cotton. Wool was greatly preferred for safety around fires. It does not burn as quickly as linen, and its odor when burning gave fair warning. Burns were the second leading cause of fatality for women at this time, surpassed only by death during childbirth.

Fancy, decorative aprons were sometimes worn only for show. These were made of fine quality fabrics and were sometimes decorated with lace, embroidery, or ruffles. These aprons would be much shorter than their functional counterparts, extending only two-thirds to three-quarters of the way down to the hem. Light-colored fabrics were often used, and many were made of polished cotton-type fabric. Ladies' magazines of the period gave patterns for these as sewing projects. These aprons would be worn when doing needlework or when receiving guests at home (Volo and Volo 2004, 150).

Gloves were an essential of a nineteenth-century woman's wardrobe. Arthur Martine, in his *Hand-Book of Etiquette, and Guide to True Politeness* remarks, "When dancing is expected to take place, no one should go without new kid gloves: nothing is so revolting as to see one person in an assembly ungloved, especially where the heat of the room, and the exercise together, are sure to make the hands of the wearer redder than usual. Always wear your gloves in church or in a theater" (Martine 1866, 55).

Daytime gloves were short. Commonly, they were joined by a button at the wrist. Some were secured by short lacing. Kid leather was the most common material, but fabric and lace were also used. Fingerless gloves of netted lace or silk, known as "mitts," were popular during the 1840s and 1850s. Evening gloves were long, to the elbow, until the second half of the 1830s when they were shortened to wrist length.

For day wear, gloves could be found in a wide variety of colors, but only white was proper for evening and formal wear. Some were embellished with decorative stitching or embroidery (Volo and Volo 2004, 150).

Footwear

Shoes were slipperlike with flat, square toes. After 1840, they began to have small heels of one inch or less. For ordinary wear, they were made from leather or cloth and were black, light brown, or gray. Formal day dress shoes would be made of fancier fabrics such as satin. Black satin shoes were the dominant evening fashion until about 1840. Evening shoes after that time came in a variety of styles. Some had ribbon ties, which wrapped around the ankle. Others displayed embroidered tops. Evening shoes were often in bright colors to match the ensemble.

Women's boots were ankle height and laced up the sides at the inside with elastic gussets at each side. Some buttoned at the sides. Dressy boots might be made from kid or satin. Congress gaiters, rather low-cut boots finished with a wide piece of elastic on the side, were made of cloth, came in a variety of colors, and were tipped in patent leather. Balmoral boots, which laced up the front, were considered very stylish and were widely popular. Rubber overshoes were introduced in the late 1840s.

House slippers were low-heeled mulelike foot coverings commonly done in Berlin work. The Berlin work was a form of needlework done on the canvas that made up the vamp, or upper part of the shoe, and many patterns were featured in ladies' magazines. The mule was a low, open-backed affair that covered only the front of the foot. Slippers were also crocheted in a low bootie style (Volo and Volo 2004, 151).

Items at Hand

As with the previous century, fans remained a popular accessory. The traditional, semicircular fan was often covered in paper or silk. Some were beautifully painted. The average fan length of this period was 6 to 10 inches. Circular fans were also fashionable. These fans had handles that, when folded backward, revealed an accordion-pleated, fabric fan. Round or spade-shaped palmetto or straw fans were less expensive and were sometimes homemade (Volo and Volo 2004, 151).

Umbrellas and parasols were two different accessories, and each served a separate purpose. Umbrellas were for use in inclement weather. They were large and black and were meant to protect the carrier from the weather. Parasols were small, ladylike contrivances. Their purpose was to protect the carrier from both the sun and unwanted glances. When hats were very large in the 1820s and 1830s, the parasol was often carried unopened. Parasol frames were made of metal. Handles were ivory or wood. Parasols designed for carriage rides often had a hinge at the top of the stick, which allowed the top to tip to better fit the confined space. They varied from 16 to 22 inches. Parasols used for walking were generally larger, 22 to 26 inches. Silk was the most common fabric. Trimming was lace or ruching. Paper oriental-style parasols with cane ribs were used at the seaside or for informal occasions (Volo and Volo 2004, 151–52).

Purses came in a variety of styles. Patterns for crocheted, knitted, or Berlin work purses abounded in ladies' magazines. Purses were decorated with tassels, cording, and embroidery. Shapes were round or rectangular, but the six-inch-square bag was most popular. One of the most interesting kinds of purses was a long, thin, knit or netted cylinder closed at both ends with a slit in the center. These were called "miser purses" or "long purses" and were quite popular. Toward the end of the period, small bags, sometimes referred to as "waist pouches," were suspended from the waistband. Formal purses often had beading or were made with metallic thread (Volo and Volo 2004, 152).

Jewelry

In the 1820s and 1830s, gold chains with lockets or scent bottles were fashionable. *Chatelaines* were still being worn. Popular in the previous century, these ornamental chains were suspended from the waist and contained a variety of useful items, many often related to sewing such as scissors, a thimble, a needle case, or a pincushion. They could also feature a scent bottle, a penknife, or anything else that a woman wanted to keep handy. Brooches, bracelets, and drop earrings were also popular. In the 1830s, it became fashionable to wear a narrow velvet ribbon or tress of hair around the neck. Known as a "Jeanette," this adornment often supported a heart of pearls or small cross.

The 1840s saw less jewelry being worn. Watch ownership, however, was fairly common by this time, even for women. Watches were worn on watch chains and were tucked in the belt or carried in a watch pocket at the waist. Patterns for crocheted, beaded, and braid work watch pockets appeared in period ladies' magazines. Watches were hung on a long, fine chain worn around the neck, which extended well below the waist. Some were suspended on a short chain from the belt.

Many photographs from the end of the period show women wearing some jewelry. Popular materials included jet, ivory, bone, onyx, jade, amber, garnet, and pearl. With its discovery in California, gold was the order of the day. Particularly fashionable was the brooch worn at the center of the neckline. Brooches varied in size from large to small and were worn both vertically and horizontally. They closed by simple "C" clasps without safety catches. Cameos were highly favored and often bore images of mythological figures. The female head, almost synonymous with the modern cameo, was just coming into fashion toward the end of the war. Cameos were made from sardonyx, shell, lava, ivory, and coral (Volo and Volo 2004, 152).

The mid-nineteenth century was a very romantic and sentimental era. It was a common practice to have a piece of hair as a keepsake from a loved one. Many period brooches contained a lock of a beloved's hair under glass in the center of the brooch. Other brooch materials included goldstone, agate, bog oak, enamel, horn, and mosaics. The mosaic pieces were very small and portrayed classical scenes or floral sprays. Enameled pieces were usually blue or black with a gold figure in the center (Volo and Volo 2004, 152–53).

Other neckline decorations included short necklaces of single-sized pearls or beads, especially jet. Long chains, popular earlier in the period, were still being worn by some. Both a beaded and a long chain necklace might be worn at the same time.

Bracelets were also stylish and often were worn in pairs, one on each wrist. These tended to be large, almost chunky, bangle style. Serpents were one motif much in vogue. Jet beads strung on wire were also worn. Dangling earrings with long ear wires were worn. These were usually shorter than those worn later in the century. Many earrings were made of hollow wear, an inexpensive rolled gold that appears almost puffed or was formed into hollow tubes. Naturally, this made the earrings very light in weight. Use of acorns as a motif was widespread. Often earrings and brooches came in matched sets.

The wearing of rings was widespread. Unmarried females would wear a ring on the first finger of their left hand no doubt in hope that they would soon be wearing it on the third digit of that same hand. A simple gold band was the prevalent sign of a married woman. Generally, diamond rings were not worn. The diamond mines of South Africa were not discovered until 1870, and it was not until this time that diamonds would become affordable to anyone but the most affluent. Rings were likely to bear garnets, amethysts, pearls, onyx, amber, jade, red coral, or cameos (Volo and Volo 2004, 153).

Hairstyles

In the early 1820s, women generally parted their hair in the middle and had tight curls around the forehead and temples. The back was usually tied into a knot or bun. After 1824, elaborate plaits of false hair were often added. *La Chinoise* was a style that was popular in 1829. Hair was pulled from the back and side into a large knot atop the head while the hair at the forehead and temples was arranged in tight curls. By the mid-1830s, the hair was parted in the middle and pulled flat against the temples from where hanging finger curls, plaits, or loops of hair covered the ears. The hair at the back was pulled into a bun or chignon (Volo and Volo 2004, 153).

As with other fashion items, hairstyles of the late antebellum period were intended to emphasize a broad upper body. To that end, the center part is almost universal in period photographs. This allows for a wide, bare forehead, making the face appear broad while creating no height on top. To continue this illusion, the fullest part of the hairstyle was at or below the ears. Most women had long hair, which they wore rolled, braided, or otherwise confined and pulled toward the back of the head. If the hair was not confined, it was generally fixed in long finger curls and pulled to the side of the face. The variety of curls and hair rolls was as rich as the ingenuity of the women who styled them. Ladies' magazines of the period offered many suggestions for elaborate hairdressing for evening wear and suggested incorporating such items as flower blossoms, pins, combs, chains, feathers, and false curls (Volo and Volo 2004, 153–54).

MEN'S CLOTHING

Martine, in his handbook of etiquette, remarks, "There are four kinds of coats which a man must have: a business coat, a frock-coat, a dress-coat, and an over-coat.

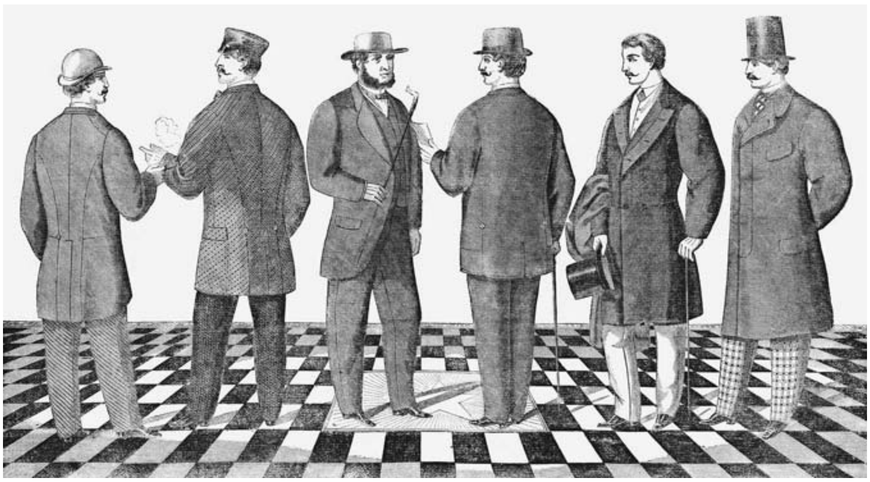
A well dressed man may do well with four of the first, and one each of the others per annum. An economical man can get along with less." Yet this was not reality. Just as the average woman did not have a specialized outfit for every task of the day, most men did not enjoy the wardrobe depth detailed by Martine. Like women's clothing, men's clothing in practical application tended to fall into formal and informal, summer and winter. New clothes would be considered best dress until they became worn, and they would then be relegated to work status (Volo and Volo 2004, 155) (Martine 1866, 49).

A shirt, vest, and trousers would be the very least in which a man would allow himself to be seen in public. A man appearing with anything less was considered to be in a state of undress. Even laborers and farmers would not allow themselves to go with less. The rare workman who would not be so attired, such as the blacksmith, would wear a heavy leather apron, which covered him somewhat above the waist.

Dress shirts were made of white cotton. Longer than the modern shirt, they were pullovers that buttoned from the midchest to the neck. Small vertical tucks commonly decorated either side of the buttons, but this became less favored as the decade progressed. Shirts had neck bands and detachable collars. Work shirts were made in a variety of colors and checks and could be made from cotton or linen.

For formal day wear, the collar was upright with a gap between the points, which just touched the jaw allowing for freer movement of the head and neck than had been the style earlier in the century. For informal wear, men wore either a shallow single collar with sloping points meeting at the center and forming a small inverted V-shaped opening or a shallow double collar similar to the modern collar.

Stocks or cravats were worn around the neck. Stocks were often black and fastened at the back. As the period progressed, they were abandoned in favor of the cravat. The cravat was a band of fabric passed around the neck and tied in either a bow or a knot with hanging ends. Sometimes they were fastened with a decorative pin. Silk was the fabric of choice, and it was one area where a man might be able to display his good taste even if his purse prohibited further extravagances. Ladies' magazines of the period, however, offered patterns for woolen and cotton knitted cravats. Even laborers would simulate the look, although they may only have been able to knot a cotton kerchief around their neck (Volo and Volo 2004, 155).



The various types of men's clothing worn during the mid-nineteenth century can be seen in this picture. © North Wind / North Wind Picture Archives—All rights reserved.

The suit ensemble consisted of a coat, waistcoat, and trousers. For dress occasions, tailcoats were worn. Tailcoats could be either double-breasted with large lapels or single-breasted with smaller lapels. Collars were cut high behind the neck with a rolled collar, which joined the lapel in a V- or an M-shaped notch (Volo and Volo 2004, 155–57).

Frock coats, which had a fitted torso, collar lapel, and skirt flaring from the waist, were popular throughout the period. Prior to the 1830s, sleeves were full at the shoulder and formed a puff at the top when the excess fabric was gathered into the armhole. After 1830, the skirt became somewhat shorter and narrower and the coat became longer waisted. Early in the period, the most fashionable coats had padding in the shoulders and chest area, but this disappeared during the late 1830s.

Jackets were single-breasted garments with side pleats and no vent in the back. The front closure was straight but curved back slightly below the waist. Collars, lapels, and pockets were small.

Toward the end of the period, the fuller suit seems to have been favored by the average man. Perhaps this was due to comfort or the need for less-skilled tailoring. The formal suit appears to have been the look to which men of power aspired. Lapels sported a more modern single notch than earlier in the century. Frock coats sometimes had velvet collars and cufflink-style buttoning. Trousers had buttoned, full fall fronts or buttoned French flies. Wool was the fabric of choice, and linen was popular during the summer, especially in the South. Farmers seemed to favor tweeds and more sturdy woolens. Generally, solids dominated, and browns and grays were most common. Black was the choice of professionals, who also preferred fine woolen broadcloth, serge, and twill. These fabrics often had a certain amount of silk woven into the fabric to give it a finer finish and lighter weight.

Vests or waistcoats were worn under the suit coat. Early in the period, they had straight standing collars or small, notchless, rolled collars arranged so that only the edge would be seen at the edge of the coat. They were either single- or double-breasted, although single-breasted was more popular during the 1820s. Lapels narrowed and were less curved in the 1840s, but by the end of the decade they had widened again. They could be made of the same fabric as the suit or they could be of much finer, dressier fabrics such as silk taffetas, embossed silks, or brocades. Patterns ranged from tone-on-tone to stripes, checks, and paisleys. The neckline cut came to lie flat and moved lower during the period. Watch pockets were becoming common (Volo and Volo 2004, 157).

For outdoor wear, men wore overcoats that were referred to as greatcoats. Between 1820 and 1840, these often reached down to the ankle and had deep, rolled collars. The fit was very close to the body at the beginning of the period, but this characteristic disappeared in the 1840s. The box coat was a large, loose-fitting greatcoat with one or more capes at the shoulder. Coats of this looser style became increasingly popular as the period progressed. The mackintosh was a waterproof coat made of rubber cut like a short, loose overcoat. While their water-repellent nature was welcome, many chose not to sport them due to the offensive odor they emitted. Capes continued to be worn and were especially the fashion for evening wear. They were cut in gores and fit smoothly at the shoulder. Some featured large standing collars; others had flat ones. Some had capes of varying lengths and even multiple capes at the shoulder. In the 1830s and 1840s, short, round capes lined with silk were the fashion for evening wear. Later in the period, some men wore shawls over their suits as outerwear (Volo and Volo 2004, 157–58).

Hat styles varied. The top hat was popular for both day and evening wear. Many southern gentlemen favored what has come to be called the "plantation hat." This a low-crowned, stylish hat with a substantial, but not overstated, brim. The commonly found round hat had a round crown with a medium brim. This should not be confused with the derby, which was not developed until later in the century. Many men wore flat-topped straw hats in the summer. Rural men often wore wide-brimmed, high-crowned hats, which offered less in fashion but more in protection from the elements and a cool space above the head.

As with women, gentlemen wore gloves. These were made of leather, wool, or cotton for the daytime and silk or kid for the evening. Leather-work gloves and riding gloves were also common. When "dressed," men carried canes often with fine detailing and gold or silver trim. In inclement weather, they carried large black umbrellas.

Shoes had low heels and square toes. Shoes with laces first became popular during the 1830s. Work shoes were often fashioned with the rough of the leather exposed. This allowed a cheaper grade of leather to be used, and the nap of the leather could be greased to help repel moisture. For formal wear, the shoe was made with the smooth side out. It was often open over the instep and secured with a ribbon bow. Leather or tarred canvas gaiters, which covered the shoe top and were secured by a strap under the shoe, were worn in bad weather. Spatterdashers, which reached to just below the knee, were longer versions of gaiters that were worn for hunting and other sporting activities. Knee-high boots were worn for riding. Later in the period, shorter half boots with elastic sides or laced closings were also worn.

Male jewelry included cravat pins, brooches worn on shirtfronts, watches, jeweled shirt buttons and studs, and decorative gold watches and watch chains. Rings of all types were popular. They took the form of signet rings, seal rings, mourning rings, and commemorative rings. As the period progressed, jewelry lessened and was generally limited to rings, cravat pins, watches, and watch chains (Volo and Volo 2004, 158).

Braces or suspenders buttoned on to the trousers by means of leather tabs. It was quite the fashion for women to crochet them or decorate them in Berlin wool work. Once again, ladies' magazines featured patterns for doing this. Makers were cautioned, "This crochet should not be done too tightly, as a little elasticity is desirable." Elastic had been invented by this time, but its only apparel application was in wide panels in shoes. Men unfortunate not to have braces made by an attentive woman may have sported those made of linen cloth (Volo and Volo 2004, 158–59) (Shep 1987, 290) (Weaver 1864).

Throughout the period, men wore drawers that extended down to the ankle and had button fronts. These could be made of silk stockinette, cotton, or linen. In the early years of the period, some men wore corsets or padding at the shoulder, chest, hip, or calf to have a fashionable silhouette. Later, an undershirt—a long-sleeved pullover that buttoned to midchest—was added. However, one-piece Union suits with the trap door in the rear were not developed until after the war.

When it came to lounging in the privacy of one's home, gentlemen had several specialized items of attire. The lounging or smoking cap was an elaborate item made of rich fabrics and adorned with embroidery, beadwork, or braid. They generally came in three basic styles: the round pillbox style; the fitted six-panel cap; and the teardrop-shaped Scotch style. The first two styles ended with a tassel on top. The last was finished with a narrow ribbon at the back of the cap at the point. Ladies' magazines carried patterns for making and decorating these. In addition to slippers, which greatly resembled the woman's slipper, a man might have preferred the dressing or lounging boot. These boots were made of fabric and were decorated with elaborate embroidery.

Nightshirts were made of white cotton and extended to the ankle. They had long sleeves and small turned-down collars. The nightcap was a bag-shaped item with a tassel on top. Some were knit or crocheted, but these were going out of style. Over his nightshirt, a gentleman may have worn a wrapper. This was a long, sack-style robe with a plain sleeve confined by a cord at the waist.

Men wore their hair parted on the side, in a short to moderate length often in loose curls or loosely waved but cut short in the back. Beards came into fashion around 1825 with a small fringe of whiskers. Facial hair continued to grow longer throughout the period, and many arrangements of facial hair became stylish. Men sported beards of all styles, lengths, and degrees. Mustaches were equally in favor. Photographs from late in the period show the tremendous variety that abounded (Volo and Volo 2004, 159).

CHILDREN'S CLOTHING

Children's clothing rivaled women's fashions both in complexity and ornateness. Some middle- and upper-class children were dressed in layers of clothing, often in impractical fabrics. *Godey's Lady's Book* carried the following description with an accompanying illustration: "Child's dress of green silk with narrow pinked ruffles, corselet of green silk, white muslin gimp, white felt hat with white wing." Ornate as it sounds, this outfit is not classified as a party dress. Gauze, silk, wool, and taffeta were common fabrics suggested for children's dress in ladies' magazines. Print fabrics tended to be small geometric or abstract designs. These kinds of designs allowed for economical use of material since it was easier to match such prints and there was less waste when cutting patterns. Braid or ribbon were popular trims even for the children (Volo and Volo 2004, 159–60).

In rural areas, children's clothing was considerably more practical, much the same as their parents'. Muslin or cotton was the fabric of choice for country and poorer folk. To allow for growth, it was common for seams at the shoulders and under the arms to be folded in an inch each, so that they could later be let out as the child grew. Sometimes a waistband was added as the child grew. Several tucks of an inch or so were often made near the hems of skirts and trousers. These created an attractive detail that could later be let down to accommodate growth (Volo and Volo 2004, 160).

Little girls were dressed very much like their mothers. *Godey's Lady's Book* contained an illustration for a corset for a little girl, which laced down the back only. Not everyone encouraged its use, however, as the editor of *Peterson's Magazine* points out: "Stays or tight bands about the ribs compress them readily, as these bones are not fully formed, hence readily cause deformities, and alter the natural and healthy position and action of the lungs, heart, liver and stomach, and produce a tendency to disease in these organs" (Shep 1987, 326) (Weaver 1864)

The main difference between a woman's attire and a girl's was that a girl's skirt was considerably shorter, ending about midcalf. Pantalettes hung just below the edge of the dress. These would be plain for everyday and would be adorned with lace or eyelet for dressier occasions. These pantalettes differed from women's in that the crotches were sewn, and they buttoned at the sides. Like her mother, a little girl wore a chemise as the basic undergarment. Once the hoop made its debut, even young girls of age seven began to wear one, although it would likely have only one hoop ring at this time. Once again, like adult women, she would wear under- and over-petticoats. One popular style dress for Sundays and parties around midcentury was the bateau or boat neckline. This extremely wide neckline was another impractical fashion and many photographs show one sleeve slipping off the child's shoulder. Like their mothers, little girls wore undersleeves and chemisettes. They also wore tuckers. A tucker was a panel of crimped muslin secured by a tape and sewn on the inside edge of the neckline and sleeve edge. The purpose of this was to save wear on the fabric, and the tucker could be removed and laundered separately from the garment. Blouses and skirts were not popular for toddlers but were worn by young girls (Volo and Volo 2004, 160).

Fancy aprons for children were popular. These tied around the waist and covered almost the entire skirt portion of a dress. The top covered only part of the dress front and crossed over both shoulders on top. These were commonly decorated with flounces, bows, and other decorative details. Pinafores, which covered almost the entire dress, were more practical and much more common across all economic lines. They were constructed in such fabrics as muslin, calico, or linen. The pinafore fit closely to the chest and hung down loosely to the hem. Another layered style for young girls was the white dress covered by another jumperlike dress (Volo and Volo 2004, 160–61).

Children's jewelry tended to be modest and simple. Little girls wore strings of beads, lockets, and chains. Very young girls wore coral necklaces or pairs of coral bracelets. Infants were given elaborate coral rattles mounted in silver or teething rings also made of coral.

Boys wore a series of different types of outfits, each befitting a certain age group. Very young boys often had shirts that buttoned to the waistband of their pants and provided a neater look. From age one to four, boys wore a Nankeen suit. This

This Currier and Ives lithograph, "The Burning Glass," shows the clothing that children wore during the mid-nineteenth century. Courtesy of the Library of Congress.

was a dresslike costume worn over white underdrawers not unlike the girl's pantalettes, although they were likely to be less fancy. It was a blousy sack, often with a large sash or a cord tied around the waist.

Between the ages of four and seven, boys wore the French blouse. Essentially, it was a loose, dresslike tunic secured at the waist by a belt and large buckle or sash. This would have been worn over loose knee pants, although it was also worn over skirts for very young boys. They may also have been attired in a loose jacket and waistcoat, once again with loose knee pants. Boys may also have been clad in a suitlike outfit with a slightly cutaway jacket, gently rounded in front, and very loose trousers, which extended to about midcalf.

From 7 to 12, a boy may have worn what would be thought of as a suitlike outfit consisting of a loose, ankle-length trouser and waist-length sack coat with a ribbon tie fashioned into a bow. The pants might have box pleats. At this time, suspenders became fashionable. Sailor suits were also popular for young boys 7 up to 14. Some boys in certain areas did not wear long pants until 14 or 15.

As older teens, boys dressed much as adult men. They wore pants, vests, and jackets. Jacket types included sack, frock, and a short, military style. Boys' undergarments included an undershirt and drawers that reached down to the knee. When boys graduated into longer pants, they wore longer, ankle-length drawers that fit the leg more closely.

For outerwear, children often wore coats, jackets, and cloaks similar to those worn by women. They also wore capes secured by buttoned tabs across the chest. Girls generally wore small hats, usually straw for summer and cloth for winter. As with women, slatted bonnets were worn in rural areas. Brims tended to be small, and they were very simply decorated. Boys wore caps and small hats with rounded crowns (Volo and Volo 2004, 161).

Girls wore leather or canvas short boots for day wear and slippers for dressy occasions. Some of the slippers had ankle straps. The boots either laced up the side or had elastic gussets on the side. Canvas boots often had toe and heel portions covered in leather for added protection and durability. Boys wore footwear similar to adult shoes or short pull-on boots sometimes decorated with a tassel on the front (Volo and Volo 2004, 162).

Girls wore their hair in a short, ear-length blunt cut, which was pushed behind the ears. Some wore their hair in long finger curls. The latter seems to have been more popular among girls of higher economic status. Occasionally, ribbons were used to keep the long hair out of their faces. Girls of about eight or nine began to wear their hair in hairnets. Sarah Morgan, at age 19, wrote in her diary, "The net I had gathered my hair in fell in my descent and my hair swept down half way between my knee and my ankle in one stream." Like their mothers, the hair was center parted. Boys parted their hair to the side. The sides and back were usually short. Due to the fashions in which young boys were attired, when looking at photographs, the part is often the only clue to the sex of the child (Volo and Volo 2004, 162) (East 1991, 102).

Finally, the editor of *Peterson's Magazine* offers the following advice to mothers about clothing children:

> To guard against cold, the child should wear flannel, of varying thickness, according to the season of the year, next to the body, and fitting tolerably close, for, without this protection, the present style of dress, causing the clothes to project away, leaves the body exposed to sudden chills. The head should be lightly covered, so as to protect it from the sun, or sudden change of temperature; but it should never be covered with thick or heavy material. Anything causing fullness or congestion about the head will very commonly act by sympathy, as it is called, on the stomach, and cause obstinate and violent vomiting.... A pin should never be used about a child's clothes at any age; buttons and strings should always be the modes of fastening. (Shep 1987, 326) (Merrifield 1861).

Infants wore long gowns that were often twice the length of the child. This provided the child with greater warmth. Long gowns could not be cast off as loose blankets could. The gowns were generally white to withstand the frequent washings that infant clothing required and were of "soft material, entirely free from starch." For the first few weeks after birth, infants wore long narrow strips of fabric known as "belly-bands." These were several yards long and were designed to protect the navel. In addition to diapers, or napkins as they were called, infants wore a shirt, a pinner that contained their lower limbs, a skirt or skirts, and a dress. Babies also wore caps for which women's magazines frequently carried patterns (Haskell 1992, 344).

As the child grew older, clothing adjustments were made. Mothers were commonly advised to "keep socks on after the child is two months old; before this, its pinners will be sufficient protection.... When a child shows a disposition to creep, shorten its clothes that it may have free use of its limbs, and protect its feet with stockings and shoes" (Haskell 1992, 385–86).

The antebellum era was the first era to provide students of fashion with an abundance of pictorial documentation. Ladies' magazines and their fashion plates achieved tremendous popularity during the period and had a wide readership among members of both the upper and middle classes. The fashion plates provide a monthly history of changes in styles and supply tremendous detail. Even though the fashions depicted in these magazines may have been extreme, they show the ideal and provide insight into the styles to which many aspired. The development of photography later on in the period documents what was actually worn and provides insight into adaptations of the fashion plate exemplars. Unfortunately, documentation of working-class clothing remains sketchy, as what few pictures these people might have had taken always showed them in their best clothing (Volo and Volo 2004, 163).

FOOD AND DRINK

Food Preservation

Despite movements during the period toward modern foods, the single most important controlling factor of diet remained the food that was available. For most people, the majority of fresh food choices were governed by regional and seasonal availability. Certainly a person's economic situation provided the means for wider choices, but even these were limited. The storage of food in the mid-nineteenth century was a problem for everyone, regardless of economic status, and this reality colored the types of foods that people ate, how they were prepared, and their very quality. In addition to recipes for cooking and suggestions on maintaining the household, books like *Miss Beecher's Domestic Receipt-Book* (1850) invariably contained suggestions on how to make slightly spoiled foods palatable. "If meat begins to taint, wash it and rub it with powdered charcoal and it removes the taint." To restore rancid butter, Miss Beecher advised putting "fifteen drops of chloride of lime to a pint of water, and work the butter in till every particle has come in contact with the water" (Volo and Volo 2004, 165) (Beecher 1850, 30–31, 286).

Many foods, such as grain, root crops, and cooked and smoked meats, would last for a reasonable amount of time if kept in a cool, dry place. This was not a major problem during the winter months when the temperature and relative humidity were low, but hot and humid weather posed a significant problem, especially in the South with its difficult climate. One of the earliest solutions to keeping food from spoiling during warm weather was the icehouse. Originally, farmers used axes and long saws to harvest ice. The ice was cut from frozen ponds or lakes in large blocks. This could be an individual or community operation in rural regions, but there were a number of ice companies that hired large crews to cut ice and transport it to the cities and commercial storage facilities (Volo and Volo 2004, 165–66).

Regardless of its source, ice was most often stored in wooden or brick structures known as icehouses, which were usually constructed partially below ground level or into a bank of earth or cliff side. The temperature a few feet into the ground rarely becomes warmer than about 45 degrees Fahrenheit even on the warmest days. Icehouses were owned by individuals or were cooperatively owned by a group of farmers living in close proximity. Most icehouses were located near a pond or other source of quiet water where thick ice was likely to form and a minimum distance was needed for transportation. Licenses were issued to local communities to cut ice from frozen canals as early as the 1840s. It could then be moved many miles by sledge along the frozen canal with little effort. The ice was usually cut in late January or early February, when it was thickest, and brought to the icehouse where it was stacked in layers with spaces between filled with sawdust or straw to prevent melting and to keep the cakes from freezing into a solid block. Once the structure was filled, the top layer of the ice was covered with a canvas tarp and sawdust or straw for insulation. Melting in the icehouse ranged from 25 percent to 50 percent annually, but the ice could last through the following October if conditions were favorable. By the dawn of the Civil War, the icehouse had become an indispensable component on the rural farm.

Thomas Moore patented the first domestic icebox in 1803. The icebox gave individual homes and city residences a means of keeping food cold. Fresh meat, dairy products, and perishable fruit could be kept in good condition for much longer if kept cool. Household iceboxes, many of which were homemade, consisted of a wooden box inside another, separated by some insulating material, with a tin container at the top of the interior box. The exterior of the boxes were made of oak, pine, or ash wood and they were lined with zinc, slate, porcelain, galvanized metal, or wood. Charcoal, cork, flax straw, ash, or mineral wool provided the insulation between the walls. Irregularly shaped ice blocks were sold to consumers in baskets. Even with the icebox, the frozen blocks would only last for about a day. Boston families could obtain 15 pounds of ice per day from an iceman for two dollars a month just prior to the Civil War. By 1850, *Godey's Lady's Book* called the icebox a "necessity of life" (Volo and Volo 2004, 166).

In 1825, Frederick Tudor and Nathaniel Wyeth solved the problems of preserving ice and made ice harvesting a commercial interest. Commercial ice harvesting was conducted in the months of January, February, and March in the New England and mid-Atlantic states. Holes would be driven into the ice to determine its thickness, which varied from as little as 6 inches to as much as 30. After clearing the ice of any snow cover, rough ice would be planed. The field was then marked off in squares using a narrow blade, which was steered by plow handles drawn by a horse. An ice cutter, which cut approximately two-thirds the depth of the ice, was then employed to cut the ice into sheets of approximately 12 blocks. The sheets would then be channeled to the edge of the pond by long-handled ice hooks, and from there they would be transported to the storage facility. An icehouse that could hold 25,000 tons of ice would require nearly 100 men with 10 to 12 teams of horses to fill it. The entire process would usually take 15 to 30 days. Ice was not only provided to city residents in the North, but it was also shipped to southern cities and even to the West Indies. Between the 1825 and 1860, New Orleans alone increased its demand for ice 70-fold. In the 1860s, a rudimentary refrigeration system was invented, but American ships were carrying ice to such faraway places as Calcutta and Bombay in India for another 40 years (Volo and Volo 2004, 166–67) (Giannitti 1994, 148) (Root and de Rouchemont 1976, 148) (Rowe 1948, 207–20).

Modern Advancements

By midcentury, the railroads had become the prime cause of increasing the diversity of food for the American table. Perishables such as milk, oysters, and lobsters were transported by rail to urban areas in large cars filled with ice. The railroad not only augmented the diet, it also served to improve the quality of the food that was eaten. Beef was fatter, more tender, tastier, and less expensive. The cattle no longer were driven to market on hoof, and hence, they developed less muscle. The cattle were fed on grain that was also shipped via the railroad, thus improving the flavor. Finally, the entire cost was reduced because there was less weight loss between pasture and market. A similar situation arose with pork. Prior to railroad transportation, a desirable breeding characteristic among hogs was their ability to walk to market. This made long-legged varieties superior to short-legged ones. With the advent of rail shipping, breeders began to focus on more portly hogs and tastier meat (Volo and Volo 2004, 167).

The processing and preservation of food had always been a domestic activity, until Frenchman Nicolas Appert invented vacuum-packed, hermetically sealed jars early in the nineteenth century. In 1818, Peter Durand introduced the tin-plated can to America. The following year, Thomas Kensett Sr. and Ezra Daggert began canning oysters, fruits, meats, and vegetables in New York. In 1825, Kensett filed the first American patent for tin cans, but it was not until 1839 that tin cans came into widespread use. In 1821, William Underwood, who would go on to be famous for canned meat spreads, established a canning plant in Boston. He canned a variety of vegetables, fruits, and condiments, producing grape and mushroom catsup, jams and jellies, and mustard. In 1849, Henry Evans was granted a patent for a machine that limited the amount of hand labor needed to produce tin cans. It increased worker production from 5 or 6 cans an hour to 50 or 60 per hour, stimulating the processing of food as a commercial endeavor. Lobster and salmon were the first foods to be commercially canned. The canning of corn, tomatoes, peas, and additional varieties of fish rapidly followed. Gail Borden obtained a patent for condensed milk in 1856, and although his earlier attempts at canning were less successful, the condensed milk met with great success (Volo and Volo 2004, 167–68).

By 1860, five million cans a year were being produced. Canned foods were welcomed because not only did they permit consumers to eat out-of-season products but they also provided a certain consistent quality. Americans living in isolated western territories particularly welcomed the profusion of canned foods. The line from the song, "My Darling Clementine," which describes Clementine's footwear as "herring boxes without topses," refers to the oval-shaped fish tins that were plentiful in mining towns (Volo and Volo 2004, 168).

Putting Up the Harvest

Food preservation was an essential household activity. The harvest season came but once annually, and if a family were to live comfortably through the year, careful attention had to be paid to putting up harvest surplus until the next growing season. Families generally ate well through most of the winter as the household was still enjoying the abundance of the harvest. Spring and even early summer were generally the hardest times. Fresh produce was not yet up and stored foods were often becoming limited. Catharine Beecher cautioned housewives, "One mode of securing a good variety in those months in spring when fruits and vegetables fail is by a wise providence in drying and preserving fruits and vegetables [in the fall]" (Volo and Volo 2004, 168) (Beecher 1850, 224).

Produce was preserved by a number of methods, and much of it was stored in crocks and jars. Instructions for sealing these vessels included a number of methods for a variety of containers: "[S]oak a split bladder and tie it tight over them [jars]. In drying, it will shrink so as to be perfectly air tight." "[C]over each tumbler with two rounds of white tissue paper, cut to fit exactly the inside of the glass." "[S]ecure [jars and crocks] with paper dipped in brandy and a leather outer cover." Finally, "cement on the covers [of stone jars] with a composition of bees-wax and rosin melted together, and thickened with powdered brick dust" (Volo and Volo 2004, 153) (Leslie 1999, 238, 264, 405–6).

Hundreds of men and women obtained patents for jars that would ease these time-consuming processes. Perhaps the most famous of these was John Mason who patented his Mason jar in 1858. These threaded glass jars had zinc lids with threaded ring sealers. Newspapers often carried notices of patent jars for sale. One such ad boasted "Tomatoes, green corn, peaches or any other fruit or vegetable may be preserved without sugar, by using Spratt's Patent Cans, which are acknowledged to be the only reliable self sealing cans to market." Immediately below this statement followed another notice that asserted, "Few things will be found more delicious in Winter than finely flavored apples and pears, kept fresh in 'Arthur's Self-sealing Cans and Jars.' Let every housekeeper try a dozen or two.... She will thank us for our advice next Christmas if she follows it." Jars such as these were a welcome improvement for both city and rural homemakers who had to preserve nature's bounty until the next harvest season (Volo and Volo 2004, 169) (*New York Times* 1857, 5).

Food Attitudes

Modern issues of vitamins, salt, fiber, and fat content were virtually nonexistent for most people during the antebellum period. A few groups emerged during this time urging people to refrain from eating meat or to increase grain consumption, but generally their followers were thought to be eccentric by most Americans. Some women's magazines and receipt books did urge balance and moderation in diet. *Peterson's Magazine* contained the following statement on corpulence: "Dr. Radcliffe recommends that the mouth should be kept shut, and the eyes should be kept open; or, in other words, that corpulent persons should eat little food, and that the quantity of sleep should be diminished. These precautions may be followed with discretion, but it may be dangerous to carry them too far." Most meals at this time contained meat, which was likely to be high in fat content, and bread in one form or another. Frances Trollope, a visitor to the United States in the 1830s, was shocked by the American diet. She remarked on the extraordinary amount of bacon and other meats eaten in American homes. "Ham and beef steaks appear morning noon and night." Equally astonishing to her was the way eggs and oysters, ham and apple sauce, beefsteak and stewed peaches, salt fish and onion were eaten in combination (Volo and Volo 2004, 169) (Shep 1987, 155) (Merrifield 1861) (Stewart 1975, 202).

Common Foods

Pork was the most common kind of meat consumed, particularly in the southern diet. Pork might be served three times a day in some households without engendering comment, but it was not likely fresh pork. Salt pork and smoked pork were the staple varieties during most of the year except during the harvest season. The abundance of pork was mainly due to the fact that pigs were relatively easy to maintain. They required little space and tolerated a wide variety of foodstuffs, including leavings from household food preparation. Pigs did not have to be put to pasture and consumed less feed than cattle to add the same amount of weight. They could be, and often were, set to fend for themselves in the brush along the margins of the family farm (Volo and Volo 2004, 169–70).

Pork could be easily preserved in a number of ways, including pickling, salting, and smoking. Salting and drying retarded the growth of bacteria, as did pickling, smoking, and sugar curing. It was a common practice among farmers' and upper-class planters' wives alike to sell their cured hams as well as surplus lard, butter, and eggs.

In 1856, the mistress of a Georgia plantation recorded the selling of 170 pounds of ham. James Fenimore Cooper summed up the feelings of many in *The Chainbearer* (1845) when he wrote: "I hold a family to be in a desperate way when the mother can see the bottom of the pork barrel. Give me children that's raised on good sound pork afore all the game in the country. Game's good as any relish and so's bread; but pork is the staff of life" (Volo and Volo 2004, 170) (Cooper 1970, 97).

Beef was popular in the North especially after the expansion of the railroads to the West. With his commitment to cash crops such as tobacco and cotton, the southern planter was not inclined to set aside large portions of land for the grazing of cattle. Many households preferred their beef relatively fresh. During the deep winter, cuts of beef were stored for months in barrels packed with snow. "Hung beef" was another preference where the beef would be hung for several weeks in a dry place to allow it to age. Beef could be preserved by drying or smoking or in brine, but it was not as versatile as pork. Most farmers did keep enough cows to provide their own supply of dairy as well as some beef in the form of male calves.

Lamb was eaten less often, but it was popular, particularly in Kentucky, where it remained a mainstay of the local diet. Lamb was only available in the spring and early summer. Once the lamb matured, its meat, now known as mutton, proved to have a strong flavor that was not favored by the American palate. The main disadvantages of mutton were that the animal was more valuable as a source of wool than of food and that the meat was not easily preserved (Volo and Volo 2004, 170).

Chickens were also an important source of meat. Once again, they required little space but were difficult to preserve. Like other domesticated fowl, chicken was generally eaten fresh. Chickens had the additional appeal of being egg producers while they lived. Eggs were another good source of protein. Eggs were preserved in several ways. Receipts instructed homemakers to "pack them in fine salt, small end down . . . [or] pack them small end down, and then pour on them a mixture of four quarts of cold water, four quarts of unslacked lime, two ounces of salt, and two ounces of cream-tartar." They could be "preserved for two or three months by greasing them all over, when quite fresh, with melted mutton suet, and then wedging them close together [the small end down ward] in a box of bran or charcoal." Hard-boiled eggs were sometimes pickled in vinegar (Volo and Volo 2004, 170–71) (Beecher 1850, 206–7).

In the South and rural areas, hunters would supplement the cuisine by bringing home such victuals as geese, rabbits, squirrels, wild turkeys, partridges, pheasants, deer, and reed birds. The meat supplied in this manner was particularly important for poorer families. Even youngsters of 10 or 12 might be experienced enough with firearms not to waste a shot in haste. Defending against predators alone made knowledge of firearms and their use imperative, and it helped to fill the larder in times of want (Volo and Volo 2004, 171).

Fish and seafood were eaten in abundance in shore communities. Relating a visit to the island of Nantucket, Herman Melville's Ishmael observed, "Chowder for breakfast, and chowder for dinner, and chowder for supper, till you began to look for fish-bones coming through your clothes." Freshwater fish included bass, cod, sturgeon, pickerel, perch, pike, whitefish, and catfish. Fish could be salted or smoked but much of it was eaten fresh or made into chowder or stews. Oysters were extremely popular. They were eaten fresh but were also pickled and canned. Oysters were also made into catsup. Catsup was the general name for a paste that was bottled and used as a sauce. Lobster and anchovies were also made into catsups (Volo and Volo 2004, 171) (Tanselle 1983, 214).

Salt

As can be seen from the previous discussion, salt was indispensable to the rural family. Besides its use in preserving foods, heavy doses of salt were needed to maintain the health of horses, cows, and other livestock, and for use in tanning leather. Common salt could be mined or retrieved by evaporating seawater. The North relied extensively on the salt works at Onondaga Lake near Syracuse in New York State for this important substance. There, the brine (saltwater), which welled up naturally from the floor of the lake, had provided an extensive source of salt made by evaporation for decades. Even Native Americans had used the site to provide themselves with salt. More than nine million barrels of salt, worth in excess of $30 million, were produced in New York State annually in the 1850s. In 1860, a new source of salt was found west of the Appalachian Mountains at the Saginaw River site in Michigan. This resource yielded more than 500,000 barrels of salt annually for the residents of the Ohio Valley and Great Lakes region. Previously, residents of the region had relied on a small supply of salt laboriously boiled from the mud of salt licks. So successful were the commercial domestic sources that the North did not need to import any foreign salt (Fite 1976, 26).

Southern salt works were not nearly as productive as those that served the North. Besides hundreds of coastal evaporating operations that utilized seawater, there were only five principal southern sources of salt located in Louisiana, Alabama, Virginia, and Kentucky. The major production centers, making 3,000 bushels of salt a day, were in the Kanawha Valley of western Virginia and at Saltville, Virginia. Salt brine was pumped up from among the salt-bearing layers beneath the earth and air-dried until it became a thick white sludge. Completely drying the salt at its place of origin was found to be inefficient and uneconomical. Most of this salt was transferred to railcars for transportation to northern and southern cities. On the eve of the Civil War, the southern government apprehended a major shortage of salt (Volo and Volo 2004, 171–72).

Milk Products

Dairy products were difficult to keep in the warm southern climate. Milk provided an inviting medium for bacteria, a very real problem in an age when unsanitary conditions abounded. A visitor to the South in 1838 reported that milk was a rarity and that she found it plentiful only in Kentucky. Cheese also suffered in the South due to the presence of high humidity. Making hard cheese was a good way to preserve dairy products for long periods, and those in northern climates commonly did so. In the South, the only cheeses readily available were simple cottage cheeses and cream cheeses, which did not require the long curing of hard cheeses. Some hard cheeses were imported and could be found in coastal cities (Volo and Volo 2004, 172–73).

In 1851, Jesse Williams of New York revolutionized commercial cheese making. He began to purchase milk from other farmers. By combining the milk and producing large cheeses, he could achieve a uniform taste and texture. Up until this time, commercial cheese makers would buy up batches of cheese curd from farmers to make into cheese, but the quality and taste varied greatly. Initially Williams's cheese factory would produce four cheeses daily, each cheese weighing 150 pounds. This "store cheese" quickly became popular, and central New York, Vermont, and New Hampshire quickly became cheese-making regions (Volo and Volo 2004, 173).

Greens and Root Crops

Vegetables were eaten fresh in season, and in the very Deep South were even available during the winter. Vegetables such as beets, cabbage, carrots, cauliflower, onions, parsnips, potatoes, radishes, rutabagas, sweet potatoes, turnips, and winter squash were stored in root cellars, where the climate allowed. The optimum temperature for the storage of root crops ranges between 50 and 55 degrees. This is fairly easy in the summer and early fall but could be most difficult during cold northern winters. Root cellars were insulated with straw and an insulating layer of snow was welcome. In some cases certain vegetables were packed in straw and stored in barrels. The straw acted as a barrier to prevent the spread of spoilage to the entire barrel. Carrots were often buried in sawdust boxes. Other vegetables such as corn, beans, and peas were dried and used in cooking. Onions that were harvested when their necks were long were braided and hung in the cellar. Green corn was preserved by turning back the husk leaving only the last, very thin layer and then hanging it in the sun or a warm room to dry. When it was needed for cooking, it was parboiled and cut from the cob. Sweet corn was parboiled, cut from the cob, dried in the sun, and stored in a bag that was kept in a cool, dry place. Sweet corn was also dried in the husk and then buried in salt. String beans, squash, and, in the South, okra were strung on thread and hung to dry. String beans were strung whole, and other produce was sliced thinly and dried in strips. Cabbage was made into sauerkraut. Cauliflower, cucumbers, green peppers, mushrooms, onions, red cabbage, string beans, and tomatoes could be pickled. Sometimes, assortments of vegetables were pickled together. In addition to those just mentioned, carrots, radishes, cherries, green grapes, and nasturtiums might also be included. Vegetables could also be preserved by making them into catsups and relishes. Mushroom, tomato, and walnut catsups were popular (Volo and Volo 2004, 173–74).

Southern cooks seemed to have especially favored fresh greens as they are frequently mentioned in diarists' accounts. Some slave owners encouraged their slaves to grow their own vegetables to supplement the basic diet of cornmeal, salt pork, and sweet potatoes provided to them. It was observed by at least one man that the addition of fresh vegetables seemed to lessen disease. During the winter, a small supply of vegetables could be grown in hot frames that utilized the heat of manure and sunshine to keep temperatures warm enough to produce plants year round as far north as Virginia (Volo and Volo 2004, 174).

Fruits and Berries

Although most fruits and berries were made into jellies, jams, and marmalades, or preserved in sugar syrup for off-season consumption, they were also eaten fresh when seasonally available. Apples, peaches, and pumpkins could also be sliced thinly and dried. Peaches and plums could be what was called "half dried" and packed closely in stone jars with a thick layer of brown sugar in between them. Cherries were dried whole. Apricots, cherries, grapes, and peaches were sometimes preserved in brandy. Some fruits, mainly apples and peaches, were mashed, boiled, skimmed, and dried into what were called "leathers," which were stored in boxes. Apples and pumpkins were also stored whole in barrels much like vegetables. Apples were frequently wrapped in newspaper prior to being placed in the barrels. Apples were also made into apple butter, a seasoned saucelike condiment that could be spread on bread. Squashes and pumpkins were also preserved whole. While still on the vine, they were placed on boards to keep them off the ground. At harvest, the stems would be cut long and tied off at the ends. They were then cured in the sun before being stored indoors (Volo and Volo 2004, 174).

Bread

American housewives had extreme pride in their bread making. Catharine Beecher devoted an entire chapter of her book *Miss Beecher's Domestic Receipt-Book* to bread making. She counseled, "A woman should be ashamed to have poor bread, far more so, than to speak bad grammar, or to have a dress out of fashion.... When it is very frequently the case that a housekeeper has poor bread, she may set herself down as a slack baker and negligent housekeeper." She reminded housewives to be "aware of their responsibility in reference to the bread furnished to their family. As this is the principal article of food, there is no one thing on which the health of a family, especially young children, is more dependent."

Commercially produced bread was one area in which modern convenience was strongly resisted until the early years of the following century. Many believed like Beecher that "Baker's bread [was] often made of musty, sour or other bad flour, which is made to look light, and the bad taste removed by unhealthy drugs. Of course, to the evil of unhealthy flour, is added unhealthy drugs, and there is no mode of discovering the imposition" (Beecher 1850, 227, 239–31).

Beverages

From colonial times most meals were served with beer or cider. Rural housewives brewed what was known as small beer "every week or so" and it was consumed shortly after brewing. Receipt books contained recipes for spruce beer, ginger beer, sassafras beer, and molasses beer. Strong beer was brewed annually in October from roasted malt barley and hops and in most cases was made by those with expertise in the craft.

English brewing techniques did not translate well to the humid American climate. Wild yeasts were often picked up from the air and ruined the taste of the product. The influx of German immigrants in the second quarter of the nineteenth century brought new brewing methods that yielded better beers and ales.

The Eagle Brewery, a commercial operation later to be known as the Yuengling Brewery, opened in Pennsylvania in 1829. Many others soon followed. During the period, beer became an increasingly more popular public beverage choice, and beer gardens opened outside large cities attracting both immigrant and native-born citizens. The beer garden was more than a place to drink under the shade of a tree; it was a social center. Some places were very fancy and built ponds or offered entertainment. By 1850, 431 breweries were producing 750,000 barrels of beer. It was 10 years later that the number of breweries grew to 1,269 and were producing over 1 million barrels of beer, 85 percent of which was consumed in New York and Pennsylvania.

Cider was an excellent way to preserve the apple harvest. The liquid from the pressed fruit was allowed to ferment naturally in the cellar until it was mildly alcoholic. Hard cider that was served in taverns had a slightly higher alcohol content because sugar was added during the fermentation process (Volo and Volo 2004, 175).

Fruit wines were also made in the home. Receipt books often contained recipes for blackberry, blueberry, currant, elderberry, gooseberry, and raspberry wines. Shrubs and bounces were also made from fruit harvests but required the infusion of a brandy or whiskey. Nonalcoholic versions of these fruity beverages were also made. Currants, cherries, and fox grapes were commonly used in these recipes. Commercially produced wine was generally found only on the tables of the wealthy because tariffs added to already high import costs. Commercial wine-making efforts using European grapes met with repeated failure. There were some successes with native grapes such as the Catawba. German vintners from the Rhine Valley used Catawba grapes to make wine on the islands of Lake Erie and in the Ohio Valley. Lawyer Nicholas Longworth planted Catawba grapes in Cincinnati in 1825. By 1842, he had planted 1,200 acres and had produced the country's first sparkling wine. By the late 1850s, Ohio was the leading wine-making state until the vines were destroyed by disease shortly before the Civil War. California made wines prior to the gold rush, but it was not until 1857, when Agostin Haraszthy successfully planted classic European grapevines that the roots of California wine growing really began (Volo and Volo 2004, 175–76).

Traditionally, Americans drank a good deal of whiskey and other hard liquors. The rate of heavy drinking in the 1820s was much higher than today. Men of all social classes met regularly for a friendly drink in the local tavern. On Sunday, taverns often opened during the noon hour so that men could get a drink before returning for the afternoon service. Tavern keeper Ezra Beaman of West Boylston, Massachusetts, kept a detailed record of the food and drink purchased during the 1820s and 1830s. He kept his bar well supplied with brandy, Holland gin, and New England rum. For those who preferred milder alcoholic choices, there was Lisbon wine, strong beer, and hard cider. Popular drinks at the time included flips, slings, and toddies.

As attitudes changed and the temperance movement took hold, consumption of strongly alcoholic beverages declined. Some motion toward temperance began in the eighteenth century, but the movement truly became aggressive in the nineteenth century. Activists began demonstrating and demanding legislative action. Supporters of the movement wanted new rules for American behavior that made public drinking less acceptable and generally restricted access to liquor in many states. In 1829, the American Temperance Union was created and membership quickly climbed to 100,000 members. By 1833, membership in the nation's 5,000 temperance societies reached 1.25 million. In 1846, Maine passed a prohibition law. In 1852, Vermont, Massachusetts, and Rhode Island followed suit. Prohibition was voted for in Michigan in 1853 and began in Connecticut in 1854. Many of these laws were repealed during the wartime turmoil of the 1860s (Volo and Volo 2004, 176).

Many country innkeepers gave up serving liquor to become temperance barrooms that served coffee or lemonade. A number of New England towns had a Temperance Hotel as well as a traditional tavern. Beecher even included a chapter titled "Temperance Drinks" in her receipt book, which contained recipes for sarsaparilla mead, effervescing fruit and jelly drinks, and ginger beer. She introduced the section with an explanation of various positions held by temperance supporters that ranged from those who "will not use any kind of alcoholic liquors for any purpose [and] such [who] will not employ it in cooking, nor keep it in their houses." To those who shared Beecher's more moderate view on alcoholic consumption, Beecher said that she thought "it proper to use wine and brandy in cooking and occasionally for medical purposes." Beecher further speculated that "the cause of temperance [would] be best promoted by going no further" (Volo and Volo 2004, 176–77) (Beecher 1850, 183).

Beginnings of Modern Snacks

Mineral springs abounded in many regions and Americans had long believed strongly in the health benefits of "taking the waters." Pharmacists reasoned that they could improve upon the curative powers of the waters by adding a variety of natural ingredients such as birch bark and dandelion. The flavors that emerged as most popular were ginger ale, root beer, sarsaparillas, lime, and strawberry. Pharmacists and scientists continued experimenting with the natural fizz of some waters and developed a way to artificially carbonate water. By the 1830s, both artificial and natural mineral waters were welcomed as refreshing and healthy beverages.

French-fried potatoes had been an American favorite ever since Thomas Jefferson brought the recipe back from France and served them at his home in Monticello at the turn of the century. They were on the menu at the stylish Moon Lake Lodge in Saratoga Springs, New York, in 1853 when a dinner guest complained that they were cut too thick. Chef George Crumb prepared a thinner batch and presented them to the patron, who still found them objectionably thick. Crumb returned to the kitchen, planning to spite the complaining guest by making a batch so thin and crisp that they could not be skewered with a fork. To Crumb's amazement, the diner was delighted and other guests began to ask for the crispy potato chips. They were added to the menu as "Saratoga Chips," a house specialty, and soon thereafter were sold locally in small packages.

The graham cracker first made its appearance as a health food. Originally, the unsalted, unleavened biscuits of whole grain flour were touted by New England preacher and self-proclaimed nutritionist Sylvester Graham in the 1830s. Graham encouraged the use of whole grains in baking and advised homemakers to boycott commercially baked bread. At a public appearance in Boston, a group of his supporters dumped slacked lime on a group of resentful bakers who assailed the gathering. The movement had strong supporters in certain parts of the country and certain stores carried Dr. Graham's flour, bread, and crackers (Volo and Volo 2004, 177).

The early Dutch settlers and the Pennsylvania Germans introduced doughnuts to America. The deep-fried cakes were a special treat on Shrove Tuesday, prior to the Lenten fast. The inclusion of a hole in the center is said to date back to 1847 when Hanson Gregory of Maine complained that his mother's doughnuts were raw in the middle. He tried poking holes in the center of her next batch and liked the results, and the modern doughnut was born (Volo and Volo 2004, 178).

COOKBOOKS

It was not until 1796, when Amelia Simmons published *American Cookery,* that the first cookbook written by an American author was published. Prior to that, American cooks referred to English works for culinary guidance, and the few cookbooks that had been published in the colonies were wholesale reprints of older English works. Although certain American ingredients such as turkey, tomatoes, chocolate, and vanilla had made their way into English works by the mid-eighteenth century, their appearance in cookbooks was in no way in deference to American tastes. It merely showed the evolution of the English epicure. Simmons's book started a vogue for recipes in the United States. Over 160 receipt books, as they were called, appeared during the first half of the nineteenth century. Receipt books contained far more than recipes. They were commonly divided into three sections, cooking, medicine, and household management. These books provided information on how to deal with household emergencies and day-to-day trifles. Some contained philosophical guidance on household management.

One of the most prolific food writers of the antebellum period was Eliza Leslie. Her first book, *Seventy-Five Receipts for Pastry, Cakes and Sweetmeats*, printed in 1828, was so popular that it was even included as an addendum to other nineteenth-century cookbooks. Her *Directions for Cookery,* which was published in 1837, is considered to be the most popular cookbook of the nineteenth century, with 60 editions published by 1870. Leslie followed these works with the *Lady's Receipt-Book* in 1846 and the *Ladies New Receipt-Book* in 1850. Other popular receipt books of the period included Lydia Maria Child's *The American Frugal Housewife* (1832), Sarah Josepha Hale's *The Good Housekeeper* (1841), and Catharine E. Beecher's *Domestic Receipt-Book* (1846) (Volo and Volo 2004, 178).

Just as the South had developed a separate culture, it evolved its own particular style of cooking that was recorded in its cookbooks. In 1824, Mary Randolph published *The Virginia House-Wife,* which is said to be the first regional American cookbook. A cousin of Thomas Jefferson, Mrs. Randolph represented the old Virginia aristocracy. Lettice Bryan's *The Kentucky Housewife* (1839) came from an area much more rural. *The Carolina Housewife,* written by Sarah Rutledge in 1847, included numerous recipes for rice breads, cakes, and pilaus (rice-based dishes). Eliza Leslie's *Miss Leslie's New Cookery Book,* published in 1857, was widely used throughout the South (Volo and Volo 2004, 178–79).

DINING OUT

Nearly all Americans in the early nineteenth century ate their meals at home or in the homes of their hosts. In rural areas, eating a meal in public was an unusual event. Public dining was offered only in taverns or ordinaries with the exception of community outdoor dinners on special occasions such as the Fourth of July. Travelers were forced by circumstances to take their meals at taverns and inns. Although local men also frequented these establishments to drink, they generally did not eat there unless the establishment had been catered for a dancing or sleighing party or for a ball (Volo and Volo 2004, 179).

Meals at these establishments were not brought on demand, but were served only during specified times. Englishman Isaac Wald complained, "At each house there are regular hours for breakfast, dinner and supper and if a traveler arrives somewhat before the appointed time for any one of them, it is in vain to call for a separate meal for himself; he must wait patiently 'til the appointed hour, and then sit down with the other guests that may happen to be in the house." The food served in taverns could be considered home cooking. It was unpretentious and very much in the style of the region. Both food quality and portion sizes varied greatly. Perhaps because diarists seldom recorded average or acceptable meals or innkeepers took advantage of travelers with no alternatives, journals abound with reports of horrid dining experiences. After eating at a tavern in Shelborne Falls, Massachusetts, in 1838, Nathaniel Hawthorne remarked that the meal "was about the worst [he] ever saw . . . hardly anything . . . to eat . . . at least not of the meat kind." Baynard Rush Hall detailed his breakfast at a stagecoach inn while traveling through the Midwest in the 1830s: "[T]he coffee was a libel on diluted soot . . . Eggs, too!—It certainly was not without hazard to put them in the mouth without first putting them to the nose . . . a sausage coiled up like a great greasy eel [and] hot rolls . . . a composition of oak bark on the outside and hot putty within" (Volo and Volo 2004, 179) (Larkin 1999, 10) (Hall 1916, 27).

Although some offerings were incredibly meager, Hawthorne recalled seeing a group of young college students being served what was typically a children's breakfast of bread and milk "with a huge washbowl of milk in the center, and a bowl and spoon set for each guest." Other meals were reported as being quite substantial. An 1832 diary claimed that a full-scale New England breakfast at an inn included ham, beef, sausages, pork, bread, butter, boiled potatoes, pies, coffee, and cider (Volo and Volo 2004, 179).

By the 1820s, many taverns had become hotels, which offered guests breakfast and supper. What could be termed the first luxury hotels first came about in 1829 when the Tremont House opened in Boston. This was followed in 1836 by the Astor House in New York City, which was considered by many to be the best hotel in the country at the time. Initially, hotels continued the custom of supplying set meals at fixed hours for all paid guests whether they chose to consume them or not. In the 1830s, the new, larger eastern hotels began offering table d'hôte meals from a menu of items. This became a common feature in major hotels by the 1850s. French cuisine was frequently featured, although a number of establishments offered American-style meals (Volo and Volo 2004, 179–80).

A growing number of city restaurants serving midday meals to businessmen began to open, and they began to compete with the high-quality cooking found in the hotels. Brothers Giovanni and Pietro Delmonico opened an ordinary cafe in 1827. In 1830, they opened up a "Restaurant Francais" next door. Delmonico's was soon recognized by the New York elite for its culinary excellence. In 1826, the Union Oyster House restaurant opened its doors in Boston. At this time, the nation was seemingly in the throes of an oyster craze. Virtually all principal towns and cities had some type of oyster parlor, oyster cellar, oyster saloon, oyster bar, oyster house, oyster stall, or oyster lunchroom. The owners of the Union Oyster House installed the fabled semicircular oyster bar where Senator Daniel Webster was a regular customer. Webster had his daily tall tumbler of brandy and water with a half-dozen oysters. He seldom had fewer than six plates. In addition to oysters, clams and scallops were served in season. The Union Oyster House is also famous for having been the first place where the commercially produced wooden toothpick was used. Charles Forster of Maine imported the picks from South America and hired young men from Harvard to dine at the Oyster House and to ask for toothpicks as a promotional gimmick. The toothpick fad quickly spread beyond Massachusetts, and it was not unusual to see scores of young dandies with the slim stick of wood protruding from their lips in cities everywhere (Volo and Volo 2004, 180).

COOKING APPLIANCES

Although an iron stove had been invented by Benjamin Franklin in the eighteenth century as a room heater, cast-iron ranges for cooking were a rarity in homes until the 1830s. Until this time, the stone or brick fireplace dominated the kitchen, and it remained common in southern kitchens until after the war. Around 1830, economical iron stoves were being produced as factory-made commodities for the home. These early iron stoves, like the pots and kettles used on them, were cast directly from the raw molten iron as they passed from the smelting furnaces to the sand molds on the ground in a process that had its technological roots in the fifteenth century. The impurities left in the iron during this process caused stove parts to be generally brittle and not very durable or long lasting. Jordan Mott began casting stoves from purer pig iron in New York about 1835, and experiments with cast-iron stoves continued throughout the remainder of the century with stunning results. Tinned iron stovepipes, almost identical to those used today, were also developed. Wood and coal were the principal fuels used in these stoves, but tar, sawdust, and kerosene were all tried. A gas-fired range appeared around 1850, but it was considered dangerous and was extremely expensive (Volo and Volo 2004, 180–81).

The antebellum period was a period of transition in food availability, preservation, preparation, and consumption. America was moving from a society whose diet was solely the result of domestic industry and cooked on the hearth to one that had expanded to include commercially prepared food, tinned consumables, and manufactured ranges. Industry generally took men away from the home during this period, and eating out became more than a traveler's necessity. Transportation improved and products that were once only locally available were now sent to markets across the nation. It was the dawn of the period of modern convenience and accessibility, which was to explode following the Civil War (Volo and Volo 2004, 181).

Economic Life

A NATION OF MECHANICS

Early America was deemed a nation of mechanics by the more theoretically focused scientists of Europe. The nineteenth-century sense of the term "mechanics" included artisans, craftsmen, and other persons who worked with their hands. Today we would classify them as technicians rather than research scientists. America was certainly a nation of mechanics during the antebellum period, and it continued to be so throughout the remainder of the century (Volo and Volo 2004, 41).

American inventors made the United States a warehouse of wonders for the world. While European scientists delved into the nature of matter, heat, light, or electricity, Americans were producing practical applications of these scientific principles in the form of inventions that generally helped to improve life. American inventors showed great ingenuity in the antebellum period, and important advances were made in many fields, including the development of a practical telegraph, the evolution of the mechanical reaper, the use of ether as anesthesia, and the harnessing of steam power for waterborne commerce. On the other hand, the invention of safety matches, the development of a lace-making machine, and the patenting of the attached rubber pencil eraser seemed frivolous. Yet all of these advances affected the daily lives of those in the antebellum period (Volo and Volo 2004, 41–42).

INVENTIONS

During the antebellum period it was not unusual for a person to choose a career as an inventor. Inventiveness seemed to be an American trait, and it was widely believed that any mechanical problem could be solved if one applied enough hard work and creativity to it. As early as 1820, German political economist Georg Friedrich List wrote, “There is no clinging to old ways; the moment an Americ[an] hears the word invention he pricks up his ears” (Volo and Volo 2004, 42) (Calkins 1975, 280).

As more inventors worked on a particular problem, their solutions tended to converge around the naturally correct one. This is a repetitive characteristic of the practice of engineering known as “convergent technology.” In 1838, Congress created a new patent law to deal with competing claims to inventions. Up to that time, anyone who claimed a patent received one, even if competing claims for the same invention were made. The new law established, for the first time, the principles of formal research, requiring the patent office to withhold a patent until all other prior patents had been scrutinized for the inclusion of important original ideas. Ironically, the pace of invention accelerated under the new law. Before 1838, no more than 500 patents had been granted. In the next decade alone, more than 10,000 were issued. Unscrupulous advertisers used this circumstance to advance themselves in the newspapers as agents of the Patent Office, who, for a fee, would act as “preparers of Caveats, Specificiations, Assignments, and all the necessary Papers and Drawings” so that inventors might be “saved the time and cost of a journey to Washington, and the delay there, as well as [being saved] all the personal trouble in obtaining their patents” (Volo and Volo 2004, 42–43) (Calkins 1975, 280).

LABOR

The greatest changes in employment and manufacturing prior to the Civil War were in the transition from hand labor to increased mechanization in almost every task. Household manufacturing, which was still widespread in the 1820s, declined in importance during the next four decades. Many of the items consumers once made for themselves, including basic things such as tools, textiles, and clothing, now came from factories. The craftsman, who previously made goods to the specifications of individual customers whom he knew, now enlarged his shop or took a place in a factory to turn out ready-made products for the general public. The financial capital needed for increasing mechanization caused certain geographic areas blessed with inexpensive waterpower or access to raw materials to become centers for the manufacture of specific items. Danbury, Connecticut, with its hat factories; Lowell, Massachusetts, with its textile mills; and Pittsburgh, Pennsylvania, with its iron foundries are examples (Volo and Volo 2004, 43).

Domestic manufacture remained strong in many rural areas of the country and in many industries where it was not immediately possible to apply power and machine technology to the required task. Shoemaking can serve as an example in this regard. At a time when power machinery had not yet been developed for making shoes, the process was one ruled by trained specialists who made hand-cut and hand-sewn shoes. The invention of a machine to produce small wooden pegs to attach the leather soles to the upper part of the shoe changed the way shoemakers assembled their wares. The quiet stitching of sole to upper was replaced by the dull sound of the cobbler's hammer. At the same time, sewing machine technology was successfully applied to the stitching of leather, resulting in the establishment of factories in which women sewed the uppers together and the men attached them to the lower structure of the shoe and fitted the finished product with soles and heels by hand. As a result of mechanization, there were more people involved in shoemaking than in any other industry in the nation save agriculture. By 1858, Lyman Blake had patented a sewing machine that attached the soles to the uppers mechanically, greatly facilitating the shoemaking process. This made the price of shoes, especially work shoes, much more affordable. Sizes and widths were first introduced to shoe production at this time. The general public could now buy shoes in sizes, and slave owners could provide cheaply made shoes to slaves by the barrel. Although harness and saddle making remained male-dominated crafts, the extension of power stitching to the entire shoemaking process left the traditional shoemaker with little beyond specialty work and a small repair business (Volo and Volo 2004, 43–44).

The conversion to machine operations brought many more women into the manufacturing trades and wrought changes in the relationship between labor and management that reverberate even today. The right to strike was first established by the Massachusetts State Court in 1842 when a group of mill girls in Lowell, Massachusetts, refused to return to work at their looms because of long working hours. In 1860, 800 female workers from the shoemaking factory in Lynn, Massachusetts, went on strike for higher wages. They took to the streets dressed in their best hoopskirts and carrying parasols in a March snowstorm. The strike lasted more than two weeks, and the results were somewhat ambiguous, with the shop manager being thrown into a pond. Nonetheless, as the Civil War began, many northern women were hired to make pistol holsters, riding boots, infantry shoes, cartridge boxes, and other leather items, and other women wove the cloth and sewed the uniforms for hundreds of thousands of federal soldiers on water-powered mechanical looms and sewing machines. These ladies generally filled the civilian positions of men drafted away from their trades and into the federal armies (Volo and Volo 2004, 44–45).

TRANSPORTATION

In 1800, transportation in the United States was not much different than it had been throughout the world for hundreds, if not thousands, of years. Although improvements to sailing ships over the centuries had made travel and transportation of goods easier and faster between coastal cities, inland transportation continued to depend primarily on horses or horse-drawn vehicles and boats propelled by man power (paddles, poles, etc.). For most Americans, walking continued to be the most common mode of travel (Timmons 2005, 11).

Horse-drawn carriages, wagons, or stagecoaches usually followed animal or Indian trails. Even well-traveled routes between population centers could only charitably be called roads. Various improvements were attempted, such as the so-called corduroy roads, built with a foundation of logs parallel to the path layered with smaller logs perpendicular. These logs were often covered with sand and dirt in an attempt—usually quite futile—to smooth out the ride. Later roads made of tarred planks provided a slight improvement to the comfort of a traveler. The appearance of toll roads in some parts of the country made overland travel somewhat faster and marginally more comfortable. These roads connected towns and, in the process, provided rural Americans increased opportunity for social interactions with neighbors and townsfolk (Lacour-Gayet 1969, 49) (Timmons 2005, 11).

The decisions as to where roads would be built (and, later, where railroads would be built) affected settlement patterns. Immigrants settled along main roads and railroads, while established towns bypassed by the new transportation systems often shrunk in population and sometimes disappeared altogether. A grand plan to build the National or Cumberland Road connecting the East to the interior of the country was begun in 1802 but not completed until 1852. However, by 1818 the road had connected the eastern United States to the Ohio River, and as new sections opened it became a main artery for settlers traveling west and for western farm products moving east. The difficulties facing a traveler in the United States contributed greatly to the fact that the country was still a thin strip of settled area along the Atlantic Coast in 1800 (Timmons 2005, 11–12).

A myriad of technical innovations in the nineteenth century combined to change forever the way Americans would look at travel and transportation. The perfection of steam engines allowed great improvements in transportation both over land and on the water. New methods developed to harness the power of electricity led to wondrous machines that changed the face of urban transportation. By the end of the century, the rapid development of the first automobiles formed a punctuation mark for a century of transportation advances never before seen (Timmons 2005, 12).

The Steamboat

As the nineteenth century approached, the steamboat represented the most promising advance in transportation since humans first domesticated horses. It gave rise to a new era in travel and in transportation of goods across the country and across the world. Although the steamboat eventually gave way to the railroad as the fastest and most convenient mode of transportation, its importance remains as America's initial foray into the applications of technology to transportation.

Robert Fulton did not invent the steamboat. Fulton's name is forever attached to the steamboat, however, because the American visionary was the first man to fully utilize its capabilities and to take economic advantage of those capabilities. The first Americans to build working steamboats were James Rumsey and John Fitch in the 1780s. Rumsey successfully tested a steamboat driven by jet propulsion on the Potomac River in 1786. Fitch experimented with several types of steamboats, using both paddle wheels and screw propellers for propulsion. Fitch attempted to capitalize commercially from his invention, using one of his vessels to carry passengers and freight on the Delaware River between Philadelphia and Burlington, New Jersey (Timmons 2005, 12).

Fitch and Rumsey, along with other early steamboat builders, were technical innovators who were never successful in establishing their steamboats as viable commercial enterprises. That honor falls to Fulton and his partner Robert Livingston. After years of unsuccessfully attempting to sell his ideas on steamboats, submarines, torpedoes, and other inventions to the British, the French, and the Americans, Fulton finally built and launched his steamboat in 1807. Although the vessel is called the *Clermont* by history books, Kirkpatrick Sale, in his book *The Fire of His Genius: Robert Fulton and the American Dream*, points out that Fulton actually registered his boat as the "North River Steamboat of Clermont," and referred to the boat as the *North River*. Calling the boat the *Clermont* is a historical inaccuracy that has, over a period of time, embedded itself in American history (Timmons 2005, 12–13).

Fulton's steamboat was an instant success. Not only had he surpassed his predecessors in his technical knowledge of steamboat design, but, with the help of a monopoly obtained by Livingston from the state of New York guaranteeing sole rights to steamboat navigation on the Hudson, Fulton's new steamboat proved a financial success (Timmons 2005, 13).

To Fulton and Livingston, along with a third partner, Nicholas J. Roosevelt, also goes the credit for operating the first steamboat on the Mississippi River, the *New Orleans*, launched from Pittsburgh in 1811. The ship made it to New Orleans and operated on the lower Mississippi for some time. After several setbacks, however, the partners withdrew from the Mississippi and were replaced by, among others, Henry Miller Shreve's steamboats, and others like them, which made the Mississippi the busy waterway that Americans had envisioned it would some day become. Before the appearance of the steamboat on the Mississippi and its tributaries, passengers and goods were carried down the river on various types of boats that were built to float *downstream* but, unfortunately, were not very efficient for the trip back *upstream*. Some boats, like the keelboat, could be propelled upstream by poling or by pulling on ropes from the bank. Both methods, of course, were very slow, expensive, and difficult modes of travel. Other boats were specifically built for the trip downstream and turned into scrap lumber upon arrival at their destination. The steamboat was a tremendous improvement to either of these systems (Timmons 2005, 13–14).

Although not as famous as his competitor, John Stevens probably contributed more to the technical advancement of steamboats than did Fulton. The list of innovations by Stevens and his sons, particularly Robert L. Stevens, is long. From experiments with propeller-driven steamboats to advances based on a solid understanding of the science of hydrodynamics, the Stevens family designed and built the vessels that were to become synonymous with American steamboat lore. After his father's death, Robert made many important improvements to the design of steamboat hulls and boilers. His most important contribution, however, may have been his introduction of the use of coal instead of wood to feed the boilers of his new ship, *The Philadelphia* (Timmons 2005, 14).

An important improvement to the basic steam engine design came from an American named Oliver Evans. In 1803 Evans invented a high-pressure, double-acting steam engine. It was this new kind of steam engine that powered steamboats later in the century. Fulton used a Watts-type engine in the *North River* (aka *Clermont*), but the more powerful Evans engine was needed for western rivers. In 1816, riverboats began using an Evans engine in the horizontal, rather than vertical, position. At first the piston was attached to a flywheel that turned the steamboat paddle wheels, but soon designers found they could attach the piston directly to the paddle wheels (de la Pedraja 2001, 224).

The first decades of steamboat travel, especially in the West, provided a "rough democracy of accommodations":

> There were no staterooms, and passengers bedded down on berths that folded down from the walls of the cabin. Female travelers simply slept behind a curtain. When boats became overcrowded passengers "took part in a sort of lottery" every night to determine who got the berths and who would be allotted "chairs, benches and tables" to sleep on in descending order of their desirability. On Thomas Hamilton's first night on a Mississippi steamboat, "fortune fixed me on the table, and there I lay with the knee of one man thrust directly into my stomach, and with my feet resting on the head of another." (Larkin 1988, 226–27)

Life aboard a western steamboat was generally, "heterogeneous and disorderly" with "incessant card playing" by, as a traveling minister described them, a crowd of "profane swearers, drunkards, gamblers, fiddlers, and dancers" (Larkin 1988, 226–27).

The first steamboats were not only crude and uncomfortable for passenger travel; they also often proved dangerous to the passengers. Fires, accidents involving boiler explosions, and hulls damaged by river obstacles frequently resulted in injury or death. The race to build faster steamboats and then to run them "all out" led to many careless and senseless accidents. It was not until the 1850s that the government began to regulate steamboats and their boilers in an attempt to make the vessels safer. Shreve, seeing the need to improve safety on his steamboats, designed and built a snag boat to deal with underwater obstructions. His steamboat, equipped with a specially designed bow, cleared navigation paths along the Mississippi and important tributaries, making river travel safer for everyone (Timmons 2005, 15).

It did not take long for steamboat owners to realize the economic advantages of offering comfortable, even luxurious, accommodations to their passengers. Shreve designed and built the *Washington* for service on the Mississippi, employing for the first time the philosophy that passengers could travel on steamboats in an opulent setting unlike any they had experienced. From a humble beginning just after the turn of the century, when the first steamboats carried a few passengers on hot, loud, and dangerous journeys, the steamboat quickly advanced until, in 1857, the *New World* could transport 1,000 passengers in comfort between New York City and Albany. By the 1870s thousands of steamboats carried passengers and cargo on eastern rivers, on the Mississippi, and on the Great Lakes. In addition, people were able to make the Atlantic crossing in a matter of days rather than the weeks that sailing ships took for the same trip (Timmons 2005, 15–16).

Although steamboats were viewed primarily as passenger transportation vessels, they also contributed to burgeoning trade along the river (and later canal) routes in the United States. Utilized to tow barges packed with agricultural products and mined resources such as coal, steamboats grew in size to handle increased demands for these products. Yet, in spite of the importance of faster transportation and more efficient hauling of goods, the most important long-term consequence of the steamboat actually occurred on dry land. There, settlements appeared where once there had been none, and small towns grew to become important cities flourishing on the trade supplied by the steamboats (Timmons 2005, 16).

Canal Building

In the early nineteenth century, canals quickly became vital arteries for commerce in the fledgling United States of America. With overland travel being difficult at best, American politicians, civic and business leaders, and engineers turned to canals to transport crops and raw materials east and manufactured goods west. Canals also became a preferred mode of travel for many Americans looking for a more comfortable journey than could be had over rough inland terrain. In the process, the canals came to symbolize nationalistic feelings of pride and accomplishment for a country that was only beginning to make its place in a new and changing world.

Canals have a long history, dating back to the ancient Egyptians more than three millennia B.C. Canals played an important role in Chinese and in European commerce and transportation long before the United States came into existence. In the eighteenth century, small canals began to appear in America, the first of which were used to help transport coal from mines in Pennsylvania to cities such as New York, Philadelphia, and Boston. Canal planners often sought funding from the local, state, and federal governments, but this was a time in America's history when many national leaders believed the Constitution forbade such actions by the federal government. Therefore, early canals were usually financed by a combination of private investment and state funding. The most famous and most important canal built in the United States, the Erie Canal, was built using this financial model (Timmons 2005, 16).

Suggestions for a canal across the state of New York, to connect the Hudson River with Lake Erie, first arose during colonial times. Later, such luminaries as George Washington and Robert Fulton became proponents of such a plan. However, it was not until 1817 that ground was actually broken for the long-dreamed-of canal. Over the next eight years work continued on the canal, and sections were opened for use as they were completed. Finally, in 1825, the full length of the Erie Canal was opened to traffic. Stretching across 363 miles of wilderness, the Erie Canal was 40 feet wide and 4 feet deep. Much of the credit for the canal is given to the governor of New York, DeWitt Clinton, whose vision for a canal across his state was instrumental in its completion. Often derisively referred to during construction as "Clinton's Ditch," the governor and his supporters were vindicated when the canal was completed and immediately began to turn a profit (Timmons 2005, 16–17).

The Erie Canal represented the largest construction project undertaken in the United States up to that time. American engineers, previously trained in Europe, learned their craft on the Erie project under the direction of its chief engineer, Benjamin Wright. These newly trained engineers then fanned out across the nation to build other canals and public works projects. These engineers made numerous innovations in canal building, including the design and construction of scores of locks, many with improvements made over previous designs. American engineers designed other modes of moving boats from one elevation to another on the canals. Some used lifts, operating much like an elevator, and others designed inclined planes along which the boats were pulled to the next level. A surveyor and engineer named Canvass White patented a new kind of cement vital to the building of the canal. Presaging the use of immigrants on the massive railway projects later in the century, the canals employed European, most particularly Irish, immigrants working under extreme conditions for very low wages. Thousands of laborers were used on the massive project, and many died from malaria, cholera, and other diseases (Timmons 2005, 17).

The importation of these laborers to dig the canal, and later to handle the unskilled, low-paying jobs operating the canal, led to difficulties all along the canal's length. From offending the local communities by working on Sundays to living in dirty, often temporary shantytowns, the hard-drinking canal workers—in 1835 one could find a tavern or grog shop an average of every quarter mile along its entire length—provided a multitude of threats to the middle-class inhabitants of the local towns and countryside (Nye 2003, 184).

The Erie Canal was enlarged several times over its life as more and larger vessels sought to carry goods up and down its length. It played a key role in the growth of New York cities such as Syracuse, Rochester, and Buffalo, and helped make New York City the most important port in the world. Rochester experienced such phenomenal growth after completion of the canal that a visitor described the scene as a mass of confusion where the "very streets seemed to be starting up of their own accord" and the "halffinished, whole-finished, and embryo streets were crowded with people, carts, stages, cattle, pigs, far beyond the reach of numbers." In Rochester, as in other towns in the path of the monumental canal, everyday life was forever changed (Nye 2003, 151–52).

Before the Erie Canal, it took 20 days and cost $100 a ton to move freight from Buffalo to New York City; after completion of the canal, the time and cost was reduced to 8 days and $10 a ton. By 1854, 83 percent of the nation's entire shipment of grain moved through the Erie Canal. By 1871, as the railroad began to take over as the nation's most important mode of transportation, this number had fallen to only 30 percent. However, the Erie Canal continued service well into the twentieth century (Lacour-Gayet 1969, 52) (Bauer 1988, 140).

Other major canals followed on the heels of the much ballyhooed Erie Canal. In fact, sections of the country entered into a decades-long race to build canals with the expectation of the economic impact they would have on the local areas.

A long-planned canal connecting the Susquehanna and Ohio Rivers was completed in 1834 and later linked to the Erie Canal. Whereas the Erie Canal had helped make New York City the most important port on the eastern seaboard, another man-made waterway, the Illinois & Michigan Canal, provided access to the Mississippi River from Lake Michigan and began the tremendous explosion of growth of Chicago, where the canal entered the lake. Later, railroads contributed further to Chicago's rise as the nation's "second city." When a canal was completed in 1830 bypassing rapids in the Ohio River near Louisville, navigation became possible all the way from Pittsburgh to New Orleans. The network of canals connecting the Mississippi Valley to the Great Lakes also helped cities such as Detroit and Cleveland become major centers of trade and population. Just as railroads were to do a few decades later, the location of major canals played a crucial factor in the development of population centers in the United States (Timmons 2005, 18–19).

Canals became more than just modes of transportation; they became symbols of progress. They also became tourist attractions. Families came to marvel at the engineering feats exhibited at canals throughout the country:

> The citizen who contemplated such public improvements [as canals] became aware of the power of democracy and saw himself as part of the moral vanguard, leading the world toward universal democracy. These man-made objects became national symbols. Traveling to America's natural wonders and great public works became the act of a good citizen, just as a pilgrimage to Jerusalem was the sign of a good Christian. (Timmons 2005, 19) (Nye 2003, 36)

Parades, fireworks, and other celebrations accompanied the opening of new canals as community leaders and local workers alike reveled in their accomplishments. Canals became "one of the first icons of the [American] technological sublime" (Nye 2003, 34).

While canals helped form many of the major cities in the United States, this increasing population promoted more travel along the canals themselves. The canals brought people, news, and ideas to the western settlements, in the process connecting the country in a way that many had thought impossible. The travel was not fast by today's standards. The 400-mile trip from Philadelphia to Pittsburgh took 6 1/2 days and cost about $6. If the traveler continued on to St. Louis, the trip took 13 days and cost $13. Unlike the steamboats that plied the major rivers in later decades, the canal boats were small and cramped, providing sparse, dirty, and unpleasant accommodations for the canal traveler. One magazine correspondent traveling on the Erie Canal complained of poor food, overcrowding, and unbearable mosquitoes—not a particularly pleasant way to travel (Lacour-Gayet 1969, 53) (Nye 2003, 177).

One story of a pioneer family in 1834, related by William Chauncy Langdon in his book *Everyday Things in American Life,* serves to illustrate the importance of canals to common families in the United States and also relates a certain degree of "American ingenuity" when it came to getting things done:

> A man, a Pennsylvanian, living on the Lackawanna River, whose name is lost to fame, decided, as many others did, to take his family and move out West, beyond the Mississippi. So,

> as the others did, he built himself a boat; it was like a small-sized flatboat. He put his family and all he owned aboard, and floated down the Lackawanna River. . . .
>
> They floated down the Lackawanna to the Susquehanna and down the Susquehanna to Columbia and the Pennsylvania Canal. He got his flatboat transferred to the Canal and went on by the smooth canal and up the 108 locks through the mountains (sometimes called foothills) to Hollidaysburg. Here the Lackawanna man knew he must give up his boat, sell it as lumber, and go on over the mountains, "hiring" his way from others. He probably, in looking for a purchaser for his lumber, expressed his regret at having to sell. But the canal people there at Hollidaysburg were not asleep. . . . So they made a proposition to him. Would he take a chance on letting them try to rig up a car that would carry his boat and take it in "as is" condition up the five inclined planes and down the other five inclined planes over the mountain to Johnstown? There he could slip it off the car into the canal again and he could go on without extra expense to Pittsburgh, and on a thousand miles more in his own boat down the Ohio River to St. Louis or wherever he wanted to go. The Lackawanna man said he would take the chance. He did; they did.

In spite of the vagaries surrounding this story of the Lackawanna man, this sort of travel was common to Americans during the age of canals. It inspired the canal authorities of that region to modify their equipment so that any canal boat could be "lifted out of the water, divided into sections, put on wheels, and rolled along their way over the mountain, with reverse action and reassembling at the other place." This use of inclined planes became a common method for lifting boats over higher ground to other sections of a canal (Langdon 1941, 123–24, 125).

The Great Lakes region experienced perhaps the most notable gains from being easily connected to the eastern population centers for the first time. In the meantime, the trend started by the canals to connect the Ohio Valley and Great Lakes region to the northeastern parts of the country helped to isolate the South both socially and economically from the rest of the nation and became one of the causes for the rifts developing along the North and South lines. Canals had become the first in a series of improved modes of transportation that were recognized as crucial if the expanding territories of the country were to come together as a cohesive nation (Timmons 2005, 20).

Canals were primarily nineteenth-century phenomena in the United States. From the beginning of the century, when there were only about 100 miles of canals in the country, until the end of the century, when more than 4,000 miles were in use, canals provided much-needed links to important waterways on the North American continent. The canals, useful though they were, did present certain disadvantages, especially in comparison to the coming railroads. They were limited by location, speed, and the volume of commercial and human cargo they could carry. The railroads, in contrast, could go where canals could not, at much higher speeds and with a much larger carrying capacity. By the middle of the nineteenth century the railroad had already begun the process of overtaking canals and inland waterways as the most important form of transportation in the United States (Timmons 2005, 21).

Railroads

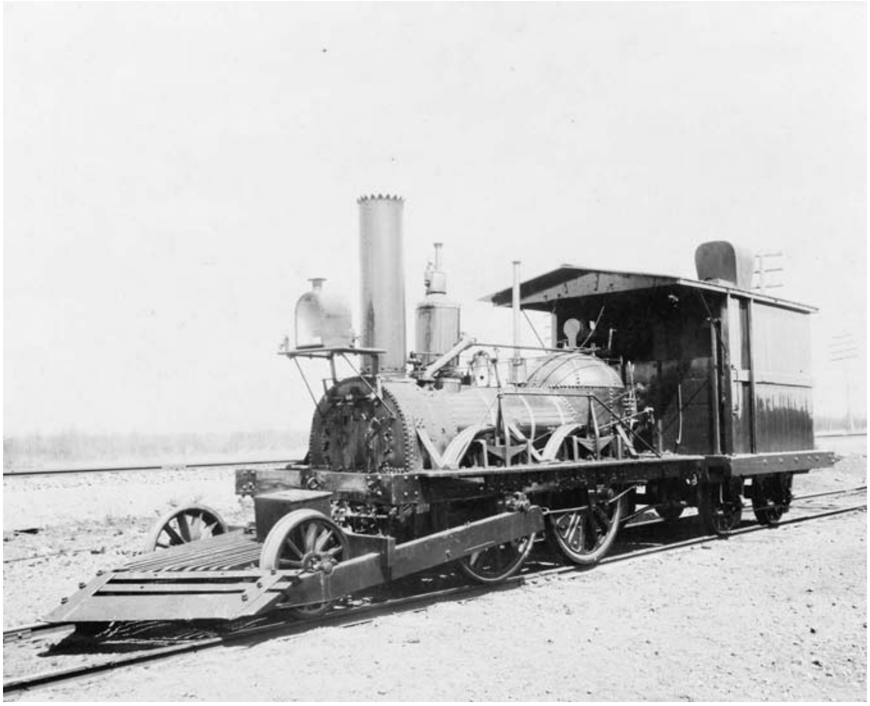
The coming of the railroads had, quite possibly, the most profound effect of all technological innovations on everyday life in nineteenth-century America. Steamboat travel was a boon to those living on or nearby major waterways, but for the growing population of Americans living in the interior of the country, far away from the ocean and from major rivers, the railroad represented the first real opportunity to travel faster and farther than their feet or horses could take them. Before rail travel, the 90-mile trip between Philadelphia and New York was accomplished partially by boat and partially over land. At best it was an arduous and sometimes dangerous trip taking an entire day to accomplish. When the railroad began connecting major cities, such trips were reduced to a matter of hours, with the added benefits of increased comfort and convenience (Douglas 1992, 1–3).

Even before the steam locomotive, rails were built utilizing cars pulled by horses or mules, or even outfitted with sails and propelled by the wind. Of course, the dream of rail travel did not become a reality until the appearance of the first practical steam locomotives. Although the steam locomotive was not invented in America (that claim goes to the English engineer Richard Trevithick), this newest form of locomotion was enthusiastically adopted by Americans and quickly adapted to the needs of the vast country. Amazingly, although the first steam locomotive did not appear in the United States until the second quarter of the century, by the end of the third quarter railroads literally crisscrossed the entire country. From its start in the 1830s, the railroad industry grew to more than 30,000 miles of track in 1860 and to more than 200,000 miles of track by the turn of the twentieth century. Such phenomenal growth forever changed life in America (Timmons 2005, 21).

One of the first Americans to envision the endless possibilities of rail travel was John Stevens, who had already contributed so much to the evolution of the steamboat. Stevens concentrated his later efforts on convincing the American government and investors of the importance of rail travel. In 1825, after years of writing letters and lobbying for his vision of modern travel, Stevens, already an old man of 76 years, laid out on his own estate a small section of track, demonstrating its effectiveness with a crudely built steam locomotive (Timmons 2005, 21–22).

John Stevens imported the first steam locomotives from England, most notably the *John Bull,* and adapted them to run effectively on American rails. Soon, however, American railroaders found that their own country presented problems not seen in England and began to develop their own track and locomotive technology. Because of the annoying and dangerous tendency exhibited by other locomotives of running off the tracks, an American inventor, John Jervis, designed an eight-wheel locomotive that handled relatively sharp curves. By the time American rails were being built over steep grades and long distances, other advances in locomotives and track construction were paving the way toward a continental system of railroads (Timmons 2005, 22).

In the late 1820s and early 1830s, railroad companies began to spring up across the Atlantic seaboard. One of the first, and even today one of the best-known, of these railroad companies was the Baltimore and Ohio (known as the B&O to Monopoly players around the world), established in 1827. The first railroads provided very limited comfort to the weary traveler. Crowded into wooden wagons connected by chains, sitting on hard seats without backs, an early trip on a railroad was sure to be uncomfortable. Add to this the fact that cars often had no windows, and it



The original "John Bull" locomotive of Camden & Amboy Railroad Company (c. 1893). Courtesy of the Library of Congress.

becomes apparent that railcars were not a pleasant place to be on a hot summer afternoon. Worse yet, if the car did have windows and open doors, dust, soot, and sparks from the locomotive provided for a more unpleasant, even dangerous, trip. One magazine article complained about the hard seats, the overcrowding, and the poor ventilation, calling the typical railroad car "a moving stable." Throw into this volatile mix other factors—a lack of reliable schedules, frequent accidents, fires started from the locomotive, washed-out bridges, breakdowns, robberies, and constant changes of cars due to nonuniform rails—and one can see that early travel on railroads could often be a very disagreeable experience (Timmons 2005, 22) (Nye 2003, 177).

This fact was not lost on famous visitors to the United States. In his influential book *American Notes*, Charles Dickens chronicled his travels in America. In one section, he wrote about his first experience with an American railroad:

> There are no first and second class carriages as with us [in England]; but there is a gentlemen's car and a ladies' car: the main distinction between which is that in the first everybody smokes; and in the second nobody does. There is a great deal of jolting, a great deal of noise, a great deal of wall, not much window, a locomotive engine, a shriek, and a bell.
>
> The cars are like shabby omnibuses, but larger: holding thirty, forty, fifty people. The seats are placed crosswise, a narrow passage up the middle, and a door at both ends. In the centre of the carriage there is usually a stove, fed with charcoal or anthracite coal; which is for the most part red-hot. It is insufferably close.
>
> In the ladies' car there are a great many gentlemen who have ladies with them. There are also a great many ladies who have nobody with them: for any lady may travel alone from one end of the United States to the other and be certain of the most courteous and considerate treatment everywhere. If a lady take a fancy to any male passenger's seat, the gentleman who accompanies her gives him notice of the fact, and he immediately vacates it with great politeness.
>
> The conductor or check-taker or guard, or whatever he may be, wears no uniform. He walks up and down the car, and in and out of it, as his fancy dictates; leans against the door with his hands in his pockets and stares at you, if you chance to be a stranger; or enters into conversation with the passengers about him. A great many newspapers are pulled out, and a few of them are read. Everybody talks to you, or to anybody else who hits his fancy. Politics are much discussed, so are banks, so is cotton. Quiet people avoid the question of the Presidency, for there will be a new election in three years and a half, and party feeling runs very high: the great constitutional feature of this institution being that directly after the acrimony of the last election is over the acrimony of the next one begins.

> Except when a branch road joins the main one, there is seldom more than one track of rails; so that the road is very narrow. The character of the scenery is always the same. Mile after mile of stunted trees: some hewn down by the axe, some blown down by the wind, some half fallen and resting on their neighbors. Now you emerge for a few brief moments on an open country, glittering with some bright lake or pool; now catch hasty glimpses of a distant town with its clean white houses and their cool piazzas, its prim New England church and schoolhouse; when whir-r-r-r! almost before you have seen them comes the same dark screen: the stunted trees, the stumps, the logs. It rushes across the turnpike road, where there is no gate, no policeman, no signal, nothing but a rough wooden arch, on which is painted WHEN THE BELL RINGS, LOOK OUT FOR THE LOCOMOTIVE. On it whirls headlong, dives through the woods again, emerges in the light, clatters over frail arches, rumbles upon the heavy ground, shoots beneath a wooden bridge which intercepts the light for a second like a wink, suddenly awakens all the slumbering echoes in the main street of a large town, and dashes on haphazard, pell-mell, neck-or-nothing, down the middle of the road.

Dickens's amusing and romantic description of a trip on an American railroad portrayed what many Americans must have felt during their first trips over the rails (Langdon 1941, 353–55).

A serious problem developed for American railroads as competing inventors and companies struggled to establish a foothold in the lucrative new business. As rails went up across the country, it became clear that a lack of uniformity in the railway gauge would cause increasingly difficult problems for travelers and cargo. It was not unusual in the early history of railroads for a journey to necessitate several changes of trains to accommodate different track gauges. For the weary traveler, this caused frustrating delays. For the farmers, manufacturers, and other businesses that were becoming increasingly dependent on the railroads for transporting their goods across the country, the delays meant loss of product and loss of profit. The problem finally came to a head when the federal government agreed to subsidize the building of a transcontinental railroad. The question of what gauge rail to use was crucial, as it would have been entirely unacceptable to embark on such a building project without a standard size for all involved. After much political maneuvering by the myriad of railroad companies, Congress settled upon 4 feet 8½ inches as the gauge of choice, effectively making that size the future standard for American railways (Timmons 2005, 23–24).

The impact on freight delivery was perhaps even more dramatic than that on the delivery of human cargo. Farm products and raw materials from the West were shipped east in a fraction of the time and at a fraction of the cost. In turn, manufactured goods were available for the first time at a reasonable cost to settlers in the West. Many western towns, where forests were nonexistent, were literally built using the wood, nails, and other supplies delivered by the railroads. Later in the century, it was not uncommon for settlers in frontier towns to order prefabricated houses from the Sears or Montgomery Ward catalogs. Of course, these ready-to-build symbols of civilization were delivered by the railroad. In Cheyenne, Wyoming, one observer noted that "Houses arrive by the hundreds from Chicago, already made." The exchange of mail, magazines, and other items of popular culture finally linked the vast continent into a single nation (Timmons 2005, 26) (Nye 2003, 165).

Coast-to-coast communication received a tremendous boost when railroads began delivering the mail in 1838. Although not as romantic as the fabled Pony

Express, the railroads delivered mail quickly, efficiently, and inexpensively all over the country. Special cars were built in which mail clerks sorted the mail as the train moved; the mail was then either left at destinations along the way or sent on to distribution centers (Timmons 2005, 26).

Interestingly, although the railroad connected vast sections of the country, it did not bring equal prosperity to each area it touched. Quite the contrary, improved transportation meant that certain areas of the country would grow and prosper as raw materials for manufacturing and food for workers became easier to obtain. As the railroad "encouraged regional economic specialization," the gap between the industrialized North and the agrarian South grew. Instead of developing its own industries, the South shipped its agricultural products—particularly tobacco, sugar, and cotton—to the North for processing. Everyday life in the North was affected by technological improvements in transportation, whereas the South (and, for the most part, the West) remained close to its agrarian roots (Timmons 2005, 26) (Nye 2003, 171).

Advances in railroad technology made rail travel safer and more comfortable for the American public, as well as for rail workers. A serious problem hampering early rail travel was the absence of an effective braking system. An alarming death rate caused by accidents, as well as the loss of valuable freight, plagued the industry. The first braking systems consisted of hand brakes on each car operated by a brakeman. A young New Yorker, George Westinghouse, developed an alternative to this slow, ineffective, and dangerous system. Westinghouse conceived of a braking system that employed compressed air to operate a piston that in turn applied the brakes. This system was much faster, safer, and very reliable, and in the long run cheaper than employing dozens of brakemen for each train. In spite of its obvious advantages, the air brake did not become standard equipment on all trains until 1893, when Congress passed the U.S. Railroad Safety Appliance Act. Westinghouse's air brakes became standard equipment on trains all over the world. In addition to the air brake, Westinghouse built a device for restoring derailed railroad cars to the track and made a mark in the burgeoning natural gas and electricity industries (Timmons 2005, 26–27).

Workers on nineteenth-century railroads experienced many hazards to their safety and their lives. Before the general adoption of Westinghouse's new braking system late in the century, railroad brakemen were particularly susceptible to accidents. One veteran brakeman described the hazards of the job during inclement weather to a congressional committee in 1890:

> Say, for instance, it is a bad night—what we call a blind night on the road—sleeting, raining, snowing, etc. We hear the call for "down brakes." Of course we cannot always be on top of the train [from where the brakes were operated]. During cold weather we go into the caboose occasionally to warm ourselves. We are called out by a signal "down brakes." We get out on top on the train. We find that the top of the cars are completely covered with sleet. In attempting to get at those brakes a great many brakemen lose their lives, slip off the cars and again, even if they do reach the brakes, it is more often the case than it is not that they find that the brakes are frozen up, and they cannot twist them. That again occasions danger. They cannot set the brakes at all, cannot set the dog, cannot twist the brake. What we call the dog is the little piece of iron which catches onto the ratchet wheel. As no brakes are set, all will

depend on the engine to stop the train, and if the train was going with any speed it would take some time to stop it.

The rail workers also experienced dangers in coupling the cars by hand; the loss of fingers was often the least severe consequence of accidents (Timmons 2005, 27) (Licht 1983, 183).

The big railroad companies often set the standard for the development of the American business model—for example, technological innovation, labor relations, government relations, and the national scope of business. The railroad companies' choices concerning the location of the new lines and of the terminals had ramifications of a scope unimagined at the time. In addition to connecting already populated areas, railways were often built into vast unsettled areas *before* populations arrived, thus making the railroads incredibly influential in determining where settlement occurred. The famous newspaperman Horace Greeley wrote, "Railroads in Europe are built to connect centers of population; but in the West the railroad itself builds cities. Pushing boldly out into the wilderness, along its iron track villages, towns, and cities spring into existence, and are strung together into a consistent whole by its lines of rails, as beads are upon a silken thread." From this one could infer that it is not so much a matter of railroads *affecting* everyday life in America as *dictating* or at least *directing* it (Timmons 2005, 28) (Nye 2003, 157).

Once settlement began, the railroad depot invariably became the center of activity for the township. Townspeople gathered at the depot for arrivals with the expectation of mail, news, goods, and visitors. The depot was usually the site of the town telegraph office, another important source of news and information. Even when no trains were in the station, the depot was a central gathering place for townspeople and day visitors from outlying areas.

The railroads were probably the single most important factor in the astonishingly rapid settlement of the American West. With the coming of the railroad, settlers were no longer isolated from the rest of the country. Mail, news, and supplies, which had previously taken weeks or even months to reach their destination, now could reach locations across the country in a matter of days. Moreover, the very future of a western settlement often depended on the route decided upon by the railroad. The railroad brought farmers and manufacturers closer to their markets and information in a timely manner to the entire country. What canals had begun the railroads brought near completion; by connecting the country, the nation was united both geographically and culturally (Timmons 2005, 28).

Transportation in the City

Mass transit plays an important role in modern America, especially in the cities. The idea of mass transit in the United States dates back to the early part of the nineteenth century, when several cities began using large horse-drawn coaches, called omnibuses, to transport passengers between predetermined locations. The first omnibus in America appeared in New York City in 1827. By building cars drawn by horses but riding on rails, the passengers in large metropolitan areas such as New

York and New Orleans rode in greater comfort by the 1830s. This form of transportation continued to predominate in the major cities until relatively late in the century. However, technology had yet to change considerably the everyday transportation habits of urban Americans. People still depended on the horse for transportation in the city, even as the nation was beginning to build a network of railroads that would revolutionize transportation between population centers (Timmons 2005, 34).

COMMUNICATIONS

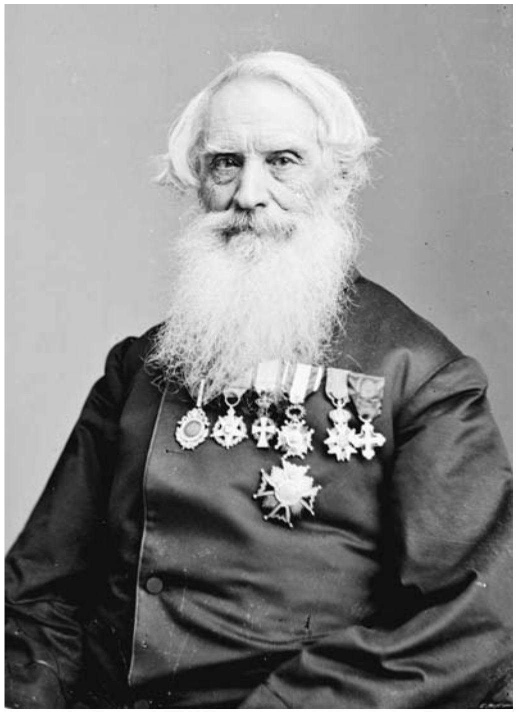
Suppose it is 1800 and you have important information to send to a relative, friend, or business partner—maybe news of a birth or death, or a time-sensitive business matter. The problem is that you live in the Deep South and the prospective receiver of the information resides in New England. In turn-of-the-century America, it takes close to three weeks for a letter to be sent across the country, by which time the news is no longer new (Timmons 2005, 47).

Such was the state of communication in America, indeed the world, in the early nineteenth century. Yet, as the United States expanded westward, the problem of communication grew exponentially. In Europe, where distances were less and roads were better, mail could be delivered relatively quickly and with some degree of reliability. In the ever-expanding United States, however, with its poor or nonexistent roads and its untamed wilderness, mail and other information could not be delivered quickly or reliably. The benefits of the steamboat and the railroad as mail carriers were realized almost immediately after their arrival on the American scene. Yet these new technologies simply resulted in faster means of delivering age-old forms of communication. The real revolution in communications in the nineteenth century came with the development of new technologies that changed the message and the way the message was delivered (Timmons 2005, 47–48).

The Telegraph

The importance of the telegraph to communication was incalculable. Its introduction changed the scale of communication by an order of magnitude. Before the telegraph, all messages were hand carried by messengers on foot or horseback, or by ships. The speed with which the message arrived at its destination was limited by the messenger's speed, a situation that had not changed in the history of mankind. (In fact, while traveling on business, a young Samuel F. B. Morse missed his wife's funeral, receiving word of her death too late to return—an event that later inspired his invention of the telegraph.) With Morse's invention, messages were sent and received over vast distances almost instantaneously, and the world would never be the same.

The experiments of another American, less famous than Morse today but well known in nineteenth-century America as one of the country's leading scientists, prepared the way for the telegraph. In 1830, Joseph Henry displayed the power of the newly discovered electromagnet. Henry sent an electric current over a mile-long wire that signaled a device to strike a bell. Henry's improvements to the electromagnet and his demonstration of a crude signaling device provided the impetus for the invention of a working telegraph. In fact, if Henry had been more interested in personal and commercial gain, he might have earned the title of "father of the telegraph." Instead, that honor goes to a fellow American greatly influenced by Henry's work (Timmons 2005, 48).



Samuel F. B. Morse. Courtesy of the Library of Congress.

Samuel Morse, a successful portrait painter, was on a ship bound for the United States from Europe in 1832 when he first heard of the capabilities of the electromagnet. Almost immediately, he realized the potential for using such a device for sending messages over long distances. Although various inventors had already built crude telegraphs, each invention involved the use of too many wires to be practical. Morse's first attempts to build a device also proved overly complicated and impractical. By 1835, however, Morse had successfully built a one-wire system and was working to perfect a new language for telegraphy—Morse Code. Although Morse began demonstrating his invention in 1837, it was not until 1844 that the true potential of the telegraph was demonstrated. Using a grant from Congress of $30,000, Morse constructed a line between Washington and Baltimore and sent his now-famous quote from the Bible. (Actually, before the line was totally completed, news from the 1844 political convention in Baltimore was sent over the partially completed line to Washington—historically the first news sent by telegraph, but not as dramatic a story as "What hath God wrought?") (Timmons 2005, 48–49).

At first, messages sent by Morse's telegraph were recorded on paper with a series of dots and dashes, to be deciphered later. Soon, however, the telegraph inventor reorganized these same dots and dashes into today's Morse Code and operators were taught to read the message by the sounds the device produced (Timmons 2005, 49).

The impact of the telegraph was almost immediate, and its growth rate was astounding. Morse and his partners opened lines between major cities in the United States and were soon challenged by competitors in the new business of telegraphy. Only a decade after that first line between Washington and Baltimore was completed, there were already more than 20,000 miles of telegraph wire in operation in the United States (Timmons 2005, 49–50).

Two American industries, both still in their infancy, began experiencing incredible growth thanks in part to the telegraph. When the Erie Railroad began dispatching its trains by telegraph in 1851, a long and profitable relationship between the two emerging technologies began. As other railroads began using the telegraph, train schedules became more reliable and the train/telegraph station assumed a central place in large cities and small whistle-stops alike. The railroad industry quickly became one of the largest employers of skilled telegraph operators.

Another industry highly suited to the capabilities of the new telegraph was the newspaper business. Before the telegraph, only local news was truly new. National stories took days, perhaps weeks, to reach across the country, and international news might be months old before it became available to the typical American. With the advent of the telegraph, newspapers in New York could receive news from Philadelphia, Boston, and eventually from overseas in a timely manner. Even more important to rural Americans, the local newspaper, which had previously satisfied itself with printing local gossip and such, now had access to news from the world at large.

A new type of competition arose among newspapers to see which one could get the news out fastest to an insatiable public. The telegraph became an important tool in this contest and led directly to the establishment of cooperative news services such as the Associated Press (AP) and the United Press International (UPI). The AP engaged the telegraph to relay breaking news to newspapers across the country. In fact, the AP was founded by a group of rival New York City newspapers in part to share the cost of receiving news over the telegraph. The telegraph truly made the world, at least from an information standpoint, a very small place.

The telegraph changed the way American businesspeople went about their daily work. The pace of business picked up considerably as time became an important factor in business transactions. No longer did a businessperson in New York have to wait several days after sending a message to an associate in Philadelphia before receiving a reply—several weeks, or longer, if the associate happened to be in San Francisco. Those active in the stock market were especially affected as "tickers" made stock data almost instantaneously known throughout the country. They learned that they must react quickly to new information or possibly lose business to a faster-acting competitor (Timmons 2005, 50).

As the new technology expanded into the far reaches of the United States, the telegraph and telegraph operator became the central feature of most towns. Railroad schedules, news, business and financial information, and even the official time were all sent along the telegraph lines. This instantaneous communication led to a fundamental change in the pace of life for many Americans. In today's world of satellite communications, CNN, and the Internet, it is difficult to grasp the significance of the new invention. The telegraph meant "business that used to occur at a leisurely pace was telescoped into minutes or hours of time." In the twenty-first century, business and industry is truly international in scope. In the nineteenth century, however, the telegraph provided for the first time the opportunity for "merchants in Boston [to] place orders in Atlanta overnight; farmers in Ohio could check the daily price of hogs in Chicago." The pace of business, and of life in general, was changed forever. By the later part of the nineteenth century, the telegraph became an important tool for various types of businesses. Shipping and financial concerns—as well as newspapers—found an outlet for time-sensitive information through the telegraph. By the 1880s, approximately 80 percent of the messages sent over Western Union telegraph lines were business related (Timmons 2005, 50–51) (Spar 2001, 70) (Israel 2001, 265).

In addition to official and business messages, the telegraph allowed people in everyday life to send and receive messages about deaths, births, holiday greetings, and all forms of social correspondence. Information that used to take days, weeks, or even months to arrive at its destination was now sent almost instantaneously. The telegraph operator became one of the most important citizens of a town, as his skill and knowledge connected the townsfolk to the rest of the world (Timmons 2005, 51).

The telegraph also made life safer for ordinary citizens, both in the cities and in the countryside. In the West, the telegraph was instrumental in tracking down outlaws by sending descriptions around the country. In cities, telegraphs were used to summon doctors, firefighters, police, and other emergency personnel. In addition to using general-use telegraph lines for such emergencies, companies developed their own private lines for calling firefighters, police, and doctors—or just for calling a taxi. The telegraph giant, Western Union, built the first transcontinental telegraph in 1861, eight years before the completion of the transcontinental railroad. With the completion of the line, the fabled Pony Express was rendered obsolete. Instead of waiting weeks for messages to be carried across the country, the telegraph accomplished the feat almost instantaneously. Western Union came to dominate the American telegraph market (Timmons 2005, 51) (Israel 2001, 265).

Contemporary observers who watched its use grow exponentially understood the importance of the telegraph. The commentary of a nineteenth-century British writer summarizes nicely the perception of the new technology:

> [The telegraph] is employed in transmitting messages to and from bankers, merchants, members of Congress, officers of government, brokers, and police officers; parties who by agreement have to meet each other at the two stations, or have been sent for by one of the parties; items of news, election returns, announcements of deaths, inquiries respecting the health of families and individuals, daily proceedings of the Senate and the House of Representatives, orders for goods, inquiries respecting the sailing of vessels, proceedings of cases in various courts, summoning of witnesses, messages for express trains, invitations, the receipt of money at one station and its payment at another; for persons requesting the transmission of funds from debtors, consultation of physicians, and messages of every character usually sent by mail.

As indicated by this description, telegraphy touched people from all walks of life (Standage 1998, 60–61).

As with many new technologies, ignorance of the technical details of the workings of the telegraph was widespread. When Western Union began wiring money across the nation, many people assumed the same could be done with other goods, from articles of clothing to family pets. If Western Union could squeeze money through the thin wires, it was thought, why not other material goods?

The technology of telegraphy was applied to countless other tasks in the United States. Several inventors adapted telegraphic technology to devise ingenious fire alarm systems in Boston, New York City, Philadelphia, and other major cities. Although superior to old systems requiring watchmen around the city, the new telegraphic fire alarms proved slow to catch on. Improvements to telegraphy increased the volume, speed, and accuracy of the new form of communication. Multiplexing, the ability to transmit multiple messages over one wire at the same time, was one such advance (Timmons 2005, 52).

Advances in Writing

The printing press holds a special place in the history of communications. Gutenberg's invention in the fifteenth century, as well as improvements made over subsequent centuries, made literacy a foundation of social, intellectual, and scientific advance. The most important improvement to the printing press in the nineteenth century—and perhaps since Gutenberg's invention itself—came from an American inventor, Richard M. Hoe. Hoe invented and patented the first useful rotary press in the 1840s. The Hoe rotary press greatly increased the speed and decreased the cost of printing, spawning a period of incredible growth for the American printing industry.

A few decades later another American, William A. Bullock, provided another boost to the printing industry with his invention of the web perfecting press. This press accomplished all of the printing process by using a roll of continuous-feed paper while printing on both sides at the same time, all at an incredible rate of speed. The new and improved printing presses had a particularly profound effect on everyday life in America. Resulting in an abundance of inexpensive books, magazines, newspapers, broadsides, and leaflets, the improved printing press played an expanding role in educating Americans in far-flung communities without access to traditional educational opportunities (Timmons 2005, 65).

In addition to allowing Americans to keep up with the news and views from their own country, inexpensive printed materials gave citizens of this isolated country, for the first time, ready access to the culture of Europe and beyond. The explosion of the print industry and American literacy went hand-in-hand in the 1840s, as witnessed by a set of amazing statistics. From 1840 to 1850, the population of the United States increased approximately 35 percent, from 17 million to 23 million (all statistics quoted from Bode 1967, 150). In the same decade, the value of books published in the country increased by over 107 percent—from \$2,850,000 to \$5,900,000—while the number of literate Americans increased almost 71 percent (6,440,000 to 11,000,000). The newspaper industry saw a similar explosion, with the number of dailies increasing from 138 to 254 and the number of weeklies from 1,266 to 2,048 (Timmons 2005, 65–66).

Advances in printing presses brought daily newspapers to the cities. The *New York Sun*, founded in 1833 by Benjamin H. Day, sold for a penny—a fraction of the cost of his competitors' papers. It printed eye-catching news stories aimed at the general public. Day used boys to hawk his papers in the streets, teaching them to shout the headlines to draw attention to the paper. He also pioneered the use of advertisers and advertising dollars to significantly increase the paper's income, so that the price could be kept down for the reading public. With the help of new printing technologies, the newspaper moved west with the settlers. By 1830, America had between 1,000 and 1,200 newspapers, three times as many as in France or England. David L. Jamison describes the importance of the town's newspaper:

> The role of the frontier and small-town press went beyond news and politics. In towns with no schools, newspapers might be the only voice of literacy. The press helped to educate the public, and the network of papers, linked by the postal exchange system, provided a mechanism for common dialogue in a nation of small and often scattered communities. (Timmons 2005, 66) (Jamison 2001, 421)

Hand-in-hand with the explosion in newspapers, the American public developed an insatiable appetite for short stories. For many reasons, "the short story was a genre perfectly suited to the rising middle classes. Not only were short stories written in the language of the people; they could be read and absorbed in one sitting and then discarded." Entire novels were published in serial form in American newspapers and magazines. Other popular forms of literature included sermons, trial reports, and novels. The popularity of nineteenth-century American writers such as Herman Melville, Nathaniel Hawthorne, and James Fenimore Cooper can be at least partially attributed to the increasingly easy access to their works brought about by advances in the printing industry (Timmons 2005, 66) (Stauffer 2001, 529).

TECHNOLOGY ON THE FARM

Like transportation and communication, agricultural practices around 1800 were not very different than the traditional practices many centuries old. Draft animals such as horses, mules, and oxen provided most of the power for farmwork that humans could not provide themselves. Science and technology dramatically changed agricultural practices in nineteenth-century America. In 1800, 80 percent of all Americans were farmers. By 1880, this number had dropped to just over 40 percent. Much of the reason for this decrease can be attributed to increased efficiency in agricultural practices. This increased efficiency can in turn be attributed to two things: an exponential rise in the use of machines and advanced tools on the farm and an ever-increasing application of scientific knowledge to farming practices (Timmons 2005, 71) (Pursell 1995, 109, 114).

The nineteenth century ushered in an era of inventiveness in agriculture unlike any other in history. From the cotton gin, actually invented just before the turn of the century; to the reaper, invented around midcentury; to the combustion engine tractor, which appeared near the end of the century, machines went from playing essentially no role in agriculture to being indispensable tools for the modern farm. In the process, the typical farm in America, and therefore the typical farmer, began a gradual evolution from the family sustenance farm to the large-scale operations associated with farming in the twentieth century (Timmons 2005, 72).

The Axe: The Simplest Tool of All

In a century that witnessed the invention of incredibly powerful and complicated machinery, an American improvement to an ancient implement led the way to settlement of virgin lands. Americans transformed the short, straight axe brought from Europe into a model with a long, curved handle made of hardwood, usually hickory. The new axe allowed settlers to clear forested land at a much faster pace. These new axes, originally handmade by blacksmiths, were soon manufactured in factories. The factories used machines that cut, heated, and tempered the blade, producing high-quality axes at low costs (Timmons 2005, 72).

As Americans moved west from coastal areas, the first order of business wherever they settled was to clear land for farming. For this reason, the new and improved axe played a central role in the settlement of America. As one chronicler of western settlement queries, "I ask you to look at this splendid tool, the American axe, not more an implement of labor than an instrument of civilization. If you cannot use it, you are not American. If you do not understand it, you do not understand America" (cited in Nye 2003, 44). The axe led the way for farming, and thus for settlement. As historian David Nye so eloquently and succinctly describes:

> A settler enters the vast primeval woods. Using a new technology, the American axe, he transforms the forest into field and meadow, allowing it to be farmed for the first time. Initial settlement draws others to the area. As the population increases, a community emerges. As the land is "improved," its value rises. The region prospers. (Timmons 2005, 72–73) (Nye 2003, 43, 44)

Clearing the land for agriculture was not the only use for the handy tool. Log cabins—the traditional home of settlers, farmers, and woodsmen—were fashioned with the aid of an axe. In addition, the American axe hewed most of the furniture and other meager belongings inside the cabin (Timmons 2005, 73).

The log cabin became a symbol of the American frontier; it was used symbolically to great political benefit by politicians from Andrew Jackson to Abraham Lincoln. A vivid description of a typical early nineteenth-century cabin, inhabited by a hunter and his family, comes from an English immigrant named Morris Birbeck:

> The cabin, which may serve as a specimen of these rudiments of houses, was formed of round logs, with apertures of three of four inches between; no chimney, but large intervals before the "clapboards," for the escape of the smoke. The roof was, however, a more effectual covering than we have generally experienced, as it protected us very tolerably from a drenching night. Two bedsteads of unhewn logs, and cleft boards laid across;—two chairs, one of them without a bottom, and a low stool, were all the furniture required by this numerous family. A string of buffalo hide stretched across the hovel, was a wardrobe for their rags; and their utensils, consisting of a large iron pot, some baskets, the effective rifle and two that were superannuated, stood about in corners, and the fiddle, which was only silent when we were asleep, hung by them. (Nye 2003, 55)

This description of circumstances surrounding the lives of a frontier family in 1817 sheds light on just how little science and technology influenced everyday life at the beginning of the century. The entire cabin—from the walls to the roof (the floor probably being dirt)—could be attributed to the hunter's axe, as were the sparse furnishings. The iron pot was most likely fashioned by a local blacksmith, just as the baskets were probably made by local weavers, possibly even the settler's wife. The fiddle, the center of attention during nonworking hours, was almost certainly handmade. The only hints of technology in the cabin were the rifles, only one of which appeared to be in working order. The other two possibly awaited a time when a skilled gunsmith could fix them or make new parts to replace those that did not work. It would yet be many decades before Whitney, Colt, and others made it possible for a hunter readily to acquire interchangeable parts to repair a weapon (Timmons 2005, 73).

The Cotton Gin

Renowned as the inventor of the cotton gin, Eli Whitney's name is synonymous with the idea of American ingenuity. Interestingly, Whitney made his original fortune, not to mention achieved his original fame, as a pioneer in the mass production of firearms. Whitney championed the idea of interchangeability of parts and, in the process, became known for developing the American System of manufacturing. Although he had only partial success in creating muskets with truly interchangeable parts for the U.S. government, Whitney's plans, in his own words, to build tools "similar to an engraving on a copper plate from which may be taken a great number of impressions perceptibly alike" formed the basis for mass production techniques. Requirements for mass production in the arms industry spawned whole new industries to design and build tools and machines required for the production of weapons (Timmons 2005, 74).

Eli Whitney did not create the first machine for removing seeds from cotton to prepare it for further processing. Long before the nineteenth century, a machine called a charka was used to separate the seeds from the long-staple cotton grown primarily in India. Unfortunately, this machine did not work on the short-staple cotton grown in the United States, making cotton an unprofitable crop in America. Meanwhile, Whitney and others realized the market for cotton was increasing with the growth of the textile industry in Britain. If only southern cotton farmers could overcome the bottleneck caused by hand cleaning cotton, they could capitalize on the burgeoning market. Whitney's machine, designed to work on the American type of cotton, produced a revolution in farming practices, especially in the South (Timmons 2005, 74).

The first cotton gins were powered by a hand crank and could, in Whitney's own words, do the work of 10 men. Soon, bigger and more efficient gins powered by horses or water appeared. These machines replaced the work of 50 men! The southern United States soon became the world's major producer and exporter of cotton. American cotton exports grew from less than 10 million pounds in 1800 to more than 2 billion pounds in 1850—an astounding increase of almost 20,000 percent. At the same time, land prices in the South rose as the profitability of growing cotton increased. "What would be the comparative value of the soil of our Southern and Southwestern States," asked Daniel Webster in 1836, "if the spinning of cotton by machinery, the power loom, and the cotton gin, were struck out of existence?" Perhaps no machine ever influenced a particular product, or geographic region, as much as the cotton gin influenced cotton and the American South (Solbrig and Solbrig 1994, 192) (Nye 2003, 36).

Along with changes in farming practices, the cotton gin brought significant social changes. In his classic work *Yankee Science in the Making,* Dirk Struik points out that "rarely, if ever, was such a social revolution promoted by so simple a machine." The cotton gin and the resulting explosion of cotton production in the southern United States resulted in several negative social and agricultural phenomena. First, whereas ginning had previously presented the bottleneck to cotton production, picking the cotton became the new bottleneck. The need for labor boosted the practice of slavery in the South and led to larger plantations where cotton could be grown very profitably (Timmons 2005, 75) (Struik 1991, 183).

Second, cotton is a notoriously soil-depleting crop. With land rather plentiful and easy to come by and cotton production proving to be a lucrative business, southern farmers tended to grow cotton in the same fields year after year until those fields were spent; then the cotton grower moved on to virgin lands. This type of farming practice contributed to the slow erosion and degradation of the fertile farmland of the South and the westward push to new land (Timmons 2005, 75).

Finally, some historians place blame squarely on the shoulders of the cotton gin for the South's traditional agrarian lifestyle and its subsequent resistance to industrialization. Although this is certainly an oversimplified picture of the antebellum South, Whitney's invention did make possible the large cotton plantations that came to define the cotton-growing states.

Although the agrarian lifestyle dominated the southern United States in the nineteenth century, southern farmers and growers were generally open to advanced farming practices. Contrary to the popular image of the South, plantation owners were among the first Americans to embrace new agricultural technologies. While the cotton gin was the most important farm machine to the plantation owners, other technologies emerged in other parts of the country—technologies that would prove just as critical to farming as the cotton gin was to growing cotton (Timmons 2005, 75–76).

New Weapons for an Untamed Land

Throughout the nineteenth century, American frontiersmen were fond of saying, "God made all men, Colt made all men *equal*." The invention of the Colt revolver is just part of the story, though. Samuel Colt's innovative manufacturing techniques and business practices exemplify the American system of manufacturing.

Although Colt was not the first to envision a revolver type weapon (the American Elisha Collier actually built pistols and rifles with revolving cylinders several decades before Colt), it was Colt who showed the technical expertise and the perseverance needed to manufacture and market the new weapons. Colt first conceived of his radical design while a young man serving aboard a ship bound for East India. After seeing a revolver made by Collier, Colt made a rough wooden model with several improved design features and proceeded to spend the rest of his life perfecting his invention. Upon returning to the United States, Colt made money as a traveling chemistry lecturer while working on his invention, obtaining a patent for a pistol with a revolving cylinder in 1835. In spite of its many advantages over older-style firearms, Colt's first attempts to produce and market the revolver failed. Finally, after winning converts during Indian wars and the Mexican-American war, Colt's new pistol became the most popular weapon in the West (Timmons 2005, 152).

Many Colt firearms were made at Eli Whitney's armory at New Haven, Connecticut. It had actually been Whitney—of cotton gin fame—who first attempted to manufacture firearms using the concept of interchangeability of parts. Eventually, though, Colt established his own factory in Hartford, Connecticut. Colt had written

A replica of an 1860 Colt army revolver. Author's Collection.

earlier that he longed to build a gun so that "each arm would be exactly alike and all of its parts would be the same." Like Whitney's operation, Colt's armory was a model of nineteenth-century efficiency. The region in which Colt established his factory had a large concentration of skilled mechanics and machinists and already had a history of producing machine-made interchangeable parts. The visionary manufacturer believed that these skilled workers might "by constant practice in a single operation . . . become highly skilled and at the same time very quick and expert at their particular task" leading to "better guns and more of them for less money." Colt's experiences with mass production were instrumental in establishing the American System of manufacture as a viable business model. Like many other manufacturers of the time, Colt built an entire town, Coltsville, around his factory, including employee accommodations and public meeting places for religious services, concerts, and lectures. He employed hundreds of workers, including many immigrants, to operate his factory. Colt, like Whitney before him and many others to come, found that one of the advantages of the assembly line method was that unskilled workers could do—for a fraction of the cost—what skilled artisans had done before (Timmons 2005, 152) (de Camp 1961, 81).

The Colt revolver was not an instant success. One of the first groups to buy the Colt revolver was the Texas Rangers, but sales were so low that, for a time, Colt was forced to stop production. Luckily for Colt, the Rangers found the revolvers quite useful and their requests for more of the guns motivated a new attempt from Colt. The Colt legend grew along with the Texas Ranger legend, as seen in a particular incident involving the lawmen and the new firearm. One afternoon in 1841, Ranger Jack Hayes found himself isolated in a fight with a Comanche war party. Hayes was armed with only a single-shot rifle, but also one of the new Colt revolvers. The Comanches waited patiently, showing themselves as they moved in and out of cover, until Hayes fired his rifle. Their experiences with fighting the Rangers told them that the time was ripe to rush the lone man as he reloaded his weapon. When they did, Hayes opened fire with his Colt revolver. The repeated fire saved his life, as the Comanches retreated under the barrage and other Rangers appeared on the scene. It was episodes such as this that caused the Rangers to request more of the revolvers from Colt (Timmons 2005, 153).

In spite of its reputation, the Colt revolver was not made with true interchangeable parts. Although mass production guaranteed similarity in parts, most still required filing and fitting to work properly. Colt employed a well-known mechanic, Elisha Root, to help mechanize his factory, but even Root showed little interest in the concept of interchangeable parts.

> [Root's] tenure at Colt's armory was not distinguished by an aggressive pursuit of interchangeability, with its requisite principles and practices of precision production, but rather by mechanization of work processes. When he moved to Hartford [the location of Colt's factory], Root had had no experience with the model-based gauging techniques used at the national armories to ensure the interchangeability of musket parts. This fact alone may explain why the Colt armory did not use as rigorous a gauging system as, say, the Springfield Armory and also why parts of the Colt revolver, despite the implications of its inventor, did not come close to being interchangeable. (Hounshell 1984, 48)

In spite of Colt's failure to achieve interchangeability, his promotion of the concept and his manufacturing techniques did much to spread the idea, if not the actual practice, of the American System (Timmons 2005, 153–54).

Thanks largely to Colt and his factories, the pistol became commonplace on the American frontier. Ownership of a Colt revolver was understood to be a necessity in much of the West. Interestingly, Hollywood dramatizations of fast-draw gunslingers "shooting from the hip" are mostly myth. The cost of cartridges precluded extensive practice and the abuse received by Colt revolvers often adversely affected their accuracy. Also, most western towns outlawed carrying guns while in town. Of course, this simply led to an increased popularity in smaller Derringer type handguns that could be easily hidden from view. Yet the Colt revolver was far superior to any other weapon in the West. It became the model upon which new guns were designed. Following the Colt revolver, inventors such as B. Tyler Henry, Oliver Winchester, and Christopher Spencer designed repeating rifles; later in the century Richard Gatling invented his famous machine gun (Timmons 2005, 155) (de Camp 1961, 84).

PLANTING, CULTIVATING, AND HARVESTING THE CROPS

The plow is nearly as old as farming itself. For centuries, farmers used plows made primarily of wood. With the appearance of iron plows, stronger, longer-lasting devices were available to farmers. In 1814, Jethro Wood patented a cast-iron tipped plow with interchangeable parts that proved very popular amongst American farmers. When one part broke, there was no need to replace the entire plow. Interchangeable parts, an innovation usually attributed to firearms manufacturers, actually began with Wood's plows. However, it was steel that was destined to create a revolution in plow technology. Plows composed partially of steel, primarily in the share tip, were first built and sold in the United States in the early nineteenth century (Timmons 2005, 76) (Hurt 1994, 101).

Although cast-iron plows were very successful in many areas of the United States, as the century wore on, one shortcoming continually came to light: The thick soil of the western prairie habitually stuck to the moldboards, causing delays as the plower stopped to clean off the prairie soil. In response to this problem, in 1837 an Illinois blacksmith named John Deere built a wrought iron plow with a steel share. The story of Deere's invention, as told by historian Douglas Hurt, made the Deere name synonymous with American agriculture:

> Sometime in 1837 Deere had an idea that would change farming in the Midwest and permanently etch his name in American agricultural history. In the sawmill of Leonard Andrus where he had gone to repair a pitman rod, he noticed a broken steel mill saw. Deere took the saw blade back to his blacksmith shop and cut off the teeth with a sledge hammer and chisel. Next, he cut a diamond-shaped moldboard from a piece of wrought iron that he then heated and bent over an anvil until it took the desired trapezoidal shape. To this moldboard Deere attached a steel share that he had cut from the saw blade. Last, he gave the moldboard a high polish. Deere's moldboard cut easily through prairie sod and allowed the soil to peel away without dulling the share or clogging the moldboard. His new plow was lighter than the prairie breakers, and it required only about half the draft for cast-iron plows.

Unfortunately, Deere's first plows were prohibitively expensive. After years of perfecting his design and the process for manufacturing steel shares, sales began to increase, and Deere's new plow became the implement of choice among farmers throughout the country. By 1858, Deere's Moline, Illinois, factory was producing more than 13,000 steel plows per year. The Deere plow, possibly more than any other machine or technological advance, made farming the endless prairie lands a practical venture (Timmons 2005, 76) (Hurt 1994, 137–38) (Ess 2001, 33).

The plow, such an overlooked and seemingly simple implement, was actually a great source of national pride. But preparing the ground for planting was only part of the process. Tools and machines for bringing in the harvest played a central role in the mechanization and resulting growth of American agriculture (Timmons 2005, 78).

Grain harvesting during the first half of the nineteenth century was performed in much the same way as it had been for centuries—by hand. Although improved hand tools made the job marginally faster, reaping continued to be an arduous, time-consuming job. When an entire crop, ready for harvesting, might be wiped out due to inclement weather at any moment, time was of the essence. Harvesting by hand required the use of a scythe, or similar cutting instrument. An improved sort of scythe, the cradle, "was equipped with an arrangement of long tines or fingers to catch the grain as it was cut and enable the reaper deftly to lay it to one side in an even windrow . . . it took a mighty biceps and an unbreakable back to make a good cradleman." At best, a man with a cradle could cut four to six acres per day. On a small New England farm, four to six acres per day might have been sufficient; however, on the increasingly larger farms of the West, this harvest rate was a severe limitation to the number of acres of grain a farmer could realistically plant (Timmons 2005, 78) (Langdon 1941, 305–6).

Simply cutting the grain was only the start of the process. Someone then had to follow behind the harvester to bind the grain into sheaves, another laborious task. The sheaves were piled together into shocks, a task that "required speed and skill so that the sheaves would stand upright and stay in place and protect the grain from the rain." After the harvest was complete and the sheaves of grain had been stored in the barn, the threshing process began:

> To get the grain out of the heads and free from the husks or chaff was the threshing. In the earlier days of the hand-tool period this was done on the barn floor with a flail. The sheaves were unbound and the gavel or unbounded sheaves were laid evenly on the floor in two rows with the heads overlapping. Then two men beat the grain heads with flails in alternate rhythmic blows. . . . When thoroughly threshed, the grain and chaff were scooped up into the large shallow winnowing basket or tray and tossed into the air so that the breeze would blow the chaff away while the grain would fall back into the basket or tray.

From plowing to sowing to cultivating to reaping to threshing and winnowing, a wheat crop required an incredible amount of manual labor. Little wonder farms at the turn of the nineteenth century tended to be small (Langdon 1941, 309, 310–11).

The appearance of mechanical reapers in the United States dates to the early years of the nineteenth century. These reapers, however, were commercial failures, and American farmers continued to depend on the scythe or the sickle for harvesting grain. Change was imminent when Cyrus McCormick patented a much-improved device in 1834 that eventually became the most popular reaper on American farms. Even then it was several decades before the McCormick reaper came into wide use, and then only in certain areas of the country. Part of the reason for the delay in adopting the reaper was due to technical flaws that McCormick worked out over a number of years. But another reason for the slow acceptance of mechanical reapers was that for the machines to become economically feasible a whole new way of farming was required. Small farms, primarily operated for sustenance, could not justify the costs of reapers or other large machinery. The farmer's labor, supplemented by seasonal hired help, remained the most efficient way to operate a small farm. It so happens, however, that as McCormick began building improved reapers, labor costs began to rise and farm size was on the increase. Economic historian Paul A. David has calculated that it required a minimum farm size of 46.5 acres to make the reaper economically justified (Timmons 2005, 79) (Basalla 1988, 153).

American schoolchildren know Cyrus McCormick as the inventor of the mechanical reaper. As is usually the case in history, the truth is not quite so simple, as exhibited by David Hounshell's summary of the history of the reaper:

> Almost from the beginning, participants in the reaper's history as well as those who chronicled its development fought vigorously over who really invented the reaper. As with the sewing machine, men had long dreamed of and tried to devise a mechanical means to reap grain, yet the basic element of such a machine eluded would-be inventors until the early 1830s. In the United States both Obed Hussey and Cyrus Hall McCormick, one from Ohio, the other from Virginia, hit upon the idea of using a vibrating knife or blade to cut the stalks of grain. Hussey made his reaper work effectively by vibrating the blade in slots cut in guide

> teeth or fingers. He patented this machine in 1833 and began to sell it in 1834. McCormick claimed that he had anticipated Hussey in the essentials of the reaper, but he did not patent his machine until mid-1834. McCormick's blade lacked the effective slotted finger bars of the Hussey machine. Yet, as is often the case in the history of American invention, McCormick moved through the courts to become eventually the famed hero who invented the reaper. (Hounshell 1984, 154)

The McCormick reaper was extremely important to large-scale farming, but the early history of the machine was also fraught with difficulties for the farmer who purchased the machine. For instance, if a McCormick reaper required a replacement part, the farmer supplied the information to the McCormick dealer, including the part and the year his reaper was manufactured. The dealer might have the part in stock, or he might have to send for the part from the factory. Either way, once the part arrived the farmer still had to fit the part to his reaper, no simple task in a time when true interchangeability of parts had yet to arrive on the scene (Hounshell 1984, 459).

Labor considerations, both at the factory and on the farm, greatly affected the design and production of McCormick reapers. A shortage in farm hands induced McCormick to introduce a self-raking reaper in the 1860s. This reaper "eliminated the need for a laborer to rake the cut grain off the reaper's platform." Interestingly, the McCormick factories were having difficulties in finding laborers to build their machines. McCormick's brothers, whom Cyrus had left in charge of the company while he traveled to Europe, wrote to the company's founder concerning the labor problems: "strikes have prevailed—men go off to escape [the] D[ra]ft . . . Workmen such as we most needed are independent." The labor shortage for McCormick's factories became an ongoing problem for decades to come (Hounshell 1984, 165, 166).

By midcentury, McCormick's company was mass producing the new machines. McCormick's first reapers, like those invented by competitors such as Obed Hussey, simply cut the grain, leaving the rest of the process—raking, threshing, and binding—to laborers walking with or riding on the machine. In time, each of these processes was automated; eventually a "combine," a single machine that performed each task, made harvesting a faster, more efficient process. Initially, horses, mules, or oxen powered these machines. The larger ones often required great teams of animals for propulsion. By 1860, approximately 70 percent of the West's wheat harvest was handled by mechanical reapers such as McCormick's. The sales of mechanical reapers—McCormick's and his competitors'—continued to rise dramatically through the century. In 1880, they sold 60,000 of the machines; by 1880, the number had increased to 250,000. It became important, perhaps even a status symbol, for a gentleman farmer to own a McCormick reaper (Hurt 1994, 144) (Ess 2001, 35).

In addition to machines for the harvest, countless other technical innovations increased productivity on the farm. During the first half of the century, most of the grain in the United States was planted by hand—a slow, inefficient process in which the grain seed was distributed by hand and then covered and worked into the soil by hand. By 1850, new and improved seed drills for efficient planting helped expedite the process. These drills encouraged uniform planting practice, which in turn made harvesting by mechanical means more practical. A large horse-drawn planter could drastically cut the time and manpower required to seed a field. After the grain was sown, mechanical cultivators, also drawn by horses or mules, relieved the farmer from tedious and backbreaking weeding chores while greatly reducing the time needed for cultivation (Timmons 2005, 83).

FOOD PRESERVATION

Preserving the products of farming and ranching was an important prerequisite for increased productivity. It didn't matter how much food a farmer could produce if it spoiled before it arrived in the consumer's hands. Several technologies arose in the nineteenth century that benefited both farmers and consumers by making food products easier to obtain and safer to eat. One of these technologies, the canning process, became an important part in the everyday life of many Americans—when they were able to get the food out of the can (Timmons 2005, 84).

Tin cans became relatively common for storing and preserving food early in the nineteenth century, but opening such cans required chisels or other forceful methods. Canned foods became particularly popular with soldiers, although they had "to attack their canned rations with knives, bayonets, and even rifle fire." Various can openers appeared beginning in the 1850s, although the device used in households today did not make it into American kitchens for some time to come. One early can opener was patented by an American, Ezra Warner, in 1858. Warner's invention was an improvement, although it still required a considerable amount of force to use. Warner defended his device against detractors:

> The advantages of my improvement over all other instruments for this purpose consist in the smoothness and rapidity of the cut, as well as the ease with which it is worked, as a child may use it without difficulty, or risk, and in making the curved cutter susceptible of being removed, so that if one should be injured it may be replaced by another, thus saving all the other portions of the instrument, and consequently much expense, and in that the piercer will perforate the tin without causing the liquid to fly out, as it does in all those which make the perforation by percussion of any kind. (Petroski 1994, 186, 188)

Another innovation to preserve food to be delivered to the consumer's table came via the railroad. With the appearance of the refrigerated railcar late in the nineteenth century, farmers could raise vegetables and other highly perishable food items as cash crops, opening the way for various sections of the country, particularly California, to become agricultural centers. Farmers found that they could transport fresh fruits and vegetables to population centers in the refrigerated cars and make a very nice profit doing so. In addition, cattle ranchers reaped the benefits of refrigerated railcars as meatpackers began taking advantage of the new technology. By the end of the 1860s, dressed meat (meat prepared for the market) was shipped across the United States in the refrigerated cars. Meatpackers began developing distribution systems that included cold-storage warehouses in major cities, meaning that residents of those cities would have easier (and safer) access to meat year round. In smaller towns, where the customer base did not warrant a cold-storage facility, peddler cars sold to small retailers or directly to the public. In this way, more and more Americans gained access to beef, pork, lamb, and other meats they had seldom been able to buy before (Timmons 2005, 85) (Saffell 2001, 276).

SCIENTIFIC FARMING

Technological advances were not the only factors contributing to the giant steps made in agriculture in nineteenth-century America. The realization, dawning more slowly on some than on others, that science might be profitably applied to agricultural methods led to large gains in agriculture efficiency and output. Farming and farmers were generally held in the same high esteem established by Thomas Jefferson around the turn of the century. Jefferson held that the self-sufficient farmer formed the backbone of American democracy. His interest in advancing agricultural practices by applying modern scientific techniques laid the foundation for just such a belief throughout the whole country. To use a technological metaphor, farming "may be considered the great wheel which moves all the machinery of society." Although many Americans—especially the poor, uneducated farmer of the South and West—may not have subscribed to such philosophical views, they were pervasive enough to constitute a major force in American society (Timmons 2005, 87) (Buel 1967, 4).

Many of the ideas concerning the role of progress in agriculture were written, circulated, and published in farmers' almanacs, journals, and handbooks. Farming periodicals dedicated much of their space to scientific farming and the application of technology to agriculture. One of these early periodicals, the *Farmer's Register*, emphasized agricultural machinery, and another, the *Prairie Farmer*, concentrated on common school education for farmers and on farm machinery. A typical example comes from Jesse Buel's *The Farmer's Companion; or, Essays on the Principles and Practice of American Husbandry*, published in 1840. Buel was a successful printer and editor who left his career to immerse himself in a quest to create a model farm outside of Albany, New York. He spent the rest of his life creating his ideal farm and working as a spokesman for enlightened farming in America. Buel firmly believed that "the more it [agriculture] is enlightened by science, the more abundant will be its products." With a working knowledge of the scientific practices in agriculture, the farmer would find that:

> The elements are subservient to his use; the vegetable and animal kingdoms are subject to his control! And the natural laws which govern them all, and which exert a controlling influence upon his prosperity and happiness, are constantly developing to his mind the new harmonies, new beauties, perfect order, and profound wisdom, in the works of Nature which surround him.

Although Buel seems to wax poetic, the notion of the gentleman farmer subjugating nature with his knowledge of science had a powerful influence in America (Wik 1966, 84) (Buel 1967, 4, 7, 11–12).

Of course, small farmers trying to scratch out a living for themselves and their families might scoff at Buel's notions, certain that they had neither the time nor the inclination to engage in such affairs. Buel, however, maintained that the farmer actually possessed more time to pursue scientific studies than those in other professions. Whereas those in industry or mercantilism might work day and night in their chosen professions, Buel claimed that the farmer had the nighttime hours to spend in study and contemplation, "to the improvement of his mind—to the acquisition of useful knowledge." In fact, Buel even listed the various studies a farmer might undertake, from the properties of soils and usefulness of different fertilizers, to methods of irrigation and crop rotation, to scientific methods in animal husbandry. All of these intellectual pursuits would lead not only to improved agricultural techniques and outputs, but also to a more general benefit to society as a whole; for "whatever tends to improve the intellectual condition of the farmer . . . essentially contributes to the good order of society at large and to the perpetuity of our country's freedom." Granted that the typical farmer did not adhere to, and probably was not interested in, the extremes to which Buel went in maintaining a model farm; however, the idea that agricultural practices could be improved with knowledge and applications of science found its way into the very fabric of American agriculture in the nineteenth century. Another growing branch of science—chemistry—met with a similar fate, as proponents of progressive agriculture often clashed with skeptical farmers intent on maintaining traditional farming practices (Buel 1967, 7, 12).

Chemistry—and science in general—played an ambiguous role in American agriculture during the nineteenth century. The American scientific community realized the importance of basic chemical research for the growth and advance of agricultural and industrial concerns. Scientists insisted that agriculture "must be made rational and scientific." As the century progressed, these views were adopted by an increasing number of politicians who lent their support for the funding and organization of chemical research, and by farmers whose support was crucial to "selling" the importance of science to agriculture. During the 1850s, Congress overcame its aversion to funding agricultural research by, in rapid succession, granting "$35,000 for agricultural experimental work on a two-acre plot near Missouri Avenue in Washington, D.C."; hiring an entomologist to join the Patent Office, as well as hiring a chemist and a botanist for research positions; and arranging with the Smithsonian Institution to publish meteorological statistics. Government support of scientific research aimed at improving agriculture in America became more pronounced as the century wore on (Rosenberg 1966, 144) (Wik 1966, 90).

There remained, however, a large gap between the producer of science and the consumer. The desire of the scientist to engage in basic research often conflicted with the insistence of the public to realize immediate practical results. Some science popularizers maintained that "every farm should be considered a chemical laboratory and every farmer a practical chemist and philosopher." In contrast, some farmers disdained "book farming" just as artisans and others without scientific training often questioned the utility of basic science (Rosenberg 1966, 147).

Around the middle of the nineteenth century, American chemistry, like many other American sciences, began to take on a decidedly German flair. Seeking graduate training in chemistry in Germany, many of these young scholars were greatly influenced by Justus von Liebig's classic work, *Organic Chemistry in Its Application to Agriculture and Physiology*. By bringing advanced notions of chemistry and its applications back to their own country, agricultural chemists were at the forefront of scientific research and education in the United States. In fact, the first chair at the first scientific school (established at Yale in 1847) belonged to the field of agricultural chemistry. Thanks to its immediate and obvious applications to agriculture and industry, chemistry became one of the first sciences institutionalized in universities and government agencies.

One of the earliest contributions made by chemists to American agriculture was soil analysis. Originally believed to be a panacea for the depleted soils of eastern lands, chemists slowly began to realize that the simplistic approach of analyzing a soil sample to determine the chemicals needed for replenishment was not a magic wand. Commercial chemical fertilizers made their way into the market by midcentury. By the turn of the twentieth century, American farmers used almost two million tons of commercial fertilizer annually. Although chemists made advances in the area of soil analysis and fertilization throughout the century, these advances were made at a pace that did not satisfy the farmer who wanted fertile fields *this* season.

The list of scientific contributions to nineteenth-century agriculture is long. Stephen Babcock developed a simple, accurate, yet inexpensive test to determine the amount of butterfat in milk. This solved an ongoing problem of compensating dairy farmers fairly based on the butterfat content of their milk. Luther Burbank developed hundreds of strains of plants from plums to lilies to the Burbank, or Idaho, potato. Norbert Rillieux, the son of a plantation owner and a New Orleans slave, developed a much-improved process for refining sugar from sugarcane. Rillieux, who received a first-class education in France, invented a new type of evaporator that revolutionized the sugar industry by making sugar cheaper for the consumer and sugar production safer for workers involved in the process. Countless other Americans contributed their own discoveries and inventions to the ongoing quest to feed a growing population (Timmons 2005, 90).

Finally, it should be noted that the relationship between farmers and technological advances was not always friendly and fruitful. The nineteenth century witnessed the first hint of backlash against the scientific and technological changes that many Americans accepted and embraced. It is true that improved modes of transportation helped to speed along technological developments in agriculture. With canals, steamships, and railroads, farmers were able to move more of their products to market in a shorter period of time; the Erie Canal, in particular, played an important role in the development of the Midwest as a major grain-producing region. It is also true that farmers and railroads often had unstable relationships. The importance of the railroads to agriculture, especially commercial agriculture, was obvious. The farmers of the prairie states certainly realized their dependency on the railroads for transporting their crops to urban markets. However, farmers often accused the railroads of unfair business practices such as price gouging. In fact, by the last third of the century, negative reactions against the railroads from all directions were commonplace (Timmons 2004, 91).

The new reality in farming was that advances brought about by technology and science led to a gradual loss of autonomy for individual farmers. They became dependent on the railroad to transport their crops out and supplies in, on the banks to finance the ever-increasing amount of equipment needed on a modern farm, and on unpredictable markets for their products. Nineteenth-century science and technology was certainly a two-edged sword for the American farmer (Timmons 2005, 93).

CHANGING NATURE OF WORK

Industrialization had a tremendous impact on the common American in the nineteenth century. In 1800, the vast majority of Americans led a life dominated by locality. Farms were small and provided most, if not all, of the necessities of life. Artisans and craftsmen operated from small locales—most often from the home itself—and seldom participated in trade outside of their local area. Of course, all of these factors meant that the typical American lived and worked in a rural, rather than urban setting (Timmons 2005, 93).

Industrialization did not happen all at once, nor did it spread smoothly and continuously once it had begun. Rather, small components of the workplace were automated, piece by piece, over a period of time. At the beginning of the century, "the production of consumer goods, from shoes and house wares to luxury coaches, remained located in artisan workshops." As the century progressed, these small, individually owned workshops faced more and more competition from factories mass-producing similar goods. Generally, the workshops either adapted or closed. The owner of the shop, or master craftsman, was forced to expand from the traditional few journeymen under his tutelage to a larger number of workers. To cut costs, the location of the shop might be moved from the building in which the craftsman lived into "lower-rent manufacturing districts or wherever inexpensive space could be found." By the middle of the century, small-scale factories operating in less than ideal conditions replaced many of the small artisan workshops—the sweatshop was born in the United States. As a result, "in the push to increase production, keep costs low, and maintain workshop survival, craft skills that had been passed from master to journeyman and apprentice for centuries were divided and lost" (Greenberg 2001, 421–22).

Exacerbating the situation was an increasing reliance on immigrant labor in the workshop. With competition for jobs with Irish and German immigrants in the East, Chinese immigrants on the West Coast, and black laborers—including slaves hired out by their owners—in the South, white artisans and craftsmen came under more pressure to find jobs. To make matters worse, ownership did not consider laborers to be any more or less important than natural resources or machinery and equipment. In fact, workers increasingly came to be viewed as both necessary cogs in the industrial machine and, on occasion, as potential threats to elite power and privileges, but rarely, if ever, as partners in a great ongoing experiment. In those mining and manufacturing industries populated by foreign-born workers, Anglo-Saxon managers tended to look upon them as predestined to be toilers. Indeed, it was the rare industrialist, like one Bridgeport, Connecticut, factory owner, who would acknowledge that his employees "have had a large share in enabling me to make my money and I feel I owe them some recognition of that fact." Labor participation in decision making was regarded as an abdication of management responsibility (Kent 2000, 59).

This sort of management theory sometimes ended in conflict. Workplace boycotts and even violence often resulted. In 1810, only about 75,000 Americans worked in industry. By 1860, this number had risen to 1.3 million. Conditions in factories and sweatshops were often atrocious, but workers did make gains in the number of hours worked and increased wages through the century. In 1840, the typical factory worker worked 11 1/2 hours a day, 6 days per week (Wahl 2001, 422).

As the manufacturing industry grew in the United States, factories took on a distinctive American flavor. Traditionally located next to rivers (required as a power source), factories began to spread to the cities where they could take advantage of a ready workforce and access to transportation for importing raw materials and exporting finished products. A typical American factory was powered by steam engines, with intricate systems of belts, pulleys, and drive shafts to translate the power to the various machines located throughout the factory (Timmons 2005, 94).

Endemic to these new kinds of factories was a new kind of worker. The nineteenth century witnessed the birth of the archetypal American factory worker: hardworking, dependable, moral, and upstanding—all traits expected from workers involved in the great democratic experiment that was the United States. Of course, with America's rejection of class systems, workers who displayed such traits were regularly promoted and given more responsibility, as well as the requisite salary and social standing that went along with it. The American dream was born (Timmons 2005, 95).

In one sense, people powered this dream; however, in another very real sense, power came from nature and from advances in technology. Waterpower dominated in the early nineteenth century in the United States because so much of it was available in the East and because it was cheap. In fact, in 1803 there were only five steam engines in use in the United States; by 1838, this number had grown to about 2,000 stationary steam engines. Steam engines had several advantages over waterpower, including better reliability (sometimes streams ran swiftly, sometimes not at all), and more horsepower. "Thanks to the stationary steam engine, shops could produce more goods at lower prices than before, while riverboats carried the merchandise to markets throughout most of the country." Several American inventors contributed to the steam power revolution; two of the most important were Oliver Evans and George Corliss (de la Pedraja 2001, 224–25).

Oliver Evans is a neglected figure in American history, perhaps primarily because his ideas and inventions were ahead of his time, and it would be several decades after his death before many of them came into common use. Evans's innovations included a fully automated flour mill, including several new kinds of milling tools and machines. But Evans's most important contribution was his design for a new kind of steam engine, one operating under high pressure rather than the low-pressure steam engines then in general use. Evans envisioned many uses for his steam engine.

He built steam-powered vehicles for use on land and water, and applied steam engines to various industrial purposes for mills and waterworks. The high-pressure steam engine of Evans's design became a staple in the industrial revolution yet to come in the United States.

American George H. Corliss patented an improved stationary steam engine in 1849. The Corliss engine was self-adjusting, meaning the engine could automatically increase or decrease the amount of steam going to the cylinder based on changing work requirements. Corliss and his new steam engine gained international fame when a single Corliss engine supplied power for the large array of machines on display at the Centennial Exhibition in Philadelphia in 1876. Other American inventors, most notably Charles T. Porter and John F. Allen, contributed important improvements to the steam engine. As steam engines improved, their use in various manufacturing industries increased. One of these, the textile mill, is representative of the industrial growth of nineteenth-century America (Timmons 2005, 95).

MILLS

The rise of large-scale textile mills in the nineteenth century caused a profound change in the lives of multitudes of Americans, especially children and young, unmarried women. American textile production was primarily a home-based industry before the nineteenth century. Farm wives performed the labor themselves—from cleaning the raw material, generally wool or cotton, to spinning and weaving—until a finished clothing product resulted. This process was long and tedious, but necessary if the farmer's family were to be clothed. Around the turn of the nineteenth century, small mills began dotting the landscape wherever running water could be found to power the equipment. These small mills generally performed only part of the process, leaving the individual farm wife to finish the weaving. Early in the nineteenth century, larger mills made their appearance in the United States. These mills were significant for several reasons. They generally performed all of the operations of finishing textiles, leaving nothing to be done by the individual except purchase the final product. These large mills also required new machinery and new power sources as demand for their product rose. Finally, as the mills grew in size, the need for increasing numbers of employees initiated an irreversible change in the very fabric of American life. By the end of the century, industrialization meant that more Americans worked in factories and industrial settings than in agriculture. As other large industries grew, they often patterned their organization after the textile mills (Timmons 2005, 96).

Textile mills were not the only industrial sites in antebellum America. Paper, flour, and sawmills also dotted the landscape anywhere swiftly flowing rivers could be harnessed to supply power for the machinery. In 1840, more than twice as many people worked in mills as in the iron industry, and three times as many as in machinery, hardware, cutlery, and firearms manufacturers combined. Usually, towns sprang up where the mills appeared. An observer in 1808 narrates the birth of a town:

> To this mill, the surrounding lumberers, or fellers of timber bring their logs, and either sell them, or procure them to be sawed into boards or into plank, paying for the work in logs. The owner of the saw-mill becomes a rich man; builds a large wooden house, opens a shop, denominated a store, erects a still, and exchanges rum, molasses, flower [sic], and port, for logs. As the country has by this time begun to be cleared, a flower-mill is erected near the saw-mill. Sheep being brought upon the farms, a carding machine and fulling-mill follow. (Timmons 2005, 104) (Nye 2003, 91–92, 98)

So, according to this observer, technology begot technology. What was once sparsely inhabited woodland becomes farmland as the forest is cut and the lumber is milled. As the area becomes more settled, a flour mill becomes a necessity to process the grain grown on the surrounding farms. And, of course, a small textile mill follows, as demand for manufactured products increases. All the while, a town is appearing in the former wilderness:

> For some years, as we may imagine, the store answers all the purposes of a public-house. The neighbours meet there, and spend half the day, in drinking and debating. But the mills becoming everyday more and more a point of attraction, a blacksmith, a shoemaker, a taylor, [*sic*] and various other artisans and artificers, successively assemble. The village, however, has scarcely advanced thus far, before half its inhabitants are in debt at the store, and before the other half are in debt all round. What therefore, is next wanted is a collecting attorney. . . . The attorney is also employed by the neighbours. (Nye 2003, 92)

As seen by this passage, progress brought on by technology is a mixed bag. Along with blacksmiths, shoemakers, and tailors, the members of the new community must deal with debt and collecting attorneys. The last thing to make its way into town, according to our narrator, is a church—making the village complete. Sometimes the village remained a village, or eventually disappeared altogether. At other times, the village grew into a thriving city. In addition to Lowell, Massachusetts, other milling villages included Minneapolis, Rochester, Louisville, and Richmond, to name a few (Timmons 2005, 105) (Nye 2003, 104).

Interestingly, according to historian David Nye, the preceding narrative can be retold later in the century by replacing the mill with a canal, a railroad, or an irrigation dam as the central stimulus around which a new settlement grows. The pattern remains the same: A new technology appears in the wilderness—whether that wilderness is a forest or the central plains—and around that new technology all of the trappings of civilization spring up. This view of American history maintains that everyday life is not simply *affected* by science and technology, but *shaped* by it (Timmons 2005, 105).

The location of villages, towns, and cities was often directly dependent on the location of industry such as mills; and, in turn, the location of the mills was predicated on several geographical factors. As mentioned previously, waterpower was of primary importance, at least until later in the century. In 1840, for instance, more than 66,000 mills in the United States were powered by water, whereas fewer than 1,000 were steam powered. A closely related need was a navigable waterway to float logs downstream to the sawmill, to export products of the mills and surrounding area, and to import those goods not produced locally. In addition, the flour mills, and therefore the towns, had to be centrally located so the farmer could conveniently bring his grain to be processed. Since, for instance, ground corn molded much faster than the unmilled kernels, the central location was also a must for frequent trips to the mill (Nye 2003, 94, 98).

Technological advances added greatly to the proliferation of mills in the United States. Sawmills sprung up anywhere vast virgin forests offered lumber for the taking and nearby transportation systems—natural waterways, canals, or railroads—provided a means for moving the finished product to a market. Simple innovations such as improved axes and crosscut saws contributed to increased logging, but with the advent of steam power, the logging industry took off. Water-powered sawmills made it possible to cut logs into lumber at an unprecedented rate. Inevitably, steam-powered sawmills slowly eclipsed them in number and importance (Timmons 2005, 105–6).

THE IRON AND STEEL INDUSTRY

Processes for refining ores into useful metals have long been a part of man's history. Iron and steel played an important role in the Industrial Revolution, and several nineteenth-century innovations led to increased production. Most notably, when Englishman Henry Bessemer developed, through a fortuitous series of accidents and engineering insights, a new process for making steel (the now-famous Bessemer process), demand for the product grew exponentially. From stronger rails and bridges to better machines for all purposes, steel put the exclamation point on the Industrial Revolution.

The growth of the U.S. iron and steel industry mirrored closely the development of other technologies in the country. The railroads depended on first iron, and later steel, for rails, railcars, and bridges. The steamship builders likewise used large quantities of iron and steel to build their vessels. The telegraph—and late in the century, telephone—industries needed high-quality products for the never-ending reels of wire required to connect America. Iron and steel were needed for farm and home equipment, building materials, and countless other manufacturing and industrial applications (Timmons 2005, 106).

Antebellum America lagged far behind England in iron production, producing far less than was needed by burgeoning industrial concerns. With a seemingly never-ending supply of firewood from the great eastern forests, America's iron industry depended on charcoal for processing the ore. Eventually, however, the changeover to coal smelting provided American iron producers with the competitive edge required to produce more, and higher-quality, iron. Before 1840, nearly all of the American iron production was dependent on charcoal. By 1860, anthracite coal accounted for more than 56 percent of the iron production, much of it taken from deposits in coal-rich Pennsylvania (Marcus and Segal 1989, 103) (Adams 2001, 133).

MINING

America has always been fortunate to be rich in ores, minerals, and other natural resources. Mining these resources was extremely important for industries of the United States during the nineteenth century. Advances in science and technology led the way as a small, agrarian country became, by the end of the nineteenth century, an industrial giant (Timmons 2005, 108).

One of the earliest mineral resources mined extensively in the United States was coal. Coal mining used technologies that were generally primitive, although some advances were made in the nineteenth century. Fans used to circulate fresh air, a compressed-air jackhammer, and the safety lamp all made coal mining safer and more efficient. The real imprint of technology on coal mining, however, was left by the increased demand for coal from railroads, the iron and steel industries, and other American manufacturing and business concerns (Mulcahy 2001, 336–37).

The successful miner became an expert geologist by necessity. They "learned to interpret the geological structures near their work areas and, drawing on their general knowledge, adapt their mining methods to them." Although not formally educated, the miner developed these skills over many years of on-the-job training. In his report in the *First Geological Survey of Pennsylvania,* Henry Darwin Rogers maintained:

> It is of the greatest importance in mining that the collier should make himself familiar with the derangements of the strata in his particular neighborhood, so as to determine for himself, if possible, the prevailing character and direction of the displacements. An intimate acquaintance with the underground workings of the adjoining mines, will very frequently show him that these follow a certain rule or law, and it will teach him to infer, from the presence of peculiar signs of irregularity, not only the nature of any fault or derangement which he may be approaching, but the readiest means for either avoiding or passing through it.

This informal education in the science of geology was an important tool for the coal miner (Gordon 1994, 267–68).

Coal mining was a dirty, dangerous, and cramped job requiring no small amount of skill, knowledge, and vigilance. The typical coal mine ran under the coal vein, where the miner drilled holes and used black powder to blow large areas of the trapped coal to pieces—a very dangerous procedure. The pieces were then loaded into a cart and taken to the surface. The miner was usually paid by the ton, so any impurities in the cart were not counted (Mulcahy 2001, 334–36).

In a mining process such as this cave-ins were always a fear, as were flash floods and other natural disasters. Long-term exposure to the coal dust caused a high incidence of respiratory conditions, such as black lung disease and silicosis. In addition to the dust, gases accumulating in the mines presented a constant threat. Methane, carbon monoxide, and carbon dioxide were all odorless, colorless gases that could overcome a miner before he was aware of a problem. Miners developed various methods for testing for these gases, all of which were uncertain. To test for methane, the miners could apply a "flame to a suspected pocket [of methane gas], which was very risky."

To test for carbon monoxide, the miners carried a caged canary into the mine—if the canary was overcome, the miners quickly left the area (Mulcahy 2001, 335).

Although coal miners worked somewhat independently once they entered the mine, their success—and even their lives—often depended on the skill and watchfulness of others. While deep in a mineshaft, the miner

> could be endangered by bad judgment on the part of the mine operator, by the aboveground staff handling the pumps, hoists, and ventilating equipment, or by almost anyone working underground in the mine. Other miners might, for example, block the ventilation system, cause an explosion by using candles when safety lamps were called for, or cause a crush by robbing too much coal from the pillars [that supported the ceilings of the mine shaft]. Each miner relied on the managers and owners of the mine for adequate ventilation and drainage systems and for the overall plan of mine developments. He could be endangered by the failure of past mine operators to keep adequate records of their work, thereby creating the possibility of inadvertently breaking into old, unmapped workings filled with gas or water, or by the operators of adjacent mines who, through greed or incompetent surveying, extended their underground workings beyond their property lines. (Gordon 1994, 266)

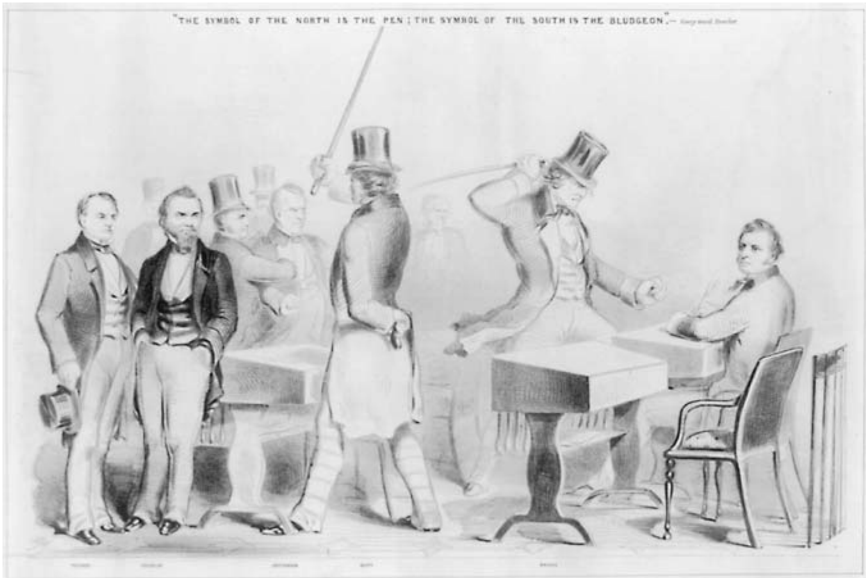
Political Life

POLITICS AS USUAL

The most modern element in American life in the first half of the nineteenth century was a vigorous interest in politics. Politics became a great national pastime, almost a hobby, shared by both the North and the South. This interest crossed many of the old social and economic lines to engage devotees from many classes in sharp debates on an almost daily basis. This widespread participation almost certainly added to the furor for war (Volo and Volo 2004, 197).

Unfortunately, restraint was conspicuously absent from the political process. Antagonists on all sides assailed their opponents with arguments taken from the law, the Bible, literature, pamphlets, election speeches, and the press. When unprepared to rebut these arguments on an equal footing the opponents often resorted to ridiculous remarks and unsupported allegations. A southern observer wrote of the period: "The hot headed politician and preacher seemed to be molding public opinion without any regard to the country as a whole. Both North and South proving, from their point of view, the righteousness of their positions by resorting to both the Bible and the Constitution" (Volo and Volo 2004, 197) (Fletcher 1997, 2).

Politics became increasingly characterized by intemperate and abusive language, or even fisticuffs, especially when the subject turned to inflammatory issues such as slavery. When Senator Charles Sumner, a man of "wicked tongue" and "intemperate language" with regard to slavery, was physically beaten with a cane by Congressman Preston Brooks in the nation's legislative chamber, the blows were struck not only in the halls of Congress, but in the barbershops, parlors, and taverns of every small town and city. Yet these attitudes cannot fully explain how the geographic sections of the nation could share so many important cultural and political characteristics and still be mutually antagonistic to the point of shedding blood. The actual causes of the war are both sophisticated and multidimensional, and any discussion along these lines inevitability remains academic. It is clear that although slavery was the root cause of secession and then civil war, it was part of a larger divide over disputes involving temperance, urbanization, poverty, politics, or economics (Bowman 1983, 383–84).



This lithograph titled "Argument of the Chivalry" depicts the assault on Senator Charles Sumner by Congressman Preston Brooks. Courtesy of the Library of Congress.

The decade before the war was one of rapid economic and social change in America; and politics was gaining a more general audience than at any time since the Revolution. The Whigs and Democrats were searching for new issues that would mobilize the voters behind the old party structure. This attempt to underscore the meaning of the old parties was to have far-reaching consequences as political and social agendas began to attract the interest of the common man and woman. One unforeseen consequence of trying to bolster the old parties was that, ironically, it would lead to their virtual dissolution (Volo and Volo 2004, 197–98).

The 1856 election proved to be the death knell of the old two-party system. In the presidential race, the newly formed Republican Party championed the slogan, "Free Speech, Free Press, Free Soil, Free Men, Fremont and Victory." John C. Fremont may have been made a national hero for his role in mapping and exploring the West, but he was an unacceptable presidential candidate in the South. The governor of Virginia warned that if the antislavery Fremont won the 1856 election, his state would secede. Consequently, the Democrats decided to run the more moderate James Buchanan of Pennsylvania. Buchanan won the election against Fremont due to the entry into the race of a weak candidate from the American Party, former president Millard Fillmore (Volo and Volo 2004, 198).

As a major third party, the Republicans had not had time to organize an electoral victory behind Fremont. Nonetheless, by the end of the decade, the Republican Party had become the foremost instrument of antislavery sentiment in the country. Its condemnation of the Slave Power forces, coupled with the earlier northern outrage over the Kansas-Nebraska Act and the Dred Scott decision, brought it adherents. The events, both real and fabricated, taking place in "Bleeding Kansas" and the schemes of fanatical abolitionists, like John Brown, to forcibly liberate slaves and promote slave insurrections, tended to radicalize even the most moderate politicians.

"Both North and South seemed to be swayed by the demagogue," observed William Fletcher, who would go on to fight as a southern private (Volo and Volo 2004, 198) (Fletcher 1997, 2).

Northern office seekers began calling for an assault on the traditions and honor of the South with all the enthusiasm that their rhetoric could convey. Such attacks fueled southern indignation, created a desire for vindictive satisfaction, and retrenched the positions of southern moderates. In a letter to a moderate northern friend, Dr. Richard Arnold of Georgia expressed a widely held opinion with regard to slavery: "The abolitionists . . . have by their intemperance, united the whole South against them as one man. . . . I will observe that with you slavery is an abstract question, with us it involves life and property, safety and security. Its abstract right I do not argue for . . . the institution of slavery, although indefensible on the grounds of abstract rights, can be defended and well defended upon this, that so intimately is it mingled with our social conditions, so deeply has it taken root, that it would be impossible to eradicate it without upturning the foundations of that condition . . . for without a population of blacks the whole southern country would become a desert." Arnold warned, "To carry their plans into effect [the abolitionists] would have to wade knee deep in blood. . . . The two races are so separated, that the one now lower, will never be allowed to mount to a perfect equality, except over the prostrate bodies of the upper" (Beston 1937, 300–301).

Prior to the nullification crisis of 1832, the shadowy line between state and federal authority had not been problematic. A contemporary observer noted that the diverse character of state governments had clearly "originated from the people" by their own "choice and formulation" and that the states "had virtually managed by themselves" without federal interference. After the nullification crisis of 1832, however, southern radicals urged the defense of states' rights and began to call for disunion as the best means of protecting sectional interests. The threat of secession came to dominate the rhetoric of many southern politicians, and the concept of states' rights was raised to the level of political gospel during the decade of the 1850s. Many southern leaders espoused secession only sporadically, and usually only during an election campaign. Those who did otherwise did not achieve lasting prominence. However, among these were the southern radicals called "fire-eaters," who were conspicuously in the forefront of the clamor for secession and served as consistent and effective proponents of disunion. What they started as an intriguing political device, however, soon got out of hand as common southerners took the concept of a nation independent of the North to heart and were swept up in a reckless euphoria for secession and the establishment of the Confederacy (McCarthy 1993, 3).

Secession in some form was a widely popular movement supported by a vast majority of southern whites. Secessionist sentiment pervaded the churches, the shops, and even the schools. Prosecession radicals smashed unfriendly presses, banned books, and fought duels with Unionists. The fire-eaters turned every news article, pamphlet, sermon, and play into a propaganda piece for secession. Even minor confrontations with the Unionists, or with the abolitionists, were declared crises upon whose immediate resolution rested the very survival of the South. Warfare in Kansas, the publication of *Uncle Tom's Cabin,* and the antislavery raid of John Brown at Harper's

Ferry gave credence to the tales of the fire-eaters. When there was no crisis, the radicals were fully capable of fabricating one. Southern leaders in Congress proposed the reopening of the transatlantic slave trade in 1859 without hope of the question being resolved in their favor so that the radicals might use the issue to good effect as propaganda.

Both the southern fire-eaters and the northern reformers were aided by a highly partisan and radical press. Public orations, electoral debates, and harangues were popular instruments used to drive public opinion, and they were well attended. Nighttime assemblies of placard-carrying zealots in streets lit by burning torches and oil lamps were particularly attractive to many people simply because of the spectacle they provided. Yet these forums addressed only those who could be present, producing a somewhat transient enthusiasm for the particular topic of discussion. Therefore, the nineteenth-century citizen favored the newspaper as a more individualized and enduring form of information. Newspapers gained influence steadily during the first half of the century. An incredibly large number of local publications appeared along with topical news sheets like the antigovernment *Citizen Soldier,* the antislavery *Liberator,* and the antialcohol *Temperance Recorder*. Speeches were printed in these papers in their entirety within a few days of their presentation. Political arguments, essays, letters to the editor, and discussions among dedicated readers—both genuine and planted for effect—flowed in the wake of every issue (Volo and Volo 2004, 200).

REFORM MOVEMENTS

It was socially encumbent on the well-to-do or those from the middle class to join a reform movement, and many well-educated Americans, especially young women lacking a venue to express their political will, were active in pursuing the objectives of the societies and organizations that they joined. The majority of the reform movements initiated prior to the Civil War were essentially benevolent, and they were characterized by the of activism of the "haves" for the "have-nots" rather than by a demand for reform from those who were oppressed. Philanthropic reforms in the antebellum period focused almost solely on the destitute or visibly degraded elements of society, including paupers, drunkards, orphans, widows, illiterates, Indians, slaves, prostitutes, and prisoners. Reform activities were characterized by a laudable urge to remedy visible social ills, alleviate suffering, and discourage behavior that was considered immoral. The planter aristocracy was remarkably intolerant of social reform and disdainful of activism. Southerners were particularly incensed by northern reformers working in the South, and repeatedly expressed a frustration with those that crusaded for or against what they termed the "isms" (abolitionism, alcoholism, feminism, pauperism, republicanism, etc.) (Volo and Volo 2004, 200).

The dangers of immoderate drinking, for example, were real, and alcoholism could end in disaster. Strong drink was often cited as the cause for eternal damnation and earthly licentiousness, as well as spousal abuse and rape. In fact, the temperance

"The bad husband: The fruits of Intemperance and Idleness" by Currier & Ives (1870). Courtesy of the Library of Congress.

movement was very closely allied with women's rights issues such as suffrage and abandonment. This may have mirrored a rising tide of female discontent with their place in the social order. Women took up the temperance struggle by forming prayer groups and railing against saloons and their bottles, mirrors, and portraits of reclining nudes.

The temperance movement was set back for a time in the 1850s by the defection of many activists to the cause of abolition. Yet the temperance reformers increased the stakes of their game and insisted on total abstinence from alcohol in any quantity or strength and supplemented their demands with calls for its legal prohibition. This shift from moderate and sometimes symbolic goals to conclusive ones, carved into the legal fabric of the nation, was typical of many of the reform movements of the nineteenth century. Besides their well-known intolerance for abolitionists, social conservatives in the South also deplored the development of free public schools, and they worked to rid their communities of the destitute Indian population by removing them to the western wilderness. Moreover, they exhibited a remarkable toleration of prostitution—at least in private. Southern antipoverty reforms emphasized a faith in the efficacy of the kinship system (a responsibility that they took quite seriously), preferring to succor the abandoned members of society in their homes rather than to consign them to some anonymous agency. Of course, the needy were much less conspicuous and more sparsely concentrated in the largely rural areas of the South than they were in northern cities (Volo and Volo 2004, 201).

Many in the North were no more fond of reformers than those in the South, and reform activists remained a minority even among the population of the North. Much of the resistance to reform was based in a natural social inertia, but some of it was caused by the inability of the activists to articulate the scope and righteousness of their agenda to the public. Moreover, the abolitionists became increasingly acrimonious and alienating in their rhetoric, and some among them even called for the abandonment of the Constitution and the dissolution of the government to save the Republic from the corruption of slavery. Many of them disrupted religious services at proslavery churches and castigated the clergy and the antislavery moderates as conspiring with southern "Slave Power." Those that espoused such sentiments were widely viewed as interventionists, fanatics, or worse. The activists proved most controversial in their insistence on immediate and total reform, and in their unwillingness to compromise. This was particularly true of the radical abolitionists who demanded that the government supplement intellectual persuasion with legal coercion in many areas (Volo and Volo 2004, 201–2).

Religious Life

RELIGIOUS REVIVAL

The United States has been a predominantly religious country from its inception, and the antebellum period was one of great religious revival fueled largely by a Protestant crusade in the East, camp revivals in the settlements and on the frontiers, and a political backlash brought about by an immense influx of Irish Catholics into the cities of America. The religious character of the country was essentially rooted in the Protestantism of England, Scotland, and Wales, but many new sects had joined the list of traditional Christian religions popular before the Revolution. Europe was swept by great religious wars and moral awakenings during the colonial period, which resulted in waves of religious zealots and exiles crossing the Atlantic. Spanish and French Catholics, Protestant Walloons and Huguenots, Dutch Calvinists, English Puritans, Quakers, Scots-Irish Presbyterians, German Lutherans, Baptists, Anabaptists, and Moravians were all moved by much the same religious spirit. Yet religious bigotry influenced many largely well-meaning clergymen, both Catholic and Protestant, and encouraged intolerance among those who chose to do God's work (Wallace 1996, 51).

The First Great Awakening, a complex movement among a number of interrelated religious groups, swept through colonial America in the eighteenth century. Begun in the 1720s by the Reverend Theodore J. Frelinghuysen, a Dutch Reformed minister from New Jersey, this movement spread into New England and reached its peak in the 1740s under men like Jonathan Edwards. In the South, it continued through the American Revolution in several distinct phases led respectively by Presbyterians, Baptists, and Methodists. Everywhere, the First Great Awakening stressed personal religion and multiplied the number and variety of churches and congregations. There were an estimated 3,100 religious congregations in the English colonies at the close of the colonial period. While this number was almost equally divided among the several regions of New England, the Middle colonies, the Chesapeake, and the Carolinas, there was an unequal distribution among the different denominations giving each region a distinct religious character (Callahan 1963, 125–26).

The Protestantism of the framers of the Constitution from New England had been essentially related to the Puritanism of the Congregational churches, whereas those from the South were generally Church of England (Anglican). Quakers, considered dissenters since colonial times, congregated mainly in Pennsylvania, and pockets of Catholicism could still be found in Maryland. The country was also characterized by a wide variety of newcomers: Germans, Scandinavians, Swiss, Welsh, French Huguenots, and Jews. The Scots-Irish immigrants added an element of Presbyterianism to American religious life, and later the Baptist church became popular among the Welsh and Germans. The frontier digested a wide variety of these immigrants, but most of them were within the same religious compass of essential Protestantism. Both the Presbyterians and the Baptists played a major role on the frontier.

Lutherans—largely Germans and Scandinavians—were the first to introduce a new element to the religious mix. Nonetheless, their churches were essentially Protestant, and they were assimilated with little fuss into the American social fabric (Volo and Volo 2004, 20).

Yet not all of the religious sects of antebellum America were considered legitimate by society in general because many sects espoused doctrines that were obviously on the fringe of traditional Christian beliefs. Some Christian evangelical revivals, particularly those headed by powerful preachers such as the Reverend Charles G. Finney of western New York and the Reverend Lyman Beecher of Boston, provoked less-thoughtful followers of mainstream American Protestantism to take up the rhetoric of the anti-immigrant and anti-Catholic. They created and published salacious rumors and anecdotes that distorted the beliefs and activities of many of these Protestant minority religions. A number of these minority religions can be considered pietist in nature because they generally abandoned a strict church structure and hierarchy. Shakers, Quakers, Moravians, Fourierists, Mennonites, Anabaptists, and other pietist sects generally emphasized inner spiritual life and a personal path to salvation and denied the need for a more formal ecclesiastical organization (Volo and Volo 2004, 20–21).

Although Quakerism had been a major component of American religious life since colonial times, it was essentially a pietist religion and many Americans viewed its adherents with suspicion. Moreover, the English-speaking Quakers, Shakers, and Fourierists were largely distinct from the Mennonites, Amish Anabaptists, and Moravians who originated in Germany, Switzerland, and other parts of central Europe. The Germans penetrated into the far northwestern portion of New Jersey and west into the region of Reading and Harrisburg, Pennsylvania. They tended to separate themselves from other groups, a process aided by their lack of the English language. Joshua Gilpin, traveling through this region, noted, "I never knew before the total want of a language for in this respect we might as well have been in the middle of Germany." Isolated in this manner, the Germans achieved a far greater social solidarity than any other group on the frontier (Volo and Volo 2004, 21) (Gilpin 1922, 25).

A SECOND AWAKENING

It was the Christian revival at the beginning of the nineteenth century—generally viewed as the Second Great Awakening—that most affected the religious life of American society before the Civil War. This religious revival drew its vitality from the southern and western frontiers rather than from New England. Beginning near the Gaspar River Church in Kentucky in July 1800, the spark of faith was ignited at camp meetings in the Midwest and was proclaimed throughout the nascent frontier settlements by an army of traveling evangelists and self-ordained preachers. Some ministers, having been brought up on "rigid Calvinism" and having been taught to preach "the doctrine of particular election and reprobation" in earlier years, revolted and, having no correct books on the new theology, "plunged into the opposite extreme, namely, universal redemption." This sort of evangelism, with its strong emotional appeal, spirit of optimism, and promise of unconditional salvation to all of mankind, was particularly influential among nineteenth-century Americans (Volo and Volo 2004, 21) (Beston 1937, 299).

Peter Cartwright, a contemporary observer of the process, noted,

> Ministers of different denominations came in, and preached through the country: but Methodist preachers were the pioneer messengers of salvation in these ends of the earth.... A Methodist preacher in those days, when he felt that God had called him to preach, instead of hunting up a college or Biblical institute, hunted up a hardy pony, or a horse, and some traveling apparatus, and with his library always at hand, namely the Bible, Hymn Book, and Discipline, he started, and with a text that never wore out or grew stale, he cried, "Behold the Lamb of God, that taketh away the sin of the world!" In this way he went through storms of wind, hail, snow and rain; climbed hills and mountains; traversed valleys; plunged through swamps; swam swollen streams; lay out all night, or tied to a limb slept with his saddle blanket for a bed, his saddle or saddle bags for his pillow, and his old big coat or blanket, if he had any, for covering. (Beston 1937, 299–300)

During the day nothing appeared unusual in the sprawling and smoke-filled revival camps with their scattering of white tents, knots of canvas-covered wagons, and bands of scurrying children and barking dogs. The occupants followed the same slow-paced routines of cooking, cleaning, and caring for the livestock found in other camps on the immigrant trails. However, nighttime drew the faithful together and transformed them into an army of God. With campfires blazing, a thunderous din of singing, and preachers beseeching the gathering to repent so that they might be saved from the fires of hell, the crowds reached a peak of religious frenzy. A circuit riding preacher, Lorenzo Dow, described a camp meeting in his journal: "About three thousand people appeared on the ground, and the rejoicing of old saints, the shouts of the young converts, and the cries of the distressed for mercy, caused the meeting to continue all night." Many shook, jerked, and rolled on the ground until they fell away in a faint (Volo and Volo 2004, 22) (Chase 1966, 211).

Methodists and Baptists reaped a rich harvest of souls at this time. By the 1830s, Methodism had become one of the two largest religions in the country, and the Baptists, in particular, had made great inroads into the black population, both free and slave. Under the influence of an evangelical spirit, most American Protestants came to believe that the path to salvation lay in placing themselves in a position to receive God's grace if they were worthy. This belief was to have a profound effect on Civil War soldiers who strove to be worthy of God's protection by exhibiting courage and steadiness under fire.

The Second Great Awakening spread new religious sects like a wildfire. Campbellites, Shakers, Rappites, Fourierists, and other minor religions popular in the North espoused theories of associative communism and utopian socialism by making provisions for the correction of inequalities of temporal possessions among their members. Many members gave up all their wealth or placed it at the disposal of the congregation. Unitarians (the followers of which were largely devoted abolitionists), Universalists, and Disciples of Christ splintered away from established churches, while Mormons and Adventists sprang from the soil of America itself. Nonrevivalist churches, especially in the more traditional South, trailed behind (Volo and Volo 2004, 22).

SLAVERY

Slavery

The early history of slavery in North America is poorly documented and inconclusive. It seems certain that none of the founders of the first English colonies anticipated a dependence on black slaves. While the first Negroes brought to the English colonies were formerly thought to have been exclusively slaves, recent research suggests that some of them were actually indentured servants or free craftsmen. It is equally clear that there were distinctions made between black and white laborers and servants in even the earliest English colonies; but in a society where whites were often degraded and treated as brutally as slaves, social distinctions often proved more important than racial ones (Volo and Volo 1998, 61) (Davis 1994, 5).

The distinction between free blacks, black indentured servants, and black slaves quickly blurred. Free blacks seem to have preferred to live in an urban setting and were twice as likely to live in cities as slaves, who were primarily agricultural workers. In cosmopolitan areas free blacks and slave craftsmen found opportunities for employment, exposure to black culture and religion, and the company of other freemen. However, the majority of free blacks lived on the margins of poverty and were subject to detention and questioning by the authorities without cause. They were continually encouraged to sell themselves back into slavery (Volo and Volo 1998, 62).

By the beginning of the eighteenth century, race-based slavery was firmly established in English North America. During the eighteenth century slave labor proved profitable principally on large-scale plantations that produced a cash crop, though small slaveholders benefited from the extra labor and the property value of their slaves. At the time only tobacco and sugar seemed to satisfy this requirement. Growing tobacco had saved Virginia and Maryland from extinction once the quest for gold and precious metals had been quelled by failure. Tobacco was used as cash, in lieu of cash payments, and as collateral for loans. Tobacco bonds, which encumbered the profits of future crops, were even accepted in lieu of taxes. But intensive tobacco farming was hard on the soil, stripping it of valuable nutrients that could not easily be replaced in an era before synthetic fertilizers. In the Carolina Low Country the production of rice was particularly lucrative, but rice cultivation was hard on the slaves, who suffered ghastly levels of mortality in the pest-infested humidity of the rice fields. If a large planter of tobacco or rice were fortunate enough to have three good agricultural years in a row, he could become wealthy (Volo and Volo 1998, 62–63) (Davis 1994, 4, 6, 22).

Rich southerners maintained their "planter aristocracy" through the Revolution and into the nineteenth century. Certainly there were upper and working classes among the whites, but nowhere was the equality between white men so complete as in their ability to force enslaved blacks to work and remain a subjugated people.

Of the 10,000 plantations that came to rely on slave labor in the antebellum period, fewer than 10 percent had more than 100 slaves. The institution of slavery had been in decline for some time before the Revolutionary War, particularly, among the small tobacco planters who had worn out their soil. In some areas of the upper South, slaveholders had switched to growing wheat and other crops and began to sell their surplus slaves to the expanding cotton areas of the Gulf region (Volo and Volo 1998, 63).

The importation of slaves into the United States was outlawed in 1808, but the ownership and selling of slaves within the confines of the country continued and grew (Volo and Volo 1998, 63–64).

Cotton invigorated the plantation system and breathed new life into slavery after the American Revolution. By the mid-nineteenth century cotton accounted for two-thirds of the exports of the country and created an unprecedented demand for agricultural laborers. The widespread adoption of the cotton gin, which economically removed the seeds from short-staple varieties of cotton, opened up cotton production into the Deep South in the antebellum period. A slave, who could process 100 pounds of cotton per day without the cotton gin, could process 1,000 pounds of fiber in the same time with it. Estimates show that by 1860 there were more than 3.6 million black slaves in the states that were to form the Confederacy. Profits from cotton in the Carolinas to Texas and from sugar in Louisiana provided a financial bulwark for slavery in the Deep South.

Virginia, noted for its production of tobacco rather than as a cotton producer, became a major supplier of slaves to other areas of the South. In 1860 the estimated value of all the slave property in the Old Dominion alone was more than $300 million. Virginians found that they could make more profit selling slaves than using them as laborers. In the three decades before the war, more than a quarter million slaves were "sold south" from Virginia alone. In 1860 young black men aged 19 to 24 could bring between $1,300 and $1,700 in the slave market; and young women between 16 and 20, from $1,200 to $1,500. Slaves with skills brought higher prices. Blacksmiths, wheelwrights, and furniture makers sold at a premium, as did particularly comely young women. Children, the aged, and the unskilled brought less. A healthy child four months old was considered worth $100 in North Carolina. The average price for a slave, taking all ages and sexes into account, has been estimated to have been $1,500. The largest number of slaves purchased were young men. Few children or older slaves saw regular trading. This difference helps to explain the high average of $1,500. It should be noted to place these values in perspective that a white overseer on a moderate-sized plantation could expect to receive a salary of only $200 to $500 for an entire year's work (Volo and Volo 1998, 64).

PLANTATION SLAVERY

The extent of the various physical mistreatments to which slaves were exposed and the psychological effects of being held in bondage are subjects of great interest to historians. A northern visitor to the South testified, "It is almost impossible to believe that human nature can endure such hardships and sufferings as the slaves have to go through." Although slavery was a great evil and was oppressive everywhere, the burden imposed on the individual slave varied depending on the master and the region of the country in which the slave resided. Profession and practice with regard to slavery were so complex that they were frequently radically different things, and generalizations in this area must be carefully drawn. At its core, slavery depended on violence, threatened at least, applied too frequently. The practices that served to underpin the institution of slavery in the South were becoming more harsh as the century progressed. This was especially true with respect to questions of black education, manumission, and the status of free blacks, though the physical care of slaves was improving, especially in the older seaboard states (Volo and Volo 1998, 65) (Strother 1962, 201).

There seems to have been a striking difference between the treatment of slaves in the small towns and cities of the South and that of blacks held on plantations. Both the material mistreatment of the "whip-driven" slave on the plantation and the "freedom" enjoyed by urban slaves, as well as black freemen, were exaggerated by antislavery advocates at the time, but notwithstanding such exaggeration, there was almost certainly a relative disadvantage to being a plantation slave. Yet the ability to create an African American slave community on plantations mitigated some of the harshness—or so some historians claim (Volo and Volo 1998, 65–66) (Blassingame 1973, 33).

The systemic abuse of black freemen was generally limited to the rural areas of the South and was much less common before the war than after. Southern blacks lived hard lives, yet many displayed fortitude, courage, and a sense of dignity throughout. Nonetheless, on the eve of the Civil War there were blacks in the South, themselves free, who owned slaves, used slave labor in their businesses, and condoned slavery. Black slaveholders often were those who owned family members, who otherwise would be enslaved to whites. There were also free blacks, especially shippers, tradesmen, and artisans, who owned slave workers, an arrangement often entered into in lieu of an apprenticeship agreement. In 1830, more than 2,000 black slaves were owned by free black masters in New Orleans alone (Volo and Volo 1998, 65–66).

Cabins where slaves were raised for market. The famous Hermitage, Savannah, Georgia. Courtesy of the Library of Congress.

The campaign to emancipate these slaves raised interesting questions about the sympathies of free blacks who owned slaves. Black masters had their rights as slaveholders recognized in law in most states. They could therefore stabilize their workforce and provide a modicum of legal protection for their loved ones. In Louisiana especially, these men were highly educated, cultured, and sophisticated in their outlook, and they were decidedly against any form of gradual emancipation without indemnification.

The available evidence about the conditions surrounding slavery comes to us from a variety of sources. Ex-slave autobiographies and narratives based on oral interviews are one major source of information. Many of these were taken down in the 1920s and 1930s by folklorists and government workers desperate to document the details of slave life before its participants faded away. These narratives were given by people who were, on the average, over 80 years old and had been children when the Civil War began. Additional sources are found in the letters, diaries, and contemporary writings of the slaveholders, and in the collections of plantation records, Freedmen's Bureau documents, and other written material dealing with the slave trade and plantation management that survived the war. More recently, historians have used archaeology, musicology, folklore, and linguistics to recover the experience of bondage from the slaves' perspective.

Slave autobiographies, in particular, have been used by historians extensively and with caution. Under close scrutiny they often turn out to be carefully crafted propaganda pieces, rooted in truth but designed by the abolitionists to appeal to all the dissimilar reform groups of the North. Still, such accounts give rare contemporary views of bondage from the slaves' point of view. The *Narrative of the Life of Frederick Douglass An American Slave* (1845) was the most popular and today the commonly referenced work in this regard. Douglass was a slave in Maryland for more than 20 years, and his book, published by the American Anti-Slavery Society, was replete with descriptions of the physical abuses of slavery, including whippings, rape, unwarranted punishments, and cold-blooded murder, though its main theme was how through learning to read and stand up for himself the slave became a man. The work appealed to a wider audience of reformers than just those who favored emancipation. Proponents of women's rights, temperance, public education, and immigration reform all found something to stir them in Douglass's work (Volo and Volo 1998, 66).

Southern readers pointed with incredulity to many of Douglass's childhood memories of the whipping and murder of his fellow slaves, and many whites were convinced that the stories were patently false, though Douglass named names and provided details easily corroborated by other sources. Between 1845 and 1850 the book sold more than 30,000 copies and was regarded by many in the North as a true picture of slavery in Maryland. The *New York Tribune* reviewer, himself an abolitionist, praised the book upon its publication for its simplicity, truth, coherence, and warmth, and it became almost the template for the genre of such works (Volo and Volo 1998, 68).

In the 1860s there was an explosion of handwritten testimony from slaves recently freed by federal troops. New Orleans fell to federal troops early in the war, and there was an active attempt to document the system of slavery in the area around that city. While historians know more about slaves in New Orleans during the war than in any other southern city, it was hardly an archetype of southern slavery. New Orleans boasted the largest black community of any city in the country at the time, composed of numerous free black businessmen and artisans, urbanized former slaves, and recent refugees from the plantations.

Nonetheless, the data that were compiled are useful, particularly since the slaves could not be expected to leave much in the way of other written documentation (Volo and Volo 1998, 66).

The accounts of slave society written by slave owners are also used with great caution by historians even though they are plentiful and regarding the business of slavery vastly superior sources of detailed information. These sources of information about slavery reside largely in the daily reports of plantation activities and the internal records of slave trading establishments. Considering them along with published tracts on the "Management of Negroes," private letters and papers of slaveholders, and advertisements for fugitives, we can at least surmise an accurate picture of what slaves looked like and did, even if we cannot get a reliable view of how they felt or what they thought (Stampp 1980, 43–45).

SLAVE CLOTHING

It would be an error to generalize about the standards of slave attire before the war based on Civil War documents. The physical appearance of slaves in the war-torn South was widely documented by the illustrated newspapers of the day and, to a lesser extent, with photography, but little of their condition prior to the war had been so documented. The photographers of the period, notorious for staging their shots, took very few pictures of common slaves. An exception to this is the series of photos taken immediately after the war that documents the scarred condition of an elderly man's back (Volo and Volo 1998, 68).

Slaves were a valuable form of property, and, as such, their owners had a financial incentive to keep them in good health. Plantation slaves were often clothed in coarse but durable trousers, shirts, and skirts made from "Negro-cloth," usually a form of coarse linen. Shoes were purchased for the plantation workers by the barrel, and most former slaves complained of rarely having had shoes that fit well. In 1839, a visitor from the North testified as follows: "The allowance of clothing on [one] plantation, to each slave, was given out at Christmas for the year, and consisted of one pair of coarse shoes, and enough coarse cloth to make a jacket and trousers.... The slaves on this plantation, being near Wilmington, procured themselves extra clothing by working Sundays and moonlighting nights." The women received the same allowance of cloth as the men (Volo and Volo 1998, 68) (Strother 1962, 197)

Slave Workweek

Slavery called for long hours of work and trying conditions by modern standards. Most slaves worked from sunup to sundown in the fields, or until the work was finished when working indoors. During harvest or corn husking, slaves could be found working into the early hours of the morning. Slaughtering, in late fall, was a bloody and offensive task that allowed no interruption for rest. Nonetheless, the testimony of former slaves suggests that there was time to do extra work "on the side." The workweek ran from Monday to Saturday noon and respected the Sabbath. Most blacks were restricted to the plantation and lived in the village of huts or cabins provided for them. Any slave found off the plantation without a pass ran the danger of being "whipped on the spot" by the slave patrol, and if he resisted capture he could be shot. Slave housing was poor; heat in winter and ventilation in summer were generally haphazard, if not altogether absent. The plantations were therefore a strange combination of labor camp, racial community, and in some cases Christian mission (Strother 1962, 203).

Slave Food

The food provided for slaves was of poor quality by modern standards, and the diet was periodically unbalanced. Yet even the slave narratives suggest that foodstuffs were often abundant. Much of the food given to slaves was thought to be offensive or unwholesome. Whites normally did not eat chicken necks, gizzards, or pig's feet; and the small intestines of hogs, made up into chitlins, and kush, a mixture of bacon fat and cornmeal, were considered less than appealing to the delicate palates of white slave owners. Wheat flour, white bread, and beef were almost unknown to slaves. Nonetheless, ham and gravy, fried chicken, ashcake, and hoecake—all standards in modest white households—were also found in slave kitchens. To supplement their diet, slaves were allowed to grow their own vegetables and to catch fish, squirrels, raccoons, opossums, and rabbits (Volo and Volo 1998, 69–70).

Slaves were periodically issued molasses, salt pork, okra, peas, collard greens, turnips, and black-eyed peas. These foods supplemented a steady diet of cornmeal, fresh or parched corn, and potatoes or yams. Salted codfish was a staple of the slave diet in many localities. Purchased from the New England fisheries, it was identical to a familiar staple item in many European communities, especially those along the Atlantic and Mediterranean coasts of Spain and Italy. Surprisingly, slaves seem to have received sufficient calories and nutrients from this diet to allow for the heavy labor to which they were put, though the diet led to health deficiencies (Volo and Volo 1998, 70).

Slave Entertainment

Slaves had no form of entertainment outside of that which they provided for themselves. As their work was tiring to the point of exhaustion, the very idea of leisure activities was displaced by a need for rest, if not sleep. Nonetheless, slaves found personal tasks to perform in their nonlaboring hours. Mending clothing, tending gardens, fishing and hunting, and caring for children and relatives took up much of their time. There were opportunities for enjoying music, dancing, storytelling, and simple sports such as footraces. Amusements included pitching horseshoes, gambling, cockfighting, and playing at marbles, checkers, or games of African origin. A good deal of time was spent in community activities such as church services, visits to the sick and elderly, and other comparable family activities (Volo and Volo 1998, 70).

Legal Rights for Slaves and Discipline

Unlike white employees, slaves were not free to change their condition should it become too burdensome. They could be physically chastised by their masters for many forms of disobedience, for insolence involving a white person, and for petty crimes. Incredibly, masters did not have unlimited legal power over their slaves. In law anyway, a slave accused of a felony could not be purposely mutilated, maimed, or killed as a punishment without the intervention of a court. The jurisdiction of these courts varied from place to place, but generally their procedures were set down in the Black Codes (Volo and Volo 1998, 70).

Of course, a slave defendant was not entitled to a jury trial. However, a hearing officer was required to determine the merits of the case and to act as a finder of fact. The county would then mete out punishment to slaves found to be guilty of serious crimes. As the hearing officers came from the community of free white slaveholders, questions of guilt or innocence were often moot. Nonetheless, the slave was allowed to make a defense. In such a case, the defendant needed to rely upon his own testimony or the testimony of other slaves. Slaves could not subpoena whites to testify. Both the Black Codes and custom gave great leeway to the officers of the court in determining the nature of any punishment (Volo and Volo 1998, 70–71).

As slaves were valuable property, masters looked down on any form of physical punishment that permanently devalued their slaves. Some masters intervened in behalf of their slaves even when their guilt had been firmly established. Hamstringing, various forms of dismemberment, and death, while not complete figments of the abolitionists' imaginations, were uncommon punishments for mere disobedience or petty crime. If only for economic reasons, the master wanted to maintain a chastised but physically capable slave in his employ, not a handicapped cripple. Punishments most often took the form of an informal laying on of the ever-present lash, while a hitching up to the whipping post for a formal flogging was reserved for major offenses. Masters also had the option of selling the unrepentant slave to the far South, into the interior, or to the disease-infested sugar plantations in lieu of punishment. The slaves themselves attest to such goings-on, and in very few narratives are such events absent (Volo and Volo 1998, 71).

Slave owners on large plantations rarely punished their bondsmen personally. This was left to the overseer. Overseers came and went on individual plantations, and "some were too severe on the Negroes . . . brutified by their employment, [and] little better than the Negroes they managed." These white men were aided by slave drivers, who, although black slaves themselves, could apply the lash with regularity and were used to chase down fugitives. Some blacks, like the slave drivers, were characterized as "white folks' servants," devoted to the master and his family and alienated from the general slave community. They were viewed by other slaves with disgust, as it was feared that they might curry favor with the master at the expense of other slaves by betraying them. Of course, on farms and small plantation, masters wielded the lash themselves. And in the "big house" slave masters and mistresses meted out punishments directly (Volo and Volo 1998, 71) (Sullivan 1995, 5).

Flogging was the most widespread form of discipline and punishment. Corporal punishment in many forms was highly common in nineteenth-century America, even in the North. Schoolmasters caned their disobedient or lazy students; fathers accompanied their progeny on repeated trips to the woodshed with a razor strop or belt in hand; prisoners were ruthlessly beaten with sticks and whips by their jailers; and soldiers and sailors were frequently punished by flogging, sometimes to the point of death. Notwithstanding these facts, slaves were certainly exposed to excessive and unwarranted cruelty through no fault of their own.

While on an intellectual level southerners claimed racial superiority for the white race, they nonetheless depended on blacks to tend their animals, repair their vehicles, cook their food, and care for their children. White slave owners were intimately involved with blacks almost all of their lives. In the isolation of the great plantations, it was possible that most of a white person's dealings, in human terms, were either with family members or blacks. Some slaves were able to accompany their owners on trips to the town or city, and, once there, they were sent off on their own, with a pass, to do their master's business. It is strange to consider that white slave owners, who so underestimated the value of human beings as to enslave them, were also able to entrust their bondsmen with the well-being and protection of their property and families. This fact seems to say much more about the humanity and responsibility exhibited by the slaves themselves than about their masters (Volo and Volo 1998, 71).

Race-based slavery promoted a type of equality among all white southerners regardless of their social status. The lowliest white man could find comfort in the knowledge that he was the legal superior of even the wealthiest black freeman. Yet many slave owners found it undesirable to have lower-class whites living on the fringes of plantations, where the slaves could be "impaired by contact with white labor." Although it is uncertain with how much respect these whites viewed the black freeman, it would be common for them to have to deal with free blacks as laborers, tradesmen, and artisans. The working white population in much of the South exhibited far less abhorrence of blacks than did many in the upper and middle classes in the North (Volo and Volo 1998, 72) (Stampp 1956, 150–51).

BLACK CHURCHES

Even in the absence of physical abuse or brutality, the institution of slavery did great harm to the bondsman. Southern blacks countered by drawing great strength from a number of traditional and cultural sources. In the years before the abolition of the slave trade new arrivals from Africa exhibited a heavy dependence on their own tribal religions. In Louisiana and the West Indies many African religious practices came to be fused into a widespread religion known as Voodoo, "which penetrated into every level of Black society." Slaves bought charms and amulets to control their masters, obtain money, ensure love or good health, or bring harm and even death to enemies and nonbelievers. The New Orleans *Delta* reported in 1854 that the participants "strip themselves naked and then commence a strange, wild sort of Indian dance" (Volo and Volo 1998, 73) (Blassingame 1973, 5–6).

White society deemed such activities pagan, innately evil, and inconsistent with its own dedication to Christianity. In any case, few enslaved blacks in the United States practiced voodoo. They did bring into their religious lives various African religious beliefs and practices. Many African religious practices were rooted in a communication with the natural world. By extension, many whites came to be intolerant of all forms of African culture that they did not understand. Slave owners, even benevolent ones, if they cared about controlling slaves' religious lives, tried to strip blacks of their tribal religious cultures. Slaves were expected to exhibit moral behavior reflecting the mores of the God-fearing Christians whom they served. The responsibility for Christianizing the slaves, baptizing their infants, and nurturing in them a fear of the Lord was seriously regarded by whites, at least on paper, though systematic efforts to evangelize slaves did not begin until the 1830s. Many slaves were therefore forced to attend conventional religious instruction for the good of their souls, but much evidence shows such slaves did not accept white-dictated religion wholesale and that they brought to biracial churches their own ideas regarding character and demonstration of one's faith (Volo and Volo 1998, 73).

White southerners used their religion to validate the concept of race-based slavery, but their religion made the masters neither more humane to their slaves nor more likely to emancipate them. Some of the most brutal masters were avid churchgoers. A southern woman wrote in her journal with regard to slave owning, "The purest and holiest men have owned them, and I see nothing in the scriptures which forbids it." White ministers often preached to the blacks in a manner calculated to make the slave satisfied with his lot as an expression of the will of God. It was not unusual for the white clergy to own one or two slaves as servants. Sometimes slaves were provided by the congregation as part of the living given to the minister. Some churches, especially the Methodists and Baptists of the South, gave up a previously antislavery sympathy to focus on saving souls. Since many of the white man's churches upheld slavery, many blacks became suspicious of organized religions with white origins (Douglass 1968, 67) (Sumner 1918, 38).

There were churches established exclusively for slaves by their owners, but the presiding white ministers, who were in the forefront of defending slavery from the pulpit as the natural and correct place for the black race, were generally disliked. Most free Negroes in New Orleans attended the Catholic church, where they enjoyed an almost equal standing with the white congregation. Separate black congregations grew in number among many sects because the white congregations of their denomination did not welcome black freemen. A growing army of black ministers was thereby able to found parishes among the freemen and slaves of the South. The African Methodist Episcopal (AME) churches had the most prominent black ministers of the period. In New Orleans there was a congregation of the Methodist church supported by more than 600 slaves; and the black Baptist church had 500 members. White authorities feared any large meeting of blacks and broke up these religious services on a regular basis for the most trivial of reasons.

There were two very different types of religious services common to black churches. In the upper-class churches, populated by large numbers of freemen, there was a great dedication to religious form and ceremony. The services were less passionate and affected a greater intellectual appeal and attention to social problems than in the lower-class churches. The communicants of the lower-class churches were primarily composed of slaves and poor blacks who held a strong belief in the power of God in their everyday lives. They emphasized revelations, visions, dreams, and outward expressions of redemption. Worship was often accompanied by shouts, cries, dancing, and other forms of joyful noise. Nonetheless, in each form, some of the African music, folk heritage, and dance survived. With time, blacks were able to blend many of their African beliefs with the biblical teachings of Christianity. Both types of worship, although generally dividing the black community along class lines, served to uphold the structure of black life in a nation that cared little for blacks except as chattels and laborers. The church proved to be one of the more durable black institutions (Volo and Volo 1998, 74).

THE SLAVE FAMILY

Another important social institution among blacks was the family. That the slave family was an incredibly unstable institution was hardly surprising in that slaves were recognized principally as chattel property in law and masters had almost complete control over their disposition. A former slave noted, "There were on this plantation about seventy slaves, male and female: some were married, and others lived together as man and wife, without even a mock ceremony.... The slaves, however, think much of being married by a clergyman." Since marriage was considered a legal medium by which property was handed down, and the slave had no property, the law saw no reason to recognize the union of slaves as binding. Some morally scrupulous planters encouraged slave marriage as opposed to the immorality of open promiscuity (Weld 1839).

Investigators in New Orleans during the federal occupation recorded more than 500 marriages that had taken place in which the couples involved had been slaves. Of these, fewer than 100 had remained unbroken. While some unions lasted from 20 to 40 years, the average length of a slave marriage was a mere 5.6 years. Records indicate that 70 percent of these marriages ended due to death or personal choice, and only 30 percent of the slave unions were broken up by the planters. Figures were different for other regions as those places that sold slaves or sent them westward recorded higher incidences of broken marriages. Many planters professed an aversion to breaking up slave families because the practice increased unrest among the blacks, but the extravagant lifestyle of the planters, coupled with the regularity of foreclosures on mortgages and demands for the repayment of loans, caused many slaves to see the auction block at least once in their lives. Slaves could be bought or sold, rented out, gambled away, or left in a will as an inheritance to almost anyone; and the law did not provide for the continuity of the slave family as a unit (Volo and Volo 1998, 75).

Slave children generally were considered the property of the mother's master. The father and the father's master, should he be a different person, were denied any standing in regard to the offspring of slave unions. "Women were generally shown some indulgence for three or four weeks previous to childbirth . . . [and] they are generally allowed four weeks after the birth of a child, before they are compelled to go into the field, they then take the child with them." The offspring of a free man with a slave woman was thereby a slave; yet the offspring of a slave with a free woman was considered to be freeborn even if the woman was black. Even the children of a white master by a slave mother were born slaves. In the case of a dispute in this regard, with very few exceptions, whenever a slave's human rights came into conflict with a master's property rights, the courts invariably decided in favor of the master. The first activity of many refugee slaves during the war was to begin a search for their missing mates or children (Volo and Volo 1998, 75) (Strother 1962, 195).

MISCEGENATION

One of the unique features of slavery in this period was the pervasiveness of miscegenation, or interracial sexual activity. The desire of white men to have sexual contact with black females was seemingly so common in the South that no social stigma was attached to it, whereas illicit liaisons between whites, extending even to white couples who were engaged to be married, were roundly condemned. White men involved in sexual relationships with black women, slave or free, seem to have received a special dispensation from southern society. Indeed, a man who openly kept a white mistress would be turned out of society; yet, if he chose a colored one, acted discreetly by not flaunting the relationship, and produced a whole family of mixed-race children from the relationship, he was seemingly absolved from any shame (Volo and Volo 1998, 75–76).

Mixed-race sexual relations were not unknown in the North, and black-white marriages were legally valid in several northern states. Nonetheless, northerners viewed miscegenation as a form of moral degeneracy, singularly southern, and rooted in the immorality of slavery. A European traveler to America found that blacks treated those of mixed race with disdain and hate. "They think them much closer to the Whites than to the Blacks." An antebellum abolitionist author confidently reported that half the slave population of the South was mixed with white blood, and his assertion was accepted as gospel by willing readers. However, statistical analysis suggests that fewer than 10 percent of the slaves in the South were of mixed ancestry; and a portion of these had Native American blood. Only a small percentage of the children born to slaves in a given year were fathered by white men (Volo and Volo 1998, 76) (Mayer 1960, 116).

Over time there developed an absurd theory that a single drop of black blood polluted the human being. Yet some southerners suggested the equally preposterous notion that miscegenation improved the black population by breeding "whiteness" into it and would gradually eliminate the black race from America by dilution.

Abolitionists spread the probably specious story of a slave owner who offered a white man "twenty dollars for every one of his female slaves, whom he would get in the family way." The extent of miscegenation is somewhat obscured by the methods used by nineteenth-century investigators to quantify the mixed-race population of the South as mulattos, quadroons, and octoroons by the criteria of the outward appearance of the skin and the absence or presence of certain defining racial features. A large population of mixed-race persons "passing for white" may also have obscured any meaningful estimates at the time (Volo and Volo 1998, 76) (Strother 1962, 207).

Some white men, abjuring any justification for the satisfaction of their lustful desires, simply considered every slave cabin a bordello. In 1851 a Louisiana court recognized the virtual helplessness of the female slave in this situation, finding that she was "particularly exposed to the seductions of an unprincipled master." A free black of New Orleans ascribed a loss of all feelings of morality and chastity among female slaves to this helplessness. "The practice of indiscriminate sexual intercourse . . . was so universal that a chaste colored girl at the age of seventeen was almost unknown." The antislavery audiences of the North were horrified by descriptions of a planter who proposed intercourse with his female slave. If she would not comply, he could send for the overseer and have her flogged. "Seeing that her case was hopeless, her back smarting with the scourging she had received, and dreading a repetition, [she] gave herself up to be the victim of his brutal lusts." No court would have heard a case of rape brought by a black slave against a white man (Blassingame 1973, 83) (Strother 1962, 206).

Southern ladies universally frowned upon any husband who was too open in his lustfulness; and while it seems that they could do little to enforce their displeasure on the male population at large, they could become quite angry and vengeful when the husband was theirs. More than one planter, taken with the beauty of a comely black slave, was forced to sell her or otherwise remove her from the reach of his wife. Evidence suggests that many of the petty lashings and beatings visited on the slaves were brought on by the vengeance of a jealous plantation wife taken out on the concubines and mixed-race children of her husband (Volo and Volo 1998, 77–78).

The question of how common sexual affairs between slaves and masters actually were, as opposed to how often they appear as titillating tidbits of gossip in journals and letters, is undecided. Abolitionists likely exaggerated the universality of the documented cases. Many slave-holding states passed antimiscegenation measures providing severe social penalties for white men who openly bed black women and massive physical retaliation upon any black men who had sexual relations with white women. Although these measures ostensibly prohibited all interracial unions, for the white male they only made the offspring of his intercourse illegitimate, and the laws hardly applied to the reality of the master's power on the plantation (Volo and Volo 1998, 78).

The concept of white women sleeping with black men, a possible consequence of the moral hypocrisy surrounding such practices, was a proposition too explosive for the delicate egos of white males. White women were expected to respond to blacks as they would to any animate property, such as pets. The diaries and letters of young women and girls are full of references to the indelicacy of naked blacks, even adult males. Young women were expected to steel themselves into viewing the naked slave as a dehumanized object, no more indelicate than livestock in the barnyard. Documented cases of the daughters of wealthy plantation owners bearing mixed-race children are rare, and, when found, are accompanied by tales of social rebuff and revulsion. Only after the war did liaisons involving white women and black men become more common and open to public knowledge; nonetheless, such women were universally labeled "sluts" (see Blassingame 1973, chapter 1).

THE ANTISLAVERY MOVEMENT

Attacks on slavery in the early years of the republic had been based on religious ideas regarding love for one's fellow humans, ideas about the debilitating effects of slavery on economic and moral progress, and the ideals set forth in the Declaration of Independence and the incompatibility of slavery with the concept that "all men are created equal." Many Americans freed their slaves during and immediately after the Revolution—a circumstance not confined to the North. Following the Revolution a large number of southerners spoke about the abolition of slavery in abstract terms, and others were sufficiently dedicated to its ultimate eradication to provide for private manumission of their slave property. Yet early opposition to emancipation, including that of Thomas Jefferson, was based largely on the racist concept that the inherent inequality in the races would prevent their living in peace and prosperity together. Allegiance to slavery as an institution was less commonly expressed. That was to come later in the turmoil over states' rights (Volo and Volo 1998, 81).

Proponents of emancipation looked to gradualism and colonization, rather than immediate emancipation and inclusion, to relieve the supposed incongruities of the races living peacefully together. Gradual emancipation provided that children born as slaves could be freed on attaining maturity, having been given a skill or education in the interim so that they might provide for themselves. Similarly formed legislation had quietly ended slavery throughout the northern states by 1806. Private parties among antislavery proponents favored the removal of free blacks to colonies established far from the Americas. The African city of Monrovia was founded as a "freemen's colony" in 1821 in this manner. Less dramatic suggestions were also made to remove freed blacks to the Indian Territories, Florida, the Caribbean islands, and Central America (Volo and Volo 1998, 81–82).

While many northerners were against slavery, they were also remarkably prejudiced against blacks. They were averse to having them live in their communities and inclined to leave the issue of universal emancipation alone. Radical abolitionists—always a minority among antislavery advocates—were loath to accept the slow pace of gradual emancipation and were becoming increasingly militant in their frustration. This militancy was not universally shared even among antislavery proponents. Abolitionist speakers were threatened with tar and feathers in New England towns as late as 1850, and an antislavery newspaper publisher, Elijah P. Lovejoy, was murdered by a mob defending his press in the free state of Illinois in 1837. It was widely held that free blacks would come North to compete for scarce jobs in the cities, and an economic downturn in 1857 did not help to relieve this fear (Volo and Volo 1998, 81–82) (Malone 1943).

The treatment of blacks in northern states was often brutish, and they were despised and treated with contempt. In the decades after independence, towns and cities had been flooded by thousands of freed blacks, some of whom had fought in the Revolutionary army. And any plan for a general abolition of slavery had to deal with the touchy problem of free blacks living in a white-dominated, racist society. This led many sympathetic whites to fear for the ultimate welfare and safety of a black population suddenly foisted on an unfriendly America should the radicals attain their goal of universal emancipation (Adams 1973, 66–81).

Even among those who volunteered to fight for the preservation of the Union, there was little sympathy for the abolitionists. Wrote one federal soldier at the beginning of the war, "I don't blame the South an atom. They have been driven to desperation by such lunatics as Garrison and Phillips, and these men ought to be hung for it." Another federal recruit said, "I want to see those hot-headed abolitionists put in the front rank and shot first" (Billings 1887, 20).

There was a growing recognition, however, that slavery was a great moral and social evil that must be ended soon. But it was also true that slavery had become uneconomical for some smaller planters, especially in the upper South. As early as 1816, several southern states, Virginia, Georgia, Maryland, and Tennessee included, had asked that a site for colonization by freed blacks be procured, and they had jointly petitioned the federal government for financial aid to offset the monetary loss involved in emancipating their slaves. The British government had successfully indemnified its slave owners for their loss when the slave trade was ended in 1808, but a similar arrangement was not possible in antebellum America, either financially or politically (Volo and Volo 1998, 82–83).

In 1817 the American Colonization Society was formed to encourage free blacks to return to Africa. The organizational meeting was held in no less a prestigious place than the chambers of the House of Representatives. Among its founders were Henry Clay, Andrew Jackson, and Francis Scott Key. The society drew its initial support from all sections of the country and from both slavery and antislavery advocates. Colonization societies outnumbered abolition societies in America right up to the opening of the war. Within two decades of its founding, more than 140 branches of the American Colonization Society were formed in the southern states, with the majority of chapters in Virginia, Kentucky, and Tennessee. In the North approximately 100 societies were formed, the majority established in the states of Ohio, New York, and Pennsylvania. Only in Massachusetts did immediate abolition have a greater following than colonization. Of all the states, only Rhode Island and South Carolina had no colonization societies—both had been major import markets in the days of the Atlantic slave trade. Unquestionably, the intervention of northern moralists into the evolution of antislavery at this point provided a fateful check to any hope of abolition without considerable turmoil (Adams 1973, 105–7).

A minority of free blacks espoused great interest in their African homeland, yet a larger number were interested not in Africa, but in other areas outside the United States. Canada, Central America, and Haiti were all mentioned as possible sites for black emigration. Several prominent free blacks, such as poet James M. Whitfield, the Reverend Henry H. Garnet, and Dr. Martin R. Delany, called for an emphasis on black nationalism and militant black unity. Most free blacks opposed colonization outright, insisting that America was their land and that they should get their due in the land of their birth (Blassingame 1976, 18).

But the abolitionists demanded immediate, unreimbursed emancipation and integration of freed blacks into white society, not gradualism and separation. No price, including war and disunion, was too great to pay in the cause of ending slavery and racial prejudice. The rhetoric of Wendell Phillips, a leading abolitionist in Massachusetts, provided an example to the South, and all of America, of just how far the radicals were willing to go when he suggested "trampling the laws and Constitution of the country" to gain their ends. Such rhetoric was seen as a call for civil disorder, even violence, on a massive level (Douglass 1968, xvii).

The radical abolitionists berated the gradualists and colonialists as being less than completely dedicated to the cause of emancipation. In *Thoughts on African Colonization* (1832), William Lloyd Garrison went so far as to suggest that the gradualists and colonialists were actually covert supporters of slavery, allowing slave owners in the upper South to "sell their slaves south," thereby recouping their considerable investment in slave property. Garrison argued that colonization would make Americans "abominably hypocritical" by allowing free blacks to remain among them only "as inferior beings, deprived of all the valuable privileges of freemen, separated by the brand of indelible ignominy, and debased to a level with the beasts" (Garrison 1832, 134).

Garrison may have been the most vehement of the radical abolitionists. Although he did not, in any real sense, lead the American antislavery movement, he was possibly the most conspicuous of the radicals. In 1845 he wrote in the highly idealized style typical of the movement: "Be faithful, be vigilant, be untiring in your efforts to break every yoke, and let the oppressed go free. Come what may—*cost what it may*—inscribe on the banner which you unfurl to the breeze, as your religious and political motto—'No Compromise with Slavery! No Union with Slaveholders!'" (Volo and Volo, 1998, 85) (Douglass 1968, xiv).

Although calls to violence were not characteristic of the abolition movement, the rhetoric of the outspoken radicals was couched in inflammatory and unambiguous terms aimed at ending slavery—"Law or No law, constitution or no constitution." Abolitionists vowed to work with "invincible determination" regardless of the consequences. The radicals publicly disavowed the unsettling concept of slaves shedding the blood of their oppressors, but they recognized that there was "no neutral ground in this matter, and the time is near when they will be compelled to take sides" (Garrison 1837).

In the seeming call for a slave rebellion, the goal of which was "to attack the slave power in its most vulnerable point," the South perceived a very real physical threat.

There had been three important black insurrections in the South: the Gabriel revolt in 1800, the Denmark Vesey conspiracy in 1822 (no actual revolt occurred though strong evidence exists to suggest one was planned), and the Nat Turner revolt in 1831. Only the Turner revolt had led to any deaths among whites, but these had numbered mostly women and children among the roughly 60 killed. Coupled with the knowledge of major slave revolts and mass murders in the West Indies, such doings were taken seriously by slave owners. Some abolitionists later endorsed John Brown's attempt to foment an armed slave rebellion in Virginia by attacking Harper's Ferry in 1859. Against this background the writings and speeches of the radicals proved truly heavy rhetoric (Garrison 1844) (Volo and Volo 1998, 85).

Young Kate Stone's diary reflected her fears in an encounter with slaves recently freed by federal forces in April 1863: "Looking out the window, we saw three fiendish looking, black Negroes standing around George Richards, two with their guns leveled and almost touching his breast. He was deathly pale but did not move. We thought he would be killed instantly. But after a few words from George . . . they lowered their guns and rushed into the house . . . to rob and terrorize us." In fact during the war, slaves showed remarkable restraint, preferring to run away or join the Union army to bring down slavery rather than engage in slave rebellion (Sullivan 1995, 91–92).

ABOLITIONISTS

Those who identified themselves as abolitionists generally eschewed allegiance to a particular religious group, but a good number were intimately involved in their religions, particularly the newly formed sect of Unitarianism. However, those belonging to the Congregational, Presbyterian, and Quaker denominations predominated in the movement. The Methodists and Baptists were quite split over the issue, and very few Catholics rose to prominence in the largely Protestant antislavery circles. The Quaker sect was probably the most unified in its position against slavery. Yet the crusade for the immediate social and political equality of blacks was championed with a religious fervor by many men and women (Volo and Volo 1998, 85–86).

Contrary to the common southern perceptions of abolitionists—preaching and teaching "hate as a gospel and the sacred duty of murder and insurrection"—the use of violence to attain emancipation never had a great appeal to the mass of people in the North, and the more provocative tactics and strategies of the radicals rarely had any effect outside of New England or areas settled by New Englanders as in Ohio. Antislavery, as a movement, was far too decentralized and subject to too many local variations to march in lockstep behind the radicals. So too abolition's association with other reforms, especially women's rights, led to internecine quarrels over means and ends (Dowdey 1957, 300).

Garrison, in particular, was prone to involving himself in factional disputes within the movement. His refusal to endorse a political solution to slavery based on compromise, his attacks on the religious institutions of the nation as supporters of slavery in the 1840s, and his continued characterization of the South as an aggressive enemy of all American institutions left him outside the mainstream of antislavery sentiment. He attacked the Constitution as a "guilty and bloodstained instrument," called for the secession of the New England states from the Union, disrupted religious services at "proslavery" churches, and castigated the clergy and the antislavery moderates as conspiring with southern slave power. These positions caused a split in the movement in 1840. Nonetheless, Garrison remains a central figure in the controversy that led to the Civil War simply because the South took him seriously and believed that he had a much greater following than reality justified (Garrison 1832).

ANTISLAVERY LITERATURE

The abolition of race-based slavery became a theme for novels early in the antebellum period, but it found little popularity beyond those dedicated to the antislavery movement until the 1850s. In 1836, Richard Hildreth, a Massachusetts jurist and historian, published the first of the antislavery novels called *The Slave, or, Memoirs of Archy Moore.* The work was immensely popular in New England, and it was reprinted in the decade before the Civil War under a number of titles. Although it did much to further the cause of abolition, Hildreth's work appeared too early in the development of the antislavery movement to have the effect of later works. However, when Harriet Beecher Stowe published *Uncle Tom's Cabin* in 1852, the book sold 300,000 copies in America and Britain in one year. Stowe's work was one of total fiction, but it stressed the humanity of the slave and the evils of slavery, and presented a picture of moral corruption and finally total brutality as the cost of slavery. The author had no personal knowledge of slavery, but her brother, Edward Beecher, was an antislavery activist, and Stowe's purpose was moral not reportorial. The factual basis for the story was found in Theodore D. Weld's radical abolitionist tract titled *Slavery as It Is: The Testimony of a Thousand Witnesses,* which was published in 1839. *Uncle Tom's Cabin* was immensely more effective in preaching the antislavery message in the form of a novel than the earlier tract had ever dreamed of being. The book was made into an equally popular play, in various versions that found audiences well into the end of the century (Volo and Volo 2004, 229–30) (Stowe 1889).

Stowe provided two divergent accounts of the origins of her own book, but it seems quite certain that the death of Uncle Tom was written first and the surrounding details of Little Eva and other characters were added at a later date. The character of Eliza Harris, who crossed the icy Ohio with her baby in her arms, seems to have been based on the experiences of an actual person, and Stowe seems to have been made familiar with the story through her brother. She wrote in the preface of the 1852 edition:

> The object of these sketches is to awaken sympathy and feeling for the African race, as they exist among us; to show their wrongs and sorrows, under a system so necessarily cruel and unjust all to defeat and do away the good effects of all that can be attempted for them, by their

best friends, under it. In doing this, the author can sincerely disclaim an invidious feeling towards those individuals who, often without any fault of their own, are involved in the trials and embarrassments of the legal relations of slavery. (Volo and Volo 2004, 230)

The South considered *Uncle Tom's Cabin* a slander and regarded it as abolitionist propaganda. A southern women, familiar with slavery and slaves, wrote that she could not read a book so filled with distortions as it was "too sickening" to think that any man would send "his little son to beat a human being tied to a tree." The same women goes on to suggest, using other literary references, that Stowe's work portrays as much fiction as Squeers beating Smike in Dickens's *Nicholas Nickleby* or the gouging of the Gloucester's eyes in Shakespeare's *King Lear*. "How delightfully pharisaic a feeling it must be, to rise up superior and fancy [to] we [who] are so degraded as to defend and like to live with such degraded creatures around us . . . as Legree" (Woodward 1981, 245, 307, 381).

Nonetheless, amicably disposed northerners found the passages describing the murderous brutality of Simon Legree indicative of the typical behavior of southern slave owners. A letter to the editor of *Frederick Douglass' Paper* wrote, "What a Book! It is, in its line, a wonder of wonders. . . . My nonresistance is of the Douglass, Parker, and Phillips school. I believe, as you do, that it is not light the slaveholder wants, but fire, and he ought to have it. I do not advocate revenge, but simply, resistance to tyrants, if need be, to the death." Another writer, this time to the editor of the *National Era*, said, "It was a noble effort—it is a splendid success. The God of Freedom inspired the thought." The editor of the *New York Independent* pronounced the book, "The Greatest Book of its Kind ever issued from the American Press." Other papers, almost exclusively in the North, carried similar sentiments. In answer to her critics, Stowe produced *A Key to Uncle Tom's Cabin* in 1853 and, in 1856, followed with a more direct appeal to violence in *Dred: A Tale of the Great Dismal Swamp*, which almost immediately appeared as a stage play in the New York theaters (Volo and Volo 2004, 230–31).

The significance of these stories, as with many of the attacks on the institution of slavery, lay in their ability to dramatize and emotionalize the issue. Writing and speech making on the subject of slavery, in particular—and of the southern culture, in general—was becoming increasingly stereotypical, and the stereotypes, even when presented in novels, were taking on a reality in the minds of the people.

Hinton Rowan Helper, born and educated in North Carolina, in 1855 wrote a book about California goldfield experiences in his *The Land of Gold*, which signaled his belief in the value of free labor. In the following year, he moved to New York and wrote *The Impending Crisis of the South: How to Meet It*, an economic discourse in behalf of the nonslaveholding whites of the South. *The Impending Crisis* contrasted the economic condition of the slave states and the free states, and it attributed the backwardness of the South and the impoverishment of southern white labor to the competition of race-based slavery. Although he showed no consideration for the plight of blacks, whom he despised, Helper attacked the owners of a large number of slaves using the threat of a slave uprising to destroy the slave labor system from within. "Would you be instrumental in bringing upon yourselves, your wives, and our children, a fate too horrible to contemplate?" Helper's 11-step program to abolish slavery formalized a growing feeling that southern economic and social welfare was being sacrificed on the altar of continued plantation slavery.

The Impending Crisis created a greater sensation than *Uncle Tom's Cabin*, and it has been described as a contributing cause of the Civil War. Men were hanged for merely possessing a copy of the book in some areas of the South. The book was furiously attacked in the South, and a good deal of effort and propaganda was put into casting doubts on Helper's integrity. In the North, it was a great success. One hundred thousand copies were printed and a shortened version was distributed for the Republican campaign of 1860. An appreciative Abraham Lincoln appointed Helper as American consul in Buenos Aires in 1861, a position he kept until 1866 (Volo and Volo 2004, 231).

BLACK ANTISLAVERY ACTIVISTS

One of the many themes of the abolitionists was that the slave was "capable of high attainments as an intellectual and moral being—needing nothing but a comparatively small amount of cultivation to make him an ornament of society and a blessing to his race." Emancipation advocates declared that only the great weight of slavery had deteriorated the natural goodness and intelligence the Negro had brought from Africa. "It has a natural, an inevitable tendency to brutalize every noble faculty of man." Frederick Douglass served as a favorite symbol of the ideally regenerated freeman, and was portrayed as a victim of slavery with a "godlike nature" and a "richly endowed" intellect. Douglass was showcased as a naturally eloquent "prodigy—in soul manifestly created but a little lower than the angels" (Volo and Volo 1998, 88–89) (Douglass 1968, vi, 24).

From 1841 to 1860, Douglass was the most prominent black abolitionist, "filled by his escape to freedom with noble thoughts and thrilling reflections." Yet, among black activists there were several equally eminent success stories. These included Charles Lenox Remond, one of the first black antislavery activists; Williams Wells Brown, the first black playwright; Frances E. W. Harper, a prominent poet; Henry Bibb, a former slave and editor of a Canadian newspaper; John Mercer Langston, a free lawyer from Ohio; Martin R. Delany, a Harvard-trained physician; and the Reverend Henry Highland Garnet, the first black man to speak in the U.S. House of Representatives.

Several black newspapers were printed in the antebellum period that vied for prominence in antislavery circles with Garrison's *Liberator*. The *Impartial Citizen* was printed in Syracuse, New York, beginning in 1848; the *Colored Man's Journal* was popular in the 1850s in New York City; San Francisco had the *Mirror of the Times* in the 1850s; and the *Alienated American* was published briefly in Cleveland, Ohio. One of the earliest papers was *Freedom's Journal*, established in 1827 by John B. Russwurm, the first black to receive a degree from an American college.

One of the most popular black papers of the 1850s was *Frederick Douglass' Paper*, later called *Douglass' Monthly Magazine*. Unlike the other black papers, which were locally popular and short-lived, Douglass's work was circulated through 18 states and 2 foreign countries. It had more than 4,000 subscribers and survived for more than 13 years. Not only did these papers showcase the ability of blacks to write and edit, but they also hinted at the large number of blacks among their subscribers who could read (Volo and Volo 1998, 89).

SOUTHERN NATIONALISM

Patriotism and nationalism were powerful motivations in Civil War America. A growing southern nationalism accompanied the development of the Confederate States of America. Nationalism was on the rise throughout Europe in the nineteenth century, and Confederates were quick to draw parallels between their struggle to found a southern nation with those of the Dutch Republic and the Portuguese against Spain; the Italian revolutions in Sicily and Naples led by Garibaldi; the Polish rebellion against the power of Russian imperialism; and the ongoing Piedmontese struggle against Austria. Confederate diplomats held forth these examples to the world in the hope of gaining international support and recognition for their fledgling country (Volo and Volo 1998, 49).

The North had similar nationalistic views, but they were more capitalistic and utopian than those of its southern counterpart. The northern nation was dedicated to physical liberty, freeing the slave from his bonds, separating the poor from their circumstances, and relieving the alcoholic from his dependence on liquor. By contrast the southern nation was more dedicated to an abstract liberty defined by traditional political ideology and personal freedom of action unrestricted by governmental intervention. As the two cultures diverged during the first half of the nineteenth century, their separate concepts of which social, political, and cultural characteristics should be indicative of America's ideal national identity diverged also (Volo and Volo 1998, 49–50).

Several of the competing characteristics came to be mutually exclusive and served as focal points for controversy. These included questions of slavery or abolition; economies dedicated to the growth of agriculture or industry; social elitism or social mobility; limited suffrage or democratization; personal religion or societal morality; patriarchy or matriarchy; personal responsibility or governmental action; and conservative or progressive politics. Forces representing different opinions on these questions were in almost continual conflict by midcentury.

Although the questions of slavery or abolition stood out at the time, southern nationalism was fueled not only by the endorsement of continued slavery, but also by a growing contrast between a conservative southern culture and a progressive northern industrial society increasingly in favor of popular suffrage, a changing role for women, widening democracy, and social reform.

By the 1850s the creation of southern nationalism and the establishment of a national identity separate from that of the North came to be viewed by increasing numbers of white southerners as necessary for the survival of southern culture, with or without the challenge of war. Many historians have continued to view the nationalist trappings of the Confederacy as a kind of mask for the southern defense of slavery. Nonetheless, southerners were strikingly self-conscious about the need to explain themselves and publicly define their position on this question. Slavery was an embarrassment to some southern apologists, but, at the time, slavery and national identity were truly inseparable in the minds of most southerners. When explaining why they seceded, southerners unabashedly asserted that they did so to protect slavery and its interests. The new state constitutions and Confederate constitution they wrote echoed that purpose.

Historically, the South had been neither democratic nor purely aristocratic. Instead, southern politics had reached a balance much closer to the classical Roman concept of the republic, a public order in which the power rested with an elite group of people who supposedly ruled for the good of all. When the war began, the South was a distinct political entity with a fully operational government, at least at the state and local levels. Confederate nationalism, although novel as a collective entity, had deep roots in a distinctive antebellum southern ideology. The plantation aristocracy had successfully dominated southern society for many years by applying their wealth and political influence to the wheels of government (Volo and Volo 1998, 50).

Small farmers had so worn out their land that they looked to cast their lot with the expansionists who were moving into the territories. Many middle-class southerners migrated with their manners and culture to other states: Kentucky and southern Ohio, Mississippi and southern Indiana, and Texas. Planters with modest holdings were able to maintain their gracious style of living by establishing subsidiaries to their planting operations. Sawmills, gristmills, distilleries, and even country stores were run on plantations. The sons of these planters turned to new professions such as law and medicine. Some went into the city to deal in cotton-related industries, and some turned to the military as an honorable profession in keeping with the traditions of the aristocrat. This may help to explain the large number of southern gentlemen who received their education at military academies such as West Point or Virginia Military Institute.

Southerners willingly tried all expedients to support their culture. The large landowners hoped, at the very least, to maintain their social status under such conditions. As the traditional prerogatives faded from the landed families, they were replaced by a defense of a lifestyle that was increasingly becoming a social anachronism (Volo and Volo 1998, 51).

This distinctiveness provided a rather warped view of the South, but many Americans accepted it as a valid interpretation of southern culture and acted accordingly upon it. No one would have cared how archaic the plantation system was becoming, but slavery was the one anachronism that many concerned Americans could not accept. Although the aristocratic southern way of life was practiced by a small minority of the population, the lifestyle of the planter class came under attack by the forces of democratization, industrialization, and abolition. The very intensity of the attack, endured for several decades by the planter aristocracy, helped to define a narrow set of characteristic social customs as particularly "Southern" (Faust 1988, 3–4).

With the increasing likelihood of secession, the large planters moved quickly to ensure that southern nationalism reflected their particular interests and strove to protect their cherished way of life under the new government. However, the planters clearly understood that they could not act alone effectively. Practical considerations made them more dependent than ever before on the white masses. Conservative and elitist tendencies were altered by this need to create a popular consensus. Politicians, journalists, and clergymen undertook, therefore, to enlist the support of the small slaveholders and the non–slave-owning white majority in the establishment of a new nation. They used an astonishing mix of political and religious language in an attempt to excite an ardent and enduring enthusiasm across the entire population for the Confederate government and its institutions. However, they carefully avoided presenting secession ordinances and state constitutions to the masses for ratification lest their plans fail the test of public support (Faust 1988, 15, 36).

Ordinary citizens quickly recognized that their support was needed for secession and that their physical assistance would be required on the battlefield. They sometimes sought to trade their support for reforms in taxation, governmental structure, and social and political access under the new governments that had been denied to them in former years. However, it was the political, social, and religious elite who most effectively interjected their concerns into the new southern nation, and they were successful in exporting their ideals beyond the battlefield soldier to the mass of the southern people.

"If the Confederate experience did nothing else, it gave southerners, many for the first time, a sense of corporate identity," noted an observer of the process. Even the citizens of Tennessee, who had previously disavowed the idea of immediate secession, overwhelmingly voted in favor of separation from the Union once Lincoln called for troops to suppress the rebellion. Hundreds of suggestions poured in from all levels and classes of southern society when a committee of the Confederate Congress asked for designs for a new national flag. Nine out of ten of these were from women. A southern woman's diary noted in April 1861: "Upon returning to my boardinghouse…I found the ladies making secession flags. Indeed, the ladies everywhere seem imbued with the spirit of patriotism, and never fail to exert their influence in behalf of southern independence." Women wore secession flags as part of their daily costume in the streets. Southern ladies formed gunboat societies that sponsored dances, bake sales, rummage sales, and auctions to raise money for building the infant Confederate navy to defend the harbors and waterways. Southern women were intensely aware of the need to maintain a southern tradition and culture that "had roots several decades deep," and their diaries and letters are replete with nationalistic themes (Volo and Volo 1998, 52) (Thomas 1991, 114) (Faust 1988, 8) (Miers 1958, 3) (McPherson 1997, 95).

The strongest feature of southern nationalism was to be found on the battlefield. The South was ripe for war. The Baltimore *American and Commercial Advertiser* reported on April 22, 1861, that hundreds of impetuous young Marylanders had left the city in wagons, carriages, and buggies or on horseback to wage war against the invaders from the North. Although volunteers dedicated themselves to the defense of their individual states, the southern army quickly showed a new unity and esprit de corps. For the first time in their lives many young men traveled away from their homes and interacted with people who were not also neighbors or relations. They accepted strangers as brethren, bonded to them by a larger identity. An analysis of the surviving letters and diaries of Confederate soldiers suggests that many expressed a patriotic allegiance to the Confederacy as a "country." Soldiers typically referred to sacrificing themselves on the "altar" of their country; yet they were equally expressive in their desire to defend their state, their home and hearth, and their families. The conflict between the love of those things familiar, personal, or close and dedication to the more abstract and intangible new nation troubled many Confederates; but the paradox brought forth by this dichotomy of motivation was not insoluble. The urge to defend one's state and family, which brought many volunteers to the battlefield in 1861, took on greater scope when the Federals launched a massive invasion of the South in 1862. Those from Tennessee and Louisiana who had fought initially to liberate their homes from the "varlet's threat" quickly extended their commitment to the southern nation as a whole, particularly when their principal cities fell to federal forces. Many Confederates came to realize that the defense of their home and hearth was best prosecuted by winning the war, even if that meant fighting on fields foreign to their domestic concerns. A southern soldier wrote of both his nationalism and his identity as a southerner: "My *country* shall be freed from the fiendish vandals who thirst for the extermination of a *people* who are actuated by motives . . . far above those that influence and characterize the enemy." Individuals may have continued to do things as Texans or Floridians, but many identified themselves as Confederates united in the defense of an independent southern nation (Volo and Volo 1998, 52–53) (Smith 1943, 304, 312).

Northern soldiers were equally vehement in their view that the Union must be preserved, and that southern nationalists were traitors. One soldier wrote:

> The Cause for which the majority of men in the army have enlisted to defend I think is sacred and should be near and dear to every true American's heart and I consider that the Union cause ought to be defended if it costs thousands of lives and millions of treasure. (Robertson 1984, 24)

Another soldier, a recent German immigrant who took the name Peter Smith, wrote that he had "grasped the weapon of death for the purpose of doing my part in defending and upholding the integrity, laws, and the preservation of my adopted country from a band of contemptible traitors who would if they can accomplish their hellish designs, destroy the best and noblest government on earth." The feelings of nationalism on both sides were at a fever pitch as the country entered civil war (Henry Schaefer to wife, March 1, 1863, letter in possession of William A. Shaffer III) (Robertson 1998, 6–7).

PRIMARY DOCUMENTS

1. GLIMPSES OF COLONIAL SOCIETY AND LIFE AT PRINCETON COLLEGE (1766)

William Paterson (1745–1806), a 1763 graduate of the College of New Jersey (now Princeton University), was attorney general of New Jersey during the Revolution, a framer of the U.S. Constitution, U.S. senator from New Jersey, governor of the state, and, at the time of his death, an associate justice of the Supreme Court of the United States. While studying law at Princeton, he wrote to family and friends about society there, as well as his studies. This letter describes Paterson's feelings about the curriculum he was following.

31st Decr Dear Johnny. 1766.

I AM very much obliged for your half dozen lines, as they serve to usher in an epistolary correspondence. A conversing on paper with an absent friend I esteem one of the greatest pleasures in life: be assured then, dear Johnny, that I shall take peculiar pleasure in receiving and answering your letters. The only unease [sic in the copy] I feel at present is, that I'm apprehensive our literary chit-tat will be of short duration, for you inform me, that in a few days you should move to Philadelphia, to study law. If so, it is highly probable you either will be so absorbed in the dulness [sic] of the law, or so enchanted with some Dulcinea, that poor pilgarlic will be left in the lurch. For my part I am tired heartier "of Vernon and ventris and all the damned entries." To be a complete lawyer, is to be versed in the feudal system, and to say the truth, I am not very fond of being entangled in the cobwebs of antiquity. *Sic Lex est,* is what every plodding pettifogger can say, but to dive into the spirit, requires intense application and assiduity. But of all the sages of the law, preserve me from the pedantic, rambling, helter-skelter Master Coke. Such eternal egotism and dictatorial pomp breathe through his works, that I lose all patience in reading them. He writes up strictly to the injunction of Horace, for he carries us "to Thebes, to Athens, and

Editor's Note: All spelling is as in the original.

the Lord knows where"—I doubt not but you have made great proficiency, and now are, a profound casuist in working out distinctions without a difference, in clouding truth with ambiguity, and in mouthing with surprising volubility, a muster role of law phrases, which like Sancho Panza's string of proverbs, you have always at command. The following couplet of Pope, portrays well the character of an expert lawyer. In a nice balance, truth with gold he weighs, And solid pudding against empty praise. My letter is of decent length, therefore adieu.

Wm Paterson.

2. A NARRATIVE OF THE ADVENTURES, DANGERS, AND SUFFERINGS OF A REVOLUTIONARY WAR SOLDIER (1778)

Joseph Plumb Martin (1760–1850) enlisted in the Continental army in June 1776 and served until the end of December 1776. He returned to the army in April 1777 and continued his service until he was discharged in 1783 as a sergeant. He began writing his memoirs in 1828, and his narrative provides a vivid description of the life of an enlisted man during the American Revolution. The following passage describes Martin's experience during the battle of Monmouth (June 28, 1778) during which he took aim at a British soldier.

We overtook the enemy just as they were entering upon the meadow, which was rather bushy. When within about five rods of the retreating foe, I could distinguish everything about them. They were retreating in line, though in some disorder. I singled out a man and took my aim directly between his shoulders. (They were divested of their packs.) He was a good mark, being a broad-shouldered fellow. What became of him I know not, I took as deliberate aim of him as ever I did at any game in my life. But after all, I hope I did not kill him, although I intended to at the time.

3. A DESCRIPTION OF PHILADELPHIA (1814)

This letter was written by the Reverend Henry Cogswell Knight (c. 1788–1835) under the pseudonym Arthur Singleton, Esq. Knight was an Episcopal minister and poet from Massachusetts. On a visit to Philadelphia, he describes to his brother one of the great cities of the United States in the early nineteenth century.

DEAR BROTHER,

THIS city, which is the great metropolis of Penn's Woodland, and which was eulogized by Him of Tarsus . . . *Philadelphia forever!* a Greek compound, you perceive, signifying brotherly-love; is as level as a Quaker's broad brim. The day after my arrival, I ascended the almost only eminence in the city, one of the two shot-towers, to spy down upon it. It appears not unlike a horizontal Brodingnagian brick-kiln; long never-ending blocks of brick, with little holes at bottom to creep in at; and little holes at top to peep out at. At this altitude, the eager currents of human beings appear diminished into a small folk, like Lilliputians; all, like the armies of the grandson of Cyrus, in a hundred years, to be no more. The city, which is six score of miles from the sea by the channel, is spread upon the isthmus between the Delaware, and the Schuylkill, half a score of miles above their confluence. These two rivers, east and west of the city, are the one grand, the other picturesque; and the elegant light broad-spanned arch thrown over the latter by our townsman Palmer, recalls agreeable associations. The Delaware waters were, last winter, so consolidated, opposite the city, that a festive ox was roasted whole upon the ice. Although this river is now floating ships to and fro from all nations, once was the time, when, if a ship arrived from Europe, the citizens used to chime Christ-church bells. As this city is, in many respects, the metropolis of the states, I confess I was disappointed in its externals. The streets running south and north were, in olden prime, called after the trees in the vicinity:—cedar, mulberry, sassafras, vine; chesnut, walnut, spruce, and pine. The streets crossing east and west are numbered; and the whole, being divided into wards and squares spreads into an immense chequer-board. There is but one crooked street in the city; and that, which is crooked, cannot be made straight. After you have walked one square, you have seen the whole. Indeed, the houses are so thick, there is no room for land. No spires, no domes, few bells, few promenades; no any thing to relieve the eye, or arrest the fancy. There is nothing like the long marble-fronted, but too finical, City-Hall; or the irregular, but beautifully verdant Battery, of New-York. Every view is quakerfied. No marvel, that Paine said, though rather irreverently, if a Quaker had been consulted at the Creation, what a drab-coloured world we should have had. Still, it is a noble city; wealthy, substantial, convenient; with extending blocks of massy private tenements; and a very few publick edifices of simple Doric grandeur, as, in particular, the marble bank. Christ-church is rather of the Gothic structure, and elegant; the bricks of this, and also of many other ancient buildings in the city, are, one red, another black glazed, in alternation. The six stately Corinthian columns, which support the roof in front of the first Presbyterian Church, look majestically. The national mint, or money-mine, is in this city; and was formerly under the supervisorship of Rittenhouse. Central in the city, is a spacious mansion-house, which was erected for the President, when Congress, in by-gone years, sat in this metropolis. The water-works, whose hydrants supply the city with water inducted for three miles in subterrean [sic] conduits, with their ponderous steam-enginery, are proofs of the resistless submission of vast mechanical power to human ingenuity. In the circular mall, which enclosed the former nucleus of these works, is a small *jet d'eau,* where the fluid is spouted upwards through the long snipe-bill of a sculptured water-fowl, which stands upon the shoulder of a water-nymph; and after rising about twenty feet into the air, spreads and falls in spray into a grassy-fringed fountain beneath. In the western part of the city, are Vauxhall-Gardens, included, with a Rotundo in the centre; and about four miles out of the city, on the border of the Schuylkill, are the beautiful botanical gardens of the Bartrams; the first ever in the country; and where once loved to stroll, and where first germinated the splendid idea of Wilson, the Ornithologist. From Market-street wharf, upon which Franklin first landed, one has a fine view of Jersey-shore opposite; and of the Mariner's Hotel, fitted from the hull of a large ship, with an ensign for a sign, and moored on the middle of the river. The Delaware is daily crossed by steamboats, with their broad dusky pennons of steam trailing behind; and by team-boats, which wheel along the water, propelled by horses on board in circular motion. About four miles above the city, on the west banks of the river, are the almost forgotten ruins of the mansion of William Penn, upon whose top was once, it is said, a leaden fish-pond. It is a curious fact in Natural History, that the environs of this city, and of Jersey, are visited, once in *seventeen* years, with locusts in Egyptian multitudes. Most places this way, even if small, are chartered with their mayor, recorder, aldermen and common council; and I trust that Boston will soon persuade its honest township into a lordly city; inasmuch as green-turtles are plenty. Soon after my arrival, a report of peace convulsed the whole city into ecstacies [sic]. Illumination! illumination! Briareus, with his hundred hands, was wanted to light the flambeaux of rejoicing. Soon, however, a counter-report palsied the spirits, and extinguished the tapers.

4. CRUELTY TO SLAVES ON A MISSISSIPPI PLANTATION (1819)

This letter by Henry Cogswell Knight (c. 1788–1835) from New Orleans details the brutality on a Mississippi plantation.

Natchez is a city set on a hill, and yet hid. It stands two hundred feet above the river, on a *bluff* of almost perpendicular ascent, back of a low landing place, which intervenes; thus it cannot be viewed from the river. The few mansions are open with windows, and doors, for ventilation. Near Natchez, are some Indian tumuli, not unlike many in the west. The *levee,* or *embankment,* commences, on one side, at Natchez. What flat lands are in New-England called *intervales,* the Western planters call *bottoms,* or *prairies;* and the Southern, *natural meadows,* or *savannahs.* The intervales between pine tracts and the savannahs, are called *hammocks;* and, except that they have wood, are similar to the latter. The plantations here are generally sold in form of a parallelogram; forty *arpents* (French acres) deep from front to rear. The river alluvion is the best arable soil. The western-side plantations are the most valuable; being less frost-bitten by north-winds; as the vapours from the river are warmer than the air. The plantation mansions are commonly of one story, light and airy, with surrounding piazzas, and delightfully fragrant orangeries. You can imagine nothing more grateful, than to walk among these orange groves. Not far from the mansions, may be seen immense sugar-houses; and long rows, or squares, like a fort, of slave-quarters; with a tall belfry in the midst, to summon the slaves from their repose to their tasks at day-break. It appears rather a paradox, that a planter, although he may buy slaves, yet has an abhorrence of a slave-dealer. I learnt many particulars about the living, and punishment, of slaves. The planters, although kind and hospitable to visitors, are, perhaps more from custom and policy, than inhumanity, cruel task-masters to their slaves; or boys and wenches, as they call them, however old. A sugar planter is discouraged, if he cannot pay for his plantation in five or six years; and thinks, if he gets ten years labour from a slave, he does well, although the slave then die. The slaves have three distinct tasks on every day; the before-sun task, the day-task, and the evening-task. A planter is not rich, unless he owns a hundred slaves; and, in the cotton season, may be seen, sometimes, four or five hundred at once in a field, in their loose gabardines, picking the bolls. Little children can do this work; and small boys go entirely nude, in some places. Under some masters, the slaves, unless they raise poultry themselves, which they are permitted to do, receive flesh only three times a year, and this on holidays. Their usual fare is, a peck of corn in the ear a week, which they must break in their hand-mills; and the *grit,* or refuse, of rice, like the western *screenings* of wheat; and, for relish, a salt herring. I regret to say, that the slaves will frequently exchange even this their scanty unsavoury meal for whiskey, which is sometimes distilled from the Carolina potatoe; any expedient to aid them to forget themselves. When they proceed in droves to their several tasks, a driver follows, with a huge long heavy stimulator. If a slave be slack in his labour, his feet are locked in the stocks, and his back answers it. A girl, for running out at nights, may wear, for a week, under her chin, an iron ruff, with a sharp-peaked border. My desire is not, that the Creator would have mercy on the masters, as they have mercy on their suffering slaves.

5. FRANCIS J. GRUND ON AMERICAN HOMES (1837)

Originally from Bohemia, Francis J. Grund (1805–1863) was educated in Vienna and taught mathematics at a military school in Rio de Janeiro, Brazil, before settling in Philadelphia, Pennsylvania, in 1826. He published many essays and addresses, as well as books on his observations of American society. This excerpt from one of his books, *The Americans in Their Moral, Social, and Political Relations,* discusses the homes of families of different classes in the United States around 1837.

The houses of the wealthier classes resemble those of the gentry in England, and are wanting in nothing which can materially contribute to comfort. Some of the higher elegancies of life, are, indeed, confined to a few imitators of European fashions; but there is a sufficiency of all that is essential and needful. No ostentatious attempt is ever made to display either fortune or riches; but, on the contrary, every thing avoided which, being contrary to republican plainness, might offend, or unnecessarily attract the attention of the people. Furniture, dress, carriages, &c., are all of the simplest construction; and the oldest and most aristocratic families set, in this respect, the example to the more recently promoted fashionables. Whatever political reason there may exist for the prevalence of this taste; it is nevertheless a good one, and being shared by the great majority of the nation, impresses a peculiar character of simplicity on the domestic life of Americans. It is impossible for an European to live for any length of time in the United States, without being constantly reminded, in town or in the country, at home or abroad, that he is living in a republic, and that the sovereign power of that republic is solely vested in the majority; for, whatever is capable of exciting envy or jealousy by too glaring a distinction from the inferior classes is condemned by public opinion, and on that account, studiously avoided by persons of all ranks of society. But then the great prosperity of the country enables even the labouring classes to enjoy comforts much beyond the reach of superior orders in Europe; and prevents the scale from becoming too low.

On entering the house of a respectable mechanic, in any of the large cities of the United States, one cannot but be astonished at the apparent neatness and comfort of the apartments, the large airy parlours, the nice carpets and mahogany furniture, and the tolerably good library, showing the inmates' acquaintance with the standard works of English literature. These are advantages which but few individuals of the same class enjoy, by way of distinction, in Europe; but which, in America, are within the reasonable hopes and expectations of almost all the inferior classes. What powerful stimulus is not this to industry? What premium on sobriety and unexceptionable conduct? A certain degree of respectability is, in all countries, attached to property, and is, perhaps, one of the principal reasons why riches are coveted. A poor man has certainly more temptations, and requires more virtue to withstand them, than one who is in tolerable circumstances. The motives of the rich are hardly ever questioned, while the poor are but too often objects of distress and suspicion. *Pauper ubique jacet.*

The labouring classes in America are really less removed from the wealthy merchants and professional men than they are in any part of Europe; and the term "mob," with which the lower classes in England are honoured, does not apply to any portion of the American community. With greater ease and comfort in his domestic arrangements, the labouring American acquires also the necessary leisure and disposition for reading; his circle of ideas becomes enlarged, and he is rendered more capable of appreciating the advantages of the political institutions of his country. Both thought and reflection may be crushed by excessive labour, and the lofty aspirings of the mind enslaved by the cravings of the body. Liberty, without promoting the material interests of man, is a thing altogether beyond the comprehension of the multitude; and there are many who, had they attained it, would, like the Israelites of old, wish themselves back to their meat-pots. I know not whether it is quest of liberty or property which causes Europeans to emigrate to America: but I am satisfied that there is an intimate connection between the two, and a constant action of one upon the other.

6. FRANCIS J. GRUND ON AMERICAN NEWSPAPERS (1837)

In this excerpt from *The Americans in Their Moral, Social, and Political Relations*, Francis J. Grund (1805–1863) tells of how newspapers were part of everyday life in America, and how they were available to everyone in the country.

As to the number of newspapers published in the United States, nothing definite can be said about it, except that it baffles all attempts at computation; there being hardly a village or a settlement of a dozen houses in any part of the country, without a printing establishment and a paper. The amount of knowledge and useful information circulated by these most powerful engines of civilization, is really enormous; and although no great depth of reasoning or proficiency of learning particularly distinguishes the fraternity of editors, common good sense is nevertheless the characteristic of an American paper; as without this most necessary commodity it would be difficult for them to make the least impression upon the public. The amount of circulation is prodigious, and greatly facilitated by the reduced postage.

Each paper, not carried out of the state in which it is published, or if carried out of the state not over one hundred miles beyond it, pays but one cent, and if over one hundred miles out of the state, never more than one and a half cent postage; and it is even contemplated to abolish the postage on newspapers altogether. Printers of newspapers may send one paper to each and every other printer of newspapers within the United States *free* of postage, under such regulations as the Postmaster-General may provide. Thus an inhabitant of Boston or New York is able to read the New Orleans papers with little more than an additional expense of four dollars fifty cents, or less than one pound sterling *per annum;* and the inhabitants of the South are at the same cheap rate furnished with information from the North.

7. HARRIET MARTINEAU DESCRIBES WASHINGTON, D.C., IN THE 1830s

Harriet Martineau (1802–1876) was a well-known English journalist, abolitionist, political economist, and feminist. In 1834, she paid an extended visit to the United States, and wrote about her experiences. What follows is her description of Washington, D.C., in the mid-1830s, a far cry from the well-paved streets and impressive public buildings of the city today.

Washington is no place for persons of domestic tastes. Persons who love dissipation, persons who love to watch the game of politics, and those who make a study of strong minds under strong excitements, like a season at Washington; but it is dreary to those whose pursuits and affections are domestic. I spent five weeks there, and was heartily glad when they were over. I felt the satisfaction all the time of doing something that was highly useful; of getting knowledge that was necessary to me, and could not be otherwise obtained; but the quiet delights of my Philadelphia home (though there half our time was spent in visiting) had spoiled me for such a life as every one leads at the metropolis. I have always looked back upon the five weeks at Washington as one of the most profitable, but by far the least agreeable, of my residences in the United States.

Yet we were remarkably fortunate in our domestic arrangements there. We joined a party of highly esteemed and kind friends: a member of the House of Representatives from Massachusetts, his wife and sister-in-law, and a senator from Maine. We (the above party) had a drawing-room to ourselves and a separate table at Mrs. Peyton's boarding-house; so that we formed a quiet family group enough, if only we had had any quiet in which to enjoy the privilege.

We arrived at Washington on the 13th of January, 1835, the year of the short session of Congress which closes on the 4th of March, so that we continued to see the proceedings of Congress at its busiest and most interesting time.

The approach to the city is striking to all strangers from its oddness. I saw the dome of the Capitol from a considerable distance at the end of a straight road; but, though I was prepared by the descriptions of preceding travellers [sic], I was taken by surprise on finding myself beneath the splendid building, so sordid are the enclosures and houses on its very verge. We wound round its base, and entered Pennsylvania Avenue, the only one of the grand avenues intended to centre in the Capitol which has been built up with any completeness. Our boarding-house was admirably situated, being some little way down this avenue, a few minutes' walk only from the Capitol, and a mile in a straight line from the White House, the residences of the heads of departments and the British legation.

In Philadelphia I had found perpetual difficulty in remembering that I was in a foreign country. The pronunciation of a few words by our host and hostess, the dinner-table, and the inquiries of visiters [sic] were almost all that occurred to remind me that I was not in a brother's house. At Washington it was very different. The city itself is unlike any other that ever was seen, straggling out hither and thither, with a small house or two a quarter of a mile from any other; so that, in making calls "in the city," we had to cross ditches and stiles, and walk alternately on grass and pavements, and strike across a field to reach a street. Then the weather was so strange; sometimes so cold that the only way I could get any comfort was by stretching on the sofa drawn before the fire up to the very fender (on which days every person who went in and out of the house was sure to leave the front door wide open); then the next morning, perhaps, if we went out muffled in furs, we had to turn back and exchange our wraps for a light shawl. Then we were waited upon by a slave appointed for the exclusive service of our party during our stay. Then there were canvass-back ducks, and all manner of other ducks on the table, in greater profusion than any single article of food, except turkeys, that I ever saw. Then there was the society, singularly compounded from the largest variety of elements foreign ambassadors, the American government, members of Congress, from Clay and Webster down to Davy Crockett, Benton from Missouri, and Cuthbert, with the freshest Irish brogue, from Georgia; flippant young belles, "pious" wives dutifully attending their husbands, and groaning over the frivolities of the place; grave judges, saucy travellers [sic], pert newspaper reporters, melancholy Indian chiefs, and timid New England ladies, trembling on the verge of the vortex; all this was wholly unlike anything that is to be seen in any other city in the world; for all these are mixed up together in daily intercourse, like the higher circle of a little village, and there is nothing else. You have this or nothing; you pass your days among these people, or you spend them alone.

8. HARRIET MARTINEAU'S DESCRIPTION OF AMERICAN SLAVERY (1830s)

The American tour of Englishwoman Harriet Martineau (1802–1876) was not without controversy. She became an early member of the abolitionist movement, which, in the 1830s, was small and very much despised. Her intense feelings of hatred for the institution of slavery can be seen in the following passage in which she relates a story about the attempted escape of a slave.

On other parts of the frontier I heard tales which I grieve that it is not in my power to tell, so honourable are they to individuals of both races, friends of the slaves. The time may come when no one will be injured by their being made public. Meantime, I will give one which happened many years ago, and which relates to a different part of the country.

A., now an elderly man, was accustomed in his youth to go up and down the Mississippi on trading expeditions; and both in these and in subsequent wanderings of many years—to Hayti among other places—he has had opportunity to study the character of the negro race; and he is decidedly of opinion that there is in them only a superinduced [sic] inferiority to the whites. In relating his experiences. among the coloured people, he told the following story:—

When he was a young man, he was going down the Mississippi in a boat with a cargo of salt, when he stopped at a small place on the Kentucky shore called Unity, opposite to a part of Arkansas. While he was there a slavetrader came up with his company of upward of two hundred slaves, whom he was conveying to the New-Orleans market. Among these A. remarked a gigantic mulatto—handsome in countenance and proud in bearing—who was nearly naked, and fettered. He had an iron band round his waist and round each wrist, and these bands were connected by chains. The trader observed to A. that this man was the most valuable slave he had ever had on sale. I think he said that he would not take two thousand dollars for him; he added that he was obliged to chain him, as he was bent on getting away. When the trader's back was turned, the mulatto looked at A. as if wishing to talk with him.

"Why are you chained in this way?" asked A.

"Because my master is afraid of losing me, He knows that I am the most valuable slave he has, and that I mean to get away."

"Have you told him so?"

"Yes."

"And how do you mean to get away?"

"I don't know; but I mean it."

After a pause, he said in a low voice to A.,

"Could not you give me a file?"

"No," said A., decidedly. "Do you think I don't know the law? Do you think I am going to help you away, and get punished for it? No; I can't give you a file."

As A. went back to his boat he saw the slave looking wistfully after him, and his heart smote him for what he had said. He bethought himself that if he could manage to put an instrument of deliverance in the man's way without touching it, he might keep within the letter of the law, and he acted upon this notion. He looked about his boat, and found a strong three-sided file, which he put between his coat and waistcoat, so that it would be sure to drop out when the coat was unbuttoned. He sauntered back on shore, and the mulatto, who watched all his movements, came up to him, eagerly whispering,

"Have you got a file? Are you going to give me a file?"

"No," said A. "I told you that I knew better than to give you a file."

The slave's countenance fell.

"However," continued A., "I should not wonder if I can tell you where to get one. If you look about by yonder woodpile, I think, perhaps, you may find a file. No, not now. Go back to your company now, and don't look at me; and, when I am gone on board my boat, you can wander off to the woodpile."

A. unbuttoned his coat as he appeared to be picking up the scattered wood round the pile, and presently returned to his boat, whence he saw the mulatto presently walk to the woodpile, and stoop down just at the right spot. A. watched all day and late into the night, but he saw and heard nothing more.

In the morning the slavetrader came on board the boat, exclaiming angrily that A. had a slave of his concealed there. A. desired him to search the boat, which he did, looking behind every bag of salt. He was confident that A. must have helped the man away; chained as he was, he could not have got off without help. As for himself, he had rather have lost thousands of dollars than this man; but he always knew it would be so; the fellow always said he would get away.

Thus grumbling, the trader departed to make search in another direction. In an hour he returned, saying that the slave must either be drowned or have got over into Arkansas. His irons and a strong file were lying on a point of land projecting into the river about a mile off, and the marks were visible where the fugitive had taken the water. A. went, and long did he stay, questioning and meditating; and during all the years that have since elapsed, it has been his frequent daily and nightly speculation whether the mulatto escaped or perished. Sometimes, when he remembers the gigantic frame of the man, and the force of the impulse which urged him, A. hopes that it may have been possible for him to reach the opposite shore. At other times, when he thinks of the width of the Mississippi at that part, and of the tremendous force of the current, which would warrant the assertion that it is impossible for a swimmer to cross, he believes himself convinced that the fugitive has perished. Yet still the hope returns that the strong man may be living in wild freedom in some place where the sense of safety and peace may have taught him to forgive and pity his oppressors.

9. CHARLES DICKENS ON THE MILL GIRLS OF LOWELL, MASSACHUSETTS (1842)

The Englishman Charles Dickens (1812–1870) was one of the best-known novelists of the Victorian era. His novels and magazine and newspaper articles detailed the experiences of everyday people struggling to cope with a changing world. Dickens made two journeys to the United States and published his observations of the lives of ordinary citizens in his work titled *American Notes for General Circulation*. The following passage deals with the mill town of Lowell, Massachusetts, and the young women who were recruited from surrounding farms to work in the mills. The town and work were carefully regulated, and it became a model for the development of factory towns that came in succeeding years. Here, Dickens describes the condition of the young women working in the mill.

These girls, as I have said, were all well dressed: and that phrase necessarily includes extreme cleanliness. They had serviceable bonnets, good warm cloaks, and shawls; and were not above clogs and patterns. Moreover, there were places in the mill in which they could deposit these things without injury; and there were conveniences for washing. They were healthy in appearance, many of them remarkably so, and had the manners and deportment of young women: not of degraded brutes of burden. If I had seen in one of those mills (but I did not, though I looked for something of this kind with a sharp eye), the most lisping, mincing, affected, and ridiculous young creature that my imagination could suggest, I should have thought of the careless, moping, slatternly, degraded, dull reverse (I *have* seen that), and should have been still well pleased to look upon her.

The rooms in which they worked, were as well ordered as themselves. In the windows of some, there were green plants, which were trained to shade the glass; in all, there was as much fresh air cleanliness, and comfort, as the nature of the occupation would possibly admit of. Out of so large a number of females, many of whom were only then just verging upon womanhood, it may be reasonably supposed that some were delicate and fragile in appearance: no doubt there were. But I solemnly declare, that from all the crowd I saw in the different factories that day, I cannot recal [sic] or separate one young face that gave me a painful impression; not one young girl whom, assuming it to be matter of necessity that she should gain her daily bread by the labour of her hands, I would have removed from those works if I had had the power.

10. FREDERICK DOUGLASS ON THE CRUELTY OF SLAVEHOLDERS AND THE SUFFERING OF SLAVES (1845)

Frederick Douglass (1818–1895) was a very important figure in both African American and U.S. history. A former slave who escaped to New York in 1838, Douglass, who had been taught to read and write while a slave, became a tireless advocate of the abolition of slavery and racial equality. He was an orator and writer of note in the cause of abolition. His first autobiography, *Narrative of the Life of Frederick Douglass, An American Slave,* detailed his experiences as a slave and became a best seller. This excerpt gives a detailed account of the cruelty of the slaveholder and the suffering of slaves.

I have had two masters. My first master's name was Anthony. I do not remember his first name. He was generally called Captain Anthony—a title which, I presume, he acquired by sailing a craft on the Chesapeake Bay. He was not considered a rich slave-holder. He owned two or three farms, and about thirty slaves. His farms and slaves were under the care of an overseer. The overseer's name was Plummer.

Mr. Plummer was a miserable drunkard, a profane swearer, and a savage monster. He always went armed with a cowskin and a heavy cudgel. I have known him to cut and slash the women's heads so horribly, that even master would be enraged at his cruelty, and would threaten to whip him if he did not mind himself. Master, however, was not a humane slaveholder. It required extraordinary barbarity on the part of an overseer to affect him. He was a cruel man, hardened by a long life of slaveholding. He would at times seem to take great pleasure in whipping a slave. I have often been awakened at the dawn of day by the most heart-rending shrieks of an own aunt of mine, whom he used to tie up to a joist, and whip upon her naked back till she was literally covered with blood. No words, no tears, no prayers, from his gory victim, seemed to move his iron heart from its bloody purpose. The louder she screamed, the harder he whipped; and where the blood ran fastest, there he whipped longest. He would whip her to make her scream, and whip her to make her hush; and not until overcome by fatigue, would he cease to swing the blood-clotted cowskin. I remember the first time I ever witnessed this horrible exhibition. I was quite a child, but I well remember it. I never shall forget it whilst I remember any thing. It was the first of a long series of such outrages, of which I was doomed to be a witness and a participant. It struck me with awful force. It was the blood-stained gate, the entrance to the hell of slavery, through which I was about to pass. It was a most terrible spectacle. I wish I could commit to paper the feelings with which I beheld it.

This occurence [sic] took place very soon after I went to live with my old master, and under the following circumstances. Aunt Hester went out one night,—where or for what I do not know,—and happened to be absent when my master desired her presence. He had ordered her not to go out evenings, and warned her that she must never let him catch her in company with a young man, who was paying attention to her belonging to Colonel Lloyd. The young man's name was Ned Roberts, generally called Lloyd's Ned. Why master was so careful of her, may be safely left to conjecture. She was a woman of noble form, and of graceful proportions, having very few equals, and fewer superiors, in personal appearance, among the colored or white women of our neighborhood.

Aunt Hester had not only disobeyed his orders in going out, but had been found in company with Lloyd's Ned; which circumstance, I found, from what he said while whipping her was the chief offence. Had he been a man of pure morals himself, he might have been thought interested in protecting the innocence of my aunt; but those who knew him will not suspect him of any such virtue. Before he commenced whipping Aunt Hester, he took her into the kitchen, and stripped her from neck to waist, leaving her neck, shoulders, and back, entirely naked. He then told her to cross her hands, calling her at the same time a d—d b—h. After crossing her hands, he tied them with a strong rope, and led her to a stool under a large hook in the joist, put in for the purpose. He made her get upon the stool, and tied her hands to the hook. She now stood fair for his infernal purpose. Her arms were stretched up at their full length, so that she stood upon the ends of her toes. He then said to her, "Now, you d—d b—h, I'll learn you how to disobey my orders!" and after rolling up his sleeves, he commenced to lay on the heavy cowskin, and soon the warm, red blood (amid heart-rending shrieks from her, and horrid oaths from him) came dripping to the floor. I was so terrified and horror-stricken at the sight, that I hid myself in a closet, and dared not venture out till long after the bloody transaction was over. I expected it would be my turn next. It was all new to me. I had never seen any thing like it before. I had always lived with my grandmother on the outskirts of the plantation, where she was put to raise the children of the younger women. I had therefore been, until now, out of the way of the bloody scenes that often occurred on the plantation.

11. SIR CHARLES LYELL DESCRIBES A BOSTON SCHOOL (1845)

Sir Charles Lyell (1797–1875) was a Scottish-born geologist whose book *Principles of Geology* brought him world renown. Lyell was also a friend of Charles Darwin, and became the first scientist to support *On the Origins of Species*, although he didn't support all its ideas. Lyell traveled twice to the United States, and published his experiences from both trips. In the following excerpt, Lyell discusses his visit to a Boston school, and the performance of its students as opposed to those in England on his second visit to the United States in the late 1840s.

Nov. 27, 1845

The population of Boston, exclusive of Charlestown, Roxbury, and Cambridge (which may be regarded as suburbs), is at present about 115,000, of which 8000 are Roman Catholics, chiefly of Irish extraction; but there are besides many Scotch and English emigrants in the city. In order to prove to me how much may be done to advance them in civilization in a single generation, I was taken to a school where nine-tenths of all the children were of parents who had come out from England or Ireland. It was not an examination day, and our visit was wholly unexpected. We entered a suite of three well-aired rooms, containing 550 girls. There were nine teachers in the room. The pupils were all between the ages of nine and thirteen, the greater portion of them the daughters of poor laborers, but some of them of parents in good circumstances. Each scholar was seated on a separate chair with a back to it, the chair being immovably fixed to the ground to prevent noise. There was no uniformity of costume, but evidently much attention to personal neatness, nearly all of them more dressed than would be thought in good taste in children of a corresponding class in England. They had begun their studies at nine o'clock in the morning, and are to be six hours at school, studying fifty minutes at a time, and then being allowed to ten minutes for play in a yard adjoining. I observed some of the girls very intent on their task, leaning on their elbows and in other careless attitudes, and we were told by the masters that they avoid as much as possible finding fault with them on minor points when they are studying. The only punishments are a reprimand before the class, and keeping them back after school hours. The look of intelligence in the countenances of the greater number of them was a most pleasing sight. In one of the upper classes they were reading, when we went in, a passage from Paley "On Sleep," and I was asked to select at random from the school-books some poem which the girls might read each in their turn. I chose Gray's Elegy in a Churchyard, as being none of the simplest for young persons to understand. They each read a verse distinctly, and many of them most gracefully, and explained correctly the meaning of nearly all the words and allusions on which I questioned them.

We afterward heard the girls of the arithmetic class examined in algebra, and their answers showed that much pains had been taken to make them comprehend the principles on which the methods of calculation depended. We then visited a boy's grammar school, and found there 420 Protestant and 100 Catholic boys educated together. We remarked that they had a less refined appearance and were less forward in their education than the girls whom we had just seen, of the same age, and taken from the same class in society. In explanation I was told that it is impossible to give the boys as much schooling, because they can earn money for their parents at an earlier age.

12. AN AMERICAN HOME (1849)

Fredrika Bremer (1801–1865) was a well-known feminist novelist from Sweden. She traveled in the United States by herself in 1849 and wrote of her experiences over two years. Here she discusses the home of one of her hosts, Andrew Jackson Browning.

Newburgh, on the Hudson, October 7, 1849

He built his house himself, planted all the trees and flowers around it, giving everything, it seems to me, the stamp of a refined and earnest mind. It stands in the midst of romantic scenery and shadowy pathways, with the prettiest little bits of detail and grand views. All has been done with design, nothing by guess, nothing with formality. Here a *soul* has felt, thought, arranged. A certain darkness of tone prevails within the house; all the wood-work is brown; even the daylight is somber [sic], yet clear, or, more properly speaking, pregnant with light—a sort of imprisoned sunshine, something warm and profound, appearing to me like a reflection of the man's own brown eyes. In forms, furniture, and arrangement the finest taste prevails; everything is soft and noble, and as comfortable as it is tasteful. The only brilliant things in the rooms are the pretty flowers in lovely vases and baskets. Besides, there are books, busts, and some pictures. Above small bookcases, in the form of Gothic windows, inserted like niches in the walls of the parlor, stand busts of Linné, Franklin, Newton, and many other heroes of natural science. One sees in this dwelling a decided and thorough individuality of character, which has put its stamp on all that surrounds it, and every one ought to mold himself and his own world in a similar way. One feels here Mr. Downing's motto, *Il bello è il buono*. A real luxury obtains in food, fruits, and in many small things, but it makes no outward show; it exists, as it were, concealed in the inner richness and exquisite selection of the thing itself. I did not expect to meet this type of home in the young New World.

13. AN ADDRESS TO THE LEGISLATURE OF NEW YORK, ADOPTED BY THE STATE WOMEN'S RIGHTS CONVENTION AT ALBANY (FEBRUARY 1854)

Elizabeth Cady Stanton (1815–1902) was a social activist and the leader of the women's movement in the United States. Her activities went far beyond voting rights for women and included abolition, women's custodial rights, birth control, divorce rights, and the economic rights of women. This address to the New York legislature, which was adopted by the Women's Rights Convention in Albany on February 14 and 15, 1854, gives a taste of the issues that Stanton believed needed to be addressed in the lives of women.

To the Legislature of the State of New York:

"The thinking minds of all nations call for change. There is a deep-lying struggle in the whole fabric of society; a boundless, grinding collision of the New with the Old."

The tyrant, Custom, has been summoned before the bar of Common Sense. His Majesty no longer awes the multitude—his sceptre [sic] is broken—his crown is trampled in the dust—the sentence of death is pronounced upon him. All nations, ranks and classes have, in turn, questioned and repudiated his authority; and now, that the monster is chained and caged, timid woman, on tiptoe, comes to look him in the face, and to demand of her brave sires and sons, who have struck stout blows for liberty, if, in this change of dynasty, she, too, shall find relief.

Yes, gentlemen, in republican America, in the 19th century, we, the daughters of the revolutionary heroes of '76, demand at your hands the redness of our grievances—a revision of your state constitution—a new code of laws. Permit us then, as briefly as possible, to call your attention to the legal disabilities under which we labor.

1st, Look at the position of woman as woman. It is not enough for us that by your laws we are permitted to live and breathe, to claim the necessaries of life from our legal protectors—to pay the penalty of our crimes; we demand the full recognition of all our rights as citizens of the Empire State. We are persons; native, free-born citizens; property-holders, tax-payers; yet are we denied the exercise of our right to the elective franchise. We support ourselves, and, in part, your schools, colleges, churches, your poor-houses, jails, prisons, the army, the navy, the whole machinery of government, and yet we have no voice in your councils. We have every qualification required by the constitution, necessary to the legal voter, but the one of sex. We are moral, virtuous and intelligent, and in all respects quite equal to the proud white man himself, and yet by your laws we are classed with idiots, lunatics and negroes; and though we do not feel honored by the place assigned us, yet, in fact, our legal position is lower than that of either; for the negro can be raised to the dignity of a voter if he possess himself of $250; the lunatic can vote in his moments of sanity, and the idiot, too, if he be a male one, and not more than nine-tenths a fool; but we, who have guided great movements of charity, established missions, edited journals, published works on history, economy and statistics; who have governed nations, led armies, filled the professor's chair, taught philosophy and mathematics to the *savans* of our age, discovered planets, piloted ships across the sea, are denied the most sacred rights of citizens, because, forsooth, we came not into this republic crowned with the dignity of manhood! Woman is theoretically absolved from all allegiance to the laws of the state. Sec. 1, Bill of Rights, 2 R.S., 301, says that no authority can, on any pretence whatever, be exercised over the citizens of this state but such as is or shall be derived from, and *granted by, the people of this state*.

Source: Elizabeth Cady Stanton, preparer, *Address to the Legislature of New York, Adopted by the Women's Rights Convention held at Albany, Tuesday and Wednesday, February 14 and 15, 1854*. Albany, NY: Weed, Parsons and Company, 1854.

14. FREDERICK LAW OLMSTED DESCRIBES THE AMERICAN SOUTH (1856)

Frederick Law Olmsted (1822–1903) was an American landscape designer and father of landscape architecture in the United States. His most famous designs include Central Park in New York City and the landscape surrounding the Capitol building in Washington, D.C. He also had a career as a journalist, and he was recruited by the *New York Daily Times* (which is now the *New York Times*) to travel through the American South to Texas to study the slave economy from 1852 to 1857. Olmsted became convinced that slavery was morally odious and also economically inefficient. In this passage, Olmsted makes observations about southerners he encounters on a steamboat ride.

THE CITIZENS.

There were about one hundred passengers on the Fashion, besides a number of poor people and negroes on the lower deck. They were, generally, cotton-planters, going to Mobile on business, or emigrants bound to Texas or Arkansas. They were usually well dressed, but were a rough, coarse style of people, drinking a great deal, and most of the time under a little alcoholic excitement. Not sociable, except when the topics of cotton, land, and negroes, were started; interested, however, in talk about theatres and the turf; very profane; often showing the handles of concealed weapons about their persons, but not quarrelsome, avoiding disputes and altercations, and respectful to one another in forms of words; very ill-informed, except on plantation business; their language very ungrammatical, idiomatic, and extravagant. Their grand characteristics—simplicity of motive, vague, shallow, and purely objective habits of thought; spontaneity and truthfulness of utterance, and bold, self-reliant movement.

With all their individual independence, I soon could perceive a very great homogeneousness of character, by which they were distinguishable from any other people with whom I had before been thrown in contact; and I began to study it with interest, as the Anglo-Saxon development of the Southwest.

I found that, more than any people I had ever seen, they were unrateable by dress, taste, forms, and expenditures. I was perplexed by finding, apparently united in the same individual, the self-possession and confidence of the well equipped gentleman, and the coarseness and low tastes of the uncivilized boor—frankness and reserve, recklessness and self restraint, extravagance, and penuriousness.

15. A STEAMBOAT RIDE ON THE MISSISSIPPI (1857)

John Benwell was an Englishman who traveled extensively throughout the United States in the 1850s and recorded his experiences with the people and places he encountered. In this excerpt, he discusses a steamboat ride along the Mississippi River, noting not only the scenery, but his fellow passengers.

The *Narraganset,* like most of the large river steamers, was constructed with three decks, and fitted up in sumptuous style. One large saloon, with a portion partitioned off for the ladies, serving as a cabin and dining apartment. There is no professed distinction of class in the passengers on board steam-boats in America. I found, however, that the higher grades, doubtless from the same causes that operate in other parts of the world, kept aloof from those beneath them.

The scene from the upper or hurricane deck (as it is called) was very attractive. Flowing, as the river Hudson does, through a fine mountainous country, the magnificent scenery on the banks strikes the observer with feelings allied to awe. The stream being broad and tortuous, beetling crags, high mountains and bluffs, and dense forests, burst suddenly and unexpectedly into view; fearful precipices abound here and there, amidst luxuriant groves and uncouth pine barrens, forming altogether a diversity that gives the whole the character of a stupendous panorama.

Before we were out of the tide, which for miles flows up the river, our vessel grounded three times, but after puffing and straining for a considerable time, she got off without damage and pursued her onward course. Most of my fellow-voyagers were disposed to be distant and taciturn, and so I enjoyed the grandeurs of the scene in solitary musings, to which the steamers, sloops under sail, and other vessels proceeding up and down the river, gave a pleasant enlivenment. The promenade deck, crowded with lady passengers and beautiful children, under a gay awning, added to the cheerfulness of the surrounding aspect, and the fineness of the weather, but for the fear of collapsing boilers, would have made the trip one of great enjoyment.

Another drawback I had nearly forgotten, and as it serves to illustrate steam-boat and indeed all other travelling [sic] inconveniences in America, I must not pass it over; I refer to the vulgarity of the men passengers, who, in default of better occupation, chew tobacco incessantly, and, to the great annoyance of those who do not practise the vandalism, eject the impregnated saliva over everything under foot. The deck of the vessel was much defaced by the noxious stains; and even in converse with ladies the unmannerly fellows expectorated without sense of decency. The ladies, however, seemed not to regard it, and one bright-eyed houri [sic] I saw looking into the face of a long sallow-visaged young man, who had the juice oozing out at each angle of his mouth with disgusting effect, so that enunciation was difficult.

APPENDICES

APPENDIX 1: POPULATION OF THE UNITED STATES BY DECADE—1790–1860

As the following census figures show, the population of the United States grew from almost 4 million people in 1790 to over 31 million people in 1860, with the rate of growth increasing steadily after 1820.

1790	3.9 million
1800	5.3 million
1810	7.2 million
1820	9.6 million
1830	12.8 million
1840	17.0 million
1850	23.1 million
1860	31.4 million

Source: United States Census Bureau.

APPENDIX 2: PRESIDENTS OF THE UNITED STATES—1789–1861

Listed below are the presidents of the United States who held office between 1789 and 1861, with their party affiliations and their terms of service.

George Washington	Federalist	1789–1797
John Adams	Federalist	1797–1801
Thomas Jefferson	Democratic-Republican	1801–1809
James Madison	Democratic-Republican	1809–1817
James Monroe	Democratic-Republican	1817–1825
John Quincy Adams	National Republican	1825–1829

Andrew Jackson	Democrat	1829–1837
Martin Van Buren	Democrat	1837–1841
William Henry Harrison[1]	Whig	1841
John Tyler	Whig	1841–1845
James K. Polk	Democrat	1845–1849
Zachary Taylor[2]	Whig	1849–1850
Millard Fillmore	Whig	1850–1853
Franklin Pierce	Democrat	1853–1857
James Buchanan	Democrat	1857–1861

[1] Died in office in April 1841

[2] Died in office in July 1850

APPENDIX 3: VICE PRESIDENTS OF THE UNITED STATES—1789–1861

Listed below are the vice presidents of the United States who held office between 1789 and 1861, with the president under whom they served, their party affiliation, and their terms of service.

John Adams	Washington	Federalist	1789–1797
Thomas Jefferson	Adams	Democratic-Republican	1797–1801
Aaron Burr	Jefferson	Democratic-Republican	1801–1805
George Clinton[1]	Jefferson/Madison	Democratic-Republican	1805–1812
Office Vacant	Madison		1812–1813
Elbridge Gerry[2]	Madison	Democratic-Republican	1813–1814
Office Vacant	Madison		1814–1817
Daniel D. Tompkins	Monroe	Democratic-Republican	1817–1825
John C. Calhoun[3]	J. Q. Adams/Jackson	Democrat	1825–1832
Office Vacant	Jackson		1832–1833
Martin Van Buren	Jackson	Democrat	1833–1837
Richard M. Johnson	Van Buren	Democrat	1837–1841
John Tyler[4]	Harrison	Whig	1841
Office Vacant	Tyler		1841–1845
George M. Dallas	Polk	Democrat	1845–1849
Millard Fillmore[5]	Taylor	Whig	1849–1850
Office Vacant	Fillmore		1850–1853

William Rufus King[6]	Pierce	Democrat	1853
Office Vacant	Pierce		1853–1857
John C. Breckinridge	Buchanan	Democrat	1857–1861

[1] Died in office April 20, 1812

[2] Died in office November 23, 1814

[3] Resigned from office December 28, 1832

[4] Succeeded to the presidency upon the death of William Henry Harrison on April 4, 1841

[5] Succeeded to the presidency upon the death of Zachary Taylor on July 9, 1850

[6] Died in office on April 18, 1853

APPENDIX 4: SECRETARIES OF STATE OF THE UNITED STATES—1789–1861

Listed below are the secretaries of state of the United States who held office between 1789 and 1861, with the president who appointed them, their party affiliation, and their terms of service.

John Jay	secretary under the Confederation		1784–1790
Thomas Jefferson	Washington	No party	1790–1793
Edmund Randolph	Washington	Federalist	1794–1795
Timothy Pickering	Washington/Adams	Federalist	1795–1800
John Marshall	Adams	Federalist	1880–1801
James Madison	Jefferson	Democratic-Republican	1801–1809
Robert Smith	Madison	Democratic-Republican	1809–1811
James Monroe	Madison	Democratic-Republican	1811–1817
John Quincy Adams	Monroe	Democratic-Republican	1817–1825
Henry Clay	J. Q. Adams	National-Republican	1825–1829
Martin Van Buren	Jackson	Democrat	1829–1831
Edward Livingston	Jackson	Democrat	1831–1833
Louis McLane	Jackson	Democrat	1833–1834
John Forsyth	Jackson/Van Buren	Democrat	1834–1841
Daniel Webster	Harrison/Tyler	Whig	1841–1843
Hugh S. Legaré	Tyler	Whig	1843 (interim)
Abel P. Upshur	Tyler	Whig	1843–1844
John C. Calhoun	Tyler	Democrat	1844–1845
James Buchanan	Polk	Democrat	1845–1849

John M. Clayton	Taylor	Whig	1849–1850
Daniel Webster	Fillmore	Whig	1850–1852
Edward Everett	Fillmore	Whig	1852–1853
William L. Marcy	Pierce	Democrat	1853–1857
Lewis Cass	Buchanan	Democrat	1857–1860
Jeremiah S. Black	Buchanan	Democrat	1860–1861
